Coal mining machinery	3,563	In \$U.S. Millions		
Electric generators	5,000	220	387	3,078
Oil refining plant	1,848	300	...	4,700
Steel plant	a	555	33	1,260
		400	...	a
Tractors	838	In '000 units	b	1,219
Locomotives	9.4	...	...	12.0
Freight cars	724	c	...	621
Passenger cars	24	c	...	22

a No estimate given; most of the new equipment will be provided by the participating countries.

b Total exports 446,000; net import requirements, 51,000 heavy, 14,000 light tractors.

c Deficits may involve imports from U.S.A. totalling \$367 mn. for freight cars and \$112 mn. for passenger cars.

There is no special merit in the fact that Western Europe, as a whole, should be able to provide the bulk of its new basic equipment from its own resources during the next four years. It has always done so in the past, and the national plans of the participating countries are based on the simple necessity of doing so in the future. The Paris report is not, in this respect at least, a shopping list. But, by its concentration on the essential foundations of industrial recovery, it has perhaps given less than due weight to the technical importance of the residual imports of new plant which will be required from the United States—of which the steel strip mills and certain oil refinery plant are good examples.

It would be a useful exercise, if the material existed, to relate the Paris plan to the British planning for industry and agriculture, and to the export drive. Unfortunately, this is at present impossible, except in very general terms. Britain will clearly be expected to supply a high proportion of certain items in the table above to other European countries. That will not necessarily conflict either with the progress of re-equipping British industry or with the balancing of Britain's external account as a whole. But it does mean that after the acceptance of the Paris report, some machinery will have to be created so that exports of heavy industrial plant are allocated

in accordance with Europe's needs, even at the expense of Britain's need for dollars. Nor does the Paris report attempt to cover the full range of European self-help to which Britain will have to contribute. There is no mention of textiles, general industrial machinery or trucks, which British industry will have to supply in large quantities. Already, the potential drain of supplies from the home market which will be needed to meet the 1948 export targets is generally under-estimated. Here are some comparisons between the required increase in certain exports during the next fifteen months and current deliveries to the home market:—

	Increase in Exports over Jan.-June 1947 Average to meet End-1948 Targets (Monthly Rates)	Equivalent Proportion of Current Home Deliveries (per cent.)
Coal ('000 tons)	1,195	8
Steel ('000 tons)	83	4
Machinery* ('000's)	5,780	61
Motor cars ('000's)	3,800	135
Commercial trucks ('000's)	450	21
Cotton (mn. lbs. yarn equivalent) ..	9.6	22
Wool (mn. linear yds)	7	52
Cement ('000 tons)	51	12

* Includes agricultural machinery, boilers, internal combustion engines, pumps, machine tools, etc.

None of these targets will be easy to hit, least of all the machinery target. Yet this is inseparable from the success of the Paris proposals. It involves a serious diversion of output from home supplies of the very capital items that are urgently needed for British industrial re-equipment—even of items which are required for the fulfilment of British undertakings in the Paris report. Once more, old lessons have to be relearned: that swollen capital programmes must be pruned, though in the right way, so that the damage inflicted on British industrial recovery is kept to the minimum in order to raise the speed of European basic industrial recovery to the maximum. It is impossible to increase the rate of output of heavy industrial plant very rapidly—though a bout of disinflation would certainly work a few miracles in easing the congestion of work now optimistically labelled “in progress.” Nor is a great expansion in the capital producing industries required—new output would not emerge in time and it would have scarcely any temporary usefulness. It is industry of the second order of importance which may have to go short of new plant, so that those basic industries in Europe which cannot make do and mend can have a chance to recover in four years' time.

Patent Law Reform

THE Departmental Committee set up to consider the Patents and Designs Act and the practice of the Patent Office and of the Courts in matters arising from them has now published its final report. It was set up in April 1944, and issued two interim reports, the first in April 1945 and the second in April 1946. Some action has already been taken on the first interim report, which dealt urgently with the problem of providing additional machinery by which an extension of the period of a patent could conveniently be granted to compensate inventors for their inability to develop patents during the period of the war. The result was the passing of the Patent Act, 1946. No action has yet been taken on the second interim report.

The reports cover all aspects of a subject which abounds in technical difficulty. They are concerned with a branch of statute law of some antiquity and their recommendations are in the nature of modifications to the existing law rather than drastic changes in established principle. Many of these modifications are of technical interest to patent law practitioners

which it would be impracticable to deal with here—matters on which experience has shown that some alteration in present law or practice is desirable. None the less, the reports do raise a number of major points, and on some of the Committee's recommendations there may well be differences of opinion.

The first is the proposal made in the second interim report that the Comptroller-General of Patents should have the power to investigate the subject matter of a specification before granting a patent. At the moment the Patent Office is concerned to see that an invention for which a patent is requested constitutes “a manner of new manufacture.” It is not required to investigate whether in fact there is inventive merit at all. This is a matter for the High Court if, and only if, the patent is subsequently challenged. The final report, with two dissentients, recommends that the Comptroller should be given power to reject any application on the ground that it appears to him “to be wholly lacking in subject matter”, that is, that it lacks inventive merit. The implications of this recommend-

ation are obvious. It would cast on the machinery of the Patent Office a wholly new burden (and one which the Courts now discharge). It would involve every inventor in the obligation, with its attendant delay and expense, of establishing that his invention had substance. And it is doubtful if the subsequent gain in the repute of a patent when granted would compensate for this new obligation.

Another important suggestion made in the second interim report was that two special technical Judges should be appointed to hear patent actions. This was a unanimous recommendation and could have been carried into effect under powers contained in the Judicature Acts without the need for special legislation (just in the same way that many reforms in divorce procedure have already been made). It is to be regretted that the opportunity has not already been taken of making this experiment; it would certainly be unfortunate if it were deferred until any legislation required to deal with the Patent Acts themselves can be considered by Parliament. The final report makes suggestions for the alteration of some 50 sections in the Patent Acts and for a divorce between the law affecting Patents and that which concerns Designs.

On the whole the Committee have shown great skill in their suggestions for removing anomalies and anachronisms in the statutes as they exist at present, without creating any real break in the structure of patent law. There are ten major matters upon which they made recommendations, and of these, probably eight would command general acceptance. These eight include first, a provision conferring the right to apply for patent protection upon the assignee of an invention as well as on the original inventor; second, statutory provision to clarify the rights of joint owners of a patent; third, a restatement of the rights of third parties where a patent is prolonged or restored; fourth, the provision of statutory rules to meet the case of an invention made by an employee in the course of his employment, when there is any dispute regarding the ownership of the patent.

★

Another important recommendation proposes that the period of monopoly granted by a patent should start from the filing of the complete specification though priority in respect of the invention should accrue from the time when the original application is deposited. This would clear away many practical difficulties and should meet many of the points raised at the International Patent Conferences on behalf of countries whose patent law provides no counterpart to the British procedure for the grant of provisional protection. There is likely to be little disagreement on the further suggestions that statutory recognition should be given to the interest of an exclusive licensee in any litigation which concerns a patent in respect of which he holds a licence, and that some machinery should be provided by which any person who desires to manufacture

an article which might be alleged to constitute an infringement of an existing patent could ask the Court to declare whether or not the proposed manufacture would in fact constitute an infringement. At the moment such a person may be left in a state of complete uncertainty by the holder of a patent, to the detriment of enterprise in trade.

More controversy is likely to arise over the two remaining recommendations. The first relates to Section 38 of the Act. Under this section, new substances produced by chemical processes or intended for food or medicine cannot *per se* be subjects of a patent, though a patent may be granted in respect of a particular method of manufacture. The recommendation of the Committee is that this exception should be repealed. It is not possible to feel complete assurance that the view of the Committee is right. The original provision was introduced into patent law by the Act of 1919, mainly to debar numerous broad claims in respect of new dyestuffs made by German inventors in British patent specifications. The evidence laid before the Committee tended to show that progress in chemical research had made it very difficult to interpret the Act as it stands and that as a result there is a tendency for patent specifications to attempt to get round the Act by claiming protection for all possible methods of manufacture, in the hope that by these means they will protect what in fact is being manufactured. Can anyone now draw a satisfactory line between what is a chemical process and what is a mechanical process? Is a new alloy a new chemical substance or a mixture of metals? Would all chemists agree on an answer?

On the other hand the Committee did accept the fact that to amend the Act in this way would give the holder of a patent for a new chemical substance an exclusive right to manufacture that substance, and there are strong arguments that if the patent laws are to be amended, amendments should be directed towards freeing enterprise and not restricting it still further. The final answer is probably to be found in the provision of safeguards, such as compulsory licences, which will protect the financial rights of the patent holder while preventing him from building up a monopoly in a manufacturing process to the detriment of trade.

The final recommendation, on which there will be some discussion, deals with the use by the Crown of patented inventions. Under the existing Acts, the Crown, or its servants and agents, has the right to use an invention “for the services of the Crown.” This right exists in peacetime and is distinct from the additional rights given by wartime legislation and from the Crown's interest in what are known as “secret patents.” This part of the Committee's proposals deals with what rights should be possessed by the Crown under normal conditions. Its conclusion broadly is that if the Crown desires to make use of a patented invention in circumstances that correspond to an ordinary industrial use then it should apply for a compulsory licence in precisely the same way

Export and Import
Banking on Sweden
SKANDINAVISKA BANKEN

CHRISTIANIA BANK
OG KREDITKASSE
OSLO
Established 1848

Every banking facility

Paid-up Capital and Reserves - Kr. 43.000.000

that an ordinary industrial user is entitled to do at the present time. The two points of view on this can easily be stated. Since the Crown has increasing interests in industrial activity, there is much to be said for limiting any unusual privilege over the patent to those cases where the invention is of value primarily for the Crown's services. Yet, many activities essential to the well-being of the State are not carried on directly by the Crown but by industrial concerns on its behalf. If these were compelled to disclose their purpose in the use of a patented invention to a patentee who may be a national of any country, obvious dangers would arise. Many will think that the Committee's recommendation requires further consideration.

As though changes in patent law were not enough, the Committee has also tackled the law relating to designs. Both subjects have usually been linked together, but their association

is largely historical and, despite their administration by the same Government department is now no more than a matter of administrative convenience. The report makes the tidy recommendation that designs might well form the subject of a separate act, but the detailed proposals which it offers are rather contentious. But whatever the President of the Board of Trade may feel about this part of the report on designs, the proposals on patents do call for prompt action, now that the patent law has been given an expert overhaul which has produced such a large measure of agreement. Industry is inevitably handicapped by defects in the patent laws whether they be large or small. It is to be hoped that the Board of Trade will seize the opportunity presented by the completion of this survey to press its claim for Parliamentary time for new legislation, with the confidence that industry and commerce are on its side.

Business Notes

No Exports, No Steel

Hard on the announcement of the export targets with their emphasis on vehicles, machinery and other engineering products and on Sir Stafford Cripps' admission that the system of steel allocation needed improvement, Mr Wilmot has this week given the engineering industry notice that allocations of steel and some other raw materials are in future to be related to the export achievements of individual firms. Mr Wilmot describes this step as both a sanction and an incentive. There is no possibility of any substantial increase in total deliveries of steel to the engineering industry and therefore the increased needs of steel for export production will have to come from production for the home market, "including particularly capital goods of all kinds, building, civil engineering works and machinery." The intention is to squeeze the home market very hard; industries will be given a low home quota, to be divided among manufacturers in proportion to their export performance. And this whole process of the big stick and little carrot is to be controlled, Mr Wilmot hopes, by an adjustment of steel allocations to individual firms.

The Minister of Supply was prudent enough to recognise that special complexities will arise. In the machinery industry, for example, the diversion of output from home to export will do more harm than good if it jeopardises the export ability of the home industries for which it had been designed. Coal mining machinery is a case in point. But for industry generally, cuts in machinery and supplies for the re-equipment of home production will be inevitable. As for the important common service item—components like ball bearings, electric motors and precision chain—the Government will "do what it can" to provide raw materials.

The intention of the Ministry of Supply to modify the previous practice which allocated steel according to the using industries, and not according to the markets in which their end-products were to be sold, has a certain realism about it. It is an admission that export targets require something more than propaganda for success. But Mr Wilmot's sanctions and incentives are not convincing. They will clearly involve new delays, new arguments between individuals, firms and departments, difficulties of relating supplies of raw materials to promises of export performance (particularly in an industry like engineering where individual items may take many months to complete) and greater difficulties of proving that the maximum effort has been put into increasing export business. Is the administrative machine competent to cope with these new planning responsibilities? There is little in the previous record of the Iron and Steel Control which suggests that it is. The engineering industry has meanwhile been put under notice that the Minister of Supply may in future require statutory returns (perhaps each quarter) of production and exports; he is also contemplating that the manufacture of engineering consumer goods should in future be permitted only under licence. The Minister is asking more than a little of industry in his latest proposals. They recall some of the reservations expressed in *The Economist* of September 6th on the policy of doling out raw materials for export only. The new system will not work without much friction, even assuming that radical improvements can be made in the efficiency of allocation of steel supplies.

The Motor Industry's Reply

Mr Wilmot's announcement of the new steel allocation plan for the engineering industry was followed on Thursday by a report to the Minister from the Society of Motor Manufacturers and Traders on his suggestion (which was also discussed in the article of September 6th) that the industry's aim should be one model per firm or factory. This proposal was made on August 28th and the industry has in consequence been able to take account in its reply of the official export target for motor cars announced in the intervening period. The Society's reply was presented to the Minister on September 30th, only 24 hours before the announcement of the new allocation scheme for steel, but the Minister may well have been already aware of the industry's views on steel allocation through the Engineering Advisory Council.

It was not expected that the Ministers' suggestion for a quicker cut in the number of models produced would get a hearty reception from the industry. The manufacturers are satisfied that an annual rate of production of 475,000 cars can be achieved by December, 1948, "without further abnormal capital expenditure" (which more rapid standardisation might entail) provided that adequate steel supplies are forthcoming. This figure of 475,000 compares with a present rate of under 300,000 and allows for meeting the end-1948 export target plus home requirements of 160,000 cars a year for three years. Essential home requirements are defined as the minimum desirable replacement rate of old cars. The Society points out that the imposition of a greater rate of standardisation than is at present being worked out in the production of models and components would jeopardise the export orders and the rearrangement of the labour force would be necessary. The import potential and research functions of the specialist producers are also considered at length.

There is a wide gap between the industry's preference for increased standardisation by raising production and the Government's decision to allocate steel supplies on the basis of export target requirements tying each firm's steel quota for home requirements to its export performance. The industry's emphasis on the need to maintain production of those models which have a proved export market—even at the price of a little less standardisation of models—is a point of substance. The industry has not given the impression that it is trying to evade the issue of a greater degree of standardisation, which is a question somewhat apart from exports. But it is not disposed to hurry, because it thinks haste at this juncture might be dangerous. So it might. But the obvious need is to bring discussion about standardisation within the discipline of a timetable.

Steel Prices and Costs

A year ago, basic steel prices were raised by 5s a ton—a modest increase which passed on only half of the increase in production costs for wages, transport, ore and stores. The balance was to be met from reduction of costs arising from increased efficiency of new plant and economies in fuel by the use of richer, imported ores. With the industry running close to effective capacity, the scope for further savings was bound to be small, and recent increases in fuel and freight charges have

suggested that a consequential increase in steel prices of 7½—10 per cent might be justified.

In the event, the increases have again been more modest than the rise in costs. Steel prices generally have been raised by 5 or 6 per cent from October 1st. Steel billets are increased by 15s a ton, heavy steel products by 18s 6d a ton and sheets by 23s 6d a ton. Greater use of foreign ores has reduced the coke consumption in pig iron production from 1.06 tons per ton of basic pig to a little over 1.05 tons during the twelve months to last July, but ore imports from Empire sources have declined this year and steel scrap has been increasingly difficult to obtain at home and abroad. Imports of richer ore from abroad can be maintained for the next few years—though there is a significant passage in the Paris report which points out that supplies will be adequate up to 1950 but will fall short of demand in 1951. Scrap supplies are more problematical; the postponement of less important capital extensions in many European countries is likely to reduce them for the next year or two. Some further economies may be expected from full-scale operation of iron and steel plants, from the starting of new furnaces and the gathering impetus of the Federation's development programme. But they they are not likely to be large, and they would be imperilled by any failure of coal supplies or transport.

Price Fixing and the Consumer

The President of the Board of Trade has appointed a Committee to inquire generally into the practice of resale price maintenance. The Committee have been given wide terms of reference to consider such practices as the fixing of minimum wholesale and retail prices or margins by producers, and the consequent effects upon the supply, distribution and consumption of goods. They are asked to report whether any steps are desirable to "prevent or regulate" the continuance of these practices in the interests of efficient production and distribution.

Such an inquiry is certainly long overdue. Too little is known about the composite costs which together make up retail selling prices, and this lack of knowledge will not be remedied until the new censuses of distribution have been operating for a few years. The Committee's report will be regarded as an essential supplement to this information. Their inquiries must inevitably cover the policies of manufacturers with regard to prices, discounts and "stop lists"; the methods employed by wholesale and retail trade associations to ensure that resale price maintenance is observed, and the repercussions of these policies on costs of manufacture and distribution. The only trade specifically excluded from the Committee's work is building materials, for which a Committee has already been appointed by the Minister of Works to report on distribution problems.

Wartime economies greatly compressed the distributive system and weakened its competitive elements. Before the war agreements for rigid profit margins, minimum prices and "tied discounts" were being increasingly required from retailers by producers of branded goods. Resale price maintenance received further impetus during the war, often as a result of official policy to keep prices down. Owing to wartime inflation and the depreciation of quality of many consumer goods, the cushion of manufacturers' profits which in many cases looked reasonable enough to gain official consent when retail prices were originally fixed appears, in the light of later events, to have been too generous in some cases. Since many of the restrictions of war will remain for a long time in peace, it is not too early to look at this particular aspect of "feather-bedding."

Thus the Committee will not suffer from lack of subject matter. It will be certainly important if they conclude that effective measures of regulation of resale price maintenance can be devised. Despite the rapid progress which has been made in the art of costing, the revision of fixed prices tends to be too late and too limited. But if the Committee were to propose the prevention of resale price maintenance, fundamental changes in the law would be involved which could hardly be confined to the retail trade.

Higher Prices for Canadian Wheat

With American wheat prices still advancing towards the \$3 per bushel mark, the recent negotiations under the Anglo-Canadian wheat contract were bound to concede an increase in the price to be paid by Britain for next year's supplies. Under the contract, the price for 1946-47 and 1947-48 was fixed at \$1.55

per bushel and the guaranteed minimum price for 1948-49, \$1.25—leaving the actual price to be negotiated. The new price for the 1948-49 crop is \$2 per bushel, and the quantity remains at 140 million bushels, including a minimum of 300,000 tons of flour. Considerable opposition to the contract was first voiced in Canada, though it came more from merchants than from the farmers, but it is now generally recognised as an important instrument in the stabilisation of Canadian wheat production. In present circumstances, the increase in the price for next year's supplies is unavoidable, and it is not immoderate, given the prospect of a continuing world shortage of bread grains.

From the British viewpoint, indeed, the contract has great advantages, for prices in the world market would undoubtedly be well above \$2 per bushel, and the supply of 140 million bushels is, within the limits of prediction, more or less guaranteed for next season. The International Wheat Agreement proposed by the United States last spring (which the United Kingdom did not support) set a maximum price for 1948-49 of \$1.70 per bushel, but under conditions of acute shortage of supplies it could certainly not have been kept at this level and supplies for Britain would not have been assured. Once again, expectations that the world grain position would regain normality in a couple of years have been belied; at the risk—and in the hope—of undue caution, it would be better to defer the prospect of equilibrium between grain supplies and requirements until the early 'fifties.

The Wages Spiral

It is a pity that the Ministry of Labour's innocent proposal to set up a special department to watch wage movements has incurred the suspicion of the TUC, which in the last week or two has shown a psychopathic fear that the Government might seek to exercise some influence over the course of wages. Mr Isaacs' famous letter may have been tactless in giving publicity to a proposition put by the Prime Minister two months ago, when he urged that workers should not press for increased wages at this time. But measurement of wages seems a fairly innocuous function of administration, which even the TUC might have been expected to admit. Given the current pressure for wage increases and the pattern of recent wage agreements, the collation of information on wages can hardly serve a harmful purpose.

There have been no major increases in wages since railway workers were awarded a rise of 7s. 6d. in July by the special Tribunal, but a number of workers in the distributive trades have secured advances in the past few weeks. There are, however, several outstanding claims—the most important, though it has yet to be precisely formulated, being from the miners, who appear to be seeking an increase which would raise the minimum wage of low-paid day wage workers by as much as £2 a week.

A decision on the building workers' claim for an increase of 3d. an hour awaits the result of the ballot on their attitude to payment by results. Their acceptance, however, can be taken as certain and already negotiations between the two sides have been opened on a national agreement; this will be a framework within which each firm can apply its own arrangements to suit the wide variations in local conditions. Building employers only agreed on the increase of 3d. an hour by a narrow margin, and before doing so they sought—but did not get—a lead from Mr Isaacs. But they regard payment by results as an essential step towards greater output and hope that the immediate price of an increased time wage will be justified by improved output later.

Meanwhile, boot and shoe operatives have tabled a claim for a £5 a week minimum, which is now under negotiation. Furniture workers are working out their claim for a "substantial increase" and for narrowing the gap between men's and women's rates. The Post Office workers' demand for a £5 minimum and higher maximum pay will be discussed with the Postmaster-General on October 15th. In all, it is estimated that the wage claims now under consideration or about to be presented affect well over 2,000,000 workers.

The Financial Half-Year

The Exchequer Returns covering the first half of the financial year show a surplus of ordinary revenue over expenditure of £219.5 million. This compares with the estimated surplus of £269.6 million for the full year—an estimate which, on the basis of the result achieved in the less favourable revenue half of the year, promises to be more than realised. This, however, is a year when estimates based on the normal seasonal rhythm of revenue.

and expenditure may easily prove to be falsified. One of the items on which doubt must be focused is the effect of the import cuts, and of the diversion of goods from the domestic to the export market, on customs and excise receipts. Among the items of revenue which have done particularly well are estate duties, which to date have yielded £12.7 million more than in the corresponding period of last year, whereas for the full year the increased yield was only estimated at £7,000,000. Customs duties are also running well ahead of estimates, owing to the high level of imports, but by contrast excise duties are lagging well behind schedule. The general revenue and expenditure position, including the "below-the-line" items, may be summarised in the following table:

EXCHEQUER RECEIPTS AND PAYMENTS

April 1st to September 30th, 1947

	In Million £		
Ordinary revenue	1,647	Ordinary expenditure	1,428
Net domestic borrowing (other than floating debt)	15	Sinking funds	8
Net external borrowing and gifts	614	E.P.T., Post-war Credits & War Damage payments (net)	106
		Capital expenditure	139
		Repayment of floating debt	593
	2,276		2,274

The second half of the financial year will show considerable and significant contrasts with this state of affairs. The net overseas borrowing, which has made possible the repayment of nearly £600 million of floating debt will dwindle to a small fraction of what it has been in the past six months. The capital expenditure items will, it is to be hoped, reflect the cuts in the capital programme which have yet to be specified and announced. Finally, there is the effect of the supplementary budget, the preparation of which is now confidently reported to be under way.

* * *

Lag in Small Savings

The savings movement has had an unhappy summer. At the opening of the autumn Silver Lining Campaign it finds itself £100 million behind its self-set target—a net total for 1947-48 of £366 million—for the yield of the first 25 weeks of the savings year has produced only £65 million net. Sir Harold Mackintosh's recent admission that the Savings Movement is badly behind its target and is "really up against it" is certainly justified. To the familiar explanations that the holiday season always produces a lull in savings and that the cost of living is now affecting the ability of many regular savers to maintain their contributions, Sir Harold added a third factor—the intrusion of political considerations into the movement. He did not express any opinion about the quantitative importance of this new factor, but it is sincerely to be hoped that it does not account for more than a small part of the savings lag. The stability of the movement as a whole is based on the avoidance of short-dated withdrawals of savings and in no earlier economic crisis have these been severe. But if the

aims of the movement were to become entangled in political quarrels, the results might well be disastrous.

These are timely warnings, but better progress in small savings should be made during the remainder of the year, given the assistance of savings weeks and of a new savings service which the movement is understood to have in mind. Of the small savings media, National Savings Certificates show, on paper, the best progress with an advance of nearly £47 million net. But this increase is, of course, largely due to the introduction of the new series of Savings Certificates with its extended limit for individual holdings. It seems probable that, in framing this year's net target, the National Savings Committee expected appreciably greater support from those two million savers who had already bought Savings Certificates up to the earlier limit, and might therefore be prepared to invest up to the new limit in the new issue. It is calculated, for instance, that if one in ten of these savers had bought the full amount of the new series, they would have provided £100 million of new money.

The failure of the larger type of investor to play his expected part is also reflected in the poor performance of 2½ per cent Defence bonds, the net proceeds of which have shown a fall of £87 million, compared with the first 24 weeks of the 1946-47 year. This issue has, of course, been left high and dry by the rise in gilt-edged yields to a 3 per cent basis and the movement is inhibited from taking a realistic course about it owing to the Chancellor's devotion to 2½ per cent. The fact is that the success of the savings movement in reaching its targets in earlier years has been a direct part of deficit financing, in which it has played the useful if economically menial role of mopping up some of the dormant cash and bank deposits. To expect in to-day's circumstances to produce net savings of £1,000,000 a day may turn out to be an error of heroic faith in the willingness of the population to face, for the first time, the necessities of genuine voluntary saving.

* * *

Switching Begins

The start of "switching" in foreign (mainly dollar) securities on Wednesday was marked by mild enthusiasm and some curiosity on the Stock Exchange. Prices of old favourites such as US Steel, Chrysler, and General Motors were shouted by dealers who had been silent for some years, but the first animation of the scene soon died away. This was hardly surprising to the large gathering of members who had come to celebrate the opening dealings, for the supply of foreign securities is small, especially of the more popular counters of prewar days which have been largely requisitioned, and most holders are either unaware of their new power to switch, or are quite prepared to hold what they have. In fact, the few transactions which were carried through were the subject of negotiation.

The accompanying table shows that London prices opened and settled down at a substantial premium over the sterling equivalent of prices quoted in the United States. The premiums are mainly attributable to the present over-valuation of sterling at the official rate against the dollar and to the hedge element in dollar stocks

STOCKS OCTOBER 1st PRICES

Stock	Closing London Price	Sterling Equivalent of New York or Montreal Prices	Stock	Closing London Price	Sterling Equivalent of New York or Montreal Prices
United States Steel	97-98½	88½	Electrolux	21½-22½	20½
General Motors	79-82	73½	Shell Union	39½-40½	36½
Chrysler New	79-82	74½	Woolworth	62-64	56½
New York Central	20½-21½	18½	Massey Harris	20½-22½	19½

against a further fall in the official or unofficial sterling rate.

There seems to have been no pent up desire of holders to sell their securities and buying inquiries received by brokers who formerly did a good business in United States and Canadian stocks were few. Of course the public appetite for "switching" securities may be greater than has so far been shown, for it has yet to be generally appreciated that purchases can be made by investors even where they cannot offer securities in exchange, while the higher yield available on US common stocks and their immunity from political risks in this country may eventually carry greater attraction for investors on this side of the Atlantic. But despite the importance which has been attached to switching, particularly by the few overseas brokers who still have connections in London, the freeing, upgrading, and development of the market

DISTRICT BANK LIMITED

A Simple Solution

Many companies have considerably simplified their clerical work and reduced their expenses by employing the complete Registrar Service provided by the Banking House of Glyn, Mills & Co. Where a Company wishes to maintain its own Registration Office the Bank is also prepared to undertake work in connection with the conversion, repayment and reorganization of capital, the payment of dividends and other incidental matters. Information on this Service is obtainable from the Registrar at Lombard Street. Telephone Mansion House 5400.

"The Economist is not doing its duty"

But it is not our fault. We cannot find paper for all the facts and figures which are essential for the business man and the student of affairs. So last January we shed the load on to the

Records and Statistics

Supplement to *The Economist*

Records and Statistics has already established itself as an economic source book. Each week it contains at least sixteen pages of statistical tables and factual records, covering public affairs and Parliament, State papers, and economic developments at home and abroad, all presented in a digested form for quick reference.

A subscription to *Records and Statistics* (by post only) costs 30s. per annum. Or it can be combined with a postal subscription to *The Economist* at a total cost of £4. The Publisher will be pleased to send you full particulars.

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

in foreign securities will evidently be a slow job. And overhanging it is a precarious dollar situation which may call, once again, for further requisitioning of dollar securities, even though that course has been formally renounced.

2½ per cent for Transport Stock?

Last week-end produced an authoritative denial that the taking over of railway stocks on January 1st next year might be deferred. The denial itself was not surprising, for rumour had been very busy. That it spread in snowball fashion is a fact which the Chancellor might well ponder; notwithstanding the statutory authority of the vesting date and of the schedule of take-over prices in the Transport Act, a wide circle of by no means sensationally minded people were a week ago prepared to admit the possibility that the Government might seek to alter their undertakings in the Act.

Unfortunately, Mr Dalton, having laid down the general proposition that the proper long-term rate for gilt-edged borrowing should be 2½ per cent, proceeded to apply it in detail by taking 2½ per cent as the basis for his arithmetical demonstration of the profits which would result from the taking over of railway stocks. If there is any truth in the report that negotiators on the railway side would have been prepared to settle for 2½ per cent, the Government must now be regretting its rejection, for the Chancellor is now confronted with the cold market fact that 3 per cent, and even a little more, prevails on long-dated gilt-edged securities.

The Chancellor has undertaken that the new Transport stock will be redeemable "within this century." But a 2½ per cent compensation stock, issued at par, would have to be redeemable within this decade, and no one would suggest that the Transport Commission should be started off with the tremendous financial hazard of £1,100 million of short-dated capital. Some ingenious people have accordingly been working out various devices which might save the Chancellor's face but would fit the present market facts. Some have suggested a stock carrying 3 per cent for, say, 10 years and 2½ per cent thereafter. While this might have some attractions for the small rentier holder of railway stocks, because it would cushion his prospective fall in income, it would hardly appeal to large institutional holders. Others are toying with the possibility that the Chancellor might offer railway stockholders a number of options—a short-dated security of the Exchequer Bond type, a 2½ per cent issue which would be accepted at par in payment of death duties and a 3 per cent stock for the general run of stockholders. The Chancellor has the assistance of a free forum of advisers in his railway problem. Their discussions have somewhat narrowed the discounts at which railway stocks stand in relation to the take-over prices.

Coal Compensation Delays

The inadequacy of the "interim income period" of two years, provided in the Coal Industry Act 1946, has been the subject of general complaint at recent coal company meetings. Nine of the twenty-four months of the "interim period" have passed and at the end of next year the companies will receive no more "interim income"—under the Act this amounts to half the profits for income tax purposes for the year to June, 1946, or the average of the two years to June, 1945. The assumption was, of course, that by the end of 1948 the process of distributing compensation to the companies through the district valuation boards would have been completed. But the district valuation boards have just been appointed, and few colliery companies' spokesmen confidently expect that the compensation stock will be issued before the end of 1949 and some are even putting off the date to the 1950s.

This prospect of delay has raised the spectre of a gap in colliery company incomes from the end of 1948 until compensation is received. It has prompted the chairman of Manvers Main Collieries to demand a suitable extension of the interim income period since the industry is in no way to be blamed for the delays which have occurred. Once the district valuation boards start functioning, however, the process should be speeded up, if only because the companies will be eager to co-operate in a quick settlement. In any case, the fears of the companies lose some of their point since interest payments on the compensation stock will be dated back to the end of the interim period, though extended interim income payments for a further period, at the rate of half of profits computed for income tax in the datum year,

would be agreeable enough to the many companies whose compensation stock will yield a much smaller sum in interest.

It is unlikely therefore that pleas for an extension of the period will move the Government, even though the distribution of the global compensation sum of £164 million through the districts and thence to the companies is proving more cumbersome and lengthy than was originally assumed. Provided the delay is reasonably short, colliery companies will not suffer greatly, for most of them have adequate liquid assets from which dividends can be paid. At any rate, holders of good coal shares seem content to keep them in expectation of assets distributions well above current share prices. But is there any justification for the postponement of payment for consumable stores until December 31, 1948, which appears to have been decided by a Treasury ruling?

* * *

Eastern Telegraph Distribution

The announcement of a special 100 per cent tax free dividend on the £5 million ordinary capital of the Eastern Telegraph Company, which is very largely held by Cable and Wireless (Holding), took the market by surprise on Tuesday afternoon. It reopens the controversy between the preference stockholders, led by Mr Kavanagh, and the controlling ordinary shareholder, by which the former petitioned the Court last June to secure the company's liquidation and so to obtain their *pari passu* share in the division of the company's net assets. Preference shareholders have maintained that the alterations in the company's articles of association, under which the board has power to make this week's distribution, amount to a variation of the rights of the preference shareholders, and they may conceivably challenge the special distribution. The Court rejected their application for a compulsory order for liquidation on the ground that it was premature because the compensation to be paid for Cable and Wireless Limited, had yet to be fixed and because foreign concessions were held by Eastern Telegraph in trust for that company. The Court therefore held that the "Substratum" of the Eastern Telegraph Company still existed.

Preference shareholders were evidently anticipating the time when the winding up could be undertaken; now they are confronted with a special distribution which has the attributes of a capital transfer rather than a normal dividend and leaves, according to the latest balance sheet, only £763,000 of the general reserve fund to be distributed. Eastern Telegraph 3½ per cent preference stock fell 7½ points to 110 on the announcement; unless a successful application can be made to the Court for the recession of the payments, preference stockholders will have to be content with repayment at par, plus their share in the balance of the assets. By contrast, the ordinary stock of Cable and Wireless (Holding) responded with a rise of 21 points to 176, presumably on hopes that what the Eastern Telegraph preference stockholders may lose Cable and Wireless (Holding) ordinary stockholders may gain. But the latter have since become a little less confident and the price had fallen to 166 on Thursday.

Control of Engagement Order

The pattern of the Government's plans for the better distribution of manpower is beginning to take shape. Full details of the Control of Engagement Order, which comes into force next Monday, have been issued, together with a list of exempted categories. These will be followed by a statement on the essential industries and occupations which are to be given first call on the labour which offers itself for employment at the Employment Exchanges. Finally, when the Ministry of Labour's Joint Consultative Committee has met the proposals for dealing with "spivs and drones," which are important as psychological public enemies and not as a useful source of new manpower, will be announced.

From the information so far available, the measures are not very convincing. They may have a partial success, but they cannot produce the radical redistribution of manpower which is needed. The scope of the Control of Engagement Order is limited to men and women, within the prescribed age limits, who are unemployed or want to change their jobs, while the employers' freedom is restricted by the prohibition on advertisements for workers covered by the Order. At present about 200,000 workers are placed by the Employment Exchanges each month, but when labour is being transferred from less to more essential work the rate will be about doubled.

The Secretary of the Ministry of Labour, Sir Godfrey Ince, has himself given a warning against "expecting too much from the Order." Only in conjunction with powers of direction

could it become effective, but political and practical considerations alike suggest that these powers will not be widely applied in its opening stages. Although the Exchanges have power to direct single men and women (except women under 20) to work away from home, this will only be done as a "last resort," and lack of housing will in any event be a practical obstacle to any great improvement in the mobility of labour. Directed workers will be protected by the right of appeal; they cannot be dismissed except for serious misconduct, and they will get the rate for the job in whatever employment they are placed. Even so, direction in peacetime has been a bitter pill for the trade unions to swallow.

The exemptions from the Order cover those employed "in a managerial capacity" or "professional, administrative or executive" work. The accent is on capacity—for there are many who might regard themselves as "managers." Heads of departments, superintendents and head foremen are exempted; foremen or charge hands paid by the hour are not. The professional category is very wide; it includes actors, architects, "technical advisers," doctors, nurses, social workers, political workers, but excludes clerks, typists, salesmen and draughtsmen without executive responsibilities.

Many who feared that they would be included in the Order have recently hastened to better themselves, and some increase in part-time work (which, if less than 30 hours a week, is exempted) seems likely. The interpretation and administration of the Order will depend on the capacity and tact of local Exchange officials. Control of labour worked fairly smoothly in wartime, but opinion then gave full recognition to the need for industrial conscription. Under today's conditions it may be far more difficult to administer a diluted form of control, and its product of new manpower for industries which are understaffed will be problematical.

* * *

Fall in Bank Deposits

The September clearing banks statements show a modest drop of about £13 million in bank deposits which, at £5,615.1 million, are now about £43 million below the June 30th peak and £70 million below the all-time high record set up at the end of last year. There was no appreciable change in the total of cheques in course of collection and transit items last month, so that the actual fall in deposits is also a measure of the reduction in "true" deposits. On the assets side the fall in cash from £479 million to £464.8 million almost exactly balances the movement in deposits, with the result that the cash ratio has fallen from 8.51 to 8.28 per cent. The other movements among assets, which are therefore substantially self-balancing, are of no particular magnitude except for the continued transfer of resources from Treasury deposit receipts into bills, reference to which is made in a separate note. TDR's are down by £54.5 million over the month, whereas bills discounted have risen by £33.9 million. There has also been a rise of £17.6 million in money at call or short notice, reflecting the larger volume of bills held in the discount market. Investments are almost unchanged over the month, the latest total of £1,493.2 million being a mere £800,000 up on the figure for August. Although the total of investments is now levelling off, the slight increases are still carrying it to heights never before reached, and the latest total is about £100 million higher than it was a year ago. The rise in advances was also slowed down last month, their total at £1,148.5 million showing an increase of £2,500,000 on that for

August. It is interesting to note that despite the suspension of convertibility of sterling, the clearing banks' acceptances continued to increase, though very slightly, last month. This figure now stands at just over £248 million, which is nearly £88 million more than a year ago. Future movements in this item will be watched with interest as an indication of the extent to which London's international banking business, which is reflected in this total, will be affected by the new status of sterling.

* * *

Exchange for Foreign Travel

The first retreat the British Government have had to make from the defensive exchange measures taken after the suspension of convertibility of sterling was the reversal of the ban on residents of the United Kingdom who travel to and from this country using foreign planes or ships. This ban, announced on August 28th, was to take effect on October 1st. Tourists were, of course, involved by the abolition of their exchange allocations, but in addition were specifically banned from travelling on foreign lines in respect of journeys undertaken at the invitation of friends abroad and therefore involving no expenditure of foreign exchange. In the case of travel for business purposes no outright ban was announced, but it was stipulated that in order to obtain permission to travel on a foreign line, Form V would again have to be filled in and surrendered, a procedure which had been abandoned since March, 1946. It appears that some applications backed by this Form had actually been refused by the Bank of England, leaving would-be travellers with no alternative other than that of travelling on a British line. Foreign air-lines, who were mainly involved by this decision, lost no time in making violent protests against what they regarded as discrimination against them and these protests have proved successful. The authority for the issue of travel tickets without the surrender of Form V will now remain in force, whatever the purpose of the journey. Tourists will be allowed to travel by foreign lines that provide direct routes. This change of mind provides a small but significant example of the unconsidered haste with which some details of the retreat from convertibility were originally decided.

* * *

More Treasury Bills

The well-known preference of the banks for Treasury bills rather than Treasury deposit receipts—because six months TDRs are much less flexible instruments than the bills which the banks acquire at will through the bill market only after part of their three-month life has already run—makes them ever watchful for any change in official policy towards these two sources of floating finance. During the war the authorities kept the banking system on a minimum ration of bills, which bred in money market circles a chronic tendency to construe even temporary reductions in the bill issue as a portent of a more stringent policy involving still greater official reliance on TDRs. Now, it seems, opinion is in danger of swinging to the opposite extreme. At yesterday's Treasury bill tender the amount offered was again raised from £180 million to the new high level of £190 million—after some weeks of successive net repayments of TDRs. Although this is the sixth year in which the bill issue has been expanded in the autumn (so as to ensure that a larger proportion of the Government's float-

NATIONAL PROVIDENT INSTITUTION

FOR MUTUAL LIFE ASSURANCE

— ESTABLISHED 1835 —

48 Gracechurch Street, London, E.C.3.

ing borrowings mature in the "revenue" season when it has large sums available for temporary debt redemption), some observers have interpreted the Treasury's action as foreshadowing a further large switch from TDRs to bills, and have even begun to look towards the day when the TDR issue is extinguished.

This is altogether too fanciful a speculation. Certainly the authorities since 1945 have plainly recognised that the banking system in peacetime, as the emphasis in demand for credit shifts from Government to private borrowers, needs greater flexibility and therefore more bills. As Government deficit-financing diminishes (and, *a fortiori*, if the Chancellor should decide to budget for a genuine surplus) there will be a further trend away from TDRs. But it would be wrong to suppose that there has been any policy decision to accelerate the process in any dramatic fashion. The market's assumption may conceivably derive from the fact that in the three months from end-September, 1946, the total issue of tender bills was expanded by no less than £200 million—a much larger seasonal expansion than in previous years—and from the further fact that the weekly offering did not, as previously, relapse to its pre-autumn level. It would be unwise, however, to assume that the expansion will necessarily be as large this time.

There are reasons for believing that only moderate movements are in prospect; and the cessation of drafts on the US credit, unless these are replaced by comparable drafts upon the gold reserve, reinforces the argument—because the authorities will have smaller resources available for redemption of TDRs. Yet a more vigorous switch from TDRs to bills is probably desirable. Though the banks' money market ratio looks healthy, it must not be forgotten that, to achieve a stable day-to-day cash ratio a substantially larger supply of the most liquid assets is needed than was reasonable when cash balances could fluctuate violently. And, for the same reason, the case for instituting a 91-day Treasury bill to promote a smooth flow of maturities still seems unanswerable.

Smaller Firms and Exports

It has been estimated that one-third of the net value of industrial production in this country comes from firms employing fewer than three hundred workpeople. The share of total export trade which is provided by firms of this size is, however, far more modest and the decision of the National Union of Manufacturers to undertake an inquiry among the small and medium-sized firms which it represents to see how far they can increase their contribution to the export drive is timely.

Convenience of administration often leads Government departments to discuss their economic policy with large industrial units and trade associations and there is a consequent danger of a lack of "follow through" from the laying down of broad policy to its detailed application in the small factory. That danger is particularly real in the export drive. The small concern often gets

less attention from the departments than its bigger rivals in the supply of raw materials, manpower and new equipment. It is usually predisposed to sell as much of its output as possible in the home market and is frequently unused or unwilling to deal directly with export inquiries. Given the present ease of selling in the home market and the risks and expenses of selling abroad, this preference is natural enough. Unfortunately, the merchant concerns which played such a large part in establishing export connections for the smaller manufacturer before the war have lost much of their expert manpower and connections. To find a well-run export agency which has the knowledge and energy to find overseas markets for the specialised products of the small manufacturer is difficult—so difficult indeed that some of the smaller manufacturers who oppose nationalisation of industry at home are rather ruefully supporting the idea of "nationalisation of exports," by which they presumably mean the setting up of a Government department to get export orders for their products and to undertake their shipment abroad. But this emphasis on machinery is not the crux of the matter. Until the comparative ease and high profitability of production for the home market has been reduced, exports from small manufacturers as a whole are not likely to show the increase which is urgently required.

Sterling Copper Supplies

The price of copper in the New York market has remained surprisingly steady at 21.25-21.50 cents per lb. during the past two months, and future quotations have shown little change. This firmness appears to be justified by the statistical position. World output of copper during the first seven months of this year was running about 25-30 per cent higher than in 1946, but the different producing areas showed a wide variation of output. The United States, Canada, Chile and Mexico have all reported larger production, but output in Rhodesia has suffered sporadic interruptions owing to a shortage of coal and transport—average monthly output up to July was 2 per cent lower than last year.

American consumption has remained high and there are reports that the Government are again negotiating purchases for the strategic stockpile. Output as a whole is now more in line with world consumption than it was a year ago, but new possibilities of dislocations in supply to sterling consumers have arisen from the dollar crisis.

Consumption of virgin copper in the United Kingdom is running about 10 per cent higher than last year's level; for the first eight months total copper consumption was 223,000 tons compared with 203,000 tons in the same period of 1946, while scrap consumption increased to 123,000 tons compared with 107,000 tons. Stocks at the end of June, including quantities held abroad, were equivalent to about four months' supply. British copper supplies at the moment give less cause for anxiety than the

possible consequences of a coal shortage, for there is no assurance of priority fuel supplies for the copper manufacturing industry. But if copper consumption in the United Kingdom is maintained at the current rate of about 30,000 tons a month during the winter period, a shortage in supplies may develop next spring unless purchases from the dollar area are continued. Sterling sources of copper are limited and outputs in Rhodesia, South Africa and Australia have not increased sufficiently to cover full British requirements. In any case certain copper shapes can only be obtained from the western hemisphere, owing to lack of suitable refining capacity in Britain and Rhodesia.

Shorter Notes

The Board of Trade index of import prices rose to 254, in August (1938=100) from 252 in July. The main feature was a rise of 3 points, or 1 per cent, in raw material prices. The export price index rose by 1½ per cent from 230 in July to 234 in August. The main increases were in metal goods and textile prices—the latter in particular seems overdue. A single holiday month, which saw the first effects of the import cuts, affords no evidence of a decisive change in the terms of trade in Britain's favour, but it is worth noting if only as a rarity.

Telegraphed summaries of the agreement between the Mexican Government and the Mexican Eagle Oil, which provided the basis of a Business Note in *The Economist* of September 6th, have now been followed by the full text. This confirms that the Mexican Government have contracted to pay fifteen annual instalments of US \$8,689,257.85 to the company's agent in New York, the first to be made on September 18, 1948. In addition, interest in US dollars will be paid on the total compensation sum of \$81,250,000 from March 18, 1938, to September 18, 1948, at 3 per cent. The compensation covers properties in the government's physical possession and other properties not yet taken over, except cash and securities.

The trade and finance talks between the British and Danish Governments are continuing in London. Although no Danish farmers' representatives are taking part, food obviously cannot be excluded from the agenda. If many of the problems which frustrated the recent food negotiations were overcome on an official level, in particular agreement on the basis of fixing prices and export quantities, the prospects of agreement with the Danish Export Board would be greatly improved.

Higher coal prices due to the increased railway charges which came into effect on October 1st range from 6d. to 6s. per ton according to the distance from the pithead. The increase to the consumer in Central London is nearly 4s. This is in addition to the increase, at the beginning of September, of 4s. per ton in the pithead price, which was discussed in *The Economist* on August 30th.

Steady conditions have prevailed on the Colombo tea market during the past month, but there has been some signs of the reappearance of the "concertina movement" in prices, familiar before the war. Lower grades have been advancing and the better types have been steady. Export prices in Calcutta have also fallen during the past month; this may be connected with the Ministry of Food's absence from the auctions.

A Working Party has been appointed to investigate the Mauritius sugar industry. Mauritius normally produces 300,000 tons a year, compared with annual British requirements of 1.8 million tons, but this quantity, it is thought, could be increased to 400,000 tons. As the bulk of British supplies at the moment come from Cuba and St. Domingo, both in the US Dollar Area, an expansion of Empire supplies has become a matter of urgency.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Coast Lines; Great Universal Stores; Metal Industries.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks maturing over 3 per cent will be redeemed at the earliest date (these are marked 'a'), and those paying 3 per cent or less will be repaid at the latest date (marked 'b'). (n) Net yields are calculated after allowing for tax at 4s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 1.6 per cent). (i) To latest redemption date. † Free of tax.

COMPANY MEETINGS

ANGLO-CYLON AND
GENERAL ESTATES
COMPANY, LIMITED

INCREASED DIVIDEND

The sixty-first annual ordinary general meeting of The Anglo-Ceylon and General Estates Company, Limited, was held, on the 25th ultimo, in London, Mr Francis W. Douse, the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts:—

The operations of the company for the year to March 31, 1947, have been not unsatisfactory. In Ceylon, with the exception of the ill-conceived "Hartal," to which I made reference at our last meeting, the year was marked by no more than the usual symptoms of political unrest which are the inevitable outcome of war and are in evidence throughout the world. I regret to have to extend my reference to the more recent deplorable general strike in Colombo. Fortunately estates were not directly affected. The Ceylon Government is to be congratulated on its handling of the situation.

Our tea crop for the year was 5,052,563 lb., realising 24.08d. per lb., against 5,154,961 lb., realising 20.60d. Yields, considering all things, have kept up well, but there is a pressing need for more fertilisers. Our cocoa estates gave us a better crop and price—3,338 cwt., against 1,856 cwt. last year—the price being 108s. per cwt., as against 80s.

In Mauritius, following the disastrous hurricanes of 1945, the Island was free during 1946 of any severe cyclonic disturbances and, as a result, there was a crop of 292,000 tons of sugar. For various reasons this was not as good as expected. Representations were made to H.M. Government for an increase in price for 1947, and as a result the price was raised by 4s. 9d. per cwt., with certain reservations, which gave the producer an increase of 2s. per cwt. on all sugars shipped in 1947. The balance of 2s. 9d. was withheld to be allocated to stabilisation and rehabilitation funds and welfare. 42,835 tons of sugar were manufactured by our interests, as compared with 20,477 last year, a welcome and timely increase.

STRONG POSITION

The operations of all our interests for the year resulted in a gross profit of £275,737, of which £270,910 was earned overseas. There is a net surplus of £101,168 accruing to the group. The directors have pleasure in recommending a final dividend of 15 per cent., less tax, making with the interim dividend already paid a total of 20 per cent., less tax, for the year, and leaving £57,110 to be carried forward. The consolidated balance sheet reveals a strong position, the reserves and undistributed profits applicable to your company standing at £628,803 and exceeding the issued capital by a substantial margin.

In paying an increased dividend, your directors have given full consideration to the remarks of the Chancellor of the Exchequer in his Budget speech, but the balance sheets put before you reveal a strong position, and it will be apparent that disregarding the liquid assets, your estates and holdings in subsidiary companies must stand in the books at considerably less than they are worth. The reason for this is that for many years profits have been ploughed back into the business to a considerable extent.

The prospects appear reasonably good, and it certainly seems that for the current year we ought to show results no less satisfactory than for the year under review.

The report was adopted.

GOLD MINES OF
KALGOORLIE, LIMITED

IMPROVED PROFIT

The thirteenth ordinary general meeting of Gold Mines of Kalgoorlie, Ltd., was held on the 30th ultimo, in London.

The following is a summary of the statement issued with the report and accounts for the year to March 31, 1947:—

The mill throughout was maintained at capacity, averaging 12,000 tons per four-weekly period and totalling 156,502 tons for the year, 39,901 tons more than for the previous year. The average net realisation was 38s. 5d. per ton, or 10d. less than for the year before. Working costs at 30s. 8d. were 3d. per ton lower, a reduction of 1s. 6d. per ton in the cost of treatment, due to the higher throughput, having been offset to the extent of 1s. 3d. by an increase in the cost of mining, owing to the greater tonnage of stope ore treated.

The net result is that despite an improvement of £15,411 in the profit, the amount available for distribution is £12,094 less than for the year before. This difference, due to the exceptional tax credit, represents the amount distributed as a bonus of 4½d. per unit of stock a year ago. The dividend proposed is at the same rate as for the preceding year, namely 5 per cent., or 6d. a unit, less income tax. The net cash position shows an improvement of £4,479 at £183,994.

The net improvement of 21,318 tons in the estimate of proved and probable ore represents an actual addition of nearly 178,000 tons of new ore, allowing for the fact that over 156,000 tons were raised to the surface during the year.

The report was adopted.

GOLD EXPLORATION AND
FINANCE COMPANY OF
AUSTRALIA, LIMITED

NET REVENUE DOUBLED

The thirteenth ordinary general meeting of the Gold Exploration and Finance Company of Australia, Limited, was held on the 30th ultimo, in London.

The following is an extract from the statement by the board issued with the report and accounts for the year to March 31, 1947.

Net revenue for the year at £73,092 was almost double that of the previous year. This improvement is largely made up of items of a non-recurring nature, being almost entirely due to the payment by Gold Mines of Kalgoorlie of a special bonus of 4½d. per unit in addition to the dividend of 6d. for the year ended March 31, 1946, the receipt of dividends from Victoria Gold Dredging Company totalling 4s. (A) and an exceptional profit of £10,246 on sales of Government securities. It is proposed to pay a dividend of 9d. per unit, less income-tax, requiring £37,662 and leaving £3,547 to be carried forward.

Central Norseman had a good year. The dividend was increased from 6d. (A) to 1s. 6d. (A) per share, making the total distributed to date 5s. 3d. (A) per 5s. (A) share.

The two major prospects now being investigated by Gold Mines of Australia are the Stawell goldfield in Victoria, and a large area near Mulcra in the Clermont district of Central Queensland. Gold Mines of Australia offered your company a 40 per cent. participation in each project, and this offer has been accepted. We are entitled to regard your company's present position as satisfactory.

The report was adopted.

THE TUNNEL PORTLAND
CEMENT COMPANY LIMITED

INCREASED TRADING PROFIT

The thirty-sixth annual general meeting of The Tunnel Portland Cement Company Limited will be held on the 6th instant in London.

The following is an extract from the speech which the Chairman, Mr N. M. Jensen, proposes to make:—

The wartime Pooling Scheme for the cement industry ended on December 31, 1945, and did not apply during the period of the accounts. It had been adopted reluctantly to meet wartime difficulties and its termination has restored a welcome incentive to efficiency in the industry. During 1946 there was a steady increase in the home demand for cement, coupled with very heavy demands for export. Towards the end of the year the demand in the home market had increased so much that the Ministry of Works requested the industry to limit the export of cement. This has considerably reduced the level of our exports since January 1, 1947, and has prevented us from playing a full part in the drive for exports. We hope, however, that in common with other exporting companies we shall now be allowed more freedom for export, for there is still an unsatisfied demand for cement in many parts of the world.

EXPANSION OF PRODUCTIVE CAPACITY

Throughout the period, shortages of raw materials, particularly coal, gypsum and kraft paper for packages, have hampered production and increased costs. These culminated in the fuel and power crisis last winter which virtually stopped production at our various works. We did not discharge our men but kept our labour force together. The stoppage, which was general throughout the industry, left stocks very low at the beginning of the building season of 1947. Good weather during the spring enabled builders to get well under way while we remained short of coal, though supplies have improved somewhat from about June onwards. These factors have led to a shortage of cement during the summer.

The erection of our new works at Padeswood, near Buckley, in Flintshire, has progressed steadily in spite of the many difficulties we are up against. This new factory is the eventual answer to the shortage of cement supplies in Lancashire, Cheshire and North Wales. Building work is well advanced and plant is being delivered, and I hope it will be possible to commence production before the end of 1948.

At our West Thurrock works we have scrapped some old plant and are proceeding with the installation of a new unit which will fully restore the works to its pre-war capacity and will increase its efficiency. This works is particularly well situated for conversion from coal to oil and we are therefore proceeding with the installation of oil-firing plant. We are planning to duplicate our Pistone works which from a labour and fuel point of view is one of the most efficient works in the country. Unfortunately, owing to the shortage of materials, we have not yet been able to put the work in hand, but I hope we shall do so before very long. Building operations for extensions of Ribblesdale Cement Limited, in which your company has a 50 per cent. interest, have started and plant has been ordered.

Favourable results during 1946 enabled the industry in November last to make a voluntary reduction of 2s. per ton in the price of cement. Subsequent events outside the control of the industry, including rises in the price of coal and in railway rates, have led to increases in cement prices approved by the Ministry of Works. The report of the Committee on Cement Costs was favourable. Its findings are welcomed by the industry which will implement its recommendations.

GOVERNMENT RETURNS

For the 10 days ended September 30, 1947, total ordinary revenue was £112,992,000, ordinary expenditure of £104,632,000, leaving a surplus of £8,000,000. Thus, the sinking fund allocations of £8,000,982 surplus accrued since April 1st is £8,000,982 against a deficit of £487,942,000 in the corresponding period a year ago.

something tragic in this spectacle. It is tragic in the first place because, strictly speaking, it is not necessary. The figures of the Paris Report are the best estimates which Europe's best experts could assemble in face of the galloping crisis of Western Europe. They themselves would not claim infallibility for them. Some countries lacked the statistical apparatus. Many of the premises on which the figures were based disappeared while they were being drafted—for instance, the Report makes much of mutual trade, and week by week, the crisis is cutting it back. Many of the estimates of Europe's own contributions of food were made before last summer's devastating droughts hit the Continent. Even in the last revision of the Report, the potato figure does not appear to bear much relation to reality. The experts in Washington can and will discover all these things. Returning Congressmen will add a mound of information, relevant and irrelevant, about this and that country's readiness or ability to make its contribution. But their discoveries will not lessen the reality of the crisis or alter the fact that the Paris Report, rightly understood, is not so much a merchant's estimate of four years' normal trading under stable conditions, as a general's rough guess of what the battle will cost, a Chancellor's estimate of his war budget. The calculation must be made, but the crisis can never be held within the calculation. As one of America's elder statesmen said in Washington last week, "We really have all the facts we need about the crisis. We do not need more facts. We need more decisions."

Similarly, in the matter of "availabilities," in one sense, there are no American availabilities. The consuming power of the United States is such that it can devour everything its farms and factories pour out. In normal times, nothing could be more desirable or happy. But are the times normal? That is precisely the crux of the Paris Report, of the Marshall Plan, of Europe's crisis. If the Report is to be scaled down to meet the supplies that can be secured by Mr Charles Luckman's campaign of voluntary abstention, the result may be something Congress can pass with easy minds. But it will be irrelevant to Europe. Mr E. R. Murrow reminded the Americans last week that if they had relied on "availabilities" after Pearl Harbour, they would have lost the war. Now, as then, the surpluses have to be created—by controls and rationing if the history of the war is any guide. But no amount of examination will bring these controls about. While the examination continues, the wheat goes irretrievably into the hogs.

There is another sense in which the present prospect is tragic. Perhaps in the long run it may make economic sense. But it is likely in the next crucial months to make political nonsense. For in what is the process of examination almost certain to consist? The European experts will be hauled over the coals for false or over-optimistic estimates. Already they have been blamed for trying to revive Europe's livestock at the expense of grain and for assuming an end to petrol rationing. The European governments will be prodded, lectured, urged, and admonished on every aspect of their policy. Visiting Congressmen will not spare (or rather have not spared) their criticisms, and more than one has echoed Mr John Taber in reference to Europe's laziness and lack of serious purpose. Moreover, guarantees will be laid down, or at least proposed—American oversight of the aid, American trustees, political modifications in governments, abandonment of socialisation—as preliminary conditions to the granting of any aid at all. But in Europe, in the ear of every European government, will re-echo Mr Molotov's bitter jeers at their "loss of national sovereignty" and the local Communist clamour over "dollar imperialism." And all this time, while the political pre-conditions of aid are pressed, the aid itself will still lie in the future. It is no slur on American generosity in the past, or the possibility of American generosity in the future, to say that in the

next few months the combination of political intervention and economic inaction is likely to turn the European nations from grateful partners into sour clients and to intensify at every turn the irrational anti-Americanism already disastrously widespread. And who profits from this, save the Communist Party?

Yet the most tragic element in the whole tragic picture is the fact that it is perhaps inevitable. The American people, to meet this crisis, are being asked to behave in peace, in an abundant, an incredibly abundant peace, as nations have hitherto only behaved in war. Moreover, their political system, based upon a Constitution whose professed purpose is to prevent action, is designed at every point to favour the laggards and the "do-nothings" and to frustrate the responsible few. Paris is still a long way from the Middle West. It is inevitable that all the discussion in America should be about whether the European nations deserve help, or will turn to the best advantage whatever help is given them—when all the time the real question is what will happen if they do not get it. There would be no sense at all in the Paris Report on the Marshall Plan if it were not first assumed that America wanted to win the Battle of Europe as the first step in the longer struggle for Western society. But the present methods, however understandable and inevitable, will not win this battle. That is America's and Europe's tragedy.

This unhappy statement of fact is not written on this side of the Atlantic in any sense of superior wisdom or performance for Western Europe's inadequacy to meet the crisis has preceded America's. In London, in Rome, in Paris, in the Ruhr, we need no more facts. The facts are all assembled. We need decisions and results. No further examination of the British economic crisis will bring to light fresh facts about coal. What is lacking is the policy, the skill and the leadership to bring up the extra fifty million tons a year. No further research is needed to establish that Frenchmen are hoarding enough gold—and possibly even enough grain—to reverse the downward spiral of the French economy. What is needed is the courage to pursue a tough anti-inflationary policy. No return to the statistics will establish further the determination of wealthy Italians to avoid taxation or Italian peasants to deal exclusively in the black market. Only genuine penalties and incentives can resolve those deadlocks. It is not necessary to point out that a dismantled Ruhr cannot contribute its quota of coal and steel to the Marshall Plan. There is hardly a field of European policy of which it is not possible to say "The facts are known. What is lacking is the clarity, the audacity, the vision and the staying power to take the necessary decisions." Behind all other crises lies a deeper crisis of leadership; and this crisis stretches in full paralysis from the Elbe to Washington, D.C.

The gods of history are fond of irony, and doubtless when they survey the fumbings and the fears and the hesitations and the downright refusals of the Western world, as it now shivers before the necessary decisions and the necessary acts, they are looking into a future in which all those decisions and acts will have been achieved not by the choice of free men but by the iron compulsion of necessity. Dictatorship of the Right or of the Left will have shattered European democracy and broken the strikes and the spirit of the European worker. Mass unemployment and a starvation ration will have brought up the coal from the mines in Britain and set the workers to work under the lash of hunger and the dole. And in America, perhaps, at the end of the story, the most inexorable creator of availabilities, the most certain purveyor of rationing and control—war itself—will impose in their crudest and cruellest form the disciplines from which a leaderless America shrinks today.

Cabinet and Government

MR ATTLEE has one remarkable attribute; a talent for anti-climax. He deflates every issue—except, of course, the swollen finances of the country. For almost six months now rumours of Cabinet changes have been in the air. Hardly a Minister has not been talked into another office—Mr Attlee himself has not been exempt from rumour. This week what looks like the final instalment of change (although it would be wrong to dismiss the possibility of a postscript) has been announced. The result is an extensive, but still a minor, reshuffle. Immobility, however, can be as significant as movement; and the fact that it is still Mr Attlee who makes the changes is in itself a triumph of immobility.

The changes announced are a valuable index to the problems that beset the Prime Minister and to his attempts to solve them. The first problem, of course, was the elimination of what is usually termed the dead wood, and useful work has been done there. Mr Wilmot and Mr Bellenger return to the back benches. The lift conveying Mr Hynd's political career has now reached the ground floor again. Lord Inman's brief flight through the higher Cabinet levels—in itself one of the unsolved political mysteries of the decade—is now over. Room is thus found in the Government for a number of newcomers, and on the whole Mr Attlee seems to have chosen those who are both young and able. But these were the practical tasks facing any cabinet-maker. In themselves they throw little light on a capacity for creative design.

At the moment the two dynamic centres in the Cabinet are Sir Stafford Cripps and Mr Ernest Bevin, with Mr Attlee appearing somewhat as the resultant of their forces. The majority of the changes announced this week have been made in those offices which come within the orbit of a Minister for Economic Affairs and it looks as though Sir Stafford had had a considerable say in the new appointments. The offices within the orbit of Mr Bevin have suffered little change, and that may be the explanation—for it would be difficult to find another—of why Mr Alexander, Mr Isaacs and Mr Barnes still retain their posts—though it may still be possible that Mr Alexander will leave the Ministry of Defence for the House of Lords when the time for his successor is ripe. The third force in the Cabinet, at the moment largely a negative one, is Mr Aneurin Bevan, which adds significance to the appointment of Mr G. R. Strauss to the Ministry of Supply. Mr Strauss stands somewhere between Sir Stafford Cripps and Mr Aneurin Bevan—rather closer to the latter—and he has gained great experience in the drafting of nationalisation Bills in the course of the very competent assistance he gave Mr Barnes with the Transport Act. It may be that he has been given the Ministry of Supply as being

persona grata to Sir Stafford and as a reassurance to Mr Bevan that the nationalisation of iron and steel is not abandoned.

The remaining important figure to be moved is that of Mr Shinwell. Mr Shinwell has suffered more from his friends, though they are few, than from his many enemies. After the arrogant tone of voice in which the miners' leaders have recently insisted that he should stay where he was because he possessed their confidence, it was impossible for Mr Attlee to retain both his self-respect and Mr Shinwell as Minister of Fuel and Power. Mr. Attlee is to be congratulated on his courage in facing this issue with firmness—indeed, on rubbing it in by refusing to appoint an ex-miner but rather one of the most competent and promising of the young "intellectuals." Mr Shinwell should not be underrated as a Minister; he is not as bad as his own rancorous tongue makes out. But his interest in military matters has not hitherto been conspicuous, and it is a pity that once again the War Office is being treated, wrongly, as a post where continuity in ministerial control does not matter.

But when full weight is given to all these changes, the new picture looks very like the old. None of the changes in office-holders promises any change in the policy of the Government as a whole. In fact the reverse is more likely. Sir Stafford Cripps and Mr Bevin have established themselves more strongly. The Government are still in their old dilemma. Their declared policy of 1945 has been brought to a full stop. Nationalisation may or may not make an industry more efficient; over the next twelve months at best it will not increase output, at worst it will create enough disturbance or uncertainty to diminish the productivity of any industry threatened by it. Socialism has no contribution to make to the crisis in which the country finds itself. What is obviously needed is a policy—short-term maybe, but all the more urgent on that account—which is the exact opposite of all that the Labour Party has ever preached. The country needs more work for less money. The Government, particularly the trade union side, are still thinking in terms of more money for less work. If that policy is not reversed, the country will finish up by having less work and even more certainly less money. And, despite Mr Isaacs, it will not be the eels and the butterflies who will then suffer most.

If this Government, now slightly refurbished, cannot find a solution, can the Opposition? The answer to that must depend upon the outcome of a struggle within the Conservative Party that its Conference last week did not do very much to decide. The Conservative Party still has a choice. It can depend on the ebb of a reformist tide to carry it into office, and there is plenty of evidence that many Tories cannot think beyond 1931;

The Gap between

... inadequate capital and the provision of essential income for dependants may be bridged by the capital and income benefits secured through the Family Provision Scheme

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844

20, LINCOLN'S INN FIELDS, LONDON, W.C.2

they hope to be given a "doctor's mandate" to clear up the mess that Labour creates, and then to go on drawing a recurrent fee for prescribing a single catharsis. But the Brighton Conference showed that there is a greater number of Conservatives who want to pursue a positive policy and build up a real alternative to Labour Socialism. Mr Churchill may well be right in thinking that the details of Conservative policy will have little effect on the next General Election, which will be decided by the merits or demerits of the Labour Government. But if the Tories have no policy after they get into office, they will soon be out again. The balance of power in this country—the two to four million votes that decide elections—lies with the middle class. The evidence is that the British middle class today whole-heartedly accepts the need for some purposive direction of economic affairs; it wants the state to try to influence the economic environment in which it lives. But the evidence is also increasingly that the middle class dislikes the purely negative pull that the trade unions exert on the Labour Party and that it resents the element of mere malicious envy of the fortunate and successful which crops up so often in Socialist policy. But this same decisive sector of opinion, which turned against the Tories in 1945, has not yet turned back to them, and hesitates to do so. If the only alternatives to TUC selfishness and Shinwellian class prejudice that it is offered are FBI monopolies and suburban snobberies, then it will vote Tory only

when it is more than usually exasperated with Labour. If the Tories want to play a higher role than the jetsam of the ebb tide, they will have to work out a positive policy for the reconstruction of the British economy and demonstrate that they can impose it upon the vested interests among their own camp-followers.

The Labour Party is faced with the need of sufficient moral courage to suspend its long-term policy for a short-term policy which seems to go in a contrary direction. The Conservatives might be more at home in the necessities of the immediate moment. But thereafter they would need strength enough to change a congenial short-term policy for real national planning, to know when to switch from medicine to exercise. In both parties the struggle is between reason and instinctive prejudice.

At the moment, it is difficult for a conscientious outside observer to feel convinced that either Party has made the right choice—or, indeed, any choice, at all. Sir Stafford Cripps has yet to convince the TUC. The Conservative Party leaders are more shy of their Industrial Charter than their followers. But both parties have some members who see the light—and who can see in it other colours besides red. The coming months are bound to affect the balance of forces; in any event too many relevant factors are now outside the control of any Government. But it would be a grim picture indeed if it were necessary to despair of any victory ever being won by reason.

Counties and County Boroughs

ENGLISH local government grew up in the towns, and the all-purpose county borough—that is, the large borough which has conferred upon it the powers of a county and which therefore has neither superior authorities above it (other than the state itself) nor smaller subordinate bodies beneath it—is the most satisfactory of existing local government units. This is so for obvious reasons. The county borough runs all its own services, and there is thus no local division of responsibility to complicate administration and perplex the elector. Moreover, it usually comprises a compact urban area, simple to administer and held together by obvious ties of interest and tradition. The duties of its council are important and yet can be mastered (save in the largest towns) without undue sacrifice of time and travelling. It is worth serving on the council, and yet it is not too onerous to do so; and the same circumstances should make for an active and interested electorate. The structure of the county borough has strong appeal to local government officers, and to become a county borough is the hope of almost every town in England and Wales.

Indeed, the mystery is why, with these great natural advantages, the county borough is not a much more successful unit than it is. The average poll at local elections over the last decade, in so far as a few sample investigations enable it to be measured, does not seem to be higher in county boroughs than in non-county boroughs or urban districts. Polling for the county council, which only takes place every three years, and where a majority of the seats is normally uncontested, easily represents the nadir of popular interest—the reason lying in the scattered and dispersed character of most counties, the political passiveness of rural areas, and the difficulty and cost of standing for election. In fact, the typical county's disadvantages are the obverse of the typical county borough's advantages. Even so, there are rural regions where the county council, drawn from the leisurely and retired, the squirearchy and the professions, is far and away more progressive than the county borough, which may be under the narrow domination of a trading clique.

Whatever its disappointments in some directions, there can

be no denying the advantages which the county borough holds over other existing types of unit. It is, therefore, surprising, at first sight, to find that serious suggestions are being made for the extinction of the county borough over the whole country or large parts of it. In Lancashire, where the county borough is associated with strong local patriotism, and which contains 18 out of the 83 county boroughs in England and Wales, the questings of the Local Government Boundary Commission have gone so far as to cause the appearance of a purely defensive document, the "Case for the Retention of the All-Purpose Authority in Lancashire and Parts of Cheshire," signed by all the affected authorities except Liverpool, Manchester and Salford. As a case for the defence, the document is impressive; but it must be remembered that only a few months ago these authorities were arguing, not their right to exist, but their urgent need to make very large boundary extensions, even at the cost of almost swallowing the county.

★

This *bouleversement* of local government tracts has been brought about by considerations which do not lie on the surface but which have never been absent from the minds of investigating Commissions. Three powerful arguments (to which there are two strong counter-arguments) suggest the dismantling of all or many of the county boroughs. The first is the simple test of what size of population is needed for administrative efficiency. On this test, there can be no case whatever for keeping county boroughs of under 100,000 population, which means that nearly half of them should go. The Ministry of Education has laid it down that the area of no Divisional Executive should contain less than 60,000 people; to get the best results, the education authority itself should probably cater for 200,000 to 300,000 population, a figure which is certainly requisite for the proper provision of further education. The new local health services need something like 100,000 as a minimum, and much more if close coordination with the new hospital authorities is the aim. Recent legislation strongly suggests that no local authority of under 100,000 inhabitants ought to possess

either its own fire service or police force. And so the catalogue could go on. Much will, of course, depend upon the character of the area, its administrative record, its financial resources, its community of interest. When these other tests are applied, some county boroughs of over 100,000 residents may be found wanting; but the tests would need to be very favourable indeed to justify the retention of a smaller authority.

★

The second argument against the county boroughs contends that so sharp a distinction between town and countryside is bad and outmoded, and highly hurtful to the countryside, since it distributes the financial load unequally. There is also a strong argument for spreading major services over a mixed area, now that the physical integration between a town and its environs is so much stronger. But the argument cuts both ways. For if counties can claim their focal towns, so can county boroughs claim their rural environs. True, the counties' claim is the stronger and should probably be conceded in very rural or very poor areas. But there is the further point that to merge the better unit in the worse, for the latter's improvement, is a dubious proceeding.

The third argument against the county borough is that there is a number of major services whose proper range of operation is larger, in terms of population, and far larger, in terms of area, than should be conceded to any all-purpose authority—that is, to an authority without subsidiary local bodies. These services arise out of an enlarged conception of town and country planning and embrace as well the provision of "overspill" housing schemes, the building of new towns, and the principal public utilities—transport, electricity and gas supply, water and main drainage. This argument—especially as it relates to housing and planning—is particularly applicable to the large conurbations and is at the root of the proposals to carve out new counties, without any county boroughs inside them, round Manchester and Merseyside, which have caused such perturbation among the Lancashire county boroughs. The simple counter-argument is that many of the services mentioned have been or will be removed from the local government sphere altogether and managed by separate bodies. But the local government enthusiast will never accept—and rightly—that all the present arrangements are permanent or irrevocable. He will argue that, given the right local structure, the Government will allow local authorities to do the jobs.

European Socialists

THE announcement that the Communists have formed a new International to fight "Western imperialism" carries with it the threat that they will now intensify their attacks on those Socialist parties of Europe which are not subservient to them. The accusation is that these Socialists, in particular the French Socialist Party led by such "social fascists" as M. Ramadier and M. Léon Blum, or the Right Wing of the Italian Socialists led by Signor Saragat, are the agents of American capitalist domination and of its British junior partner and that it is owing to them alone that the unity of the working class in defence of real democracy has been destroyed. It may even be that the new "Cominform" presages a return to the Communist Party's tactics after 1929, when the Communists all but abandoned their opposition to the Nazis—with whom on occasion they made common cause in 1932—in order to concentrate their energies on destroying the "social fascists"—in other words, the moderate Social Democrats.

The violence of Communist propaganda does not lessen the interest of the question whether in fact they have something

Added up, these arguments against the county borough become formidable. If it is small, it is inefficient and if it were to be made large enough, by taking in the surrounding countryside, to administer the large-area services, it would be too cumbersome, lacking subsidiary bodies on which local affairs could be devolved. In sparsely populated areas, it obstructs the spreading of the financial and administrative load, while in the great centres of population it gets in the way of the proper integration of certain major services.

Should the county borough then be abolished? A provisional answer must be No, even though many individual county boroughs should be eliminated. Nothing that has been said destroys the desirability, or the practicability, of keeping what may be called the middle-sized county borough. This phrase has been conveniently defined by the protesting Lancashire towns so as to include all of themselves, but in fact the optimum range of a county borough lies between 200,000 and 500,000. Within this range there are 14 existing authorities, but some towns should be brought within it by the inclusion of their suburbs, while elsewhere county boroughs within the range may have to be extinguished. Thus, the solution for Merseyside and the other conurbations will have to lie between the creation of a new urban county and division of the whole area among several all-purpose authorities. It would be wrong simply to enlarge the existing county boroughs and yet leave a rump for the county council to look after as best it might. Which alternative is preferred should depend partly on the circumstances in the region and partly on the view taken of what services will eventually be administered by locally elected authorities.

The choice in the conurbations is difficult and needs further discussion. The point to insist on here is that there will in any case remain a number of large isolated towns—Hull, Leicester, Nottingham, Southampton, Plymouth, to risk a few examples—which are strongly suited to the county borough form of government and to nothing else. Their continued existence need not seriously weaken the reorganised counties, so long as the latter swallow enough of the smaller county boroughs. It is of the essence of this proposal that such county boroughs as are left should be permitted boundary extensions that are fully adequate for housing and planning purposes. In this way county boroughs, though far fewer than at present, should gain the full potential advantage of this form of local government, without remaining a drag on the rest of the system.

to fear, whether Europe's Socialists are, in an organised and coherent fashion, pursuing a policy of support for America and Britain and using their position to "weaken and disrupt" the working class. On the score of close association with America, Europe's Socialists can be immediately acquitted—indeed, a majority of Americans would probably like to make the scrapping of socialism a condition of American aid. But there may be more in the charge that European Socialists have closely associated with Britain. The Labour Government represents, after all, the solidest achievement of moderate Social-Democracy and it would be only natural if some links had been formed with the European Socialists. In fact, three conferences of European Socialists have already been held and another is in the offing. It is on the basis of these meetings that the Soviets base whatever is positive in their charge of anti-Soviet collusion among the Social Democrats of Europe. The two substantial charges against the Labour Party, as developed in *New Times*, the fortnightly Soviet encyclical, are, first, that a revival of some kind of Socialist International, with a professed anti-Soviet bias,

is in preparation; and secondly, that where the emissaries of the Labour Party have been unable to bring the Socialist party of a European country round to their point of view, they have worked to promote a split within it and to disrupt the unity of the working class. Needless to say, both charges hardly bear examination.

A Second International does not exist—nor is one contemplated for the time being. What has occurred has been merely a series of conferences. The Socialist Parties of Europe and other continents last year accepted the proposal of the Labour Party to hold conferences every six months, the first two were held in Clacton and Bournemouth, the third last June in Zürich, and the next will meet in Antwerp early in December. These conferences have confined themselves to the exchange of information and the election of new member parties. The only rules governing their work are that political decisions must be unanimous; that candidates for membership must receive the votes of two-thirds of the existing parties, and that procedural decisions are reached by simple majority. Since the conference has no policy, there is no permanent executive committee. A consultative committee meets in London between conferences to supervise the work of a tiny Socialist information and liaison office and to prepare the agenda for the next conference; political questions are explicitly excluded from its competence, and its chairmanship rotates among all the parties.

The nearest approach to political discussion in these conferences took place over the proposal to admit the German Socialists as members; it met the Polish veto last November and failed to obtain the necessary two-thirds majority in June at Zürich. The coming Antwerp conference, however, includes in its three-day agenda the whole problem of world peace and economic reconstruction, as well as the possible restoration of a Socialist International. But it would be unrealistic to expect that any common policy on these subjects will be framed. The time available is quite inadequate, and few of the delegates will be technically equipped for the type of study which any significant proposals would require. Moreover, most parties, including the Labour Party, would be unable to commit their governmental representatives.

The Labour Government in Britain is constitutionally unable to fit its policy to the decisions of an international party organisation. The Labour Party will only allow itself to be represented abroad by members of its executive committee or by permanent party officials. The most able members of the executive are inevitably, at present, Ministers who, for diplomatic reasons, may not travel abroad as party delegates. Thus the only members of the Executive who are available for foreign conferences are trade unionists who are not members of the TUC General Council, some of the women members, and Professor Laski, who has consequently become for Soviet propaganda the evil genius of European Socialism.

The existing limitations on the scope of the international Socialist Conferences have created dissatisfaction among more doctrinaire elements in the French and Belgian parties as well as among minority or émigré parties which hope to draw strength from membership of a formal Socialist International. But it is also clear that these parties would be content with the organisation of an international debating society, in which verbal victories could be gloriously won and magnanimously forgone by the construction of equivocal formulas for unanimity.

The formation of the Cominform is likely to strengthen this doctrinaire approach, but the experience of power and responsibility has turned most of the European parties firmly away from the attempt to cure a compound fracture by spells and incantations. The majority know that contact must be more flexible and informal than it was under the old Second International. No centralised organisation can attempt by more or

less public discussion to unify or co-ordinate the policy of parties working in every variety of circumstance. And even if such difficulties could be overcome, the basis for such an organisation does not exist among the European Socialist parties. There is no unquestioning deference to a single state party—the deference which kept all Communist groups subservient to Russia in the Comintern. The doctrines, methods, traditions, experience and environments of the various parties are widely diverse; their unity is partly a verbal coincidence.

This diversity can of course be overstressed. On the whole the European Socialists have beliefs in common which they do not all share with other parties in their own countries; they combine a faith in economic planning for social justice with a faith in the dignity of the individual and his right to an area of freedom from state control. Above all, they have today certain common problems, common dangers, and common interests. Many of them are embarrassed in holding the balance of power between extreme parties whose policies are irreconcilable without Socialist mediation. All of them dread the necessity of choosing finally between an American or Soviet bloc, or between junior partnership in a "bourgeois" or in a Communist-controlled government. The moment of choice on either issue—which may indeed have arrived—is all too likely to split the various parties, and to destroy a popular appeal which is based on the denial that such a choice is necessary. For this reason, the parties have in the past realised that their own survival depends primarily on the survival of Labour Britain as an independent world power. It is this fact, and not any international organisation, which has explained the potential solidarity of the Socialist parties in Europe behind British policy. The tragic dilemma forced on the genuinely independent Socialist groups in Poland and Czechoslovakia by the Communist decision to set up a Cominform lies precisely in the compulsion on them to choose between East and West, whereas they have hitherto sought to keep a foot in both camps.

This point meets the Soviets' second charge—that Britain has sought to weaken the working class in Europe. On the contrary, the main interest of the Labour Party is that a foreign Socialist party should retain its organic independence, and extend its effective political influence through an increasing membership and efficient organisation; it is only in the survival of the party as a legal entity that the possibility of a future initiative under more favourable circumstances can be preserved. The limitations imposed on an independent British foreign policy by the economic crisis and the world situation have taught the Labour Party to sympathise with, for example, the Socialist parties of Eastern Europe in their present difficulties. In fact the position of Britain in world politics and the position of many Continental Socialist parties in internal politics are identical in form. So the Labour Party, whatever Soviet propaganda may say, has consistently tried to discourage disunity in foreign parties and has, where splits have occurred, ignored the dissidents and remained in relations with the majority party, even when very critical of its policy.

In fact, when the facts are examined coolly, it becomes obvious that it is the Communists, not the European Socialists, who have taken the decisive step in destroying the last vestiges of "working-class unity." Europe is still full of men of the Left who would regard a permanent division of the Continent as the last disaster and have sought by "common fronts," by "united action," and by every expedient at their disposal, to bridge the growing gulf. But now Moscow has put them on the spot. The only unity permissible is unity imposed by the Communists and aimed directly against the West. The bridges must be broken and European Socialism must accept "brotherhood"—Soviet version—even if the process involves knocking in every Socialist head from Warsaw to Penzance.

NOTES OF THE WEEK

On the Eve

Sir Stafford Cripps, speaking at his first press conference in his new office, fully lived up to his reputation for austere realism. Unless additional dollars were made available "within the quite near future" there would have to be further cuts in imports, including food and essential raw materials. This, he said, would be the beginning of a descending spiral of depression which, unless it was rapidly arrested, would lead to gradual economic strangulation. These statements, though they contained nothing that has not been perfectly obvious for a very long time, were treated by the popular press as a sensation.

The incident prompts two reflections. The first is that, since Sir Stafford's words were still couched in the future tense, the Government are evidently still gambling on getting some additional dollars this autumn, although they have been given the plainest of warnings from Washington—reinforced by Mr Snyder within an hour of Sir Stafford's statement—that the gamble will not come off. Meanwhile the last reserves are running out painfully fast.

The second reflection, derived from the newspapers' evident surprise at the strength of Sir Stafford's statements, is that the British public still has no idea of what is coming to them. It will not be long now.

* * *

"Cominform"

In one sense, there is nothing new in the formal promulgation of a Communist International, grouping the Communist Parties of Poland, Hungary, Czechoslovakia, Rumania, Bulgaria and Yugoslavia with those of France and Italy round an information bureau in Belgrade. Nobody has been under any illusions about the closeness with which the political strategy of Eastern Europe has been co-ordinated with the wishes of Moscow, and two such experienced pillars of the old Comintern as M. Thorez and Signor Togliatti certainly carried their old habits of collaboration into the postwar era. The only question is why such an announcement should have been made now. Is it a declaration of war? Or is it a declaration of defence, springing from a sense of isolation and a desire to close the ranks in a formal, signed and sealed alliance?

These alternatives go to the root of the Western world's difficulty in understanding Soviet strategy. It is possible to interpret the miserable record of the last year in terms of a terrified Russia throwing up improvised defences. Marxist theory compels the Russians to believe in an America which is by definition a bloodsucking imperialist only awaiting the favourable moment for intervention (and armed with the atom bomb). From this conception everything follows. Control of Eastern Europe is a defensive *glacis*. The murders—judicial or otherwise—of Eastern Liberals and Socialists, and the bitter attack on Western Socialists, are the checkmating of capitalist spies. The fight against the Truman Doctrine and the Marshall Plan is simply, as the new Cominform claims it to be, the defence of the European working class against imperialist penetration.

Equally, however, every line of this strategy can be interpreted in the exactly opposite sense. Marxism is a worldwide orthodoxy and basically believes itself incompatible with any other. With Marxism as their fighting creed, the Russians are imposing their rule on Eastern Europe. They eliminate all opposition in its name, but with particular virulence when it is a question of attacking Socialists who will not accept Communist leadership—just as a religion persecutes heretics more vigorously than non-believers. They oppose the Truman Doctrine and the Marshall Plan fiercely because they set boundaries to their ambitions and offer alternative principles of economic organisation. Finally the Cominform will use every instrument of propaganda and pressure to ruin any efforts of non-Communist reconstruction.

But which version is true? The difficult fact is that both are true. In the world dear to dialectical materialists, Russian policy is "ambivalent" and no useful guide to Russian intentions will therefore ever be yielded by analysis. The only policy for the West to pursue is to offer the equal ambivalence of fearing the worst and hoping for the best—fearing the worst and therefore yielding not an inch to Communist pressure, but hoping for the best in that its genuinely non-aggressive intentions will finally abate the war hysteria and the defensive follies of Eastern Europe.

Extremism Grows in France

The news of the setting up of the new Communist Bureau has had a more profound and a more disheartening effect in France than in any other European country. The French situation trembles on the knife-edge of disorder and each new shock, from whichever side, whittles away the narrow margin of stability. The general background is one of increasing economic stringency. Vital orders for coal and raw materials to keep the factories at work in November and December have had to be postponed for lack of foreign exchange and over the immediate horizon looms the spectre of mass unemployment. Meanwhile the cost of living has leapt up, and each week the ordinary family budget grows more inadequate. This state of affairs has not been accepted with any resignation. The riots in Verdun, where for ten days crowds battled to keep a consignment of sugar for the American Zone of Germany from leaving the country, have been only one in a series of major and minor disorders in the cities of France.

This angry undercurrent of discontent spells disaster to the moderate parties in the Government, both because they are moderate and because they are the Government. The only hope of restoring them to some measure of prestige before the municipal elections this month—in which everyone predicts a growth of the extremist vote—would lie in a speedy and generous response to M. Bidault's desperate appeal for dollars. But the urgency felt in Paris cannot communicate itself to Washington, and the chances of the Socialists and the MRP wane in proportion. The elections are thus likely to be the battlefield of extremist parties.

It may be argued that this is nothing new. The Communists have been the largest party in France for some time now. Yet it has, in fact, proved possible to govern without them. The new factor is, however, the emergence of a leader on the Right. Both in France and Italy, in the first two years after liberation, the Right was splintered and discredited. The old Right voted with the Moderates for the centre parties and gave de Gasperi in Italy and Bidault and Ramadier in France the voting balance they needed to govern without the extreme Left. This situation is now ending in France. General de Gaulle has everything a Right-wing leader needs. His *mystique* is genuine, his programme is vague, and his bogey is obvious—the Communists, who have even provided a new Comintern to justify his taunts that these "secessionists" are the agents of a foreign power. If last Sunday's address at Vincennes is typical of his election campaign, the General can sweep together a great vote of negative force—anti-Communist, anti-rationing, anti-controls, anti-Government. The one voting strength he will not invade is that of the Communists, who in part compete in the same market of fears and negations. After the October elections, France may see the division of East and West and the shadow of war reflected in microcosm in the irreconcilable duel of Thorez and de Gaulle.

Conservatives at Brighton

The Conservative Party held its annual conference at Brighton at the end of last week, and on the whole it is fair to say that a good time was had by all. The weather was magnificent and the hospitality, naturally enough in Brighton, considerable. The standard of speaking was high. There were no doctrinal rifts in the scene itself and if the conference lacked the tension of conflict it had the charms of custom. The affair concluded with a speech characteristic of Mr Churchill's present-day view; it is pleasant to have your worst suspicions reinforced, provided you are not absolutely convinced of their truth.

There were two significant features of the Conference. The first was a remarkable outburst from a Norfolk delegate on the subversive activities of Communists, coupled with more than a tinge of anti-semitism. The incident was not well handled by the Chairman of the Conference. It was left to Mr Quintin Hogg and Sir Ian Fraser to deflate the gust of passion that swept the mass of the delegates. But the outburst is a warning. The British are not a people without passions, but it has been greatly to their advantage that they have kept passion out of politics for a considerable period. Those who introduce it must answer for the fact that passion on one side creates an immediate and similar reaction on the other and any constitutional party which tolerates

it in its own ranks is thereby digging the grave in which it will ultimately be buried.

The other outstanding event was the absence not only of any foreign policy but also of any real discussion of foreign policy. The Conservative Party seems to have retreated further from the Fulton Speech than has Mr Ernest Bevin. The last year has not aligned the Conservatives alongside the Americans in the cause of free enterprise. It has driven them far more towards a defensive Commonwealth Allegiance with an uneasy feeling that probably they ought to have a policy about Western Europe, too. This should be an additional proof to visiting American Congressmen that free enterprise à l'américaine is not an exportable commodity.

But the Conservative Party as a whole is over its defeatist phase. It is fair to say that the austerity of the last two years has done it good. It is still entranced by the spectacle of a Conservative trade unionist; but it is no longer hypnotised by a public school accent.

The Government and Wages

Whatever hopes Sir Stafford Cripps may have cherished that, as Minister, he might be able to induce the unions to forgo wage claims until higher wages could be balanced by greater production appear to have been dashed to the ground, at least for the time being. The Trades Union Congress, which feared that Mr Isaacs's letter to joint industrial councils, reminding them of the Prime Minister's appeal not to press for higher wages, was the thin end of the wedge of Government interference in wage matters, came away from their meeting with Mr Attlee last week completely reassured. The Minister of Labour received an implicit rebuke, and the Prime Minister reaffirmed the Government's intention to leave wage questions to the two sides of industry. Nobody had ever suggested that there should be any departure from the established practice of collective bargaining. All that the much misunderstood advocates of a wages policy had proposed was that there should be a more conscious influence over wage movements, as a means both to improve the distribution of manpower and to prevent inflation. Even this limited interpretation, however, is too strong meat for the sensitive trade unionists to stomach.

Sir Stafford, however, appears determined not to abandon the struggle to keep wages in line. At the week-end he gave a short lesson in elementary economics to the tinplate workers of Swansea, pointing out that unless production rises higher money wages bring no real gain to the workers and moreover cripple the export trade. Meanwhile, the Ministry of Labour reports an increase of over £800 millions in the weekly full-time wages of 2,600,000 workers, and substantial reductions in hours affecting 4½ millions; and further increases have been won or are being demanded by another two million, including most conspicuously the miners. True, the upward trend has considerably slackened since last year, but the Government's exhortations have evidently produced little effect.

It may be perfectly true that a revolution in relative wage scales is overdue. It was always social and economic nonsense, on the assumption of full employment and a modicum of industrial mobility, that coal mining, at once the most vital and the least attractive of occupations, should pay wages near the bottom of the national scale. It no longer does so; but are miners' wages even yet relatively high enough? Mr Horner thinks not. That is what it is his business to think; and he may be right. But since what the miners get (in real value) someone else will have to forgo, and since it is not at all proven that higher wages will elicit more coal, their claim is not merely a matter between Mr Horner and the Coal Board, but between the miners and the whole community.

The argument holds good for other and less essential claimants. One way or another, wage levels must be co-ordinated with what must by courtesy be called the Government's plan. By their negative attitude the TUC are skewing the economic foundations of democratic Socialism.

* * *

Mr Williams on Agricultural Expansion

The Minister of Agriculture, in two speeches this week, has clothed his programme for expansion with a few new details. He stressed the need for farmers to apply for, and to retain, all the regular British labour they needed, warning them that the amount of gang labour supplied by the agricultural committees would in time get less. For obtaining the new labour, and replacing German prisoners, he appeared to rely—optimistically—on tapping labour exchanges. He did not contemplate any cut

in rural housing, pointing out that 20,000 Airey houses were on order by the Government for rural purposes. The one positive statement was that the steel allocation for agricultural machinery had been restored to the maximum that the manufacturers could use, and that exports would also be encouraged in order to build up production to an economic level. This is a wise move. On feeding stuffs, Mr Williams said the aim was two-thirds of prewar imports from 1951 onwards (why not more?) and was cautious about obtaining even this goal. He relied on farmers getting half a million acres more wheat, and maintaining the potato acreage for next year without resort to direction.

Mr Williams also dealt, briefly, with economic criticisms of his target. He pointed out rightly that the abolition of food rationing, for which the Government was working, would require budgeting for dietary standards that would ultimately be very much higher than those of 1938. He assumed that half the nation's food would always need to be imported, and hoped for some fall in world prices, but argued that even so there was urgent need of greatly increased output from home sources. This also is sound. But the Minister then overreached himself by boasting that, if the 1951 targets were secured, agriculture would have replaced £202 million (at postwar prices) of imported food and have "done so in large measure by an increase in efficiency." This is a strange conception of efficiency, a word which Mr Williams several times employed in similar contexts. For it appears to have no relation whatever to the calculation of cost—or if there is one, it was not vouchsafed. The Minister underlined his aberration by repeating the doctrine that the new capital equipment, which is certainly necessary, is best got by inflating farm prices.

Wooing the Indian States

The settlement which left the Indian States free to choose whether to adhere to India or Pakistan is now producing, as was to be expected, some very knotty problems. For the great majority, geographical location and the religious persuasion of the rulers and their peoples have determined the choice without much difficulty, and the recalcitrance of states such as Bhopal and Travancore has been overcome after a little bargaining. For Moslem rulers within the geographical orbit of India the choice has been harder. Hyderabad has avoided it by claiming full independence without adherence to either India or Pakistan. On the other hand, the small state of Junagadh in Kathiawar, which has a Moslem ruler and a mainly Hindu population, has caused a turmoil by opting to join Pakistan. The Indian Government has openly declared its refusal to permit this to happen, has sent troops to Kathiawar to overawe Junagadh and has demanded a plebiscite of its people to decide the issue. Meanwhile a Hindu "provisional government" of Junagadh has been set up outside the state to organise opposition to the will of its Moslem monarch.

Pakistan has asserted the legal right of the ruler of Junagadh to join Pakistan, but has declared its willingness to discuss a plebiscite to be held there. The plebiscite proposal, if accepted on principle, would be applicable also to Hyderabad and Kashmir, and Pakistan would stand to gain by its general application, for, whereas Hyderabad is not in any case going to join Pakistan, and probably cannot remain independent for long, surrounded as it is by Indian territory, Kashmir, which is ardently coveted by the Moslem League leaders, could presumably be brought in by the votes of its Moslem majority, and an adverse decision in the small and isolated state of Junagadh would be a small price to pay for Kashmir. If it is going to be consistent, the Indian Government may, therefore, find the plebiscite principle inconvenient, for the Hindu Maharaja of Kashmir is believed to incline towards accession to India and would probably take this step sooner or later if the right of the autocrat were to be recognised as the only rule. So far indeed he has been sitting on the fence—or on the elephant's trunk, if a more Indian simile may be used—and the supporters of the Moslem League among his subjects have already started a rebellion against him in anticipation of his coming down on the wrong side. The Kashmir situation has not yet reached its climax, and before the crisis is resolved, it may yet impose a severer strain than any other conflict so far on relations between India and Pakistan.

More Talks on Germany

The talks which open in Washington this week between the British and the Americans to discuss further aspects of their German policy are not intended to prejudice the outcome of the Four

Power Conference later in the year, but in the present division of Europe, it is difficult not to feel that more binding decisions are likely to issue from Anglo-American than from quadripartite discussions. Two issues which visiting American Congressmen have urged on General Clay do in fact trespass on Four Power territory; nevertheless, they may be discussed. Lack of a government and of a stable currency are generally felt to be two of the root causes of Western Germany's continuing collapse, and the establishment both of a separate parliament at Frankfurt and of a separate currency in the West—with the probable adhesion of France to both—are likely to appear on the agenda.

The most immediate problem remains, however, the financing of Bizonia. Dollar imports for 1947 may amount to as much as \$800 million and the British are still responsible for financing half of them. Such a position is so obviously intolerable that the Administration has tried to persuade the Appropriations Committee of the Senate to sanction the transfer to Germany of money allocated to occupation costs elsewhere, but there is no evidence yet that Senator Styles Bridges has been convinced. A further difficulty lies in the possibility that the figure, high as it is, may be inadequate. The cost of food is rising. At the same time, the productivity of Western Germany continues to decline. In spite of direct individual incentives, the crucial output of coal in the Ruhr has fallen again. The average daily figures in recent weeks have been: week beginning September 21st, 240,367 tons; September 28th, 239,850; October 5th, 239,672. (The highest daily figure ever achieved was 244,080 tons on September 4th.) Now some observers are inclined to argue that since work is a social as well as an individual effort, the complete destruction of a functioning German community—visible daily in the ruined cities and paralysed administration—is perhaps the first cause of the constant fluctuation in the miners' output.

* * *

The "Holmag" Affair

It is this problem of social and psychological environment that makes it literally impossible to understand the latest twist in Anglo-American policy. For some months now, and with increasing certainty in recent weeks, the people of Western Germany have begun to realise that a large and undefined number of factories are to be removed as reparations. Week by week, the publication of the actual list has been postponed, so public rumour has been free to boost the figure of condemned factories from the probable 1,800 to tens and tens of thousands. The prospect of transferring some 30,000 workers from the zones' meagre labour force at the onset of winter to the demolition of factories where some of them at least have been at work for two years, was so revolting to the German authorities and to the trade unions that Military Government has received a series of appeals and protests. To these General Clay has replied, in the idiom of the conqueror, that if German workers refuse to dismantle their factories, food shipments to Germany will be cut.

It is a weary business to attempt to follow the logic of Anglo-American policy in Germany. Even if Potsdam were sacrosanct and every claim for reparations justified, it should be clear that dismantling cannot be undertaken now. Some "Category A" war plants could be shut permanently and demolished later. Western claims could perhaps be met at a future time by some reparations from current production. But demolitions and dismantlings now will spell the end of any constructive Allied policy in Germany.

The "Holmag" affair in Kiel has come to underline the warnings of the German authorities. The Holmag factory, which was converted to war production under the Nazis, returned to its previous civilian output in 1945 and for two years now has been working, with 1,800 workers, on machines needed by the railways, the mining industry, agriculture, fishing and other sectors of the industrial front. Early in September (by irony, immediately after Kie's Reconstruction Week) the order came to demolish the works. The workers refused and the factory was occupied by British troops and German police—a fact which led to the strongest protest from the German administration, who believed themselves responsible for the police force. When the workers arrived to work next morning, they found the factory shut and barred and the rumour spread through the town that "the British had sold the whole plant to India." There the matter rests; but the case only needs to be extended to a dozen towns and a score of factories for the Allied authorities to produce complete political and industrial paralysis in their zones.

Enter Labour Control

The Control of Engagement Order came into force on Monday with remarkably little fuss or bother. It will indeed be possible to gauge the effectiveness of this measure, and the extent to which it will need reinforcement by the use of direction, only during the next few months when Sir Stafford Cripps's policy of cutting down less essential production and reducing capital expenditure is put into force. The Order itself affects only people who are actually unemployed—at present a tiny proportion of the working population—and, even so, with its long list of exempted categories it allows a large number of loopholes. Sir Godfrey Ince himself recently warned an audience of industrialists "not to expect too much" from the Order. This is both because there are physical limitations in lack of housing in areas short of labour and because, in the existing state of full employment, it becomes increasingly difficult to find for particular jobs well-qualified men who are not already occupied.

For obvious reasons the Government is anxious to avoid using its powers of direction and to "persuade" rather than compel workers to take on essential jobs. Employment exchanges have been informed of what the Government regards as the priority industries—the list is discussed in a Note on page 615. In the interpretation of the term "essential," as in the administration of the control, much will be left to the discretion of local officials. They have been briefed with two unexceptionable principles—to make the best use of a man's skill and experience and to place him as rapidly as possible.

* * *

Rounding Up the Spivs

In the meantime, the Government's plans for dealing with spivs and drones are shortly to be discussed with the Ministry of Labour's Joint Advisory Council. Here again, Sir Godfrey Ince talked good sense. As he pointed out, the contribution which men and women of this type can make to production is bound to be negligible—"I have yet to meet an employer who is prepared to take on a spiv." It is not hard to understand why. You may take a horse to water or a spiv to a workbench, but where do you go from there? What sort of work is he likely to turn out? What sort of moral effect is he going to produce on his workmates? No doubt a good deal depends on what sub-species he (or she) belongs to: the wide boys, the born-tired, the reclaimable misfits, or the incorrigible individualist. How deplorable and unmitigable a spiv, for instance, was Mr W. H. Davies, the Super-Tramp; and into what essential industrial category would Mr Isaacs have fitted him?

There is some danger, as a matter of fact, of this handy little term of abuse being applied a great deal too widely. The spiv of only a few years ago was a hanger-on at racecourses, fun-fairs, billiard saloons and such; at his most amiable he was something out of Damon Runyon, at his worst, one of the less attractive characters of Graham Greene. There cannot have been very many of him, and certainly he did not constitute a national problem. Now it is almost easier to define him negatively. Anyone of working age, sound in mind and body, who is neither a Civil Servant, a member in good standing of a trade union or professional association, or a *bona fide* working housewife, is a potential spiv. Greengrocers hurl the epithet at their grower-to-consumer rivals. Novelists, artists and students are suspect. To be a free-lance of any kind is perilous. A pessimist looking ahead might discern, without much strain on the imagination, a Britain divided into two categories only: the smugly *gleichgeschaltet* and the hunted, harried, but still defiant, spivs. It is impossible, as Mr Isaacs marshals his posse for the roundup, not to feel a certain sympathy for these irreconcilable mavericks; nor indeed to spare a little for those responsible, in the immediate future, for breaking them to harness.

* * *

Controlling the BBC

The pother about the new machinery of survey of the BBC's expenditure, announced in a Treasury memorandum last week-end, turns out to be very much of a storm in a teacup; there is no substantial threat to the Corporation's vaguely delimited independence. In so far as its overseas broadcasts are financed not from its own revenue but from Exchequer grants-in-aid, it is proper and inevitable that the Auditor-General should exercise his usual powers. The more general functions of the proposed standing committee of representatives of the Treasury, the Post Office and the BBC, in checking the Corporation's estimates and forecasts against actual expenditure, are eminently elastic, and likely to become a matter of convention and precedent rather than

of cut-and-dried precept. The BBC in effect regains its prewar independence, but at the end of a long leash which could, in certain circumstances, be twitched by remote Parliamentary control.

On the financial side there is no ground either of logic or of anything but the narrowest expediency on which to defend the Treasury's grabbing of a considerable proportion of the BBC's licence revenue, instead of contenting itself with whatever sum is needed to recoup the Post Office for administrative services rendered; the Treasury rake-off is merely a disguised, inequitable and arbitrary tax. But this is, of course, nothing new nor peculiar to the BBC. It reproduces the Treasury's relationship with the Post Office and—to cast further back—the Road Fund. Any profitable public enterprise may be called upon to serve as a Treasury milch-cow, just as any unprofitable one may be a Treasury pensioner. There may be, in any particular case, excellent reasons for taxing the one and subsidising the other; the economic theory of public institutions has for the last fifteen years or so been occupying some of the brightest brains in the country. But actual practice has always followed the line of least political resistance and most immediate financial expediency; it is hard to feel much confidence in the soundness of an expanding "public sector" the resources of whose component parts bear no relation either to their own efficiency or to the public's demand for their products, because the Treasury has no guiding principle other than to slap down the profitable by appropriating their profits and to bolster up the unprofitable out of the general revenues. To formulate and apply such guiding principles is not easy, but it ought not to be impossible. It is a pity that a beginning could not have been made on the BBC.

* * *

Voting in the Saar

The Saarlanders have voted in a general election which will not only decide the Government which will rule them but also the international status under which they will in future live. The voting* gave a clear majority to the Christian People's Party, which can now, if it wishes, form a single-party government to administer the territory.

But the significance of the voting lies not so much in the predominance of the Christians as in the fact that only the Communists—who received a fraction of the vote—are opposed to some form of union of the Saar with France. A few days before the election a constitutional committee, composed of the four parties, passed by eighteen votes to the Communists' two a Constitution which is in part a sort of separate peace treaty with France and in general paves the way for the territory's economic and political incorporation in France, for the introduction of French law and for the transfer to France of the Saar's defence and diplomatic representation. Since the parties which passed this draft will now dominate the Constituent Assembly it may be assumed that, with only the Communists dissenting, it will become both law and the "freely expressed wish of the Saarlanders."

This, then, is the justification of annexation which the French can take to the London conference of the four powers. In fact, some of the phases of incorporation have been carried through already. A new Saar mark has replaced the German currency. A separate customs frontier was introduced last year, and the industries are organised under French direction. The only matter for doubt now is not the fact of incorporation but the form—autonomous area, department in Metropolitan France or membership of the French Union.

The die in the Saar is clearly cast—yet one cannot but wonder why a community which twelve years ago voted by a 90 per cent majority for incorporation in Germany should vote now with equal emphasis for union with France. The French have been skilful. They have increased the food ration and given priorities to the Saar's coal and steel industries. The present state of Germany is so obviously unattractive that, like Bavaria in 1921 and Austria in 1923, the Saar for the moment finds its nationalist fervour damped. It is also true that the Saar has been for so long on the margin of geo-politics, dumped now in one direction, now

in another, that a strong strand of opportunism runs through local politics. Yet herein lies a lesson and a warning for the French. When National Socialism raised its head, its representation in the "autonomous" Saar was doubtless minute, but the full flood of triumphant nationalism finally swept it to power. Are the Communists to-day a similar portent, another cloud no bigger than a man's hand?

* * *

Denmark Before the Polls

The Danish Parliament last week passed a vote of no confidence in the Liberal Left (*Venstre*) minority government of Mr Knud Kristensen, which on several occasions in the past few months seemed on the point of being brought down by its leader's policy on South Schleswig. And it is the problem of South Schleswig which, with the economic crisis and housing policy, will be the main election issues. On this matter the Prime Minister, like his opponents, has based himself on the compromise "October Note," agreed between the parties a year ago. This Note, which was sent to Britain on October 1st, 1946, avoids an open demand for a plebiscite on the issue of re-uniting South Schleswig and its predominantly German population with Denmark, but says that Denmark would welcome the union if the people voted for it of their own accord. But the Prime Minister has consistently sought to interpret this Note in a more positive sense by openly demanding the holding of a plebiscite. This unpopular "forward" policy would not, however, have been enough to bring the Government down, had not the growing severity of Denmark's economic position brought the necessary extra strength to the Opposition. Criticism became sharper when the negotiations with England for revising the prices of Danish food supplies were postponed and then failed. And as the economic outlook worsened everywhere the Government faced increasing opposition. Attempts to form a broader-based coalition foundered on the Prime Minister's insistence that his policy on South Schleswig should be that of the Government. Accordingly, it was no surprise that, when Parliament re-assembled at the beginning of last week, the Government immediately came under the heavy fire to which it eventually succumbed.

The Social Democrats, who with 48 out of 149 seats in the present Lower House (*Folketing*), are the largest party but lack an absolute majority and hold no portfolios, have for some months sought to force a new election. They are now virtually certain to return to power and their leader, Mr Hans Hedtoft, will be the next Prime Minister of Denmark. Yet it may be doubted whether their representation will increase spectacularly. True, the party has grown since the previous elections in October, 1945, and had cause for jubilation in the results of the municipal elections in the spring. On the other hand, the different bases of voting qualifications in municipal and general elections makes it necessary to treat cautiously any prophecies based on the results in the towns. Also, although the retiring Prime Minister has raised up some opposition by his South Schleswig policy, he has equally gained some support. The chances are, therefore, that the Social Democrats will gain some seats—mainly at the expense of the Communists, who now have 18 seats compared with 3 before the war—and will head a coalition government.

* * *

Fruit and Vegetable Prices

Some three months ago Dr Summerskill announced that an inter-departmental committee would be set up to investigate the distribution of fruit and vegetables, but nothing further was heard of it publicly until last week, when Mr Strachey told Labour housewives that a small Fruit and Vegetable Organisation would be set up with the function of improving marketing and distribution. There is no question, as was at first suggested, of the new organisation itself engaging in direct—or presumably indirect—trading. Mr Strachey is not to run his own barrow boys. It will rather be responsible for the activities of "a team of experts" who will investigate projects, in consultation with local authorities, for improving the marketing and storing of fruit and vegetables and for eliminating waste in periods of heavy supply. It will also examine costs and profits of importers, wholesalers and retailers.

Hopes of any spectacular developments from the new organisation are officially deprecated, and since its functions are not apparently executive but mainly investigating and recommending, this modesty is wise. Supposing that it finds that retailers' profit margins are excessive, what then? Is price control, the relaxation of which is, in the Ministry's opinion—and rightly so—an essential condition of cheap and efficient distribution, reimposed? In any case, the season of glut is nearly over; next summer, by when

any of the organisation's activities may have come to something, there may be a shortage of fruit and vegetables. The organisation's work will, in fact, be more effective in the technical sphere, in encouraging methods of processing, storing, canning and freezing to eliminate waste in periods of abundance, than in any direct attempts to reduce retail prices. It is difficult to see how there can be any real fall in these so long as there is the present huge demand for food and the money in hand to satisfy it. "The masses," on whose behalf Dr Summerskill, so frequently and with so much distortion of argument, takes up the cudgels, have the remedy—to refrain from buying. And if they cannot, as they naturally will not, pass this self-denying ordinance, the Chancellor of the Exchequer must impose it for them.

* * *

Amber at the Ministry of Health

Mr Bevan is one of the few Cabinet Ministers about whom rumour was rife, but who has nevertheless kept his place unchanged. It remains to be seen whether this is due to stubbornness or tractability. Has he won his case for keeping housing priority number one in the building programme, or has he been persuaded into a less clamant frame of mind? Presumably this will not become apparent until the revised programme of capital expenditure is announced. Meanwhile the lights are at amber for new housing plans.

It is inconceivable that some adjustment downwards has not been agreed; the danger is that it will not be large enough. Politically, housing is a major issue and the Labour Government have in the past trumpeted their intentions about housing so energetically that the counterblast is likely to be very loud when the public realises that it will have to endure an additional three or four years of overcrowding and domestic friction. And Mr Bevan has pledged himself so unreservedly to bigger and better houses in ample numbers that a reversal of policy would come as a severe shock. Shocks are not what this Government have so far been willing to produce deliberately, but perhaps they have learned wisdom. It would serve them and Mr Bevan far better to cut drastically now and to improve upon these cuts later. Nothing is so disheartening to the public than a steady whittling down of expectations.

It is to be hoped that the lights will not be left at amber for

long, for whatever restrictions in the plans are thought necessary, the truncated version should be pursued without delay. Too much personal misery is involved for it to be tolerable that avoidable delays should aggravate the unavoidable. At Tuesday's meeting of the London County Council it was reported that the Ministry of Health had informed the Council that the Government was reviewing the country's building programme and that until this review was complete no new tenders for houses would be approved. A similar statement is being given to any other local authority which seeks to proceed with new building plans. One of the secrets of success in building is to produce an even flow of work from start to finish. The sooner local authorities can readjust their starting plans to the new situation the better.

* * *

Future of the New Towns

Four new towns in the London region—Stevenage, Crawley, Hemel Hempstead and Harlow—a new town at Aycliffe and another at Kilbride in Scotland, have now been designated, development commissions appointed, and preliminary plans made. The immediate future of the new towns is in peril now that drastic housing cuts have to be made. On economic grounds new towns are among the worst places to build during the next few years. Extensive outlay on utility services in advance of housing is necessary even where the nucleus of the town already exists. In particular, building labour is scarce at the new sites and accommodation for it must be first provided. The new towns are in rural areas and compete with agriculture for building labour. The logical place to concentrate urban housing, when the cuts come, is in the vicinity of existing towns where a reservoir of labour exists which cannot easily be transferred elsewhere. From the viewpoint of minimising the investment programme while maximising the output of houses, new towns have a poor claim on national resources at the present time.

This is the economic case against new towns. The planning case for them remains as strong as ever, but it cannot of itself be allowed to outweigh the economic arguments. However, their very predicament gives the planners a chance. Extensive suburban building plans, such as the LCC's Chessington scheme, have been sanctioned on the plea that the building of new towns will be too slow to satisfy immediate housing needs. Now suburban housing

METAL WINDOWS

in the Life of the Nation

Broadcasting House

More than 180,000,000 copies of books are printed in Britain every year. The printing of those millions of books accounts for but a small part of the vast tonnage of paper used in this country each year. Monsanto manufacture a wide range of chemicals for the British paper and printing and publishing industries.

SERVING INDUSTRY . . .
WHICH SERVES MANKIND

as well will be held up. If, when the housing drive reopens, the new towns programme is all ready to go ahead without any delay, then there is good hope of turning it into an effective instrument of urban decentralisation and making town and country planning effective.

It is therefore desirable that plans and preliminary preparations for those new towns already designated, and others as well, should proceed without interruption. As far as it can be done, basic engineering works should be undertaken and there may be sites where housing can be started without difficulty. Much will depend upon how drastically the national housing programme is to be cut. The creation of new towns seems due, however, for a chrysalis stage.

The Right of Judicial Murder

The Bulgarian Government has now replied to the British Government's Note on the trial and condemnation of Nikola Petkov, asserting that the trial was fair and that the protest is an "encroachment on Bulgaria's judicial authority." Meanwhile the Agrarian Union has been dissolved as a sequel to the trial and a new batch of alleged "conspirators" are being tried for their lives. From other countries in the Russian zone of Europe come reports of similar manifestations of judicial activity of the kind we are now accustomed to associate with the Communist conquest of political power. In Belgrade, Mr Jovanovitch, leader of the Serb Peasant Party and distinguished as the solitary opposition member of Tito's packed parliament, has been sentenced to nine years' imprisonment for trying to form "a peasant bloc" within the People's Front, having been instigated thereto by a former British Press Attache and by Mr Hugh Seton-Watson. In Yugoslav Istria a "People's Tribunal" has just imposed sentences of only three and five months' imprisonment on two men who brutally murdered a Catholic priest, but sentenced to six years for "provocation" the local parish priest, who himself narrowly escaped assassination, and to terms up to eight months several peasants who had tried to prevent the Communist mob from forcing its way into the church. In Rumania the veteran leader of the National Peasant Party, Mr Maniu, now faces capital charges of conspiracy. Even in Czechoslovakia, the hardest political nut to be cracked by Communism in Eastern Europe, sensational plots are being discovered daily, and political trials of far-reaching importance are apparently being prepared.

It cannot be asserted in advance that there are no real plots against the new regimes in Eastern Europe. But the outside world can only judge of the reality of the alleged offences for which prominent public figures are imprisoned or put to death by the conduct of the trials in which they are convicted, and when the misconduct of the trial is as scandalous as it was in the case of Petkov, it can only be inferred that the prosecution's evidence was not such as to stand up to cross-examination and that the whole business was a "frame-up" designed to get rid of a formidable political opponent.

An EAM correspondent in a letter published in *The Economist* last week compared the case of Petkov with those of Partsalides and other Communist leaders who have been condemned or are on trial in Greece. It will be agreed that, though this country and the United States have no legal ground for intervention such as they have in ex-enemy countries on the basis of the terms of the peace treaties, they have a moral obligation in view of the support they are giving to the present Greek Government to observe political trials and censure any irregularities in their conduct. It is to be hoped that steps have been, or will be, taken for observation of these trials. It must be pointed out, however, that there is a difference between the cases of Petkov and of Partsalides, as is explained in a letter from the side of the Greek Government which appears on page 597.

Russian Initiative in Korea

The Russians have recently made a proposal for the settling of the Korean problem, which, if it is meant seriously, may resolve the Russo-American stalemate on the 38th parallel. General Shtikov, the head of the Soviet delegation to the joint American-Soviet Commission for Korea, has proposed that the United States and Russia should simultaneously withdraw their occupation forces from Korea by the beginning of next year. Under the Potsdam agreement, the USA and the USSR were to occupy Korea for a period of five years after the armistice. Until quite recently the Russians treated the agreement on the occupation of that country as sacrosanct. So much so that they summarily denounced as disloyal elements all Korean groups and parties which were opposed to the occupation and declined their right to any share in the Korean administration. General

Shtikov's proposal is therefore a new departure which deserves examination.

What is not quite clear yet is whether the Soviets propose that the withdrawal of the occupation forces should take place regardless of whether a central Korean government has been formed before the date of the withdrawal or whether they suggest that a central government shall be set up within the next three months and that only then shall the withdrawal take place. If it is proposed that a government should be formed first, then there is little hope that the stalemate will be resolved, because it has been precisely on the composition of such a government that the Americans and the Russians have stubbornly failed to agree. Russian sources vaguely suggest that the armies should withdraw first and that the formation of a central government should be left to the Koreans themselves.

The Russian initiative in Korea, startling as it appears at first sight, might be an extension of Russia's general military withdrawal behind its own frontiers in Asia. The process started with the evacuation of Persian Azerbaijan early last year and was continued with the evacuation of Manchuria. In the course of this year, the Russian attitude in Asia has been one of increasing passivity; and this has newly been illustrated by the lack of any Russian reaction to the reverses of the former Yenan regime in China. Against this background, Russian anxiety to terminate the occupation of Korea and thus to eliminate a potential storm centre from Asia might be genuine. On the other hand, the Russians are reported to have built up a Korean Communist army in their zone and they may believe that simultaneous Russian and American evacuation would enable this army to dominate the whole country and determine the composition of Korea's future government. There can be no doubt that the propagandist effect of General Shtikov's proposal has had repercussions favourable to Russia in the whole of Korea, since this sort of "championship of independence and sovereignty" is bound to evoke response in any occupied country. It is also certain that, when the Korean issue comes up for discussion before the United Nations, the Russians will make the most of their proposal, which has probably been put forward in the hope that it will effectively block the debate in the United Nations.

Road Accidents

The Committee on Road Safety, appointed in December, 1943, has now submitted its final report to the Minister of Transport and the report has been published (HMSO 2s. 6d.). It is a long document, containing 144 pages—no one could say that the committee have left any avenue unexplored. Yet its continued effect is, rather surprisingly, one of vagueness and uncertainty.

It is possible to pick out many recommendations of value. It is advisable, as the committee suggests, that pedestrians on busy roads should be placed under more specific duties, particularly that of obeying traffic signals; the careless pedestrian may himself escape injury, but he may leave behind an angry, and possibly temporarily a more "accident-prone" motorist. Similarly the committee's proposals that cyclists shall be subject to driving duties and penalties similar to those imposed on the motorist is no more than common sense. Possibly most valuable is the suggestion that all vehicles on the road should undergo periodic inspection. Defects likely to cause danger would result in either a temporary or a permanent stop being placed on them. All of the committee's recommendations, if adopted, would reduce the total of road deaths. None of them solve the real problem, which is that the motor vehicle is far more lethal a weapon than either driver or pedestrian will admit.

Shorter Note

Recommendations for increasing the salary scales of school teachers were made last week. This week similar proposals are made for the teachers in technical colleges and schools. For the grade of assistants the recommendations are the same: that is, the maximum is raised to £555 for men and £444 plus additional increments for a university degree. Scales for senior assistants are increased from £750 to £800 for men and from £600 to £640 for women. Similar increases of £40 to £50 for heads of departments will do little to improve the relative positions between heads of departments in universities and in technical colleges doing work of university standard. Such a leveling up was one of the recommendations of the Parliamentary and Scientific Committee for improving the quality of teaching and research in the technical colleges.

Letters to the Editor

Patent Law Reform

SIR,—Your article on the final report of the Departmental Committee on Patents and Designs, touching as it does the important subject of invention, recalls the great value to the nation of new ideas, and especially those possessing patentable novelty.

It is a distressing fact that the particular incidence of taxation levelled at inventors should operate to stifle rather than encourage invention. It is probably not generally realised that in this country the purchase consideration payable for an invention embodied in a patent is taxed in many respects as if it were income. Although a lump sum payment for a patent is spread equally over the inventor's tax assessments for six consecutive years, this hardly excuses the arbitrary conversion of a capital asset—a patent—into income the moment it is replaced in the hands of the patentee by a sum of money. It would no doubt serve as a valuable stimulus to invention if some proportion at least of this consideration could be treated as capital.

Inventions spring from two main sources: (a) organised research and (b) inherent inventive genius. Research has now been given some degree of official recognition in that, for example, an industrial undertaking may be permitted to spend up to an agreed sum annually out of profits upon fundamental research and such sum is exempt from tax. This, however, does not help the individual who is not employed in some commercial undertaking and who works on his own. This class of inventor, who may not be amenable to organised routine, is nevertheless a national asset whose contributions should be recognised.

No doubt many inventions lie dormant either because the inventor does not fully appreciate the existing or potential demand or because he lacks knowledge of how to set about investigating markets. Generally speaking, the patent agents' usefulness ends when a patent is granted and the lawyers' usefulness does not arise until a purchaser or licensee has been found and some form of agreement is required. What the inventor frequently needs is advice on the commercial utility and possibilities of his invention and the way to set about its exploitation. A comprehensive service of this kind could be of immense use to inventors.

It would be interesting to learn to what extent the Government have considered invention as a contribution to, say, our export trade. Some practical encouragement to inventors from official quarters might well have valuable consequences. At the present time there is often more incentive to develop an invention abroad than to exploit it here for the full benefit of this country, and some inventors have already followed this course. Others prefer not to apply for a patent at all and to leave their ideas unproductive.—Yours faithfully,

DOUGLAS JOHNSON

The Death of Petkov

SIR,—Mr Doganis's comparison between Mr Petkov's execution and the death sentences passed by Greek Courts on "resistance fighters," as Mr Doganis euphemistically calls them, is somewhat naive.

Mr Petkov was sentenced on evidence and in circumstances which the Western democracies have denounced as "judicial murder." In Greece, on the other hand, guerilla bands have taken up arms against the State in open rebellion against the legally-elected Government and this is a capital offence in any country. I hope Mr Doganis is not propagating the theory that participation in the resistance movement during the occupation automatically renders one immune from subsequent crimes.

With regard to Mr Partsalides, the case is *sub judice* and any advance comment would be contempt of court. But I think Mr Doganis and your readers can rest assured that his trial will bear very favourable comparison with that of the late Mr Petkov.—Yours faithfully,

A. A. PALLIS,

Department of Information, Greek Government.

34, Hyde Park Square, W.2

Agricultural Expansion

SIR,—The National Farmers' Union has no desire to enter into argument on the two recent articles on agriculture which appeared in your paper. There is one point, however, which

we must ask you to correct, namely, that the NFU cheerfully accepts the concept that "high farming" means higher average costs.

It is well known by agriculturists, and certainly by the NFU, that high farming means, to use grain as an example, lower costs of production per cwt., although of course higher costs per acre. This applies up to the stage where the law of diminishing returns reverses the trend.—Yours faithfully,

45 Bedford Square, W.C.1

JAMES TURNER,
President, National Farmers' Union

[*The Economist* equally cheerfully accepts Mr Turner's assurance, and hopes that his Union will be equally ready, at the next price review, to accept his thesis that increased output means lower rather than higher average costs.—EDITOR.]

The Export Drive

SIR,—British bicycle manufacturers, who are playing a vital part in the present export drive, are gravely concerned at the circulation in your columns (in *The Economist* of September 20th) by Mr. G. O. Canning of a story that a British bicycle in Denmark "broke in two." Obviously such a story should be investigated before circulation, but when I asked Mr Canning for details he replied "the story of the bicycle which fell apart might be quite apocryphal." Reports of this character can do a great deal of harm to British export interests.

I have visited Denmark twice recently and have had conversations with most of the leading figures in the Danish bicycle

From *The Economist* of 1847

October 9, 1847

THE great sensation caused by the explosion of the *Cricket* testifies to the rarity of such occurrences. Were they as frequent on the Thames as on the Mississippi, we should treat them as matters of course, and pass them by unnoticed, like the ordinary dispensations of Providence. But coming seldom, when one accidentally happens, it is the parent of prodigious alarm, and of much foaming eloquence, almost as alarmingly as the occurrence.

From the first application of steam to navigation, low pressure engines have generally been employed, which consume so much fuel as greatly to lessen the efficiency of steam for long sea voyages. The danger of high pressure engines applied to ships, from which there is no means of escape when at sea, was considered too great to allow them to be used. Latterly, however . . . a distinct and clear proof has been obtained by experience [on the railways] of the safety of high pressure engines: they have been accordingly applied to the oscillating marine engine to impel boats, and the application constitutes a great improvement in steam navigation. . . .

The invention has in the first instance been brought into use on the river, where, should danger arise, rescue is possible. It has been applied to comparatively small boats, and its advantages and safety tested in the presence of great multitudes of people. In the course of nearly three years those boats have carried backwards and forward about 5,000,000 persons without a single mischance; but at length an explosion has taken place, and five human beings have unfortunately perished. Immediately it is inferred that the whole service is one of great danger; and even those journals which condemn hasty conclusions . . . adopt and enforce the opinion that the whole steam navigation of the river must be placed under the supervision of the Government. . . . Considering, in fact, the immense number of persons who are carried by steamers . . . the accidents on the river are amazingly few. More lives, probably, are annually lost above bridge by the upsetting of wharves than by all the casualties of steamboats. Compared to loss of life by small boats, steam navigation on the river seems almost infinitely safe. Its comparative novelty has caused it to be watched, and all its accidents to be faithfully noted. Nothing of importance, however, can be alleged against it; and except, perhaps, the supply of our markets . . . we are not acquainted with any part of the business of society which has been more successfully and safely managed, under the influence of competition and under the eye of the Press, than the steam navigation of our noble river.

industry. Not once did I hear complaints of the quality of British bicycles or the British components which are so largely used by the Danish manufacturers. The great regret of the Danes is that for some time they were compelled to import French bicycles—whilst we alas may not now export bicycles to Denmark at all.—Yours faithfully,

H. R. WATLING,
British Cycle & Motor Cycle Manufacturers and Traders Union
Warwick Road, Coventry

A Hungarian Democrat Wonders

Sir,—The letter from Mr Basil Davidson with the title "Turning Point in Hungary" in your issue of July 20th was one of the most enlightening comments on the Hungarian situation I have read in the English press after World War II. May I explain some of the reactions of the ordinary Hungarian democrat to the official attitude of the English-speaking world?

The British and American diplomatic representatives in Hungary protested against the withdrawal of the right to vote from certain people. The allegations were disposed of by the Hungarian Government, but one wonders:

(1) Why the British and American Governments did not take similar diplomatic action two years ago in Prague, when about half a million Czechoslovak citizens were deprived of their right to vote merely because they were of Hungarian extraction?

(2) Why the same Powers did not find any cause to protest as late as 1938 when, by the introduction of anti-Semitic legislation in Hungary by a pro-German, Fascist Government, several hundreds of thousands of Hungarian citizens of Jewish extraction were denied access to the polls?

(3) Why Britain, which is likely to be forced to play only the role of a "brilliant second" because of America's predominance, makes everywhere, especially in Central Europe, common cause with Uncle Sam against Russia, instead of being, where possible, a mediator between these contending world powers?

(4) Freedom-loving people wonder too why British foreign policy in Hungary, as well as in other Danubian countries, does not recognise the obvious fact that precisely those persons who, under Nazi domination, were loudest in their vituperation against Britain and America, are now the leaven of anti-Russian feeling. Those elements believe that, just as Horthy could rise to power and co-ordinate his counter-revolutionary regime—which was Fascist even before Italy became Fascist—by the help of British backing and American loans, Britain and America will again come to their aid.

The present Hungarian regime, even if a Communist advance after the elections is discounted, is broader-minded than any previous government in this country. It is not doctrines that count, but only practical solutions. The sole object which was—and had to be—obtained at the start was land reform. In the religious field, the first clerical misgivings were not justified. Although the Church has lost its big estates, it has recovered the freedom of speech which it had lost under Horthy, when it was dangerous even for the highest prelate to protest against racial legislation which persecuted—on fundamentally pagan grounds—scores of thousands of innocent people, many of whom were of the Christian faith.

Every Hungarian democrat desires to be on good terms with Britain as well as America, and acclaims trade agreements such as those recently concluded with Great Britain. Yet they expect their country's economic, democratic and social achievements to be esteemed and her difficulties considered. Hungary is on a good path; of course, loaded as she is with the heavy burden of the past, she sometimes stumbles. Those—are there any?—who are without sin among the nations, let them cast the first stone at her.—Yours faithfully,

Ponty utca 4, Budapest, Hungary

ANDOR KARÁSZ

Equality and the Budget

SIR,—The remark, in your article in your issue of October 4th, that, as a result of cuts in the food subsidies, the wage-earners would have less money for football pools and betting, for drink and tobacco, but they would suffer no diminution of the things that are scarce,

is less than honest. A saving on working class expenditure on circuses is not going to redress the national economy; neither the saving of labour or of imports would be sufficient. The main point of the cut you propose would be to make them consume less bread—including in this food, clothes, household needs and fuel, so as to release labour and goods for more urgent needs, including exports.

I am not arguing whether this is, in fact, necessary or just—I am condemning your putting a false colour on the argument—it is a little too reminiscent of the days when a wage increase could be resisted on the grounds that the wage earners would only spend it on beer anyway.—Yours faithfully,

D.

Books and Publications

Cole on the Universe

"The Intelligent Man's Guide to the Post-war World." By G. D. H. Cole. Gollancz. 1,143 pages. 21s.

THIS encyclopædia of current events is an extraordinary feat, no less of publishing than of journalism. More than usual, of course, it confronts the reviewer with the perennial problem of the quart and the pint pot. One might deal faithfully (given adequate expertise) with Mr Cole on Indonesia, or on the inner contradictions of capitalism, or on education (almost his best section) or on the Ruhr, or on the American Labour movement; but not on all of these and dozens more. One can only indicate and comment on the policy and characteristics common to them all.

Mr Cole's guiding principle is of course Socialism. He reels off the familiar indictment of things-as-they-are with the slickness of a very old hand; where a genuine argument (e.g. on the lines of Keynes) lies ready to his hand, he expounds it like a first-rate teacher; failing such, he is never at a loss for a debater's trick. If the inexperienced reader—"intelligent" but uninformed—fails to distinguish the two, who cares? Where Socialism itself is under discussion, the same technique serves a different end; if the solution to a difficulty is plain, if not easy, difficulty and solution will be admirably expounded (how excellent, for instance, is the paragraph on *Workshop Opinion and the Climate of Industrial Democracy*!). Where the difficulty is fundamental and the solution uncertain, a quick twist of the conjurer's wrist will whisk both out of sight. Having established that capitalism is evil and doomed to collapse, while Socialism is good—a task which occupies about a quarter of the book—he is ready to discuss practically every specific political and economic question agitating the postwar world, from Palestine to the Peckham Health Centre, from the Danube to Bretton Woods, from Beveridge to Uno; and very well and illuminatingly he does it, providing that the reader shares in his labours by constantly

correcting the course to allow for a drift to the Left. Dealing with Russian policy, Mr Cole has sympathy, objectivity, and so nice a diplomatic turn of phrase that the most sensitive comrade could hardly take offence. For America he has quite a different vocabulary, of petulant sneers and snarls expressing a personal spite only less than that elicited by the British "governing class." Possibly the latter was unpleasant to him at school; but what can America have done?

Mr Cole is in fact rather a pity. There is so much of value in these pages; not only so much clarity, so competent a marshalling of complex and inchoate facts, so apt a style, but also so genuine an idealism, so strong a sense of human solidarity, so lively and realistic a vision of the better things that might be. He belongs on the side of the angels. His final chapter on *Morals and Politics* is an admirable manifesto of human decency. But the hallmark of an honest democrat is objectivity in argument; not a superhuman impartiality, indeed, but a sense of responsibility to the truth. Any other form of government may rest on a lie, a myth, an incantation; but not democracy. The slickly disingenuous debaters, the darkeners of counsel with carefully selected witchwords, are unfit to be its champions, however admirable and however sincerely professed their ideals. To watch Mr Cole stating his case and drawing his picture of the postwar world, with all the bluff man-to-man persuasiveness of honest Iago, is to feel that the democratic idea, upheld by such methods, is heavily handicapped indeed.

Documentary Russia

"The Foreign Policy of Soviet Russia." By Max Beloff. Vol. 1. 1929-36. Issued under the auspices of the Royal Institute of International Affairs. Oxford University Press, 1947. 15s.

THE more sympathetic discussions of Soviet foreign policy today fluctuate between two extreme schools. The school of devotees

holds that the USSR has behaved consequentially as the only Socialist state in a hostile capitalist world, and that all its actions flow from that. The eternal Russia school, taking a more historical view, regards Soviet policies as in continuation of Czarist and pre-Czarist Russian policies under a new, more dynamically integrated regime. The truth seems to lie not so much between these two extremes as in a proper appreciation of the nature of power politics. There are patterns or tendencies of behaviour common to all powers, regardless of their ideological structure. But the methods they employ, and the manner in which their individual representatives explain their behaviour, may vary much more, according to their ideology. The representative of one power may seek to justify an act of power politics apologetically as necessary in the circumstances, while that of another will claim it arrogantly as right in itself.

"The Foreign Policy of Soviet Russia" by Max Beloff will not solve these problems, but it will provide more of the material for a solution than any book yet published in English. It is a work not of analysis but of that selective documentation in which Chatham House specialises. The present volume covers the period from 1929 to 1936 in no more than 261 pages, including an essential index—a notable feat of summarisation. The numerous footnotes are evidence of the vast amount of ground that has had to be covered.

The period up to 1929 has been covered in other works, and has therefore been reserved by Chatham House for later treatment. During that period the Soviet Union was growing up, out of the nothingness of revolution and civil war, into power status. By 1929 it was still "peculiar," but indubitably a power. The fact that *de jure* recognition was still withheld by a number of states, in and outside Europe, was an aftermath of revolution which did not much affect the general picture. More than half the volume under review is given to the 1933-6 period when the Soviet search for security against Hitler led it to join, and to play a challenging part in, the League of Nations. By 1936 the USSR was no longer a weak power. Its international prestige, which had not yet suffered the shock of the 1936 purge and treason trials, was at a high level, never to be reached again until the heroic days of Stalingrad raised it to a new peak.

One point of detail—the habit of referring to powers as "she" perpetuates the illusion that powers are like people, rational and moral. This is the source of much confusion in political judgments, and it is to be hoped that in a second edition Russia, Great Britain and the rest will be described uniformly as "it."

The Seventh Age

"The Real Lloyd George." By A. J. Sylvester. Cassell and Company. 322 pages. 18s.

MR SYLVESTER, then a confidential shorthand writer in the Civil Service, first met Lloyd George in 1915. He became his confidential political secretary and remained with him until he died. He arrived at the peak of his career and he watched it decline. This book is a record of those years.

It is not a good book. It is disconnected and not sufficiently selective; there is far too much in it that is purely superficial. Yet it has its own fascination. It is about Lloyd George, and Lloyd George, even in the days of his decline, when he had ceased to be the leader of his nation and had become an old man incapable of making up his mind, never lost his power to fascinate and entrance. He had some quality of genius. Mr Sylvester believes this and there is sufficient evidence of it in this book to confirm it.

THE POSTMAN WHO CARRIES A LIBRARY

At any given moment there are thousands of individually chosen new books in the post addressed to members of The Times Book Club who are not within easy reach of one of the 24 London and Country branches of the Circulating Library. Write now for particulars of the "Guaranteed" and "Ordinary" subscription terms. The postman calls at your home at least once a day and, with little cost, you need never again be without a good book to read

THE TIMES BOOK CLUB LIBRARY

HEAD LIBRARY: 42 Wigmore Street, London, W.1

The powers that Lloyd George possessed were instinctive, not reasoned. He was a showman, with all a showman's care for the detail that his public will see and contempt for that which it will not. He reacted to people, not principles (and thus was unfortunate when he encountered Hitler). He needed success to make him believe that he could be successful. Above all he needed to be successful. When the spell was once broken, as it was with the collapse of his Coalition, he could never recapture it. He was a great tempest, turning some windmills, destroying some landmarks, wrecking a hostile armada, and leaving a legend behind him.

Some of this is in Mr Sylvester's book. The rest must wait for a biography yet to be written, a biography which will be the most difficult literary task of this century.

Money Matters

"The Gold Standard in Theory and Practice." By R. G. Hawtrey. Longmans Green and Company. 280 pages. 9s. 6d.

"The Meaning of Money." By Hartley Withers. John Murray. 324 pages. 8s. 6d.

THE reprinting in a revised and up-to-date form of these two prewar classics will be welcomed with relief by students, teachers and all those interested but frustrated individuals who once felt that they knew something about how the financial system worked but have since 1939 despairingly ceased to do so. Mr Hawtrey's book is perhaps more interesting to the historian than to the student of current affairs, though the latter also will find it useful, and his account of the Bretton Woods institutions, set in perspective against such previous stabilising efforts as the Genoa Conference of 1922, is a valuable aid to understanding the present. Mr Withers's inside view of City institutions, both in their day-to-day functioning and in their wider economic significance, is as invaluable as ever—more so, indeed, for he used to have competitors and now he has practically none. He is not, of course, merely a guide to City procedure; he is also a shrewd judge of, and cogent reasoner on, economic policy in general. One enormous gap, however, will strike the reader; he makes no mention whatever of the relationship between monetary and employment policy. Even if (as well he might) he had decided that his book would be pushed completely out of shape by any full discussion of that relationship, he might at least have pointed out its existence. A minor criticism is that revision has left here and there—particularly in Chapter XV—a confusion of tenses which makes it hard to tell whether any given statement refers to 1937 or to 1947.

Shorter Notice

"Blue Pencil Admiral." By Rear-Admiral G. P. Thomson. Sampson Low. 216 pages. 15s.

REAR-ADMIRAL THOMSON, rather to his surprise, was appointed to the press censorship section of the Ministry of Information at the outbreak of war and, again probably to his surprise, remained there as Chief Press Censor for the whole period of hostilities. It is generally agreed that Admiral Thomson made a good chief censor; his record in this book shows why. He was practical, ready to learn, willing to make decisions, to justify them and to stand by them, all of which are qualities proper to good admirals and good editors. Admiral Thomson must have enjoyed his job, in retrospect. He certainly saved many in Fleet Street from having a worse one.

IN NOVEMBER, 1946, we wanted an infra-red ray to examine through the Daltonian fog the true, undistorted mind of the market. So we invented the Confidence Indicator for this purpose, which it served tolerably well. Our invention possessed, however, other quite unexpected attributes. It seemed capable sometimes of forecasting secondary reversals of the market. Further, in May, 1947, it was announcing very clearly, in advance of the break in the market, that the six-year movement upward had ended. It is possible that we have here an investment tool of major importance; it is certainly an instrument whose properties and uses all serious students of investment should examine.

AMERICAN SURVEY

The Problems of Eating

(From Our US Editorial Staff)

THE immediate food problem with which the American Government is very painfully struggling is how much grain the United States can export this year without causing domestic food prices to be at levels destructive to the economy and to the political situation. The export goal of the Department of Agriculture has been 470 million bushels, the Cabinet committee has suggested 570 million bushels, and good international relations and humanitarianism both suggest more—Congressman Taber's outrageous Berlin statement that he could find no one in Europe ill-fed to the contrary notwithstanding. Food prices are already dangerously high, with only about half of the Department of Agriculture's programme accomplished—dangerously high for future economic stability and dangerously high for the fate of whichever political party is tagged with the blame in next year's election. And dangerously high for foreign relations, though the effect of American prices abroad is often exaggerated, since so large a proportion of food is obtained at prices having no relation to those here. The level of prices received by farmers on September 15th was 18 per cent above a year ago, 22 per cent above the highest point reached after the first war, and 286 per cent of the 1910-1914 average.

In this situation, President Truman has appointed a Citizens' Committee headed by Mr Luckman to devise a programme, and, working with other governmental groups, to get it into effect. Discussions of what the programme may contain when it is formulated cover a wide range of subjects. Emphasis will almost certainly be given to less waste of food, and this has decided potentialities, as one bushel saved per head would make an enormous difference. The programme may not go so far as Mr Taft's thoroughly valid but politically inept suggestion that the American people should eat less. It will almost certainly include substantial efforts to curb the feeding of grain, especially of wheat, to livestock; the threat here to supplies and prices is very great owing to the short corn crop and the very high prices and great demand for meat. A programme to curtail the use of grain by the distillers is already under way. And efforts are also under way to curtail speculation, with the Chicago and other main exchanges agreeing to a new variable scale of margin requirements. Export controls will also be tightened.

Whether these moves will be sufficient remains to be seen. Voluntary efforts, including the late Newburyport plan, have a scant record of success. This doubt has led some people to urge the reimposition of price controls and rationing, at least for certain items. But quite aside from political doubts, based on grounds both of domestic and of international relations, there is a very great question whether price control and rationing would work. The hypothetical case for them is very strong, but planners are learning, as physical scientists long ago learned, that what goes well on paper too often goes very badly in life. The great risk of price controls and rationing now is that they would reinstitute the black market in meats at once and on a large scale, and result in more, not less, feeding of grains to animals.

But while the immediate task is to obtain 100 million bushels or more without inordinate price dislocation, the food problem has very long and complicated roots. The problem is not one of small production, for total food and agricultural output in the United States this year will be 35 per cent to 40 per cent above prewar and, despite the short maize crop, only a very little below each of the past two years. What is happening is

enormously high consumption in this country as the adjoining tables, taken from a Congressional document, show. And within this apparent consumption there is undoubtedly much waste and not a little literal overeating. And the real root of this is in turn, inflation. The enormous and still expanding money supply overruns even the greatly enlarged production. And it is not foreign demand, for exports take only about 7 per cent of agricultural output and only about 8½ per cent of those types of production which are exported.

But agricultural policy has made its own contributions to the present plight. During control days it established price relationships which encouraged the feeding of grain to livestock and depleted storage supplies, so that this year's short maize crop

was the more serious. Last year it led to government purchase and destruction of vast amounts of potatoes in price-support operations, instead of letting prices go down to increase consumption of a plentiful and cheap food; this was coupled with official efforts (successful) to reduce potato acreage this year. Consequently, now potatoes, which might otherwise be a real boon to those who are being squeezed by high prices, are scarce and expensive. In the same far from beneficent way, eggs were bought and made unusable last year and poultry production discouraged. Now poultry is scarcer than last year (as the table shows) and eggs almost no greater. And with scarcer and dearer potatoes, eggs and poultry, consumption is turned even more to meats, to the impairment of the consumer's budget and the curtailment of grains.

The United States is not, of course, the only nation whose food problem has been grievously aggravated by monetary

management and agricultural policy. The Paris report of the sixteen nations to Secretary Marshall is fluent on the former subject and the great reduction in French wheat acreage this year as a result of price policies is a classic example of the latter. It is the terrible misfortune of Europe and the world that, in addition to this vast human mishandling in the United States and abroad, the weather also reduced output.

American Notes

An RFC for Europe?

The President's decision to play a waiting game with Congress on stop-gap aid is viewed more charitably and more hopefully in the United States than was possible in the first days of indignant disappointment. Without minimising the dangers of delay, it is felt that to call a special session without first securing the agreement of the Foreign Affairs and Appropriations Committees would be even more risky than the gamble that Congress will, by December, see the light unaided. Mr Roosevelt himself fully appreciated the dangers of getting too far ahead of public opinion, under political conditions never as awkward and explosive as those which confront his successor.

It is possible—as is argued in a later note—that by the time the Marshall plan is in operation the peak of the American inflation, which mops up all surpluses, may have subsided. For the moment, however, the realisation reached by the Harriman committee, that in many directions an effective scheme of aid will require the institution of relative priorities between European needs and American demands, foreshadows not only a lengthening of Congressional debate, but the creation of some new agency to act as permanent arbiter. Mr Winthrop Aldrich, chairman of the Chase National Bank, in a speech last week, called for a Reconstruction Finance Corporation for Europe to handle this winter's relief appropriations as well as the longer-term programme. In his view such a corporation should be completely non-partisan and expert; it should have wide discretionary powers within the limits set by Congress and also be subject to Congressional review. The Corporation would not only have the power to determine how much and what kind of aid was to be granted to each area, but to negotiate agreements concerning measures of self-help to be taken by the recipient countries. Foremost among such aims should be the discouragement of inflationary trends abroad. The pressure on American prices should be relieved by abandoning the depression-minded demand that all funds should be spent in the United States and all goods carried in American ships.

The creation of such a corporation would satisfy the demand for more vigilant administration of American loans; it would also meet the criticism that funds voted by a Republican Congress were to be administered through a Democratic Administration through a multiplicity of agencies not really fitted for the task. President Truman is so evidently determined not to go any faster than the whole bi-partisan convoys, that he might well welcome a scheme which would permit the appointment of Congressmen and outside experts, and thus tie the opposition firmly to the Marshall plan.

Industry's Cupboard

The more closely that European needs are examined in relation to the estimates which followed from the Paris Conference, and in relation to prevailing US demand, the more pessimistic do most American trade experts seem to become. Beginning with such purely technical problems as differences in measurement and specifications, which can delay, but can scarcely obstruct urgently needed shipments abroad, the list of import requirements has aroused anew the Lend-lease controversy concerning the availability of exported goods and materials for re-export from the

receiving nation, and on the broader issue, the argument over domestic supplies.

In terms of foodstuffs, and more especially grains, this concern rests upon a very solid foundation. President Truman's campaign for "wasting less" may well be spectacular, but it is scarcely likely to bring the very substantial economies which are needed just as much because of the uncertainty of future crop yields as because of the precise pressure of European and other demands in 1947-48. Similarly, it is argued, the shortage of steel may be a basic obstacle to full assistance under a Marshall programme, the argument being that demand this year, in terms of finished steel products, will be from four to seven million net tons above supply. A similar gap is noted over a much wider list. For this reason, quite authoritative observers are now solemnly reviewing the controls which could be devised by an Administration acting under "emergency conditions."

Continuance of the domestic demand for industrial products at the peak all through 1948 is by no means assured. Notes in these columns over recent weeks have contained details which show quite clearly that, while exports have exerted a formidable marginal pressure on price levels within recent months, they have not assumed unwieldy proportions in relation to domestic demand. This is borne out by a recent survey undertaken by the Office of International Trade which reveals that very few industries show any exceptional gains in overseas shipments when measured against current output. Over a wide list of machinery manufactures, for example, the only group to export more than 10 per cent of current output in the first half of 1947 was the machine tool industry, with 42 per cent. But this industry has always enjoyed large export markets, and was in 1939 exporting an even larger percentage. After the tremendous retooling effort of recent years by American industry, it is now said to be "capable of meeting every home and foreign demand." Indeed, the industry's leaders are now complaining that dollar shortage is hampering markets. One other industry which has shown a tremendous gain in export volume has been that for freight cars, where 41 per cent of 1947 output has so far gone abroad, against a negligible foreign shipment in 1939. The gains here are due in the main to heavy French orders, built to specifications given more than two years ago, and now largely complete.

The Domestic Picture

It has never seemed possible that Congress would meet European and foreign pleas for assistance on a scale that would sustain exports at the peak levels of 1947, and current reports suggest that such a result is even more unlikely to-day. Stop-gap aid, or a full Marshall programme, will no doubt cushion any setback which occurs, but it can scarcely stay a recession springing from domestic sources. It is interesting, therefore, to examine supply in relation to 1935-39 over many of the items upon which Europe is now placing emphasis:—

	Pre-war† Average	1938	1946
Automobile trucks (000's)	709	488	1,250
Electrical motors and generators (1936-100)	100	66	416
Farm equipment (\$000's)	425	444	721
Machinery production (1937-9=100)	100	...	240
Foundry equipment (1937-9)	100	...	494
Pumps and steam power mechanism (\$ million)	1,300	...	3,100
Locomotives	295	272	690
Freight cars	38,200	16,470	41,200
Steel output (000's net tons)	46,700	32,400	684,500
Fertilisers (000's tons)	7,400	7,500	17,000
Crude oil (million barrels)	1,170	1,213	1,733
Motor fuel (million barrels)	550	570	776
Fuel oil (million barrels)	430	447	719
Bituminous coal (million tons)	400	350	600

* Or latest available rate. † 1935-9 unless otherwise stated.

Any precise forecast of domestic demand is at this stage a quite impossible task, and comparisons are complicated by the fact that a deficiency in capacity was undoubtedly developing throughout the whole of the 'thirties in relation to any condition approaching the full employment of labour and resources and by the fact that some of to-day's demand no doubt represents an effort to regain the ground then lost, apart from meeting extraordinary post-war demands.

But there can be no doubt of the extremely high level of current domestic demand. And however powerful may be the longer-term forces affecting industry, it seems at least reasonable to suggest that the present phase of an intense industrial effort may now be very near completion.

"Go by Flying Clipper when you go"

PAN AMERICAN WORLD AIRWAYS

THE SYSTEM OF THE FLYING CLIPPERS

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

This line of argument does not, of course, suggest that in the near future the world will be confronted with a United States bewildered by a complete collapse of the sellers' market and by an overwhelming need for exports to sustain prosperity. In some items there is bound to be a continuing shortage. Nitrogenous fertilisers, for example, are even now under rigid export control and look like continuing to be scarce for a long way ahead. And other items, such as freight cars, mine machinery, rail equipment and some farm machinery, may not react very quickly to any sharp fall in earnings prospects, simply because consumers are now financially much stronger than in prewar years and have large deficiencies to meet even by comparison with relatively "normal" years. But it is by no means difficult to imagine a very appreciable change within a very short space—it is not difficult, for example, to imagine a level of business at which the demand for steel ingots would be no higher than, say, 70 million tons. Such a change would not only simplify to a most encouraging extent any allocation problems before which Washington now stands in dread, it would no doubt bring a decided, if not decisive, change in the temper of many Congressmen. Unfortunately, it would probably be too late to affect the prospect of stop-gap aid.

* * *

Reserve Board Warning

For the immediate future, there are widespread rumours that the Truman Cabinet will press for revival of the Second War Powers Act, which lapsed at the end of 1946, and of direct price controls on certain basic raw materials, with perhaps, fixed prices for grains and other foodstuffs. Such moves, however, would arouse intense political antagonisms, and the Administration is altogether unlikely to move fast or far unless and until Congress gives a solid indication of the eventual line-up on the Marshall proposals. It is more probable that an attempt will be made to extend export controls under present powers—steel export regulations are tightening almost daily—and some assistance may be given both by the State and Commerce Departments which, under limited priority authorities, may certify that individual export items are both vital to foreign consumers, and that shipments will not damage the domestic economy.

At this stage, however, political sentiment towards the reimposition of drastic controls finds an ample reflection in a recent statement by Mr Chester Bowles who, as Price Administrator, last year struggled to retain ineffective price control powers until the moment that Congress refused absolutely to continue the game. Mr Bowles says that all recent clamour for price controls is quite unrealistic and "the task of restoring proper balance by arbitrary government action within a reasonable period has become quite impossible."

In the absence of direct controls, there is a growing demand for a much sterner monetary policy to replace the timid steps by which the Treasury has sought recently to harden short-term money rates and prevent the further "monetisation of debt." Here again, however, there are no signs of drastic action, and the situation has prompted an unusually forceful speech by Mr Marriner Eccles, the chairman of the Federal Reserve Board. The Reserve Board has pressed consistently for rigid controls on member bank credit, but the proposals have never reached Congress, which is now strongly opposed to an extension of the Reserve Board's powers, and which recently showed its distrust of that institution by the removal of its remaining authority over consumer credits.

Mr Eccles, in reviving the demand for further powers of control says that "economic collapse" must follow from the continuance of recent price movements, and that the sooner the United States faces a sharp readjustment, the "better it will be for the nation and the world." He contrasts a postwar figure of \$16.5 billion for aid to foreign countries, with \$25 billion spent on the services, and declares that it might be better to place spending "to maintain peace" above spending "to prepare for the next war." He also wants rationing—though again only if voluntary action fails—and a return to other direct controls.

The Reserve Board's warning follows a new burst of expansion

in bank loans, assisted by easier credit conditions which have followed from substantial gold imports. But while many believe that they indicate a new wave of expansionist pressure which may last through until the Spring, they are also widely regarded as a culminating phase in the present industrial boom. Mr Eccles is unlikely to secure any extension of Reserve Board powers.

* * *

The Eisenhower Boom

The routine political round-ups of Senator Taft and Governor Dewey have been dimmed by the bright new star of the Eisenhower boom. A Gallup poll pitting General Eisenhower against Mr Truman is both recognition and confirmation of his popularity. Of those questioned, 48 per cent would vote for the General, running as Republican candidate, and 39 per cent for Mr Truman as the Democratic candidate. The sensational result of this and other recent polls is that General Eisenhower emerges as the only Republican candidate who, if the election were taken today, could defeat the President.

Such a poll is, as President Roosevelt used to say, decidedly "iffy." The Eisenhower boom is being stage-managed by influential Republicans like Mr Landon, the candidate of 1936 and former governor of Kansas, and Mr Roy Roberts, of the *Kansas City Star*; but the average voter is still mystified whether General Eisenhower is a Republican or a Democrat. It is far from certain that he would consent to run, though he has never taken the opportunity of quoting General Sherman's famous "if nominated, I shall not accept; if elected, I shall refuse to serve."

On other scores it would be wrong to give too great a weight to such a poll. Much of General Eisenhower's strength may be due to the very fact that he is still above the party battle. Among the Democrats polled, 27 per cent said they would prefer General Eisenhower to Mr Truman. But many of these would cross a real party line with much greater reluctance than the imaginary one drawn by Dr Gallup. The Institute of Public Opinion itself points out that in the past samples of party affiliation have proved a sounder basis for forecasts than the ephemeral showing of individual candidates.

The latest test of this kind put Democratic strength at 55 per cent of the total and Republican support at 45 per cent. In this fact lies the only hope that the leaders of the Republican party may be led to accept an independent of great personal prestige, however reluctant they might be to fasten their wagon to five stars uncharted in their political course. They still remember with distaste the Willkie victory at the 1940 convention. The Eisenhower boom has come too early to make a repetition of the Willkie eleventh-hour strategy possible. There are more than six months ahead in which the Eisenhower candidacy will be tested to see whether it is boom or bubble.

Shorter Notes

The seasonal peak of employment has recently tested a civilian labour force which has remained above the sixty million level for many months. Though unemployment remained nominally above the two million mark in August, employers in many key industrial centres are now reporting extremely tight conditions, with numerous plants forced to curtail output to some degree, and with many local authorities forced to curtail publicity programmes designed to encourage new factory development.

*

Mr Beardsley Ruml, famous as the author of the American pay-as-you-go plan of taxation, has produced another Ruml plan. This is to finance the productive loans contemplated under the Marshall plan—estimated at about \$5 billion—by the sale of savings bonds. This scheme would have the advantage of drawing off purchasing power, making taxes lower, and not taxing those who cannot afford to contribute to European aid. Like Mr Truman's plan for voluntary rationing, it seems to have every merit except that of certainly producing the wheat—or in this case, the cash.

*

Senator McGrath of Rhode Island, has been appointed to take Mr Hannegan's place as director of the Democratic National Committee and, the Democrats hope, the architect of victory in 1948. Mr Hannegan was a convinced exponent of the view that the Democrats must concentrate on winning the labour vote, and he consequently alienated many conservative Democrats. Senator McGrath has held the Truman line, and he is acceptable to labour.

THE WORLD OVERSEAS

Comintern to Cominform

(From a Correspondent)

"I CHANGE, but I cannot die. . . . I silently laugh at my own cenotaph." Thus the ghost of the Comintern which was laid in Moscow four years ago reappeared in Warsaw last week; and the western world is once again haunted by it. Reports on the reappearance have filled the columns of the press and produced a spate of anxious speculation and grave comment. What sounds like a ghost story is in fact a serious political event.

What has happened in Warsaw? Delegates of nine Communist parties met in conference and decided to set up a permanent International Information Bureau which is to function in Belgrade. The nine parties were those of Russia and of the countries of the Russian sphere. Western Europe was represented only by the Communist parties of France and Italy. Mr Zhdanov, member of the Politbureau of the Soviet Communist Party, made a report on the international situation, after which the conference passed a resolution in which it explained the motives that impelled it to set up the International Bureau. The declaration can hardly be said to contain any sensational features. It merely sums up the stock arguments of Communist propaganda which have become familiar in the course of the last year or so. It emphasises the new alignment of international forces that has developed since the war and the opposition of two "political lines":

At one extreme the policy of the USSR and the democratic countries, aimed at disrupting imperialism and consolidating democracy; at the other extreme the policy of the USA and Britain, aimed at strengthening imperialism and strangling democracy.

The setting up of the new organisation is explicitly treated as a counter to the recent campaign against the USSR and the countries of Eastern Europe, a campaign which is "reinforced by the threats of a new war on the part of the most zealous imperialist politicians in the USA and Britain." It is in this context that the leaders of Right wing Socialism, especially those of Britain and France, have been singled out for attack, on the ground that

they by their grovelling and servility are facilitating the task of American capital, provoking its exactions and pushing their own countries on to the road of vassal dependence on the United States.

The task of the parties associated in the International Bureau is to organise the defence of peace and resist the war psychosis which is fostered in order to intimidate those "with weak nerves and the waverers" in the ranks of the "new democracies." The Communist parties warn the world against the making of concessions to the war-like trend of United States' foreign policy since, in their view, such concessions no longer serve any purpose; instead of facilitating agreement, they merely stimulate the aggressiveness of American imperialism.

War of Nerves

All the i's in the statement have been dotted; and nothing has been written between the lines. The call for strong nerves *vis-à-vis* the "anti-communist crusade" has been the most significant motif of the declaration and suggests that the Communist move ought to be regarded as an incident in the present "cold war" of nerves between east and west. It is an old truism that in such a war the side with stronger nerves is most likely to win; and the Soviet bloc is out to demonstrate that it possesses that strategic advantage. The mere hint of a revival of the Comintern, in one form or another, was certain to be taken as a provocation or a challenge by the Western Powers—this much, at least, must have been clear in advance to the initiators of the Warsaw conference. Yet the awareness of this did not prevent them from making the move. On the contrary, probably the hint of the revival of the Comintern was thrown out precisely because of its provocative implications. Moscow seems to say: "If you mean to put our nerves to a test and if you look for the signs of our weakening—well, then we shall show you the signs of our militant self-confidence. If it pleases you to indulge in an anti-Communist crusade, then we shall give you something to crusade against. . . ." In the light of this, the rump Comintern is Moscow's direct answer to the Truman doctrine.

It may be said that the event has no significance at all; that the Communist parties have anyhow been acting on Russian orders; and that the disbandment of the Comintern in 1943 was never meant to be more than an empty pretence. However, the problem has hardly been as simple as that. In the light of the Comintern's history, it appears almost certain that its disbandment in 1943 was not originally meant to be only a tactical trick. It was rather the natural epilogue to a long process in the course of which the Comintern had been withering away. Mr Stalin then seemed to have made a sincere attempt to rid his regime of one of the legacies left over from the Leninist period, a legacy which he found embarrassing but which he could not, because of the traditions of his regime, give up under normal pre-war circumstances.

Stalin and the Comintern

The Comintern was founded in 1919, when the Soviet leaders of those days, Lenin, Trotsky, Zinoviev, Bukharin and others, banked on imminent world revolution. Unlike the Second International, the Third International was not to be a loose association of fraternal parties, but a single militant world party, whose national branches were to work under a unified strategic leadership. As the hopes for world revolution gradually faded, the role of the Comintern steadily declined, until in the thirties the once dreaded organisation was little more than a meek and more or less insignificant auxiliary of the Soviet Foreign Office. Throughout the 24 years of its existence the Comintern held seven Congresses, at which its political line was formulated. Five of these Congresses were held in the first six years of its existence, 1919-1925, before Mr Stalin's ascendancy to undisputed power. The statutes of the Comintern provided for a Congress to be held every year. Yet, in the next 18 years, under Stalin's leadership, the Comintern held only two Congresses, in 1928 and in 1936. The stronger the Stalinist isolationist mentality grew in Russia, the more did Russia shut itself off not only from the outside world at large but even from foreign Communism. The decisive reason why the Comintern was not disbanded before 1943 was that the institution had been of Lenin's own making; and its formal dissolution would then have seemed to offend against the official Leninist cult. Extraordinary circumstances were needed—a state of emergency and the wartime upsurge of nationalist Russian traditionalism—for the *coup de grâce* to be delivered to the International.

The moment chosen for this was highly significant. It was May, 1943. The battle of Stalingrad had been victoriously concluded, and it was followed by a series of sweeping and successful Russian offensives. The tide of war had definitely turned in Russia's favour. Mr Stalin's motive in disbanding the Comintern could not possibly have been his desire to secure military assistance from the western Allies, as is sometimes suggested now. If that had been his motive, it would have been more natural for him to dissolve the Comintern much earlier, in 1941 and 1942, when Russia's military situation was most critical and before the great alliance of the war was firmly established. It is nevertheless true that the disbandment of the Comintern was ordered with an eye to the Western Allies. That was the moment when the mind of all Allied leaders was beginning to turn to the issues of the future peace settlement; and Mr Stalin hoped that his gesture would facilitate the working out of an agreed settlement. The present partial revival of the Comintern is a measure of the extent to which this hope has been dashed. Thus it is in a sense a gesture of frustration. Yet nobody who has had an inkling of Mr Stalin's profound contempt for the old Comintern will suspect him of much enthusiasm for the new Information Bureau. If he has given his blessings to it, he has certainly done so *contre cœur*, in the belief that the Truman doctrine leaves him no alternative but to try to reassemble the old instrument of ideological warfare.

In spite of its provocative implications, the initiators of the Warsaw conference have been curiously careful not to transgress certain limits of provocation. The statement of the nine Com-

munist parties, for all its customary abusive verbiage, has refrained from expounding any offensive policies. It is *fortiter in modo, mediocriter in re*. Its avowed purpose is defensive. It is to rally "forces that will remain staunch and firm in the defence of peace," and to create a barrier against increasing American pressure. The declaration contains not a single appeal for revolutionary action and not a single call for class warfare in the traditional Comintern style, although in view of the very great strength of the French and Italian Communist parties such appeals might have been effective. By any normal Communist standards, an utterance of that sort would be thought mild.

The same curious combination of offensiveness and of an anxiety not to be offensive can be seen in the organisational side of the Warsaw Conference. The absence, for instance, from that conference of any representative of the Greek Communist party sheds light on the cautiousness with which the venture appears to have been planned. The Greek Communist party is the only branch of the European Communist movement at present engaged in a civil war. It would have been quite normal for any international Communist gathering, taking place now, to invite the Greeks and acclaim them as the heroes of the day. (During the civil war in Spain Dolores Ibaruri was hailed in Moscow, without any inhibition.) What has prevented the Greeks from attending is probably the anxiety of Russia, Yugoslavia and Poland not to add

fuel to the controversy over Greece in the United Nations. It is for similar tactical reasons that the Communist party or the Socialist Unity Party of Germany was not invited either. Nor was the other party embattled in civil war, the Chinese Communist Party, represented in Warsaw. Unlike the Comintern, the new organisation has so far not been universal but purely European.

"International Letter Box"

The new organisation has assumed the modest name of an Information Bureau in order to stress that it is not a real International with rigid discipline and centralised leadership though it may be the forerunner of a real International. The irony of this circumstance will be grasped if one remembers the Communists' sneers at the Second International, which, precisely because it did not effectively direct the activities of its members but merely kept a sort of an information bureau for them, was ridiculed as the international "letter box" for the various Socialist parties of the world. Even more eloquent in its way is the fact that Moscow is not to be the seat of the Bureau, undoubtedly because the Soviet Government does not want to burden itself with the full responsibility for its day-to-day activities. Thus the centre of the Stalin Church has now been moved from Moscow, the Third Rome, to Belgrade—a second Avignon?

The Politics of Western Germany

(By a Correspondent recently in Germany)

WITHIN a few weeks the four Foreign Ministers will go to London for a last attempt at reaching a unified settlement for this unhappy country. Unless they succeed to an extent far beyond the present dreams of British and American military government—and, one cannot help suspecting, far beyond their present intentions—those responsible for the combined zones will proceed with the establishment of a state of western Germany—with or without the French zone—having its capital in Frankfurt on the Main. German party leaders are now busy plotting the likely outlines of this new member of the European community.

German calculations have changed a great deal since the end of the war. The two great certainties that the invading allies would impose their will and that their will was democracy no longer stand so clear and high upon the political horizon. If at the end of the war the German people were prepared to receive presented, they were probably so no longer. In the western zones, the blessings of democracy in whatever alien form they might be at least, there are signs that many energetic and intelligent Germans have begun to see the road to their salvation along lines specifically German—and not necessarily democratic.

The reason for this is not hard to see. Each of the occupying powers—except, perhaps, the French—has attempted to reproduce a German administration in the likeness of its own image. Where the image is sharp and clear, as in the Soviet and French zones, the reproduction is easily recognisable. Both the French and the Russians have been consistent and coherent. They have carried out their policies. But with the British and American zones the image has been far less sure, and the reproduction shows signs of touching and retouching until it has almost ceased to have recognisable shape and content. The Americans wanted to reproduce the American way of life, and the British a kind of liberal social democracy; and even if any two or three people gathered together could be got to sign a simple definition of either, it is likely that some entirely new brand of German would have to be invented to understand the definition. In fact, of course, neither military government has been consistent with itself. The Americans, more empirical by nature and less wedded to doctrine by government, have far outrun the British in simple contradiction, so that Germans in the American zone now understand that, by and large, their first and only duty is to cause no trouble, feed themselves without a riot, and get on with the business of living in any way they can. It would be rash to suppose that this must lead in the direction of democracy, much less of the American way of life.

The British have done a good deal better than this, for they have had longer intervals of lucidity, a stronger, more efficient and perhaps more conscientious control commission, and problems so tough as to enforce intelligent solutions. But on consistency the record is the same. Even supposing the Germans were capable of acting as liberal social democrats—and there is no precedent for suggesting that they could—the encouragement of social

democracy must have called for a control commission which both understood and wanted this development. It is no fair criticism of the present Control Commission to say that 90 per cent of its members have no intention of hastening the Germans towards this Fabian state of grace. They dislike intensely the efforts to that end now being made at home, and for the life of them they cannot see why "their" Germany should be subjected to a similar fate. No great statements of policy by visiting Ministers or commanders can alter this. There has been nothing to stop the British from introducing long ago all those reforms proclaimed necessary by Labour leaders: land reform, the transfer of basic industries to public ownership, removal of important nazis or Right-wing nationalists from key positions, decartellisation of the big monopolies. Two and a half years after the end of the war none of these has been done, or done decisively, and few of them have now any hope of being done. American officials grow savagely indignant when they find that the British begin to blame them for this. Why haven't you got on with it, they ask, if you're so keen about it? The answer, of course, is that the commission as a whole is not keen about it, and the government at home has been content to let things lie.

Readjusting Their Position

Gradually German politicians have come to understand the nature and the depth of these uncertainties. They may not understand why the British failed to grow fat upon victory, but they see the consequences clearly enough. How carefully they are likely to watch the latent interplay of British and American rivalries is shown by Dr Schumacher's acceptance of an invitation to the United States by the American Federation of Labour. Dr Schumacher is a good enough politician to know that the compromising effect of such an invitation—for the reputation of the A F of L is well known to Left-wing Germany—could be accepted only against the promise of large and positive returns. With the whip hand for the combined zones passing to Washington, it is absolutely vital for the German Social Democrats to readjust their position—just as it is vital for the Americans to thread another string to their bow besides the Christian Democrats. The resignation of the Social Democrat Ministers from the Bavarian Government is another evidence of new-found confidence. In Bavaria the Christian Democrats have 104 seats in the Landtag out of a total of 180 and the Social Democrats only 54. Hitherto the Social Democrats have been happy to accept a coalition in which they had only seven ministries against the CDU's 15. Now they want more.

The second great lesson now being drawn from British and American examples in Germany is that the business of the majority parties in the west—the Social Democrats and the Christian Democrats—is to present a solid and aggressive front against "reaction to the right or to the left." Since reaction to the right was beheaded by the internment of a large number of

TESTED and treasured by millions throughout the world, here is the incomparable Parker "51."

Touch point to paper and it writes unfailingly—the patented ink-trap maintains an even flow. The unique tubular nib of 14-ct. gold is hooded against dirt and damage. Fused to its tip is a ball of osmiridium, micro-polished to jewel-smoothness.

The gleaming Lustraloy cap slips on securely without twisting. The patented filler is hidden within the barrel.

Nazis, and even former Right-wing Nationalists like Dr Schlange-Schoeninger, British nominee for food administration, are careful to play down their past, this means joint action against the Communists.

It is against this background that the parliament of Frankfurt will come together. If the French zone is included in the state of western Germany, the lion's share of influence will go to the Christian Democrats, since they hold eleven ministries out of the 25 which compose the three governments of that zone. It is even possible that the Christian Democrats would have an absolute majority in the Frankfurt parliament—with the Right wing of the party in strong ascendancy—and it may be that Dr Adenauer, the likely leader of this great party, will want to try his hand at single-party government. If the Americans listen to Dr Schumacher—and the political situation in the Ruhr will make this obligatory—they will encourage a centre coalition without the Liberals (who, with a number of splinter separatist parties, form the present German Right wing) but also, of course, without the Communists. By the same token they will probably choose to forget some of their insistence on "states' rights." The government which may be expected to emerge will bear an unpleasant resemblance to the coalition governments under which the Weimar Republic slid nervelessly into dictatorship.

The policies upon which this unhappy parliament will join issue will not necessarily be those of good government and efficient administration so dear to the occupying Powers. It may be wrong to look up the record of Stresemann and guess that Schumacher or another will blackmail the British and Americans into one concession after another in order to avert this or that supposed disaster. But it is as plain as a pikestaff that the one issue upon which no German party can afford to show weakness is the primary duty of reuniting eastern with western Germany. Federalist tendencies within the CDU may be expected to prove no barrier against the pressure for all-German unity and for rescuing from isolation the great segment of the party left in the eastern zone. The Social Democrats will act at their peril if they allow a monopoly of patriotism to be seized and openly defended by the Communists. In the eastern zone, each of the three great parties (the SED, the CDU and the LDP Liberals) is doing its utmost to persuade the electorate that it, and it alone, can achieve unity. It seems inevitable that the political fight in the west, once the Frankfurt rump state is erected and Allied control is largely withdrawn, should move along the same lines.

Mexico's Programme—II

[FROM OUR CORRESPONDENT IN LATIN AMERICA]

IN the programme of "reconversion" to which Mexico is committed, irrigation and the development of industry are the chief hopes of the planners. (Their hopes of securing American capital for the expansion of oil production have been described in a previous article.) They believe they can maintain not only their export outlets but their domestic market, in the face of rising competition. The country is undoubtedly rich in some important raw materials of industry. There is a proved abundance of iron, lead, zinc, copper, mercury and antimony. Timber reserves are plentiful, and domestic cotton surpluses became during the war an embarrassment to the Government and an anxiety to the growers, as well as a boon to the mills. Mining has inevitably slowed up following the decline of "strategic" demand; but the iron and steel industry is now said to be capable of meeting almost all home needs. The cement industry, which also blossomed during the war, is to add 64 per cent to its present capacity by 1948, but has lately been working to only two-thirds of its present capacity. For cement and steel, production and imports combined have been insufficient to meet building demands, which in turn have lost momentum after their wartime boom.

Transport and power shortages, rather than productive "capacity," are determining industrial output. Railways, in "make-do and mend" basis under the guidance of a United States mission; they now require both extension and re-equipment if the industrial pace is to be maintained. Hydro-electric schemes provide the obvious solution to power problems, since Mexico has only scanty resources of cheap coal. This year's electricity target of 55 per cent more power than in 1942 seems likely to be attained, but further demands are already showing themselves.

It is to manufactures—particularly food-processing, for which the outlook seems bright—that the planners look first of all to the outlook seems bright—that the planners look first of all to consolidate these wartime industrial gains. In them expansion has been greatest, and in them competition now becomes the

greatest threat. According to an industrial census of 1945, the number of factories in Mexico grew from 13,510 in 1940 to 28,513 in 1945. The rise in exports of finished manufactures from 1½ per cent of total exports in 1938 to 12 per cent in 1944 points to the expansion of the textile industry which, with a contribution of some £7,000,000, represented virtually the whole of the 1944 percentage. Stiffer protection for the industry appears likely to accompany stiffening competition, a phase which has its parallel in Brazil. At a recent industrial congress vigorous protests were made against the "unfair competition" of foreign branch factories set up in Mexico; the Government was asked to "impede the entry of foreign capital which operates to the detriment of sound national industries"; and resolutions were passed—endorsed by Mexico's two powerful trade union groups—asking for higher tariffs and subsidies to basic industries. In his inaugural address, President Alemán had already promised "wise protection of national industry against ruinous alien competition."

The growth of industrial activity, with economic nationalism as its offshoot, barely touches Mexico's abiding problem and the central theme of its revolution. This is to break down Mexico's "dualism," to knit together two economies, one active, the other passive. Or—to change the metaphor—the gearing into the commercial economy of Mexico's unproductive population. This segment—largely *mestizo* and Indian, comprising at least 70 per cent of the whole population—is unproductive in the sense that it subsists by self-sufficing village agriculture.

The broad picture is that, of the total population of over 21 million, only 6,200,000 are classified as gainfully employed. Of these, 3,800,000 are engaged in "productive" farming, and only 600,000 in industry. The remaining 14 million contain the tremendous hard core of Mexico's "disguised unemployment." They toil and spin; but they exert no real influence on consumer demand. Informed Mexicans estimate that the incomes of even the "productive" peasantry average no more than £70 per family per year. And social welfare has not advanced far beyond reconnaissance of the formidable difficulties: the Carnegie Institute found in 1942 that 77 per cent of the inhabitants in a remote region of Yucatán died before reaching the age of 15.

Mexican TVA

The Government holds that the future of Mexico lies first, in distributing to the peasantry larger smallholdings than the 2½ acres that is the basis of the *ejido* (communal grant); secondly, in drawing the rural population from the densely populated but waterless central plateau to coastal districts where irrigation would make for economic farming beneficial to the whole nation. Some, at least, of the implications of this vast scheme of agrarian reform may be grasped when it is realised that Mexico grows only half the wheat it consumes, and that (according to reliable estimates) 17 million acres would have to be placed under irrigation to make the country self-supporting in basic foods. President Alemán's inaugural bill provided for enlarged *ejidos*, and about 2,500,000 acres of land have been irrigated—1,750,000 of them since 1940. During his six-year term, Alemán hopes to make available a further 3,500,000 acres of irrigated land.

Only by taking into account the progress and prospects thus broadly sketched can one judge the importance to Mexicans of the Papaloapan irrigation scheme—and the store they set by its financing. Here in the southernmost lowlands behind Vera Cruz, the Papaloapan river and its tributaries have been surveyed, and work has already started on a real and promising development project—a sort of Mexican TVA—estimated to take four years and to cost from \$300 million to \$400 million.

From his two immediate predecessors, Cárdenas and Avila Camacho, Alemán has inherited, and appears to be consolidating, a new and promising degree of political stability. To it he adds his energetic approach to the fundamental problem of Mexico's "dualism." But the Mexican economy demonstrably needs capital as well as political stability. The time—predicted by a Mexican writer—when "democratic Socialism" takes over where Capitalism leaves off, is not yet. What will take its place should foreign capital not flow fast enough remains to be seen.

Meanwhile, the present administration is clearly in the market for private risk capital of the type indicated by Mr Truman, as its oil negotiations show. Equally clearly, it considers that it has a good case for a long-term "development loan" on a scale which could only be provided by some such entity as the Export-Import Bank or the United States Treasury itself. It is this case, and the programme that supports it, that will be put to the test in Washington in a few months' time. In the interim—and afterwards—the Government's liberality towards private investors may provide a measure of the concessions which the Mexican Revolution is willing to make in the interests of Mexican progress.

THE BUSINESS WORLD

Europe's Dollar Needs

MUCH is made in the general report of the Committee of European Economic Co-operation on European self-help and economic integration, and chapter 3 is optimistically littered with production targets designed to breathe conviction into these hopes. But on the estimates of Europe's balance of payments the report comes down to more solid realities. Its essence is an appeal to the United States for assistance in a task of rehabilitation which could not be attempted on the scale here set out without that assistance.

Chapter 7 of the report, which deals with the problem of payments, offers estimates of the scale of assistance which is needed. It may be possible to quarrel with the data on which these estimates have been made, including the somewhat optimistic assumptions about the future behaviour of the terms of trade. The assumption is that export prices will remain unchanged at current levels until the end of 1951, the period for which the estimates are made. For import prices the assumptions are that as compared with levels ruling on July 1, 1947, there will be no change in 1948, but that falls will later occur of 7½ per cent in 1949, 10 per cent in 1950, and 12½ per cent in 1951. What matters is not that each of these views of the level of export and import prices respectively must be realised, but that the relative movement between the two series of prices should produce this net result. The basic assumption on this score, at least as far as the immediate future is concerned, would seem to err decidedly on the side of optimism. There have already been indications, as for example in the negotiation of the 1948 Canadian wheat price, and in the breakdown of the food talks between Britain and Denmark, that 1948 may see a further shift of relative prices in favour of agricultural produce (which form the bulk of Europe's import requirements) and against those of manufactured goods.

The specialised committee set up to look into the balance of payments problem drew up a common account showing the deficits of the 16 participating countries (together with their dependent territories) and Western Germany in their trading

relations with the American continent and with other non-participating countries. This account was not the sum of individual balance of payments estimates submitted by these various participating countries. In order to avoid inconsistency which that procedure would have involved, the estimate was made on the basis of a common import programme and, on the other side of the account, on the basis of export estimates submitted by the participating countries. The analysis deals with the American continent and not merely with the United States, since Canada and Latin America must in large part insist on being paid for their supplies in American dollars or their equivalent. This may also be true of some of the supplies derived from other non-participating countries, but this group has been shown separately in the estimates. The scale of the dollar problem in 1948, as revealed by this common account, is shown in Table I below.

*

This is the immediate gap to be filled before "self help" can have much chance of showing its paces, and the report points out that "unless means can be found of filling this gap Europe will be unable to receive the flow of goods and services which its recovery requires and a catastrophe will result." The deficits of the main participating countries with the American continent in 1948 are shown in the next table. The figures are not strictly comparable with the global figures given in Table I; and adjustments have been required owing to the inability of certain countries to supply estimates and because certain supplies which are taken into account in the separate import estimates will not be forthcoming.

The fact that there should be a deficit between the participating countries and the American continent is no new phenomenon. The comparable deficit in 1938 amounted to no less than \$1,450 million. Before the war this adverse trade balance was offset by earnings on invisible account, by the sale of colonial produce to the United States and by earnings of dollars from sales to the rest of the world. This normal pattern

TABLE I—BALANCE OF PAYMENTS—1948
PARTICIPATING COUNTRIES AND WESTERN GERMANY
(\$ Billion)

	American Continent	Other Non-Participating Countries
Imports	9.17	4.70
Exports	2.16	4.30
Net invisible account	-0.57	+0.38
Dependent territories' net deficit	0.45	0.22
Total Deficit	8.03	0.24

NOTE.—If imports of certain equipment were financed by loans from the International Bank or other credit operations, the deficit would be reduced to \$7.11 billion.

TABLE IV—EXPORTS TO THE AMERICAN CONTINENT—1948-51
PARTICIPATING COUNTRIES AND WESTERN GERMANY
(\$ Billion)

	1948	1949	1950	1951
U.S.A.	0.85	1.11	1.23	1.48
Rest of American Continent	1.31	1.72	2.14	2.46

of multilateral and payments has, however, been distorted. As the report points out

The foreign investment income is gone; there is a big dollar bill for shipping services; tourist income has not yet recovered. At the same time the loss of other sources of supply has forced Europe to turn to the American continent for essential supplies on a much greater scale than before and prices have increased heavily. . . . The destruction in the Japanese war has turned the net income from sales of rubber, tin and other dollar earning colonial products into a net expenditure. Finally, the shortage of dollars generally has made it hardly possible for Europe to earn dollars by sales to the rest of the world. The size of the deficit results from the cumulative effect of all these forces.

If, however, European recovery progresses according to plan, the dollar deficit will be on a steadily diminishing scale. Yearly and total figures up to 1951 are given in Table III.

Of the overall total of \$22.44 billion the report estimates that \$3.13 billion in respect of equipment and capital projects will be financed by loans from the International Bank or other agencies, leaving a net total of \$19.31 billion. The assumption made in the report that such imports, apart from agricultural and mining machinery to which special considerations apply, will be so financed may also be ranked as one of its disputable passages. It is certainly known to have caused surprise in International Bank quarters. It might, therefore, be better to regard the global figure of US aid as \$22.44 billion and leave for later discussion the distribution of that total between the various lending agencies that may be mobilised in the task. These are all net figures but the report gives some estimates of the exports by participating countries and Western Germany to the American continent, which were taken into account in calculating net requirements from the United States and are reproduced in Table IV. The experts have taken decidedly cautious views both of the exportable surplus of Europe and of the absorptive capacity of the American continent for these exports in the next four years.

This, however, is not the sole source from which Europe will derive dollars. There is, in addition, the surplus on current account which the 16 countries and Western Germany will

have with non-participating countries other than the American continent. For the year 1951 this surplus is estimated at the equivalent of \$1.8 billion. If by then there is a sufficient flow of dollars to the rest of the world this surplus will in fact be available as an offset against the participating countries' dollar deficit with the American continent. The return of such conditions would signify a restoration of the normal pattern of payments by which Europe balanced its dollar deficit before the war. Given such conditions, the participating countries and Western Germany would, by the end of 1951, be very close to a global balance of their international accounts. Any deficit that might still be running by then would, on these calculations, be such as to lie well within the scope of normal commercial banking and lending operations.

The Committee conclude this part of their report by asserting that on the basis of their research, the problem of Europe's deficit with the American continent cannot be solved in less than four years, and that even then a solution depends upon the disappearance of the basic maladjustments of which the deficit is a symbol.

The action which the participating countries can take is limited. The power to correct the maladjustment is not theirs alone. The maladjustment can never be corrected on a basis of expanding trade unless market conditions in the American continent permit Europe to sell goods there in steadily increasing quantities and permit other countries to earn dollars there and use them to purchase from Europe.

This is not the first time that the United States has been told that international trade must be two-way if it is to endure and to lead, as it should, to the enrichment of the countries which participate in it. The further reiteration of this axiom may not be particularly relevant to the problem of the next four years which is essentially that of finding the wherewithal to finance the abnormal surplus of exports from the American continent which the rest of the world needs for its rehabilitation. But that emergency assistance will be largely wasted unless the United States also accepts all the implications of the longer term principle that as a country wishes to sell, so it must buy.

Food from the Empire

BRITAIN'S dependence on overseas food supplies, to cover even its basic requirements, is unique. It was willingness to accept this dependence which made Britain the world's greatest trading power until 1914, and the most vulnerable belligerent in the two world wars of this century. This dependence greatly helped, and was in turn assisted by, the economic development of the Dominions and colonies. But until the institution of the Ottawa agreements in 1932, Britain still bought more than half of its food supplies from foreign sources. It was not, however, until the later nineteen thirties that the import pattern changed in favour of Empire countries, and the war accentuated this trend. Of the main foodstuffs listed in Table I, the Empire supplied 57 per cent of British imports in 1938; by 1946 the proportion had risen to 67 per cent, a change which was due largely, but not entirely, to the reduced scale of imports.

At the outset, it can be laid down dogmatically that the British Commonwealth cannot be self sufficient for food supplies. The first stage in examining the extent to which the Empire countries can supply Britain with food is to measure British requirements for the different items. In Table I these requirements are based on consumption and alterations in stocks have been allowed for in the import figures. The wheat figures have been recalculated in terms of flour (using average extraction rates for the periods concerned) and consumption of wheat (and also of sugar) has been taken as total disposals less exports and re-exports. In

1946, the total consumption of all foods listed, except flour and cheese, was well below the prewar level, although the population increased by 4 per cent between 1939 and 1946. Home production of wheat for milling almost trebled during the seven-year period, and sugar output expanded by nearly 15 per cent; but production of other foodstuffs generally showed a serious fall.

To assess the extent of the Empire's contribution to British food supplies in the long period, however, neither the 1938 nor 1946 patterns of consumption provide a satisfactory datum. The figures for 1946 show the effect of the increase in population, but the present scale of rations could hardly be continued for a further four or five years without affecting the health and productivity of the nation. Some idea of "normal" requirements can be obtained by taking the prewar figures of consumption, and then allowing for the increase in population, and for the aggregate effect of the changed pattern of food consumption between income groups. At present the lower income groups, as a whole, are purchasing larger quantities of some rationed foods than they did before the war. This is due partly to their relatively low prices, after they have been subsidised, and part to psychological compulsions that "the rations must be bought." Any attempt to estimate this aggregate effect can only be a guess, because so many unknown political and economic factors are involved. It is quite certain, however, that

if consumption by the higher income groups were to regain its prewar level, the burden of subsidising basic food prices, which is already too heavy, would become quite insupportable for the Exchequer. But if progressive steps are taken to remove the subsidies, will the present level of demand be maintained? For the purpose of this article, "normal" postwar requirements have been calculated on the basis of 1938 consumption, with a total increase of 10 per cent for meat, bacon and hams, butter, cheese, eggs and sugar—equivalent to little more than a 5 per cent increase in demand per head of population—and only 4 per cent for preserved milk, flour and tea. These figures are more or less arbitrary, but under present conditions they are likely to err more on the low side than on the high; the potential increase in demand for certain foodstuffs, particularly meat and butter, may well be about 15 to 20 per cent—increases of this order have occurred in Canada and the United States.

This potential expansion in requirements is considerable. Leaving wholly on one side the problem of paying for it, to what extent can it be provided by increased production at home and within the Empire? Under the £100 million scheme for the development of British agriculture, it is intended to expand wheat production to about 2,550,000 tons in 1951, compared with 1,967,000 tons in 1946; an expanded output of this order would give a flour supply of about 800,000 tons at the prewar extraction rate of 70 per cent. The meat target as a whole would restore the total output of beef, veal, mutton, lamb and pork to the prewar level. Although a higher milk yield is an essential part of the plan, the larger output will be mainly required for the liquid milk market; cheese production may regain the prewar level, but butter output is likely to remain as low in 1946. The home production of shell eggs is to be increased to 52 per cent above the prewar level, while sugar-beet will expand by 31 per cent. These targets form the basis of the estimates of postwar home food production included in Table I.

In the Dominions and colonies agricultural output can be expanded, but in many cases expansion might take longer than is assumed under the British plan. In Canada, for instance, the peak wheat acreage was attained in 1940; the pig population reached its highest figures in 1943 and has subsequently declined quite sharply; in poultry, on the other hand, the wartime expansion has been more or less maintained, and cheese production is still 50 per cent above its prewar level. New

Zealand butter production is still some 20 per cent below the prewar average and cheese output has expanded by only 3 per cent; the dairy population has steadily declined since 1936, even though total numbers of cattle and sheep have increased. Australian experience has been similar, except that the sheep population was seriously reduced in 1944-45 owing to the severe drought, while the wheat acreage which fell to a low level in 1943 has since recovered to its prewar extent. Information relating to South Africa is incomplete, but output has evidently been barely maintained. Tea production in both India and Ceylon was adversely affected by the war, whilst Empire sugar output has only been kept at prewar levels in the colonies.

The level to which Empire production can be expanded within, say, the next five years is limited. Even during the war agricultural output was impeded by lack of labour. The response of Dominion volunteers to the armed services was beyond praise, but it had repercussions on agricultural expansion even during the war; and, as a result of wartime unsettlement, many demobilised agricultural workers have not returned to the land. Australia and New Zealand, in deference to British requests, expanded meat output rather than dairy produce and put cheese before butter. In all Dominions, consumption of food per head of population has increased during the war period, although in Australia and New Zealand it has latterly been restricted by rationing—a point which emerges clearly from Table II.

Agricultural expansion would have to be achieved by both intensive and extensive means. Labour efficiency in the Dominions was already at a very high level before the war and there is not much scope for improvement unless radically new methods can be developed, and these would be conditional on the supply of capital equipment. More intensive methods would yield greater returns in many of the colonial areas, but apart from sugar and vegetable oils, they are not likely to yield an important increase in the supply of basic foodstuffs. The opening up of new agricultural areas in the colonies is dependent on an adequate supply of machinery and skilled European supervisors; in the Dominions it would require, in addition, a larger agricultural labour force, presumably drawn from immigrants; but even so, the supply of suitable land and transport is limited.

Nor are these the only problems to be faced. For example, Canada has been included as a Commonwealth supplier; but if world trade becomes increasingly constricted into a bilateral pattern, and the trade balance between Britain and Canada can-

not be brought into equilibrium, Canadian dollars will be no less scarce than American dollars, and the Canadian contribution to the British larder may be materially reduced through Britain's inability to pay in dollars. Again, serious political considerations arise in the Dominions of India and Pakistan, Burma and Malaya. These areas have normally played an important part in the British food economy directly by their supplies of wheat, tea and vegetable oils, and indirectly by their trade in rice. Political instability will undoubtedly reduce their agricultural output and so long as the Western World undertakes moral responsibility for their welfare, food supplies which might otherwise come to Britain will continue to be diverted to them.

The development of production and exports of staple foodstuffs in certain Dominions is shown in Table III. The figures given are not strictly comparable but at least they show past trends and future possibilities. The estimate of the Empire supplies in the postwar period (shown in Table I) is based on the reversal of the current downward trend and on the resumption of the rate of advance in output which was achieved in the early years of the war. In the case of wheat, the estimates of exports assume that a larger proportion of Empire supplies will come to Britain, but the calculations of potential exports of other food-

stuffs follow the prewar pattern fairly closely, so that any optimism in the estimates of potential expansion of output should, to that extent, be compensated.

The deficit in British food supplies when postwar "normality" returns, will, on the basis of Table I amount to 2,600,000 tons compared with 3,500,000 tons prewar. This quantity must be purchased from foreign sources, and it will be increased as home and Empire supplies fall short of the outputs estimated in that table. It is not suggested that Empire production should, or can, expand to this extent. But this analysis (which in many respects is cast in optimistic terms) does at least portray the size of the problem which would face Britain in the feeding of its peoples, in a bilateral trading world. "Normality" will depend on the world food situation as well as on the action taken in the Commonwealth, and it would be surprising if the objectives examined (though not proposed) in this article could be attained within 10 years. The cost would be great, in financial and real terms. And the expansion of Empire agricultural production would involve, on Britain's part, the offer of a guaranteed market, based on long-term contracts which might only be justified on the assumption of a perpetual deficit of world food supplies.

Business Notes

Chancellor and Governor

The Bankers' Dinner traditionally provides the occasion for a review of the nation's economic health by the Chancellor of the Exchequer and the Governor of the Bank of England. It was natural and inevitable that important sections of their speeches on Thursday should have dealt with the gallant attempt to maintain sterling convertibility. The duty was imposed by the American loan agreement, and honoured until it was impossible to sustain. Nor was there any apology for making the attempt. It might, said Lord Catto, have succeeded but for the undermining of confidence by Britain's balance of payments crisis. And the Chancellor observed that it would be a poor future for us and mankind at large, if sterling ceased to be a world currency. The sentiments are unexceptionable; but the underlying factors which caused the suspension and will impede the resumption of free payments are formidable indeed.

Uncertainty about an Autumn budget is now at an end. The "exceptionally favourable" budgetary position for the first half of the financial year will have to be further strengthened early in the new session—the first open acknowledgment by the Chancellor of the necessity to curb increasing inflationary pressure resulting from the import cuts and the export drive. As for the gilt-edged market, the Chancellor adheres to his view that present levels represent no more than "a temporary lapse" from the cheap money peak, which has been caused by exceptional discouragements and a period of monotonously bad news. In that case, what are the grounds for regarding the fall as temporary? Does the Chancellor know of good news just round the corner? And why did Mr Dalton emphasise that this was a period when the Government had not found it necessary to borrow, unless to suggest by inference that borrowing would have been accompanied by active intervention (to choose a polite word) in the market?

If the Autumn Budget is to be a realist affair, the Chancellor can hardly dispense with some assistance, at least, from the deflationary forces of higher interest rates. He claims, of course, that higher rates would not serve any useful purpose as a screen for capital projects and places complete faith in physical controls. If this is to be the guiding principle of the Autumn Budget—that financial policy makes no difference—it will hardly be worth the Chancellor's labours or the country's sacrifices.

Loan from South Africa

Yesterday's formal announcement—preceded by the Chancellor's anticipatory references at the Bankers' dinner on Thursday evening—of the loan of £80 million in the form of 9,275,000 ounces of fine gold from South Africa to the United Kingdom

marks an important tangible outcome of the recent sterling area discussions. Subject to a safeguarding clause by which the Union Government will be able to call on Britain for gold to make up any shortfall in the Reserve Bank's gold reserve below £100 million—not a likely eventuality—and to the right of the British Government to repay at any time, the loan will continue for three years, after which it will be repayable on the demand of the Union Government. It will carry interest in sterling at one-half of one per cent per annum.

Important consequential changes in the supply of gold from South Africa will follow. The existing gold contract between the two Governments expires at the end of this year and will not be renewed during the lifetime of the loan. Thus, the British Government will receive £80 million of gold (probably at the beginning of next year after the consent of the South African Parliament has been obtained), but thereafter will forego gold shipments which in 1946 and 1947 will have produced about £55 million. But arrangements have been made for the Union Government to provide gold to meet any drafts on sterling area reserves of dollars on South African account during the period of the loan.

Supplies of fruit, wine, canned fish and eggs to the total value of £12 million a year will be imported by Britain from the Union, at commercial prices. Mr Dalton claimed at the Mansion House on Thursday evening that these "would help to brighten and sweeten the long dark days of the coming winter," but the programme is not due to start until the beginning of next year, and presumably the winter will be largely over by the time the first shipments under it begin to arrive. No formal priorities have been promised for supplies of mining equipment from Britain to the Union, on the practical ground that existing orders stand high on the delivery lists. Steps are to be taken to prevent the flow of "undesirable movements of capital" which are not required for any "legitimate or productive purpose." No impediment, however, is to be placed on financial assistance for gold mining and industrial development in the Union.

In all, this is a useful agreement to assist Britain's dire straits. But there is no point in attempting to conceal the fact that it amounts largely to taking now what would have accrued gradually to Britain during the next three years. Beggars cannot be choosers, and they are lucky if they can live, as Britain is now living, from hand to mouth.

Higher Bank Rate?

For the first time since October, 1939, rumours of a possible rise in Bank Rate have been heard in the City. They cannot be dismissed as mere idle chatter. They fit logically into the pattern of recent changes both in the domestic and external economic

TABLE I
BRITISH FOOD ESTIMATES
POTENTIAL REQUIREMENTS AND SUPPLIES
'000 tons

Cheese	89	158	94	82	78	87	77
Meat	385	340	332	281	313	352	348

position. Recourse to fiscal methods for remedying some of the troubles in the British economy would logically call for parallel monetary measures. The psychological shock of harder money would fit in with an anti-inflationary budget. In certain other countries, where the price system still has a function to perform, money rates have recently been rising, and a position has been reached where the three-months' bill rate in New York is about 50 per cent higher than it is in London. In these circumstances it is not altogether surprising that rumours should recently have begun to circulate that Bank Rate will before long be taken from behind the glass doors of the curio cabinet in which it has remained since June, 1932. Admittedly there was one brief airing in September, 1939, when, for the space of about a month, it was pulled out and raised from 2 to 4 per cent. This was done in an attempt to stop the flight from sterling and to discourage the rush for liquidity which developed just before the outbreak of the war and before the mechanism of wartime controls could be devised to deal with these phenomena. This brief break and the rapid restoration of the former level emphasise rather than weaken the continuity of the artificially rigid rate maintained now for more than 15 years.

Current Bank Rate talk, however, tends to ignore one important thing, namely, that the 2 per cent rate has long ceased to be effective. It would be possible to engineer a considerable increase in short-term money rates, were such a movement deemed to be desirable, without changing Bank Rate from its present figure of 2 per cent. The Treasury Bill Rate was halved to its present figure of $\frac{1}{2}$ per cent as the first shot in Mr Dalton's cheap money drive. If there were any advantage in such a move, the figure could be put back to 1 per cent without in any way calling for a change in the official rate. It may, however, be asked what such a move would achieve other than increasing the earnings of the banks on bills and short loans. It would also raise the interest payable on a large part of the accumulated sterling balances invested in this country and would thus create additional sterling available for current purposes to overseas countries. The pull of higher rates elsewhere, and particularly in New York, would have constituted a serious argument if Britain had continued undisturbed on the road to convertibility and relaxed the control of exchanges. But the trend, alas, is all in the opposite direction; the insulation of the domestic credit situation is being made every week more complete and now offers little scope for the free roaming of balances from one money market to another. If, moreover, this freedom were to obtain, it would need much more than a 3 per cent Bank rate in London to exercise any effective influence on the movements of such capital.

Continued Advance in Steel

Steel production figures for September, published this week by the British Iron and Steel Federation, record the highest monthly rate of production since March, 1943. Output last month was at an annual rate of 13,841,000 tons compared with 12,178,000 tons in August and 12,402,000 tons a year ago. Figures for pig iron and raw steel production are set out in the accompanying table.

Though this improvement is due in part to the seasonal upswing in activity at the end of the holiday season, it is gratifying indeed to find one key industry which is within sight of achieving its output target for 1947 and may build up a useful momentum towards the 14 million ton target set for 1948.

The industry is beginning to show the benefit of new capacity coming into production as a first instalment of the modernisation

	PIG IRON AND STEEL PRODUCTION (Tons)			
	Pig Iron		Steel Ingots and Castings	
	Weekly Average	Annual Rate	Weekly Average	Annual Rate
September, 1946.....	147,300	7,660,000	238,500	12,402,000
August, 1947.....	147,300	7,660,000	234,200	12,178,000
September, 1947.....	150,100	7,805,000	266,200	13,841,000

programme; the conversion of steel furnaces from coal to fuel oil firing is enabling the industry to take full advantage of the continuous week which was negotiated with the steel workers last April. September's high level of activity should be maintained, and indeed bettered, provided that the improvement in supplies of coking coal continues and that scrap supplies can be increased during the next few months. Meanwhile the improvement in pig iron production is particularly welcome, in view of the depletion of stocks in recent months.

The Sterling Area's Dollars

The discussions with members of the sterling area on methods of dollar economy were completed in London this week. The negotiations were concerned with matters of general principle, and not with detailed programmes for reduced imports from the dollar area, and for more conscious direction of exports to that area. The guiding objective of the participants was to achieve in each case approximate balance in their dollar receipts and expenditure. The official announcement issued after the close of these meetings stressed that the discussions had emphasised the importance to the economy of all the countries in the sterling area of the central reserve system "which has served it so well for so many years." There is thus no question of London withdrawing from its role of banker to the sterling area. It could not be otherwise since, apart altogether from the compelling arguments of convenience and efficiency, Britain holds the cash reserve.

The sterling area London talks ranged well beyond the problem of dollar income and outlay and covered more positive methods of strengthening the central gold and dollar reserve. No detailed announcement has yet been made on this aspect of the discussions—with the important exception of the South African loan, which is discussed in an earlier note. The keynote of the talks has been the need to reduce the dollar drain to the minimum during the next nine months. Frankness has prevailed on all sides, but successful co-ordination of the needs and resources of the sterling area will require closer and more continuous contact, as Mr Dalton evidently recognised on Thursday.

Egypt was, of course, not a participant in the sterling area talks. Reports from that country suggest that it may not be long before Egypt asks to rejoin the sterling family. Her departure was not made with particularly good grace, but occasioned little regret among other members. Since then Egypt has learned to her cost how difficult it is to operate a new system of exchange controls *vis-à-vis* countries with which payments were previously free. Egypt has also found her ration of hard currency painfully inadequate and has made an unsuccessful request for increasing the dollars placed by Britain at Egypt's free disposal. It should be added that some readiness has been shown by the British authorities to sell dollars to Egypt against sterling in order to finance specific shipments of food and fertilisers.

The talks with Argentina have hitherto been conducted at "embassy level" at Buenos Aires. The main point at issue is the guarantee that will apply to sterling accumulated by Argentina in the course of her current transactions with the United Kingdom. The British offer of a strictly bilateral exchange guarantee, on the lines of that in the new agreement between Britain and Belgium, has been found unacceptable and Argentina is pressing for a form of guarantee in terms of gold or dollars, i.e. one which would cover them in the event of a parallel depreciation of sterling and of pesos in terms of gold or dollars. For the short term the issue is somewhat academic since Argentina is still engaged in the task of building up her sterling balances to the level required to complete the purchase of the British owned railways and other public utilities.

Using Up the Reserves

In two speeches this week Sir Stafford Cripps has emphasised that "every week that how passes means further drawing on our (gold and dollar) reserves." These reserves, he admitted, were now between £500 million and £600 million, and he stressed that these were the reserves of the entire sterling group and were not merely to be regarded as available for our own use. These admissions and statements can cause no surprise, however disturbing the shiver they may send down the spine. The current balance of payments must still be running against Britain at a rate of close on £500 million a year. The dollar deficit is probably greater than this. Import cuts have begun to make their effect felt on dollar expenditure, but will not do so in real earnest until nearer the end of the year. Sir Stafford announced at a press conference this week that Britain had ceased to enter into fresh contracts for the import of foodstuffs from the United States, but that many existing contracts were still running. The renewed export drive is barely under way. The discussions in Washington which will ultimately lead to an easing, if not to a complete cancellation, of the dollar burden of British occupation costs in Germany only began this week. Since the unexpended \$400 million in the US line of credit remain unavailable, further dips into the gold reserve and further pur-

chases of dollars from the International Monetary Fund appear to be indicated and indeed inevitable. The Chancellor of the Exchequer warned the nation last month that such further encroachments into our final reserve would have to be made. It seems to have been decided by the Government, however, that the welcome and helpful publicity given to the sale of £20 million of gold to the Federal Reserve Bank of New York and the purchase of \$60 million from the IMF is not to be extended to these further operations.

For news of these operations we shall have to depend on leakages and rumours from New York, periodical formal statements from the IMF or the usual belated announcements regarding the state of the gold reserve from London. The leakages have begun already, and there have been reports from New York this week that a further sale of £30 million is being effected and that a second shipment of £16½ million of gold has been made from this country to the United States; and a further shipment of £12½ million not from Britain. Shipments do not necessarily mean that gold of this amount has been sold to the New York Federal Reserve Bank; it might be that the British reserve of gold earmarked in the United States is being built up in order to provide for the calls that are certain to be made on it in the months to come.

A further deterioration in some of the invisible items in the balance of payments was indicated by Sir Stafford Cripps in the same speech. Foreign investment income is only running at a net rate of about £75 million a year at present. As regards tourist expenditure, Sir Stafford pointed out that, despite the austerity fare which we offered to foreign tourists, no fewer than 320,000 of them had visited this country in the past season and had spent an estimated £16 million here in foreign exchange, largely in hard currencies. One might add that the whole of this item will be offset by the higher wheat bill to Canada which will have to be paid next year as a result of the agreed raising of the minimum price from \$1.55 to \$2 a bushel.

Danish Food Talks Fail

Despite indications to the contrary when last week's issue of *The Economist* was going through the press, the trade talks between the British and Danish Government officials have broken down on the question of prices. This is not a very auspicious event for those who believed that the end of dollar convertibility would give Britain a new access of bargaining power in bilateral trade negotiations with its suppliers. In the quasi barter arrangements of the sort which were under discussion with Denmark, the United Kingdom has tried to get specific quantities of particular foods at firm prices. But Britain lacks an essential item in the armoury of bilateral trade negotiations—an export control organisation which could obtain and insist on the performance of priorities of particular goods in guaranteed quantities and prices.

The problem with Anglo-Danish trade, as with Russian, is certainly wider than mere disagreement over prices, as the official announcement claims. Denmark wants coal, feeding stuffs, iron and steel and equipment. These goods ought to provide the main source of British bargaining power. It might be held that they should be used to purchase goods even more valuable than Danish butter, eggs and bacon. That is a decision which must be left to the Government. But the negotiations were opened. The Danes must have recalled that before the war Britain insisted that Denmark should take 80 per cent of its coal imports from this country. In 1938, Denmark imported some 3 million tons. It seems incredible that even half this quantity—say two days' output—could not be spared, even this year, to bring the recent negotiations to a successful conclusion, for British food supplies are barely adequate and stocks are low.

Danish agricultural costs have risen sharply since the end of the war because labour has to be used to dig peat for fuel, thus reducing the agricultural labour force, and because the price of feeding stuffs has risen abnormally—its dairy industry has always been organised on imported supplies of high protein cattle foods. In the past year, the Danish Government subsidised exports of dairy produce to Britain as a short-term policy to regain the British market. And it was clearly understood that such a policy could not be continued indefinitely. At the moment there are other markets which are willing to pay the higher prices and at the same time to supply some of the required imports. Belgium sends iron and steel and Russia has agreed to ship 60,000 tons of rye and 40,000 tons of barley in return for 8,000 tons of fat, consisting mainly of butter and some lard. Under present conditions, Danish butter could not compete with Empire produce on

a competitive basis in spite of the efficient organisation of the Danish dairy industry. Denmark's dollars have to be used to purchase coal and bread grains from the United States and there is little left for feeding stuffs. The Ministry of Food was very successful in its first contract with Denmark. But it can hardly expect to use the "best customer" argument and expect to persuade the Danes to accept low prices as well as exiguous supplies of British exports.

Labour Priorities

The list of essential industries which has been circulated to Employment Exchange managers for their "guidance" in placing workers under the Control of Engagement Order follows expected lines. Obviously undermanned industries, such as mining, agriculture, iron and steel and textiles are to get first priority in manpower. Engineering, while essential for exports and re-equipment, is not affected by labour shortage, except in certain sections, and has been omitted from the list. Home industries, urgently requiring manpower, include laundries, fishing, quarrying, food processing, and domestic work in hospitals and public institutions, but private domestic work will not qualify unless there is a clear case of hardship. A number of other industries, where there is no general shortage of labour or where the work is only part of an individual undertaking, are classed as essential. They include the development of atomic energy, refractory bricks, and sections of heavy engineering, such as the production and repair of electrical generating plant, railway locomotives and coal wagons, and deep and opencast mining machinery.

The "less essential" occupations are those which, broadly speaking, help to make life more comfortable and congenial. They include entertainment and sport, road passenger services other than public or works buses, personal services such as hair-dressing and window cleaning, while distribution, other than food distribution, is also to be cut down.

Building and civil engineering will not rank for priority and there is no intention of increasing their labour force. Whether, and to what extent, it may be reduced and building workers transferred to other industries will only be known when the capital expenditure cuts are announced. It would be uneconomic to retain numbers of unemployed building workers, but to disband the building labour force which the Government has taken some pains to build up to its prewar strength will not be easy or smooth.

The lists are obviously not final, and no hard and fast definition of "essentiality" has been laid down. The main decision on priorities must rest with the local and regional authorities, and the Ministry of Labour has been mainly content to define broad categories and to emphasise the need for flexibility. In many cases, labour supply will have to be regulated according to the needs of individual firms, rather than of whole industries. The essential industries and occupations for priority purposes are situated in the North and Midlands rather than in the South, and since the Government means to use its powers of direction and transfer as sparingly as possible, the Control of Engagement Order is not likely to lead either to any great geographical mobility of workers, or to a considerable redistribution of industrial manpower.

Steel for Shipbuilding

The shipbuilding industry is becoming hardened to alarms and incursions about its steel supplies. An article in *The Economist* of September 27th showed that the likelihood of any reductions in steel supplies for shipbuilding was small, for those mills designed to turn out steel plates for ships would go on doing so as long as their supplies of fuel and materials last out. Yet a noisy little scare blew up last week-end after the Admiralty had circularised the industry on the subject of steel allocations. This signal, to which shipbuilders generally are turning a blind eye, suggested the possibility of an impending cut in steel allocations which might have hindered the attainment of production and export targets. The truth appears to be that the circular originated from an administrative misunderstanding, and does not reflect any sudden change in the steel supply situation for shipbuilders.

But the episode, despite prompt denials from authoritative sources, caused momentary concern, and may be taken as a pointer to the uncertainties which engineering firms face in preparing their production programmes. On such a crucial question as steel allocations, the industry can hardly be blamed for a high degree of sensitiveness, and even if no damage has resulted from the

equivocal terms of the Admiralty's letter, it was an irritant which the industry might well have been spared.

Miners' Hours and Output

Although final agreement on the extension of working hours in the mines will not be concluded until after the miners' delegates conference this week, the outcome of the negotiations is at least certain. Before the end of this month, the miners should be working systematic overtime, after deciding by local option between working Saturday shifts or a longer daily shift. In the vast majority of cases, it is expected, the men will prefer Saturday working. Whichever method is adopted, full overtime rates of time-and-a-half will be paid, with double time on Sunday. In this way, the miners' claim that "the principle of the five day week must not be impaired" has been conceded.

The miners appear to have won a complete victory, and their proposals seem to have been adopted *in toto* by the Coal Board. The Government has climbed down from its original insistence on a longer daily shift, although it still has misgivings that Saturday working will be more costly and will lead to increased mid-week absenteeism. The whole history of the negotiations, which have been dragging on since the end of July, reflects credit on nobody and discredit on many. The delay has meant the loss of well over a million tons of coal which could have been produced if agreement had been reached in the first week of September, as was originally hoped. It has embittered relations in the industry and has created an unfortunate atmosphere for the opening of similar negotiations in other industries.

The need for rapid measures to increase production is underlined by the latest coal returns. Although last week's output of 3,900,000 tons represents an improvement on that of previous weeks, it is 400,000 tons below the now hopeless weekly average of 4,300,000 tons which would be required to reach the target of 200 million tons by the end of the year. There are dim signs of improvement from increased mechanisation and more regular attendance, but too much production is still being lost by disputes Manpower which had risen to 719,100 at the beginning of August is now down to 716,000—the numbers fell by 1,200 during August alone. The miners are not wholly right in insisting that manpower is the key to the problem, but it is certainly an important factor, and unless the Coal Board can intensify its recruitment efforts and until the men will accept Poles and Displaced Persons in local practice as well as in principle, there is little prospect of getting very close to the manpower target of 730,000. The only target which now seems certain to be reached is the stock figure of 15 million tons by the end of October. There are now 14.3 million tons in stock, compared with 10.3 million tons a year ago, and electricity stations now have nearly double the stocks of that time. Unless there is another quite abnormal winter, this side of the programme should be safe. But although the Government are framing the winter coal allocation for industry on the basis of total requirements of 24½ million tons, this very adequate figure has yet to be translated into coal actually delivered at works.

"The Economist is not doing its duty"

But it is not our fault. We cannot find paper for all the facts and figures which are essential for the business man and the student of affairs. So last January we shed the load on to the

Records and Statistics

Supplement to *The Economist*

Records and Statistics has already established itself as an economic source book. Each week it contains at least sixteen pages of statistical tables and factual records, covering public affairs and Parliament, State papers, and economic developments at home and abroad, all presented in a digested form for quick reference.

A subscription to *Records and Statistics* (by post only) costs 30s. per annum. Or it can be combined with a postal subscription to *The Economist* at a total cost of £4. The Publisher will be pleased to send you full particulars.

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

Britain and European Currencies

One of the aspects of the Marshall Plan report in which British interest has cooled with significant rapidity is the scheme for inter-European payments arrangements described in very general outline an Appendix of the General Report and submitted a fortnight ago to a committee of financial experts which met in London. The proposals, largely the work of the Benelux delegation, were intended to remedy the deficiencies in the system of bilateral commercial agreements between European countries which have tended to hamper and distort the development of trade. These agreements generally provide for settlement in gold or in convertible currencies of debit balances arising out of the bilateral payments of each pair of countries in excess of modest margins stipulated in each of these agreements. The general effect of these arrangements has been to generate the customary contractionist influence of strict bilateral agreements of this kind. The Benelux scheme was an attempt to increase the multilateral use of these balances by making European currencies transferable between each other. As the report pointed out,

This system would make it possible to abandon the existing procedure for the bilateral balance of trade, and to deal only with the disequilibrium of the trade of the given country in relation to other countries of Europe taken together.

This transferability, however, was to depend ultimately on the ability of countries acquiring European currencies in excess of the margins provided for by payments agreements (it was part of the scheme that these margins be increased) to convert the surpluses into gold or US dollars. The two-fold effect of the plan would have been to extend the scope of multilateral trade in Europe and to give every European country every possible incentive to export in order to accumulate balances which would be convertible into gold or dollars. The scheme thus required that part of the American aid be earmarked for this task of providing convertibility.

When the details of the scheme were discussed in London it was rapidly realised that Britain would play very little part either in the formulation or the operation of the plan. Britain let it be known that it would be an interested but neutral observer, ready to supply advice and statistical information about its own balance of payments, but, beyond this, determined to keep itself free from any of the commitments which the scheme would involve. This attitude is part of the understandable (but not necessarily excusable) British revulsion against anything that tastes of convertibility. British experts appear to see in the scheme merely a device to put more gold and dollars at the disposal of the few countries, like Switzerland and Belgium, whose export potential is high at the expense of the more urgent needs of the deficit countries. This argument ignores the fact that gold and dollars so accumulated would represent effective help given by the countries concerned to the European community.

Hesitation in Dollar Stocks

Trading in derestricted US and Canadian dollar securities has so far failed to develop on the scale anticipated in some quarters. The main reason has been the shortage of stock of the leading issues, and lack of interest in miscellaneous stocks, some of which were not even requisitioned during the war. The broader inquiry which was noticed in the later part of last week following the cautious opening of dealings has not been sustained, though while it lasted the premiums on United States securities rose steadily from the initial 10 per cent to around 20. The accompanying table indicates the peak reached by premiums on selected stocks and the extent to which these have subsequently been narrowed.

\$ STOCKS: PREMIUMS OF LONDON OVER NEW YORK PRICES

Stock	October 1st		October 6th		October 8th	
	London Price	Premium over New York	London Price	Premium over New York	London Price	Premium over New York
United States Steel	97-98½	10-0	106½-108½	19-2	105-107	17-4
General Motors	79-82	10-0	86-88	19-0	85-87	17-0
Chrysler New	79-82	8-0	88-90	18-2	86-88	15-0
Shell Union	39½-40½	8-5	43½-44½	19-5	42½-43½	15-3

The growing realisation that the Treasury might be forced by the dollar shortage, emphasised yet again by Sir Stafford Cripps on Wednesday, to reintroduce wartime requisitioning (to which reference was made here last week) has produced a mood of greater caution, though some would-be buyers are still adhering

October

In October the Overseas Branch of the Midland Bank handles documents representing large shipments of fresh and dried fruit on its way to markets throughout the world; among these documents are those representing substantial shipments of the cashew nut from the Mediterranean to Minneapolis, a great cake-making centre for the United States. Thus London forms a vital link in the chain of commercial activity extending across the world. Whether your business is concerned with precious stones, intricate pieces of machinery, fine silks, raw wool—or even cashew nuts—the Bank offers its services at all stages of the transactions, at all times and in all parts of the world.

MIDLAND BANK LIMITED

AFTER 1918 the demand for rayon soared and, to meet it, Courtaulds built new factories. The largest of these was at Dunstall Hall, Wolverhampton, bringing to the town an entirely new industry. Building operations began in 1924, and the first viscose rayon yarn was produced in 1926.

Later the works were doubled in size, and in 1937 the present warp-knitting mill was added to make knitted rayon fabrics; this is now in process of being re-equipped with new British machines, fastest of their kind in the world.

The Second World War brought upheaval. Large areas of the factory were requisitioned for Admiralty and other purposes. The knitting department was moved to one of the Company's Essex mills. Bomb-filling at the factory kept some hard at work, while largely from Wolverhampton the Company provided personnel for a complete Royal Ordnance factory a few miles away. Most of such rayon yarn as was still made at Dunstall Hall went into aeroplane and vehicle tyres.

Now this great factory is again getting busy on the spinning of viscose rayon yarn for the manufacture of dress goods, furnishing fabrics, tyre cords and other purposes; it is also employed on winding and warping, and on the production of knitted fabrics.

In 1939 over 3,000 people worked there. During the war, the number fell to below 1,000; now it is gradually rising, though many more vacancies need to be filled before the management is satisfied with progress. Of over 21,000 people employed by Courtaulds in the United Kingdom, to-day about 1,900 are getting on with the job at Dunstall Hall.

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

Issued by Courtaulds Ltd., 16 St. Martins-le-Grand, London, E.C.1.

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA • CEYLON • BURMA • SINGAPORE
MALAYAN UNION • BRITISH NORTH BORNEO
SARAWAK • CHINA • HONG KONG
THE PHILIPPINE REPUBLIC
FRENCH INDO-CHINA • SIAM • INDONESIA

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

to the view that almost anything is better to hold than sterling stocks. There has been a notion in some quarters that the premium on American stocks would eventually settle down at a level roughly discounting the difference between the unofficial and official sterling-dollar rates, but there has so far been no rapid movement in this direction, and the trend this week suggests that premiums are being determined rather by the lack of sellers and the consequent difficulty of dealing. It is something that buyers are showing that they are not willing to push their offers beyond prudent limits.

Firmer Rubber Market

The rubber market has become firmer in recent weeks, though there has been no very marked change in the statistical position. Apart from one break at the beginning of September, the average unofficial spot price in London rose steadily from 8½d. per lb. for the week of August 12th to 10½d. for the week of October 7th. By the end of June stocks of natural rubber had increased to 930,000 tons compared with 895,000 tons at the beginning of the year, while synthetic rubber stocks declined from 140,000 tons to 115,000 tons in the same period. The fall in synthetic rubber consumption has continued in the United States, but there has been no parallel expansion in the consumption of natural rubber.

Undoubtedly the market has been buoyed up by the persistent reports that the United States may purchase rubber to build up a strategic stockpile. But if purchase for stockpiling is adopted as a definite element of American policy, it would presumably be on the dual grounds of unsettled political conditions and of the need to expand the world's dollar resources; the first ground would equally justify the maintenance of a relative high level of synthetic rubber capacity, if not actual production. It seems probable, however, that some relaxation of the American Government's control on rubber consumption in favour of natural rubber may still be introduced. Some reports also suggest that Russia may purchase rubber from Malaya. Information on Russian synthetic production is slight, but output is unlikely to be sufficient to cover Russian requirements for postwar reconstruction.

Meanwhile, Malaya is still suffering from a shortage of rice, and prospects of increased supplies are not promising. Without adequate rice supplies at reasonable prices, there will be little chance of reducing rubber plantation costs. Despite all the current difficulties, however, output has been increasing—July's total was 53,858 tons compared with a monthly average for the first six months of the year of 51,900 tons. Average monthly output for the Netherlands East Indies during the same period has been estimated at 23,750 tons.

* * *

World Oil Shortage

The campaign to reinstate the basic petrol ration proceeds; meanwhile the urgent need to conserve oil supplies has been underlined by the cancellation of a routine fleet cruise to save fuel. The case for reducing petrol and fuel oil consumption has been argued as a means of conserving dollar resources. The case might have carried wider acceptance if it had been put in terms of a world oil shortage.

The latest figures of world oil production, covering roughly the first half of this year, emphasise the three factors which, already at the end of last year, were presaging the present difficulties: the shortage of world refinery capacity; the shortage of tanker capacity to transport oil to consuming areas; and the phenomenal expansion of demand for oil products in the United States. World production for five key producing areas, expressed as annual rates over the past three years is given below:—

	ANNUAL RATES OF PRODUCTION IN THOUSAND METRIC TONS		
	1945	1946	1947
United States	231,544	234,215	240,474*
Venezuela	46,368	55,495	48,432†
Iran	17,109	19,497	19,098*
Iraq	4,712	4,470	4,386*
Saudi Arabia	2,872	8,090	12,000§

* Based on six months' figures. † Based on four months' figures.

§ Very provisional.

Production in the United States has continued to expand to new heights while Saudi Arabia, which provides large quantities

of oil for the US Navy, has sustained its phenomenal increase in output (which is only roughly indicated in the table). But in South America and Iraq, production is held up by a shortage of refinery capacity and in Persia the shortage of tankers puts a ceiling on output which is well below the potential level of the oilfields.

But expansion of production in the United States has been wholly swamped by the increase in demand. According to the US Bureau of Mines statistics domestic demand for motor fuel was running at the rate of about 852 million barrels a year in June, compared with 735 million barrels consumed in 1946, itself a record year. This jump in demand, coupled with correspondingly heavy increases in the consumption of certain heavier oils, has been met only by importing greatly increased quantities of crude oil. The United States imported 86 million barrels of crude oil in 1946. In the first half of 1947, imports were running at an annual rate of 98 million barrels. Assisted by these imports, America has been able to cater for an increased home demand for petrol and to maintain roughly the same level of exports in the first half of this year as in the same period of 1946. But this has not been true of the heavier oils. The demand for gas and distillate oils has far exceeded the capacity of domestic refineries and exports have been reduced. Since there is every indication that domestic demand for the heavier oils will continue to expand, the possibility of growing pressure on heavy oil supplies from the Middle East, with all the aggravated transport problems that would bring, cannot be disregarded. Such a possibility has serious implications for Europe's supplies of heavy oils under the Paris plan and for the coal-to-oil conversion programme in this country. It is already clear that during the coming winter, industry will at best only barely scrape through with its promised fuel oil supplies. It would indeed be ironical if conversion to oil-firing to save coal were to be imperilled, in its first winter of serious trial, for want of oil supplies.

* * *

Prospectus and Performance

Two companies have recently announced results which make a mockery of the forecast of profits contained in their prospectuses. The Miles Aircraft Company when issuing 350,000 4½ per cent cumulative £1 preference shares in March this year estimated that profit for the year to December 31, 1947, would not be less than that for 1946—the report, not then available, later showed this to be £110,993—and indicated that its order books were full. Now, only six and a half months afterwards, it has indicated that owing to the fuel crisis—which must have affected production at the time of the issue, even if its full consequences were not clear—it is trading at a considerable loss, and that the first two dividends on the new preference shares would be met out of the chairman's own pocket.

The case of Peerless and Ericsson, manufacturers of food preparation equipment, is more inexplicable, if only because it concerns a period before the fuel crisis. This company's prospectus estimate of profit before taxation of £85,000 for the year to December 31, 1946, was made in September, 1946, when only three months' trading was left to complete the year; but the company actually reports a trading loss of £114,461 for 1946, and has only been able to meet the dividend on the issue of £247,000 preference capital out of EPT recoverable. Apart from these two companies, there have been some others—including Douglas Holiday Camps, which suffered from an unforeseen shortage of ships to fill its camps, and Walkers, Dyers and Cleaners, who failed by narrower margins to realise their prospectus profit estimates. Generally speaking, the performances of companies which have been publicly floated since the end of the war have been satisfactory, and in some cases they have exceeded expectations.

It would be premature on the basis of one or two failures to bring censure either on the Capital Issues Committee (which takes responsibility for the financial soundness of new issues), or on the Stock Exchange Council for failing to provide adequate safeguards for the investor. There is a risk in profit making, and even in these days of pervading inflation and ready-made profits, an unfortunate few may encounter a loss. A new issue boom normally produces a percentage of failures, and so far the post-war spate has produced fewer failures than earlier booms. But that does not dispense with the need for the fullest public accountability of those companies and their backers, which do fail to match prospectus by performance. The case of Peerless and Ericsson, in particular, calls for a particularly frank explanation.

Ashanti Obuasi Dealings Suspended

The suspension of dealings in the shares of Ashanti Obuasi Reefs by the Stock Exchange Council, after the market itself had voluntarily decided to do so, comes as the climax to a series of contradictory reports from the Gold Coast which began in July. A statement of the company on August 1st which revealed an assay value of 1 oz. 10 dwts. over 132 inches at a depth of 160 feet in the B shaft of the mine, provided the signal for a revival of interest in the shares of the company which, although it was registered in 1921, has not yet reached the production stage. These values were confirmed in a progress report from the mine on August 12th and the shares advanced from a low level of around 1s. 3d. to 1s. 10½d. by the end of September. On October 3rd the company stated that further sampling of the lode had proved the non-existence of gold values; this statement, coupled with the sale of considerable numbers of the shares on the previous day prompted the Council officially to suspend dealings.

It now remains for the "serious mistake" admitted by the company to be fully investigated, and until that is done the circumstances surrounding the affair must remain a mixture of the curious and the suspicious. To clear it up completely, however, it would seem that on the facts at present available it may be necessary to take the inquiry to the mine itself, despite the inconvenience of distance, for it is from the mine that the earlier optimistic accounts of development were first reported. This is not the first occasion in the history of the Gold Coast gold mining industry that incorrect assay values have been reported and subsequently disproved. A similar history attached in the thirties to the Hano Dredging Company which led to the company's eventual liquidation in 1942.

* * *

Free Market in Tin?

The tin market has recently been overshadowed by speculation about the new American-Bolivian contract on the one hand and by the insistent demands of Malaya for a free tin market on the other. World tin output during the first seven months of 1947 has been estimated at 59,300 tons, compared with an estimated consumption for the same period of 75,000 tons. The development of production in Malaya has progressed satisfactorily and rehabilitation is well under way. Output in the Netherlands East Indies, however, has fallen short of expectations owing to the recent strike, which has since been settled, in Billiton. World stocks of tin and tin-in-ore at the beginning of July have been reported as 90,000 tons—a decline of 23,000 tons since the beginning of the year, but supplies of tin afloat were some 6,300 tons higher on July 1st. Stocks in the United States dropped by 17,000 tons during the first half of 1947 and prospects for the second six months are regarded by the industry as being even better, as the Reconstruction Finance Corporation have purchased considerable amounts of tin metal. Some 1,250 tons were shipped to America from Singapore in September out of a total shipment

of 1,820 tons for the month. Statistics compiled by the International Tin Research and Development Council are published in this week's *Records and Statistics Supplement*.

The present American contract with Bolivia terminates at the end of the year. Bolivia has already made it clear that it desires a price above the existing level of 76 cents a lb., and if the United States agrees this increase will be reflected in the British buying price from the Patino group and also in the Malayan price. Conditions in Bolivia are rather unsettled, although the recently threatened strike proved to be unsuccessful. Bolivia appears to be hoping that American strategic requirements for tin will be the major consideration under the table during the coming negotiations, and will presumably argue that output from other sources, notably Malaya, is still not adequate to cover American requirements. Moreover, Malayan producers have also made it clear that the present controlled price of tin is too low, particularly in relation to their increased costs of production.

The case for a free tin market, regarded from the producers point of view, may be a strong one; certainly, at the present time, the current controlled price is well below the probable price in a free market. But the tin problem is as much political as economic, and it might be unwise, at this particular juncture, to set the tin market free while there is still a condition of relative shortage. Twelve months ago such a policy would have been easier to justify, when America abolished its domestic controls, though even then supplies to Britain would have been smaller and a lot dearer.

Shorter Notes

The Stock Exchange has announced an interim dividend of £4 per share for 1947-8. This compares with an interim of £3 followed by a final of £5 per share for 1946-7. No increase in the total payment for the year is expected. The next payment will probably be the first under the new capital structure, by which the present 20,000 £36 paid shares will be replaced by 40,000 £4 cumulative redeemable annuities which will provide an annual return equivalent to £8 per share on the existing capital.

*

It has been officially announced from Johannesburg that New Union Goldfields will in future be controlled by Anglo-Transvaal Consolidated whose chairman, Mr A. S. Hersov, supersedes Mr N. S. Erleigh as chairman of the company. An exception to this arrangement is the constitution of a new group to be known as the Union Free State Group under the chairmanship of Mr J. Milne, formerly Mr Erleigh's chief assistant, to consist of Union Free State Mining and Finance, Bloemfontein Consolidated and Free State Gold Areas. This information confirms rumours which have been circulating in the mining market for the past fortnight.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Odeon Theatres; Triplex; United Steel; Ransome and Marles.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying 5 per cent or less will be repaid at the earliest date (these are marked 'e'), and those paying 5 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked out on 15 per cent basis. (g) Fifteen months to March 31, 1947 (yield basis 16 per cent.) (h) To latest redemption date. † Free of tax.

Roads

In the further evolution of our transport systems roads are becoming increasingly important lines of communication. To the construction of roads the Dowsett organization brings the services of executives who have specialized in this form of civil engineering and public works undertaking. They are qualified engineers to whose technical skill and knowledge of modern methods of road building are added the extensive Dowsett resources in the form of up-to-date plant and equipment and ancillary road building materials such as pre-stressed concrete bridge beams, fence posts and kerbs, made by the Dow-Mac Process.

KIRKHAM ABBEY

CENTURIES OLD ABBEYS, churches, castles, mansions of imposing exteriors... furnishings and decorations, priceless heirlooms of craftsmen of the past—these are the historic background of the Yorkshire to-day with its thousands of craftsmen skilled in so many trades.

This tradition is to be seen throughout Yorkshire, among its people, in its cities and towns, in its industries, and is the solid foundation upon which "The Yorkshire Post" is established.

Owned, edited and published in Yorkshire it is indeed part of Yorkshire life, yet with that breadth of outlook which causes its viewpoints to be studied and quoted throughout the world.

CONSOLIDATED MAIN REEF MINES & ESTATE, LTD.

(Incorporated in the Union of South Africa.)

Extracted from the Annual Report for the Year ended 30th June, 1947.

CAPITAL, £1,247,602 IN £1 SHARES, ALL ISSUED, FULLY PAID.

DIRECTORATE.
W. M. FRAMES (Chairman), W. M. BARCLAY, MAJOR C. S. GOLDMAN,
P. S. HAMMOND, W. H. A. LAWRENCE,
G. V. R. RICHDALE.

Tonnage Milled, 2,310,000. Per ton milled
Total Working Revenue £2,881,068 19 10 £1 4 11
Total Working Expenditure 2,625,697 18 1 1 2 10

Working Profit £245,371 1 9 £0 2 1

Total Profit for the year £245,151 2 8
Balance unappropriated at 30th June, 1946 439,321 7 5
Forfeited Dividends Account 8,690 4 0
Taxation—Adjustment in respect of previous year less provision for year ended 30th June, 1947 9,188 8 4
£702,346 0 3

This amount has been dealt with as follows:—

Funds transferred for Capital Expenditure £5,348 9 3
Silicosis Act, 1946—Provision for outstanding Liabilities and Provision for additional outstanding Liabilities 21,989 13 10
Transfer to Contingency Reserve 8,700 0 0
36,038 3 1

£666,307 17 2

Dividends declared during the year:—
No. 74 of 8½ per cent. and No. 75 of 11½ per cent. 249,520 8 0

Leaving a balance unappropriated of £416,787 9 2

The available Ore Reserve, re-estimated as at 30th June, 1947, was as follows:—

	Tons.	Value	Width
		dwt.	inches.
Main Reef	571,000	7.3	58.0
Main Reef Leader	1,582,000	6.9	53.9
South Reef	1,188,000	3.9	48.8
Bird Reef	1,561,000	2.8	63.3
Kimberley Reef	72,000	3.0	63.4
Total	4,974,000	3.7	55.8

The Kimberley Reef tonnage is partly derived from ore developed many years ago but not previously included in any reserve estimates, since it was not available for mining or payable under the then existing conditions. There were, in addition, 1,248,000 tons of payable ore valued at 4.1 dwt. per ton contained in shaft and safety pillars not at present available for stoping.

Compared with the previous year the available reserve showed a decrease of 206,000 tons, the estimated stoping width was 0.9 inch less and the average value 0.1 dwt. higher.

The full Report and Accounts (with Plans of Workings) may be obtained from the London Secretaries, A. MOIR & CO., No. 4, London-wall Buildings, London, E.C.2.

"Good-bye
my boy"

One of these days you may be saying good-bye to your son as he goes away for Army Service or to live and work among strangers. Then he must find his own friends. His moral and spiritual quality will be tested under new conditions, and especially by loneliness—the loneliness of a barrack room, a strange town, or perhaps a foreign country.

One of the tasks of the Y.M.C.A. is to serve young men in these circumstances. It offers friendship and encouragement, as well as recreative activities for body, mind and spirit. Your son may be one of the many thousands who look to the Y.M.C.A. for help and guidance. By supporting this great undertaking now, you can do something to ensure that he does not look in vain. Please send a contribution to-day.

Donations may be sent to the Rt. Hon. The
Earl of Athlone, K.G., G.C.B., President of
the Y.M.C.A. War and National Service
Fund, 112 Great Russell St., London, W.C.1

COMPANY MEETINGS

ODEON THEATRES, LIMITED

RE-FINANCING COMPLETED

The 10th annual general meeting of Odeon Theatres, Limited, was held, on the 11th instant in London, Mr J. Arthur Rank, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:—

The great expansion which this group of companies has made over the last five years has been dealt with by means of temporary finance. In the year under review we have completely and permanently re-financed the group and have raised the sum of £13,335,000 at an average rate of 3.76 per cent. per annum, which I am sure you will agree with me is no mean achievement at any time, in particular in the difficult times in which we are living.

The operations were as follows:—

- (a) Odeon Properties, Limited, issued on July 5, 1946, £3,500,000 3½ per cent. first mortgage debenture stock at 98 per cent., and 1,000,000 4½ per cent. redeemable cumulative preference shares of £1 each at 21s. Prior to the issue of these two securities, it had issued to Odeon Theatres, Limited, £1,000,000 4 per cent. second mortgage debenture stock at par on June 24, 1946.
- (b) Odeon Associated Theatres, Limited, issued on February 7, 1947, £3,500,000 3½ per cent. first mortgage debenture stock at par, and 1,250,000 4½ per cent. redeemable cumulative preference shares of £1 each at 21s. per share; and on January 27, 1947, £1,500,000 3½ per cent. second mortgage debenture stock, at par, in favour of Odeon Theatres, Limited.
- (c) (i) Odeon Theatres, Limited, redeemed the outstanding balance of £1,500,841 5 per cent. first mortgage debenture stock at 102½ per cent., giving holders the right to convert into the 3½ per cent. second mortgage debenture stock of Odeon Associated Theatres, Limited, or to be repaid in cash.
- (ii) On September 16, 1946, the holders of the outstanding £1,260,400 5½ per cent. debentures were offered the right to convert their holdings into Odeon Properties, Limited, 4 per cent. second mortgage debenture stock upon the basis of receiving £79 of such stock per £105 (including redemption premium) and £26 in cash.
- (iii) On September 16, 1946, 1,186,849 6 per cent. cumulative preference shares of £1 each in Odeon Theatres, Limited, were offered to shareholders at 26s. per share.

All of these operations were successful.

The effect of these transactions is that the finances of this group have been placed upon a permanent basis, and, in the opinion of

your directors, leave the group with adequate liquid resources to cover its requirements, taking into consideration the nature of its business.

It is difficult at this moment to forecast the results of the current year, but I am confident that we can meet and beat whatever problems we have to face as your company is soundly financed and soundly managed.

The report was adopted and the proposed final dividend of 10 per cent., making 17½ per cent. free of tax for the year, was approved.

THE GREAT UNIVERSAL STORES, LIMITED

LARGER SALES AND DIVIDEND

The 29th ordinary general meeting of this company was held, on the 2nd instant, in London, Mr Isaac Wolfson, chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to March 31, 1947: The company has successfully accomplished its changeover from war to peace-time conditions, and there has been a large increase in the combined sales of the group of approximately 40 per cent. in relation to the previous year. The increase in the sales of the Jays and Campbells group, which is mainly concerned with the distribution of furniture, is even greater, but the results of this increase will not be revealed until next year's accounts are presented for the period to March 31, 1948.

The consolidated trading profit has risen from £1,077,530 to £1,384,083, an increase of no less than £306,553, which arises from the greatly increased turnover mentioned above. Taxation, amounting to £721,144, has again been provided for in full on the current year's profits. This compares with £578,712 last year. Your directors have recommended a final dividend of 30 per cent. less tax, making, with the interim dividend of 10 per cent. less tax, a total of 40 per cent. less tax for the year, which compares with the equivalent of 31.45 per cent. last year. In addition the profits shown have permitted of a transfer of £145,090 to General Reserve, which will then amount to £700,000.

RESERVES

The total reserves and undistributed profits of the group as shown in the consolidated balance sheet now amount to no less than £1,582,633, as compared with an issued ordinary capital of £1,056,289. As at March 31, 1940, the total reserves were £359,863 and these have over a period of seven years been increased to the above-mentioned figure of £1,582,633. It will, therefore, be seen that a large portion of the group's profits and surplus has been ploughed back into the business, which policy in these uncertain times will, I feel sure, meet with the approval of all stockholders.

In addition to the consolidated profit of £1,384,083 for the year, the Jays and Campbells group showed earnings of £322,981 before providing for depreciation and taxation. The whole of the Ordinary capital of Jays and Campbells (Holdings) Limited, is now held by your company free of any encumbrance.

FUTURE TRADING ACTIVITIES

I think we can be satisfied with the results of the year under review, especially as controls and more austerity seem to be placed upon us. Since 1933 your company has extended its activities by the acquisition of established businesses and the results now presented more than justify the decisions which have been made in past years. Each of our companies is a self-supporting trading or manufacturing unit having its own management, dealing with the general running of the business independent of the parent company except for broad direction and control.

So far as the current year is concerned I am pleased to state that sales and profits to date are in excess of the same period last year. I can only repeat as in previous years that our sales mainly consist of articles of everyday household and personal requirement. Our group of companies fulfil a definite need of the community in manufacturing, seeking out and supplying to the public the wide variety of goods that is required at the best possible value. The report was adopted.

BRITISH HOMOPHONE COMPANY, LIMITED

SIR HERBERT MORGAN'S SPEECH

The annual general meeting of the British Homophone Company, Limited, was held, on the 29th ultimo, in London.

Sir Herbert E. Morgan, K.B.E., the chairman, said that results of the Homophone and Ebonestos companies should be regarded together in that the businesses were carried on in the same premises and, to a very large extent, under the guidance of the same personnel. The position taken as a whole showed that the profits before taxation were substantially up at £12,766, as compared with £8,576. The volume of orders in hand was extremely satisfactory.

The directors viewed the company's prospects with sober and confident optimism. The British Homophone Company was specialising in high-grade transcription and reproduction work for special purposes. Their record of profits should at least be maintained. That section of the manufacturing activities was limited in regard to expansion through lack of space at New Cross, but the board was making every effort to overcome that difficulty when increased turnover and larger profits should result. The Ebonestos Company was primarily concerned in the manufacture of components for the electrical, engineering, radio and motor industries, and it also made important parts of the G.P.O. telephone installations. A very good proportion of the finished articles for which it made components were exported.

The indications were that the profit figure for the Ebonestos Company for the half-year to date was well in advance of the figure for the same period last year. He concluded by paying a tribute to the managing director, Mr Jack Lesser.

The report was adopted.

HUNGARIAN GENERAL CREDIT BANK. In our issue of September 13th last (p.462) the title of this Bank was incorrectly given as Hungarian Credit Bank.

AN IMPORTANT manufacturing and distributing company in Dublin requires an administrative assistant (male). Successful applicant must have had a first-class general education, and preference will be given to a candidate holding a University degree in Commerce, or professional secretarial and accountancy qualifications. Applicants can be interviewed in Dublin and London. Applications should first be submitted in writing, giving full details of age, schools, qualifications, experience and salary required, to Irish Chemical Products, Ltd., 41, Hill Street, Dublin.

PERMANENT CONFIDENTIAL SECRETARY. Your personal and business telephone messages received, recorded and, upon demand, relayed to you. If you have no phone or are away from home make use of this service by joining Finders, Ltd. Membership 10s. p.a.—Details from Finders, Ltd., 77 Dean Street, W.1. GERard 9050.

GOVERNMENT RETURNS

For the 4 days ended October 4, 1947, total ordinary revenue was £41,065,000, against ordinary expenditure of £48,103,000, and issues to sinking funds £300,000. Thus, including sinking fund allocations of £8,302,982 the surplus accrued since April 1st is £204,169,924 against a deficit of £500,994,360 for the corresponding period a year ago.

GOLD AND SILVER

The Bank of England's Official buying price for gold remained at 172s. 3d. per fine ounce throughout the week. Spot cash prices were as follows:—

THE UNION BANK OF AUSTRALIA LIMITED

ESTABLISHED 1837

With a network of branches throughout every important pastoral, agricultural, commercial and industrial area in

AUSTRALIA and NEW ZEALAND

and with Agents in the principal cities throughout the world, The Union Bank of Australia, Limited, is able to offer the facilities of a most comprehensive banking service.

Head Office:

71, CORNHILL LONDON, E.C.3.

West End Agency:

15, CARLOS PLACE LONDON, W.1.

MARKETS for you in AUSTRALIA

Obtain a copy of this book from your bankers or direct from the Bank of New South Wales, London.

Australia and New Zealand are rich markets to develop because of the relatively high purchasing power of their people. For trade, investment and travel information, ask your bankers to consult

BANK OF NEW SOUTH WALES

(Incorporated in New South Wales with limited liability)

FIRST AND LARGEST COMMERCIAL BANK IN THE SOUTH-WEST PACIFIC
London Offices: 29 Threadneedle Street, E.C.2., and 47 Berkeley Square, W.1.

THE ALEXANDRIA WATER COMPANY, LIMITED. ALEXANDRIA—EGYPT

INTERIM DIVIDEND.

NOTICE IS HEREBY GIVEN that an Interim Dividend of FOUR SHILLINGS per £5 share on Coupon No. 118 will be paid without deduction of British Income Tax, but less Egyptian Government and Alexandria Municipal Taxes amounting to 5.904d., making 3s. 6.096d. net on and after October 15, 1947, at the National Bank of Egypt, in Alexandria at Rue Toussouf, or in London, at 6, King William Street, E.C.4.

Dated, Alexandria, Egypt, September 10, 1947.

By Order of the Board,

J. C. de V. BISS, Sub-Manager.

THE CIVIL SERVICE Commissioners, at the request of the Government of Northern Ireland, invite applications for a few vacancies in the Administrative Class of the Northern Ireland Service to be filled in 1948 by Open Competitive examination under Normal Regulations. The examination will be held in London concurrently with that for the Administrative Class of the Home Civil Service, and candidates may compete by Method I, which will be held between mid-June and end of July, 1948; or by Method II, which will begin on January 6, 1948. For Method II candidates must have taken, or must obtain in 1948, a degree with at least Second-Class Honours, but this will be waived for certain candidates who have had regular service in H.M. Forces. Age limits are 20-24 on August 1, 1948, with extension for regular service in His Majesty's Forces, but exceptionally candidates born on or after August 2, 1915, may be admitted for Method I. Full particulars and application forms can be obtained by writing (preferably on a postcard) to the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 1982/N in the top left-hand corner of postcard or envelope and in any letter. The forms must be returned in time for delivery by November 15, 1947, for Method II, or by February 28, 1948, for Method I.

ASHRIDGE, BERKHAMSTED, HERTS

(Principal: General Sir Bernard Paget, G.C.B., D.S.O., M.C.)

Ashridge is a residential college for education in Citizenship, and provides an open forum for discussion.
Course 43.—Week-end, October 31 to November 3, 1947: Housing in the Crisis.

Subjects.—Housing in the Social Structure of the Nation: The Hon. Lionel Brett, A.R.I.B.A.; The Economics of Housing: Professor Ian Bowen; Design and Construction: R. Fitzmaurice, Esq., B.Sc., M.I.C.E.; The Principles and Method of House Property Management: Miss Jean Thompson.

The Course assembles Friday evening and disperses early Monday morning. Inclusive fee, £3 3s.

Application for enrolment should be made to the Bursar, Ashridge, Berkhamsted, Herts. Telephone: Little Gaddesden 3191.

INCREASE YOUR INCOME. Purchase an Annuity. Practically free of Income Tax for 15-20 years. No capital loss in event of premature death. Best terms obtainable.—Apply, stating date of birth, to Brewer and Leslie, Ltd., Incorporated Insurance Brokers, 3, St. James's Place, London, S.W.1.

HONGKONG & SHANGHAI BANK (TRUSTEE) LIMITED.

The Hongkong and Shanghai Banking Corporation, incorporated in England, and an affiliate of the Hongkong and Shanghai Banking Corporation, is prepared to act as Executor and Trustee in approved cases. Trustee Companies, also affiliated to the Corporation, are established in Hongkong and Singapore.

Full particulars may be had on application.

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000

ASSETS EXCEED £27,000,000

CLAIMS PAID EXCEED £181,000,000

(1946 Accounts)

THE Boot and Shoe Manufacturers' Federation, now at Kettering, Northants, but returning to London when reserved accommodation becomes available, is the national trade organisation of the boot and shoe manufacturing industry; and invites applications for appointment to the post of Deputy Director, with a view to succeeding the present Director within one year of appointment. The post affords full scope to an able man in varied interesting work and the appointment is intended to be for not less than 5 years. In selecting candidates for interview, preference will be given to those offering a sound general education; experience in industry, business or trade association work; academic or professional qualification in law, economics or accountancy; a good service record age about 30/40. Salary from £1,500.—Apply by letter, giving full particulars, to the Director, Boot and Shoe Manufacturers' Federation, Norwich Union Chambers, Kettering, Northants.

GENT (age 60), active. Held high experienced posts in Government and commissioned service. Travelled widely. Prepared to visit place overseas to negotiate export trade and arrange agencies.—Box 570.

THE WHITEHALL LETTER: An intimate weekly study of world affairs now available to new subscribers.

QUALIFIED ENGINEER, of 38, widely travelled and fluent in three languages, with exceptional experience and contacts in central government, now free to consider post needing imagination and drive. Salary £2,000.—Box 569.

IF you require staff "WOMEN'S EMPLOYMENT" has been widely sought for forty-eight years by those seeking posts. First and last Fridays, 5d. post free, from Women's Employment, Terminal House S.W.1.

SHORTHAND.—Private. Individual tuition. Beginners or advanced. Rapid courses. Central position. Afternoons or evenings.—Phone: PAD. 6929.

INDIAN statistician and sociologist, considerable experience. Market Research, Public Opinion and Sample Surveys, seeks suitable appointment.—Box 575.

BUSINESS STATISTICIAN.—Large Manufacturing Organisation requires Statistician with degree or equivalent qualification. Candidates should have had experience of economic and statistical investigation or research and an adequate commercial background. The situation calls for an aptitude to detect economic trends and to assess their business implications. Particular emphasis is placed on trade forecasting, market assessment and measurement of performance. The appointment required will be commensurate with the candidate's Scheme and the experience.—Applicants should give full personal particulars, including education, business experience, professional other qualifications, and present remuneration to Box 574.

ASSISTANT SECRETARY, under 40 years of age, required immediately by The Gas Research Board. The successful applicant will be required to keep the Board's accounts and should possess an appropriate professional qualification. Commencing salary £600 to £750 annum, according to age and experience.—Applications, with not more than two recent references, to be endorsed "Assistant Secretary" sent to the Secretary, The Gas Research Board, Gas Industry House, 1, Grosvenor Place, London, S.W.1, to reach him not later Monday, 27th October, 1947.

Postal Tuition for B.Sc.ECON

The London University B.Sc. Econ. Degree is a valuable qualification for statistical and welfare work in commerce and industry, and for teaching or administrative posts in Education authorities, etc. The degree is open to all, without University residence may prepare for the three examinations at home under the experienced guidance of Hall (est. 1894): moderate fees, payable by instalments, if desired.

End of Act Two

NEXT week will see the end of the second session of the present Parliament and the beginning of the third. This is the Labour Government's and the Labour Parliament's watershed. Parliaments sometimes run to five sessions, but not often, and there are plenty of voices willing to prophesy that this particular Parliament will not even see its fourth. This, then, so far as can be foreseen, is half-time. And as if to mark the fact, the programme for the new session is apparently to show a sharp difference from that of the old. In the past twelve months an unprecedented number of highly complicated and controversial measures have been rammed through Parliament by a brutal use of the Government's majority. But the King's Speech next week—unless the prophets are misinformed—is to contain comparatively little that will arouse fierce controversy, for the nationalisation of the steel industry, it is said, is to be deferred and the nationalisation of the gas industry, if it is included, has the blessing of a Committee presided over by one of the country's leading industrialists.

How, at this dividing-point of its career, does the Labour Government stand? What is the score at half-time? Not by any stretch of language can Mr Attlee's Government, to judge by its record so far, be deemed a good Government. If judgment was still suspended at the end of the first session, it is crystallising at the end of the second. It is true that the Labour Party has yet to lose a by-election; but that, as has been pointed out once or twice in these columns, is a more or less fortuitous circumstance, and the by-election figures, when properly analysed, have recently begun to show a decided turn against the Government. What put Labour in two years ago was the large number of middle-class votes that they got. But the middle class, to judge by the admittedly scanty pieces of evidence that are available, have turned against them. What is even more significant is that the young people have also turned against them; the Cambridge Union's refusal of confidence to a Labour Government this week, by a vote of more than 5 to 2 and against the advocacy of Mr Strachey, is almost inconceivable to those who knew the undergraduates of the inter-war years.

The defects of the Government have, indeed, become painfully clear in recent months. The most crying defect is the low calibre of the men who hold office. Some, but a very few, of the present Ministers would challenge comparison with the best that other Governments have contained. But the average level of competence and courage is very low; and Mr Attlee's recent changes, though they were improvements, have served only to emphasise how many incompetents he is apparently compelled to leave untouched. Mediocre individuals can nevertheless sometimes make a good team, if they are well led and act together. But the present Cabinet have little leadership and, if reports are to be believed, they suffer from an unusual number of personal vendettas.

Their second defect is that they have squandered even such resources of talent as they possessed. They have diverted the attention of Parliament, of their official advisers and of public opinion to a grandiose programme of legislation which is now seen to be not so much bad as

utterly irrelevant to the nation's needs. In what particular, however small, can the nationalisation Acts be said to have helped the country to weather the gigantic storm that is now brewing? The storm was long predicted; Ministers have had the most ample warning; yet when its first icy gust blew in the windows of the Cabinet room last February, it found Ministers playing tiddleywinks.

These are hard words. But politics is the art of the possible and he who would condemn a group of politicians for their misuse of power must first convince himself that a more effective grouping was possible. Given the fact that the electors wanted to put a Labour Government into office in 1945, could it reasonably have been expected to do better? And given the addition of the Labour Party to the more sentimental aspects of Socialism, given the vast inertia of the trade unions, the answer can only be no. Could a Tory Government, if the narrow electoral margin had fallen the other way, have done any better? The answer is less certain, but it is also probably no. The Conservatives might have done better in some things. They would not have distracted attention so completely from the real issues. They might have seen trouble coming a little earlier. They might even have found the courage to act a little earlier and a little more decisively. But against this a Conservative Government would, deservedly and undeservedly, have had to face much more social and industrial unrest. It is very difficult to believe that, had the crucial two millions voted the other way in 1945, the position of the country would have been substantially different today. For what is happening is not the crisis of a single party or of a single creed, to be cured by the application of another party and another creed, but the crisis of a whole political and social system, the crisis of a whole nation which has to shake itself out of habits of sloth for which the Tories are as responsible as the Socialists, the FBI as much as the TUC. It is said that a people always gets the Government it deserves, and it would be hypocritical, as well as uncharitable, to blame Mr

Attlee and his colleagues for so faithfully reflecting the British people in their cardinal misjudgment of the situation that existed in 1945 and in their obstinate refusal to admit that life is very much harder than they hoped it would be.

So, although the Labour Government has done far from well, it will turn out to be a good thing that it has been there these past two years. And, by the same token, it is better that it should stay in office than that any of the possible alternatives should be followed. A coalition would merely be a dilution of responsibility and would still further diminish and retard the Government's power of decision. A General Election, followed by a Conservative Government, would be resented as a repetition of the trick of 1931 and be used by the Labour Party ever afterwards as an all-embracing alibi. If there were, waiting in the wings, an alternative Government, equipped with a clear and contrasting policy which would certainly be better, if the return of a Conservative Government would alter any of the fundamental factors in the national crisis, if it would mine more coal or sell more exports or secure more dollars—it might then be right to snatch at the immediate advantage. But doubts hang over all these things, and the present Government are slowly being forced into doing the only thing that a Conservative Government could do at once—that is, initiate a sharp bout of disinflation. And while the advantages of a change are problematical, there is one great advantage to be derived from the Labour Party remaining in office. If they go on as they have been going, they will be soundly beaten at the next election. But that will not finish the Labour Party; it will continue to govern the country, in alternation with the Conservatives, for a long time to come. That being so, the more it has its nose held down to the grindstone of factual reality, the more sentimental nonsense is squeezed out of its beliefs, the more ideological delusions it is compelled to abandon, the better for everybody. All things considered, it is best that the education of the Labour Party should continue.

One of the Five

IN the years after the First World War it was a remarkable feature in world affairs that China was able to conduct an active diplomacy abroad while its domestic affairs were in the greatest disorder. A sense of vast human resources, of great inheritance and of fundamental national strength gave vigour and persistence to the voice of its envoys in international conference, even at a time when there was in China no Government worthy of the name. Today there is, indeed, a Government which has far more authority than the Peking regime of 1919 or 1921, but civil war and economic dislocation, following the long struggle against Japan, have so weakened China as a state that its international status as a Great Power seems a matter more of form than of reality. Yet it would be a great mistake to underrate the importance of China, even at the present time, as a factor in international affairs. China is a giant only half awake, but a giant nevertheless. As compared with its situation at the time of the Washington Conference a quarter of a century ago, there has been a great advance, and among Chinese diplomats there is a still greater confidence in the future. Moreover, the war years have given to China a juridical position which remains as a powerful asset. On the Security Council it is one of the five Powers with the right of veto; in Japan it is one of the four Powers represented on the Allied Council in Tokyo, and it has been established as a convention that it is one of the Big Four for discussion of Pacific affairs. For the Far East, China is the substitute for France in the Council of Foreign Ministers; China protested with extreme vigour when Russia tried to get the Chinese situation put on the agenda of the alternative group of Foreign Ministers, and appears to have gained the point that the jurisdiction of

the western Big Four (and in this context Russia is also western) does not extend east of the Pamirs. The supreme aim of Chinese policy is that there shall never be another Yalta, and Chinese diplomacy has certainly made some progress in building up a position which it will be difficult for the Western Powers in future to break through. But the respite that China gains from the intense rivalry of Russia and the United States is only temporary and precarious; and the Chinese, after their bitter experience of recent years, have an uneasy suspicion that, if the two great ideological protagonists were to be once more reconciled, it would be through new piratical secret bargains at the expense of weaker parties.

This *arrière pensée* determines the attitude China has taken up on the question of the veto right in the Security Council and on the procedure to be adopted for the making of the Japanese peace treaty. On the former issue the Chinese Foreign Minister, on his departure from China to attend the session of the United Nations Assembly, declared that he was "fully prepared to respect the consensus of opinion of the Assembly on the regional restriction of the exercise of the veto," but was not in favour of "trying to amend the Charter itself." As one of the privileged veto-holders China is evidently reluctant to lose entirely the power of blocking distasteful action of the Security Council, especially after the Council's action over Indonesia has revealed its tendency to override domestic jurisdiction. In the matter of the Japanese peace treaty, China has advocated a curious compromise between the Russian demand that the preliminaries should be settled by the Pacific Big Four (the United States, Britain, Russia and China) alone and the American view that all the eleven nations represented on the Far Eastern Commis-

sion should take part. The Chinese proposal is that all the eleven nations should take part, but that the Four Powers should have the right of veto. In view of Moscow's open hostility towards the present regime in Nanking, it is in the Chinese Government's interest that there should be as many nations as possible other than Russia in a conference; on the other hand, China values the privilege of the veto as assuring that its present economic and military weakness will not cause its claims to be treated lightly, and thus finds itself on the Russian side in its fear of international majority voting.

The possibility that the Soviet Government may decline to take part in the peace conference, or to sign the peace treaty with Japan unless its demands about procedure are met, affects China particularly in connection with Dairen. The treaty concluded between China and Russia in August 1945, on the basis of the concessions made to Russia, at China's expense, by President Roosevelt and Mr Churchill at Yalta, provided that the great port of Dairen, the maritime gateway of Manchuria, should in time of war against Japan be placed under the Russian military administration established for the neighbouring naval base of Port Arthur. The Chinese, in their innocence, seem to have supposed that this provision covered only the contingency of possible future aggression by Japan contemplated in the treaty and that the current war against Japan would come to an end with Japan's formal surrender—which was then imminent. But the Russians have ever since maintained that, as there has been no peace treaty with Japan, the war against Japan is still going on and that, therefore, Russia is entitled to continue the military occupation of Dairen and to refuse admittance to Chinese troops. Although in theory a Chinese Government civil administration is allowed to function, it cannot do so without military protection against the Communists and Dairen has thus remained to this day in the hands of the Russians and of local anti-Government Chinese. It is, indeed, difficult for an Englishman to be critical of the Russian exploitation of a legal technicality for keeping control of one of China's principal ports, for the same technicality is used by the British Government to escape from the obligations of the Geneva Convention for the post-war return of German war prisoners. But the crux of the situation in Dairen is that, if Russia does not sign a peace treaty with Japan, it retains a pretext for holding Dairen indefinitely, and this in itself might be a strong motive for not signing a treaty. The Americans, however, are apparently prepared to go ahead with the peace-making, along with other Allied nations represented on the Far Eastern Commission, even if Russia were to stay out. If China were formally to conclude peace with Japan while Russia remained technically at war, it might still prove impossible to get the Russian garrison out of Dairen, but China's legal position would be much stronger than it is now.

The conflict with Russia over Dairen is not, however, the only issue on which China would come to a peace conference with a strong sense of grievance. Since General Wedemeyer's

recent tour of the country, opinion there has been increasingly critical of American occupation policy in Japan and of the new American tendency to grant favours to Japan rather than to China. The Chinese believe that General Wedemeyer has advised against further American economic aid to them while the civil war continues, whereas credits of \$500 million have been announced for Japan, to be secured on gold and silver bullion holdings of the Bank of Japan which the Chinese think should be earmarked for reparations.

China has indeed spoilt its own chances of obtaining American economic support in world competition for dollars; the spectacle of civil war, runaway inflation and administrative corruption in China compares unfavourably with peaceful, orderly and

relatively efficient Japan, quite apart from the pressing need for the United States to reduce the burden of supplying Japan assumed as the responsibility of the occupying Power. Nevertheless, it is only natural that, after eight years of Japanese invasion, the Chinese should have bitter feelings when they find their late enemies regarded by their late allies as more credit-worthy than themselves. Moreover, the first attempts of Chinese industry to export to the South Sea countries have already run into strong Japanese competition, fostered by General MacArthur's administration as a means of enabling Japan to pay its way. There is thus—over and above the Chinese Communist antagonism to the United States, which propagates the doctrine that the Americans have replaced the Japanese as the imperialist menace in Asia—a rift between the United States and China over policy towards Japan, and at the peace conference China is not at all likely to give docile support to the American lead.

Americophobia

(By a Correspondent)

DURING the war economists and publicists who claimed to belong to "the Left" desired and predicted for the post-war world, among other things, increased prosperity, smooth and efficient state planning, friendship with Russia. These things, in this and other countries, have not come to pass, even though there has been an overwhelming political victory for the Left. The Conservative party was easy meat, but Mr Molotov and the laws of supply and demand were made of sterner stuff.

Tendencies repressed by reality show themselves in apparently irrelevant symptoms of a hysterical nature. The main result of left-wing frustration is Americophobia. There is no logical, but a deep psychological, connection between the now so ridiculous prophecies of post-war prosperity or the illusion-tinted programmes put out a few years ago by the Left and the frightened fury against all things American now evinced by the same school.

There had, in effect, to be a safety valve. And what better target for the steam than America? For it is not that country's vices, but its virtues, that are most particularly irritating. An American paper once published a cartoon of a very shabby man, labelled Planned Economy, and a very prosperous man, labelled Free Economy. The caption was "Buddy, can't you spare a dime?" Now in fact the implications of this cartoon were grossly unfair. Economies are planned because they are poor, not poor because they are planned. But the actual situation portrayed is wholly accurate, and this is a most bitter pill for us all to swallow, convince ourselves how we may that it is not our fault. The Left may refurbish Lenin's doctrine of Imperialism, or rightly and acutely criticise US foreign trade policy; they may seize on every indication of a coming slump, or correctly expound the effects of the unequal distribution of incomes in America, but deep down it is "Buddy, can't you spare a dime?" that rankles.

There are a number of fallacies propagated by these people, some barely suggested or merely condoned, some firmly held, some subtle, some merely Soviet, which it would be well to explode:

(1) The unequal distribution of American incomes is indeed the cause of the country's export surplus, but it would take a long time to convert the surplus export industries (e.g., films and automobiles) to the sort of industry that would be demanded by an equalised income structure (e.g., education and building).

(2) The one thing Europe does *not* want to see is a New Deal in America. The more unequally income is distributed there, the more goods can come here.

(3) In any event, the problem that now has to be faced is not so much America's surplus as Europe's deficit. The two are indissolubly united (by the purest chance, be it said), but the thin spouse must be fattened before anybody needs to bother about slimming the stout one. The time may come when the US export surplus is a world problem, but just now we must thank God for it. It is not the surplus that should be complained of, but American reluctance to finance it.

(4) According to Leninist theory, loans from one country to another are merely a means by which the imperialist creditor enslaves the debtor. But loans from one industrial country to another cannot be brought into Lenin's scheme of things. Britain will not become a semi-colonial economy dependent on America, for it is a well-administered nation with a spirit and a tradition of its own, and a skilled labour force ready

trained; nor is it to individual capitalist tycoons that Britain owes money, but to the American state; and, in any event, British goods are competing with, not complementary to, American. If historical parallels are to be sought, Britain must be compared not with Cuba or Santa Domingo but with Germany after the last war. That country built factories, even municipal swimming baths, with its dollars and then defaulted. And there was nothing America could, or even would, do about it, even though Germany was an ex-enemy.

(5) Repayment is not Britain's worry but America's. When the time comes, all the debtor has to do is to insist on offering goods, not gold, or capital, or territory, and the creditor will ask for a "moratorium." In these days of comparative economic enlightenment it should not be too difficult to insist that payment can only be made in goods.

(6) There is very little danger of the Americans getting to own vast blocks of capital in the countries to which they lend, provided the policy set out above under (5) is followed. But even if the debtor does decide to pay in capital, it should be easy to avoid American domination of British industry. To start with, equities or mortgages need not be offered, but only debentures. And even if equities are offered, the percentage transferable in each concern can be limited by law to 49 per cent, or less, or foreign-owned shares deprived of voting rights. If Mexico and Egypt can control foreign capital in this way, why not Great Britain?

(7) It is not true that a slump in the United States in the next year or two—unless it became a very deep one, of which there is little probability—would necessarily do harm on balance to the British economy. There is a vast backlog of demand in every other country in the world, which would hinder the slump from spreading. What might have to be dealt with is a purblind Congressional refusal to lend abroad during the slump. But, if one thing is weighed with another, it is doubtful whether the American public would allow Congress to refuse; the impact of Keynes, Roosevelt and the 1930s has been very deep, and the exporters are already, at the top of a boom, logrolling for more foreign lending.

(8) On the contrary, a slump in the United States, taking place preferably after the Marshall Plan gets through Congress, would enhance the real value of outstanding dollar loans and make producers all over the world more ready to sell in sterling.

(9) This country could not have avoided the initial dollar loan and cannot now refuse another if it is offered. A sudden and complete reduction of British imports to the value of British exports is simply not the most efficient way of going about the problem. It could not possibly be achieved on food, films and tobacco alone without real malnutrition and loss of production; whereas to cut raw material imports would cause loss of production too. In either way, the effect would be to reduce exports and set up a vicious circle. The cut should be sharp, but not big enough to lower efficiency. And in that case it will not be big enough to close the gap. So there is no "dollar noose," only a "no-dollar vortex." It is most revealing with what complacency the extreme Left would sacrifice the workers' standard of living on the altar of an irrelevant Marxist doctrine.

(10) It is not wholly true that the United States is compelled to lend abroad to avert a slump. First, its present charitable export drive is one of the main factors in its rising prices; to some extent a slackening in exports would merely check inflation. Secondly, the United States could easily consume

much of its exports internally, there being still backlogs of demand for many goods and services.

(11) The United States has not been parsimonious or grasping with Britain, rather the reverse. Anyone who remembers George Babbitt and George III, and the fact that the United States is a continent, not a single state, so cannot but move slowly, must be impressed with the extreme generosity shown to Britain; particularly by the Administration, which has many times stuck its neck out simply to give Britain aid to which it had no legal claim.

(12) Trade with the whole non-American world is highly desirable, not only with Eastern Europe (or only with the Commonwealth). But we can only get all the goods we need by going to the United States as well, and we cannot get the credit we need except in North America. If there is one area more certainly unable to supply Britain with more goods or with credit than another, it is Eastern Europe.

American policy must not be white-washed. The tariff, for all the nibblings at it that have happened in the last dozen

Political Plague

IN his new book "Inside USA," John Gunther relates how in front of one of the huge generators of the Bonneville dam he saw a small notice which read: "13,800 volts, 48,000 KW. Caution: Before Operating Read Instructions."

Engineers indeed are not encouraged to be casual or careless in releasing the vast and dangerous natural forces which science has brought into man's service. For politicians, unfortunately, there is no simple book of instructions to ensure safety when they let loose the great forces of human interest and passion; the situations in which political action must be taken are too complex and variable. Yet there are a few rules observance of which will always reduce the possibilities of disaster, and one of them is the advice to avoid anti-semitism like the plague. This principle has unhappily not been followed by the British Government in the last two months. The decision to send the *Exodus* Jews to Hamburg, to disembark them there by force, to put them in places which retain the physical lay-out and accessories of Nazi concentration camps, and to hold them under an administration partly German, was an act of which nobody can yet measure the consequences. It has not only produced an unprecedented hostility and resentment towards Britain among Zionists everywhere; it has also convinced most Germans that Britain is at last learning the truth of what Hitler said about the Jews, and it has thus wiped out at a stroke whatever has so far been achieved in "re-educating" Germany away from the Nazi creed; last, but not least, it has given a great psychological impetus to anti-semitism in this country.

That anti-Jewish sentiment—of a mild brand, it is true, but real enough—flourishes today, though without public expression, in high official circles in Britain is a proposition which only hypocrisy or blind-eyed complacency will deny. Its main source is to be found among those who have been concerned in civil or military administration in the Middle East; this background accounts for its strength in the Colonial Office and the War Office. Its existence in the Foreign Office is due to a somewhat different cause: to the fact that the Foreign Office conducts diplomatic relations with a number of Arab States, and is continually informed by its missions in their capitals how disastrously these relations will be affected by any concession to the Jews, whereas friendly relations with Zion form no part of foreign policy. The outrages perpetrated by the Irgun terrorists, especially the blowing up of the King David Hotel and the hanging of the two British sergeants, have naturally intensified the anti-Jewish trend, and it was the accumulation of emotional pressures which determined the

years, is still monstrously too high for a country in the United States' supremely strong economic position. The American refusal to take seriously the need for a full employment policy—at least to take seriously the need to do anything about it before the event—will in the end cost the world a lot of misery. There is the unimaginative blindness that could force on Britain two such clearly unworkable principles as non-discrimination and immediate convertibility. And there is the infuriating complacency that cheerfully ascribes all America's good fortune to the conscious practice of "the American way of life" and therefore urges it on everybody else, regardless of circumstances, in and out of season. If the critics of American policy would confine themselves to matters such as these they might be listened to. But they so clearly start from the conviction that the United States has acted in bad faith (because, of course, no capitalist can be sincere) and with the determination to prove that America is steering for a disaster (because, of course, no capitalist economy can be allowed to succeed), that they land in false evidence, pure fancy and bad economics.

decision to send the *Exodus* immigrants to Germany. At best it was an act of folly. But it was not due simply to thoughtlessness. There can be no reasonable doubt that the will to "teach them a lesson" played its part in the order to deport the 4,000 "illegal immigrants" as prisoners to the country which has slaughtered six million Jews—including many of the immigrants' near relatives—in the most frightful massacre of modern history.

We did not need to be told that there were no SS atrocities in the Hamburg landing. But the situation was not redeemed because British Tommies carried out an unpleasant duty with their customary decency and restraint and one of them was even seen giving a Jewish child a bun. The point is that Britain has become by the sequence of events the residuary legatee to the maleficent tradition of European anti-semitism. Because of this there is, without any conscious design or sense of common purpose, a convergence between the politely veiled anti-Jewish sentiments of high officialism and the crude, blatant, hysterical anti-semitism of the gutter which is being exploited by Mosley's political friends. Antagonism to the Jews in Palestine cannot be separated from antagonism to the Jews in Britain. Britain indeed now really has for the first time a Jewish question, and no good purpose is to be served by pretending that it does not exist.

Any serious study of anti-semitism as a historical phenomenon must bring recognition that, while it works on grievances which may be called rational, it engenders a terrific emotional force which is utterly destructive of reason and in its extreme development brings on a mood of violence of maniac intensity. It is this emotional force which is the special characteristic of anti-semitism, rendering it so potent an instrument for those who know how to exploit it and so terrible a danger for liberal democracy.

Anti-semitism owes its power to the peculiar suitability of the Jew for identification with the evil power which the unconscious mind postulates as the cause of the disharmonies and breakdowns of modern society. There are many possible ways of attributing blame and thus creating targets for hatred and retaliation. One way, natural to the propertied classes, is to put the blame on "agitators," "radicals" and other subversive elements who are undermining the established order. Another, natural to the unpropertied wage-earners, is to put all the responsibility for human ills on the greed of capitalists. A third way is to blame everything wrong on the wicked designs of foreign nations. There may be good rational grounds in each case for reproach against the human group viewed with enmity,

but always there is the tendency towards a purely mythical personification of the mysterious adversary, and in each country the Jew well fits the part required.

The Jews are a minority which is felt by the national majority to be alien, because it has a separate and not easily comprehensible social existence and also retains physical characteristics which were originally brought by migration from Western Asia and are sufficiently general to give the Jews the appearance of being a distinct "race." This minority, further, has had, as a result of centuries of history, a curious dual development which renders it obnoxious both to the upper classes and to the popular masses. As a result of long exclusion in most European countries from the ownership of land and productive industry and of specialisation in petty trade, usury and speculative finance, the Jew has been traditionally identified with the form of capitalism most oppressive to the "small man." The belief that the Jews flourish best on other people's misfortunes gets apparent confirmation in times of monetary inflation, when certain aptitudes originally developed in the hard school of the ghetto give their possessors a perilous eminence in a sick economy. On the other hand, the old antagonism of the Jew towards a social order which has oppressed and humiliated him, combined with the Messianic hope and moral fervour springing from the Jewish religion but secularised with the decline of religious belief, has produced from among the Jews in modern times much of the political leadership of social revolution. Thus it is possible to build a picture of the Jew who, in his dual role of malignant revolutionary and financial exploiter, can be an object of detestation both for rich and poor, for the haves and the have-nots. It is the art of the Fascist demagogue to canalise all the fears, hatreds and discontents of an unstable society against the Jew and thus in the end to ride to dictatorial power on a tidal wave of popular fury.

The solution of the Jewish question propounded by nineteenth century Western liberalism was assimilation, that the Jews in each country, given full rights and citizenship and freed from hostile discrimination by state and society, should merge themselves in the national community, forming merely a religious sect with no more political significance than any other. But

in our time anti-semitism has defeated assimilation. Assimilation requires that people should forget about the separateness of Jews, that nobody should bother to classify a given individual as a Jew or a non-Jew. But since Hitler's rise to power, what Jew has been able to forget that a Jew is a Jew? Six million corpses have come between the assimilationist and his comfortable ideal. The tragedy of the Jews in this generation has been too great for any Jew to believe in his heart that the three thousand years of his people's history will find fulfilment if he can gain admittance to an exclusive Gentile club. The average British or American Jew has no wish to go to Palestine or to be anything but a British or American citizen, but he cannot reject the idea that some Jews, on behalf of Jewry as a whole, must have an independent national existence. Morally Zionism today holds the field in Jewry; there is really no convincing alternative.

It is this political fact which makes it so alarming that Britain, by a policy which has hardly paid its expected dividends in Arab goodwill, has committed itself for so long to the role of the arch-enemy of Zionist aspiration. The Government's decision to withdraw from Palestine should enable Britain ultimately to extricate itself from this position. But there is still unfortunately a long way to go before we are out of the wood. What is too little understood in this country is that an anti-Jewish policy in Palestine is inseparable from the growth of anti-semitism in Britain. It will not be possible for the Government effectively to check anti-semitism in London or Manchester while the newspapers continually carry reports of violence, reprisal and repression in the Government's campaign to enforce its immigration laws in Palestine. Any steps which the Labour Government decides to take to tighten up the operation of the law against incitement to racial persecution, or acts of racial violence will have the support of all those who care for the maintenance of civil rights and liberties and who know to what deadly mass hysteria such agitation can lead. But the Government must first set the example by not yielding to anti-semitism in high places, and Ministers must make up their minds that the episode of the *Exodus* is something which must never be allowed to happen again.

NOTES OF THE WEEK

Mr Clayton Goes

Mr Clayton's resignation had been rumoured in Washington for some time past, and there is no doubt that the reason given for it, the state of Mrs Clayton's health, is genuine. Nevertheless, the timing of the announcement and some of the attendant circumstances have led to some speculation whether the President and the Secretary of State are turning away from the international economic policy that Mr Clayton inherited from Mr Cordell Hull and has pushed with such fervour. It may be so. But it would probably be wiser to assume, until proof of something more is forthcoming, that the only difference will be a fall in the pressure behind the policy.

Mr Clayton's good intentions have never been in doubt. It should also be remembered to his credit that he was one of the firmest advocates of the loan to Britain in 1945 and of large and immediate help for Europe in 1947. But he has mainly identified himself with the twin principles of convertibility and non-discrimination, and in this capacity there can be no doubt that the harm he has done has greatly outweighed the good. Just how much harm was done by the premature attempt to make sterling convertible into dollars, and by its failure, is only gradually becoming apparent. Trade between every single pair of states can never be exactly balanced, and there must, therefore, be some medium of exchange in which countries can hold their balances—a medium which they trust and which they can obtain for the purpose. Sterling was beginning to resume that function for a large part of the world. But as part of the preparation for July 15th, sterling had to be made much scarcer, so that it was no longer available. And since August 20th it has no longer been regarded with the necessary confidence. Dollars will not fill the

gap, since nobody has any. The attempt to make sterling convertible over the whole world has made it inconvertible even in the narrower circle than it served before. So there is at the moment no international medium of exchange, and world trade is suffering from a classical text-book case of a beggar-my-neighbour deflation. Moreover, any attempt by a group of countries to make special arrangements among themselves to contract out of the universal restriction is banned by the doctrine of non-discrimination, which means, in its most rigid form, that no country can expand other sections of its trade faster than it can expand its trade with the United States—which every country is being compelled to cut. These are the practical effects of Mr Clayton's well-intentioned theories.

It might be wrong, however, to jump to the conclusion that this general condemnation should cover Mr Clayton's latest handiwork, a new tariff agreement between the United States and the British Commonwealth, whereby some American tariff reductions are exchanged for the reduction or elimination of British imperial preferences. It is true that Mr Clayton has been impelled by the bogus doctrine that a preference, however small, is more noxious than a non-discriminating tariff, however high; he is of the school that can convince itself that the British tariff, because it embodies preferences, does more harm than the American. It is also true, according to reports from Washington, that the consent of the British Government was only secured by threats. But, after all, it is the practical effect that matters. Imperial preferences are (most of them) of greater importance as political symbols than for their effect on trade. What the other British

countries can sell in the United Kingdom market will be determined for a long time to come by almost anything other than tariff preferences. And though the same can hardly be said about the preferences that the United Kingdom enjoys in Empire markets, it is certainly true that a loss of export markets in the sterling area in return for an equivalent gain in the United States would be well worth while. Whether that is in fact the effect of the new agreement cannot be said until some information is given of the American concessions. But if it is, it would be a mistake to waste any regret over the false reasoning that has led the Americans to make such a dead set at imperial preferences or any indignation over the tactics that Mr Clayton used to secure agreement.

D-Day for Dismantling

The total of 682 plants to be destroyed or dismantled in the British and American Zones of Germany turns out to be substantially smaller than was once estimated. A number of the works included in the faked lists circulated by Communists in western Germany are now free of the blight of uncertainty. Unfortunately, however, it appears that the list is not really final. In theory, at any rate, another is still to come, when the four Powers have agreed about it, consisting of works in totally prohibited industries such as shipbuilding. The number of them is not large, but its existence destroys one argument in favour of insisting on the present list, which was to show the Germans once and for all where they stand.

Whitehall can produce a most logical case for the dismantlement plan. It has been long and carefully considered by Mr Bevin as well as by men "in the field." They have honestly tried to do as little harm to German, and as much good to European, industry as possible. If pledges are to be honoured dismantlement had to come, for it will be only a very belated fulfilment of the Potsdam Agreement and Paris Pact of 1945. Nearly half the total on the list consists of Category I war plants scheduled for destruction. The rest are for reparations, representing capacity which is clearly surplus to the recently revised level of industry for the Anglo-American Zones. It is undoubtedly true that western Germany could not conceivably make use in the next four years of the capacity which it is proposed to remove; and that the Marshall Plan would be aided if the plants were handed over to countries which could use them before they rot. The nations taking part in the Paris conference have already included the listed plants in their own estimates of production and their gain, it is argued, will be far greater than the loss to production in Germany caused by diverting a proportionately small part of labour and transport resources to dismantlement. The beneficiaries do not all belong to the Marshall Plan group of nations. Russia will receive 25 per cent, for division with Poland. The balance goes to the Brussels Reparations Agency for allocation among all the war-time allies, including Yugoslavia and Czechoslovakia. To Britain, which has not yet received a single complete reparations plant, 28.7 per cent of this balance is due.

This case for the dismantlement plan belongs to the ideal, statistical world where multilateralism and denazification and other mass solutions belong. It takes too little account of the innumerable individual problems which will arise. The British have promised to take these into account. No dismantlement will take place in scheduled factories which have started production until the German authorities have transferred the staff and restored production in another factory of the same type. But the endless complications involved in transferring labour in Germany, with little goodwill from either workers or management, will probably defeat the best intentions. It is true that scarcity of raw materials demands a concentration of production, and that too many plants have been restarted; but life in Germany is reduced to the struggle for food, and the man who is removed from the intricate system of factory bartering and local "contacts" in the countryside is lost.

There will certainly be protest strikes as dismantlement proceeds. But it is quite possible that, given fair food and weather conditions, serious disorders will be avoided. The Social-Democrat Trade Union leaders intend to control any strikes, as they did in the Ruhr last winter. It is highly probable, on the other hand, that combined passive resistance by workers, management and Land authorities will frustrate the whole scheme, unless the troops are ordered to carry it out. It is a melancholy

fact that, while the Germans see only the destructive side of the level of industry plan, the Russians, French, Poles and Czechs see in it only a means to restore the German menace. The British and Americans are making the worst of both worlds.

Five Months Wasted over Austria

A final settlement with Austria seems as far off as ever. Last Sunday the deputies of the Foreign Ministers, having sat in Vienna for five months, gave up trying to agree on the articles left in dispute by the Moscow conference. Their masters, when they meet in London at the end of next month, will have to start again with a 70-page report to help them. It is likely to bewilder them unless moods and attitudes change. For the essential problem—Russian claims to German assets to which the Potsdam declaration gave them a title—is none the easier for having been clarified.

If the very broad Russian definition of these assets had been accepted the result would, according to a spokesman of the American delegation, have been the following: the Russians would have acquired in their zone whole or part ownership of 300 plants, 20 per cent of banking and insurance interests, 500,000 acres of land already seized and virtual control of the important oil industry. It seems, moreover, that these Russian-owned assets would not have been subject to Austrian law—doubtless for fear of nationalisation measures by the Vienna government. The estimate may be exaggerated and it is unfortunate that the Russians were unable to accept the procedure suggested in Moscow by Mr Bevin: that a committee of experts should work through the disputed assets item by item and reach a compromise. The six weeks' wrangle over this proposal which opened the Vienna talks seems to have destroyed whatever willingness to negotiate Mr Novikov may have had when he arrived. Even his special visit to Moscow produced no new instructions. So the opportunity has been lost of getting the Russians to reduce their demands to a figure more like that foreseen at Potsdam.

The chill of the "cold war" between Moscow and Washington obviously affected the delegates, for they failed to agree even on disarmament and demilitarisation clauses. It was expecting too much to imagine that the Russians would subscribe to a guarantee of Austrian independence and integrity, with the Austrian Government's attitude to them stiffening weekly under the stimulus of the Truman doctrine. And the Yugoslav claims to frontier concessions and reparations from the Austrians were made no less distasteful to the American delegate by Yugoslav behaviour on other fronts. Yet the problem of Austria remains far simpler than that of Germany, and if there is any real desire to make progress at the November conference—whether on the Russian or the Anglo-American side—it is in discussions on Austria that it might appear.

Dreamland Closes Down

The Parliamentary session that begins next week approaches with the Government on the defensive. Mr Morrison, last Sunday, talked very sensibly, but he laid himself open to the charge of protesting too much. It is no longer "Who could have done better?" now it is "Anyone else would have done worse." He as good as admitted that the Government had gambled on the chances of getting through this period of post-war adjustments without a fall in the standard of living, without even telling the country of the size of the task before it. Now the cuts have to be "grim and distasteful," far more so than they would have been had not other expectations been aroused. The holiday is over.

The programme for the coming session should reflect the change in mood. In the last session, Parliament was in the main a machine for producing controversial legislation, and its other functions were obscured. In the coming session it appears that the controversial content is to be reduced, and Parliament may become again the proper forum for the discussion of the nation's affairs. So far as economic matters are concerned, there is very little need for fresh legislation at all. The majority of the decisions the Government has made, and of those it has yet to make—or at least to announce—can be carried into effect under powers that the Government already has, both temporary and permanent. If Parliament were no more than a machine for recording decisions taken in Downing Street, or at Transport House, both Commons and Lords would find themselves with more early nights than they have yet enjoyed. Fortunately, Parliament has no such limited function.

Sir Stafford Cripps has pointed out that the extra production that the country needs is no more than an average increase of 10 per cent. It seems a small figure, when written down. It is a big target when translated into a factory. But it is a figure which can be reached, and which should be reached without either too many extravagant inducements or threats of starvation or imprisonment. Parliament and parliamentary discussion are still a centre of interest to the majority of the public. The shape of parliamentary activities and debates over the next six months can do a very great deal to convince the average man that the extra 10 per cent is needed from him, as well as from the man next door.

* * *

The New Austerity

The first cold winds of autumn have blown this week, and the British people have had their first intimation of how warm and well fed they may expect to be in the coming winter. Last year, in the allocation of coal supplies, industry was, wrongly, regarded as the residuary legatee, and the needs of the domestic consumer were put first. This year, as Mr Gaitskell said in presenting his coal budget on Tuesday (discussed in detail on page 651), distribution is based on the principle that industry should have all the coal it needs, on the assumption that the full programme for the export of manufactures will be carried out. Domestic consumers have had allocated to them the same supplies of coal as they had last year, after allowance has been made for an additional number of householders, but as many of them have not received their summer allocation in full, their total supplies may be lower. Moreover, they are warned that they will have "substantially less" coke.

What are the domestic consumer's chances of using more gas and electricity to compensate him for a possible shortage of coal and coke? There is to be no rationing. That was announced by Mr Gaitskell earlier this week—it is impracticable; it would need too much manpower to carry it out. Moreover, absolute priority is to be given to supplying coal to power stations and gas works to enable them to keep going—there is to be no shut-down of industry as there was last winter. Therefore, if necessary, coal will have to be diverted from industry, which uses the same type of coal. Furthermore, it will be necessary unless domestic and other non-industrial consumers reduce their gas and electricity consumption "by at least 10 per cent" below the level of last year, and even if coal supplies are adequate, unless domestic consumption is reduced, the generating stations will be unable to carry the load. In the long run, therefore, industry is still a residuary legatee, dependent on the voluntary abstinence of the domestic consumer.

The drawback is that this voluntary abstinence cannot be relied upon. An exceptionally fine summer presumably enabled the statutory ban on space heating by gas and electricity to be generally observed, but it is not yet known whether the total saving of 25 per cent in gas and electricity consumption was achieved. If not, it is highly unlikely that there will be a 10 per cent reduction in consumption this winter if it is as cold as the summer was hot. With the promise of further instalments of enforced austerity coming to them people are in no mood for self-imposed restrictions. Given a moderate winter, and given a steady output from the mines and no industrial disputes, their fuel consumption may be kept within bounds until the spring—although there may well be many individual cases of hardship. Is the Government again to gamble on the weather, or is it prepared to reduce the domestic consumption of electricity by a stiff tax? The right choice is obvious.

* * *

Food Cuts Begin

On Friday of last week the Ministry of Food announced that the bacon ration is to be temporarily reduced from 2 ounces a week to 2 ounces a fortnight from October 19th. On the previous day Mr Bevin is reported to have said that potatoes may be rationed. This week it was announced that some of the priority rations of milk hitherto regarded as sacrosanct, as well as non-priority catering rations, are to be reduced so that supplies of babies' milk foods can be built up for the winter.

None of these cuts is really serious. The bacon ration is already so small that halving it will not greatly affect supplies of calories and protein, though from the point of view of variety the odd rasher will be sadly missed. There is also room for a temporary reduction in priority milk which is supplied fairly lavishly at present. As for potatoes, people who have queued for single

pounds in the last two winters will probably welcome a rationing scheme if it ensures them definite amounts. There has often been an unofficial rationing scheme in times of shortage, and it is only a pity that Mr Bevin should have spoken out of turn and caused a run on supplies from people wishing to pile up stocks before the shortage is felt.

What is significant about these cuts is that they are the result of some quite fortuitous circumstance, beyond the control of the British Government. The reduction in the bacon ration is due to a strike in Canadian bacon factories. The shortage of milk and potatoes is due to the drought. That these cuts have to be made for such unforeseen mishaps should bring home to people on what a narrow margin their food supplies are based. It should be a grim warning of what may be expected when the cuts enforced by balance-of-payments difficulties begin.

* * *

Half-hearted Budget?

So Mr Dalton has conceded at last that there is a link between the specious buoyancy of Britain's internal finances and the sorry state of its external accounts. The avowed purpose of the Autumn Budget, of which he gave warning just as *The Economist* was going to press last week, is to relieve inflationary pressure. It is true that he still preens himself on the size of his so-called surplus, but the very fact that the budgetary position is, even so, declared to need "further strengthening" is an admission that a Chancellor's duty extends beyond the role of clever book-keeper. In this as in other matters Mr Dalton is trying to save face.

But how will he tackle the political dilemma of the Budget, the dilemma analysed in these columns a fortnight ago? There is unhappily a danger that in this phase of phoney peace Mr Dalton's conversion to the path of virtue will prove to be as half-hearted as the comparable manoeuvres in the phase of phoney war. Rumour affirms, and seems to find some circumstantial support, that the Government remain determined to leave the cost-of-living subsidies virtually undisturbed. If so, Mr Dalton's conversion to disinflation will prove to be a worthless one. On that depressing assumption, the scope for using the budgetary weapon to restrain the torrent of surplus demand would in practice be limited to extension of the purchase tax and other indirect taxes, increases in which would all too probably be combined with a purely political attack on business profits. Such measures could not possibly entrap a sufficient proportion of the surplus incomes, but even if that were not so, they could not reach the heart of the problem, which is to prevent the spending of the surpluses from enticing productive resources into the making of goods for home consumption which the country cannot at present afford. The purchase tax in present circumstances is a valuable instrument, and in particular instances could operate with real force to reserve more goods for export. But as a means of restraining expenditure in general it is of little value unless combined with more direct measures. It operates to mop up surplus spending power only after the goods which it is sought to curtail have been produced and sold.

The only really effective techniques are those which will entrap the income surpluses as nearly as possible at source, and since an increase in income tax (at least on earned incomes) is ruled out because of its disincentive effects, the only remaining direct technique is to reduce the subsidies. That would catch the surpluses at the point at which incomes are spent on necessities, and hence would directly reduce the whole volume of spending upon less essential goods—provided that wages were not stepped up proportionately.

* * *

Can Russia Conciliate?

From time to time, but at increasingly wider intervals, Russian diplomacy has shown moderation and what—to sore Anglo-Saxon eyes—looks like good sense. When that happens it may be difficult to record the fact without a patronising tone or an over-subtle inquiry into motives. Yet the effort has to be made, in the face of Mr Vishinsky's cussedness and violence and in spite of the diplomatic deadlock which exists on every Russian-American front. It is always possible that Mr Marshall's tactics may bring some short-term results, a concession here or a change of attitude there. The time has perhaps come to keep a map of the "cold war" and to watch the movements of the flags day by day for hopeful signs.

There are obviously several diplomatic climaxes ahead of us in the next six weeks. At the end stands the Foreign Ministers'

Conference, about which no one feels any optimism at all, except possibly Mr Molotov. In between comes the end of the United Nations session, with results that must be remarkable either by the failure of the members to accomplish anything at all or by their success in weakening the Russian position; the clarification of the situation between government and Communists in France and Italy; and the celebrations in Moscow for the thirtieth anniversary of the "Great October Socialist Revolution." This last occasion must surely bring some major statement of policy by Mr Stalin; is it quite out of the question that he should analyse the present situation without indicating to the world and the Russian people some possibilities of agreement with the west?

Clearly there is no question of reversing the main trend of Russian policy. Nor is it reasonable to suppose that willingness to make concessions would be shown at the heart of the power struggle, in eastern Europe or in Germany. Nor indeed is it sensible to imagine that concessions would be made in the Briand style, with moist hand and overflowing heart. But the willingness might be shown in less conspicuous quarters of the diplomatic field; it might take the form of restraining action already planned from positions long taken up—for example in the Middle East, or in Asia, or in the economic sphere. So far there is little sign that this is anything but pre-Christmas optimism. But it is worth pointing out and reflecting on the following facts: that the Russian contribution to the Uno debate on Palestine was sensible, moderate and at bottom in line with the American case; that the Russians have proposed that their army and the American troops should both leave Korea in January; and that so far things have gone very smoothly in the London talks on the future of the Italian colonies.

* * *

Investigating the Italian Colonies

The London conference between the deputies of the Big Four about the former Italian colonies has distinguished itself by agreeing fairly quickly and fairly widely. So far its immediate problem has been to appoint one or more investigating commissions to visit the colonies. While the Russians have withdrawn their original insistence on separate commissions—at least for Libya and the East African pair, Eritrea and Italian Somaliland—Britain has given up its desire to have consulted all countries that consider themselves "interested." In particular, this meant surrendering Iraq's claim to be heard.

A single commission of investigation has now been appointed, on which Britain, America, Russia, and France may contribute up to ten members each. No other countries will even be allowed to send observers; and the commission is to leave London during November. Its work is to be completed in not less than six and not more than seven months from the date of departure; the rather unusual specification of a minimum period was made at the request of the Russians. A separate report is to be drawn up at the end of the visit to each colony, and will contain no actual recommendation on the disposal of the territories.

During the Italian Peace Treaty negotiations last year the Russians caused consternation by asking for trusteeship over Tripolitania, the western province of Libya. Since then they have shifted their ground. Mr Kostylev, the Ambassador in Rome, has assured Count Sforza of Soviet support for Italy's claim to trusteeship over all its former colonies. At the same time he explained that the Russian veto on Italy's entry into Uno was due to America's refusal to admit Hungary, Rumania, and Bulgaria, particularly the last named. This was reassuring if tactless.

British policy is now to wait for the reports of the commission of investigation, and the only point on which it must stand firm is Mr Eden's pledge in 1942 to the Senussi of Cyrenaica that they would never again be placed under Italian rule. The French seem merely concerned to oppose the appearance of an independent Arab state next door to Tunisia; they would accordingly be prepared to see the return of Italian rule to Tripolitania. The Americans have so far made no advance on their rather non-committal, and virtually impractical suggestion of international trusteeship for all the colonies. The Italian Government is in the pleasant position of having suitors to the right and to the left.

* * *

Arab Armies and Jewish Garrisons

On October 9th the Arab League decided to ask its member states to mobilise their troops on the Palestine frontiers. Since then wild rumours of concentrations and hasty disavowals of

serious intentions—notably in the Egyptian press—have competed for precedence. The British Chargé d'Affaires has given restraining advice in Damascus and similar cautions may well have been given in Beirut and Amman. It cannot be far from the thoughts of the Arab rulers that the British, through their military advisers, are exceptionally qualified to judge the capacity of the Arab troops for regular, as distinct from guerilla, operations to frustrate the partition of Palestine.

If the Arab states are really planning to put "armies" into the field this can only be because they dangerously underrate Zionist fighting strength. Of all their forces only the Arab Legion of Trans-Jordan—two brigades, partly motorised, under British officers—has any experience of warfare outside its own borders. The others are at best internal security forces and cannot be properly classed as military effectives. Moreover, if one of these "armies" were officially engaged, the prestige of its government would be engaged with it, and the first defeat might mean the government's overthrow. Then there are the diplomatic complications which would be created by an official war, involving British officers and military missions. Demonstrations apart, Arab League support of the Palestine Arabs is more likely to resemble that given by the French Popular Front Government in 1936 to the Spanish Republicans.

The Zionists, too, are victims of dangerous illusions if they believe either that Arab disunity will save them, or that the establishment of a Jewish state will be a walk-over. Arab disunity certainly exists, but it has time and again been shown that the challenge of Zionism is one of the few forces that can overcome it. Likewise the Jews enjoy a false self-confidence because of their extremists' success in terrorist operations against the British and occasional reprisals against the Arabs. Terrorism is easy, but the job of the 70 or 80 thousand men of the Haganah in a partitioned Palestine would be not terrorism but garrison duty. It is doubtful whether the Zionists have any conception of the difficulties of such a task, particularly in a vulnerable economy like their own, which depends on imports for food and for a great part of its raw materials and manufactured goods. The Jews would probably be capable initially of setting up without much trouble a Jewish "state" in as much of Palestine as they wish. But that would be merely the beginning of their troubles.

* * *

Revolt in the Desert?

The west, too—particularly the United States—is dangerously deceived if it thinks that trouble in Palestine can be localised. Once an Arab resistance movement started in Palestine, with strikes, civil disobedience, terrorism, sabotage—whether sporadic or organised makes no difference—the Arab States would be drawn in. None of them could incur the odium of forbidding its nationals to organise help. The Jews would no doubt be based on the coast and would hope for reinforcements from overseas—doubtless with good reason. But, unless the boundaries of their "state" were very small—and this would involve the sacrifice of many settlements—the Jews could not prevent the constant passage of Arab bands to and fro across the frontiers. Opinion in the Arab countries, always excitable and always ready to turn against the west, would get steadily more bitter. In the Middle East press there would be no lack of atrocity stories. From motives of self-interest the Arab governments might at first officially refrain from action against the hostages they hold from the west—oil installations in particular—but security conditions in their countries might in time resemble those in Palestine itself.

The issue of peace or war in Palestine—if indeed it has not already been decided—will turn first on the boundaries of the area assigned to the Jewish State; secondly, as the Russian delegate at Uno wisely observed, on the methods used to build up partition. The western governments must realise that war in this context means not a brief Ruritanian affair of gimcrack armies, but a prolonged revolt centred on Palestine and involving the whole Arab world. The American policy outlined by Mr Herschel Johnson in his speech at Uno is quite inadequate either to avert or quell such a conflagration.

* * *

Infantry Cuts

The War Office is the centre of a universe that is contracting fast and its principal concern must be to see that enough balance is maintained to ensure that contraction is not accompanied by distortion. The latest cuts announced this week are cuts in the infantry arm. All infantry regiments are to consist now of one battalion only. Primary training centres and infantry training centres will be abolished, but the specialist schools, such as the

School of Infantry, will be retained. The general picture, of course, is simply a translation of the total cuts in the Services into the organisational details for one particular arm.

There are two essentials in any proposals such as these. The first is that the standard of training for those men who are left and who do subsequently pass into the Service is not reduced. The second is that the new organisation should be clearly designed to permit of expansion as well as contraction. The second point is not one that can be discussed on the information now available, or likely to become available in the near future. Only experience can give any clues to what the Army as now organised could become if circumstances changed. But it is possible to see at once what is lost, and a serious loss is the primary training centre. The primary training centre served two purposes, basic training and personnel selection. All men coming into the Army passed through such a centre and it was there, on the basis of observations, that they were sorted into categories related to their capacities and aptitudes. In future, men will be put through some sort of personnel selection screening before joining. That cannot be as effective a test as one based on a longer period of observation, and the result may well be a higher percentage of misfits in the various areas afterwards, coupled with fewer opportunities for remedying any mistakes. What has been gained is an extended period of training in a normal infantry battalion, from which the majority may benefit as soldiers. What has been lost—or may have been lost—is the chance to direct the minority who are below average towards activities that they can manage—with benefits to them which may last far longer than their Service career.

* * *

Civil Aviation

The Report of the Select Committee on Estimates, its sixth, on Civil Aviation was recently published (H.M.S.O. 6s.) and is again an illustration of the extremely useful work that the Select Committee undertakes. The current problems of civil aviation raise no acute political issues—provided, of course, the general proposition that recognised civil air services should be carried out by Government-owned operating companies is accepted. There are organisational and financial troubles that are the growing pains proper to a child that is assumed to have an active and brilliant future.

The Committee had no major criticism to make over organisation. It comments that both the Ministry of Civil Aviation and the operating corporations have been “hampered by the Government's delay in announcing their decisions” over the purchase of aircraft and on the development of the airfields themselves (which sounds a tactful way of commenting on the absence of decisions at all). Civil aviation is not the only sufferer and neither department nor corporation can be blamed for that. The majority of the other points under this head are matters of detail which trial and error will solve. Progress is on the right lines. Decentralisation, an increase in the powers and responsibilities of each airfield commandant, the need to keep the structure flexible and to avoid stereotyped methods—all these points were realised by the individuals who gave evidence before the Committee as well as the Committee itself.

The most difficult question is finance. The operating companies ran at a loss. It is inevitable that they should, for the moment, run at a loss, which makes it the more difficult to formulate a sound financial policy. Safety, research, communications, are all in the nature of standard changes which cannot be cut to fit the volume of traffic. If landing charges on airfields are too high—and the Committee inclines to the view that they are—future traffic is discouraged by too great an effort to make the present service more self-supporting. Yet no subsidy, direct or concealed, to an operating company can run on without constant review. One way in which receipts can be increased is by the development of the earning capacity of airfields simply as spectacles or entertainments. There is everything to be said in favour of this, and again the Committee point it out, with no disagreement from the other side.

The most controversial section of the Report is that which deals with aircraft construction. The present arrangements involve quadrilateral negotiations between the constructor, the operating companies and two ministries—Civil Aviation and Supply. The reasons for that are mainly financial; the cost of the development of any new aircraft is beyond the means of either constructor or operating company alone. But the result may be, as the case of the “Tudor” suggests, the creation of a paper system that is admirable in intention and damnable in practice. On this

the Committee say very little; they accept the need for the Ministry of Supply to be responsible for ordering prototypes. For the rest they comment, a little weakly, that they were “impressed with the need for close co-operation” between the other organisations concerned. How is that “close co-operation” to be achieved? This may not have been a question for the Select Committee. It certainly is a question for Parliament.

* * *

Nationalisation of the Banks in Australia

The Australian Government's Bill to nationalise the whole banking system of the country was introduced into the House of Representatives on Wednesday. The Government intends either to acquire the business of banks operating in Australia (this will apparently be the method followed in the case of those banks which are mainly owned abroad—that is, in Great Britain) or else to acquire the shares of the banks which are incorporated in Australia. In either case it appears to be the intention (though it is difficult to be quite sure in the absence of the full texts) to merge the purchased institutions in the Commonwealth Bank so that there will be only one bank in Australia and that fully owned by the Commonwealth. This, of course, makes the step that is being taken all the more serious, since whatever there is to be said for and against the state ownership of commercial banks, monopoly is likely to be at least as noxious in banking as in any other trade, and probably much more so. Unfortunately, the Prime Minister did not give any reasons that would appeal to a reasonable man for this very far-reaching step. His speech, to judge from the cabled summaries, appeared to consist in equal parts of the Socialist doctrine that there is magic in public ownership and of the money cranks' argument that there is something sinister about the Money Power—that is, of two brands of nonsense.

The Bill has aroused enormous controversy in Australia and though the Government is evidently determined to force it through, that may not be the end of the matter, since there is evidence that the Bill is widely unpopular and is bringing to the Liberal Opposition a degree of support that its own efforts have never secured. It is, of course, a domestic concern of the Australian people. It has, indeed, repercussions on this country, since the head offices and many of the shareholders of several of the banks are here. But this external ownership of the banks has not been made an issue in the controversy and it would be a pity to make it so by anything being said or done in England that could be represented as exerting pressure or taking sides in Australian politics. A British interest would arise only if the shareholders were to be unfairly or inadequately compensated, of which there is no present suggestion.

* * *

Corpses and Diamonds

The strange story of the “island of corpses” in the Bay of Hiroshima has thrown a sudden and somewhat disconcerting light on conditions in Japan. After the destruction of Hiroshima by the atom bomb in August, 1945, orders were given for the bodies to be taken to a small island in the bay and cremated there. But the workers entrusted with the task failed to complete it and took to flight, partly because they ran out of fuel and partly because some of them were infected by corpses still radio-active. Several hundred corpses were thus left lying in the open and the fact was apparently known to the local inhabitants who acquired a superstitious dread of landing on the island. Although it was close to a British headquarters, and although both British and American missions made detailed studies of the effects of the atom-bombing of Hiroshima, and correspondents from various countries visited the remains of the stricken city to write up its story, the condition of the island morgue remained unknown either to the Allied authorities or to the new municipal officials of Hiroshima until a month ago, when it was decided to erect a memorial to the dead on the island. The gruesome discovery which was then made suggests that there may be, in other respects, too, more things in Japan than are known to the present holders of higher authority. This impression is confirmed by the less macabre, but no less interesting, story of Japan's missing diamonds, as disclosed by Keichi Seko, vice-chairman of a Diet committee for the recovery of pre-surrender government property. He declared recently that all kinds of government property to the value of 50,000 million yen had been hidden away, mainly military stores of blankets, shoes, clothing and food, but also including some 10,000 million yen worth of diamonds which the government had

bought from civilian holdings during the war as a measure of war-time finance. There is at the moment no recognised exchange rate for the yen, but black market transactions give it a value of about 100 to the American dollar, so that this Aladdin's cave of gems would be worth approximately \$US100,000,000.

China has officially pointed out that this sum would be very useful for reparations, and, alternatively, no doubt the Japanese Government could find a use for it in balancing its budget or foreign trade account. But it is “unlocated.” Between the surrender and the arrival of the American occupation forces it seems that a number of army officers helped themselves to all kinds of stocks in the possession or in the safe keeping of the army and departed without leaving addresses. Japan is a small country, but three-quarters of it consists of mountains, and in any case diamonds do not take up much space. There must be many people in Japan who have an idea where these hoards are, but apparently they are not eager to talk.

* * *

The National Trust

There is no reason why the great increase of state planning activity, and the projected public provision of national parks and major open spaces, need clash in any way with expanding activities of the National Trust. The state's role is one of general provision and supervision; the Trust is a specialist in the management of historic houses and individual estates of special interest and beauty. The Trust's constitution and standing permit of a welcome flexibility in its arrangements with private owners, which would be impossible to the public authorities. Moreover, as the Trust's latest annual report points out,

it will be long before the state machinery has reached the stage when it is able completely to put in force a wise plan of preservation and administration. In the meantime, the Trust in its independent role, and with its 50 years of experience . . . will continue to play as useful and constructive a part as ever in the past.

The activities of the state and of independent preservation societies should continue to be complementary. It is therefore gratifying to note that since 1939 the membership of the National Trust has doubled and its holdings have grown from 49,000 to

126,000 acres (in addition a large area is under its control by means of restrictive covenants). The Trust's activities are in fact increasing faster than its financial resources. Mr Dalton, who counts himself an enthusiastic supporter, has set aside £60,000 from public funds to double the total received from the Trust's jubilee appeal. In addition, the 1946 Budget set up a £50 million Land Fund, which can be used to hand over to the Trust (or some similar body) estates which are accepted by the Exchequer in lieu of death duties. Three estates have so far been dealt with in this way. But the Trust has need of more direct financial support.

There is one grave new obstacle to the Trust's work. Many owners hand over property to the National Trust in the firm conviction that this is the way to preserve it in national enjoyment for perpetuity. Wholesale compulsory requisitioning of land by Service departments and other Ministries (for opencast coal mining, for instance) will play havoc with this belief. The Government would be stupid not to show greater respect for gifts made in a public cause.

* * *

Labour's ABC

Perhaps as a preliminary to the coming Session, the Labour Party has, this week, produced a pamphlet entitled “ABC of the Crisis.” A Party publication is entitled to be a propaganda document and it would be unfair to judge it as though it were intended to be entirely objective. But fair propaganda is a matter of emphasis. It does not justify a distortion, nor a suppression, of the relevant facts and this pamphlet is guilty of a fair amount of suppression. It starts off well enough. Its summary of the export and import situation is an intelligible condensation and put in everyday terms. So, too, is its account of the original American loan. Up to twelve months ago it makes a fair case because it has a fair case to make.

But from the start of the 1946-47 winter there is a change. The suppression is visible in two consecutive paragraphs. One refers to the fact that the fuel crisis of that winter cost this country £200 million in exports. The next glibly talks of Sir Stafford Cripps's announcement of the Government's export policy on September 12, 1947. Is there any explanation of that gap of nine months of brooding uncertainty? Is time of no importance

TI

back their beliefs

TI, with confidence in Britain's future, have staked six million pounds of their own resources on the belief that the country's great reserves of technical skill and 'know-how' offer an effective answer to the difficulties ahead.

The finest skill demands the best equipment, the most efficient processes. That is why TI Companies are now tearing out and replacing old plant, reorganising production methods, acquiring new works, turning to account the lessons of the war.

This wide programme of reconstruction has been planned as a coherent whole, each part fitting, jigsaw-like, into one picture. Its realisation will mean more TI products for the world markets, of TI standard, but at prices to meet overseas competition on equal terms.

Their plans are being pushed ahead with all energy in readiness for Britain's second D-Day, the passing of the Seller's Market—which TI expect sooner than later.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paints—the whole is TI.

Tube Investments Ltd, 3 Grosvenor Square, London, W.1

THE WHISKY LIQUEUR

'GLEN MIST'

Whisky Liqueur

SAVERMO Ltd., 1 Crutched Friars, London, E.C.3

in a crisis? If the pamphlet could truthfully say that all the Government's plans that it summarises were dated January and not September it would be on happier ground. As it is . . .

But to criticise a pamphlet is not to condemn it. It would be ridiculous to expect a political party to place in the hands of its loyal members an indictment of its own activities. The proper question to ask is whether this pamphlet, in the hands of a member of the Labour Party, will have a good effect or not, judged from the national standpoint. The answer to that question must be "yes." The pamphlet does convey a sense of present urgency. It is intelligible and not written too far above people's heads. It finishes with a proper emphasis on production. Of course it could say a great deal more; it might have said a great deal less.

* * *

Sidney Webb

There is something symbolic, if one has a taste for such things, in the death of Sidney Webb ("the person who goes under the fantastical name of Lord Passfield") in this year 1947, at the testing time of the political creed which he did so much to inspire. For the last eight years he had been living in a retirement which the death, in 1943, of his partner in fame could hardly deepen; and except to his personal friends, who were many, there is lost in him a magnificent monument of the past rather than an active force. But what a force he was. He permeated the Labour movement through and through; to the Webb partnership, more

than to any other single factor, is due that characteristic of the British Labour movement which has always distinguished it from all others: its positive appeal to the intelligent and practical bourgeoisie, as distinct from the class-conscious proletariat and the disgruntled intelligentsia. Neither Utopian nor "scientific," without hatred or sentimentality, they documented and formulated the Socialist case, inspired and guided successive generations of Socialist thinkers, and thus contributed overwhelmingly to the building both of the intellectual framework and the trained cadres of the Labour movement.

One wonders what line the Webbs would have taken had they been entering now upon the political scene. What would the authors of "Trade Unionism" and "Industrial Democracy"—that infinitely shrewd analysis of the relation between social mechanics and achievement—have had to say about the machinery of unplanned planning and the uncontrollable proliferation of controls? In the light of their reaction to Soviet communism one cannot imagine that the curtailment of personal liberty would in itself have worried them much. But while they had a profound sympathy and tolerance for the struggles and gropings towards efficient organisation of the ill-informed and technically unequipped, a complacent ineptitude was to them anathema, and to bite off more than one could chew was the unforgivable blunder. Gradualness is inevitable; so Sidney Webb taught his future Socialist leaders, and the lesson was well learned. He did not live to see whether—at all events in the circumstances of the late 1940's—it was also possible.

Letters to the Editor

The Coal Board's Plans

SIR,—In your issue of September 20th, page 495, reference is made to the two sinkings, Rothes (Fife) and Calverton (Nottinghamshire), as having actually started. There could be only one inference from this announcement, and this to the effect that the National Coal Board were in some way responsible for these sinkings. The truth is quite otherwise. Rothes I cannot speak on from personal experience, although I am aware that it had been planned some time ago and it was sunk to a depth of thirty feet or so before Vesting Day. In other words, the actual planning and preparation was completed up to 100 per cent under its original ownership.

In regard to Calverton I can be more specific. You will appreciate that before sinking takes place a great deal of preparatory work is required in regard to proving the mineral area, subsequent rail and road arrangements, and various factors which arise in regard to housing and welfare of the personnel.

Calverton was originally conceived in 1934, and the next three years were spent in the necessary preparatory work, as well as on visits to America and the Continent to level up design and methods with the most recent developments. I turned the sod of the first shaft on June 14, 1937, and by the outbreak of war 75 per cent of the surface plant was completed, and the shaft was being used for man-riding purposes. Had it not been for the war the second shaft would have gone down in 1940. As it was, it was not until January 11, 1945, that I turned the second sod and work on the coal-winding shaft was commenced.

By Vesting Day it is fair to say that over 95 per cent of the planning and arrangements in regard to this pit were completed. I think I can likewise claim fairly that I have been wholly responsible for its conception and general design, in which I have had the advantage of excellent technical help and of the collaboration of Mr G. A. Jellicoe as my architect.

By Vesting Day Mr Jellicoe had completed, within three months, his ten-year task. The first action of the National Coal Board was to give him notice of termination of his contract, although they were subsequently prevailed upon to see how absurd this was.

I am sure that the above will show you how inaccurate it would be to give any impression that the National Coal Board have been in any way responsible for the work at Rothes and Calverton, both of which I believe will turn out to be among the best developments in the mining world.

I feel certain, moreover, that in due course the National Coal Board will do good work and will have every right to claim credit for their achievements; and I am sure that the country and, I hope, ex-coalowners will be ready to accord it. Meanwhile, the

National Coal Board do nothing to enhance their stature by making claim to achievements which were the result of private enterprise.

In this latter regard, the one million additional tons which the East Midlands have produced this year were planned and organised more than two years ago, and would have been produced whether or no nationalisation had occurred.—Yours faithfully,

House of Commons

C. G. LANCASTER

Russian Oil Reserves

SIR,—Since Mr Hughes has drawn me into the discussion on oil reserves, will you permit me to make some comments on your reply to his letter in last week's issue of *The Economist*, and also on the article on "South of the Caucasus" in your issue of September 20th, which started the argument.

The real issue, surely, is not whether Russia's proved oil reserves are 1,000 million tons (which was my figure) or 3,000 million tons, which is your figure "quoted from a recent French official publication." Even if the French estimate is nearer the truth than that of Dr Pogue, the well-known oil economist of the Chase National Bank—which I doubt—it does not warrant the elaborate argument which you construct in your article.

First, you say that oil production in the Soviet Union in 1946 "was estimated at only 22.8 million tons of crude, or about

a quarter of the average production between 1938 and 1940." This suggests that oil production in Russia before the war was over 80 million tons annually. The actual figures were:

1938 32 million tons.
1940 32 million tons.

The five-year plan target for 1950 is 35 million tons.

But by ignoring the slow rate of reconstruction and expansion and concentrating on the hypothetical reserves available, your article then draws this surprising conclusion:

There seems to be no reason to suppose that, in the long run, it is a vital interest of the Soviet Union to have exclusive access to large quantities of oil in Persia or elsewhere in the Middle East.

Once the idea is put aside that Russia urgently needs additional oil which can only be secured from northern Persia, it is possible to concentrate on the other alternative explanation of the resumed diplomatic offensive.

Surely neither of the two assumptions in this paragraph are warranted by the facts.

Russia's policy in the Middle East must clearly be dictated by her short-term acute oil shortage. Even under the most favourable conditions this will last for at least another decade, and cannot seriously be offset by the oil she may produce herself in the very, very long run. Her present requirements have been authoritatively estimated at about 60 million tons annually, about three times her current production.

To go on and argue that the idea that Russia urgently needs additional oil can be put aside in considering her politics in the Middle East seems to me to ignore the root of the whole problem. One has only to compare the production figures in Russia and the Middle East, to see how closely the short-term problem is related to the present diplomatic conflict in Persia and elsewhere in the Middle East.

OIL PRODUCTION IN MILLION TONS

	1946	1951
Russia	22	38
Middle East	32	91

The Russians have to close an annual gap of 30 million tons. Here it is on their doorstep in the Middle East. It seems, therefore, that they have more than a negative or long-term interest—as you suggest—in their recent newly-found activist diplomacy affecting the Middle East, and so have the United States. Can these two very real and conflicting interests be reconciled without continuous troubles in the Middle East? That, it seems to me, is the real issue.—Yours faithfully,

Tribune, 222 Strand, W.C.2

[The error regarding Russian prewar production was explained and corrected in *The Economist* of September 27th. It seems evident that exploitation of the North Persian oilfields would not contribute for some time to filling the gap which Mr Kimche mentions; whereas negotiation with the other interested parties south of the Caucasus would open the way not only for immediate supplies of oil on commercial terms but for a demarcation of vital interests in an area where confusion and uncertainty can only threaten peace.—EDITOR.]

Food from the Empire

SIR,—The article in your issue of October 11th, though instructive in itself, provokes me to question the practical utility of this

This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

FINDLATER MACKIE TODD & CO. LTD.
Wine & Spirit Merchants to H.M. the King

kind of economic analysis, even when, as in the present case, it is specifically stated that potentialities rather than proposals are being discussed.

It has become almost standard practice, nowadays, to begin any discussion of our possible courses of future action by fixing an arbitrary "datum" of consumption "requirements" (which cannot be lowered because to do so would "affect the health and productivity of the nation") and then to do a sort of hypothetical juggling act with the productive resources of the rest of the world. Such an approach to the problem of feeding one small branch of the human family, i.e., regarding our prewar standard of living as the solitary constant among a host of variables whose sum we know to have varied for the worse, may be useful when bidding for Marshall-aid or as a preliminary to a demand for *lebensraum*, but it can have little bearing on the "normal" policy of a peaceful state.

Assuming that we are going to be, in the main, a peaceful state, and that in consequence we may expect foreign suppliers to react to our "requirements" much as the miners reacted to Mr Shinwell's "targets," it seems worthwhile to attempt a new system of forecasting economic permutations. This would consist of estimating the amount of food and other goods we are in fact likely to receive—when the American enthusiasm for lending either diminishes or comes to an end—in exchange for the volume and quality of exports which our present methods are in fact likely to make available.

The resultant figures might then, if you wish, be compared with your "datum"—a process which would at least permit a positive inference to be drawn about matters within our own control.—Yours faithfully,

B. GUY

The Grange, Beaconsfield, Bucks.

Authors' Protests

SIR,—Your review of my book "The Intelligent Man's Guide to the Postwar World," in your issue of October 11th, is a singular mixture of praise and blame. I should not complain of the blame had not your reviewer in effect accused me of intellectual dishonesty. May I assure you and your readers that I have not consciously "whisked" any difficulty "out of sight," though there are of course a great many difficulties to which I do not pretend to know the solutions, nor am I conscious of having lacked "objectivity in argument" nor "a sense of responsibility to the truth." To be regarded as "a slickly disingenuous debater," you will hardly be surprised to hear, hurts me, and I do not believe that the description fits either my record or the treatment of very difficult matters which I took much pains to make as objective as I possibly could in the case under review.—Yours faithfully,

G. D. H. COLE

All Souls College, Oxford

SIR,—In an otherwise kindly notice, in your issue of October 11th, of the revised edition of my book on the "Meaning of Money," you point to what you describe as an "enormous gap" in it, namely "no mention whatever of the relationship between monetary and employment policy." May I suggest that on page 228 your reviewer would have found, "By devaluing your currency you can, it is now discovered, stimulate employment, and

Insurers and Interest Rates

SIR,—Might I comment upon the article in the “British Insurance” section of your *Records and Statistics* Supplement of September 27th?

(1) The suggestion to increase the charge in the premium of a life policy for the right to participate in profits so that “the burden of future unknowns would rest more largely on the policyholders” would have the effect of reducing the initial life assurance cover which a “with-profits” policyholder could obtain for a given outlay. A life company is not a savings bank nor a trust company; its *raison d'être* is to provide life assurance cover. A profitable investment element included in a policy without curtailing materially its essential purpose is, of course, unexceptionable; but the right of participation is designed to provide life assurance cover at cost price to the general body of policyholders and its advantages from an investment point of view should be incidental.

(2) The writer further states that “If the offices continue to conduct their business on traditional lines they would be faced with still larger holding of Government securities.” It has never been the traditional policy of the majority of life offices in normal times to invest a large proportion of their assets in these securities. Before 1914 the amount held was very small indeed, and the large holdings today were mainly acquired during two world wars and give a measure of the support which life offices lent to the country's finances on these occasions. Life offices have in the past been able to secure with reasonable safety considerably higher yields on their assets than those obtainable on Government securities.

(3) The general adoption of the methods of valuation mentioned in the article, under which the value of the assets and the valuation rate of interest are more closely related to market conditions at the time, would not necessarily reduce “the great disadvantage of equities . . . arising from violent changes in market values.” It does not follow that, because equity prices have fallen, circumstances will be such as to justify a raising of the valuation rate of interest. Most life office managements probably consider that the proportion of their funds which they can put into these shares is limited, not by reason of any difficulties caused by the valuation methods employed, but because of the financial caution which their position as trustees of their policyholders' money imposes upon them.

I should like to emphasise the last point that life offices have a prime duty as trustees of widows' money. British life assurance companies have built up their present proud position by adherence to prudent financial principles; that the practices they have adopted in the past have not been detrimental to the interests of their policyholders is demonstrated by the facility by which their contracts may still be sold both at home and overseas.—Yours faithfully,
ACTUARY

A Hungarian Democrat Wonders

SIR,—Professions like Dr Karasz's letter in your issue of October 11th are plentiful from all the police-states; but no propaganda can obscure the real issues. In Hungary's case these are the following:

- (1) The election was the swindle inseparable from the practice of all totalitarians, Nazis or Communists.
- (2) Hungary is a police-state tyrannically ruled by a minority. This again is the characteristic of all totalitarians.
- (3) Hungary is part of the new Comintern, which has just launched an open declaration of political war against real democracy.

It is therefore deceptive to talk of the desire of any of the nine police-states to be on good terms with the West. They cannot have it both ways. We may sympathise with the oppressed who sincerely wish the truth to be different, but we cannot blink the truth. Had we been earlier alive to it in the case of the nazi police-state, the course of history might have been different.—Yours faithfully,
VANSITTART

Denham Place, Denham, Bucks

The Savings Campaign

SIR,—One way of bridging the “inflationary gap” is to encourage people to put more of the national income into national savings—as we have been instructed *ad nauseam* during the last seven or more years. But at the moment, I believe, more is actually being taken out of national savings than is being put in.

Since we are all so sick of the old line “Spend less, save more,” why not attempt to overcome the present unwillingness to save by removing some of its root causes?

One, and perhaps the chief of these, is the conviction that the pound which we save today will be worth a good deal less than a pound when spent five years hence. Controls have proved unable to prevent a steady decrease in the value of money. Why then is it not feasible to preserve the value of savings by relating them to the new price index? This would mean that the money which we save today, would be withdrawn, say, five years hence, plus interest, and adjusted up or down, according as the index has moved, so that the value of the money when spent is roughly equal to its value when it was saved.

If confidence were thus restored, one of the greatest arguments against saving, “What's the use of saving?” would be removed. Were we assured that the value of our savings would remain, many of us would be content to take a lower rate of interest, since at present any interest which we earn may be swallowed up completely in the fall in value of the capital sum.—Yours faithfully,
RAYMOND F. B. FENN

Keble College, Oxford

On the Eve

SIR,—As the Chancellor will not lack advice in preparing his autumn budget, I hesitate to reiterate the obvious. I do so because I am employed in industry, and because I know your Note on page 591 in your issue of October 11 “... the British public still has no idea of what is coming to them...” to be an accurate statement of an appalling fact.

It is of vital importance to bring home the severity of our position to everyone employed in industry, and to emphasise that the only solution is hard work. The best way of doing so is to abolish the food subsidies forthwith, and to grant relief wholly or in part primarily by way of the earned income allowances, and secondarily by increasing the allowances in respect of persons who cannot work (e.g. for children and dependent relatives) and by revisions in old age pensions and family allowances.

Sooner or later, hardship will be the spur. The sooner it is applied, the better.—Yours faithfully,
W. S. HAYES

Oakley, Heath Close Road, Dartford

From The Economist of 1847

October 16, 1847.

WE see with much regret that the conduct of the police is deservedly exciting severe admonition. On three separate occasions, within the last week, at different police offices, police constables have been found guilty of committing gross outrages on unoffending persons, chiefly women, and have been sentenced to various degrees of punishment.

We are not disposed to bear hard on the police constables. In our own experience we have ever found them a well-behaved set of men; but it cannot be doubted that in their dealings with the lower classes, they are extremely apt to be arbitrary, outrageous, and even brutal. Never yet were men placed in their situation who did not abuse their power; nor can such abuses be stopped or rectified by punishment. As long as such a force exists, and it has to deal with such a population as that of the alleys, courts, and lanes of the metropolis, individual constables will continually overstep the bounds of moderation, and be guilty of gross outrages on the humble classes.

To us that seems a very strong reason why the most scrupulous care should be employed in the selection of the constables. There is no means of controlling them in the practical exercise of their authority but their own discretion. They cannot each man be watched by another police constable. They ought therefore to be well educated, well drilled, respectable men. They ought to be men in whose discretion their officers can rely. They ought also, considering rather their responsibility than their labour, to be well paid. Their officers, as well as they, should be called to account when the men misbehave, because on the officers the public depend for selecting men worthy of confidence. . . . In general, brutal conduct in the constables is a *prima facie* evidence of neglect in the inspectors and commissioners, and we shall not have the force what it ought to be till some of them are dismissed whenever the constables require, as at present, to be repeatedly punished for continual misbehaviour.

AMERICAN SURVEY

Mr Marshall's New Wine

(From Our US Editorial Staff)

THE criticism that the foreign policy of the United States is still not fully formed was justified until so recently that it is still accepted, even in Washington—though it is no longer true. Any fluctuations in its operations (and a gradually decreasing number are still visible) are caused by the difficulty the State Department has had in explaining the change to its representatives in distant fields. The steady policy dates only from the time when Mr Marshall took over. Its coherent development has depended on the speed at which he and his immediate advisers have been able to instil understanding of it into an amorphous and far-flung organisation.

American policy had for long been a series of unco-ordinated attempts to put catchwords into practice. The emotional belief of the American people in self-determination had laid them open to exploitation by anyone who could round up enough support to become an “oppressed minority.” The curious result of this irresponsible approach to world politics was that, unconsciously, America became the prophet of disintegration while her own history was an example of integration, and an object lesson in its virtues.

Even the Monroe Doctrine began as an assertion of the rights of Latin American peoples to govern themselves. It was not until the building of the Panama Canal that an American imperialism developed wherever the defence of the Canal was concerned. Moral interludes, of which the diplomatic bout with Perón was the latest, never lasted very long and were allowed only at a respectable distance from the isthmus of Panama. Argentina, previously a marginal state, has, since bombing ranges have been officially extended, become a power to woo. That was the lesson of the recent Rio Conference.

American foreign policy is now made by the new Planning Division of the State Department, which, though it has to be more responsive to public opinion than other foreign offices, has learned the techniques of leading from behind. At the end of the war there was a surge of emotional support for the United Nations—the violence of which was increased by the memory of failure to join the League. So the Russian vetoes, with their threat to the effectiveness of the United Nations, have meant more to the United States than to others because they have interfered with its attempt to rehabilitate its conscience; they have therefore created a deeper anti-Russian feeling. As public opinion has become more firmly anti-Soviet, so has American policy. Mr Marshall, in fact, took a big risk with the original version of his plan, which, before Russia denounced it, was a genuine and sincere attempt to bring Eastern Europe, including Russia, back into the market places—provided they would accept the principle that peoples should be free to choose their own form of government. From the moment that Mr Molotov left Paris the negative side of American policy—opposition to Russian expansion and the extension of Communism—has been ascendant. Subsidiary, but vital to this policy, is the programme of giving aid and comfort to the enemies of Communism.

New political and economic attitudes are called for to make this policy work. Faced with a struggle with Russia America cannot encourage the disintegration of the democratic world while the enemy follows a policy of intensive integration of the countries in its sphere of influence. The Marshall Plan is the first sign of the realisation of the new patterns that the new situation has made necessary. It has now been accepted in principle that a democratic (i.e., Non-Communist) and economically prosperous

Western Europe is vital to the American anti-Communist policy.

Yet in some places the old ideas and the new still overlap. And there will be many struggles between abstract justice and political reality before all the traditional attitudes are abandoned. There have been two recently. The Marshall Plan (or any other policy for reviving Western Europe) needs a strong Netherlands while tradition demands support for the Indonesians. The United States has swung between the two in recent weeks, shyly recognising the present but not quite able to cut out all ties with the past. In the British-Egyptian dispute, again, the same internal disagreement could be seen. It would be dangerous for the United States if Britain were to be driven out of the Middle East. Yet the American representative on the Security Council voted against the Colombian resolution calling on Britain and Egypt to sign a military alliance. This action, it must be admitted, disturbed the policy-makers in the State Department, instead of giving them a glow of self-righteousness—as it would have given their fathers. Mr Marshall would not have refused Britain, as his predecessor did, the trusteeship over Cyrenaica while insisting on acquiring the Japanese-mandated islands for America on the same terms.

There remains the problem of whether the Secretary of State can persuade Congress and the electorate—and his successor, if the Republicans win next year's election. The editor of *Foreign Affairs* said recently that the United States seems to have been consistently one generation late and to have grown up now to the Wilsonian reality. That reality he describes as “collaboration with like-minded colleagues in a world which is gradually becoming increasingly democratic.” Beyond that point, Mr Marshall has to lead his public opinion. Politically he will be able to do it—thanks to the ineptitude of Russian tactics. The doubt is whether the American people are prepared to accept the self-discipline which his policy will require in execution, even when they have accepted it as a doctrine.

One of the greatest difficulties of the present situation is that Britain and Western Europe have gone from creditor to debtor nations, and the United States from debtor to creditor, in one generation. The economists in the State Department—those at least who did not get side-tracked in the old lavender of Geneva—seem to understand this permanent change in the economic status of the two hemispheres better than recent visitors from Europe. But, if a few in the State Department understand, Congress and American business most certainly do not. Subsidies for American shipping and laws making it obligatory for American officials to travel in American ships are ridiculous if the policy is to encourage Britain and Norway to earn dollars by recovering their old positions of carriers for the world.

The Marshall Plan will cost, it has been reckoned, at the most about one-fifth of what the country would have to spend on defence during the next five years if the whole of Europe fell under Communist control. For that reason it will probably be accepted, in part at least. The part easy of acceptance will be immediate relief and “interim aid.” It will take real salesmanship before the Administration can persuade anyone of the need for providing money to rebuild European industry for competition with N. America. Since nobody except Mr Henry Wallace, can think of a policy different, except in emphasis, from Mr Marshall's, Congress will have to face this issue. It is fortunate that the Secretary of State has such an imposing reputation and that his machine is now so formidable. They will have some hard work before their policy is allowed to run a consistent and logical course.

Wheat—or Dust?

(From an American Correspondent)

THE American farmer has been given new reason in recent weeks to pause and think about the parable of the seven good and the seven lean years. Since 1940 most of the big food producing regions of the United States have enjoyed phenomenally favourable weather. Not only has good weather made possible the unparalleled harvests of recent years, but it has largely obscured the steady and heavy drain on farm land fertility which the soil experts know (but as yet have not been able to measure precisely) has taken place as a result of continuous wartime cropping to "soil depleting" crops. But this year flood, midsummer heat and early frost have cut heavily into the corn crop, and now drought has risen like a dark threat on the horizon of the 1948 winter wheat crop.

At least four-fifths of America's grain exports during and since the war have come from wheat, and most American wheat is winter wheat. That is, it is planted in the autumn and harvested the following summer. Practically all of this wheat is grown in the vast, flat Great Plains area in the centre of the United States. More than half of it is produced by five states in the southern half of the Plains—Kansas, Oklahoma, Texas, Colorado and Nebraska.

Here is the heart of the American "breadbasket"—but, unfortunately, here also is the American "dust bowl."

Since the beginning of settlement in the mid 1880s, the Southern Great Plains has been a land of great booms and sudden "busts." One year—or maybe five years in a row—wheat land produces 30, 40 or even 50 bushels to the acre; the next, the crop is so short that it does not justify the expense of harvesting. This summer—the sixth in succession—the Southern Plains produced a bumper crop: 579,662,000 bushels out of an estimated total US winter wheat output of 1,095,648,000 bushels. Throughout the Plains farmers made preparations for a still greater expansion of their wheat acreage. But then the weather changed.

Late August and September ordinarily bring good rains to the Southern Plains. But at the beginning of October most of the wheatlands south of the Kansas-Nebraska border had not had a good rain in more than a month. Stubble from the 1947 wheat crop, which should have been ploughed under weeks earlier, still was standing on thousands of acres. The topsoil was dry and dusty.

Every day's delay in getting the new crop into the ground increases the hazards. Although experts say wheat crops have been planted successfully on the Southern Plains as late as November 1, they say the area already is "skating on thin ice." Farmers need to get a good wheat cover on the ground before the hard winter freezes begin. Otherwise they run a serious risk of losing their crops to the high late-winter and spring winds which are a constant dimension of life on the Plains.

As October arrived dry, many farmers (who had been fortunate enough to get their ploughing done before the drought closed in) planted their wheat in the dust, and hoped that rain would come soon enough to save them. Farmers on the Southern Plains have to hope, because nothing there is ever certain. Seeds for trouble lay not only in the sudden unhappy turn in the weather. They lay also in the ploughing up of new sod land, in

the speculative prices for farm land and in the influx of new farmers from other sections of the country.

Farm land which went begging at less than \$5 an acre less than 10 years ago recently has been selling for \$30 to \$50 an acre. One Soil Conservation Service official in the area reported that by 1945 the average price of land on the Southern Plains had risen more than 140 per cent "above normal"—as compared to a rise of about 40 per cent which he believed to be "justified by the steady demand and good prices" for wheat and livestock during the war. The increase has been sharper since then.

Heavy disc ploughs pulled in tandem by powerful Diesel tractors are turning up sod at an accelerating rate. You can drive for miles across the Southern Plains these days without losing sight of newly ploughed sod ground. Paradoxically, this new "plough-up" is occurring simultaneously with a continuing struggle, started during the "dirty 'thirties," to turn the most badly damaged Dust Bowl lands back to grass. It is a losing race.

The Committee on Conditions of the Great Plains Agricultural Council, a watchdog group of government soil experts, recently found that in 10 Great Plains States 558,114 acres of former "blow land" had been returned to grass (by reseeded or natural vegetation) during the last year. But during the same period 1,335,956 acres of sod was turned under by the plough for the first time. At the same time, the committee found that farmers are progressively abandoning many of the soil and moisture conservation measures by which they profited in the last years of the "big drought" and the early years of the war. Rainfall over the Great Plains—from the Canadian-Dakota-Montana border to Texas—averages about 15 inches a year. Over the long pull, every drop of available moisture must be saved to make farming possible. Yet, a sharp decline has taken place in the acreage farmed on the contour, and a million fewer acres of wheat land were summer-fallowed (that is, left idle through the summer to store up moisture) this year than a year ago.

These are the signs which impress the oldtimers most. Many of them have seen the Dust Bowl country practically depopulated more than once by drought. It happened in 1890-95, in 1910-11 and again in 1934-39. Before each of these tragic droughts the area had experienced a wild speculative spree, such as the one which has been under way since 1942. It is common knowledge that most of the plough-up is taking place in the lightest and sandiest soils of the Plains region—soils which will turn to powder and shift with every wind if the weather stays dry very long. Most of it is taking place in areas where the normal rainfall is considerably less than 14 inches a year—areas where soil experts know farming is not a safe occupation.

It is common knowledge, too, that much of the land is being broken out (and other acres purchased) by men who have come, as they did in other boom times, from the more humid sections of the United States: men who do not know how to appreciate the wind—which, even now, averages 18 miles an hour every day at 2 p.m.; men who have never seen how quickly wind and dust can burn and tear out a wheat crop by its roots. It is because of men like these that some of the oldtimers, who worked their hearts out during the 1930s to save their land, are selling out and leaving the country. The newcomers have been the first to leave when things turned bad in the past, and many of the oldtimers don't want to be left adrift in a sea of dust again.

Of course there are sharp differences between the present boom and the others. Most farm land changing hands now is being paid for by cash; new settlers will be better fortified against hard times than their predecessors. Fewer shoe clerks

from the eastern cities are buying land this time; more of the newly arrived have been farmers somewhere else. New types of farm machinery especially designed to combat dust are coming into widespread use, and there is a much wider application of precautionary soil practices. Maybe when the next drought comes—as the oldtimers know it must—they will be in better shape to ride it out, and more adaptable to the conditions which will confront them. But one acre of land shifting in the wind can destroy crops on dozens of surrounding acres. And when blowing starts, it spreads rapidly. Neither farmers nor soil experts yet are willing to predict that the spring of 1948 will be a dusty spring on the Great Plains. Most of the region still has substantial subsoil reserves of moisture. But the time is rapidly approaching when rain will be too late to prevent serious trouble next year. The danger that Europe's hunger may revive America's dust bowl is a real one, a fact with which the writers of the Paris Report will be forced to reckon.

American Notes

Stop-Gap Aid

It would be very difficult indeed to derive encouragement from the present political picture in Washington. The demand by leaders of the Republican opposition in Congress that lengthy consideration should be given to any substantial programme of long-term assistance for Europe seems to have been accepted more or less completely by the President, who has never troubled to conceal his dislike of the prolonged struggle which he deems to be inseparable from a decision to call for a Special Session, and who now seems to be wholly prepared to abandon the idea, and to concentrate upon the possibilities attaching to what has become known as "pre-stop-gap" aid.

White House conferences this week, attended by Mr George Marshall, and by the Ambassadors to London and Moscow, have produced no evidence that the President and his advisers are seeking any fresh, and immediate, approach to Congressional leaders. They have, however, fortified the belief that the Export-Import Bank will be called in to provide new funds—a measure which itself may require legislative approval—and it is suggested that these funds, along with the distribution of gold seized by the Nazis, may supply altogether something like \$1 billion for the European countries in most desperate need of aid. Such a total compares with President Truman's own estimate that rather less than \$600 million would bring Europe through the winter. But the Presidential estimate conceded only the minimum shipments necessary to avoid collapse in many areas, and there seems to be, as already noted, no solid assurance that the Export-Import Bank, which is scheduled to provide the bulk of these funds, can in fact do so without provoking a new Congressional storm.

Those Americans who fear a breach in Europe's all too fragile barriers against economic collapse are concentrating their criticism as much upon the general lack of leadership as upon the need for a particular date upon which the Congress should reassemble. The theory now seems to be that if Congress is not worried by any thoughts of external crises until the end of December, it may be prepared to stretch the legal interpretations of the powers of the various agencies to grant loans, that it may provide in January an as yet undefined total of emergency funds, and be prepared to settle down to a leisurely scrutiny of longer-term assistance which might not be planned to start until the beginning of the new fiscal year on July 1 next. The pressure of events may well enforce a speedy revision of this time-table, but for the moment the Administration seems altogether to have lost the initiative in the realm of foreign policy (which even Senator Taft was willing to concede to it), and to be throwing responsibility back to Congressmen whose prevailing mood is to wait for clear evidence that dykes have burst before considering how much money would be needed for repair, or even whether the structure is worth repairing at all.

* * *

NLRB Gives Way

Delegates to the annual convention of the American Federation of Labour this week roared their defiance of the Taft-Hartley Act as the machinery of that complicated and still-untested measure moved slowly into gear. The delegates also roared their approval of a general electoral campaign to

defeat all sponsors of the new Labour Act, and more specifically Senator Ball (Republican, Minnesota) for his work as chairman of the joint Congressional Committee on Labour-Management Relations.

The mood of electoral aggression and the new fervour of Mr William Green, the AFL president, no doubt found reinforcement in the internal struggle which has followed from the refusal by Mr John L. Lewis, as head of the United Mine-workers, to sign the anti-Communist affidavits now demanded as the price of recognition by the National Labour Relations Board. This stand by Mr Lewis threatened—before the convention began—to remove all AFL unions from the benefits, and the restraints, attaching to recognition, since the General Counsel of the Labour Board had ruled that the anti-Communist affidavit must be given, not only by union officials, but also by "the officers of any national or international labour organisation of which it is an affiliate, or constituent unit." (Mr Lewis is a vice-president of the AFL.)

Superficially, at least, a complete boycott of the Labour Board had its attractions for the bolder spirits among organised labour. But a majority of the craft unions comprising the Federation were in no mood to decry the jurisdictional advantages attaching to recognition, and Mr Lewis this week discovered that his initial victory on the issue of recognition had been replaced by general disapproval.

*

Meanwhile, the Labour Board has made a spectacular retreat from the decision given by its counsel, Mr Robert Denham, and has now ruled that non-compliance with this provision of the Act by the officials of any parent body cannot be held to disqualify constituent unions whose officials are prepared to sign along the anti-red line. In its decision, the Board has skillfully evaded precision in terms of definition, since, whatever Mr Taft may now affirm, it seems unlikely that his original purpose in framing the Act was to declare the non-Communist oath as constitutional for local unions, and unconstitutional for parent organisations. The Board justified its decision on more practical grounds in the assertion that it had avoided a widespread boycott, safeguarded employers, and held the spotlight on Communist-dominated unions. "No categorical answer," it declared, could be given in terms of legal definition.

This retreat followed from the apparent decision by both the AFL and the Congress of Industrial Organisations to present something like a solid and united opposition to the wider interpretation of the anti-Communist clauses. But the bitter antagonism between the two bodies has precluded a united front, and AFL opposition, enforced for a brief spell by Mr Lewis, never looked very formidable. Since many of the CIO unions could not afford to fight the Federation on ground selected by the latter body, resistance in the CIO itself has been crumbling rapidly in recent weeks. As the annual convention of that body began this week there was a general belief that individual CIO unions would be left to measure their own strength, and to comply with the Labour Act as and where they decided.

*

For Mr Lewis, the path seems to lead back once again to a lone wolf career in the union world. The AFL this week moved towards a vote that would remove all its vice-presidents from office purely in order to deprive the Mineworkers' leader of his remaining right to disqualify AFL workers without local organisations, who thus depend still upon the willingness of Federation officials to record the non-Communist oath. If he has, indeed, lost a major battle for labour unity, Mr Lewis can scarcely complain, for all the brilliance of his personal record from 1935 onwards has not served to allay the suspicion that his private ambitions will, in less favourable circumstances, work to the detriment of those who follow his lead.

New Farm Price Policy

American farmers remain hag-ridden by the fear that the current boom must, sooner or later, be followed by a slump both in home and foreign demand, by the collapse of prices and by a return of the unwieldy stocks which overhung the commodity markets through the deflationary 'thirties. The prospect of heavy relief shipments to Europe continuing through to 1951 has removed some of the urgency formerly attaching to farm policy in the eyes of the Department of Agriculture. But price support programmes will lapse on January 1, 1949, and the farm horizon is limited by the storage bin and the daily column of commodity prices. The need for sustained high-volume output, and the importance of the farm vote compel early decisions in terms of price policy.

The new price schedule which the Department has now issued rests broadly upon the assumption that Congress, with the Council of Economic Advisers, will sustain a high level of national income and employment. As a guarantee against depression, however, Mr Clinton Anderson, the Secretary of Agriculture, proposes to revive the National Food Allotment Plan of subsidy payments for low-income groups as a buffer to potential surpluses. This plan has long received the support of Senator Aiken (Republican, Vermont), who plays an influential part in shaping Senate policy.

Under present farm law the Federal Government extends "parity price guarantees" to the end of 1948 on all major commodities. The guarantees cover at least 90 per cent of a "parity price" which is designed to secure for the farm community prices for what they sell bearing the same relationship to the prices of what they buy as prevailed in the 1909-14 base period. The new index will adjust price levels on the record of the last ten years, but the guarantee level may be reduced quite sharply; Mr Anderson has suggested 75 per cent of "parity" rates which, in fact, have long been inoperative, with most farm prices soaring far above support levels. The new rates would lower parity prices for grains and raise those for livestock and dairy produce:—

FARM PARITY PRICES

	Present Rate, Mid-Sept., 1947	"Modern Parities" Excluding Wage Costs	Including Wages
	\$	\$	\$
Wheat (per bushel)	2.10	1.70	1.79
Corn (per bushel)	1.52	1.34	1.42
Oats (per bushel)	0.95	0.77	0.81
Hogs (cwt.)	17.20	17.20	18.10
Beef cattle (cwt.)	12.80	15.10	16.00
Milk (cwt.)	3.79	4.01	4.22
Butter fat (lb.)	0.62	0.63	0.66

Mr Anderson has rejected efforts to obtain an overall guarantee of farm income, and has also rejected bolder proposals whereby "price floors" would be divorced from parity prices, with Federal support for "export commodities" limited by world prices. Congressional resistance to executive control presumably explains his rejection of a far more flexible system of parity rates for each commodity. The Department notes that retention of the parity formulae means the continuance of marketing quotas and other controls. The new programme will be examined jealously by Congressmen of both parties eager to secure the farming vote. It has secured support from leading farm organisations. The initial political reaction has been more lively. Republicans condemn the "perpetuation of controls" and some Democrats are hostile to any retreat from the generous price guarantees now prevailing.

Rail Rates Up Again

The Interstate Commerce Commission, as suggested in these notes on September 13th, has been quite unable to resist the plea of the railroads for emergency treatment on freight rates. The advance of 10 per cent, effective from October 10th, covers all commodities other than iron ore, coal and coke, on which smaller concessions were granted, and is expected to add about \$125 million to the national freight bill over the remainder of 1947, and probably more than \$600 million over a full year.

Although the decision has followed fairly quickly from the plea first made in September, the railroad managements declare that delay has already made dangerous inroads into net incomes, and they are petitioning for a further substantial advance. The ICC decision will just about offset recent increases in material costs, and the wage increase of 15 cents an hour given to the "non-operating" employees from September 1st. Now the managements are facing claims from the operating Brotherhoods for wage advances amounting to 30 cents an hour, at an annual cost of

\$400 million, along with new working rules (or "feather-bedding" concessions) which might well add at least \$1 billion yearly to operating costs. Resistance to these claims is now very strong, and it is generally conceded that a compromise arrangement is well within union ambitions. But many of the most important lines which are now covering their fixed charges with a comfortable margin would be seriously affected by a heavy reduction in the volume of freight traffic. A further increase in rates is looked upon as inevitable early in 1948. The railroads are asking for a further increase of 17 per cent, bringing the general level to almost 50 per cent above that of 1939.

No Pensions at Ford

Last July the Ford Motor Company made labour history by agreeing to a pension plan for its workers costing \$15 million a year, with a capital endowment of \$200 million to permit immediate benefits. Members of the United Automobile Workers have now turned down the plan by overwhelming majorities, running in some plants as high as 10 or 11 to 1. This reversal of the workers' opinion comes at a time when many companies apparently are convinced that competition for labour means that pension plans are here to stay. Less than 3 per cent of the 10,000 plans established during the war have been allowed to lapse, and new applications continue to come in at a high rate despite the end of the excess profits tax, which provided a war-time incentive.

One reason for the thumbs-down decision among Ford workers is that they were presented with a choice between a straight 11½-cent-an-hour raise, with pay for six holidays, amounting to a total raise of 15 cents and the pension plan plus a 7-cent increase. With the contribution to the pensions plan offered by the Ford Company this would have totalled 22 cents an hour. It was offset, however, by the fact that each employee was to pay in an additional 2 per cent of his pay to the pension plan. The very human tendency to prefer jam today to jam tomorrow was unquestionably strengthened by the high costs, today, of more bread and butter.

Whether this was the decisive factor is hard to say. The struggle for control of the world's largest—or second largest—union still goes on between Mr Reuther and the left-wing; it has been the sharper in recent weeks in preparation for the union's convention in November, at which Mr Reuther hopes to sweep the board. The pension plan, as the brain-child of one of Mr Reuther's rivals, became the target both of the Reutherites and the Communists, who for once found themselves in agreement.

A year ago there was a distinct move among the unions to turn from straight pay increases to holiday concessions and security plans such as pensions and the annual wage. The sharp rise in the cost of living has put a premium on cash down; it has sacrificed the opportunity of establishing a precedent in the Ford Company which might have been hard for the other automobile companies to resist.

Shorter Notes

The Council of Economic Advisers has prepared an eight-point emergency control programme embracing: (1) stringent regulation of commodity dealings; (2) tighter export controls; (3) control of grain supplies for brewing; (4) regulation of millers' supplies; (5) allocation and price control "for a few key items"; (6) regulation of livestock dealings; (7) renewed control of consumer credit; and (8) abandonment of claims for tax relief. For most of this programme the President would need Congressional assent.

The "Eisenhower for President" boom, discussed last week, has touched new peaks following a report in the *New York Sun* that the General will enter the New York State primary elections next spring, in competition with Governor Dewey, for the Republican nomination. The *Sun* also forecasts an announcement by the General immediately after his retirement as Chief of Staff at the close of this year. There has been no denial from General Eisenhower, whose current political views remain a wholly unknown quantity, but who commands, quite undeniably, an extremely widespread public support. As an active candidate, however, the General could well become a less glamorous figure, and Republican managers are still far from convinced that the electoral prospect compels the choice of an "independent" candidate who has played no part in the Party's struggle for power.

Available steel output appeared by error in our Note on "The Domestic Picture" last week at the quite fantastic level of 684 million tons annually. The correct figure, based on ingot tonnage for the first half of this year was 84.5 million.

THE WORLD OVERSEAS

France's Struggle for Bread

(By a Correspondent)

FOR more than two months now Parisians have been eating yellow bread. Despite the substantial tonnages of wheat imported into France since the autumn of 1946 and the long prewar years of development towards a position of self-sufficiency in wheat, France has now been forced to turn to maize, and the French officials are seeking large imports of cereals again during the next twelve months. The effects on world market prices of grains, and the resulting aggravation of Europe's difficulties with its balance of payments are obvious.

One reason for this position is found in the weather of last winter and spring; another in the shortage of tractors, horses and implements. But perhaps the most important reason lies in French policies on prices and control of marketing during the last few years.

Since 1936, when the "Wheat Office" was given full statutory powers for the control of wheat, payments to producers have been determined by a standard formula, based on something akin to the "parity" concept which developed in the USA. This formula adjusts farmers' returns for wheat in the years 1911-14 to present conditions by a coefficient; this is calculated from changes in the cost of living, in the prices of the goods farmers buy, in agricultural wages, and in other charges incidental to production. Discretion was still retained, however, to take other factors into account in determining actual prices. Since 1940 decisions on prices have been a direct Cabinet responsibility.

WHEAT PRICES PAID TO FRENCH PRODUCERS
(Prewar and 1944-45 to 1947-48)

August-July Years	Official Price	Price According to 1936 Formula	"Official" as Per Cent of "Formula" Price
Average :—			
1938-39.....	s. d. 12 2	s. d. 12 10	94
1944-45.....	8 9½	12 2½	72
1945-46.....	13 9	16 5	82
1946-47.....	15 8½	21 3½	73
1947-48.....	29 0	29 9	97

(The prices for 1947-48 are based on information available up to the end of August.)

* French prices have been expressed in terms of English currency by converting the franc at the following equivalents: 1938-39, 1.38d.; 1944-45 and 1945-46, 0.48d.; 1946-47 and 1947-48, 0.37d. These rates reflect the relative purchasing powers of the two currencies more nearly than does the official exchange.

Influenced by the fact that world prices were usually lower* than the price prescribed by the formula, the French Wheat Office has never paid the full amount of that price. Nevertheless, French farmers have had some safeguard against any radical disequilibrium between prices and costs of production. Thus in 1946-47 the wheat price index compared very favourably with the cost of labour and fertilisers, but it was rather low in relation to prices for superphosphates and, of course, very low as compared with the prices of horses, which are scarce.

COMPARATIVE PRICE INDICES:

WHEAT AND SOME PROMINENT FACTORS IN PRODUCTION
(1938-39=100)

	Wheat	Wages	Sulph. of ammonia	Super- phos.	Petrol	Horses	Transport (Railway Goods Tariff)
1944-45.....	72	88	61	87	...	...	65
1945-46.....	113	110	117	174	102	...	65
1946-47.....	129	116	126	171	106	390	128
1947-48.....	238	260	168	214	204	652	146

Apart from low yields, the real cause of the bread problem in France is not disequilibrium between prices of wheat and costs

*For example, in 1946-47 Britain was buying Canadian wheat on long-term contract at 14s. 4½d. per cwt. But USA grain cost 22s. per cwt. in January, 1947, and the Argentine Government asked 30s. New wheat is on offer now in Chicago at 23s. 6d. per cwt.

of wheat production. It lies in the fact that wheat prices have been kept low in relation to prices of other agricultural products, so that farmers grow less wheat than they otherwise would, and feed more of what they do grow to poultry and other livestock instead of selling it. The policy of controlling bread prices, rents and some other basic items in living expenses, while allowing wages to rise very substantially, has left French workers with greatly increased spending power to devote to food: which could not be, or were not, brought under effective control.

PRICE INDICES OF SOME MAJOR FARM PRODUCTS*
(1938-39=100)

	Wheat	Beef	Pork	Eggs	Milk	Butter
1938-39.....	100	100	100	100	100	100
1944-45.....	72	139	164	149	120	164
1946-47.....	129	346	317	552	265	298
1947-48.....	238	454	456	552	282	300

* This table is based on official quotations only. It is generally recognised that a very large proportion of the total output of livestock products only reached consumers at more than double the controlled prices. Butter found purchasers at 6s. 4d. (index 714) per lb. in 1945 and rose to 7s. (789) the following year. Good cuts of beef now make up to 10s. per lb. (index 3490). Fat stock, fat pigs, and table poultry rarely appeared in the open market if it was known that controlled prices would actually be imposed.

The sharp rise of food prices during 1946 reflected an attempt to limit black market transactions by raising the official price to the unofficial level. In spring, 1947, an all round reduction in prices of 10 per cent was attempted, but the inflationary pressure proved too great.

The fact that it paid better to use wheat for livestock feeding was patent to all in the years 1945 and 1946. It was clearly reflected by the black market price for wheat offals and tailings, which was 30s. to 46s. per cwt. in 1946 as compared with a legal price of only 13s. 9d. per cwt. for the best quality wheat. Without much more effective control of the prices and distribution of livestock products, it is too much to expect that small farmers in France will make a real effort to produce more wheat at present prices, and, having produced it, to sell it off the farm for flour milling. The table below shows the effects on production of these policies.

WHEAT PRODUCTION AND CONSUMPTION AND NET IMPORTS
(Prewar and 1944-47) (Grain and Flour in Terms of Grain)

	Area	Total Domestic Production	Net Imports	Total Supply	Total Consumption for Flour Milling and Seed	Remainder Stock Feed Wasted, etc.
1935-38.....	'000 Acres 12,726	'000 Tons 7,837	'000 Tons 228	'000 Tons 8,065	'000 Tons 7,185	'000 Tons 880
1945-46.....	9,348	4,247	1,890	6,137	...	...
1946-47.....	10,030	6,568	495*	7,063*	5,500*	1,563*
1947-48.....	9,385	3,200*	...	...	...	...

* Preliminary.

Thus, whereas 6,137,000 tons of wheat covered all requirements in the year 1945-46, maize flour had to be called upon for bread use in June, 1947, although the 1946 harvest had yielded 6,568,000 tons and 495,000 tons of wheat were imported during 1946-47. Furthermore, in the face of a much publicised world grain shortage, the farmers of one of the traditional wheat-producing areas of Europe actually reduced the seeded area for the 1947 harvest to only 74 per cent of the pre-war acreage. France has already been allocated for September 59,500 tons of American grain which is badly needed elsewhere.

The world now faces a deficit in internationally traded wheat supplies of the order of 18 million tons during the 1947-48 marketing year. And the French Government is taking new measures to deal with the situation. Recognising the inadequacy of the storage and delivery incentives employed hitherto, it proposes once again to make threshing contractors responsible for an accu-

rate report of the quantity of grain threshed on each farm, a method of control which was very unpopular during the German occupation. An area premium of 12s. 6d. per acre is to be paid and the farmer will thus receive the equivalent of some 30s. per cwt. for his wheat, an increase of 91 per cent on last year's prices.

The tables accompanying this article give an idea of the effect of this apparently large increase on the position of the farmer in the current marketing season. Increases in the cost of production have been allowed for, and the apparent gross margins in feeding wheat to dairy cattle and poultry have been reduced considerably. It is significant, however, that the egg market is free and attractive even at the new wheat prices. Quotations for fat stock have advanced sharply during the last two months and the differential in favour of using some bread grain to fatten pigs is larger than ever. Current difficulties experienced in buying milk and butter in urban areas are proof that official prices do not reflect the full pressure of demand. It only needs a parallel increase in the profitability of dairying to destroy the whole purpose of the new wheat price.

Spanish Tight Rope

[BY A CORRESPONDENT RECENTLY IN SPAIN]

LIKE the Balkans, Spain cannot be judged by the same standards as Western Europe. The country's fundamental problems—poor land, great estates, nationalist movements, the undue power of army and church—have to a great extent been solved in other European countries. Its industrial revolution is still in progress. It is extraordinarily insular, and its insularity has been aggravated by the dropping of an iron curtain, isolating it from the ideas, the artistic movements and the political standards of its neighbours. "If this were England," said a Madrid banker, "of course I should be a member of the Labour party." But as things are, with these major problems awaiting solution, he and the great bulk of Spain's financial, industrial, social, military and spiritual rulers, support Franco's regime as the least evil alternative and are prepared to ignore or condone its excesses because, after nearly 150 years of struggle, they regard compromise between Left and Right as impossible.

Actual enthusiasm, even among Falangists, for the present regime is extraordinarily rare, and it is in this that lies the difference between Spain and a proper Fascist country. The Falange is not a Fascist party which grew naturally; early in its life it became part of the official machinery, with the double role of flattering by imitation the Germans and Italians and becoming a comprehensive organisation to embrace all job-holders. Around a small core of real enthusiasts gathered all the *enchufistas*, the men firmly dug into official posts. The result was that ideologically it became far weaker than other Fascist parties, with no dynamic policy and only the trappings left; the usual uniforms, P.T., brass-bands and flags. And, now since the defeat of the Germans, it has become more of a liability than an asset to a regime which would like to present a respectably democratic appearance. Expenditure has not been cut, but the party has been hushed up and smuggled into the background.

The main pillars of the regime are, as is well-known, the army and the Church, both more concerned with self-preservation than with the Government's positive achievements. It is perfectly true that Spain is in effect an occupied country, conquered and occupied by her own army, and it is with military government at its worst rather than with Fascist Italy or Germany that the regime has most in common. The Church, too, is in much the same position, though here there is an increasing minority of dissidents. Events have proved it to be an inevitable victim in any period of civil disturbance, and the majority feel that, although their association with a repressive and inefficient government may lay up greater trouble for them in the long run, the short-term security is worth the price. With the decline of the Falange, too, it has been the Church and Catholic Action which have gained power, and the Vatican clearly does not want to give up this newly-won advantage, especially as it has already a second line of defence. As happened in France and Italy it can always, in the event of change, transfer its support to the Christian-Democrat minority who, by disagreeing, have preserved a decent reputation in the eyes of the opposition parties.

Although the army, the Church and the upper stratum of Spanish society in general see the present regime as the least evil alternative and, faced with another civil war, would support it as in 1936, many differences have come to the surface. The Government's bad economic record has provoked much criticism, and yet it cannot take the drastic steps needed to get it out of its

present difficulties without giving offence to one or other element of its supporters. The black market, for example, cannot be tackled without provoking scandals in the army and administration; official corruption is too widespread to be capable of painless reform; the raw material shortages can only be regulated at the expense of free enterprise. All this puts the Government, with its vague hope of pleasing everybody, in an unpleasant quandary. Inevitably, discontent is growing, particularly among bankers and industrialists. The rise in costs, the social insurance schemes which mean that every worker costs at least 42 per cent more than his nominal wage, controls and shortages, unbalanced budgets, cheap money, increased taxation and the National Institute of Industry with its plans for state intervention: all are most unwelcome to them.

The Split on the Left

It is the Monarchists who represent most closely the feelings of those whose discontent is balanced by their fear of radical change. They have little that is positive in their programme, and they see the problem as one of how to get rid of Franco himself without upsetting the social and political structure of the country. For this reason they are extremely cautious, and their sharing in the recent referendum was undoubtedly feeble. They are frightened of appearing as allies of the Left, and Monarchists in Madrid express horror at BBC broadcasts which suggest that a Monarchist regime would be liberal and democratic. For it is Conservative rather than Liberal grievances of which they set out to be the spokesmen; and whatever they may have against Franco, they have no doubts that they fought on the right side in the civil war. They are thus very reluctant to make any positive gesture.

It is on the point of whether or no to collaborate with the Monarchists that the Left has split. The Monarchists are the only opposition element with a footing inside the regime itself, and without them any attempt to overthrow Franco is likely to result in civil war. On the other hand, their quarrel is more with Franco and the Falange than with the rest of the present system, and they are more anxious to take charge of the machine than to reform it. The Communists emphasise the dangers of such an alliance, while the Socialists and, following their lead, the Anarcho-Syndicalist CNT argue that it is nevertheless the only alternative to a continuance of Franco in power. In this the Socialists are evidently influenced by the consideration that the present situation favours the Communists. The Communists did not organise the Spanish partisans—they organised themselves, and the stories of a Master Mind at Toulouse stirring up civil war is pure rubbish—but partisan conditions are undoubtedly those in which Communists show up at their best, and they favour the party's growth in numbers and influence. So, too, does British policy towards Spain. The Socialists have unwisely tried to justify rather than disown this, and the result has been a tendency to secede to the Communists which seriously worries them. In the circumstances it is natural for the Socialists to wish for a change of regime at almost any cost, while the Communists, who are less impressed with either the possibility of bloodless change or the necessity of forming a regime which will qualify for American aid, can afford to take a longer view.

Growing Unity Against Franco

It is easy to exaggerate the extent to which the Left is split. It is the experienced Republican politicians in exile who are most chary of co-operation, and their divisions are more conspicuous than the sturdily growing unity in Spain itself. Within Spain the ANFD or national alliance of democratic forces, in spite of many weaknesses, does function as a means of consultation between Left Republicans, Socialists, Communists and CNT, with committees meeting fairly frequently even (to judge from Southern Spain) at the town and village level. Socialists of all varieties, Communists and CNT are all represented among the partisans, whose activities seem to be on the increase; and the government, far from relaxing its repressive measures, has had to introduce new and stricter legislation, declare rural areas "military zones" and conduct serious military operations against partisan groups in the Cordoba and Valencia areas.

All of this represents a considerable change from the situation of 18 months ago. Deteriorating conditions at home and the refusal of the Great Powers to remove Franco for them have made the Spanish people more ready to face their problems themselves. In the great Basque strike of May all Republican parties united to make the biggest demonstration against Franco since the civil war ended. The Left's leaders may differ as to methods, but so far this difference has not offset the growing agreement over ends.

Austria Between Two Plans

[FROM A CORRESPONDENT IN VIENNA]

WITH the decision of Czechoslovakia not to attend the Paris economic conference Austria became once again an "Ostmark," the eastern outpost of a world which threatens to fall into two. The economic implications of this are dangerous enough even for the big nations on both sides; for Austria they may be fatal.

Like Britain Austria must export or die. Before the war its foreign trade per head of the population was the biggest in Central Europe, with the exception of Switzerland's. War occupation, and the prolonged confusion of a four-Power administration have left production and foreign trade in a sorry state. The bulk of the badly needed imports of food, agricultural implements and means of transport had to be provided by the Allies, by Unrra and other international agencies. Of the total goods imported in 1946, 79 per cent (by value) came from these sources. The "normal" trade had shrunk in value to about 18 per cent of the 1937 level which, in view of the rise in prices, corresponds to some eight per cent of the 1937 foreign trade volume.

"NORMAL" FOREIGN TRADE (In Million Schillings)

	Imports	Exports
1937.....	1,453.7	1,216.9
1946.....	250.9	219.3

The position was made worse by the fact that the very important invisible items in Austria's balance of payments, the tourist traffic and the transit traffic, had also declined to a very low level.

In such circumstances the only remedy would seem to be a policy which, on the one hand, would try to secure loans in order to obtain the necessary import surplus for the period of reconstruction and, on the other hand, would try to build up as quickly as possible a foreign trade structure which would make such assistance unnecessary. Unfortunately, the Austrian Government's policy so far has been to concentrate almost exclusively on the first line of action. In its desire to obtain American loans it has neglected resolute direction of goods towards exports and has deliberately opposed—for political reasons—essential trade links with Eastern Europe.

The fundamental weakness in Austria's export policy is that of her economic policy in general: lack of control over the use of scarce raw materials. The question "to control or not to control" is discussed at an academic level, while only few seem to realise that argument about principles has little meaning when conducted on a leaking ship liable to sink. This lack of effective control (there is plenty of red tape to drive crazy the honest business man, who really tries to observe the rules) means that a ridiculous surplus of all sorts of unnecessary semi-luxuries exists internally side by side with a shortage of such essentials as nails, while an insufficient proportion of goods is leaving the country. In some cases the producer prefers to sell his goods in the black market at prices which he could never get abroad; in others he will try to leave the income from his exports abroad in the form of precious Swiss francs, pounds or dollars, and thus reduce the already small volume of imports. Such acts, while not the rule, are sufficiently frequent to be disquieting.

The Schilling Undervalued

Then there is the difficulty of the exchange-rate. When the pound sterling was fixed as equal to 40 Austrian schillings, the rate was calculated with an eye on the expansion in Austria's currency volume. But prices had been very rigidly controlled up till 1945 and had risen less than the currency volume would suggest. The consequence was that the schilling was badly undervalued. This meant that Austria could export very easily—the lack of goods set a very severe limit to this—but that it got very little in return. The terms of trade grew increasingly adverse. This undervaluation of the schilling provided a strong inflationary stimulus, which came also from the increased internal spending, as one control after the other lost its effectiveness. Thus prices rose: first in the black market to which former export goods were now diverted, and later also officially, so that prices of many goods reached or even surpassed the world level and found their export opportunities dwindling. Thus Austrian timber houses, which sold so easily in France in 1946, were refused in Britain recently because they had already become more expensive than permanent houses.

Until the present price and currency chaos in Austria has been mastered, it will be difficult to say what the "proper" exchange

rate should be. At present some export prices are still far below world prices, others are well above them. Also, under the abnormal conditions of 1946, many firms began to export which in the long run have no chance of continuing to do so. All this presents a number of intricate problems whose solution is still hardly discussed. The American loan provides a more fascinating topic.

The strength of Austria's foreign trade in the past was the variety of goods and customers dealt with. Raw materials, like timber and magnesite, machines and electrical appliances, tourist traffic, leather goods and arts and crafts, all played their part. Though Germany was the biggest single trading partner, with a seventh of the imports and exports, she never had a commanding position. Goods went to all parts of the world, but the most important area was Eastern Europe. Yet, even before the Marshall offer was made, there was a deliberate attempt to direct trade away from that area and to supplement the western orientation in politics with a similar economic policy.

PERCENTAGE DISTRIBUTION OF THE "NORMAL" FOREIGN TRADE

	Jugoslavia, Poland, Rumania, Czechoslovakia, Hungary		Germany,		Italy,		Belgium, France, U.K., Netherlands, Switzerland		U.S.A.	
	Imports From	Exports To	Imports From	Exports To	Imports From	Exports To	Imports From	Exports To	Imports From	Exports To
1929.....	44	39	21	16	4	9	12	16	6	3
1937.....	39	32	16	15	5	14	14	18	6	3
1947 (1st qtr.)...	21	23	27	6	5	10	39	46	2	7

This policy has already largely succeeded. Though short-term trade agreements have been concluded with the East European states, this was only done slowly and reluctantly, so that in most cases Czechoslovakia got the cream of the business offered. On the other hand, western Europe has now a much bigger share in Austria's trade than was the case before the war. This is above all due to a lively flow of goods to Switzerland, which now takes first place on Austria's export list and second on her import list (Germany keeping the first place, owing to Austria's imports of Ruhr coal).

With the other nations in western Europe trade is still in an experimental phase and hampered by payment difficulties. With a value of 7,366,000 schillings, imports from Britain (in the first quarter of this year) were 4.7 per cent of total imports, and exports to Britain (4,377,000 schillings) came to 4.5 per cent of total exports. Trade with Britain is for the moment concentrated on a few goods and is dominated by contracts whereby Austrian textile factories work for British firms in exchange for raw materials. Thus two-thirds of the imports from Britain from January to March, 1947, consisted of wool and wool-waste, and another quarter of cotton and cotton-waste. The main items on the export list were cotton yarns and goods (44 per cent), cardboard and paper (22 per cent) and silk fabrics (15 per cent). There is no doubt that this trade—as well as the tourist trade now resuming—could be considerably extended and widened.

Role of America

In spite of America's strong influence on Austria's economic policy, it is unlikely that trade relations with that country will ever play an important part. At present (taking again the first quarter of this year) America's share in Austria's exports is actually higher than before the war. But of the 6,538,000 schillings worth of goods that are sent, no less than three-quarters are silk fabrics and glass wares. This is a poor basis for a stable Austrian economy. The slightest fall in American prosperity would lead to a big drop in the scale of these arts and crafts goods.

Tourist traffic, and the export of raw materials, leather goods, arts and crafts, textiles may all bring a big and even increasing income to Austria. But its engineering, electrical and chemical industries cannot be neglected. They always provided an important share of Austria's foreign income. On their foreign sales depended the employment of a large number of highly skilled workers. In a world where the potential of industrial efficiency decreases as one moves from west to east, the eastern edge of a cut-off western half of Europe could only play a minor industrial role. Complete dependence upon America could give Austria immediate benefits. But if it forced the government to sever trade relations with eastern Europe, Austrian industrialists would run the danger of becoming sub-contractors of American concerns.

Hollerith Electrical Punched Card equipment needs no "break" for tea. Its anflagging efficiency ensures maximum speed and accuracy in dealing with every accounting problem.

It is a wise move to investigate the part which Hollerith can play in your Business. Write now for Booklets 2 and 6 explaining just how Hollerith works.

Valenta

IMPORTED JAMAICAN CIGARS
of outstanding merit

Ask your usual cigar merchant for VALENTA (not just 'Jamaican') and you will be sure of getting the foremost imported cigar of today. In three popular sizes—illustration shows Dousita, actual size. Box of 25:
NEFINA 75/-, DOUSITA 83/3, CORONA 97/9

Guaranteed by the Government of Jamaica

"Scarcity alone, Sir, never made anything desirable. After all, Dictators are scarce, but who wants one!"

If you find White Horse Whisky hard to obtain, it is partly because so very many people want what little there is.

MAXIMUM PRICES:—Bot. 25/9, 1-Bot. 13/6 as fixed by the Scotch Whisky Association

BALKAN SOBRANIE CIGARETTES & TOBACCO

THIS ENGLAND... • Number Twelve

THE traditions of our English way of life are many and astonishing. From legal wigs to academic 'squares', from Beefeaters to Bobbies, from top-hatted Etonians to yellow stockinged Christ's Hospital boys, there is no end to the things that are done because they have always been done... In the smoking of pipes and cigarettes some of us act likewise. After all, pipes go back to Raleigh, and it is a pleasant thought that in a modern *Balkan Sobranie* we enjoy the same perfect leaf first discovered by officers who so long ago went with Kitchener to Khartoum.

SOBRANIE LTD. LONDON E.C.1

They've bidden adieu to queues—this couple with the world before them and the friendly sea beneath. They are taking an enchanted voyage in a great Short flying boat. And, like every one of the thirty-odd passengers in their roomy cabins, they have an unrestricted view of the sea-lanes and the coast-lines far below.

Dinner is served—upstairs in the dining saloon. The generous hull of a Short boat permits roomy arrangements on two decks, with cocktail bars, lounges, or other amenities not found in land planes of comparable size. Passengers enjoy dinner in comfort, with the sense of well-being that comes from flying "over the sea in ships."

The trend to flying boats is shown by the routes increasingly served. You can fly by Short flying boat from England to Africa, India, China, Australia, and New Zealand. Also in South America and Scandinavia. Your travel agent has details.

It's fun to fly by flying boat!

THE BUSINESS WORLD

The Doctor's Dilemma

"I OBSERVE," said Mr Dalton last week to the assembled bankers and merchants of the City of London, "that the gilt-edged market has been in the doldrums for the last few months. Before that it looked better. Soon, I hope, it will look better again." It is a familiar theme which the Chancellor has always frankly proclaimed by brassy trumpet and big drum. He affirmed his objective of borrowing "as cheaply as economic and financial conditions permit"—a formula slightly more equivocal than his earlier naming of $2\frac{1}{2}$ per cent as the appropriate long-term rate for Government borrowing. But he went on to argue that the present levels of gilt-edged prices reflected no more than a "temporary lapse due to exceptional discouragements and a period of monotonously bad news." A little rest and a touch of the doctor's hearty bedside manner ought to put the market back to normal—which on Mr Dalton's thermometer is still marked $2\frac{1}{2}$ per cent.

Of course the patient has perked up—tell a man he is suffering only a temporary lapse and he is halfway to convalescence. But if Mr Dalton hoped to restore the market to full health, as he conceives it, he has not been altogether successful. His remarks have been followed by rises of three points in $2\frac{1}{2}$ per cent Treasury Stock and Old Consols with a corresponding reduction in their flat yields from 3 per cent to $\pounds 2$ 18s. 2d. per cent. There is a long way to go before "Daltons" reach par and although a moderate amount of speculative buying has occurred it has been based on the argument that the gilt-edged market could hardly go amiss on a strictly short-term view. So far, at any rate, there has been no sign of the sort of big institutional buying which has invariably sustained the cheap money drives of the past two years.

There is another reason for describing the response to the Chancellor's salesmanship as lukewarm. Gilt-edged dealers have been badly shaken by the fall in gilt-edged prices this year, and the anaemia which has long been notorious in other sections of the market has now affected the Funds. In its prime, this was a market where a price in a quarter of a million pounds' worth of War Loan would be quoted with a turn of one-sixteenth—a mere fifteen pence per $\pounds 100$ between the buying and selling prices for stock running into six figures. But conditions are very different today. It is difficult to get a close price in more than $\pounds 10,000$ of stock; in large amounts, the turn is often as much as half a point. These illustrations show the anxiety of the market at present to take no extended position either way; and they explain why, when the market trend is reversed, prices swing round very sharply and it becomes as difficult to buy as it was to sell a few hours earlier. Given the thin markets which prevail today, it might have been expected that Mr Dalton's observations on gilt-edged prices would have made a much sharper impression than, in fact, they have done.

Evidently, even the gilt-edged speculators who have usually been quick (though not so quick in the last six months) to follow Mr Dalton's lead are now sceptical about his ability, or his willingness, to undertake a new cheap money drive of the old pattern. The possibility, to be sure, is not absent from the Chancellor's mind, for in a passage of almost cynical frankness, he pointed out that the lapse in prices during the past six months occurred in a period "when it was not necessary for the Government to borrow," except on floating debt. Further reflection

on these words does nothing to abate the suggestion in last week's issue of *The Economist* that the Chancellor must have meant to imply that if the Government had found it necessary to borrow, it would have supported—in plain English, rigged—the market. The next two months will be very different, for on January 1st the Government has to issue, with the backing of its own guarantee, some $\pounds 1,100$ million of British Transport Stock. Under the terms of the Transport Act, this will be "a stock" (the use of the singular presumably rules out the suggestion of alternative stocks of varying dates and rates of interest) which "in the opinion of the Treasury" is equivalent in value to the compensation already fixed for the different classes of railway stocks. To this, Mr Dalton has added that the Transport Stock will be redeemable "within this century."

Obviously, the only basis by which "equivalent value" can be calculated is by reference to a gilt-edged stock bearing broadly the same redemption terms as the new Transport Stock. This, in effect, is what the Act prescribes. "The opinion of the Treasury" will have to be supported by the behaviour of the comparable gilt-edged stock over a respectable period of time before the appointed day. Equally, the Chancellor would hardly escape the odium of sharp practice if he procured a rise in the gilt-edged market before the take over, in order to float off the compensation stock on favourable terms, and then took no responsibility for what happened thereafter.

Until the Chancellor spoke ten days ago there was a general disposition to believe that he might be prepared, reluctantly no doubt, to consolidate his cheap money policy on the line of 3 per cent, and to abandon the $2\frac{1}{2}$ per cent outpost. But there is a passage in his speech which suggests that this may not be the case. He admitted that he was well aware of the prevailing view in the City that $2\frac{1}{2}$ per cent is "unreasonably low," but suggested that claims for higher rates on Government loans might be regarded outside the City as ill-timed and unseemly. That may be so, though it is difficult to see his point in recalling the proverb that sauce for the goose is sauce for the gander now that the lender on Government security gets much less (and after income-tax, far less) while the man who receives income from profits or wages gets a good deal more than he did before the war. The whole point of the doctrine of the euthanasia of the rentier—or the policy of pushing cheap money to extreme limits—is precisely that what is sauce for the goose is not sauce for the gander. And that would still be true even if the goose were garnished with 3 per cent sauce.

If, however, the goose refuses to be cooked except on its own terms, what can the Chancellor do about it? Can he muster sufficient pressure in the market to secure his own terms, or something nearer them than 3 per cent? He may get some assistance from the disbursement of War Damage payments next month, of which part—though perhaps a relatively small part—will find its way into the gilt-edged market. Then there is the Argentine railway compensation amounting to $\pounds 150$ million; much of this belongs to trustee holders, and will have to be reinvested directly or indirectly in Government securities. But an oppressive silence has descended on the negotiations in Buenos Aires about the payment, which was due 30 days after the sanction of the Court had been obtained to the scheme. This sanction was given as long ago as

The truth game

"Glad you like this sherry—it's South African."

It's extremely good. I got some South African wine the other day....

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines

as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

SOUTH AFRICAN WINE FARMERS ASSOCIATION
(LONDON) LIMITED

August 21st, the day after the convertibility of sterling was suspended, and evidently this new factor in the situation has caused delay. Whether it will be exploited as a reason for reopening the bargain has yet to be seen. All that can be said at present is that the timing of such aid as the Argentine railway purchase may bring to the gilt-edged market is by no means certain. And there are only ten weeks to go before the terms of the Transport Stock have to be fixed.

There is also the question of how the repayment will be financed by the Government. The Argentine sterling balances, which will provide the bulk of the purchase price, are at

* Yields to earliest date where not otherwise indicated. † Yield to latest date. ‡ Flat yield

present lent to the British Government against floating debt created when the debt to Argentina was incurred. To enable Argentina to use these balances to pay out the stockholders, the Treasury must repay the debt, and to do so it must first raise the cash. In present market circumstances it is unthinkable that the Chancellor would attempt to raise the wind by forcing departmental holdings of long-term securities on to the market. Hence he has no alternative but to borrow on floating debt from the banking system. The Argentine pay-out will therefore inevitably involve an inflation of domestic credit; but, to the extent that the reinvestment demand of Argentine rail stockholders so far relieves the gilt-edged market as to enable the authorities, if they thought fit, to sell departmental holdings, a portion of this additional credit would eventually be cancelled.

From the Chancellor's point of view, the necessary mechanics

of the operation are therefore rather convenient; he has a good excuse to create more credit, in the knowledge that some of it will find its way into the gilt-edged market. But when that has been said, it is surely inconceivable that, on the eve of a Budget which is to be devoted to relieving inflationary pressure, the Chancellor would be prepared to heighten still further the very forces which he is endeavouring to suppress—to produce at one and the same time a Budget of unparalleled austerity and a Stock Exchange boom of unparalleled ferocity. He can no longer count on the sedative effect of the American loan in countering the visible effects of inflation at home—save, of course, to the extent that sales of gold perform the same function. What then remains? Thinly veiled "requests" to City institutions to accept 2½ per cent as the right rate? But the City cannot hoist itself by its own bootstraps. It functions through the Stock Exchange, which, for all its imperfections, is still a market where prices are determined by the balance of supply and demand. Does Mr Dalton propose to change that?

Last week, the Chancellor made his now-familiar diagnosis of the gilt-edged market, but he was careful not to say anything about his prescription. He rules out higher rates of interest on the not wholly convincing ground that under present conditions they would not assist the work of the controls in "screening" capital projects. And he repeats the familiar—and surely exaggerated—proposition that a rise in interest rates would increase the already heavy burden of the public debt. Leaving floating debt out of the reckoning, there are £1,800 million of stocks and bonds which are finally or optionally redeemable during the next three years, and even a rise of half of one per cent on the average on these issues would add no more than £9,000,000 to the cost of the National Debt—and this would be subject to taxation. Would that be a devastating addition to inflationary pressure? Might it not be a fair price for a modest lever to help in bringing that pressure under control? This is not an argument for dear money; but it is an argument for a sense of perspective in the pursuit of cheap money at a time when the real rate of interest may be four or five times higher than the return on Government securities. There is no tolerable rate of interest under present conditions which would bring the demand for and the supply of real capital into equilibrium. But equally no policy is acceptable which threatens to widen the already extreme gap between the two rates. That is the Chancellor's dilemma. He has built much on the assumption that the railways might be taken over on a 2½ per cent basis. He should have the courage to re-work his sums of the "profit" from this operation on the basis of 3 per cent, or perhaps a little less, simply because that rate fits the facts of the market, and cannot be manipulated in his favour without running grave inflationary risks. That it might also secure more reasonable treatment for the railway stockholder is, in that context, only incidental.

Winter Coal Supplies

WHAT the Ministry of Fuel and Power has lately lost in volubility and volatility has been more than made good by the straightforward clarity of Mr Gaitskell's remarks on the coal problem since he became Minister. There is more scope for confusion and misunderstanding about coal figures than about any other industrial statistics. There have been times in the past—the summer coal budget in its original and revised versions was certainly one—when even those who are practised in the devious task of unravelling the figures had to admit defeat. It is a great relief to have the figures clearly explained and assembled in a winter coal budget which, as far as is possible at this early stage of the winter, carries a convincing air of good sense.

The new Minister begins the first winter for which he has direct responsibility in a much happier position than his predecessor twelve months ago. For that, he and his present Minister in Chief deserve much of the credit. Last autumn, of course, everyone knew about the imminence of a fuel crisis except the Minister himself—as Mr Shinwell proudly boasted six months too soon. The new Minister stops short of guaranteeing that industry will get its needs met in full, whatever happens. But the programme of coal supplies this winter—"not targets or aims which we should like to achieve, but hard objective estimates of what we think is likely to happen"—contemplates no cut in industry's full consumption requirements. It is only six months ago, in the panic atmosphere of the fuel crisis, that industry was being allocated a total coal supply which would have covered no more than two-thirds of its summer requirements. Panic gave place to the realisation that this sort of planning meant industrial suicide, and the basis of the summer supplies was later revised for the five months June to October to supply industry at the same level as in the summer of 1946—that is with roughly 85 per cent of its solid fuel requirements.

To give even a guarded promise that industry's fuel requirements will be met in full during the winter is at least one bright feature in a dark industrial scene. How is it possible? First—let it be recorded with all solemnity—a target has been achieved, and even bettered. Coal stocks at the beginning of the winter coal period (which runs from November to the end of April) are likely to be 15½ million tons. Instead of adding 4,000,000 tons to the stockpile as in the summer of 1946, 9,000,000 tons have been added. The crazy risks run last year when the winter coal season started with less than 11 million tons of distributed stocks, are not to be repeated. But, as Mr Gaitskell properly emphasised on Tuesday, the improvement of 5,000,000 tons in summer stock building is not altogether meritorious. Two million tons have come from the elimination of exports during the summer—at a time when British coal was never more sorely needed abroad. Of the increase of 1.3 million tons in coal supplies this summer, nearly half has come from imports. Thus more than half of the increase in stocks has been due to the failure of the industry to produce and export. And a bright summer has largely to be thanked for the saving of 1.6 million tons in internal consumption of coal, compared with the summer of 1946.

When industry was brought to a standstill last February, coal stocks were 5½ million tons. Mr Gaitskell has put the minimum figure for safety at 6½ million tons—and that will be none too high for comfort. This leaves a total supply to be drawn from stocks during the winter six months of 8½ million tons. Output of deep-mined coal in this same period is put at 97 million

tons and of opencast coal at 4½ million tons—together they produced 97½ million tons in the winter months of 1946-47. Total supplies for the winter 1947-48 should therefore amount to 110 million tons. The estimate for winter production makes certain optimistic assumptions—that there will be a net gain in output from working longer hours (about which two precious months have already been wantonly wasted), and that production will average 3½ million tons a week. An output of this order is by no means impossible, as the results obtained in the first flush of enthusiasm after the five-day week was introduced last May clearly show. But if account is taken of holidays it means getting 3.9 million tons in most weeks, and that is a figure which, as Mr Gaitskell frankly pointed out, has only been touched on one occasion this year. As for the increase of 500,000 tons in opencast production, much depends on the weather and the introduction of new American diggers. None of these assumptions is necessarily unrealistic, but it is as well to recognise that they have been made.

Inquests on dead targets are not very profitable, but a few tears on the "indispensable minimum" of 200 million tons for coal production this year which the "Economic Survey" proclaimed are called for. It was obvious, even on that bleak February morning when the target was set, that it would not be hit. The best revision which Mr Gaitskell can offer is 197 million tons, and the coal account has been balanced only because consumption this summer was 3,000,000 tons lower than was expected. The "most drastic economy" which the "Economic Survey" contemplated has been further stiffened, and perhaps those who were busy earlier this year with arguments that the coal target should be raised to 225 million tons have now learned a little realism.

Given total supplies of 110 million tons this winter, how are they to be distributed? The detailed answer is given in the accompanying table, which sets out the figures for industry, public utilities and railways, domestic and other consumption, and bunkers, and relates them to production and changes in stocks. The budget for the coming winter and the actual consumption for last winter were given by the Minister. The original summer budget is also included in the table, not because it had any contact with reality, but because it provides material for a diverting study in comparative planning:—

COAL SUPPLIES
(Million Tons)

	Consumption Last Winter Nov., 1946- April, 1947	Original Summer Budget May-Oct., 1947	New Winter Estimate Nov., 1947- April, 1948
Large industrial consumers	19.87	17.6	23.51†
Electricity	15.50	11.8	16.45
Gas	12.70	9.7	13.75
Coke ovens	9.70	5.2	10.75
Railways	7.70	7.0	7.50
Collieries and miners' coal	8.40	7.4	8.70
House coal	16.30	12.8	16.90
Other merchants' disposals	1.38	1.2	1.30
Miscellaneous	8.34	5.2	8.34
Inland distribution	99.89	77.9*	107.20
Bunkers	2.90	3.1	2.80
Production:—			
Deep-mined	93.8	83.0	97.0
Opencast	3.7	6.0	4.25
Change in stocks	-4.86	+10.0	-8.75

* Less 2 million tons to be saved by oil firing.
† After allowing for 900,000 tons saving by oil firing.

Large industrial consumers should get no less than 23½ million tons this winter, plus the equivalent of 900,000 tons in the form of fuel oil. This represents an increase compared with

1946-47 of nearly 25 per cent, and industry as a whole will have no cause for complaint if it receives a total supply of this size.* Of the other allocations, electricity requirements (already covered by stocks to the extent of 5½ weeks' winter consumption) have again been generously conceded—come what may the power stations will not go short this winter. A 10 per cent increase in coal for coke ovens recognises the still severe shortages of coke and pig iron—both urgently needed to sustain the increased target for steel production next year. By this means, the steel industry will get 25 per cent more coke than it did last winter. Railways are slightly cut, while domestic and miscellaneous consumption remains on the same basis as last winter. In addition, the household consumer is expected to make a 10 per cent saving in electricity and gas.

These figures relate to the broad sections of industry as a whole. They are based partly on the assumption that firms in each of these sections will have enjoyed an equal opportunity to take coal into stock during the summer—an assumption which has been qualified by disputes and other interruptions of supply. When the summer re-stocking target of 15 million tons was set, the Government gave a specific undertaking that the size of stocks held by individual firms would not be taken into account in fixing their winter coal allocations. For steel firms, this undertaking has been replaced by another which ought to provide each company with its full requirements. For the rest of industry, the undertaking stands, but it is coupled with the assumption that each firm can draw upon stocks to the extent of 2½ weeks' supplies (10 per cent of requirements, or 1,800,000 tons). By the end of the winter, the steel industry should have 1½ weeks' supply of coal in stock, and industry generally about 2 weeks' supply. For those companies which have been unable, for causes beyond their control, to build up stocks during the summer to the required level, supplementary

*A recent note in *The Economist* did less than justice to the planned supply of 24½ million tons—now slightly bettered—to industry this winter, by suggesting that it was less than the summer allocation. The table above shows that this is not the case, and the confusion arose partly because Sir Stafford Cripps's original forecast of winter supplies to industry a month ago did not make it clear that coke ovens were excluded.

Business Notes

Markets and Ministers

One by one the leading Government spokesmen are tuning their speeches to the same sombre pitch, and are now approaching unison upon the austere note first struck and least waveringly held by Sir Stafford Cripps. In content, there was nothing novel in Mr Morrison's speech last weekend, but his tone reached new depths. Three months ago he was talking mildly of the prudence of carrying an umbrella because of a passing shower. Now he is grim and earnest, and the metaphor changes to the choice between the "fatally dangerous way and the sound way," with doubts whether even that choice now remains. It was perhaps this contrast, this proof of belated progress towards realism, which most affected the City. The speech had more discernible effect in the markets than the much more informative "downward spiral" speech from Sir Stafford a week earlier, and even than the first announcement of the export programme. Industrials in the closing phase of the last Account faced a fresh bout of weakness in narrow markets, and the *Financial Times* index on Tuesday stood nearly seven points below its level of ten days ago (but a similar amount above the nadir touched early last month). It is naturally impossible, however, to apportion responsibility for this weakness between the Chancellor's confirmation that a new budget is imminent (the share index dropped two points on the morrow of his Mansion House speech) and Mr Morrison's warnings of the unpleasantness of the industrial change-round and of deepening austerity. For investors, the industrial uncertainties—heightened as they are by the risks of Whitehall bottlenecks on the one hand and the rapid changes in overseas markets on the other—are perhaps the more important; but it is questionable whether the Stock Exchange takes this view. At all events, the coincidence of the opening of the new Account with the announcement of a winter

allocations will be made through the machinery of the Regional Boards.

Here, at last, is a coal budget which is intelligible and reasonable. If it errs towards optimism on the side of future production, it may be also that it sets out to give industry slightly more coal than will, in fact, be consumed this winter. It would be altogether too optimistic to suppose that the winter coal budget represents the turning point in the coal situation. Indeed, its success is the measure of failure to supply any coal at all for export. Coal-hungry Europe will certainly be looking enviously at British industry going flat out this winter—or, perhaps more accurately, not prevented from doing so by lack of coal. The Paris Report contains an undertaking that Britain will export 6 million tons of coal to Europe next year, to which the Minister of Fuel and Power has added the postscript this week that if this is to be done, the job must be started before the winter is over. "We will," he said, "probably be pressed to start soon." But his estimates of production this winter are not so optimistic as to suggest that towards the end of the winter supplies will be running sufficiently above the present level of requirements to provide half-a-million tons a month for export. The export target next year is more likely to involve cuts at home; and the only consumer who can be cut is the domestic consumer.

Meanwhile, for this glimpse of realism in coal budgeting, industry will be grateful. True, it might be fairly described as "pit-head budgeting"—at least on present indications of a severe shortage of coal wagons this winter. In view of that shortage, it may well prove to be a good thing that the miners insisted on having their way and working on Saturday morning instead of an extra half-hour on five days. There may be risks of increased absenteeism among the coal producers as a result, but an extra half day will make a great difference to coal movement. Present shortages of coal supplies and of transport to move them could not decently be accompanied by the shocking waste of loading and transport facilities standing idle on two days every weekend this winter. Given the transport, the coal budget is capable of realisation. But transport (as a later note shows) may be a serious threat to its achievement.

coal programme which might have been expected to be regarded as tolerably reassuring for industry quite failed to arrest the market trend.

At least until the budget, the markets will obviously remain both narrow and cautious. Is there any budget portent in the fact that the problem of industrial costs, previously rather neglected in Ministerial speeches, was selected for special emphasis both by Mr Morrison and Sir Stafford? To the extent that Government policy can check the rise in costs or influence a reduction, it is with the Chancellor rather than with his colleagues that the initiative lies; and now that Mr Morrison has dropped his voice from the note of truculent optimism it is Mr Dalton whose tone is most jarringly out of tune. Certainly, it is his turn to pipe down. But the kind of budget which is now most commonly expected—there is some discussion of the probabilities in a Note on page 632—would impose only indirect and secondary pressure upon the costs level, though it would tend to restrain the rise. The first effect of a budget of indirect taxation, whether or not combined with a reduction in subsidies, would be to raise prices further, and hopes of a reduction in the unit costs of industry would then have to rest wholly upon the chances of preventing a further rise in wages and of securing greater efficiency from labour and management—apart from the uncontrollable factor of import costs. To make a frontal assault on the cost structure, the only fiscal approach would be by way of increases in direct taxation, and the effects of these upon costs would be at least partially neutralised by the repercussions upon incentive and efficiency. For Britain to achieve competitive costs internationally is obviously imperative, but in the long run the only practicable means of doing so may be, not by reducing internal prices, but by writing-down external prices—in other words, adjusting sterling at the right time.

Miners' Hours and Wages

The miners' acceptance of the scheme to work longer hours this winter—it is limited to the six months from November to April—now awaits confirmation by union branches. At last, some of the lost ground can be retrieved. Had the scheme started at the beginning of September, as was originally intended, the chances of reaching the target of 200 million tons in 1947 would have been much greater. As it is, Mr Gaitskell does not apparently expect the introduction of longer hours to accomplish any miraculous improvement; he cautiously expects "something more from longer hours." The miners' own estimate of the results of overtime is considerably higher, but, in the light of past experience, the Minister of Fuel is wisely adopting a more cautious view. There may be technical difficulties in working out the scheme. If districts agree to extend the working day, the vexed question of revision of "stints" and tasks will arise. If, as seems more likely, they adopt Saturday working, the problem will be to secure the full attendance of all workers of all grades.

The miners' conference last weekend, having agreed unanimously on hours, proceeded to adopt their Executive's proposal to press for an increase of £1 a week in minimum wages, though with considerably less unanimity, for many delegates hoped that the reported increase of £2 would be sought. The proposed minima are £6 for underground workers and £5 10s. for surface workers; the underground minimum is only slightly higher than the national average of weekly earnings in coalmining in 1946 of £5 18s. 7d. But there are wide variations between districts; the average for Leicestershire was £7 7s. 1d. and for Nottinghamshire £6 14s. 8d. but the figures for South Wales were only £5 10s. 5d. and Durham £5 14s. 6d.

The avowed purpose of the miners' claim is to raise the standards of lower paid day workers, but it is coupled with a demand to maintain existing differentials, between the various grades, by increasing day rates to 3s. 4d. per shift with a corresponding increase in piece rates. The claim in no way replaces the union's intention to secure a radical revision of the wages structure. It is put forward rather as an "interim" measure until the more complex and fundamental changes can be tackled. But it is an ominous omission that the claim is not related to higher output. Unless an undertaking of higher output is given, and effectively carried out, the result of a wage increase of this formidable character can only be further inflation of costs, which domestic and industrial consumers must meet. The omens for success in the export drive are already obscure enough. A further inflation of British export costs would be the sure guarantee of defeat.

* * *

"Save the Franc"

Another "Save the Franc" campaign has been launched in France—and not a moment too soon. Monetary stability and a balanced budget which were repeatedly stated to provide the twin pillars of the Monnet Plan for capital reconstruction have signally failed to do the task that was expected of them. In the past year the note circulation of the Bank of France has risen by 30 per cent. The cost-of-food index for Paris has almost doubled and the cost-of-living index has risen by 45 per cent. There has been no holding back the tide of demands for increased wages, many of them backed by strike action and damage to national production. The ordinary budget has been running at a deficit of close on

100 milliard francs a year and has left the whole of the supplementary budget to be covered by borrowing. Since the general public has lost confidence in the currency there has been no genuine flow of savings into Government securities, and the greater part of the borrowing has been made direct from the banking system. The nationalised institutions have been working at a loss. Fortunately there has been a substantial inflow of imports, financed by external borrowing, to neutralise a good deal of this inflationary material. But that is now virtually at an end. The only terms on which appreciable Marshall aid can be forthcoming will be a genuine evidence of self-help and financial rehabilitation by France. Hence the latest campaign which M. Ramadier launched towards the end of last week. It is a plan of budgetary economy and of tax revision.

The target is to balance not merely the ordinary budget, but also the supplementary budget—in the latter case by cancelling the whole of the capital programme which it covers. Ordinary expenditure is being reduced partly by substantial curtailment of the number of recruits called up for the army this year. Taxation will not be increased but its collection made more efficient. In particular, agricultural, commercial and professional incomes, which M. Ramadier with considerable understatement said "bear a tax burden much lower than wages," will be made to pay their fair share of taxation. All this is aspiration and oratory. France now awaits the deeds that will translate these brave words and intentions into a positive and effective policy. The first technical development in the campaign was an increase in the Bank of France discount rate from 1½ per cent to 2½ per cent. This could have little but psychological effect, but nevertheless is a welcome evidence of the intentions of the authorities. Meanwhile, the immediate crisis in the balance-of-payments is being met by emergency help from the United States, in particular by the return of nearly \$100 million of captured French gold from Germany and of nearly \$40 million that was stolen in India and China by Japan. In addition some dollars earmarked for later purchases out of the Export-Import Bank credit are to be made immediately available. A considerable sum of urgently needed dollars may also be forthcoming from the vesting of dollar assets held by French residents. The United States has been asked to help such an operation by disclosing to the French Government all dollar balances, securities and gold held for account of French nationals. Another small instalment of interim aid for France will be made available by the direction given to the US army authorities to purchase francs to the equivalent of \$50 million in anticipation of their French currency needs. These expedients will help to tide France over the immediate emergency. In itself, however, this emergency aid will do little to prepare the ground for the longer term plan of which the domestic financial rehabilitation scheme must be deemed an integral and essential part.

Gold Movements

Seldom have international gold movements assumed such a disparate pattern as in recent times. Up to the end of July the United States was actually exporting very small amounts of gold to the United Kingdom. The amount, however, did not total more than some \$1,500,000 for the first seven months of this year. Since then the movement has been reversed and though no details are as yet available the reports of substantial shipments of gold from Britain to the United States may be taken as well founded.

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

South Africa continues to make regular monthly exports of gold to the United States, but it is Latin America which in recent months has provided the main source for the influx of gold into that country. In July no less than \$104 million was imported from Latin American republics, reversing the movements which were apparent in the years 1944-1946. Small amounts of gold continue to be exported from the United States to British India. More recently a new factor has appeared in the world of international bullion movements, namely the resumption of appreciable gold exports by Russia, most of which are canalised to the United States. The latest weekly figures, covering the period to September 24th, show that 160,000 oz of gold as well as 1½ million oz of silver was imported into the United States from the USSR.

International movements of bullion are unlikely to reflect the recent freeing of gold to Italy and France. The equivalent of £6 million in gold, which was captured from the Germans by the Allies in Northern Italy, is being handed back to the Italian Government. This is likely to be held in Italy, and even if it forms the basis of US emergency aid for Italy it is probable that Italy will remain in physical possession of the metal. In the case of the French gold recaptured in Germany and in Japan, restitution is also unlikely to make itself apparent in actual international shipments in the near future. The general trend of gold shipments continues unmistakably in the direction of the United States. The diversity of the currents along which this flow is moving is a token of the gradual breakdown of the normal mechanism of international exchange, of the fact that overdraft facilities under existing payments agreements have either been reached or exceeded, and that the world is slowly drifting back either to the bilateral balance of barter agreements or to payments in specie for the settlement of net differences on international accounts.

* * *

Second Thoughts on South African Loan

The most important implications of the financial agreement between the United Kingdom and the Union of South Africa are those that derive from the clause referring to control of movements of British capital to the Union. The main part of the arrangement dealing with the loan of gold and the consequential changes in the arrangements for the sale of newly mined South African gold amount to little more than a change of timing in the arrival of South African gold to the central reserve of the sterling area. What could have been counted on over the next three years is promised, subject to ratification by the Union Parliament, early next year. Moreover, this is the offer of a net figure of gold whereas the yearly sales agreements which operate until the end of 1947 left it open to the Union of South Africa to have recourse to the sterling area dollar pool in order to meet the whole or part of its deficit with the dollar area. From the beginning of next year, that deficit will have to be met from South Africa's own resources. The clause in the agreement regarding the exchange of information on the movement of capital between the Union and other parts of the sterling area, and the possibility of measures to control or prevent movement of capital to South Africa from the United Kingdom should remove a factor which in the recent past has seriously disturbed the balance of payments between the two countries and has caused South Africa to misread the strength of its own position and to indulge in a grossly excessive import programme.

It is estimated that over the past twelve months close on £100 million of capital has left Britain for the Union of South Africa. The bulk of this was refugee capital, some of it accompanied by its owners who emigrated, but most of it driven out of this country by the fears of a deteriorating political and economic situation and by the search for the greater security that the Union was thought to offer. Most of that money has remained in South Africa in the form of cash. A small trickle may have made its way into dollars because the control over the export of capital from South Africa, particularly capital which accompanies emigrants, has been decidedly less stringent than in the United Kingdom. Far more important has been the effect of this movement of sterling from Britain to South Africa on South Africa's import programme. There is no clear demarcation between capital and current payments in sterling area machinery and this substantial inflow of British funds into the Union led inevitably to an increase in the Reserve Bank's sterling balances—a movement which the South African authorities have constantly resisted. On this occasion they have resisted it by holding back their gold deliveries under the current sales contract and also by dipping into the sterling area dollar pool on a larger scale than they would otherwise have done. If, therefore, the further movement of such refugee capital is controlled or prevented, and since at the same time South

Africa is to remain directly responsible out of her own resources for her dollar deficit, it follows that South Africa will be compelled in the immediate future to curtail very considerably her substantial imports from the United States.

* * *

Transport Crisis Next?

There is every justification for the recently increased anxiety about the ability of the railways to meet the heavy demands of the coming winter traffic. The volume of rail traffic is still above the prewar level and coal and mineral movements are higher than they were a year ago. Freight movement on the railways will increase during the winter as the volume of heavy traffic shows its usual seasonal rise and particularly if bad weather affects coast-wise shipping and canals. Additional traffic will be diverted to the railways this winter owing to the 10 per cent cut in petrol for road haulage. And owing to the general adoption of the five-day week in industry, which now affects about 30,000 firms, a large number of important concerns are now refusing to accept traffic or put it on rail on Saturdays. This contraction of the working period is creating an uneconomic peak demand for transport services and entails the provision of additional vehicles and tractive power.

When the war ended, transport was in sore need of overhaul after the tremendous load it had carried in the previous six years with the minimum of attention to maintenance. Since then the arrears have not been overtaken; it has not even been possible in all cases to deal with current maintenance. The inevitable results of such enforced neglect are becoming increasingly apparent. There are, in particular, no fewer than 200,000 railway wagons out of service for repair, compared with the standard under normal efficiency of about 60,000. Last August the number was 170,000 and the subsequent increase to the present unprecedented figure is contrary to the normal seasonal cycle of wagon repairs. Nearly 20 per cent of the railway locomotives are out of service for repair and the percentage of heavy freight locomotives is even higher. Last winter's coal crisis has left its legacy of reduced new construction. Thus, at the onset of the winter, there is the prospect of greater demand for transport and fewer resources to meet it. The risk of a further slowing down of traffic movement is high; and perhaps only a benign winter will avert a serious breakdown. It is, frankly, an alarming outlook, and it obviously tempers the favourable character of the winter fuel allocations. The coal may be got but will it all be moved? And in the middle of this critical winter, the Transport Commission and Railway Executives will take over full responsibility—and will inevitably add their quota to the prevailing uncertainties and difficulties.

* * *

Doubts About Oil Conversion

The coal-to-oil conversion programme is making laboured progress. The annual rate of fuel oil consumption in October last year, for all industries, was just under 2,000,000 tons. The official programme of conversion published in the summer aimed at raising this figure to 8,000,000 tons by the third quarter of 1948. At present, the prospects of fulfilling this programme within the next twelve months are remote. Of the additional 6,000,000 tons, about 4,500,000 tons have been authorised for industry and 1,500,000 for the railways. Within the industrial group, the steel industry accounts for 900,000 tons, glass for a much smaller tonnage, the non-ferrous metal industries for another slice, and the remainder—which comprises the bulk of the authorisations—has been allocated for boiler conversions in steam-raising plant.

Out of this expansion programme installations of rather less than 2,000,000 tons have been completed. If allowance is made for an increased consumption of fuel oil by plant already using oil before the present programme was drawn up, it is probable that the present rate of fuel oil consumption is about 4,000,000 tons a year—about halfway towards the target. The slowest pace has been made in the locomotive conversion programme; the ultimate target here is 1,500,000 tons a year, but so far capacity for using only 40,000 tons has been completed and there is little hope of raising it above 70,000 tons by the end of this year. One of the chief obstacles to the programme, at least until recently, has been the shortage of storage capacity. An additional difficulty in delivering oil from bulk storage centres to users' tanks. These various shortages have become so acute that some firms, whose conversions have been authorised, have been advised to continue on coal for the time being.

Is Australia your market?

Do the people of Australia buy your products? Or do you buy theirs? Whichever is the case, the Commonwealth Bank of Australia is able to give you considerable assistance. Guaranteed by the Commonwealth Government, the Bank has 330 branches throughout Australia and New Guinea; it has an unrivalled first-hand knowledge of Australian produce and Australian requirements; it is, therefore, unusually well equipped to facilitate trade between this country and the Commonwealth. The Managers of the London branches welcome enquiries from those whose interests lie in the Australian market.

ONE MAN MOVES 100 TONS OF EARTH IN ONE HOUR!

1 In the construction of London Airport, the contractors, Geo. Wimpey & Co. Ltd., had to carve a table-top surface out of 3,000 acres of rough country.

2 20 men with 'Caterpillar' Bulldozers and Scrapers—each doing the work of 300 labourers—sliced off obstructions and unwanted earth at the rate of 2,000 tons an hour.

3 Thanks to 'Caterpillar' power and dependability, the immense task of removing 2,000,000 tons of earth was completed in less than 4 months.

London Airport, still expanding, is destined to become the World's greatest Airway Centre. In its construction 'Caterpillar' Diesel tractors and earthmoving Equipment—provided and serviced by the Jack Olding organization—cut down time on earthmoving contracts by months—doing the job more efficiently and at far less cost.

'Caterpillar' moves the earth—to help rebuild Britain.

(Manager: G. C. Cowan)

Altogether the relief which coal-to-oil conversion will afford this winter and the next is likely to be much smaller than the original programme contemplated. It is essentially a relief scheme, and particularly so in steam raising, and the recent increase in the price of fuel oil to about £7 10s. per ton (equivalent roughly to £4 8s. per ton for coal) has further underlined the need for serious reconsideration of its long-term possibilities for different uses. Steam raising (as distinct, say, from steel smelting) is one of the least efficient ways of consuming fuel oil.

* * *

Anglo-Argentine Trade Talks

A trade delegation from the Board of Trade and the Ministry of Supply will visit Argentina early next month to discuss trade problems with the Argentine authorities. They will be joined in Buenos Aires by representatives of the Treasury and the Ministry of Food. The groundwork of the talks is obvious enough—Argentina requires British manufactures and Britain desires Argentine foodstuffs—but the crux of any actual bargaining will undoubtedly be the financial problem which has arisen from non-convertibility.

The current discussions on the use of sterling balances for the purchase of the British-owned railways have already been prolonged owing to this new factor, and both countries are concerned about their trading deficits. Useful trade negotiations can hardly proceed very far until the two sides have reached an accommodation about the acceptability of sterling as a basis for mutual trade.

The meat contract with Argentina runs until September, 1950, and agreement has already been reached about the proportion of Argentina's exportable surplus which is to be shipped to Britain next year, in addition to the minimum fixed supplies under the contract. But Britain would be willing enough to take additional quantities provided that the price was reasonable and that sterling was acceptable in payment. As for supplies of feedingstuffs, the present slight improvement in the British position is only likely to be temporary, and stocks will be very low by the end of the winter. Future supplies are problematical in view of the world grain shortage. Earlier this year Britain purchased a million tons of maize from Argentina (of which 250,000 tons is to go to Eire), but annual prewar requirements were nearly 3½ million tons. Linseed oil is another commodity which Britain would be willing to purchase, but not at an exorbitant price.

Many of the import restrictions which the Argentine Government imposed on British goods in July and August have been relaxed, but many import permits which have been recently issued by the Argentine authorities are only valid for 15 days. That fact alone makes export trade to the Argentine a difficult business. The new discussions will accomplish a good deal if they can restore trade between the two countries on a more permanent and stable basis. But this will not be done without assurances about delivery of British exports which Argentina most urgently requires. The general expansion of exports contemplated in the 1948 targets is not much of a bargaining counter in discussions with countries who want particular classes of goods at particular dates.

* * *

Sauce for Surtax-Payers

The National Savings Committee was certainly wise to drop the style "small" savings from the activities which remained to it after the issue of "large" securities ceased. For now it is frankly addressing an appeal to the surtax payer to buy savings certificates. It is true that the new "Save the Bank Way" scheme is designed to extend the practice of regular purchases beyond those who are within the reach of the familiar group schemes, and hence is directed to "the middle income groups, the professional man, the salaried executive, farmers, in fact all those with a private joint stock banking account"—and by no means all these persons are payers of surtax. But the notable feature of the publicity drive is that it points out more blatantly than in earlier advertising the special attractions of savings certificates to those beyond the standard income tax brackets.

The savings certificate, it deserves to be recalled, is traditionally an instrument designed for the small saver, and if held to maturity carries an unusually high gross rate of interest. Before purely political considerations came into the reckoning, this was justified almost wholly by the fact that the genuine small saver before the war was either wholly exempt from income tax or paid only a very low effective rate. This principle is underlined by the

existence of the limits upon individual holdings—limits which have recently been raised. Now that genuine small savings are lagging so badly—total net subscriptions for the first twenty-seven weeks of this year, despite the large repayments of Defence Bonds at maturity, have been running at only 36 per cent of the target rate—the National Savings Committee is dangling the small saver's carrot before the noses of the large savers. While the Chancellor is declaiming that 2½ per cent gross is a fully adequate rate for Government securities, the Committee goes out of its way to point out that its own particular brand of Government securities returns no less than £11 16s. 3d. per cent gross to tax-payers in the 15s. 6d. bracket—with, of course, much higher rates to those in the highest brackets. Mr Dalton's warning about "sauce for the goose being sauce for the gander" was obviously addressed to the wrong audience.

The evil is minimised, of course, by the existence of the limits. But the Committee's tactics are in principle well calculated to arouse resentment among the only classes whose "savings" really count; but for their ignorance of the inwardness of such matters, this resentment would probably take a very concrete form. It must be conceded that the conversion of bank deposits into savings certificates must tend to reduce the disposition to spend, but this tendency is at its greatest with genuine small savers and can scarcely be said to exist at all when the "savings" are made from surtax payers' accumulated bank deposits. Yet the genuine savers earn a little under 2½ per cent and the sterile subscriptions cost the Government a multiple of that rate. If the "large" savers now take the hint—it is surprising, indeed, that they needed any reminder—the extent of the inevitable shortfall from the year's target will be smothered in a smoke-screen. The Committee may thus secure a book-keeping "success," in a fashion which fittingly parallels the Chancellor's techniques of 1946—but at what a cost in terms of hard cash and of retreat from the principles and dignity of a great movement. Why cannot the authorities honestly face the facts? It is better to fall short of the target by £200 million than to pretend that it has been reached by collecting the subscriptions from moneys which would not have been spent in any case, for that process hides even from the Movement itself the magnitude of the job it is tackling. An extra £10 million of genuine savings from the little men would be worth incomparably more than twenty times that sum "saved" by subscriptions from the middle and upper income groups—even if these "savings" were not being extracted by questionable means.

Car Production and Exports

The Ministry of Supply has now agreed not to press the motor car manufacturers for a greatly accelerated rate of standardisation of manufacture as a means of speeding up the export drive. When he outlined his plans to the industry last August, Mr Wilmot went so far as to suggest "one factory one model," an idea which found little favour with the industry. Their reply to the Minister, which was discussed in a Business Note in *The Economist* on October 4th, stressed the danger of interrupted production which might arise if standardisation were pressed too quickly.

The Ministry has now agreed that standardisation must come second, and the attainment of the export target first. But although it has bowed on the question of fewer models, it has carried its point about steel allocations. In their memorandum three weeks ago the Society of Motor Manufacturers and Traders asked for enough steel in 1948 to make 475,000 cars, of which 315,000 were intended for export and 160,000 for the home market. The Ministry has countered with a suggested programme of 400,000 cars: 315,000 for export and 90,000 to 100,000 for the British market. There figures are apparently based upon a realistic estimate of the probable steel supplies to the industry next year.

Car manufacturers will no doubt be well satisfied with the outcome of their exchange of views with the Ministry. They have secured an unspecified extension of time for the standardisation of models, and though they have been advised to plan their production on the basis of a severe cut in sales of cars to the home market, they could hardly have expected to obtain enough steel to meet their original target of 160,000 cars. But the industry would do well to recognise that, except for a few specialist firms, it will be under continuous pressure to produce a minimum number of models which can command a ready sale at home and abroad. After 1948, when industry will be faced with the problem of holding its export target, the two issues—standardisation and expanding exports—will become even more closely interdependent.

Biro- ATTENTION!

And now ROYAL BLUE INK

The colour of Biro ink has been changed to Royal Blue as a result of a majority vote by users of BIRO. The present Blue-Black ink is still available and is recommended by us for use in business and legal documents where a higher degree of light-fastness is desirable. With both colours BIRO writes for months without refilling, and continues to offer the many advantages now known to everybody. BIROS and Biro refills are obtainable from your retail stationer.

'World markets' are sometimes in out-of-the-way places, and the story of the post-war selling of British films for export deserves a film script to itself.

In China, for instance, coolies are often employed as the quickest means of getting films from one city to another. They battle along the old caravan routes, by paddy field, mountain pass and river; carrying *Odd Man Out*, *Great Expectations* or *Black Narcissus*. Every day some far-off audience sees its first British film.

The game is worth the hazard. There is more at stake than a British export, vitally important though that may be. For at journey's end there are the richer rewards of good will and better acquaintance. Through the new British films Mr. Tang of China sees the British people, sees Mr. McLeod of Edinburgh, Mr. Smith of London.

Nowadays we are all so much 'involved in mankind,' so much in need of this closer view of one another. Edinburgh may be eight thousand miles from Cheng-tu—but good films diminish the distance.

By Appointment
Suppliers of Aga Cookers to H.M. The King

The Aga Cooker for Export

NEW PRIORITIES SCHEME

AGA HEAT LIMITED have recently had to make an embarrassing decision. The problem was this. The backlog of orders for Aga Cookers and Water Heaters is now so great that the earliest delivery date for any normal order now received must, at the present rate of production, be set some 27 months ahead.

Recently, however, Aga opened new works at Ketley in Shropshire. In consequence the present rate of production should be materially increased. In normal circumstances this would mean that the period of waiting for delivery could be proportionately reduced.

But meanwhile the National economic crisis has come to a head and it is clearly

the duty of every responsible British firm to allocate as much of its production as possible to Exports which alone can save this country from disaster and starvation.

Against this, Aga Heat Ltd. had to consider the fact that their home sales are also of value to the nation. The country is short not only of foreign exchange but also of fuel. And the Aga cooks more food and heats more water to each cwt. of fuel than any other stove of any description. In fact the Aga Cooker and Water Heater is not, as some people seem to think, a luxury toy for the well-to-do but an engineering invention of importance to the whole community. Besides directly saving solid fuel, Agas also relieve the load on

Gas and Electricity undertakings. What's more, the country is also short of manpower and the Aga, which requires only a couple of minutes attention a day, is a valuable labour-saver.

Aga have reconciled these conflicting considerations as follows:

Until further notice the entire production of Heavy Duty Aga Cookers will be exported, as well as an increasingly high percentage of the production of Domestic models. First priorities of deliveries at home will be given to Farmers and Doctors, who most urgently require, in the National interest, the saving of fuel and labour which the Aga affords.

AGA HEAT LTD. (Proprietors: Allied Ironfounders Ltd.)

20 NORTH AUDLEY STREET, LONDON, W.1. MAYfair 6191

The word AGA is the registered trade mark of Aga Heat Ltd.

Discount Company's Loss

Most of the effects upon individual investors of the aftermath of Mr Dalton's excursion into market-boosting will never be traceable, but some of the consequences for the discount market have been revealed this week. The discount houses prospered in the phase of rising gilt-edged prices, and during the war years it became apparent that the profits they were winning came from the pursuit of a function of real importance—that of providing a very necessary "cushion" in the rapidly expanding market for short bonds. When, therefore, Lombard Street sought in 1945 to expand its capital to meet the expected impact of industrial reconversion upon the bond market, its wishes found favour with the authorities; but it can safely be assumed that Mr Dalton's market-boosting designs contributed not a little to the official blessing. In 1946 and early 1947 the discount market added roughly 50 per cent to its capital resources and, in the conditions of the market at the time, was quickly called upon to increase its bond portfolios more or less proportionately, and thus gave important technical support to the Chancellor's drive.

This year the tide in the gilt-edged market has turned, and its ebbing has confronted all gilt-edged holders with substantial capital losses. The first discount house to make up its annual accounts since the major weakness occurred is Allen, Harvey and Ross, Ltd., whose year ends on what has proved to be the particularly unfavourable date of September 30th. At that date, 1½ per cent Exchequer Bonds and 2½ per cent National War Bonds 1949-51 were standing fully two points and the National War Bonds 1951-53 nearly five points below the high levels reached early this year. To provide for the depreciation on its portfolio and to meet realised losses upon sales, the company has had to find £275,650, which more than absorbs the year's gross profit of £269,907. Hence, after charging administration expenses and crediting recovered income-tax, there was a net loss of £14,972. An interim dividend of 4 per cent had been paid on the ordinary capital last April and, despite the subsequent bond depreciation, a further payment of 1 per cent is now recommended both on the ordinary and (necessarily) on the participating preferred ordinary shares. These payments involve a draft of £23,000 upon the general reserve and a reduction of £17,000 in the carry forward.

In all the circumstances, it would be unreasonable to cavil at the decision to pay a modest final dividend—despite the uncertainties of the market outlook. The discount houses confine their operations to short-dated bonds and naturally reckon to amortize any premiums at which they are bought out of current profits during their life. But in this case the capital loss which, on an optimistic view, might have been expected to have been spread over two or three years was compressed within as many months, and Allen, Harvey and Ross, by accounting thus early, have had little time in which to repair any of the damage. But, if the bond market does not fall further, the amortization process will now proceed more rapidly than could have been expected twelve months ago, for the effect of the depreciation and the writing down has been to raise yields upon book values and upon new business to levels which afford extremely generous margins over the ½ to ¾ per cent which has to be paid for the call money by which the portfolio is financed. After so long a period of continued expansion, this recent experience has been salutary for Lombard Street, but it is to be hoped that it will not induce in the discount market such timidity as to prevent it from performing fully its function of shock absorber when next a bout of heavy pressure occurs.

* * *

South African Food Supplies

Before the war South Africa had built up a flourishing export trade in agricultural product to Britain. South African grape fruit, oranges, fruit juice, raisins, jam, rum and wines were among the larger import items. But in addition Britain bought three staple commodities—maize and maize meal, sugar and butter—which are now in short supply in this country. In 1938 250,000 tons of South African maize and maize meal were imported into the United Kingdom (representing 7 per cent of annual requirements) and 215,000 tons of unrefined sugar (equivalent to 10 per cent of Britain's yearly consumption). Quantities of South African butter were relatively small and most of it was used for blending.

The decline in shipments of these staple commodities from South Africa, which is shown in the table below, was due in the main to increased industrialisation and prosperity in South Africa during the war years. Wages for both Europeans and natives rose considerably, but food prices were kept fairly stable, and a sharp increase in food consumption inevitably followed. Rationing was attempted but it was found to be administratively impos-

sible, owing to the widely differing tastes and the great differentiation which existed between the various income groups.

South Africa is not basically a producer of staple commodities; its agriculture is more concentrated on fruit production. But at the present time, any increase in the supply of grains, especially for feedingstuffs, would be of great assistance to the world in general and to Britain in particular. Moreover, the dollar

shortage will probably force Britain to curtail its sugar purchases from Cuba and St. Domingo, which together supplied three-quarters of the entire sugar imports to this country last year. South Africa's fruit and wine will brighten a dark winter in this country; but the winter would be less dark if there were more basic foodstuffs.

Powell Duffryn and Coal Compensation

Voices have been raised in recent weeks against the hardships which are likely to arise under the "interim income period," which is defined in the Coal Nationalisation Act as 1947 and 1948. Shareholders of Powell Duffryn, whose colliery assets have been vested under the Act, will find grounds for satisfaction in the latest consolidated accounts of the group. This is the first set of accounts from a large colliery company which does not intend to liquidate. It shows a subdivision of its assets between those vested in the National Coal Board and those remaining at the disposition of the company. Naturally the bite taken by the state from this group's assets is a big one—Powell Duffryn formerly had the largest coal output of any one group in the country with an annual production of some 20 million tons. Even so, the transfer of its colliery assets represents little more than one-third of the balance-sheet total. In the case of fixed assets (which are by far the greater part of those handed over) some £7,241,097 has been written off the book value out of depreciation and other reserves. The result is that assets with a written-down value of £9,359,651 have been vested, and assets valued at £8,338,899 net have been left in the group's control.

It would not be right to presume that the former total of £9.4 million will be identical with, or approximate to, the group's claim as a "compensation unit" for its share of the global sum

"The Economist is not doing its duty"

But it is not our fault. We cannot find paper for all the facts and figures which are essential for the business man and the student of affairs. So last January we shed the load on to the

Records and Statistics

Supplement to The Economist

Records and Statistics has already established itself as an economic source book. Each week it contains at least sixteen pages of statistical tables and factual records, covering public affairs and Parliament, State papers, and economic developments at home and abroad, all presented in a digested form for quick reference.

A subscription to Records and Statistics (by post only) costs 30s. per annum. Or it can be combined with a postal subscription to The Economist at a total cost of £4. The Publisher will be pleased to send you full particulars.

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

of £164 million which is to be distributed under the Act. It is stated quite categorically in a note to the accounts that compensation is to be assessed on the basis of what a willing buyer will pay to a willing seller and that book values will not necessarily be a guide to the final figure. In any case, an agreement on compensation with the District Valuation Board cannot be reached independently; it will emerge as the result of an accommodation of the several claims of companies in the same district.

Two other items appear in the Powell Duffryn accounts under the heading of vested assets. The first, "mineral rents paid in advance," is self explanatory; the other consists of consumable stores. Compensation for both these items will be paid in cash and will be met outside the global sum of £164 million, though claims for payment for these items will be adjudicated by the District Valuation Boards on the basis of a willing buyer-willing seller. But here there is obviously a greater degree of likelihood that the company's estimates of the value of such assets should be fairly close to the eventual purchase price—there cannot be much dispute about mineral rents (except perhaps on the score of interest), while the valuation for consumable stores has been based on inventories already submitted to the authorities. It now seems likely, moreover, that contrary to a previous Treasury ruling which actually proposed not to pay for these items until the end of the "interim income period" in December, 1948, a substantial payment on account will be made before the end of 1947.

Improved Steel Allocation

The announcement by Sir Stafford Cripps on Tuesday that the existing method of allocating steel is to be improved, turns out on examination to be only slightly more precise than his general comments on its inefficiency five weeks ago. Sir Stafford described the existing procedure, which is notoriously inefficient and suffers in each succeeding production period from an inflation of the "M" forms against which steel should, notionally at any rate, be supplied. Any scheme for allocating steel must retain some degree of flexibility if it is to work at all. Licences to obtain steel cannot be exactly matched by supplies in each production period and some carry-over of licences is necessary and desirable.

For example a main contractor who obtains a bulk licence for steel supplies may have to sub-divide these licences to innumerable sub-contractors whose contribution to the finished output of the main contractor may not be required until several months have elapsed. The fact that any particular firm may find it necessary to obtain licences from a number of authorising departments is another feature of the existing scheme which sets in circulation far more paper than can be backed by current supplies of steel. It would probably not be very far wide of the mark to say that 90 per cent of the steel output actually to be produced in

the fourth quarter of this year is already earmarked by "M" forms which are already in issue, and that the time lag between the issue of a form and its redemption in hard steel may be anything up to six months.

Sir Stafford suggested that the "M" form system had resulted in the accumulation of about two million tons of steel which had been allocated on paper and not met by supplies. He hopes that it will be possible to revise the present method of control and "in the course of some months" to get rid of the excessive amount of "M" form paper which is now in circulation. Obviously the comparative success of the "M" form system during the war was due to the fact that the number of end products needed in wartime was limited and the main producers of them were large and few. In peacetime, the tremendous variety in end products for which steel has to be used, and of the firms making them, has led to a partial breakdown of the system. The Minister for Economic Affairs hopes that the new scheme will avoid undue complication and will not require extra staff for the steel industry. "The Government," he said, "will need four or five extra officers to assist industry in working the scheme." This may sound a little optimistic. But until the details of the scheme are published the fairest comment is that it could hardly be less efficient and more productive of friction than the existing arrangements.

Wool Tops Decontrolled

The Board of Trade have announced that the maximum price schedule for wool tops, noils and waste will be removed at a date to be determined. Maximum prices for these products have been a recurrent source of trouble to the worsted industry ever since the war, for as fast as they were raised, the price of raw wool rose further and made it impossible for the topmakers to commission tops within the permitted prices except by incurring a loss. It has, admittedly, sometimes been difficult to distinguish between cause and effect—to some extent the increases in maximum prices for tops have encouraged the topmakers to bid higher prices for raw wool at the auctions. But usually higher top prices have lagged well behind the rising price of raw wool.

The full implications of the projected removal of price control, however, are not yet clear, but at least the differential prices for tops for export and home use (the latter, of course, have been effectively restricted by the ceilings on utility clothing prices) will disappear. Hitherto, top prices have been the determining factor in utility price control for worsteds; under the new system it is to be expected that maximum prices will be retained only for utility cloths. But even if price control is still kept on at the earlier stage of worsted yarn, the industry would still enjoy a greater degree of flexibility than in the past.

As soon as the control is removed, top prices are certain to rise, for the present maximum prices are well below the free market level. But after an initial, and possibly exaggerated, advance,

top prices might well settle down at a more stable level. If so, they may have an important stabilising influence on the raw wool market. If the existing specifications of utility cloths are maintained, however, it will be difficult to make them within the limits of the maximum utility worsted prices which are at present permitted. The wool industry has not, by any means, seen the end of its problems.

A further restriction is to disappear next month, when auctions of home-grown wool are to be resumed, after a lapse of eight months. The Order which lays down official maximum prices for British wools has been revoked and in future the price level will be determined in the open market. Provision has been made for reserve prices to operate at these sales, on the same lines as for Dominion wool.

New Union Goldfields

When the first undercurrent of rumours about the affairs of New Union Goldfields became evident in the mining share market several weeks ago, it was generally presumed that the difficulties sprang from differences between the leading personalities connected with the company, in particular the former chairman, Mr N. S. Erleigh, and his co-director, Mr J. Milne. As *The Economist* was going to press last week, news from Johannesburg suggested that more fundamental changes had been taking place. Certainly Mr Erleigh, a star who had risen very rapidly on the Rand firmament, was out, and Mr Milne, a less spectacular figure, was in. But the greater part of their "empire" has passed to the control of a new set of directors who, it is reported, have been "invited to take over."

But these changes of management, and the marking up of the share prices of the company and associated issues, have not prevented the persistence of underlying doubts about the position. The decision of the new board about the new issues which had already been planned for next month for New Union and Rooder-land is awaited with some uncertainty. Other observers have been critical of the obscurity with which the changeover has been effected. And so far there has been no comment from Mr Erleigh, save that he is tired of the whole affair and would like to play golf with Mr Bobby Locke. Neither side in the dispute has shown any inclination to unravel the mystery. It is rumoured

that the Union Free State group which now comes under the control of Mr J. Milne is to take over more of the companies of the New Union group in addition to Free State Mining and Finance Corporation, Free State Gold Areas and Bloemfontein Consolidated Investment Corporation which he acquired under the deal. Another message invites the investing public to await a full announcement from New Union on the terms of the new issues. The Stock Exchange has views of its own about the affair, and remains for the time being unimpressed by these *ex parte* statements. But it is high time that some definite facts emerged about it from Johannesburg.

Manpower Movements

The Ministry of Labour's latest manpower return relates to August, and does not therefore show any reactions in the redistribution of manpower for the export drive. The August unemployment figure of 238,078 is the lowest since October, 1945, and represents a mere 1½ per cent of the total insured population. A considerable rise in temporary unemployment may, however, be expected in future, to the extent that it proves possible to close down less essential production and to switch the manpower to export production.

The total number recorded as working for exports in August was 1,580,000—an increase on the previous month's figure and representing 160 per cent of the mid-1939 figure. But this monthly division between home and export manpower is arbitrary and probably exaggerates the export total. The total working population continues to decline, though it is still some 250,000 above the 1939 level. It is discouraging that in spite of the effort to recruit women to industry, a slight net loss of 9,000 occurred between July and August, though the present total of 5.6 million women in employment is about 750,000 higher than at the beginning of the war.

Shorter Note

Regulations have now been made under the Factories Act, 1937, to reduce the risks to health in potteries. They follow recommendations made by the National Council for the Pottery Industry to prohibit the use of glazes, except "leadless" or "low-solubility" glazes, and restrict the use of powdered flint or quartz.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: British Celanese; Austin Motor; Electrical and Musical Industries; Powell Duffryn.

COMPANY MEETINGS

RANSOME AND MARLES
BEARING COMPANY, LIMITED

SALES A PEACETIME RECORD

The thirty-first annual general meeting of Ransome and Marles Bearing Company, Limited was held at Newark-on-Trent on the 9th instant.

Mr Fred W. Baker (chairman), in the course of his speech, said: The sales for the year were a peacetime record. The large purchases of new plant reported last year have been in production for nearly the whole period and have contributed to the increased output and helped materially to counteract rising costs. A new works purchased during the year has also made a considerable contribution for part of the period. Throughout the year we have not obtained all the labour, steel and other necessities which we could have used, and had also to close for two weeks owing to the fuel crisis. These difficulties have naturally curtailed our output during the past year.

PROFIT AND DIVIDEND

The actual net profit for the year, without the non-recurring items, amounts to £152,830 against the previous year's comparable figure of £102,018. This result does not represent a record, and is a very smaller percentage on our sales than pre-war profits were. The capacity of the plant, however, is now such that, given the necessary materials, labour and power, we can achieve a turnover many times greater than in pre-war days, which enables us to work on a much smaller margin of profit. This is the justification of our policy for many years of putting back into the business large portions of our profits.

We have available for distribution £265,132. To make up the usual annual payment to 20 per cent., less tax, for the year, requires £48,125, and we propose in addition to distribute part of the accumulated overseas profits brought in by paying a small bonus of 5 per cent., less tax, in addition to the usual 12½ per cent. final dividend.

The liquid assets exceed the current liabilities by almost one million pounds, which indicates a very sound position. All indications are that demand is likely to continue at a very high level for a considerable time ahead. We have today more orders on hand than a year ago, and there is every evidence that the use of our products is expanding rapidly in many directions. Before the war the motor industry took over 50 per cent. of our output. Today, with the application of bearings to every type of machinery and equipment, this proportion is very much lower, although the motor trade volume is as great as ever. We are making a considerable contribution to the drive for mining machinery and generating plant, and also in the no less essential agricultural equipment field.

EFFECT OF SHORTAGES

The difficulties and shortages during the past year have compelled us to refuse many orders, and it is particularly unfortunate that

much export business had to be sacrificed. We must agree, however, that from a national point of view our products, after meeting home priorities, have a higher exchange value when fitted into a valuable machine or vehicle than if exported by themselves. It is a matter of urgency that we do an increasing

export trade, as many of the Dominions and other countries are developing secondary industries and require quantities of bearings far in excess of their pre-war demands. We therefore hope that our output this year will show a substantial rise on last year. The report was adopted.

MERCANTILE AND GENERAL
REINSURANCE COMPANY, LIMITED

GRATIFYING RESULTS

MR RICHARD GUINNESS'S SPEECH

The ordinary general meeting of the Mercantile and General Reinsurance Company, Limited, was held, on the 14th instant, at 25-31 Moorgate, London, E.C., Mr Richard S. Guinness (chairman of the company) presiding.

The manager and secretary (Mr H. P. Hewitt) having read the notice convening the meeting and the report of the auditors,

The Chairman said: The accounts before you show once again gratifying results, with an increased net premium income on fire and miscellaneous accounts totalling £1,691,324.

A special feature of the year's operation is that we have provided at our branch office at 46 Moorgate a department equipped to underwrite facultative fire risks. It is evident that these facilities are useful to our ceding friends, and it will be our endeavour to combine helpful service with sound underwriting.

INCREASED ACCIDENT INCOME

I am happy to be able once more to report a large increase in accident premium income both at home and abroad, together with a compensating margin of profit. The volume of business offered to us gives an opportunity for careful and yet liberal selection which is exercised by those in charge. Our management strive to combine full facilities to our ceding friends with well-adjusted balance of risk; it is to their success that we owe the good results now before you.

The marine account also shows a gratifying increase in premium income. It is our endeavour to build up this branch on the basis of careful selection and steady progress. The balance carried forward on marine account is £158,040 against a premium income of £94,539.

LIFE ACCOUNT

The life account has shown once again increased vitality and expansion of home and abroad. New business written has reached the record figure of £3,131,000. It is evident that throughout the world the security offered in these troubled times by a life policy with definite terms of payment, and, if desired, the prospect of bonus additions has a strong appeal both to the capitalist and to those of modest means. In consequence, we have enjoyed our share in the large accretion of business to life offices at home and abroad.

I would mention that we recognise the responsibility of husbanding the assets pertaining to the life funds, and to that end your directors have permitted the funds of the life account to accrue since this branch was established.

In all branches the past year has been full of endeavour not only to maintain, but to cement by personal contact our happy relations with friends at home and abroad. Our

general manager has been untiring in the task of renewing contacts with our friends in Europe. He is now on a visit to the U.S.A. and we miss his presence here today. Other members of the management and staff have been equally active, and the results of their combined efforts have borne fruit in the figures we are enabled to lay before you.

STRONG RESERVES

Profit and loss account shows increased interest and dividend receipts totalling £80,992, while the transfers from fire, miscellaneous and marine accounts total £93,484. Provision for taxation calls for £80,000, and there is also a debit item of £25,000 to provision for exchange and investment fluctuations. It is essential for us to maintain strong reserves to cover these ever-present risks, and therefore your board has decided to allocate thereto an additional £50,000 out of the credit balance carried over at the close of the year.

The board, with the approval of the trustees of the superannuation fund, have revised and increased the benefits thereunder in view of the ever increasing cost of living. They have no doubt the shareholders will endorse this decision and a special allocation of £10,000 to strengthen the fund in addition to an annual contribution of £6,000.

The same dividend as in 1945 is proposed for the year 1946, viz., 5 per cent. free of income tax on the paid-up capital.

Let us hope that England and the British Empire will give the lead in peace, as already in war, to the restoration of freedom of world trade untrammelled by forms, permits and other methods of political interference. Mankind can only restore the ravages of war and continue to progress in peace and prosperity on the basis of individual effort and inspiration guided and fostered by free and enlightened government.

TRIBUTE TO MANAGEMENT AND STAFF

I conclude by inviting our shareholders to join in a vote of thanks to our management and staff for the satisfactory results presented to you today as the result of their untiring efforts, for which we are sincerely grateful.

I beg to move the adoption of the report and accounts now before you and the declaration of a dividend of 5 per cent. per annum, free of income tax, for the year 1946, upon the paid-up capital.

Mr C. M. Woodbridge seconded the resolution and it was carried unanimously.

The retiring directors, Mr Richard Sidney Guinness and Mr Erwin Hurlmann, were re-elected; and the auditors, Messrs Peat, Marwick, Mitchell & Co., having been re-appointed, the proceedings terminated with a vote of thanks to the chairman.

There is a vacancy in the Marketing Advisory Division of Lever Brothers and Unilever Ltd., London, for a first-class writer to undertake the preparation of a series of studies of marketing developments at home and overseas. The work requires ability to assemble arguments, evidence and conclusions in orderly and logical form, and to present them in forceful English in a style that is easily translated into foreign languages. An essential qualification is first-hand knowledge and experience of the modern practices of selling and advertising. The position will be well paid and offers considerable scope. Written applications, giving full details of experience and qualifications, should be addressed to Marketing Advisory Division, Lever Brothers and Unilever Ltd., Unilever House, London, E.C.4, marked "Personal".

EXPORT specialist from Canada having large experience, technical know-how and substantial contacts, seeks employment.—Box 579.

GOVERNMENT RETURNS

For the week ended October 11, 1947, total ordinary revenue was £40,062,577, against ordinary expenditure of £37,371,425, and issues to sinking funds £248,328. Thus, including sinking fund allocations of £8,551,310 the surplus accrued since April 1st is £6,612,548 against a deficit of £502,314,924 for the corresponding period a year ago.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA—EGYPT

INTERIM DIVIDEND.

NOTICE IS HEREBY GIVEN that an Interim Dividend of FOUR SHILLINGS per £5 share on Coupon No. 118 will be paid without deduction of British Income Tax, but less Egyptian Government and Alexandria Municipal Taxes amounting to 5.904d., making 3s. 6.096d. net, on and after October 15, 1947, at the National Bank of Egypt, in Alexandria at Rue Toussoun, or in London, at 6, King William Street, E.C.4.

Dated, Alexandria, Egypt, September 10, 1947.

By Order of the Board,

J. C. de V. BISS, Sub-Manager.

UNIVERSITY OF CAPE TOWN

Applications are invited for the CHAIR OF ACCOUNTING. The salary is £1300 per annum plus a temporary cost of living allowance on the Public Service Scale (at present £84 per annum for a married man and £28 per annum for a single man).

Applications must be submitted in triplicate and must give age, qualifications and experience and the names of two or three referees to whom the University may refer. Two copies of the application must reach the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1, by 30th November, 1947 and the other copy should be sent direct to the Registrar, University of Cape Town, Private Bag, Rondebosch, South Africa. A memorandum giving the general conditions of appointment and a special memorandum on the Chair of Accounting are obtainable from the Secretary of the Universities Bureau.

NATAL UNIVERSITY COLLEGE

DEPARTMENT OF ECONOMICS

Applications are invited for two Research Posts for duties in the DEPARTMENT OF ECONOMICS and centred mainly in Durban. The appointments will be on probation for ONE YEAR from January 1st, 1948 and will be renewable for at least TWO further years. The Research Fellow will also be required to assist in the organisation and training of research workers.

RESEARCH FELLOWSHIP. Salary will be between £500 and £750 depending on qualifications (including a good Degree in Economics) and successful experience in research.

RESEARCH ASSISTANT. Salary is on the scale £350 x 25—£450 plus a cost of living allowance. A degree in Economics is a necessary qualification and some research experience will be desirable.

Further particulars may be obtained from the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. Closing date for the receipt of applications is 24th November, 1947.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability)—ONTARIO AND QUEBEC RAILWAY CO. FIVE PER CENT DEBENTURE STOCK. SIX PER CENT COMMON STOCK.—In preparation for the payment of the half-yearly interest payable on the 1st December next, the Debenture Stock Transfer Books will be closed on 31st October and will be re-opened on 2nd December. The half-yearly interest on the Common Stock will be paid on 1st December to holders of record 3 p.m. on 31st October. R. F. TREMAYNE, Deputy Secretary, 8, Waterloo Place, Pall Mall, London, S.W.1, 9th October, 1947.

UNIVERSITY OF BRISTOL

DEPARTMENT OF ECONOMICS (AGRICULTURAL ECONOMICS).

Applications are invited for the following appointments:

Agricultural Economist: Salary of £470 (plus £90 bonus) rising by £25 annually to £710. Candidates must possess a University degree in Economics and preferably should have a sound knowledge of agriculture.

Assistant Agricultural Economist (B grade): Two vacancies. Salary: Men £230 (plus £78 bonus at age of 21), rising by £15 annually to £290. Women £230 (£63 bonus at age of 21) rising by £10 annually to £280, with further possibilities of substantial improvement. Candidates should possess a University degree. Preference may be given to candidates holding a degree in Economics or Agricultural Economics.

Successful candidates will be required to work under the direction of the Provincial Agricultural Economist at Newton Abbot, Devon.

Applications should be addressed to the Registrar, University of Bristol, Bristol 8, to be received not later than 14 days after the appearance of this notice.

WINIFRED SHAPLAND,
Secretary and Registrar.**THE BANK OF NOVA SCOTIA**

(Incorporated in Canada with Limited Liability.)

Established 1832.

General Office: Toronto, Canada.

Paid-up Capital ... \$12,000,000

Reserve Fund ... \$24,000,000

Total Assets over ... \$650,000,000

Special facilities are available to the public through the Branches of this Bank for the transaction of business with Canada, Newfoundland, Cuba, Puerto Rico, Dominican Republic, Jamaica and the United States at New York.

Address enquiries to London Branch:

108, OLD BROAD STREET, E.C.2.

C. G. WEBSTER, Manager

THE WEST OF SCOTLAND AGRICULTURAL COLLEGE

Applications are invited for the post of ASSISTANT ADVISOR OFFICER IN AGRICULTURAL ECONOMICS. Candidates must be graduates in agriculture or economics, having at least 12 months appropriate experience. Preference will be given to applicants with honours or high degree. Salary scale, £730 x £25—£875, plus consolidation addition (£90 at minimum).

Further particulars may be obtained from the undersigned, with whom applications should be lodged not later than November 14th.

N. B. BAIN, Secretary, 6, Blythswood Square, Glasgow, C.

LEADING Agricultural Industry in Kenya invites applications for post of "Economic and Development Commissioner." Salary £2 per annum on five years contract, with one year's probation. Age limits 35 to 45 years.

Essential qualifications for the post include a first class educational background and a proved record of significant business experience combined with professional training and practice in economics commerce.

An intimate knowledge of American, European and Eastern markets is eminently desirable.

Position involves overseas travelling and the conduct of high-negotiations with Government Departments and commercial firms; also a measure of public speaking; it calls for a man of proved initiative, drive, creative imagination and tact of the highest order.

Applications invited only from those who have held similar positions commensurate with the salary stated.

Further details regarding security of tenure, provident fund, housing, and travelling allowances will be given to applicants at personal interview.

Apply in first instance to—Box 583.

RESEARCH DEPARTMENT of LABOUR PARTY. Assistant Secretary of Department. Responsible research projects, information, pamphlets. Knowledge Economics, Labour Movement, drafting ability essential. Advantage enclose specimen essays or articles. Salary £500-575. Pension Scheme. Application forms, which should be returned by November 3rd, from Secretary, Labour Party, Trans House, Smith Square, S.W.1.

LEADING LONDON BUSINESS group wishes to establish contact industrial psychologist with a view to regular consultations covering production incentives, welfare etc. Please communicate with—Box 582.

FINANCIAL ACCOUNTANT required to take charge of Accounts of well-known food manufacturing company (medium sized London. Age 30/40. Must have had experience of supervising accounting routines handled on a strict time schedule. Commencing salary exceeding £750, according to experience.—Write Box 2051 c/o W. Ltd., 72, Fleet Street, London, E.C.4.

REGULAR Indian Army Major, 25, single, extensively travelled, excellent record, now undergoing General Business Course, position in firm connected with Dominions or India and Far East. Box 582.

SCOT (29), B.Com., A.S.A.A., ex-naval officer, no commercial, but considerable admin. exp., desires opportunity (at home or N. Am.) in commerce or industry, to use energies and initiative.—Box 581.

LADY DR. ECONOMICS with wide experience in research administrative work at institutions, government departments, is looking for responsible, interesting and permanent post. Languages: Polish, French, Russian and German.—Write Box 576.

DOCTOR OF SCIENCE (English, aged 38), with a background administrative experience in the biochemical sciences, esp. nutrition and agriculture, is open to offers of appointment as tech executive to an industrial concern with overseas interests. Esp. interested in development schemes associated with vitamins, hormones or pesticides.—Box 553.

AMBITIOUS GRADUATE, aged 21 having gained B.Com. hon. degree (London) while serving in R.A.F. seeks an entrance commercial life. No practical experience of anything but willing competent to learn everything.—Box 578.

AMERICAN MAGAZINES available. *Magazine of Wall Street*, 63 *Saturday Evening Post*, 50s.; *Fortune*, 67s. 7d. Incl. one year. list of other magazines send s.a.e. to Willen, Ltd. (Dept. 50), 120 George's Road, London, E.10.

PART-TIME (evening) work required by young woman; writes rent affairs articles and sub-edits *Trade Journal*. Highly experienced Committee/Report work; Politics; Office organisation; typewriter.—Box 586.

BABY GRAND PIANO: 4 ft. 9 ins.; welmar (British Bluth) fiddle-back mahogany case; B.B.C. piano; serviced by makers; pe condition: Ideal instrument for professional musician or discerning amateur.—Box 584.

OTHER NOTICES APPEAR ON PAGE 662.

Mischief at Westminster

THE KING opened the third session of the present Parliament on Tuesday with the customary Speech couched in the customary words. Possibly there is something to be said for understatement in times of crisis, but the Cabinet, in choosing the words for His Majesty's speech, seem to have pushed that doctrine to its logical conclusion. The Oracles could teach them little. However, consideration of the content of the Speech falls into three parts: the proposals for constitutional reform, the remainder of the legislative programme and the omissions.

The history of the legislation to "amend the Parliament Act, 1911," is not difficult to piece together. It springs from the conflict within the Cabinet over the timing of the Bill to nationalise the iron and steel industry. One section of the Cabinet desired that to be the main doctrinal part of the activities of the new session. Another section considered that to introduce such a controversial Bill while the economic situation of the country is as it is would cause more embarrassment than gain to the Government. But, said those who disagreed with this latter view, if the Bill is not taken this session, it will then be at the mercy of the House of Lords. Under the Parliament Act, 1911, it needs two years for a majority in the House of Commons to override the power of veto possessed by the Lords. And no doubt at some stage of the ensuing argument someone proposed a compromise. Let the time limit within which the House of Lords can delay a Bill be shortened. In that way the 1947-48 session will be spared controversy over iron and steel and yet this Bill can still, by some juggling, be carried over the heads of the Lords before the natural term of life of the Government expires. It is quite likely that whoever proposed such a solution was hailed as a brilliant tactician.

Nothing could be further from the truth. Once again the Cabinet, and the Prime Minister, have taken evasive action and called it statesmanship. Nationalisation of the iron and steel industry is a real political issue. It has meaning in public life today. Politically, it may be a good policy or it may be a bad policy—*The Economist* is not among those who think it good politically, still less so on economic grounds—but it is an issue which must be decided one way or the other if the industry itself, and so, in a great measure, the whole industrial life of the community, is to be given stability and an atmosphere in which it can think of production and efficiency first and last. It would at least be honest, if misguided, to introduce the Bill now. It would be honest, and realistic, to say that the Bill will be postponed until the electorate can vote on it again, in the light of what they think of the other industries that have already been nationalised. But what has, in fact, been done? The Bill has been placed in storage—and not even cold storage—and instead a new, distracting and basically irrelevant issue has been dragged out of the past. Why have the Labour Government chosen to draw this very old red herring across the political arena? For it cannot be claimed that the Government have by this manoeuvre diminished the chance of a General Election next year. The power of veto possessed by the Lords does not impose two years of delay upon a Government. It presents a Government with the need to decide whether to accept two years of delay or make an immediate appeal to the

country. If a Government, faced with a rejection of a Bill, decided to ask for a dissolution of Parliament, and if it were successful at the resulting General Election, it is inconceivable that any House of Lords—certainly not the present House—would refuse to pass a measure which had been so recently approved by a majority of the electorate. Is the House of Lords more or less likely to accept a Bill to amend the Parliament Act than it is one to nationalise iron and steel? The Government, like a conjuror, is diverting the public mind from the real issue and, again like a conjuror, its purpose in doing so can only be to bewilder, not to assist. It may well be that many in the Cabinet are afraid that they have not a majority of public support behind them on the nationalisation issue. Hence this ghost, this reference to a reform of the Senior Chamber, this proposal which is not a reform at all.

This is not to claim that the House of Lords is perfect. No sane constitution maker would—or could—have invented the British Constitution as it exists on paper. But the essential thing about the British Constitution is that it changes without recourse to paper. The House of Lords of 1947 is not in any way, either in its personalities or in its ideas or in its powers, the House of Lords that existed in 1911. Imperceptibly it has grown into a body that is Conservative in name but far from partisan by nature. Its contribution to national life in general, and to legislation in particular, has over the last two years been enlightened and informed. The Prime Minister does not dispute that, but claims that its leadership might fall into less "responsible hands." By the steps it is now taking the Government is doing its best to ensure that in fact this calamity does take place.

*

Few will quarrel with the remaining items in the list of impending legislation. Final judgment on any measure from the present Government on a reform of the franchise and electoral procedure must wait until the actual proposals can be examined, but almost all the other items in the list will be welcomed. The poor law proposals follow from the vast social service schemes already passed. Rating reform is long overdue. So is the Bill on criminal justice; that for the better care of children deprived of home life is another non-party measure. The Bills on Burma and Ceylon are a proper mark of the development of those two countries. The two Bills likely to cause controversy in Parliament will be that to nationalise the gas industry and that to control the proportion of British films that must be exhibited in every cinema. The most mysterious Bill is that which is proposed for the reform of the law relating to actions for personal

Climax to the Cold War?

FOR seven months now Mr Marshall has been trying to seize the diplomatic initiative from Mr Molotov. On paper he appears to have succeeded beyond all expectations; in practice it remains to be seen whether the American people will give him the power and the money to hold it. His blocking moves in Greece and Turkey have proved for the time being effective; the positions he has taken up in Western Europe and at Uno have still to be consolidated and reinforced. All over Western Europe, as far away as Austria, the centre and the right have taken heart; and the Communists have been forced away from tactics of coalition with Socialists into campaigns of opposition and coercion. The balance of power established at Yalta has been shaken. So far so good—but not entirely good. For the question arises, more insistently than ever: What is the immediate objective of American foreign policy? And when it is reached, where do we go from there?

injuries. If that is the Bill to abolish the legal doctrine known as "common employment" few will object.

Thirdly, there remain the omissions. Clearly none of the Bills enumerated above has any bearing on the crisis that faces the country. That is not an argument against them. Parliament has no reason to drop its normal legislative functions simply because so much of what has to be done—and of what it can do to help—needs no legislative action. The one remaining Bill of importance is that needed to carry an autumn Budget into effect, but it would be unfair, if not improper, to expect a Chancellor of the Exchequer to anticipate his autumn budget speech and give in any detail what his proposals are. Yet if the King's Speech, and the debate that follows it, are to be considered as a general survey of the work that awaits the leaders of the country, there are still many gaps in the picture yet to be filled in. Sir Stafford Cripps had just made his statement on the cuts in capital expenditure and on the balance of payments as *The Economist* was going to press, and though some discussion of the announcement will be found on p. 691, full consideration of the effects of the cuts will have to be deferred. But it is now nearly three months since it was first said that some were essential. Does Sir Stafford Cripps's statement mean that the Government has at last made up its mind? That it has at last decided what capital expenditure, in the present context, is productive and what not?

Suppose it is impossible to redress the adverse balance of payments. What plans exist for alternative ways of meeting the situation? The descent on the spiral of bilateralism in international trade has not been halted. What can Britain do to lead the sixteen nations that met in Paris towards a reversal of that movement? Suppose the attempt to increase the numbers of men and women in the coalmining, agricultural and textile industries by direction of labour on the present pattern fails, as so many think it will? The list could be continued almost indefinitely. Mr Dalton's task is comparatively easy. Cuts in the food subsidies and an increase in the purchase price are at least something of a way out for him if he chooses to take them. The problems that face Sir Stafford Cripps are of a different order, for he must add persuasion to decision and flexibility to his figures.

All these are questions that will be asked and not all of them can be or will be answered at once. But the country is coming to see that while legislation may fill files and bookcases, it does not fill order books, coal cellars or shopping baskets. And it will not be diverted from asking pertinent questions by Mr Attlee's references to the need for fire extinguishers when it is his Government which is responsible for starting the fire.

Obviously, the British should not be the first to cast a stone at Mr Marshall's methods. The revelation that they were unable any longer to shoulder the entire burden of guarding Greece and Turkey was the shock that jolted Mr Truman into proclaiming his challenge to Communism in March. The imminence of the British financial crisis was in Mr Marshall's mind when he framed his offer of economic aid to Europe in June. And, at this very moment, the State Department is considering the alarming increase in appropriations for Germany that will be needed if Britain is to slip off the burden of paying dollars for the food and raw materials with which the German pump is to be primed. It has to be recognised that Mr Marshall's strategy is urgently and decisively influenced by the need to make good British weakness in the counsels of Europe. To resent this situation, and to pretend that it need not continue is ungenerous and dishonest. But it must be emphasised

nevertheless, that it is one in which the British Government may find itself suddenly committed to action beyond its calculations, and in which every effort must be made to foresee the trend and consequences of American policy. It is common knowledge that London was surprised—if not shocked—by Mr Marshall's three main strokes: the Truman speech, the offer of economic aid, and the proposal to circumvent the Russian veto at Uno by setting up the "little Assembly." It would be deplorable if the London conference of Foreign Ministers, which opens a month hence, were to produce another surprise attack by the Americans, with Mr Bevin bringing up the rear with a different set of maps. Mr Marshall must not expect the British and the French to toe the line wherever he chooses to draw it.

This is a good moment to examine some of the doubts which are exercising Americans as they look back on the diplomatic excitements of the summer. In the last six weeks they have been publicly accused by Mr Vishinsky of being warmongers; they have read in Mr Byrnes's "Speaking Frankly" that Mr Marshall's predecessor contemplates a challenge to the Russians to withdraw their troops from Europe—a challenge to be backed, if necessary, by the forces of members of the Security Council. They have seen written in billions the sums of dollars needed to make Europe safe for democracy. They have been told that the next war might begin in their garbage cans.

*

Against such a background of rapid developments and almost world-shaking decisions, two alternative developments are to be expected: firstly, a growing impatience for results—one of the most disturbing features of democratic foreign policy; secondly, a growing fear of consequences. The logic of the first, pushed to extremes, is that America should threaten Russia with preventive war; of the second, that America would clear out of Europe and become as self-sufficient as Russia. Either development would have serious effects on British policy; even more disturbing is the possibility that American opinion would waver nervously between them. Some of the arguments and less rational processes which affect that opinion have been made clear in Mr Walter Lippmann's striking series of articles on "The Cold War" in the *New York Herald-Tribune*. He asks the question: Can the western world operate for ten or fifteen years the policy of containing Russia, which is the essence of the Truman doctrine? He gives numerous and cogent reasons for deciding it cannot. An unplanned economy, he says, cannot wage diplomatic war against a planned one. A policy of mere containment means that Moscow would choose the issues, the area and the weapons for sporadic tests of strength. It implies a diplomatic struggle on the lines of trench warfare, a form of campaigning for which America lacks the infantry, and for which it would have to rely on an uncertain coalition of Chinese, Afghan, Persian,

Turkish, Kurd, Arab, Greek, Italian, Austrian, Polish, Czech, Bulgarian, Yugoslav, and German parties—some of them unreliable, and others disreputable, allies for an America pledged to defend freedom and national independence.

Such a coalition of mercenaries and satellites—it is argued—could not be held together; it would be torn and shaken by Communist counter-tactics. It would split European Socialists (though Mr Lippmann does not make this point, it is important) by forcing them reluctantly into the anti-Russian camp. Its manipulation would give decisive powers to American diplomats—some of them very inexperienced—in storm centres. It would mean dispersing American resources over a wide perimeter, instead of concentrating them at strategic points. In short, for wise and solid reasons, Mr Lippmann is unwilling to see American foreign policy dissipate its strength by manning the Yalta frontiers with an army of mercenaries.

He then goes on to narrow the field of vital American interest by pointing to the main objective of Russian ambition. He asks Americans to forget their obsession with Communism and to think of the Soviet rulers as heirs of the Romanovs. He points out that Mr Molotov sacrificed all ideological prejudices to secure from Hitler in August, 1939, territorial concessions in Eastern Europe; that the peace treaty with Rumania and the agreement of August, 1945, with Poland completed the process of regaining everything that Russia lost between 1917 and 1921. Beyond those territories Russia has established a sphere of influence up to the Elbe which, says Mr Lippmann, is maintained not by the power of Communist parties, but by the imminent power of the Red Army. If the Soviet leaders can be persuaded, by ransom or by force, to withdraw their troops 500 miles east of the Elbe, then the balance of power in Europe can be restored by the free development of the large and small states between the Rhine and the Soviet frontier. The Communist Fifth Column would remain; but much weakened by the departure of the other four.

Mr Lippmann then approaches his problem from another angle. He wants American policy to be morally and legally right beyond reproach. The Russians have agreed there must be peace treaties; it is therefore right to use every effort to obtain them. Once they were concluded, the obligation to remove armies from Austria and Germany, and from the lines of communication to both countries, would be clear and specific. If it were ignored by the Russians, Europe would be solidly against them. If it were observed, and if Russian troops subsequently returned, America and its associates would have a cast-iron case to present to the Security Council, at worst a clear *casus belli*. In either case, the issues between America and Russia would be concentrated and clarified. The obstacle to a settlement would be single and unavoidable. To those who would object that such a confrontation makes agreement impossible, Mr Lippmann answers: "To think that rival and

The Gap between

... inadequate capital and the provision of essential income for dependants may be bridged by the capital and income benefits secured through the Family Provision Scheme

EQUITY & LAW
Established 1844
LIFE ASSURANCE SOCIETY

20, LINCOLN'S INN FIELDS, LONDON, W.C.2

unfriendly powers cannot be brought to a settlement is to forget what diplomacy is about."

There is no denying the cogency of this analysis and this criticism of the Truman doctrine, always remembering that Mr Truman last March had to startle Congress into action to help Greece. But there are implications and assumptions which need more cautious examination. Why, for example, is Mr Lippmann in a hurry—as was Mr Byrnes? Why does he think a settlement with Russia possible within a year or two? Is it because he fears that the American people will grow impatient with the long and tortuous processes involved in carrying out Mr Roosevelt's injunction to be patient and firm? Again—is he confident that American diplomacy can confront the Russians at the climax of its pressure with a threat that will work? Or is he thinking of a bargain in central Europe, an acceptance of Russian claims to reparations out of current German production, and agreement to withdraw American and British and French as well as Russian troops from Germany? If so, does he realise the immense popular appeal of the mere suggestion that the troops should all come home?

For the moment, it is sufficient to ask and ponder these questions, bearing in mind that Mr Lippmann has in the past accurately forecast, if not determined, American policy; and that there has been so far no other hint of the kind of settlement with Russia which Mr Marshall is aiming at. But it is not too early to point out that a trial of diplomatic strength of the kind Mr Lippmann recommends could not possibly be staged with Mr Bevin and M. Bidault out of the ring; clever footwork by Mr Molotov could cause confusion among the western Foreign Ministers if they begin next month with no knowledge of one another's intentions. It is not absolutely in-

conceivable that the suggestion to withdraw all troops from a united Germany might come from the Russians. For Mr Molotov cannot wish to see Western Germany, as a possible source of reparations and a certain centre of industrial power, being given its own central government and a prominent share in the benefits of a Marshall Plan. He must realise that the attractive power for Germans of that plan and of talk of West European unity is something that did not exist at the Moscow conference. And he must see, too, that the basis of Mr Bevin's brief at that conference has now been changed; that British policy for Germany must be to ensure the maximum contribution of the Ruhr to the success of Mr Marshall's policy.

It looks at present as if Mr Bevin will have to use his patience to temper Mr Marshall's firmness with his Soviet colleague. Unless he does so, using the British stake in Germany with skill and imagination, there is a risk that his American and Russian colleagues will try simultaneously to seize the initiative and meet headlong at the very outset. If they do, the London conference will fail, and the temptation for American policy to follow the path so brilliantly illuminated by Mr Lippmann might be overwhelming. It is as much in the British as in the American interest that the occupying armies should leave Europe, freeing it from its non-European liberators. But it is not in the British interest that Mr Marshall should attempt, single-handed, to force the Red Army out, nor that the Security Council should be brought into the argument; nor, indeed, that the effort to reach agreement with the Russians should be made only in Europe. The London conference may prove to be the "last chance" for some years to agree on Germany; it need not be the last chance for American diplomacy to seek a general agreement with the Russians.

Democracy in Japan

DIVERGENT views are held by those most closely concerned about the health of the democratic regime created in Japan since the end of the war. General MacArthur is very pleased with it. After all, it is primarily his own creation, and like an earlier and even more eminent Creator, he sees that it is good. The Japanese with whom he comes in contact all say too that it is good, and a leading soothsayer called Tomioka has informed the Japanese public that the General will not only be the next President of the United States, but is also destined to receive as a supplement to his allotted span of life the years "sacrificed" by Mr Atcheson, the representative of the State Department in Tokyo, who was drowned when a flying boat plunged into the ocean on the way back to North America. With such good things coming to him the Supreme Commander is optimistic about the Japanese. What is more, Dr Evatt, when he came from Australia to Tokyo to see for himself, saw and was converted. On the other hand, Mr McMahon Ball, who formerly represented the British Commonwealth on the Allied Council in Tokyo and resigned on losing the support of Dr Evatt, strongly disagrees and says that no people are as experienced as the Japanese in "hiding their real feelings." Even more dissident is the Soviet representative on the Allied Council, who sees nothing but a country dominated by imperialism and reaction, with fascist beasts prowling behind every rubble dump.

Amid such a confusion of reports it is difficult for the world to judge, and it is not likely that any better agreed story could be obtained by interviewing Japanese politicians. But it is possible by surveying what has actually been done in the past two years against the background of prewar and wartime Japan to make a tentative and provisional estimate of the stability of the new regime. That it has been imposed from outside and not produced by a spontaneous popular movement within Japan

cannot be denied. There was no revolution in Japan; on the contrary it was finally pulled out of the war by the monarchy turning against the army. And, whereas in Italy the Badoglio pull-out did not absolve the monarchy in public eyes from its responsibility for originally giving power to Mussolini, in Japan the convention remained strong that good acts of state manifested the Imperial will, while bad ones were the work of evil counsellors. Certainly there was in August, 1945, no sign there of political disintegration; the change of government came about in a constitutional manner and the last fighting War Minister, General Anami, very properly committed suicide.

Nevertheless, defeat in a protracted and bitter war, in which great human and material losses had been suffered, and nearly all the larger cities had been laid in ruins, could not have failed to shake the established political and social order to its foundations; and the economic sequel, with its stagnation and impoverishment, was bound to produce serious tensions in Japanese society. The Army was discredited and its abolition, decreed by the Allies at Potsdam, must have profoundly affected the internal balance of forces, even if the Allies had not undertaken directly to transform Japanese political and social institutions. Japan, after all, had already had for many years multi-party elections to the House of Representatives on a basis of universal male suffrage. The power of this institution had been to a great extent restricted and thwarted, partly by constitutional provisions which diverted power elsewhere—notably the convention which gave the Army and Navy control of the service ministries—and partly by police pressure in elections. In 1940, under the stress of the nationalist reaction, there was a forced amalgamation of parties which virtually put an end to all political freedom. Yet in 1937 the party of labour, the Shikai Taishuto, had managed to double its representation in a general

election—a fact which indicated at least a certain vigour in popular political life and the possibility of its legal expression. With the abolition of the Army and Navy and the catastrophic failure of the policies associated with ultra-nationalism, it is probable that in any case there would have been—even within the existing constitution—a revival of parliamentary politics, a strong movement towards the Left and, what has actually happened in the General Election this year, the emergence of the Social Democrats as the strongest single party in the elected House.

The Americans, however, were not content with the abolition of the Army and Navy or with insistence on freedom of speech and elections. They decided to present Japan with a new constitution, which was written by American political experts on General MacArthur's staff and put out as a Japanese document—this, indeed, saved Japanese face, but did not conceal its origin from any well-informed person. The Japanese thus now, as before, have a Constitution which has neither been in fact produced by a popular Constituent Assembly nor grown by a long evolutionary process of national political life; instead it has been delivered to them from on high, only this time by the Supreme Commander of the victorious enemy, instead of by the Emperor Meiji. It is true that this constitution removes the checks on popular sovereignty which existed in the old one, and is an interesting composition of what certain intelligent American theorists regard as the strong points of various existing systems. Nevertheless, it can hardly be expected, in view of its mode of inception, to command any deep loyalty or enthusiasm in the Japanese mind.

More important have been the social changes ordered by Allied Headquarters directives—notably the agrarian reform and the dissolution of the great *Zaibatsu* family trusts, which formerly dominated Japanese banking and industry. Both these measures went beyond the purge of individuals held responsible for promoting national aggression. It was held that an oppressive agrarian system (loosely called "feudal") and the exceptional degree of concentration of capital had been factors disposing Japan to aggressive policies and would, in future, be obstacles to democratisation. It was thus officially recognised in Washington that political democracy was not sufficient without certain social changes—a view which had something in common with the conception now familiar to us as "Eastern democracy" and was ardently supported by the "fellow-travellers" still influential in planning circles in 1945. But, whereas real Marxists regarded trust-busting and giving land to peasants in private ownership

as steps towards socialisation, both in industry and agriculture, the believers in the American way of life saw in them conditions of stability for a system of capitalist democracy. The social reforms imposed by the Americans in Japan are now indeed clearly envisaged as prophylactics against Communism. A society in which the majority of peasants are tenants paying high rents on plots of land insufficient to maintain them, while most of the profits of business enterprise are devoured by a few great monopolists, is obviously vulnerable to a propaganda of violent social revolution unless it is held together by a very strong authoritarian government.

It is on the success of its social policy rather than on its purely political constitutional innovations that the viability of the American-sponsored new order in Japan depends. Great difficulties have been encountered, for the vested interests affected were deeply entrenched and had a strong hold on the new parties of the Right which had replaced the dominant parties of the prewar Diet. Land reform was persistently obstructed under the Shidehara and Yoshida Cabinets, and in the last elections many peasants voted Social Democrat. With the Social Democrats coming in as the strongest party and the Right having to compete for the peasant vote, better progress in land distribution is now being made, and peasant ownership is gradually being extended. Less successful has been the attempt to disperse the holdings of the confiscated *Zaibatsu* companies; small investors are reported to have shown great reluctance to take up the shares; this is presumably due to pessimism about the future of industry which must continue until the reparations question has been settled and there are some signs of real commercial revival. At present in Japan it is more profitable to put capital into commodity speculation and black market transactions, and the "new millionaires" who arise from this kind of economy are not factors of social stability.

If the agrarian reform is carried through and if there is a revival of foreign trade or an extension of American credits sufficient to cover the imports of food, raw materials and new capital equipment on which Japan depends for adequately feeding its urban population and restoring its ruined industry, then the social bases for "Western democracy" will have been laid. Then the labour movement, now under predominantly Social Democrat leadership, will be able to develop by constitutional, parliamentary methods. But in the present conditions of economic collapse and unconsolidated reform, there is no reason to believe that democracy would survive in Japan if the American forces of occupation were to be withdrawn in the immediate future.

NOTES OF THE WEEK

Schism in France

The great schism which divides France into two irreconcilable and potentially warring factions was dramatically brought to light by the results of the municipal elections on Sunday. It is now apparent that French political opinion is being polarised round General de Gaulle, arch-enemy of the Communists, and round M. Thorez, arch-enemy of the Gaullists. Nevertheless, among the total number of voters there remain substantially more non-Gaullists than Gaullists, and almost twice as many anti-Communists as Communists.

Between these major political forces the lesser parties now present a sorry spectacle, divided within themselves and between themselves, and torn apart by their conflicting attitudes towards their successful rivals. The Socialists, MRP, UDSR and Radicals can be compared with the smaller governments on the international scene, unable either to prevent a conflict or to constitute an effective balance between the hostile giants of East and West. All are in danger of becoming "satellites."

Whether or not the present deadlock will resolve itself in civil war, which many Gaullist and Communist leaders are not only discussing but also "defensively" preparing for, will depend on

international rather than on domestic developments. For the time being it seems likely that France will continue to be governed either by a precarious coalition or again by a homogeneous Socialist Cabinet; neither would command the support of more than a small minority of the country. It is at any rate clear that the progressive Catholics of the MRP have suffered severe punishment in the elections, and were the chief agents of the Cabinet reshuffle which M. Ramadier has carried out.

Minority government could not command the authority needed to combat inflation and so to avert economic catastrophe. The capitulation to the Paris transport workers was perhaps necessary to avert a general strike and political calamity. But there is no doubt at all that the all-round wage concessions which now seem inevitable will make nonsense of the plans of intensive work worked out by the inter-ministerial committee, set up to prepare plans for balancing the budget and rescuing the franc. M. Robert Schumann's resignation precipitated a governmental crisis, but he can hardly be blamed for withdrawing after the reversal of a policy to which he has been constantly and ineffectually pledging himself for almost a year. This week has also seen a new decline of the withering confidence in the franc, since the danger signal has been officially hoisted over the dwindling French gold reserve.

What Could de Gaulle Do?

In these circumstances, with prices swerving upward and diminishing food reserves failing to enter the legitimate markets, there is a good case to be made for the Gaullist view. France's first need is a stronger executive authority. The Right cannot be expected to listen to lectures on constitutional legality from the Left, when the Government is submitting to the control, not of the elected representatives of the sovereign people, but of the trade unions who evidently command far greater authority.

On the other hand General de Gaulle has yet to reveal how he proposes to prevent workers from striking, peasants from hoarding, towns from starving, or what measures he would take to suppress the "party of separatists" as he calls the Communists. If the methods he proposes are to be violent, authoritarian and contrary to the liberal tradition of the West, then it may reasonably be asked whether the remedy would not be worse than the disease.

If the threatened parties of the centre are to save the young Republic from the authoritarians on the Right and the Stalinists on the Left, the first condition of success is substantial and prompt American aid. But the latest concessions to strikers, the governmental crisis and the apparent political deadlock are so many factors likely to discourage Americans from aiding France. The Communists must be expected to press this advantage as part of their effort deliberately to disgust the Americans with Europe in order to cripple the Marshall Plan. Certain Congressmen, now falling over one another in their enthusiasm to resist "Communist activity" in the grand purge of Hollywood, are in fact serving Moscow's interests, in their isolationist and anti-European campaigns, with a blindness which from Paris looks incredible.

From the British point of view it is plainly desirable that the traditions of western democracy and counsels of moderation should prevail across the Channel, although it is hard to see what can be done to help the French ally.

* * *

The New Session

Does the fact that the Government's new programme is to be what Mr Attlee calls "balanced" mean that, in the new parliamentary session, MPs will have time to breathe, time—and opportunity—for constructive criticism, not only of legislation but of the Government's policy in general? There certainly seems a good chance that last session's overcrowding, with attendance in standing committees three, or even four, afternoons a week, and of the guillotine closure of important debates will not be repeated. The amendment to the Parliament Act (discussed in an article on page 665) apart, much of the coming legislation would have been introduced by a Conservative Government. There will be little party controversy over the poor law bill, the deprived children bill or the criminal justice bill; and on these matters, as on the bills for promoting production in the Empire, for reforming local government finance and for reforming the law relating to actions for personal injuries, ordinary MPs will be able to apply their special interest and knowledge.

The private member, however, is still not restored to his own. Once again, the Government has decided to take "private members' time"—the time, that is, allotted under standing orders to private members for bringing in bills and motions. There was the usual protest against this decision on Wednesday, and, indeed, the Select Committee on Parliamentary Procedure recommended a year ago that private members' time should be restored as soon as possible. It may be questioned, however, whether the right to bring in bills and motions is the best way to use a back-bencher's talent and to retain his keenness. Too often in the past, private members who were successful in the ballot for bills and motions introduced bills that had the support of the Whips; thus, private members' time was often merely an addition to Government or Opposition time. Often, too, they brought forward eccentric or crank measures that could never reach the statute book. The truth is that, today, when the Government's sphere of influence becomes wider and wider, the scope for private members' bills is contracting. It is difficult to believe that the most famous private member bill of recent years—the Herbert Marriage Act—would not today be a Government measure.

Too many tears should not, then, be shed over the denial of private members' time—however desirable it may be, in theory, to give an outlet for cranks and to test the readiness of public opinion for measures not officially adopted by any party. But the true value of the private member today, and in the future as far as can be seen, lies in informed and constant criticism, by the back-bencher on the Government's side as well as on the Opposition's.

It is a poor demonstration of the value placed on the services of Labour back-benchers that when the Prime Minister was speaking on the debate on the Address, and referring to such an important topic as demobilisation, large numbers of Labour MPs left to attend party meetings.

* * *

Trimming the Services

The first day's debate on the King's Speech produced some further information from the Prime Minister on the exact size of the cuts to be made in the Armed Forces. The original figure for March 31, 1948, in the White Paper earlier this year was 1,087,000. In August last Mr Attlee announced a reduction of some 80,000 men and women below the earlier total. It has been known that further cuts were being made. The revised figure announced on Tuesday was that the present total for March, 1948, is expected to be 937,000, which is a reduction of 150,000 on the original total. From the symmetry of the figure it looks as though the total had been cut from above, rather than that the Services themselves had worked out reduced figures for their commitments. This lends point to the criticism that has from time to time been made, that the Service chiefs have never been won over to belief in the need to economise in man-power, and therefore to the need for applying their minds to how much more effective each man in the Service can be made to be.

The Prime Minister's statement was enlivened by an interjection by Mr Churchill suggesting that the present effective strength of the Home Fleet was one cruiser and four destroyers. On Service matters Mr Churchill does not usually speak without some information in his possession; and the Admiralty have not helped to build up confidence by the tone of their recent announcements over cuts in naval strengths and establishments. Nor, indeed, did Mr Attlee rise to the occasion, since he found himself unable to contradict Mr Churchill in other than general terms. The general impression left at the moment is that if the Russian Fleet did come again to the Dogger Bank all Britain would have with which to meet them would be a fishing fleet. However, it is perhaps best not to be alarmist. Again, what is important is that the 140,000 men under the Admiralty should be effectively used and trained, even if on any one day in the last few months only four vessels of the Home Fleet could have raised steam at immediate notice.

* * *

Housing Cuts

The announcement by Sir Stafford Cripps of the cuts in the building programme came too late for proper discussion in this week's issue of *The Economist*. Nor is it possible yet to estimate in detail their effects on the output of houses. It may nevertheless be useful to give a brief summary of the dilemma in which the Government has been placed.

The quick and painful way would be to cut the immediate building programme drastically and to throw a large proportion of the present labour force (260,000 working on new houses) out of work and to let economic forces compel these men to move into the expanding industries. This method would permit of a concentration on the most urgent housing schemes and might even result in more houses, not less, being completed over the next six months and a sustained output thereafter at the same level. At present the dispersing of effort over some 250,000 houses under construction is extremely wasteful. The drastic policy has, however, already been strongly opposed by the building trade when they met the Minister of Works last week, and their opposition carries great weight.

The slow, less painful but less effective way is to reduce the number of new contracts and so taper off the effects of the cut over many months, by letting existing contracts work themselves out. This is the decision the Government has apparently taken; for Sir Stafford Cripps said that the 260,000 permanent houses under construction and the 90,000 under contract would be completed "in the shortest possible time." But at the present rate of building it would take nearly two years before the houses now being built were completed; and even if the rate were doubled the contribution to the solution of the present crisis would be negligible. The only immediate contribution would be from the industries producing housing materials and components; for the flow of new orders to them would be checked, and they would be freed to adapt their output to the needs of exports or to work more in accord with the straitened circumstances of the country, or even to close altogether. Sir Stafford's emphasis on the need

to save more steel for export and to economise in timber imports is one reason for the housing cuts bears this out.

But what the public will want to know is the effect of the Government's decision on the actual completion of houses. It has already been shown that target and performance are so wide asunder that the two are unrelated. If the Government were only to determine that, say, 10,000 houses are to be completed a month and gear the labour force in the industry, both in the factory and on the site, to that number, the country will in fact get no fewer houses than it is getting now, but will have a larger reserve of labour to move elsewhere. The process will be painful, but it will at least be healthy.

Independent Burma

The treaty with Burma was signed at 10 Downing Street on October 18th by Mr Attlee and the provisional Prime Minister of Burma, Thakin Nu. A bill ratifying the treaty is to be introduced in Parliament this week, and until then the text is not to be made public, but it is known that the intention is to complete the transfer of power before the end of the year.

Burma came under British sovereignty as a result of three wars; that sovereignty is now renounced without a war, except for that war against Japan which Britain decisively won. There was a moment last year when it seemed that a clash between the residual British authority and Burmese nationalist forces was imminent; but it was averted by the Government's timely action in implementing the promises which had been made to Burma, and the final agreement appears to have been reached in a spirit of great cordiality. In the internal affairs of Burma there is still much local disorder, which remains a serious problem for the new administration, but there has been no major outbreak of party violence since the assassination of Aung San and his colleagues (for which the former Prime Minister, U Saw, is now on trial) and there is no communal strife comparable to that which has marred India's achievement of independence. There is still a problem of the Indian minority, but since the flight of a great number of Indians from the country in 1942 it has been less acute than it was before the war. The principal minority problem is now that of the Karens—a people who have a special claim on the gratitude and consideration of the British nation. There are those who think that the Karens have not been well treated by Britain in the settlement with Burma, and the word "betrayal" is sometimes used. But in the long run it would certainly have been unwise for Britain to have assumed the position of guarantor for any special status of the Karens in an independent Burma; it is better that Britain should be able, if any trouble arises, to give informal friendly advice without infringement of Burmese sovereignty.

Economically, Burma is of considerable importance both for the world market and for this country. It was before the war a large-scale exporter of rice for the Indian and British markets; apart from Indonesia and Sarawak it has the only significant oilfield in Asia east of the Indus and south of Sakhalin; it has a large share of the world's wolfram, and is a principal producer of teak, now in desperately short supply. Provided internal order can be established and production restored to prewar levels, Burma should be in an exceptionally good economic position, with its large surpluses of exportable commodities. To bring about this recovery will now be the common task of Britain and independent Burma.

New Constitution for Mauritius

The announcement that a new constitution is to be given to Mauritius will arouse little general interest in this country which seldom hears of the island unless it is visited by cyclones or disease. But the correspondence between the Governor and the Secretary of State on constitutional reform, which has now been published (Cmd. 7228), is well worth study, for it illustrates to the full how difficult it is to grant even a measure of responsible government in the dependent Empire.

Wherever one turns in the colonial empire, with the exception of the West Indies, the communal problem is seen as the big obstacle in the way of self-government. Fortunately, if the special case of Palestine is excepted, it has nowhere been necessary to fall back on the drastic solution of partition adopted for Ireland and now for India. Nor has it been necessary to adopt the delaying principle of communal representation, which freezes a country into the mould cast by its different communities. Constitutional reform has instead proceeded on traditional British lines, but reserves for the Governor power to safeguard the rights of minority communities, either through the direct appointment

in colonial legislatures of persons to look after their interests or through his right to veto or confirm legislation affecting them.

It is against this sort of background that the proposals for Mauritius, where the adult Indian population outnumbers the combined French, Coloured, British and Chinese adult population by 135,900 to 83,000, should be judged. An unofficial elected majority in the Legislative Council will be partly kept in hand by the twelve unofficial members directly nominated by the Governor. Similarly, although the introduction of a literacy test in the franchise qualification is at first sight distasteful, the Governor's explanation—that otherwise the proposed abolition of the property and educational qualifications would cause the electoral roll to be "swamped by thousands of persons whose inability to read the printed word places them at the mercy of those who can"—is reasonable. More questionable, perhaps, is the proposal that the Legislative Council should elect four unofficial members of the Executive Council. It is made as a means of solving yet another difficult problem in colonial constitutional progress—how to prevent a largely elected legislature, which has no responsibility for government, from degenerating into a place for abusing an "alien Government." But it is a device that has not had much success when it has been tried elsewhere.

On the whole, however, the new constitution proposed for Mauritius is satisfactory. It is as liberal as can be devised for such a heterogeneous population at its present stage of development. It is along lines such as these that Ceylon began to move towards self-government—not so very long ago.

* * *

The American Reply on Korea

The Russian proposal to end the Russo-American deadlock in Korea by simultaneous evacuation of the Russian and American occupying forces has now brought an American counter-proposal calling for a general election under supervision of Uno before the evacuation. The Russian proposal contemplated evacuation without any internal political settlement in Korea, leaving the Koreans themselves to work out their destiny. In the absence, however, of any proof of the proportions of popular support enjoyed by the various Korean parties, it seems only too probable that after withdrawal of Allied troops the composition of the Government would be decided not by the ballot-box but by the bullet, and in such an initial contest of force the Communists, who are believed to have built up a strong armed force in the Russian zone, would be likely to have the advantage. To avert this development and secure free elections, the United States has now proposed to the United Nations Assembly that the occupying powers should hold elections in their respective zones under the observation of the United Nations not later than March 31, 1948, as the initial step in the creation of a National Assembly and a central Government in Korea; this Government, when set up, "will constitute its own national security forces and will arrange with the occupying powers for the early and complete withdrawal from Korea of the armed forces of the USSR and the United States."

There has been some very pretty diplomatic swordplay in this succession of proposals. Russia gained the initial advantage by suddenly coming out as the champion of early independence (after having for months refused to have any dealings with Korean leaders who rejected trusteeship for Korea) and putting on the United States the onus of a refusal to evacuate. But by making evacuation conditional on a Uno-supervised general election, Washington has turned the tables; it has brought Uno into the middle of the picture and put on Russia the onus of refusing to allow Uno supervision of elections in a country not yet sovereign. The Communists and their associates might gain a majority in free elections in Korea; on the other hand, they might not. It remains to be seen whether Russia will now produce new proposals which accept the principle of Uno intervention without unduly exposing Russia's Korean protégés to the risk of not being able to control the Government. In any case the idea of trusteeship now seems to be dead and buried.

* * *

"Little Assembly"?

Mr Foster Dulles's exposition last week to the Political Committee of the Assembly, of the American scheme for a "Little Assembly," which would relieve the General Assembly of some of its burdens, received the rather uneasy approval, in principle, of most of the delegates, but was uncompromisingly rejected by the Russians and their satellites. Timid compromise proposals brought forward by Sir Hartley Shawcross provoked even more violent reactions from the Russians, and when Russia and Czecho-

slovakia were elected to sit on a sub-committee to study the American proposals, they promptly announced their refusal to serve. Although the Americans have denied that their proposals are intended to interfere with the work of the Security Council, their general effect would be to set up a committee with wide and rather loosely defined powers to investigate and discuss matters of international peace and security. The British proposals, on the other hand, strictly defined the matters which the Interim Committee could discuss, and refused it the powers, which the Americans would give it, to consider and make recommendations on "the principles of co-operation in maintaining peace."

The Russians and their friends gave full rein to their imagination in condemning the American proposals as attempts to further the sinister aims of American foreign policy which, Mr Gromyko said, were "only liable to push the United Nations closer and closer to the abyss from which it might never be able to come out." They could only regard them as an attack on the Security Council, and as an attempt by the Americans to nullify the veto by the use of what Mr Modzelewski of Poland bitterly called their "mechanical majorities."

Most of the delegates outside the eastern bloc were hampered in judging the American proposals by their inability to decide whether they were really designed to create a body which would make good the deficiencies of the Security Council. Although they felt it wrong that problems of security should not be dealt with because members of the Security Council were at loggerheads and because the Assembly was not in permanent session, they were not prepared to drive the Russians into the last ditch of opposition. Sir Hartley Shawcross's proposals for a "Little or Minute Assembly" were designed to purge the discussion of the passions aroused by the veto, thereby leaving it weak and ineffective. He felt that there must be in continuous session a body through which world opinion could make itself heard, even if it could not enforce its will. But many delegates wondered whether all the trouble and expense involved would be worth while, if they only produced another sounding-board for Messrs Gromyko and Vishinsky.

* * *

Denmark's Other Customers

Behind the stubbornness of both parties to the suspended Anglo-Danish food talks lies a basic conflict of opinion about the world market for agricultural produce and, in particular, for butter. The British say that the Danes have no other markets comparable in size to Britain and will therefore be forced to sell to Britain. The Danes say that if the price offered by Britain is not raised, they must find other markets to avoid ruin. They are therefore energetically looking for them.

In, say, the next six months they must dispose of an export surplus of about 30,000 tons of butter, of which about 20,000 tons would normally go to Britain. Markets have so far been found for about 25,000 tons, mainly in Russia, which is to take nearly 12,000 tons, Switzerland, which is to take about 5,000 tons, Belgium, which is to take 4,000 tons. Also France will get 1,500 tons and Czechoslovakia 1,000. Negotiations are in train with the United States, where a figure of several thousand tons is mentioned, and Italy and Spain, which both appear unlikely to take much butter. And an agreement involving goods worth some 200 million kroner is expected soon with Poland.

It is thus evident that the Danes are getting nearer to finding adequate markets than might have been supposed. But these markets are unlikely to be permanent. The butter that goes to Russia, for example, is said to be for the Leningrad region—the Baltic states are at present unable to produce adequate supplies and Russian transport cannot bring them from more distant Soviet lands. Similarly, as Swiss agriculture recovers from its wartime pattern, the Swiss demand for Danish butter will fall. Moreover, several countries have attached to their various trade agreements conditions distasteful to the Danes. From France, for example, unwanted wine, perfumes and silks must be taken and from Czechoslovakia bicycles and various other machines.

It should be frankly recognised here and in Denmark that most of these arrangements, however necessary now, are in truth a second best. They are emergency measures pending the re-opening of the British market and, implicit in this, resumed deliveries of British coal. Coal stocks in Denmark are now very high—but so was the price paid for them. And when one recalls the interruptions and serious distortions from which the economies of Denmark and other western nations suffer, owing to lack of British coal, attempts to justify the low prices we offer for Danish dairy produce by the alleged inefficiency and feather-bedding of Danish agriculture, even though partly true, look largely irrelevant.

The most relevant fact is that 1½ million tons—say two days' output—of British coal would buy about 12,000 tons of butter even at present Danish prices. But if the coal came the prices would drop.

* * *

Two Voices on Steel

The speeches by Mr G. R. Strauss at Cardiff and Mr Aneurin Bevan at Hull, delivered on the same day last week and reported in piquant juxtaposition in the daily press, make one wonder just how close are the political and intellectual sympathies which rumour attributes to these two Ministers. The Minister of Supply had good news to tell, of a weekly rate of steel production during September higher than any attained since the record month of October, 1940, exceeding the average weekly rate for the first quarter of 1947 by nearly 20 per cent, and accelerating in most promising fashion towards the Prime Minister's target figure of 14 million tons a year. After all due allowances have been made for the fact that September always has been a good month for steel production, that the first quarter of 1947 is a datum-line to be used with extreme reserve, and that fuel, raw material and transport difficulties lurk ahead for the winter months, this is a good showing and Mr Strauss had reason for his congratulations.

The Minister of Health sees things in a different light. The coal industry had had to be nationalised, he told his audience, "in order to rescue it from the situation in which it had been placed"; and the same destiny awaited the steel industry, which would not be left in the hands of those who had betrayed the nation's trust and could not be trusted to develop the industry to the extent required by national necessities. The charge of "betrayal" he supported by references to the inter-war years, when steel production was allowed to fall off for want of profitable outlets. (Nobody would deny that the conduct of the steel industry was in many respects reprehensible; but the presumed duty, in Socialist eyes, of every capitalist to run his works at a loss if the national interest appears to demand it, has never been balanced by a corresponding obligation on the workers to work for nothing and pay for the privilege of doing so.) Of the present performance of the steel industry he had nothing to say, except that the target had been set too low; and in view of the comparison which he tacitly invited between the relative performances of nationalised coal and as yet un-nationalised steel, he was certainly wise. (Such a comparison would, of course, be extremely unfair; but Mr Bevan does nothing to call forth even that degree of chivalry needed to point this unfairness out.) How delightful it would be, how all concerned would cheer and throw their caps in the air, if coal production were up by 20 per cent, however tendentious the datum line with which it was compared.

* * *

Thanks from the Spivs

The tangles into which the trade unions are liable to get themselves through their advocacy of the "closed shop" were beautifully illustrated by a statement from the Ministry of Labour this week. Mr Raymond Blackburn, MP, asked the Ministry what would happen to a man who refused to join the appropriate trade union when he was directed to the mines or to some other industry. The Ministry replied that

A person who expressed objections to joining the trade union would not be directed to a job in which membership of a trade union was a condition of employment, or in which refusal to join a trade union was likely to cause an industrial dispute.

What more perfect loophole could be devised for the workshy, the black marketeer or the inessentially occupied? They have but to express a high-principled objection to the union into whose close embrace they are being pushed by the Ministry's National Service Officer, and the road to their old freedom is clear. It is little use for the Ministry to claim that the worker would then be available for direction into an occupation where his objections would not be likely to cause difficulties. For the more essential the occupation, the stronger the union and the more stringent the conventions about membership. It is, of course, still possible to choose a type of employment where trade unionism is weak, but this would merely be moving the butterflies from one resting place to another.

The situation has its humorous side, for it is the trade unions who have voiced the most outspoken criticism of the spivs, drones and butterflies, and have forced the Government to spread nets to catch these relatively insignificant creatures. And now when their capture seemed imminent it is the unions' own policy on membership which will permit them to escape. The unions will receive a vote of thanks from the spivs.

The End of Plural Voting?

In this egalitarian age neither education nor property are any longer to provide their owners with special voting rights. That appears to be the object of the proposal contained in the King's Speech for electoral and franchise reform; it is intended, rumour says, to abolish plural voting. Equality before the law is to be matched by equality at the polling booth.

The proposal will not provoke widespread interest, for quantitatively it touches only two small sections of the nation. The electorate possessing an additional university vote is only some 214,000, and that possessing an additional business property vote only 57,000. Out of a total electorate of 28 million these figures are very small. Nor can many tears be shed at the disappearance of the plural vote for business property holders, for they elected no special representatives but merely swelled the number of votes for the normal run of parliamentary candidates. No members of Parliament represent, at least outwardly, the interests of property holders as such.

The position is rather different with the university vote, for the university voters directly elect thirteen members of their own. These members have usually been of high calibre and often of genuinely independent views, and their influence has been out of all proportion to their number. Eleanor Rathbone was an outstanding example, but the character of the electorate and the special status of the universities has meant that good candidates have usually been forthcoming. It would be a pity to destroy this tradition of independence and high quality.

The terms of the new bill are not yet known, but it is thought that the intention is to abolish plural voting without abolishing either the university or business property vote, and that voters now possessing two votes will be able to opt for the one they prefer. The details of how this is to be done will be interesting. At what stage will the option have to be made—before or after the candidates are known? Since a change in procedure is coming it might also be desirable to alter other aspects of the university vote. At present Oxford and Cambridge universities each have two members, London one, all the other universities of England only two between them, Scotland three, and Wales and Northern Ireland one each. This is patently unfair and should be re-adjusted. There may well be a case for giving all the universities together a single list of thirteen members and for electing them by proportional representation. There, if anywhere, PR should work to advantage.

Problem of the Blitzed Cities

Mr Silkin is holding a series of conferences with representatives of the "blitzed" cities. The grandiose plans for rebuilding the centres of these cities still exist only on paper. The "blitzed" parts and the "blighted" parts (that is, areas of obsolete housing) of these cities are inextricably interwoven—in fact, many of the central areas consist of little else but blitz or blight. Under the 1944 Act, by which their finances have until now been regulated, adequate grants are not available for the "blighted" parts. This situation should be remedied when the new Town and Country Planning Act comes fully into operation, which is hoped by the Ministry to be next April 1. Exchequer grants will then be available for an initial five years at the high flat rate of 90 per cent in respect of blitz, and on a sliding scale of up to 80 per cent for blight; and thereafter grants continue at reduced rates for the full loan period of 60 years. In the period before the Act comes into force, however, the cities are experiencing several problems, which it will be the duty of Mr Silkin to clear up.

Finance, however, is becoming almost the least of these cities' problems. It will be impossible for a further indefinite period to secure labour and materials for ambitious schemes of capital construction. There is sure to be renewed pressure for the sanctioning of makeshift building schemes. It is tragically ironic that when, for the first time, Britain's cities have the opportunity of being properly built on spacious and imaginative lines, when plans are ready and finance is available, much of the actual building should consist of temporary houses and other structures which offend against the long-term intentions. But it is still far too early to despair. What is important is to see that any temporary expedients do not seriously impede the eventual and gradual execution of the cities' plans. Later this year, the Ministry plans to issue a manual of guidance on the rebuilding of central areas, which ought to point the way to the reconciliation of long-range planning with the satisfaction of immediate needs. Such reconciliation is not easy and may involve some forgoing of immediate advantage; but the vision which has been seen of a new England is surely worth some sacrifice.

Time-saving in Teheran

It looks as if the Persian Prime Minister is following British advice in guiding the deputies of the Majlis away from a challenge to Soviet oil policy. For, although they rejected by implication on Wednesday the agreement he signed with the Russians in the spring of 1946, they have approved by 102 votes to two a resolution which would allow negotiations with the Russians to continue. It appears—though reports are sketchy—that they oppose any further oil concessions to foreign Powers, that they want prospecting to begin in north Persia, and that they would like to see their government getting a larger share of profits from the Anglo-Iranian company. Clearly Qavam-es-Sultaneh has secured himself a brief which will be useful in another battle of wits and patience with the Soviet Ambassador. He can plead that he is not to blame for the failure of his conscientious efforts to get Majlis support for the project of a Soviet-Persian oil company in the north; the agreement he signed in 1946 was the price of Russian troop withdrawals from Azerbaijan and is regarded by his countrymen as a promise made under duress.

But it must be realised in Washington and London that Qavam cannot stall for ever. The Russians need oil—that has never been disputed—and the only question is whether they insist on immediate and exclusive rights to get it themselves from northern Persia or whether they get it as a result of commercial negotiations. Their choice will depend on the British and American attitudes, which still seem neither clear nor co-ordinated. If ever there was a case where constructive proposals made through diplomatic channels might receive attention in Moscow it is this one. Far too little attention is given to the economic bases of Soviet policy, and to the possibility of patient negotiation about them.

Tonic for the Control Commission

Every inquirer who has visited the British Zone of Germany with serious intentions pays tribute to the energy and outstanding competence of the higher officials of the Control Commission. The average level of intelligence and integrity is high, and the presence of weaker brethren in the lower ranks is criticised nowhere more forcibly than in the Commission itself. Mud thrown at them sticks to all their colleagues, and one or two recent indiscriminating attacks by newspapers have been bitterly resented. Now Mr Bevin has done as the retiring Commander-in-Chief of the British Forces did—expressed publicly his confidence in the CCG, and paid tribute to its constructive achievements.

Yet more than a heartening and loyal message is needed to restore the low morale which is reflected in the flow of resignations and the difficulties of finding an adequate training staff. The success or failure of the November conference of Foreign Ministers may help to remove some of the causes: the quadripartite frictions, the uncertainty about how long jobs will last, and about future relations with the Americans. But there are others: the sense of isolation, the general ignorance of the lower ranks about control activities as a whole, the apparently haphazard methods of appointment and the tendency to substitute orders for leadership. These need some thought and attention if remedies are to be found. There are war-time precedents—for example, in the submarine service—for giving CCG its own British newspaper. There seems to be no good reason why the Civil Service "house party" or the methods of the War Office Selection Board should not be used for selecting staff. Everything possible should be done to get preparatory training transferred from rural England to a school in Germany. Along these lines much could be done to stimulate the self-confidence and team-spirit of the 19,000 members of CCG. Even then the basic difficulty will remain: the growing inability of Britain—for economic reasons—to maintain its dominant position in the north-west and the resultant hardening of German minds against spiritual and political values half-heartedly asserted.

* * *

Scientific Manpower

Two hundred thousand scientists with university degrees will be receiving a questionnaire from the Ministry of Labour during the next two weeks asking for details of their present and past employment, their qualifications, salaries and other particulars relating to the nature of their work. This inquiry is not a sleuth hunt to dig out the drones of the scientific underworld (no scientist could surely ever be a spiv) but a much needed investigation into

the existing resources of trained scientists which the country already possesses; it follows from the recommendations of the Barlow Report on scientific manpower (Cmd. 6824) that the output of scientists from the universities should be doubled.

Since the publication of that report there have been many suggestions for more detailed inquiries to fill in the picture sketched only in outline by the Barlow Committee. The universities and education authorities need more than global figures if they are to plan the expansion of particular departments in relation to the demand for, say, electrical engineers, or geochemists or nuclear physicists, and the present questionnaire is intended to find out what is the existing manpower in the scientific and technological fields and to do so in considerable detail. This is the supply side of the picture.

On the demand side the procedure adopted is different. As a legacy of the wartime scientific and technical Register seven committees, covering the main branches of science and technology, have been reviewing the demands for fully qualified men and women in their fields. The committees consist of academic and industrial experts and their recommendations will carry weight. In many cases their inquiries have revealed that earlier assumptions about the need for large increases of particular types of scientists are not justified by the facts, and the work of the committees may, therefore, result in lower demands than were expected. How far their recommendations will be related to what industry wants rather than what it ought to want remains to be seen.

When these two sides to the inquiry are complete it will be for the universities to adjust their programmes accordingly. The quicker the results are published the better, since the universities are well away with their development plans and it is important that they should have the benefits of the information which the Ministry is collecting before their schemes are too far advanced to change.

* * *

Parish and Neighbourhood

The parish council or parish meeting still plays a greater role in the life of the countryside than an analysis of its strictly

legal powers would suggest. These powers, although they cover numerous activities, are not considerable. Save in rare cases, the parish does not itself possess compulsory powers and where compulsion is necessary the legal proceedings must usually be taken through the medium of the district or county council. Its expenditure is limited, at the most, to the product of an 8d. rate (more can be raised if some service is delegated to it by the district council).

The parish council's own powers consist of effecting local improvements, such as the provision of allotments, recreation ground and village hall, the purchase or repair of footpaths, and the improvement, from local sources, of the water supply. In theory, most of the functions of the rural district council may be delegated to a parish, and one or two functions—such as street lighting and burial grounds—are fairly often delegated. The parish council's most important activity, however, is to act as the watchdog of village interests, to relay local opinion and complaints to higher authorities, and to seek representation in appropriate quarters such as the management of primary schools.

This watchdog role is becoming increasingly important. Since however, it is optional, and since the parish council's initiating powers are mainly permissive, everything will depend upon local enterprise. The first national conference of parish councils, held this week, will have done a good job if it drives home the fact that a vigorous parish council can accomplish a great deal, whilst a passive one is virtually useless. The democratic roots of the parish are probably still sounder and stronger than those of other local bodies. It is a surprising fact that, in spite of the enormous difference in powers, the parish election is often contested far more hotly than the district or county elections; and it is refreshing to have one brand of election where personality is everything and politics nothing. The vigour of parish politics suggests that it might be no bad thing to institute elected neighbourhood councils inside the larger county boroughs. The population covered would need to be larger than for the parish—10,000 might be an appropriate figure—but many of the functions should be similar.

Letters to the Editor

End of Act Two

SIR,—I was surprised to see in your leader that you attributed so much significance to the Cambridge Union's vote against the Labour Government. My surprise is not occasioned by your use of the Cambridge figures; doubtless you would have preferred the similar Oxford figures if they had been available in time. My surprise is occasioned rather by the uncritical use of any such figures. I question your conclusion that the "young people have also turned against them" (the Labour Government) for the following reasons:—

- (1) The majority of votes are cast immediately after the main speakers have finished. Then those who attend debates for the entertainment value, and they are many, file out through the "Aye" and "No" doors.
 - (2) The vote is often cast (as many think it should be in debating societies which have no responsibility) for the speakers who spoke best as distinct from the merits of the motion.
 - (3) The "best" speakers are, from a very justifiable point of view, the most entertaining.
 - (4) Defence is never so entertaining as criticism. A partially developed critical faculty—and surely few undergraduates would claim more—finds greater scope in attack. The cynical laugh—and laughter there must be in the Union—is easy to provoke.
 - (5) The "floor" debate, which continues after the main speakers and the passive audience has left, is invariably more evenly contested. Votes cast during the floor debate are invariably more evenly divided than those cast after the main speakers have finished.
- The truth is, it is no longer daring to be a "red" at Oxford. Opposition to the Government is still as fashionable as it was between the wars, but it happens to be a different government.

It requires either firm prejudice or firm conviction to stand up week after week and defend the Labour Government. It is too much to expect many young undergraduates to have either. There is, however, a small but increasing number of faithful supporters who withstand the scorn and criticism. They will not "change colour" on leaving the university as readily as many of our predecessors did between the wars.

It is my considered view that if a Conservative Government came to power, before very long it would be earning much the same votes of censure from the two Unions. We do like to defeat the Government—whatever it may be.—Yours faithfully,
Lincoln College, Oxford

D. S. TIMMS

SIR,—I was very impressed by your article, but to my mind you ignore the most serious feature of the modern political scene—the absence of any new approach or creative thinking.

It is most disturbing to see what a great opportunity has been thrown away by the Liberal Party. Its policy statement is a collection of generalisations. Its leaders have an invariable formula for a speech "one-third devoted to roundly condemning the present Government, one-third to explaining how the Conservatives are unfit to govern and, finally, a third in praise of the liberty of the subject." There are indications from reports of their speeches that the Liberal leaders are increasingly attracted by a return to *laissez faire* as the answer to twentieth-century problems, whereas the Conservatives accept the need for compromise and the middle way. But, however attractive they may make their policy, they are suspect as a party. Furthermore, the Conservatives give no indication of a willingness to reorganise the party on broader and more democratic lines comparable with Liberal Party organisation.

In the absence of any reasonable alternative I shall continue to support the Government, but the Labour Party itself is another matter. I am increasingly distrustful of it because of the growing strength of authoritarian elements. I believe party government is right and proper, but find myself in that barren no man's land of "progressive independence." To many of your readers it will no doubt appear sheer nonsense, but I submit in all seriousness that there is a case for a new progressive party in British politics in which "new dealers" of all parties could unite, released from the personal vendettas, outworn shibboleths and old orthodoxies that become increasingly meaningless as the nature of the postwar world reveals itself.—Yours faithfully,
The Cottage, Forest, Kinver, Stourbridge

G. E. MINNIS

SIR,—While I agree with much of your leading article in your issue of October 18th, there are two points which I should like to challenge.

First—it is incorrect to assume that the young people have turned against the Labour Government on the basis of the Cambridge Union vote. Cambridge, like all Universities at present, has a substantial student population of ex-officers working on Further Education and Training grants. These men were always anti-Labour (with some exceptions, of course).

Second—do you really believe that we would have got as much coal as we have if the mines had not been nationalised? I am certain that though the nationalisation of the mines has not yet solved the coal crisis, it has at least created a more hopeful prospect in the industry. I think, therefore, that this particular act can be said to have made some small contribution to our defences against the coming storm.—Yours faithfully,
The Lodge, Culverwood, near Hertford

L. E. BALL

Balkan Justice

SIR,—A "Note" in your issue of October 11th mentions the allegation by the Yugoslav prosecutions, at the recent trial of Jovanovitch and Gazhi, that I had instigated these men to form a "peasant bloc." May I use your columns to declare that this allegation is utterly false?

During part of the war I served in a department of GHQ, Middle East, whose activities were directed against the Germans and in favour of the Yugoslav resistance movement of Tito. In so far as Gazhi, then in exile in the Middle East, assisted this work he was doing his duty as a patriotic Yugoslav. It should be counted to him as a merit, not a sin. Neither then nor later was he an "agent" of the British. He returned to Yugoslavia after the war, not (as the Yugoslav public prosecutor at the trial alleged without a shred of evidence) to spy for the British, but to take part in his country's reconstruction.

After I was demobilised, and had severed all connection with my wartime work, I went to Yugoslavia as your correspondent. I met both Gazhi and Jovanovitch (whom I had also known before the war). In our conversations we simply discussed the political situation in the normal manner of a journalist with two old friends. Our talks at no point bore the character attributed to them by the prosecutor and his Ozná police spies.

Both Gazhi and the far better known Jovanovitch have since long before the war stood for a policy of left-wing peasant democracy, which specially stressed the solidarity of Serbian and Croatian peasants. This led them at first to co-operate with Tito's Communists. They broke with the Communists only when they became convinced that the Communists did not intend to carry out the democratic programme which they had proclaimed during the war. Since then they have been in opposition. It is childish to suggest that I, or any other British subject, put into their heads ideas which they have so long held.

Up to the summer of 1946, British visitors to Yugoslavia, whether friendly to the regime or not, were agreed that it was possible to talk freely with Yugoslavs. The recent series of trials suggests that this situation no longer exists. Must we conclude that no British journalist who is not a Communist or "approved fellow-traveller" can now talk to a non-Communist Yugoslav, except in the presence of a known Communist or Ozná spy, without bringing innocent people into great danger and incurring wild accusations against himself?—Yours faithfully,

HUGH SETON-WATSON

The South African Loan

SIR,—In your reference to the South African gold loan in your issue of October 11th, you state that the British Government will receive £80 million (gold) in the near future, but will forgo gold shipments which in 1946-47 will have produced about £55 million. With due respect I suggest that this does not follow.

As Dr de Kock pointed out last August, in his speech at the Reserve Bank meeting, the Union had an adverse balance of payments in the year ended March 31, 1947; in consequence the Reserve Bank's reserve of gold and foreign exchange assets fell by £84 million. During the year the Bank purchased £97 million gold, being the Rand output, and sold £86 million to the Bank of England and £55 million to the US Assay Office, New York. It is submitted that these transactions would have been effected whether or not there had been an agreement between the SA Reserve Bank and the Bank of England because the balance of payments required them.

It follows that each year the Reserve Bank must sell gold to the Bank of England to cover our adverse balance of trade with the sterling bloc, and this will only become unnecessary if the transfer of capital to the Union should suffice to cancel out our adverse balance. If that should occur, under the present arrangement, the Reserve Bank, under its agreement, would nevertheless sell gold to the Bank of England to the tune of £80 million per annum and, presumably, would invest the surplus proceeds in London. But as this is an unlikely contingency, I suggest it will be found that Britain will receive the £80 million gold on loan and will also receive its customary gold shipments each year.

Of course, the aforementioned contingency is a possibility—at least in some degree—as import of capital to the Union has been on a fairly substantial scale of recent months, but the Union is still importing heavily, and there is a strong demand for British goods, especially capital equipment. If Britain can deliver the goods we want, we are in the fortunate position of being able to pay for them by shipping gold in exchange.—Yours faithfully,
Pretoria

L.

The Savings Campaign

SIR,—Mr Fenn, in his letter published in your issue of October 18th, suggests that our savings, when we withdrew them, should be "scaled up or down according as the [price] index has moved."

In the possible, though admittedly improbable, event of the cost of living index having dropped appreciably in five years' time, perhaps Mr Fenn would be prepared to advise the then Chancellor of the Exchequer how to placate members of an irate public who find that the £1 invested in National Savings in 1947 is, in 1952, returned to them as, say, only 18s.

It is dangerous to forget the "shortcomings" of the ordinary citizen who does not understand high finance, and who instinctively mistrusts any "juggling" of figures by financiers.—Yours faithfully,
H. B. M. JOHNSTON
Seven Sisters, St. Lawrence, Isle of Wight

From The Economist of 1847

October 23, 1847

THE following memorial to the First Lord of the Treasury would be submitted for the approval of a public meeting at Birmingham last night.

The memorial of the Undersigned Inhabitants of Birmingham—Showeth—That your memorialists have witnessed with grief and astonishment the unchecked progress of much which will have made the last twelve months fatally memorable in the history of this country. Houses whose experience and wealth had grown up with the growth, and were interwoven with the existence, of English commerce, have been suddenly destroyed; and other houses, whose vast fortunes had been shattered by former shocks of our monetary system, have now been swept away by renewed calamities. The place of the great agents of English commerce, prosperity, and power cannot be suddenly filled up. The wealth and experience necessary to create and sustain these great houses must grow up together. Your memorialists lament the attempts which have been made to conceal the ruin caused by the bill of 1844, by attacking the character of its victims. These unfortunate and libelled men have not fallen from any imprudence of their own; they are found generally not to have extended their enterprises beyond the healthful requirements of trade, or beyond that due proportion to the extent of their property which ordinary experience had justified, but they have undeniably been destroyed by the fatal law of 1844.

When the high price of food . . . the great railway contracts . . . and other circumstances combined rendered an increase of monetary facilities imperative, then the Bank of England, notwithstanding the exportation of 10 millions of gold money for the needful purchase of food, was compelled by the law of 1844 further to contract its paper issues. With an abundant gold circulation, the law of 1844 permitted the issue of 30 millions of paper money by the Bank of England. The nation was tempted into enterprises of great extent by this large basis for its operations. The gold money has been reduced by at least 10 millions, and the law of 1844 has reduced the issues of paper money by the Bank of England to £21,961,585; and the Bank of England . . . has been compelled to reduce the actual circulation of legal tender paper to £18,639,885. The completion of undertakings and the payment of obligations, entered into when gold was plentiful and paper money abundant, are thus rendered impossible. It is the madness of the law . . . and not the speculative spirit of the people, that has produced the ruin that now affects the country. . . .

Books and Publications

Local Development

"Plan Your Own Industries." By M. P. Fogarty. Basil Blackwell. 320 pages. 25s.

THE spontaneous growth of private organisations which rapidly achieve a *modus vivendi* with the central and local government agencies, like the central Government's practice of delegating some of its functions to *ad hoc* unofficial committees, is one of the most interesting and important expressions of the British political genius, and every major manifestation of it deserves study. Mr Fogarty has produced a thorough study of the movement which resulted in the formation of many committees or councils for promoting local development, which will be of the greatest interest alike to economists and to students of government. As a history of the movement, this is an admirable book, though many readers who approach it without any previous deep interest in the subject will doubtless find the mass of detailed information somewhat overpowering (one suspects that its readability might have been improved by a greater use of classified lists of organisations).

There have so far been, roughly speaking, three phases in the story. First, soon after the first World War, health resorts began to advertise their attractions, and this example was followed, even before the depression, by certain industrial areas. Incidentally, it would be interesting to compare this manifestation of local patriotism with the corresponding, vastly greater, movement in the United States. The British movement, in its first phase, was largely (like its American counterpart) a product of an expansionary spirit; in its second phase, however, which began with the depression, it flourished in an atmosphere of general unemployment and of immensely sharpened competition between regions and districts for the small amount of new enterprise available. It was in this period that the movement took on its characteristic form. The third phase dates from the war; joint production machinery, and concern with the prospects of postwar adjust-

ment, have given a new impetus to the movement; but even more important for it has been the great growth of Governmental concern both with the location of industry and with the economic health of separate localities.

At first sight, this growth of the regional machinery and the regional consciousness of the Central Government might seem to destroy the case for development organisations as they grew up in the thirties. Then, they were effective largely in calling attention to lacunæ in central Government policy; and some departments are asserted to have salved their consciences by merely pointing to the organisations, or attributing to them functions which they could not effectively perform. Now, the central Government intervenes in local and inter-local development to an extent which many people regard as excessive. Mr Fogarty, however, believes that local Development Committees should play an increasing part; he argues that joint bodies consisting of local business, trade union, and other interests are highly desirable both for working out the details of development plans emanating from the centre, and for canalising local opinion on development. Perhaps he is right; but certain dangers require to be guarded against. Since organised interests are the ones which cause trouble to the administrator, there is much to be said, from his point of view, for letting them knock their heads together in the committee-room instead of converging directly upon him. It should also be remembered, however, that the organised interests are not the only ones, or, necessarily, even the most important; and much watchfulness is required to avoid giving undue weight even (or perhaps especially) to the views in which they agree with each other. The inclusion of a strong element independent of the organised interests—something analogous to the independent members of the Working Parties—would appear to be the minimum condition of safety.

The recommendations of this book, however, though formally set out at the end, are not its most important feature; it is as a history of an instructive episode in the development of the British

The world agrees

LIBRARY BOOKS BY POST

A wet afternoon. The postman's figure appears between the hollyhocks and you wish he were bringing something more exciting than a bill.

Wouldn't it be a joy if he were to hand you one of the latest novels, or a new biography, or that book of travel that you have just seen reviewed!

If you live in a remote place, why not join W. H. Smith & Son's Library and have your books sent by post? You will be delighted with this service, and the "overlap" system means that you need never be without reading-matter.

FOR FULL PARTICULARS WRITE TO:

Bridge House, Albert Embankment, Lambeth, S.E.
500 EXCHANGE DEPOTS IN ENGLAND AND WALES

economic system that its readers will mainly appreciate it. Incidentally, they must not take its title too seriously; one point that emerges from its pages is that the development bodies with which it deals have had singularly little to do (in any reasonable sense of one of the most overworked of words) with the "planning" of anything.

The American People

"A Diplomatic History of the American People." By Thomas A. Bailey. F. S. Crofts and Company. \$6.00.

THIS is a book possessing two unusual attributes: genuine scholarship and great readability. It is unequalled for the student, and the casual reader will find his interest sustained to the end. Consisting of 49 chapters and totalling 900 pages, the book covers the entire period from "Colonial Backgrounds" to a final chapter devoted to "Retrospect and Prospect" at the end of World War II. The author has not only drawn upon a vast store of published materials, but has had extensive access to State Department files and has utilised collections of rare papers in the Library of Congress and elsewhere. Extensive general and special subject bibliographies are provided. The work was first published in 1940, was revised and brought up to date in the third edition last year and has undergone two additional printings, the eleventh and twelfth, in 1947.

The recurring theme is that Europe's distress has been the United States success. The troubles of Britain, of France, of Spain, at various times permitted the United States to make territorial, commercial or other gains which might have been unattainable, or at very least more costly or slower without the pressure and preoccupations to which those with whom the growing federation was contending were subjected from other quarters.

The picture of American diplomacy is not an outstandingly pretty one. While the United States had able actors on the scene at times, it too often had mediocre ones—or worse. Yet the same was true of the representation of other nations over the span of time. More basis exists for national modesty—on everyone's part—than for complacency. Yet this is not another "debunking" or "mud slinging" tome. It is history, objectively told, without the nationalistic embellishments and suppressions that all too often slant and distort the story given to the young—and the old.

Professor Bailey concludes that nine influences have shaped the foreign policy of the United States: geographical position, room to expand, weak neighbours, a nation of hyphenates, a democracy, the power of public opinion, the primacy of domestic affairs, a mercantile and industrial people, and Europe's distresses. And he identifies seven specific foreign policies: isolationism, non-intervention and non-entanglement, the Monroe Doctrine, freedom of the seas, the open door, the pacific settlement of disputes, pan-Americanism, and opportunism.

A few sentences from the concluding pages disclose his point of view—and concern.

Few clear-headed persons will assert that isolation has not been given a fair trial. Nine world wars—nine involvements. One hundred per cent failure. . . . The statesmen in charge of American foreign policy, as well as the better informed citizens, know that isolation is not only dead but dangerous; that we must learn to see the other nation's problems as they appear to its eyes; that we must cultivate tolerance and understanding; that we must sublimate suspicion and ill-will; that we must yield pride and prestige; that we must meet the other fellow half-way, sometimes more than half-

The Economic Development of Australia

"The Economic Development of Australia." By A. G. L. Shaw. Longmans Green and Company, Limited, London, 1946. (Second Edition.) 191 pages with Index. 7s. 6d.

THIS, a revised edition of a book first published in 1944, presents a succinct and useful account of the economic development of Australia, from the first settlements to the outbreak of war in 1939. To cover so broad a canvas with so little paint is in itself something of an achievement, attained by avoiding controversy and attractive speculation. The author modestly admits that the book is not original research, but this may well attract those who seek a simple and balanced account of the peopling of a continent.

Indeed, at times Mr Shaw is almost deceptively simple. The smooth flow of successive events may hypnotise the unwary into overlooking some of the more interesting aspects of Australian development—the adaptation of English economic and social techniques to a quite different geographical environment, adaptations which, it could be said, have given Australia its present individuality. Mr Shaw tells us of the more important of these—for example, the breeding of a Merino sheep at home in Australian conditions, the invention of the "jump-stump" plough, the introduction of new wheat types, the conviction that tariff protection creates a high standard of living—but does little more than place the "event" in its proper sequence in the story. Since full interpretation would require a much longer book, the reader is left to do this for himself, with no further assistance from Mr Shaw other than provision of an adequate bibliography.

The Organisation of Sea Power

"It Might Happen Again." By Admiral of the Fleet Lord Chatfield. Heinemann. 222 pages. 18s.

THIS is the second volume of Lord Chatfield's autobiography, and it covers the years that he spent on shore at the Admiralty and finally as Minister for the Co-ordination of Defence. Those years ashore cover most of the important periods in disarmament and rearmament between the wars, and the questions Lord Chatfield discusses are once again topical as the need to economise in money and manpower once again brings its threat of cuts in naval and military expenditure.

For once, a dust cover is accurate. It attributes to Lord Chatfield "modesty, lucidity, precision and patience," and those qualities do stand out throughout the book. But Lord Chatfield has the defects of his training, of his whole experience. He is a naval officer. He sees everything in terms of sea power. It would be unkind to him to say that if he were asked to write a book on the elephant it would inevitably be entitled "The Influence of the Elephant on Naval Tactics," but there is a suspicion that he possesses that kind of mental blinker. The Franco rebellion in Spain was won—and therefore politically justified—when Franco gained command of the sea. Sanctions on Italy at the time of the Abyssinian dispute were unfortunate because they

THE ROAD TO PROSPERITY

ERNEST MARPLES, M.P.

The Case for Copartnership in Industry. With a foreword by Lord Woolton.

7/6 net

STAPLES

upset the balance of naval power in the Mediterranean. As for the failure to renew the Anglo-Japanese alliance . . .

In some ways Lord Chatfield provides his own correctives, almost by creating a mild infection followed by a convalescence. In the end—an end which Lord Chatfield does not reach—the sea power of a nation is an expression of its national strength, not the begetter of its national strength. It is true, as Lord Chatfield claims, that the cost of naval and military defences are an insurance premium and should have the priority afforded to such. But it remains for the nation to decide what kind of policy it proposes to take out, and so to determine the nature and amount of the premium it will pay.

Monopolies and Patents

"Monopolies and Patents" By Harold G. Fox. The History and Future of Patent Monopoly. The University of Toronto Press. 1947. Geoffrey Cumberlege. 35s. Net.

ECONOMIC historians will welcome this attempt by a competent investigator to link up the complexities of the modern patent problem with the history of monopoly from first beginnings. The author has taken to heart the observation once made by Justice Oliver Wendell Holmes that "Historic continuity with the past is not a duty, it is only a necessity." He scrutinises the economic history of monopolies from the ancient world and the trade regulations of the guilds down to the Statute of Monopolies of 1624; this Act is usually taken, but not so by the author, as marking the beginning of the British patent system because it exempted new inventions from prosecution for monopoly. The author gives a fully documented picture of the actual development of commercial and industrial monopolies after the passing of that statute, but comes to the conclusion that it was not the monopolies that were bad, but only their abuses—an observation which reminds us of a remark recently made by Lord Nathan that it matters more what monopoly does than what it is. With all due gratitude for this devoted study in historical research, one feels tempted to say that necessary as historical "genesis" is, history and the present must offer something comparable; it becomes doubtful after reading the second part of the book whether the main modern problems of patent legislation are not fundamentally different from those

of the seventeenth century. It would have been a gain to his book had the author strongly commented on these differences thus showing what the typically new aspects are. With the advent of a revolutionary age of research, invention and discovery the central problem has become what "invention" really means. The author takes a very radical view; he proposes that the remedy to all the vexing complexities of the interpretation of invention should lie in a complete reversal of the present situation by statutory enactment clearly providing that the ethereal, impalpable, unrecognisable quality of invention or "subject matter" need not be an ingredient present in a valid patent. In order to defend this proposition the author contends that the danger of the patent system does not arise from the abuse of the public, but from the fact that the inventor is abused in that he is often unjustly denied a valid patent. He has little to say about the use which trusts and cartels may make and, indeed, are making of patents for specifically restrictive purposes. Here is a serious defect in an otherwise most creditable effort in research and judgment.

Shorter Notice

"Financing by Credit Creation." By T. K. Whittaker. Clonmor and Reynolds. 67 pages. 3s. 6d.

THIS is a factually useful, theoretically thought-provoking and altogether welcome little study of the role of the banking system in budgetary policy and the pursuit of full employment. It compares British and American practice during the Second World War, marks its divergences from that followed in 1914-18, and goes on to discuss the possibilities and limitations of "cheap money policy" in conditions other than those which brought it to birth. "No longer," says Mr Whittaker, "can the commercial banks be regarded exclusively, or even primarily, as repositories of private savings and providers of working capital for business and temporary accommodation for private persons. Their chief function is to serve as agents of the Government in the expansion or contraction of the money supply." A whole new corpus of banking theory and practice will have to be built up to meet the new situation. Mr Whittaker, however, keenly alive to its possibilities for good, is perfectly aware of its dangers; notably, there is need for "a distinction in official manipulation of interest rates between created credit and genuine saving" and the war's "embarrassing legacy of liquidity" itself needs liquidating. Altogether, the author starts a number of useful trains of thought.

THE WORLD OVERSEAS

Will Germans Resist Dismantling?

(By a Correspondent)

WHEN Germans contested the old level-of-industry plan they were not joining with Anglo-American policy in any uncompromising or irreconcilable way. For the plan was, by its own criteria, nonsense; to any British official in the Ruhr who could see the facts in front of his face, this was as plain as it was to the Germans. And the unfulfilled assumptions about economic unity and so on were always there as a loophole. With the revised Anglo-American plan, all this is changed. The more luxuriant absurdities of the old plan have been lopped off. The loophole has gone. So has the excuse of four-Power responsibility; the new plan is an Anglo-American decision for the Anglo-American area, and the Germans are assuming for once that the British and Americans mean business.

That the Germans should oppose it, that they should do their best to keep what they can is natural enough. But the campaign against the level-of-industry plan (known by Germans as the *Demontageliste*) bears the marks of passion rather than of calculation; and of a febrile and melancholy passion, too. "Appeals to reason," as an intelligent member of the North Rhine-Westphalian Government at Düsseldorf said before the list appeared, "are out of the question." Outside Germany, where the main argument has been about whether the plan is not too kind to the Germans, this may not seem easy to understand. But one has only to spend forty-eight hours in the Ruhr for it to become intelligible. It is two and a half years since Allied Forces took Düsseldorf and Cologne and began the occupation of the Ruhr. Most of the towns still look as though war had passed over them a few days ago. The initial impulse to reconstruct spent itself,

within a few months of the end of the war, in the more elementary forms of clearing-up. People patch up their dwellings as they can, and the unauthorised builder is busy; but for every house repaired there is one in which the bomb damage of four years ago springs new leaks. A look at the still-prosperous villages of, say, the Sauerland shows at once the difference in kind of reconstruction; some of those villages were badly knocked about, but the peasant can build his house anew, with stout timber and good workmanship. If there is food in the storerooms the inquisitive inspector from the Building Office can be placated.

Hand-to-Mouth Production

What is true of housing in the Ruhr is true of industry. Factories produce, but they produce irregularly, bedevilled by the cat-and-mouse tactics of those who order power cuts, getting materials by what shifts they can, bartering their products against repairs and replacements and food for their workpeople. It is all hopelessly hand to mouth, and the years go by without a glimmer of a prospect of any orderly trading activity, no hope of steady production secure from one month to the next against shortages, bottlenecks and prohibitions. The crisis symptoms now appearing in one European country after another are old and familiar in Germany, and many times intensified.

The dismantling activities of Military Government may not amount to much compared with what was planned at Potsdam. But place them against this dismal background and it is easy to see how they excite the Germans to helpless exasperation. No doubt many of the major dismantling operations contemplated

under the old plan were put off while the revision was being worked out, and many of them will not now take place. But the innumerable minor removals (under BIOS and under the "multilateral" scheme for advanced deliveries arranged with IARA) have had the same exasperating effect; and it is arguable whether, by removing key machines, we have not done as much to dislocate production in the short run as we could have done by a whole series of full-scale dismantlings. In any case, the Germans see what we take, not what we forbear to take.

It is hard to say whether the Anglo-American plan would have been better received if the dismantling list had been published simultaneously with the general level-of-industry agreement. That agreement was published at the end of August with (after all the delays) a precipitancy which maddened and humiliated the French. Its negative side, the dismantling list, now makes a separate entry so timed that it estranges the Germans no less bitterly. It is no use imagining that the most skilful tactical handling would have reconciled the Germans to the loss of a further substantial slice of their industry. In any case, the damage is now done. At a time when the more internationally minded among them had begun to hope that a future might open up for them in a general scheme for economic revival in Western Europe they are confronted with no immediate reconstruction plans, but a programme of dismantling alone. Naturally, they will do all they can to stop it. The question arises, What can they do?

Threats and Consequences

The German Governments of the *Länder* can oppose, but there is not a great deal that they can do directly and openly to make their opposition effective—without employing their ultimate sanction of withdrawing from the work of government altogether. This threat was used in the food crisis of last spring. But its consequences for the ordinary German would be disastrous, the extent of its evil political consequences incalculable; what has been done to build up a democratic structure of government would be undone, perhaps irretrievably. If it is damaging to the credit of a political leader to be associated with unpopular Allied measures, it is damaging, too, to have dodged responsibility. The undermining of sanity will have to go a long way yet before this course is taken. No doubt it is in an effort to reverse the drift in that direction that Lord Pakenham is flying to the Ruhr this week-end to explain the British position to a meeting of representative Germans at Düsseldorf.

So it may happen that, while the *Länder* Governments, the Ministerpresidents' meeting, and the political parties will maintain the strongest formal opposition that they can reconcile with staying in office, the onus of resistance will fall largely elsewhere. It may fall on the trade unions. A speech by Herr Malina, of the transport workers' trade union in the British and American

Socialist Strength in Europe—I

Neighbours of Russia

(By a Correspondent)

THE announcement a fortnight ago that a Communist international information bureau had started business in Belgrade provoked all kinds of interpretations. Some were influenced chiefly by the violence of its language, others by the form and name of the new organisation. Among the latter was one which saw in this public challenge a retort to the work of the Zurich conference of European Socialists held in June. The delegates' activities were violently attacked by Moscow at the time, and the British in particular were accused of giving them provocative leadership. The role that the Labour Party in fact played was discussed in a leading article of *The Economist* of October 11th. It is now worth examining what in fact might be made of the European Socialists as an international force, what solidarity they already show.

To do this it is first of all necessary to understand their diversity. At the moment, they can be considered as falling into four main groups—Scandinavian, East European, West European, and German.

Of these the Scandinavian is by far the most homogeneous group. The Socialist parties of Denmark, Norway, Sweden and

Finland have similar racial characteristics, political traditions and methods; in world politics they have the same problem of proximity to Russia. In Norway and Sweden the parties have a clear majority over all others, including the Communists. In Denmark, though the largest single party, the Social Democrats are temporarily in opposition; but they may return to power this month. In Finland the Social Democrats have about a quarter of the parliamentary seats; but they share office in a coalition government with *bourgeois* parties and the Communist-controlled Democratic Union, which is only slightly weaker than themselves. Temperament and experience of power make Scandinavian Socialists empirical and reformist, primarily interested in improving working conditions and economic efficiency rather than in petrified Marxist dogma.

Except in Finland the Communist parties are a nuisance, or a spur to efficiency, rather than dangerous rivals. Norway is the only country in the world where the Socialists have obtained the tactical advantage of pressing fusion on the Communists and seeing them reject it. There is already considerable consultation between the national party executives; in fact Scandinavia

Watch on the Militants

There has already been in existence for some months the Altena resolution of the metal workers' trade union assuring workers who refused to work at dismantling of such support as the union could give them. The British Zone Trade Union Federation, in its conference at Bad Pyrmont, will have debated the matter this week. It is not anxious to embark on a resistance movement, but has to watch its own "militants," who show themselves perfectly willing to take on the leadership of a movement against dismantling, complaisant as their fellow Communists are about dismantling in the Eastern Zone. They may succeed in embarrassing the bi-zonal enterprise, and they cannot do themselves any harm. So one can say that the democratic trade union leaderships are certain to declare themselves in strong terms against dismantling; they will do nothing to persuade unwilling workers to the work; and they may be obliged to go in for obstruction. If the last were to happen, the obvious method would be to make the supply of labour for dismantling jobs even thinner and more elusive than it is now.

There is a great deal, short of physical opposition, that can and will be done (it has, indeed, to a certain extent, been done already) to make dismantling slow and unprofitable. The efficient performance of any industrial task in a run-down economy is a matter of priorities. Labour used in pulling down a "surplus" steelworks could be used instead to repair one that is not surplus. Cranes are genuinely needed to build bridges, excavators are in fact wanted for the clearing of bombed towns. The German railway administration, resisting a claim for wagons to carry away dismantled plant, can say with truth that the wagons are wanted to carry coal or food; it can be reasonably sure of the understanding and, to a certain extent, the support, of the sponsoring branch of the Control Commission. It is really impossible to tell what is obstruction and what merely a reasonable reluctance to waste valuable plant and scarce labour on an unproductive task.

As General Clay has hinted in his sledgehammer way, the occupying authorities have in their hands powerful weapons of retaliation against any open disobedience. They can always withhold food and the supplies. But who will benefit if they do?

provides a model of the flexible co-operation that is possible between Socialist parties which have each other's confidence and respect, as well as common interests.

Doubts About America

But this very recognition of their common interests limits considerably the freedom of each national party to co-operate with outside groups. For example, the principle of neutrality always pursued by the powerful and experienced Swedish Socialists is now generally accepted by all. Much of Sweden's foreign trade is with eastern Europe and the Soviet Union; clumsy American diplomacy has made the Scandinavian states look as if they are leaning further towards Russia than any other free European government. This result is not due purely to their geographical position; in many quarters there is a genuine mistrust of the stability of America's economy and foreign policy, which was reflected in Scandinavian hesitation over the Marshall offer. A further factor is the desire of all parties to preserve Finnish independence and to help the Finnish Social Democrats—aims constantly jeopardised by the obstinate integrity of the Finnish Socialists themselves, whose criticism of Communism has shown a bitter contempt rivalled in only a few European countries. Now that direct Russian influence has been withdrawn, the situation in Finland is being watched with exhausted anxiety throughout Scandinavia.

All these parties have with the British Labour Party a close sympathy which has only occasionally been strained. The Norwegians were greatly embarrassed by the British policy towards Franco Spain, largely owing to their own failure to explain the issues. But, within the limits suggested, the Scandinavian Socialist parties will understand and actively support any British policy which aims at decreasing tension between the Big Three, or at establishing an independent area outside the main Russo-American conflict.

It is noteworthy that the Cominform includes none of the Scandinavian Communist parties, while its declaration of policy omits all reference to the Scandinavian Socialist parties, though their leaders are generally more Right-wing and anti-Communist than most of the individuals singled out for attack.

Policies of Appeasement

In Eastern Europe other than Czechoslovakia, the Socialist parties are important only in Poland, Hungary and Rumania. In all these countries they faced the same problems in 1945: The Yalta and Potsdam decisions cut them off from effective help from the West so that the provisions for free elections became a provocative hypocrisy. The Soviet Union could establish a single-party Communist dictatorship in any country where that might guarantee more effective co-operation than could a government with some genuine popular support; the Russians were not prepared to trust a freely elected and freely functioning government to carry out their minimum requirements. Any party which remained in opposition to the new government blocs was doomed to political futility, if not violent destruction. The choice for the Socialists was either to accept the principles of "eastern democracy" and to fight for the largest share of power inside the government bloc, or to join an opposition led by the traditional enemies of Socialism, and to plan for a third world war in which the defeat of the Soviet Union would make a counter-revolution possible. Inevitably, the Socialists chose the former course, though all of them split in the process.

Inside the Government blocs the Socialists have struggled hard to preserve the conditions for democratic development and to maintain their own influence. Their disadvantages are obvious. A policy of appeasement, however realistic, does not strengthen character or produce dynamic leaders; continued compromise makes the rank and file restive. But the Communists have always the ultimate sanction of Soviet support behind them. Even in Poland, where the appeasement policy, skilfully operated by strong personalities like Cyrankiewicz has achieved its greatest success, a severe increase in Communist pressure has never failed to squeeze out some Socialist concessions—the establishment under the Communist Minc of a state trading organisation to compete with the Socialist co-operatives and the Communist capture of the port administration in Gdynia are recent examples.

In Hungary too many of the Socialist leaders are doctrinaire intellectuals, out of touch with the main sources of party strength in the factories; they grossly miscalculated their ability to guarantee free elections, though the very flagrancy of Communist

electoral abuses may be turned to their credit. In Rumania the Socialists share the general odium caused by the desperate economic situation; there the Communists are more ruthless and have less to lose by establishing single-party rule.

In these countries there is only one issue on which the Socialists can afford to risk a breach with the Communists: that is the maintenance of their party's structural independence. Both in Hungary and Poland recent Communist attempts to obtain a fusion of the two workers' parties have been firmly—even violently—rejected. In Rumania, however, the Socialist Party Congress a few weeks ago set up a joint committee with the Communists to organise fusion. In Poland fellow-travellers have been expelled from the Socialist Party. But it must be understood that this Socialist collaboration with the Communists is not simply the result of Soviet pressure. On the contrary, it might be much closer, because more necessary, if Soviet pressure were removed. The long-term aim of the Socialist leaders is not to escape from Russian influence, but to prove to the Russians that they are a more reliable ally than the Communists because they command wider popular support. How long this pro-Russian attitude will survive Communist double-dealing is an open question.

The other threat to Socialist survival in Eastern Europe is Russian economic policy. If Russia decides to draw all Hungarian, Polish and Czech surpluses into the Soviet sphere, the consequent fall in the standard of life will make a social-democratic policy impossible. The East European Socialists have already held two conferences among themselves to discuss an integrated economic policy; but these failed to produce major results, largely because the countries with mineral or industrial wealth cannot afford to put these resources in the first place at the disposal of their poorer neighbours.

The Socialists are thus not only the main agents of democratic pressure in these countries, but also the strongest supporters of contact with the West. But conditions already accepted make it impossible that they should ever support anti-Soviet policies—a point Americans often overlook or ignore. Most of these limitations also apply to the Social Democratic Party in Czechoslovakia, though there is no direct Russian interference here and political battles are fought under democratic rules. The Czech Party is now in an awkward position; the bad reception given to the ambiguous pact of unity with the Communists which was clumsily announced last month has shown that the party cannot hope to grow unless it sharply distinguishes itself from the Communists; such a policy, however, may complicate its relations with the Polish and Hungarian Parties.

(To be concluded.)

Right and Left in Ceylon

[FROM A SPECIAL CORRESPONDENT]

"COMPARED with India, Ceylon is a comfortable never-never land. The political affairs of the whole island would fit easily into the business of the municipal council of a big Indian city." That was the perspective given to me by a prominent Indian resident when I arrived in Colombo during the first Ceylonese general elections in 11 years. After the stresses of Indian politics, Ceylon certainly seemed an island of peace, comparatively well provided with such necessities of life as food and cloth, and free from the looming menace of internal civil war and the questionable activities of neighbours over the border.

For anyone from India, the way in which Ceylon's politicians played with fire without disaster was little short of staggering. For example, the most inflammatory of all Asia's political slogans, "Religion in Danger," was being freely bandied about in a country where the electorate includes Buddhists, Muslims, Hindus and Christians. In the past there have been religious riots in the island, and the Tamil (Indian) population is liable to find life made difficult for them by the "Ceylon for the Singhalese" element.

But for this first general election last month under the new constitution, which grants Ceylon "fully responsible status," the cleavage between parties was different. There was a fairly straight fight between the "Haves" and the "Have Nots," and the result did not give the "Haves," represented by the United National Party, the sweeping victory they had expected. In fact they have not even got a clear majority in the new parliament. For election purposes the island's leading political genius, Mr D. S. Senanayake, formerly leader of the House and chief sup-

LONDON TRANSPORT carried

in 1946 a total of 4,300,000,000 passengers — a figure equal to twice the total population of the world. Every day over ten million passenger journeys are made on the road services and over a million and a half on the railways. Every day about 25 tons of coin are collected by London Transport's staff; that is an indication of the public demand on London Transport's services.

London Transport needs and seeks the co-operation of both passengers and staff in handling this vast traffic efficiently and in playing its full part **AT LONDON'S SERVICE**

This 'BOMB' penetrates 8 inches of steel

This is what metallurgists call a "radium bomb." It is used for no destructive purpose, but to produce valuable radiographs of metals too thick for ordinary X-rays to pass through. Gamma rays from the pin-head of radium it contains can penetrate steel eight inches thick, forming a picture on X-ray film of the soundness of the metal, showing up any flaws however deep. This is just one of the many ways in which photography is solving industry's problems.

"Bristol" shows the world...

THE territories blacked-out on the two hemispheres shown above give an approximate idea of areas already covered, or influenced, by planned demonstration tours of "Bristol" Freighter and Wayfarer aircraft. To demonstrate "Bristol" aircraft and British export enterprise in this practical way, over 62 countries have been visited to date; aircraft have flown approximately 96,000 miles for approximately 630 hours flying time; 192 towns have been visited and the total population of all areas covered so far amounts to over 900,000,000.

Bristol

THE BRISTOL AIRPLANE COMPANY LIMITED

porter of the new Soulbury Constitution, induced the three leading right-wing parties, plus a miscellaneous collection of small groups to amalgamate into the United National Party.

Its main constituents are the Sinhala Maha Sabha, the Ceylon Muslim League (the leading Buddhist and Muslim communal organisations) and the Ceylon National Congress (a fairly moderate reformist group of Sinhalese, and not to be confused with Indian organisations bearing rather similar names). Some Jaffna Tamils, including Ceylon's biggest business men, also joined the UNP, which expected to dominate the new Parliament just as its constituents had dominated the old State Council.

Party of Land and Cash

The UNP thus represented the concentrated power of family, land and cash, depending more on personalities than on its nebulous political programme. The fact that it failed to gain a downright victory is probably as much due to its own weaknesses as to the appeal of the opposition's programme. Any other view involves assuming that the average citizen of Ceylon is a Socialist, far gone towards Communism, which is emphatically not the case. The phenomenon of large numbers of votes being cast for Marx-inspired candidates is, I believe, mainly to be explained by the fact that large sections of the public were tired of politicians who had held office for 11 years.

At the top of the opposition is the Lanka Samasamaj (Trotskyist), which controls many of the workers' and peasants' trade unions. Then comes the Bolshevik-Leninist Party. Students of radicalism will appreciate the difference between this party and the Trotskyist Samasamaj as a problem of doctrinaire theory which also prevents union with the Ceylon Communist

Party, the third big group of the Left. This Communist Party is allied to the Indian Communist Party, and is led by Peiter Keunamen, former Cambridge Union President and a Burgher (mixed Dutch and Sinhalese blood).

Since the UNP supported the new constitution it was inevitable that the opposition should make the demand for independence their chief plank. This brought them the support of the Indian parties in Ceylon: the Ceylon Indian Congress and the Tamil Congress. These parties take their cue from India, and found themselves in somewhat of a quandary when the parties at home agreed to Dominion status for India. However, by going along with the Left, they hope to induce among the more progressive elements a better attitude to Indians in Ceylon.

Apart from the demand for independence—never taken very seriously in Ceylon—the main criticisms of the UNP centred on the acceptance of the reformed constitution by the old State Council (led by Mr Senanayake) without consulting the electorate. Since it is generally assumed in Ceylon that “fully responsible status” is Dominion status in all but name, Mr Senanayake would probably have had little difficulty in steering it past the electorate.

Role in Imperial Defence

It was freely rumoured in Colombo that a Bill to confer Dominion status on Ceylon would be introduced at Westminster before the new year. However that may be, the question of reserved powers will remain a thorny one—in theory if not in

practice. According to the new arrangement, the Governor reserves powers over defence, external affairs, trade, transport, and communications affecting any part of the Empire. Mr Senanayake agreed to the retention of Trincomalee as a British naval base, thus making Ceylon an integral part of the imperial defence scheme and, say his critics, mortgaging the independence of the island in perpetuity.

From the practical point of view, the average Sinhalese is not sorry to be staying in the British Commonwealth, so long as the changes do not mean merely glorified colonial status. In no circumstances, either in trade or in war, can Ceylon stand by itself. Indian politicians sometimes indulge in daydreams of Ceylon entering the Indian Union, and there is no doubt that Indian culture and political aspirations exercise considerable influence. But there are no signs at present that India would be able to defend Ceylon, keep it supplied with food, or replace the West as a market for its products. Thus, while Ceylon's relations with India are carefully cultivated, they lack the practical advantages which Britain, or even Australia, can offer.

In the circumstances it may seem strange that extreme left parties should flourish, especially in the shadow of the Colonial Office. The following figures show the state of the parties in the new Parliament: UNP 42, Left 18, Tamil Congress 7, Ceylon Indian Congress 6, Independents 21 and Labour 1.

If the Left and Indian parties are taken to represent the workers' vote (there is universal adult franchise) it would seem that the under-dog in Ceylon is well represented—on paper. But it is necessary to emphasise the theoretical nature of such estimates, because in the East the practices of a party are not necessarily indicated by the label. Democratic technique can undergo a curious inversion. Instead of the party regarding itself as representing the people who voted for it, it is usually much too ready to consider itself as having a mission to lead all the people. Since the leader himself decides how the people should be led, the chances of an authoritarian outlook are not insignificant. It would thus be possible for the Left parties to carry on considerable agitation for independence—even to call strikes—although it may be fairly obvious that their alleged supporters have no interest in the question, or are openly in favour of remaining inside the Empire.

Apart from the Communist Party, it is also difficult to decide how far to the Left such parties as the Samasamaj and the Bolshevik-Leninist Party are prepared to stand. Most of their leadership is in the hands of intellectuals who have never known want. In a country where the standard of living was high they would look ridiculous; but in Asia, where there is very real want, their ideologies fit more neatly into the picture.

End of the Palmy Days

Ceylon is a particularly good laboratory because the line between the “Haves” and “Have nots” is fairly distinct. There is very little industry and therefore only a very small landless middle class. The island's wealth depends mainly on estates raising tea, rubber and coconuts and on mines. In all these undertakings the line between master and man is clear. Many of these estates were formed by the British. Some are still held by British companies, but to a great extent ownership is now in Ceylonese hands. Furthermore, the British resident in Ceylon wields very little influence today. He is usually a manager or assistant for someone else. The palmy days of the “planters” are over, though British ideas of prestige prevent any real mingling between British and Sinhalese.

It has to be realised now that, although Ceylon is still nominally a British colony, the domestic future of the island is very much in the hands of its people's leaders. Mr Senanayake and his new Cabinet face a future by no means easy. Labour troubles have already been widespread and are liable to continue, especially as Ceylon has to settle down after an unprecedented war boom. The SEAC high command was concentrated in the island, and brought prosperity undreamed of in prewar days. The war boom touched everyone, down to the man who does the mango plant trick. But the return of Malaya to the rubber market, and the possibility that the Netherlands Indies will once again be tea producers, mean that even the estates will no longer have things their own way.

Ceylon has begun to realise that a depression is possible. Whether the United National Party can hold together under the strain remains to be seen. If it succeeds, the Government of Ceylon will for some time to come lean towards the Right; if it fails, the island may well follow India along the road of Socialism.

AMERICAN SURVEY

Autumn Timetable

(From Our US Editorial Staff)

THE anticipated timetable of the Marshall Plan is now reasonably clear. The Herter Committee is back, and expects to have a report ready by the first of next month. The Harriman Committee's report will be released about the same time. Early November, therefore, will see at hand the statement of the Sixteen on what is needed, an analysis of availability and a programme for making goods available from the groups appointed by President Truman in midsummer, and findings on need with a proposal for meeting that need by the Special Committee of the House which visited Britain and the Continent during August and September. These are the preliminaries to official action.

Will there be a special session of Congress to act? Such a session has been demanded by a number of Congressmen, by round robins of college professors, by various private citizens. Will Mr Truman call it? The President's acquiescence in the departure of Congress in midsummer, and the doubts he then expressed of any necessity of reconvening it before January, have been criticised; misunderstanding of his technique has been particularly noticeable abroad.

If Congress had been kept sitting in the discomfort of the hottest summer of recent record, little would have been produced but disgruntlement. Even the prospect of an early return, announced at that time, would have concentrated antagonism on its cause. At that time, Congressmen wanted to go home. They had been home very little during the war years. They wanted to mend fences. They wanted to see the folks.

By now, they have seen them. They have seen all the fathers—and all the mothers—of all the boys who want their one available appointment to Annapolis or West Point. They have been called on by the real estate board about that little matter of the new armoury. The Chamber of Commerce has taken up the trouble caused by silting in the river. The Farm Bureau has presented its views on the agricultural legislation due next year. Home is not what it was, seen from Washington. It might be quite a relief to get away. And quite a few constituents are beginning to think that Congress ought to get to work on overseas relief before midwinter.

In addition to the political asset of this change of mood, which puts the Administration constantly nearer to the invaluable position of being pushed by the country, the mechanics of Congressional action have been taken into consideration. Normally, Congress as a whole has little to do during the first month of a session. During that interval, Bills are before the appropriate Committees; hearings on them are being held. Only after a Bill has been reported out, and given a nod by the Rules Committee can Congress as a whole come into action.

Under the timetable now proposed, the Foreign Affairs and Foreign Relations Committees of the Senate and House will be called into session early in November, to receive the materials previously mentioned, to hear testimony from the State Depart-

ment and other sources, and perhaps to frame a draft Bill. If this can be done in November, the time will have come for Congress to act.

Whether to call a special session in December, or wait till January with the understanding that the Marshall Plan will be made immediate business, will probably be decided on the condition of the supply pipeline at that time. The air is loud with the scraping of barrel-bottoms. If enough funds, such as those found in the last few weeks for France and Italy, can be dredged up to keep the pipeline full, there is a very considerable political advantage in avoiding a request for stop-gap appropriations just before the Marshall credits are considered. The chances of the plan as a whole are clearly far greater if the relief and reconstruction aspects can be combined.

If the pipeline can be financed through the crucial weeks in December, it might be entirely possible for action taken early in January to provide immediate credits for the Marshall Plan from then until the coming harvest, with consideration of later aspects following by March or April. (The fact that very specific figures can be given for food needs for the balance of the fiscal year, whereas later estimates are subject to wide variations with next year's yields, would help if Congressional sledding turns out to be tough.)

★

The quantities of aid to be delivered under this timetable are not the only items on which decisions will have to be reached. There is the matter of auspices. It seems unlikely at present that the sum proposed by the Sixteen, or anything like it, will come before Congress for appropriation as a whole. Some of the need may be handled through the International Bank, some through the Export-Import Bank, which has its own financing, some perhaps through other agencies. But for whatever credits are directly given, an administrative agency is required. Three possibilities suggest themselves: administration by an existing department; by an agency set up for the special purpose and attached to the Executive Offices of the President; by a Government Corporation on the model of the Reconstruction Finance Corporation. The first two named suffer from certain disadvantages: several departments—State, Treasury and Commerce, to name three—might present rival claims under the first arrangement, and an administrative agency, unlike a Government corporation, would have to be financed on a possibly awkward fiscal year accounting basis.

Another matter concerns the elimination of the dollar from the transaction. The case for relief in kind is very strong. But since the belief is equally general that a gift sits well neither from the viewpoint of the giver nor the receiver, what form of return, other than dollars, can be worked out? Section 6 of the Act providing Post-Unrra Relief is being examined thoughtfully by those in search of a Congressional precedent. An adaptation of its provisions for payment in local currencies might prove useful in many ways: if the proceeds from food and other goods sold in the receiving countries were held by Governments to United States credit for a time, the dangers of inflation might be considerably reduced; a return to the United States would be provided; this return might be used as a basis for reverse shipments in kind to build up United States raw materials stockpiles, or it might serve as an aid to the revival of multilateralism.

The multilateral approach also is attracting attention in connection with the desire to keep the Marshall Plan open-ended.

“AMERICAN SURVEY” is drawn from three sources. Articles described as “From Our US Editorial Staff” are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as “From an Industrial Correspondent” or “From A Correspondent in Ohio” are from outside contributors. Everything printed without attribution is prepared in London.

Europe as a whole was invited to participate. A considerable measure of East-West trade in Europe was assumed by the Sixteen in the final writing-down of their estimates. How can trade such as currently exists with Poland and the West be encouraged? How can activity with the other Eastern European states be stimulated? And outside Europe, how can the resources of countries other than the United States be meshed into renewed European activity? (The overseas revenues of Britain and France have been greatly reduced, but does it necessarily follow that new ventures in the less developed areas of the world, undertaken with new techniques, are unforeseeable?)

Such multilateralism has its problems, for one assumption of the Marshall Plan, at least on the American side, is an effort on the part of the European countries to integrate their production until a yield becomes possible in twentieth-century terms. And at any given stage, the area integrated has to have a definite shape. It affects, too, the European machinery which will serve as opposite number to whatever American agency is set up. The Sixteen did not dissolve their Committee. What subsequent purposes will it serve, and what relation will it bear to the activities and commitments of the individual participating Governments? The same question stands for the International Bank.

A final matter which affects the timetable is the temper of the discussion on both sides of the Atlantic. Progress will be slowed from the American side if there is over-indulgence on the pleasures of an election year. It will be slowed from the European side if there is too much comment that can be classified in America as biting the hand about to feed—even though there may be some understanding of the fact that fatigue, cold and discouragement can make it a pleasure to bite.

American Notes

Demand and Resources

Although it provides a useful correlation of available data on American resources, the report of the special committee established by President Truman and headed by Mr J. A. Krug, Secretary of the Interior, contains no information beyond that formerly available in the Commerce Department, or indeed, in many commercial quarters. It is an essential political preliminary to Congressional debate on the Marshall proposals, but within its own terms of reference it could scarcely resolve the contradiction between the general claim that "resources are physically sufficient to preserve national security, and the standard of living, and at the same time support a considerable foreign aid programme," and the very obvious fact that, in terms of such vital materials as steel, machinery, grains, fertilisers, etc., European estimates presume a further twist of the inflationary screw in the absence of special measures. The Krug report (which is summarised in our *Records and Statistics* supplement) does indicate certain steps which may be taken for some materials, but "economic and fiscal measures" will be defined later by the Harriman Committee, whose task is to assess the character of the resources "which may be safely and wisely utilised" abroad, and by the Council of Economic Advisers which has been called upon to "appraise the economic impact on the United States."

These demonstrations form an essential part of President Truman's complicated task of justifying foreign aid policy, not only to Congressmen, but to an electorate which, on the evidence of recent investigations is still entirely vague concerning the nature of Europe's need, or the full implications of the Marshall proposals. But the Administration which had at one time the reasonable hope that domestic demand would subside to a degree that promised important relief for overseas shipments, is now face to face with a boom that shows very few signs of evening off at least before the spring of 1948. So long as it proceeds at the current pace, Mr Truman has the following choices in terms of policy. He can, first, take no special measures, and let the price situation get entirely out of hand. He can put back priorities and allocations on key materials, or plump for a full resumption of physical controls. He can endeavour to break domestic demand by fiscal and monetary measures, or last of all, he can simply deflate the European aid figures to the degree necessary to achieve some sort of working balance—and hope for the best.

The Administration will presumably take its customary middle

path. In recommending allocation measures for such key materials as steel, it must fight intense opposition. But it has growing support from consumers, and both authoritative and influential support from the Council of Economic Advisers, which has always held the respect of the political opposition and of the industrial community. But it will certainly be in no mood, in 1948 especially, to extend priority and allocation procedure beyond the minimum necessary, and that in itself—as the freight car shortage so plainly shows—is by no means certain to bring the required results. The full resumption of physical controls is a political impossibility now, and equally debatable from an economic viewpoint, while in terms of monetary policy, the Treasury has taken no steps even to minimise the threat of new credit expansion following from the revival of gold imports—a step that was taken quickly enough in 1937 when the inflationary situation was far less aggravated than it is today. The conclusion would seem to be that while Congress may be willing to grant relatively substantial sums as stop-gap aid when, and only when, it faces undeniable indications of collapse abroad, it will insist upon protracted and meticulous examination of longer-term aid. The term of the domestic re-equipment boom, far more than authoritative backing from special committees, will determine the limits of Marshall aid.

"Symbols of Sacrifice"

The capacity of the American salesman is a national legend, and Mr Charles Luckman admittedly stands at the head of his craft. At his behest the best brains of the advertising profession are busy glamorising the food conservation campaign by such inspired legends as "Don't start the next war in here," to be pasted on the nation's dustbins. Mr Luckman got off to an admirably speedy start. Some critics are wondering whether less haste might not have meant more speed. The programme has three main sections, directed at the general public, at the farmers, and at the grain-using industries. Farmers are being asked to substitute grass and hay for grains in livestock feeding and to market at lighter weights; the distilling industry (which is hypersensitive to public pressure and subject to special forms of government control) has agreed to stop operations for 60 days, on the condition that grain saved is not distilled in Europe and sold back into the American market. The brewers are being pushed not only into alternative grains, but towards a reduction in consumption. The bakers have agreed not to accept return of stale loaves, and are considering making smaller loaves.

But for the public the test of Mr Luckman's success is the institution of meatless Tuesdays and poultryless and eggless Thursdays (with special dispensations for the national holidays that perforce fall on a Thursday). The pitfalls in such voluntary rationing have shown up early. Families already rationed by high prices are resentful of superfluous exhortations; compliance is spotty among the better-off; and, worst of all, it has been quickly realised that any pangs of conscience can be painlessly appeased by eating chicken on Tuesday and beef on Thursday. Even Mr Luckman has conceded that to refrain from eating chicken may, in the short-run, defeat the end of grain-conservation by prolonging the life—and the feeding—of hens on the farm.

A little more time for thought might also have reminded the Administration that even the great days of voluntary food conservation under Mr Herbert Hoover during the last war would not have been possible without fairly stringent controls over waste, hoarding and allocations to the food industry embodied in war legislation. Some new version of these powers is sorely needed by the head of Levers if he is to succeed. It is also apparent that Mr Anderson, the Secretary of Agriculture, has not been convinced of the effectiveness of voluntary consumer rationing. His tactless insistence that meatless Tuesdays were "symbols of sacrifice" rather than the substance, a reminder, "like going to church on Sundays," brought a sharp reprimand from Mr Truman. But however tactless, Mr Anderson's insistence that the heart of the problem is on the farm, where 75 per cent of the grain is consumed, is certainly right. The distilling industry itself cannot save much directly for Europe, as it uses chiefly rye and barley; last year it used only 42,000 bushels of wheat.

The Department of Agriculture is placing no great reliance on the food-saving campaign. The Commodity Credit Corporation is pushing its purchases of wheat for export in the prudent belief that every day will make wheat harder to buy even at prices topping \$3 a bushel. On October 10th it was estimated that 256 million bushels of wheat and flour equivalent had been

acquired, just over half the export target of 500 millions. The next 250 millions will be harder to get, even at a price which the Administration hopefully believes will apply the sharpest deterrent to livestock feeding. Disappearances of both wheat and corn are well above average already.

Taft and Stassen?

The most striking thing about the 1948 campaign, on the Republican side, at least, is its early liveliness. This is in sharp contrast with the 1944 campaign, when at a comparable stage, virtually no Republican would concede, by word or act, that he was interested in that nomination. It may be that the memory of that strategy, which gave the nomination to Governor Dewey, is behind last week's strange political honeymoon between Senator Taft and Mr Harold Stassen, who have been joining forces on one platform after another, warmly applauding each other's integrity and sincerity. Senator Taft was perhaps the warmest in declaring that, "despite our differences, we are prepared to compromise our individual views to . . . maintain the solidarity of the party," but Mr Stassen was not far behind in pointing out "the best progress in America has come from a blending together of a liberal attitude with a conservative position into a programme of action."

Mr Stassen has hastened to deny the inevitable rumour that there was to be a Taft-Stassen ticket. It is ironic that Mr Stassen, who alone has always made it perfectly clear that he was running for the Presidency, should with such monotonous regularity be cast as bridesmaid rather than bride. A month ago Mr Stassen denied with some heat any intention of running on a Dewey ticket; not long ago Mr Henry Wallace blessed a union between Mr Stassen and General Eisenhower. Mr Stassen, who inherits the international support that once was Mr Willkie's, would indeed be a formidable and attractive complement to almost any Republican ticket, but he shows no sign of abandoning his own campaign for the Presidency.

It is difficult to believe that at this stage Senator Taft and Mr Stassen are contemplating any permanent union. Mr Stassen, announcing a "stepping up" in his campaign, is about to depart on another political odyssey. What is quite likely, and has been denounced by the Dewey headquarters, is an agreement between Taft and Stassen to make each other their followers' second choices in order to ensure that Governor Dewey is not nominated on the first ballot and to throw the convention into a deadlock. This would be a perfect case of both ends combining against the middle. Mr Stassen is a pace-setter in this campaign out of all proportion to the votes he has in his pocket, and his demands that any candidate for the nomination should have a public programme, and that there should be no quibbling over food exports to Europe, showed an uncharitable bias against the Governor of New York, whose reticence is fast becoming a public joke.

Freight Car Shortage

The freight car shortage, which at one time brought a brisk exchange of protests to enliven the normally smooth relationship between Ottawa and Washington, has for many months hampered industrial output, and threatened crop deliveries. Early this year, the Office of Defence Transportation set a production goal of 10,000 units monthly for domestic use, and the railroads themselves put in firm orders for 90,000 over the first eight months.

This programme has fallen very badly into arrears. In no recent month has output gone above 8,000 cars, and the railroads have done no more than to replace war-worn stock which, under normal conditions, would have been scrapped much earlier. In its concern over such a critical shortage, the Department of Justice has now made the almost inevitable move of investigating the entire industry through the courts for alleged anti-trust law violations. A Senate committee has taken the more practical step of calling producers together, but no solution seems possible, at least until 1948.

The whole railroad equipment industry has suffered in earlier years from tremendous fluctuations in demand. Actual installations by the domestic railroads are shown below:—

Period	Expenditures on Freight Cars	
	Number Taken	Cost per Unit (\$ 000's)
1925-29 (yearly ave.)	90,200	1,900
1935-39 " "	34,200	2,800
1943 " "	28,700	3,410
1946 " "	40,400	3,950

To reinforce domestic demand, the Paris Conference estimate of import needs through to 1951 was for an expenditure of \$367 million at a unit cost which seems rather optimistically placed at \$3,500. The total for 1948 alone, on this basis, would be 48,000 new cars. The bottleneck is not in building capacity which the industry assesses at 10,000 monthly, and which could be increased perhaps to 14,000 by peak output from the railroad building shops. Controversy on the anti-trust issue surrounds the problem of steel deliveries. The steel makers assert, and ODT figures agree, that sufficient steel has been shipped to attain an output goal of 10,000 cars monthly, and that steel designed for these cars has been sidetracked for locomotive manufacture, and for coalmine loading cars.

But if these allegations are correct, they serve only to indicate the desperate need for steel tonnage in other, and equally essential, sectors of industry. It is possible that relief may accrue from a setback of domestic demand. The long-term loss of traffic to competitive undertakings has made the railroad managements very cautious in their assessment of future needs, and if they are not given further rate concessions soon they may be willing to cancel large orders. On the other hand, they are working with the same number of cars as in 1940, and are handling a traffic volume fully eighty per cent higher. The creation of a special agency for the allocation of steel to freight car-builders can do no more than to ease the problem while demand holds at present rates. There is no cause for surprise in the fact that the cautiously-moving Council of Economic Advisers has called for powers of allocation and price control "in respect of a few key materials."

Synthetic Rubber Policy

Part of the work ahead for Congress covers long-term policy on synthetic rubber output, now governed by stop-gap legislation which will expire on March 31st next. On several occasions since V-J Day Washington has relaxed controls over private purchasing, inventory policy and usage of natural rubber. But it retains control of the synthetic plants, and decides the proportion of natural rubber to be used for tyres and tubes. Its grip thus covers about three-quarters of new rubber consumed within the United States.

Recent months have witnessed a growing struggle between the government's service advisers and the rubber manufacturing industry. In the enthusiasm which followed from the "production miracle" of the synthetic industry US manufacturers believed that they had broken for all time the grip of the "Anglo-Dutch Cartel" and that the future would bring freedom from price hazards and release for the vast assets formerly frozen in inventories. But the very real success of synthetics has not eliminated the advantages attaching to natural rubber, more particularly when the government insists upon a price of 18.5 cents for synthetic and when Malayan rubber has been available below 15 cents. Mr Bernard Baruch, who played so large a part in establishing the synthetic industry still holds that a tariff against natural rubber is justified by "ridiculously low wages paid on Eastern plantations." And the Army-Navy Munitions Board decided in July that long-term legislation should include provisions for the compulsory use of at least one-third of new rubber requirements in buna-type synthetic. This programme was held to promise a market for 300,000 long tons of buna-type rubber yearly, and the Board recommended the stand-by maintenance of plant yielding at full production 600,000 tons yearly.

Industry's latest views have been developed by Mr P. W. Litchfield, chairman of Goodyear Rubber, the largest American manufacturer, who supports the stand-by total of 600,000 tons, but suggests that actual output should be held down to 100,000 tons and that control should be retained only over tyres and tubes. He also wants a "Hemisphere programme" for natural rubber at 100,000 tons yearly (a move that would certainly involve protective support) and reduction of the synthetic price to 15 cents a lb.

After months of inactivity the American Government is again in the market for stock-pile rubber. The scope of the new programme is unknown, but trade rumours suggest that it goes beyond purchases for purely defensive purposes and that stock-

piling now does mean a recognition of the need for bolstering dollar supplies abroad. These rumours again find reinforcement in persistent reports that the Anglo-American tariff agreement will be accompanied by plans, presumably informal at this stage, for an increase of natural rubber purchases at the expense of synthetic. Such an agreement, as may be noted by Mr Litchfield's remarks on price policy, will meet with intense opposition if it seems to threaten any marked rise in the rubber price. The Far Eastern plantation owners no doubt realise quite well that any return of earlier boom periods is not within sight. But if every other criticism of American postwar trade policy be declared invalid, there is no excuse for her present tariff policy—a remark that will probably apply with almost equal force despite any concessions now won. The present high volume of synthetic manufacture is debatable enough on strategic considerations. It is wholly unjustified on economic grounds and in relation to her world-wide obligations, and puts an effective barrier against one of the few major imports which might otherwise secure, with reasonable certainty, a volume market substantially larger than in prewar days.

Petrillo's Luddites

The decision of Mr James Petrillo, of the Musicians' Union, to ban after December 31st the making of recordings and transcriptions by the 225,000 members of the union was ostensibly based on the plea that by making recordings musicians were destroying their own livelihood. No doubt, if so hard-headed a business man ever dreams, he dreams of a world in which "canned music," amateurs, and foreign artists have all been abolished. But this latest gambit has its roots not in Mr Petrillo's dreams, but in his pocket.

Mr Petrillo shares with Mr Lewis the dubious distinction of having directly inspired anti-labour legislation. Not only was the Lea bill written to discourage Mr Petrillo's practice of forcing radio stations to employ more musicians than they need, but Mr Petrillo was in the mind of legislators when they wrote the Taft-Hartley bill with its new controls over union welfare funds. The musicians' union, which this week wept crocodile tears over the way recordings were taking the bread out of musicians' mouths, has been receiving an income of more than \$1 million a year from the sale of recordings, in the form of royalties paid by the industry.

This money has gone into a fund administered exclusively by the union, and has been used chiefly to subsidise symphony concerts, to popularise "live" music and provide employment for musicians. The Taft-Hartley law provides that any welfare funds of this kind must be jointly administered by the union and the employer, and the money received must be used for certain specific purposes, such as hospitalisation, life insurance, compensation for illness, and pensions. Benefits are also limited to employees of the employers who contribute. In the case of the musicians' union, the employees of the recording companies are only a handful, while the golden flow from record royalties is distributed among the whole membership.

The companies are satisfied with the royalty arrangement, but have not felt able to continue it because of the possible criminal penalties for violation of the act. The threat that no musicians will contribute to recordings or transcriptions thus becomes only a threat to force the industry to co-operate in finding a way around the law. It is a strike, not a struggle for the musicians' millennium. Mr Petrillo, as his similar tactics from 1942-44 showed, would no doubt like to be a modern Luddite, silencing the machine, but he realises, as the Luddites of a century or more ago did not, that today it is the machine that lays the golden egg.

Self-Discipline for Radio

The Federal Communications Commission warned the broadcasting interests some time ago that if they themselves did not deal with the evils of excessive commercialism, Government might be forced to take action. The National Association of Broadcasters, the trade association which includes the four major networks and most of the independent stations, has now produced a proposed code of conduct, to take effect in February, under which advertising time on the air would be reduced by as much as 20 per cent for some programmes and as little as 3 per cent for others. It is a sliding scale which is unlikely to alarm any big advertiser. The NAB also proposes a series of moral standards for the industry obviously based on those Tables of Stone which the Prophet Hays brought down to Hollywood from Mount Coolidge years ago. And, like Mr Coolidge's favourite preacher, the organ-

ised broadcasters are against Sin—they deprecate profanity, obscenity, insobriety, too much sex and too many crimes—unless, as in Hollywood, they can be cloaked under the moral that crime does not pay.

The major networks pay lip service, at least, to the view that radio has a public service to perform. But—this code suffers from the same defects that the American Commission on the Freedom of the Press noted in the Hollywood code—"it sets standards of acceptability, not of responsibility; and the standards set are minima, not goals of adequate or ideal performance." Nor is it clear how any broadcasting code can be enforced. For radio does not enjoy anything comparable to the stranglehold on theatres which enabled the major film companies to bring the independents into line; nor is radio subject to the State or City Boards of Censors that exercise control through their licensing power. The Communications Commission is by law prohibited from censoring programmes. Indeed, it is unnecessary, for even Boston has never blacked out a radio programme. The advertisers exercise a Grundyism far too rigid and immaculate for that.

These proposals go nowhere near the heart of the problem. It is not only the increasing amount of time taken up by advertising "plugs" that worries the intelligent listener, but the acceptance of the lowest common denominator in taste which commercialism often involves. The report comes out strongly against the "dramatisation of political issues" on the air. This proposal to take all the life out of political broadcasts shows that it is not human morals but human intelligence which is in peril. The code-framers are obviously determined not to permit the American public to be assaulted again by such a battery of wit, fun and irreverence as some of the brightest minds of theatre and radio subjected them to in the interests of Mr Roosevelt in the 1944 election. Safety comes first; dullness must conquer all.

Shorter Notes

Almost every government economist unites in asserting that the vigour of the present industrial boom will now continue undiminished through the rest of 1947. The Reserve Board's index of industrial production (1935-39) hit a post peak of 190 as long ago as March, and declined to 178 by mid-summer. The recovery since then is expected to bring the October figure back very nearly to the March peak. While business equipment expenditures may show some decline next year, it is not expected that there will be any substantial variation through November and December.

By an overwhelming majority vote, the American Labour Federation's delegates at the annual convention last week decided to abolish official rank for its thirteen vice-presidents, including Mr John L. Lewis, head of the United Mineworkers. Mr Lewis retains a seat on the Council of the AFL, which now has only two ranking officers, William Green, president, and George Meany, treasurer. The AFL thus secured recognition by the National Labour Relations Board for workers without local representation, who were formerly barred by the refusal of Mr Lewis to sign the anti-Communist oath under the new Labour Act. The convention staged several stormy scenes with Mr Lewis, but there is no present indication that he is prepared to make another break with the AFL.

Hollywood, according to Mr Adolphe Menjou, is a "hot-bed of un-American, anti-capitalistic, anti-free enterprise activities." The first days of "Hollywood on Trial" produced by the Committee on anti-American Activities, and starring most of the big movie names, promises to be even more super-colossal a fantasy than the Hughes investigation this summer without the excuse of providing hot-weather relaxation for the nation. Whether or not this latest probe is an equally colossal flop, the all-too-likely consequence is an even greater timorousness on the part of the film city, already hypersensitive to pressure-groups of every description.

Washington reports this week revealed that Mr John Snyder, Secretary to the Treasury, is not yet prepared to release the remaining (\$400 million) balance of the loan to Britain. He denied that any new and specific request had come from London, and affirmed his agreement "in principle" to release of these funds. But, he said, action could not be taken without the consent of Congressional leaders.

THE BUSINESS WORLD

State Banking in Australia

THE Australian Government has lost no time in launching its suddenly announced scheme for full-scale nationalisation of all commercial banking within the Commonwealth. The intention was disclosed by the Prime Minister, Mr Chifley, on August 16th; the plan itself was approved by the Australian Labour Caucus a month later; and the Bill was introduced ten days ago. Even granted the evident determination of the Government and its strength both in the Lower House and in the Senate, this speed is remarkable, for the plan has aroused deep political feelings throughout Australia. It has had to proceed amid a nation-wide clamour and in face of delaying attempts by the Opposition in the hope of forcing a referendum, which, if Gallup polls are any guide, would have had a good chance of success. The scheme has even had its religious aspects, owing to the attitude of the important Catholic Party, and a number of leading Catholic churchmen have made pronouncements against it. At one time, indeed, it seemed that Mr Chifley's intentions would be frustrated by a nation-wide cleavage precipitated by an official declaration from the Catholic Church; but Cardinal Gilroy has calmed this particular storm by stating that the affair is no business of the Church unless a moral issue is involved.

The plan has thus successfully run its first gauntlet. Given the strength of the Government's majority, it seems destined to pass into law despite the efforts of the Opposition and the banks themselves, and despite the heated controversies that are raging beyond the bounds of Canberra. If this happens there will still be a third hazard to be faced, for the legal experts are studying intensively the possibilities of a challenge on constitutional grounds. It is too early to discover whether there is real foundation for the hopes these activities are raising; but it is already plain that the last shot in the battle will not have been fired if and when the Bill passes into law.

To appreciate the Government's objectives, it is necessary to look closely at the political background. Though announcements of the scheme came as a surprise, nationalisation of banking has long been a major plank in Australia's Labour platform. The belief in the need for control of the "money power" has always been strongly held in Australia, and was influencing the structure of Australian banking many years before the principle came to be accepted, in Britain and elsewhere, that ultimate responsibility for financial and monetary policy should rest with the Government. The exigencies of war, however, placed in the hands of the Commonwealth Government precisely the kind of powers which this doctrine implied. They were, moreover, particularly far-reaching powers, and the trading banks, at the time when they helped to frame them, certainly did not contemplate that they would be continued in peacetime without substantial relaxation. But that is what happened.

The legislation of 1945 perpetuated the system of wartime control of the trading banks, extended the powers of the state-owned Commonwealth Bank, and removed from its constitution the last vestiges of independence. Under this system the Commonwealth Bank, as the instrument of the Government, has far-reaching powers over almost every aspect of the operations of the commercial banks. It can prescribe the directions

in which and the principles on which they shall lend—provided that it concerns itself only with classes of advances as distinct from individual borrowings—and total lendings must not be increased without its consent. It controls rates of interest charged on advances and allowed on deposits, can call for information beyond that furnished in the statutory balance-sheets of the banks, and has important powers of investigation. It dominates exchange dealings and external reserves, and the trading banks require its consent before acquiring any Government security or any quoted securities.

More important still was the perpetuation of the wartime "special deposit" system whereby the trading banks were required to lodge in cash with the Commonwealth Bank the equivalent of any increase in their deposits above prewar levels; these cash lodgements are withdrawable only with the consent of the authorities and may not earn more than $\frac{7}{8}$ per cent. This particular system, even without the other controls, thus gave the Government power to fix whatever upper limit it chose to the scale of operations, and indirectly to the profits, of the trading banks. Yet the Commonwealth Bank, which administers this system, was declared by statute to have a "duty . . . to develop and expand its general banking business," and in so doing was required not to "refuse to conduct banking business for any person, by reason only of the fact that . . . that would have the effect of taking business away from another bank."

A more far-reaching and comprehensive array of controls of banking, while still leaving it in private ownership, could scarcely have been devised. It is certainly the most drastic arrangement ever operated in a democratic country, and is more than adequate to arm even the most doctrinaire Labour economist with all the powers he could desire. For these reasons, it was generally assumed that the original intentions of the Australian Labour movement fully to nationalise the banks would not be revived. It seemed even to the most sympathetic observers that it had in this system all the benefits which, from its standpoint, it might expect to derive from nationalisation, while avoiding some of its more evident disadvantages. Moreover, the Australian Banking Commission of 1936 had pronounced in favour of retaining a privately owned commercial banking system; and thereafter the Labour Party was believed to have substituted "control" for "nationalisation" of banking in its programme. The Opposition contends, indeed, that this has been the limit of the Labour Party's programme in every subsequent election, and that, accordingly, its electoral victory last year gives it no mandate to proceed further.

That these hopes have been disappointed seems to be attributable largely to the personal views of Mr Chifley, who in 1936 was a dissentient member of the Commission and then formally declared:—

The evidence given before the Commission, and personal observation and experience, lead me to believe that there is no possibility of the objectives [of the monetary and banking system outlined in the Report] being reached, or of any well-ordered progress being made . . . under a system in which there are privately owned banks which have been established for the purpose of making profit.

Mr Chifley has great prestige in the Federal Parliamentary

Labour Party, and is its acknowledged expert on all financial matters. Yet it is difficult to see what objectives he seeks, except the satisfaction of purely doctrinal prejudice.

The text of his Bill is not yet available in London, but its main implications, apart from the intricate details of procedure and compensation, are plain. Private banks will be entirely forbidden to carry on banking business within the Commonwealth except during the process of absorption by the Commonwealth Bank, which is to acquire the shares or assets of all purely Australian banks and the Australian assets of banks incorporated overseas which operate within the Commonwealth. The absorbed businesses are then to be operated by the Commonwealth Bank on uniform principles. It is not clear what safeguards are actually included in the Bill, but Mr Chifley has declared that the Bank will have the duty "to provide, in accordance with the conditions of normal banking business, adequate banking facilities for any state or person requiring them; to conduct business without discrimination, except as otherwise required in law and the practices and usages customary among bankers; and particularly to maintain strict secrecy within the law as to the affairs of its customers."

If these undertakings are faithfully observed in day-to-day operation as well as in policy, the only attribute of power which the new system would in principle confer would be that inherent in Governmental monopoly. Given the extent of control which already exists, it is surely impossible to make a case for such a power on any purely economic principles which are discernible in Labour philosophy. Moreover, Australian Labour had a traditional fear of any "money ring," which explains why the Commonwealth Bank was created to be a competing institution. Unless Mr Chifley's action results simply from muddle-headed reasoning, this Bill, whatever safeguards it incorporates, shifts the issue to an entirely different plane from that upon which

the legislation of 1945 rested. It may be that prejudice rather than logic points the way to the Government's intentions; but, if logic were the guide, the conclusion would be inescapable that the real objective now is to enable the Government to use the banking power to further purely political aims. To say this is not to accept Mr Menzies' dictum that the Government is "weaving a pattern of dictatorship." But the prospect, on any logical hypothesis, is far from reassuring.

Mr Chifley himself has declared his action to be necessary because of doubts about the constitutional validity of the existing powers. His first announcement did, indeed, follow immediately upon a successful challenge to the 1945 Act. Section 48 provides that a bank shall not conduct any banking business for public bodies except with the consent of the Treasurer; and last August a direction by the Treasurer to certain local authorities to transfer their banking accounts to the Commonwealth Bank was overthrown by the Federal Court. Mr Chifley's nationalisation plan, announced three days later, was at first thought to reflect sudden pique at this ruling, but it now appears that he was simply waiting for a pretext. He claims that the frustration of these particular intentions—obviously, to enable the Commonwealth Bank to monopolise all public banking business—implies that other features of the 1945 legislation may be challenged with equal success, and he has pointed out that the validity even of the critical special deposits system had been called in question. But if this were the real explanation of the Government's extraordinarily speedy response, surely the right course would be to close the gaps in the system of 1945, not to embark upon a much more drastic plan having far-reaching political implications.

There is perhaps hardly room for hope that the scheme will be arrested, or even substantially modified, by the Legislature.

SAFE AS HOUSES

But are they? Is *your* house safe, in the sense that it is the best place to keep your cash? How much wiser it is to open an account at the Westminster Bank, where your money

will have complete protection, yet always be readily accessible. The process is simple and the account can be opened with a modest sum. The Manager of your local branch will be glad to tell you of the many ways in which the Westminster Bank can be of service to you.

WESTMINSTER BANK LIMITED

A casual observer of the architecture of the Union of South Africa would probably place more emphasis on the sky-scrapers of the Rand than on the spacious old Early Dutch houses which form such a pleasant decoration to the countryside of Cape Province.

There are, however, numerous examples of this attractive form of architecture still remaining. Many of them, as in the case of Groot Constantia near Cape Town, were designed as chateaux for the vineyards which still surround them and have served as centres for the wine industry ever since the seventeenth century. The wine industry in turn has done much to contribute to the prosperity of the Union in general and of the port of Cape Town in particular, and continues to hold its own to-day in the busy and expanding commercial life of the Union.

Full and up-to-date information from our branches in South Africa on the state and trends of local markets is readily obtainable on request.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)

HEAD OFFICE: 34 LOMBARD STREET, LONDON, E.C.3

In the immediate future, therefore, attention may perhaps be best focused on the problems of framing safeguards and ensuring fair procedure for compensation and purchase. So far there is no reason to suppose that compensation—which will be in cash, with an option to take Commonwealth Bank bonds—will not be adequate; but the principles on which it will be determined in cases of compulsory purchase are still not clear, and the proposal of tax concessions to induce voluntary agreement may

An Improved Steel Control

SINCE Sir Stafford Cripps officially admitted the existence of defects in the steel distribution scheme, a committee has investigated its working in the commendably short time of a fortnight. As a result, Sir Stafford hopes to introduce a more efficient method of control, which within a period of "some months" should get rid of the present excess of "M" forms over accruing supplies of steel, without any excess of complication or any noticeable increase in staff. Of all the physical controls, the steel allocation scheme is pivotal; if it is inefficient, no amount of efficiency in the other controls will make its defects good. And if the Wilmot proposal to ration steel to the engineering industry by reference to "export performance" is developed by the new Minister of Supply, even the most efficient control of itself will not guarantee success.

The steel distribution scheme is a child of the war years, and was designed to direct steel to essential war uses. The basic principles of the scheme have remained unchanged since 1940—the departments submitted their requirements, quarter by quarter, to the Raw Materials Committee of the Production Executive (later the Ministry of Production), which then had to reconcile them with the estimate of supplies for the same period prepared by the Iron and Steel Control, by scaling them down to the necessary extent. The Raw Materials Committee then made a quarterly allocation to each department on the basis of which "M" form authorisations were issued to the main contractors and, through them, to a multitude of sub-contractors.

The "M" form is a legal document which authorises the holder to "acquire treat and consume" a given quantity of steel, which can be allocated in part to sub-contractors for the purposes given on the "M" form. A ship-builder, for example, may receive authority from the Admiralty to acquire sufficient steel to build a complete vessel, and will then delegate to sub-contractors the necessary authorisations to cover the steel needed for engines, winches and other components. If a contractor cannot find a supplier who is prepared to accept his order for steel in the quarter for which the authorisation was issued, a new "M" form, relating to a subsequent period, has, in principle at any rate, to be obtained. But if the supplier, having accepted the order, is unable to complete delivery in the specified quarter, the "M" form retains its validity for the subsequent period. There are certain exceptions to this established "M" form procedure. In order to spare the departments from applications for trifling quantities of steel, users needing only a few tons of steel (less than one ton in the case of some products) can acquire them without a specific authorisation. Again, special arrangements had to be made for the stockholding merchants; their purchases from steel producers do not require any departmental authorisation, but merchants can buy only a limited quantity of steel in any one period, and forward orders are also subject to control. The merchant, of course, may not supply steel to a consumer without the authority of an "M" form, save for the exemption of small quantities.

Such is the basis of the scheme which, in essentials, has remained unchanged since 1940. But, during the war, allocations represented actual requirements; they were worked out by a

create a dubious precedent. These and similar matters will deserve careful scrutiny when the texts of the Bill and the opening debates are available, and they cannot be adequately appraised without them. On a longer view, hopes of mitigating the dangers which are inherent in the plan, and of preventing or checking abuses in practice, must rest upon the possibility of legal challenge, if not on the basic principles, at least on specific points.

systematic examination, and were brought down to match the available supplies. The scheme enabled each department to fix its own internal priorities and it was sufficiently flexible to cope with the fluctuating fortunes of war. The method of control has been described as a "vertical" system because it was designed to give each department sufficient steel for its requirements in the period, which was then passed down to contractors and sub-contractors who contributed to the manufacture of the final product. At the outset, a number of departments received an allocation of steel covering their separate detailed requirements, including even bearings, or motor cars. Early in the war, however, the system was sensibly modified; the Ministry of Supply assumed a general responsibility for the total requirement of bearings; and later of cars and other end products. Thus the "vertical" system of allocation gradually gave place to a "horizontal" system; and this tendency has been intensified since the war. The present situation is a somewhat confused mixture of the two systems: a firm making various products may have bulk ("horizontal") authorisations from several departments, and in addition may receive sub-authorisations from individual customers. There is no control agency to ensure that the total steel allocations held by such a firm are related in any way to its fabricating capacity as a whole.

The continuation of the distribution scheme after the end of the war was inescapable owing to the extreme pressure of demand for steel for deferred replacement and capital development, quite apart from the regular needs of the metal-using industries. When the Ministry of Production was wound up, the Raw Materials Committee was taken over by the Cabinet Offices and has continued to function as the central allocating authority for steel and other industrial raw materials. The main principles of the scheme have not been affected by this minor change in machinery; but with the return of peacetime conditions, there was a remarkable increase in the demand for sheets—for the housing programme and for industry generally—which demanded a separate allocation and a special "M" form system. Another modification relates to the licensing of deliveries for export. In the post-war transition period when British industry was busy with reconversion, steelmakers were encouraged to accept export orders, with the result that finished steel exports soared to an annual rate equivalent to some 3,000,000 ingot tons by the middle of 1946. By this time, however, the needs of the home market were greatly intensified, and severe limitations were imposed on the quantity of steel which could be exported—not, fortunately, by cancelling the relevant "M" forms and the orders placed under them, which would have damaged British goodwill overseas, but by limiting deliveries against outstanding export orders under licence.

So much for the mechanics of the distribution scheme. How far has it succeeded in matching the clamant demands for finished steel with available supplies? The answer is shown in the accompanying chart, which compares total departmental deliveries, quarter by quarter, with the allocations made to the departments concerned.

The chart shows that allocations and deliveries marched pretty well in step during the war, when the demands of the

departments, based on their agreed programmes of production, were brought into reasonably close conformity with the supplies of finished steel. There was a marked tendency, however, for deliveries to fall short of allocations during 1945; owing to the inevitable dislocations caused by the end of the war and the transition period. The main reason is that the allocations at this time were still based on wartime programmes which were cancelled as hostilities drew to a close; the ensuing period of adjustment and reconversion to a full peacetime basis lasted, as has already been suggested, until the middle of last year. For several reasons, supplies themselves have fluctuated—there was a slight downward tendency from 1941 to 1945, followed by a marked recovery last year, because production of finished steel in this country during the war years was materially assisted by lend-lease imports of ingots and "semis" from the United States, which enabled the British industry's finishing capacity to be fully utilised.

Although allocations to the departments have been kept in reasonably close conformity with available supplies, a certain inflation of the "M" form currency has occurred during the past eighteen months. Several causes have been at work. Some relaxation of the full rigours of control was necessary to facilitate the change-over to peacetime conditions; and so far this

relaxation has not been reversed. The resulting increase in the pressure of orders has been intensified by the licensing system for "B.T.5," or direct export, deliveries, for the introduction of this additional control has meant that a good many orders remain "frozen" on the steel makers' books. Finally, some of the departments themselves have found it difficult to keep the issue of "M" forms strictly within the limits of their allocations.

Accordingly, the steel industry is at present rather overloaded with orders; it follows therefore that the machinery of the distribution scheme responds only sluggishly to changes in allocations. Hence, when it became necessary earlier this year to accord prior treatment for certain uses of steel the Government did not rely on the "M" form alone, but introduced special over-riding arrangements. Six classes now enjoy first priority for supplies of finished steel: electricity generating plant; coal-mining machinery and equipment; plant for gas

undertakings; equipment for the coal-oil conversion programme; freight locomotives, coal wagons, and rails for essential maintenance; and, finally, material for atomic energy projects. These categories comprise the "Prime Minister's list," and their priority is secured by the addition of a special suffix to the departmental symbol on the "M" form, which producers are required to honour. The introduction of this new arrangement, born out of last winter's fuel crisis, has tended still further to increase the backlog of non-priority orders on the industry's books.

The growth in the industry's order load has given rise to questions about the appropriateness of the present distribution scheme in peacetime conditions. It was, by common consent, admirably adapted to a wartime situation in which there was virtually only one buyer—the Government—for the bulk of the end products produced. But the position today is very different. Now there is a multitude of buyers for the wide range of end products made of iron and steel, and the tasks of rationing and distribution have become correspondingly more complex. Moreover, the intensification of the export drive means that the shortage of steel in the home market is bound to become more acute in the near future, even granted the steel industry's expectation of achieving its 1948 output target of 14,000,000 ingot tons. The continuance of some form of distribution scheme, with its inescapable burden of clerical work for producer and consumer, must therefore be taken for granted. But some further modification of the wartime arrangements is likely to be necessary, if only because of the great stress which must now be laid upon the attainment of Sir Stafford Cripps's export targets.

Experience of the steel control scheme in peacetime shows that control should be exercised, and records of deliveries secured, on an industrial basis, and no longer on the departmental basis which served so well in wartime. The analysis of deliveries by the departmental symbols shown on the "M" forms under the present arrangements, gives little clue to the final destination of the steel, since—to quote one obvious example—the Ministry of Supply is itself responsible for a large group of consuming trades. If firms using steel were classified on an industrial basis—each industry being sponsored by a Government department—and appropriate symbols were employed, it would be possible to control the distribution of steel on a more logical basis and to ascertain more precisely in which industries and for what end products the supplies were actually being used. The operation of the scheme would also be simplified, and a good deal of paper work would be eliminated, if the method of sub-authorisation by a principal contractor to his sub-contractors were replaced by a system of direct authorisation of steel to the several firms who use it. It may be that Sir Stafford Cripps is thinking on these lines. Even so, plenty of difficulty and friction will remain, and this will only be eased by the work of an industry which the Minister of Health, with characteristic gratitude, describes as having "betrayed the national interest."

Business Notes

Cuts in Capital Programme

Sir Stafford Cripps's important statement on the nation's capital programme was being made in Parliament just as this issue of *The Economist* was passing through the Press, so that considered judgment must be deferred. But first reports suggest that, on paper at least, the global economies which the Government is planning are substantial. In the aggregate, as expected, public and private capital outlays are to be curtailed "at once" by £200 million, a curtailment which is equivalent to a cut of some £300 million on the rate originally projected for 1948 and £300 million on the rate originally projected for 1949. Whether, in the past two years, these cuts will suffice—or whether, indeed,

they can be implemented in orderly fashion with due regard for the relative priorities—remains to be seen; but at least it is clear that the phase of industrialists' pipe-dreams is over.

Rather surprisingly, Sir Stafford apparently regards the shortage of steel as the principal compelling factor, pointing out that the new export programme will absorb 1,000,000 tons which otherwise would have been available for home uses. But though steel may be a limiting factor, it is surely clear that the release of labour and other productive resources is equally important. Perhaps that is what Sir Stafford meant when he said that the economies are also designed to bring about a "measure of deflation." Necessarily, it is upon housing that a substantial part of the economies must fall; but as the houses at present under

construction and contract are to be completed "in the shortest possible time," it is impossible to estimate what immediate saving in resources will result. The steel allocation to railways will be sufficient to permit achievement of the original 1948 programme, involving 600 locomotives and 48,000 wagons in addition to the subsidiary equipment. Cuts in the factory programme are to be on the scale required to produce a saving of 30,000 tons of steel per quarter, but it is not yet clear in what directions the brunt of this economy will be felt. Upon other aspects of the capital programme Sir Stafford was apparently less specific. In particular, the first reports made no reference to the programme for electricity generating capacity. If that was indeed omitted, it is a noteworthy and questionable omission.

Speculation in Gilt-edged

The Stock Exchange this week, despite the imminence of important Ministerial statements on economic policy as Parliament reassembled, and despite the uncertainties of the coming Budget, has been in a mood of slightly greater optimism—or at least a lighter shade of pessimism. The recovery in gilt-edged has made further headway, while industrials in very quiet markets have regained a little of the ground lost in the previous Account; the industrial share index of the *Financial Times* stands nearly 2½ points above its level of a week ago. Movements such as these, however, must be attributed to technical factors and the narrowness of the market rather than to any incipient change in the attitude of investors generally. The announcement of further drafts on the nation's ultimate reserves—discussed in a subsequent note—the hints of further import cuts, and the evidence that many export markets are still contracting, are all factors which should have dictated caution. This week, however, they seem to have been regarded in the Stock Exchange as of less account than the fact that the Speech from the Throne contained no unexpected threats of action in the economic sphere.

Paradoxically, the recovery in gilt-edged perhaps owes something to the growing belief that the coming Budget may fall far short of the strenuous effort which is required. Logically, of course, the tougher the Budget the more likely the gilt-edged market is to benefit, but the City at present is disposed to argue that even Mr Dalton could scarcely combine a revival of his cheap money tactics with really stringent Budgetary measures. As it is, his Mansion House speech is still attracting speculators to the market, and speculative buying was reinforced this week by the expectation that he will return to the attack in his speech during the Debate on the Address. The two most speculative gilt-edged stocks—2½ per cent Consols and the "Dalton" 2½ per cent stock—have this week risen by a further two points and at the moment of writing both stand at 89. It needs to be emphasised that, in gilt-edged as in industrials, price movements at present are out of all proportion to the volume of business. Moreover, a significant pointer to the state of the market is the fact that in the dated stocks the recovery has been very modest. The 2½ per cent Savings Bonds 1964-67 have risen during the week by only ¼—they are still nearly 4 points below par—and the 3 per cent Savings Bonds by ½. Rather unexpectedly there has been a quite notable recovery in the short-dated bonds—the 1½ per cent Exchequer Bonds are now quoted at 100½—which should help to relieve some of the recent pressure on the discount houses' portfolios, and thus restore some much-needed elasticity to the market.

The Dollar Deficit

The Treasury disclosed this week that, following the sale of £20 million of gold in New York on September 15th, announced on that date, a further £30 million has been sold during the past month. In addition, Britain purchased \$120 million last Monday from the International Monetary Fund. This was in addition to the \$60 million purchased in September. The Treasury will henceforth make monthly statements about the gross sales of gold over the previous month. There will be no publication of gold shipments because they are influenced by the geographical distribution of reserves and may, therefore, be misleading as an indication of sales.

The gold sale and dollar purchase announced this week bring to \$380 million the US dollars that have had to be procured by sales of gold and purchases from the IMF in the two months that have elapsed since the suspension of convertibility on August 20th. That represents a drawing on gold and dollar reserves at the rate of close on £600 million per annum, which is roughly equal to the gap in the balance of payments of

the United Kingdom indicated by the trade returns for the third quarter of the year. The equivalent of slightly over £100 million was drawn from the US line of credit after August 20th in accordance with notices of withdrawals given before that date. These dollars, however, were probably required to meet the final backwash of convertibility demands. These demands are not, therefore, reflected in the \$380 million (£95 million) mobilised by sales of gold and purchases of dollars from the IMF over the past two months; this figure can be related to the net UK demand for dollars plus the smaller amount that may have been payable to meet the net dollar requirements of sterling area countries.

The gold sales will have reduced the central gold reserve to under £550 million. This reserve should be fortified by some £20 million before the end of the year as a result of the completion of the South African gold sales contract for 1947 (allowing for the fact that part of the gold still to be sold will in effect be withdrawn by South African drafts on the sterling area dollar pool). The latest UK purchase of dollars from the IMF has reduced to \$37 million the exchange Britain can acquire from that source at no higher cost than the initial ½ per cent service charge. The purchase also reduces to \$152 million the exchange Britain can purchase from the IMF between now and next September (namely, \$325 million, being one quarter of the UK quota which is the maximum that can be used over any twelve monthly period, minus the \$180 million already purchased, plus the \$7,000,000 of sterling that was bought by the Netherlands in the earlier part of this year). At the rate at which the last-ditch gold and dollar reserve is being used up, the remaining resources would be exhausted in about a year. Fortunately, the position is not so serious as this projection of recent dollar expenditure would imply—although Sir Stafford Cripps remarked on Thursday that there would be little left of the gold reserve by the end of 1948 if the dollar deficit continued at its present rate of about £475 million per annum. But the cuts in imports from the dollar area are only now beginning to take effect, the renewed export drive is scarcely reflected in the latest trade returns, while early next year the gold reserve should be reinforced by the £80 million gold loan from South Africa. Finally, there is the prospect that Britain will obtain access to the final \$400 million in the US line of credit. Discussions on this subject have been taking place since August 20th. The US Treasury wishes to be helpful. Since the suspension of convertibility constituted a default by Britain on the Anglo-American agreement, the release of these dollars without Congressional consent, or without assurance that the suspension of convertibility was in fact, as well as in words, "a temporary and emergency measure," might cause trouble for the US administration at the hands of Congressional critics. None the less, it would appear reasonable to assume that sooner or later these \$400 million will be available as emergency aid to Britain.

* * *

In Mr Dalton's Garden

Hopes that the coming budget will be anything better than a half-hearted affair will be greatly dimmed by reflection upon the Government's formal declaration of its financial policy made for the purpose of the Paris Report on "Marshall" aid. There could be no worse augury of the chances of restoring British equilibrium and of achieving the production or export targets. The declaration is one of a series from twelve of the participating Governments, published at the end of last week in the supplementary volume to the main report of the Conference. That report had declared the success of the whole European programme to be dependent upon restoration of internal financial stability, requiring "establishment of equilibrium between purchasing power and available commodities" and "prevention, in all cases where this is necessary, of the creation of new purchasing power." And the participating governments are required, they will carry them out in a spirit of rectitude and has solved all the problems. The problem of "too

These home-truths, and this obligation, might have been expected to put the British Government on the spot. Britain obviously has not descended into the crude inflation, with its huge encouragements to the black market and barter and hoarding of goods, which obtains in some continental countries; but equally obviously, financial laxity and inflationary pressure are among the principal causes of Britain's present difficulties. Yet the British Government's declaration, instead of setting an example to others, wriggles out of the dilemma by a barefaced and hypocritical pretence that financial policy here has been a model of rectitude and has solved all the problems. The problem of "too

Distillation

Here is a fine example of the glassblower's art. It is a highly efficient fractionating column, used to separate liquids by distillation. The principle of "fractionating" is very simple. Suppose the chemist has a mixture of ether and chloroform and wishes to separate the two. The mixture is placed in a distillation apparatus and heated. It begins to boil at about 35 deg. C.—the boiling point of ether—and consequently it is only the ether that distils over, forming the first "fraction" of distilled liquid. As heating is continued beyond this, the temperature rises and a mixed "fraction" is obtained until at 61 deg. C. only the chloroform distils over. The mixture has been "fractionated". When the boiling points of mixed liquids are very close together, more elaborate equipment is needed to ensure clear-cut fractions. Again, when liquids of very high boiling point are to be fractionated, it is frequently necessary to reduce the pressure. For this purpose the special apparatus shown above is required. Fractional distillation is one of the commonest operations in research, and is a fundamental process in many departments of chemical industry—in the refining of petroleum and tar; in the manufacture of alcohol, solvents and explosives; in the preparation of pharmaceutical chemicals, dyestuffs and perfumes. To take an example, the "high octane" spirit required for the aircraft of the R.A.F. could not be prepared without meticulous fractionation. The British chemical industry is second to none in such technique and in its applications.

October

In October the Overseas Branch of the Midland Bank handles documents representing large shipments of fresh and dried fruit on its way to markets throughout the world; among these documents are those representing substantial shipments of the cashew nut from the Mediterranean to Minneapolis, a great cake-making centre for the United States. Thus London forms a vital link in the chain of commercial activity extending across the world. Whether your business is concerned with precious stones, intricate pieces of machinery, fine silks, raw wool—or even cashew nuts—the Bank offers its services at all stages of the transactions, at all times and in all parts of the world.

MIDLAND BANK LIMITED

It is much more important to do right than not to do wrong; further, the one is possible, the other has always been and will always be impossible.

R. L. STEVENSON.

IN your personal and business affairs the commonest examples of going wrong are found in errors of omission rather than of commission.

To neglect taking precautions, such as the making of a will or provision against other vicissitudes of fortune, can bring untold trouble on yourself and others. If you are in doubt as to what is the right way to do the right thing, expert departmental services of Martins Bank are organised to advise you and take your instructions.

Established 1858

much money chasing after too few goods," it is said, "has been dealt with"—by retaining controls, by balancing the budget, by National Savings and by stabilising the cost of living. Thus "we have achieved a Balanced Budget and arrested a runaway inflation . . . the Central Budget estimates show a surplus of £270 million. . . . There is, in addition . . . likely to be a surplus on the Accounts of the National Insurance Funds and on the budgets of local authorities of about £100 million. . . . The National Savings target . . . is £366 million."

This is sheer misrepresentation. There is no hint here that the budget "surplus" is comprised of items which at best are non-recurring and at worst are purely nominal internal transfers. Credit is taken for below-line surpluses, but there is no word about the huge below-line outgoings. There is no admission that voluntary savings are running at some two-thirds below the target rate, despite the repayment of Defence Bonds at maturity. Worse still, it is claimed that this successful budgeting "has been facilitated by the 'cheap money policy'." Yet this was the source of huge and needless creation of purchasing power, which the main report of the Committee declares should be prevented. Finally, at the moment when expert opinion is virtually unanimous about the need substantially to reduce the cost-of-living subsidies, the Government claims that the subsidy policy is a major factor in the alleged success of its stabilisation arrangements. It concedes, however, that it is not committed "to increasing the subsidies in face of a further rise in prices." Finally, as proof of its success, the Government cites the movements in the official price indices and remarks that the weekly wage index has risen since June, 1945, only from 149 to 166. In short, the whole document is not only almost unbelievably smug, but also dishonest.

Renegotiations with Belgium

The new payments agreement with Belgium initialled in London on September 9th is already in need of renegotiation. The agreement of September 9th has not been formally signed and the discussions for the further amendments of its terms will begin in Brussels next week. The need for reopening the discussions is another reminder of the fallibility of balance of payments estimates. The renegotiated agreement of last month, it will be recalled, laid on Belgium the obligation to hold sterling up to a new ceiling of £27 million, to £12 million of which a bilateral exchange guarantee would attach; the balance of £15 million was to be held in anticipation of maturities of Belgian sterling debt falling due over the next few years. Since current commercial payments between Belgium and the sterling area were in approximate equilibrium, it was assumed that the new ceiling would comfortably cushion the position for some months, if not years, to come and that no question of converting sterling held by Belgium would arise. Contrary to these expectations, the new ceiling of £27 million was reached in little more than a month after the initialling of the new agreement, and already Belgium is in a position to offer sterling for conversion into gold or dollars under the terms of that agreement. There appear to be two main reasons for the accumulation of sterling by the National Bank of Belgium. The first is that, although Belgium is now outside the transferable account system, certain sterling payments are still being made to Belgium by European countries in the transferable account group in respect of transactions entered into before September 9th. In the second place, the flight from sterling not only by Belgian nationals but by those of other countries, including Britain, has been causing considerable daily offerings of sterling to the National Bank. Some of this sterling is the return on sterling investments of Belgian nationals accumulated here during the occupation and therefore eligible for repatriation into Belgium. Some of it is the more clandestine movement of funds engineered by residents in this country who, through visitors to Belgium, have found a means of leaving funds in that country, the individual amounts being small but in total making up substantial sums.

Sterling payments from third countries will tend to disappear now that the transferable account system is in process of disintegration. The movement of private Belgian capital held in sterling to the National Bank must also be coming to a close. The seepage of British refugee capital into Belgium is essentially a problem for British authorities to tackle and now that pleasure travel is in abeyance the opportunities for such illegal transfers of money should be considerably reduced. The main problem facing the negotiators in next week's discussions should, therefore, be of an essentially commercial character, namely to ensure that trade and payments between the two currency areas maintain approximate equilibrium. It is deplorable that two countries whose economies have been built up on a multilateral pattern of trade and payments

should be facing this necessity for mutual strangulation of their economic intercourse. The tragedy arises not because one or other of the parties is not prepared to "play the game"; it arises because one of the currencies in question no longer commands the required confidence.

Improvement in Exports

September has shown a welcome expansion in exports. The total for the month, £99 million, is the highest recorded since the war except for the rather abnormal July figure, which was inflated by the rush to complete shipments before the holidays. On a daily rate basis, however, the increase over the August total is only slight and last month's figure was, in fact, a little below that for June. A persistent upward trend in exports is not, therefore, by any means yet assured. It is, of course, too early for the intensified export drive to have had any effect; but, quite apart from the internal difficulties of switching supplies and capacity from domestic supply, there are growing signs of a narrowing of world markets.

Exports of machinery and vehicles, the two main items, last month each amounted to £15.6 million; exports of cotton goods took third place with £7,500,000. Some 12,600 new motor-cars and 129,600 bicycles—both record figures—were shipped overseas. The volume of exports for September has been provisionally estimated at 111 per cent of 1938 compared with 105 per cent for August and 126 per cent in July. The recovery of exports from the effects of last winter's fuel crisis is shown below:—

1946, Fourth Quarter	... 111 per cent of 1938 volume
1947, First Quarter	... 101 " " " " "
Second Quarter	... 102 " " " " "
Third Quarter	... 114 " " " " "

Imports in September showed a substantial reduction, totalling £160.7 million compared with £174.0 million in August. This reduction was due to technical and seasonal factors rather than to the recently announced cuts, which will not be fully reflected in the returns for some time. Smaller supplies of Canadian wheat and Australian flour were received, and there was a seasonal reduction in imports of fresh fruit and vegetables. Arrivals of linseed oil, wool and hides and skin were also less than in August and largely accounted for the decline of £8,000,000 in raw material imports.

Thanks in particular to the reduced scale of imports, the month showed the first major decline in the visible monthly trade deficit since the beginning of the year. The adverse balance amounted to £58.3 million; but, if the months of July and August are excepted, this is still the largest for the year. The total deficit for the nine months is £473 million—an annual rate of over £600 million.

No More Dollar Tobacco

Sir Stafford Cripps confirmed last Thursday that purchases of American tobacco had been stopped. To many non-smokers, dollar expenditure on tobacco has always seemed extravagant and wasteful, but it will be interesting to see what effect a substantially reduced supply of cigarettes—if that is in prospect—will have upon industrial output generally. In the first nine months of 1947, Britain imported 191 million lb. of tobacco, of which 67 per cent came from the United States and 27 per cent from Empire sources. This quantity was considerably smaller than the 276 million lb. imported in the same period of 1946 and compares with 260 million lb. in a nine-month period of 1938. Britain's annual tobacco imports have been steadily rising in recent years, reaching a peak of 433 million lb. in 1946. This year's figure, however, will probably be well below even the 1938 level of 346 million lb. Possibilities of immediate expansion in production in the Empire, to cushion the effects of cessation of dollar imports, are not very promising.

Tobacco consumption has generally been at a much higher level during the war and actually reached its peak in 1946, when 250 million lb. was consumed. The effect of the increased tobacco duty imposed by the last Budget is shown in the following table:—

RETAINED IMPORTS, CONSUMPTION AND STOCKS OF TOBACCO, 1947
(lb million)

	March	April	May	June	July	August	Sept.
Retained imports	28.2	30.6	23.3	7.5	10.9	10.5	19.7
Domestic consumption	24.9	21.3	18.5	16.3	15.6	n.a.	n.a.
Exports	3.1	3.1	3.7	5.0	5.3	5.5	4.3
End of month stocks	389.8	393.4	392.0	376.7	365.4	n.a.	n.a.

Since March there has been a continuous decline up to August. These figures, however, reflect the movement of tobacco from bond to manufacturers for use on the home market, rather than actual consumption, and there is possibly a time-lag of several months—depending on the size of stocks held by manufacturers—between these movements and actual sales. On the basis of the Board of Trade retail sales' statistics, the consumption of tobacco fell by about 40 per cent in May last, but since then there has been a steady expansion. In August, the last month for which figures are available, consumption was probably only 25-30 per cent below the 1946 level.

How soon the cut in tobacco imports will affect supplies coming on to the home market depends on the size of stocks. At the end of July the quantity of tobacco held in bond was 365 million lb., or 20 months' supply, on the basis of the post-Budget level of consumption. In addition, there are undoubtedly large stocks in the hands of manufacturers. In comparison with prewar, when stocks averaged 500 million lb., the current figures are low, but then two years were generally allowed for the maturing of tobacco in bond. At the present time Britain could probably maintain the current consumption level for nine to twelve months entirely from stocks—but presumably such a situation would dictate further measures to check consumption, as indeed are implied in Sir Stafford's warnings this past week.

Nationalisation for Gas

The Bill to nationalise the gas industry, the Government claims, is designed to complete its plan for the co-ordination of the fuel and power industries. With the Coal Board failing to reach its targets, and the appointed day for electricity still to be named, there is a touch of rhetoric in the claim. But perhaps it is fair to say that the principle of nationalisation for gas is only a little more controversial than for coal. There is at any rate, in the case of the gas industry, the authority of an independent investigation undertaken two years ago by the Heyworth committee, for prescribing nationalisation.

In particular, the case for larger units of production and distribution and a greater centralisation of control and technical management is widely agreed. Larger units in the industry have been rationalising production for many years, and the Heyworth report favoured an increased measure of centralised control in order to speed that progress. It found that the larger the group of undertakings, the greater was their efficiency. The minimum unit, in their view, should have an output of at least 1,250,000 therms a year. Yet in 1944, there were 762 undertakings with an output below that figure, and together these small gas works supplied only 13 per cent of total sales. If consumers of such undertakings could be connected by high pressure pipes to large, central units (except perhaps in rural areas) the industry could improve its sales and distribution and obtain important economies in production, so that the gas industry could play an efficient role in competition with electricity.

Of the 1,047 undertakings, the Gas Light and Coke Company alone accounts for 12 per cent of total sales. Measured on this basis, statutory companies account for 50 per cent of sales, local authorities for 36 per cent and statutory holding companies for 11 per cent. The fact that there are a few large concerns and a large number of small ones is reflected in the narrow concentration of investment interest on a few companies. Of some 80 companies whose capital is quoted on the Stock Exchange, only 30 or so have a quoted capitalisation exceeding £500,000. It follows that the problem of compensation will be complicated by the lack of Stock Exchange prices for the great majority of the undertakings, not to mention the local authorities. Will gas provide yet another different method of compensation?

No Change at Grimethorpe?

The fact-finding committee which was set up to examine the miners' objection to working an extra stint in the Melton Field district near Barnsley has now completed its report. The Grimethorpe branch of the National Union of Mineworkers has unanimously accepted its findings. The men are apparently of the opinion that the facts can lead only to the conclusion that they should not be asked to work an increased stint.

The report itself has not yet been published, and indeed it seems by no means certain that it will be made generally available. The local view is that its findings are a "purely domestic matter" for the Grimethorpe miners. That is a fantastic view. The need

for the widest possible scrutiny of the findings is, moreover, heightened by reports that the investigations have been made in a somewhat cursory fashion, and that the facts set out derive from evidence of conditions at only one of the coal faces involved. There is every desire to see justice done to the miners' complaints. But if for no other reason than that they have obtained the five-day week, they have evident obligations to the industry and the consumer. In the present context, one of these obligations is to work on the basis only of a full investigation of the facts, and the second is to publish them. In no other way can a body of technical knowledge and "case law" be built up within the industry to ensure that full justice is done by and to all parties. The question of the adjustment—in either direction—of the size of the stint worked each shift, to fit, in the light of all available facts, the changed working conditions of the five-day week, is of crucial importance to the raising of productivity in the industry. It should be made quite clear that the Grimethorpe issue is not just a "purely domestic matter" but an issue of national importance which requires the publication of the fact-finding report—and of any subsequent reports that may be made on working conditions in the Grimethorpe area.

Higher Wages in Cotton?

The Prime Minister's appeal to workers last August not to press for increases in wages except in return for higher output seems to have been lost in the limbo of endless exhortation. Each week provides a new twist to the inflationary spiral, and emphasises afresh the need for the more comprehensive policy which the Government is now, at last, reported to be discussing. The latest increases in wage rates are those obtained by tobacco and building workers. Now there are reports that the Operative Weavers' Amalgamation in the cotton industry is to press a new claim for higher wages, which were raised in December last year when the five-day week was introduced.

If the weavers go ahead with their demand, the cotton industry as a whole is likely to be affected, for higher wages for weavers would be followed almost automatically by further claims from spinners and finishers. Since the supply of cotton labour shows so little sign of expansion, it is unlikely that a general advance in cotton wages would be counterbalanced by increased production—unless, indeed, there is a great increase in recruitment and an equally great change of heart among employees about restrictive practices. Although there have been some encouraging cases recently of increased manpower and output in the cotton industry, a general rise in its costs would be a most discouraging burden for it to shoulder at the very moment when it is faced with an export target of £6,350,000 per month, to be reached by the middle of next year.

The haze of unreality, however, is not limited to the operatives' views on higher wages. When Sir Stafford Cripps announced the details of the cotton export target to a Lancashire audience towards the end of last month, he called for an immediate increase in production of 10 per cent to prevent drastic cuts into supplies destined for the home market. The same point has since been made by the Minister of Labour. The only hope of achieving any immediate expansion of output is by working overtime, and in the wool and hosiery industries this is being done. Why do both sides in the cotton industry take so long to make up their minds on policies which are clear enough to everyone else, and particularly to Labour Ministers? So far, there has been no discussion about overtime working—whether by a longer day or Saturday morning working—despite the urgent need for a decision.

There seems, however, to be some hope that part-time working, which has been a marked success in spinning, may be more widely adopted in the weaving section. But there is an air of *laissez aller* in the industry's attitude, particularly marked on the union side, towards the implications of the export drive. A sense of urgency is much overdue.

Building and Payment by Results

Meanwhile, the wage agreement reached on Monday by the building industry's National Joint Council brings to an end the long controversy about incentives in building. It was the occasion of a sharp interchange at the Margate Labour Party Conference between the Minister of Health and Mr Luke Fawcett, the trade union leader, who affirmed that the unions would never accept payment by results. It is certainly satisfactory that the

unions' opposition has at last been withdrawn. But the pill has needed a generous coating of sugar, in the form of an increase in time wages of 3d. an hour; even so, while the ballot showed a substantial majority in favour of the scheme, the Woodworkers' Union lifted their dissentient voice.

Of course, such a scheme should have been introduced two years ago, when it would have contributed greatly to raising the productivity of the industry and to speeding up the housing programme. It comes now at the very moment when cuts in the construction programme are being made. Although these cuts in no wise reduce the need for greater efficiency in the building industry, the new scheme will add greatly to costs, unless there is a corresponding increase in productivity, and it will tend to increase the reluctance of building workers to move from their industry to other more immediately essential work.

One welcome feature of the agreement (which comes into force on November 16th) is that it provides for a "standstill" until February 1, 1949, and should therefore prevent any further pressure from the unions to improve their position during the next fourteen months. The scheme has been described as experimental and will be reviewed in the light of experience. While the national agreement lays down that piece rates should enable the average worker to earn 20 per cent above his normal day rate, the actual details of the target and bonus rates will be left, inevitably in such a localised industry, to individual agreement between employers and workers. There will, however, be a central record of all local agreements and appropriate machinery for settling any disputes that may arise. The question of the cost-of-living sliding scale is to be reviewed by the industry's joint council—a step which other industries where wages are linked to the cost of living might well follow.

Marshalling the Facts

Volume two of the proceedings of the Committee of European Co-operation in Paris provides the technical reports and statistical framework of the Paris report on "Marshall aid" which has been summarised and discussed in recent issues of *The Economist*. If the industry of the technical sub-committees commands respect, the work of the experts in Washington who have since been analysing it deserves something akin to sympathy. They cannot complain about lack of facts.

The measure of Europe's capacity for industrial recovery has been based primarily on food, power and steel. The technical reports add little to the general report on the food situation, for the Committee of 16 had no alternative but to base their proposals on imports of food from dollar sources until domestic production catches up with Europe's requirements, as they hope, in the latter part of the period 1948 to 1951. But at least the technical report on food does not succeed in removing the impression which emerged from the main report that the estimates of European production are based on rather optimistic assumptions about the available supplies of agricultural machinery, labour and fertilisers.

Yet supplies of food, especially for the Ruhr, are essential if Europe is to meet its own requirements in coal and restore the prewar pattern of the coal trade by 1951. These requirements will also call for \$220 million worth of coalmining equipment over the same period and 86 million tons of coal from America, mainly required in 1948 and 1949. The estimate of 41 million tons for coal imports from the United States in 1948 is higher than actual imports are likely to be in 1947. An "international programme" for the installation of electricity generating plant has been drawn up which provides for erecting power houses at the most advantageous points for stimulating European, as opposed to only national, recovery. It is hoped that such a plan would provide sufficient electric power for Europe's needs by 1952, whereas national plans would not do so until 1953. It is not clear, however, how Britain's requirements and its potential for manufacturing electricity generating plant is to be fitted into the scheme.

Full use of steel capacity will be possible only if coke supplies can be increased by 50 per cent and if supplies of scrap and semi-finished steels can be obtained from America. Increased supplies of coking coal may be obtained from the Ruhr, but scrap and semi-finished steel must come from the United States. The complex factors governing steel production have made it difficult for the committee to estimate the level of production in 1951, especially as there is a threat of a shortage of rich ores, but they have estimated a shortfall in steel production below requirements for that year of 3,000,000 to 4,000,000 tons.

In all these estimates there are bound to be major weaknesses;

they were compiled in a hurry, and fortuitous changes, such as a series of severe or mild winters, would have a vital influence on production prospects.

Further Rise in Rubber

The firm tone in the rubber market, which has been evident for several weeks, has now carried the average spot price in London for the week to October 21st as high as 11½d. a lb. compared with an average of 10½d. for the week ending October 7th and 8½d. for the week to September 2nd. The main reason for the continued rise is undoubtedly the persistent belief that the American policy of restricting the use of natural rubber consumption, particularly in tyres and inner tubes, will be modified—perhaps as a concession in the trade negotiations with Britain. American consumption quotas fixing the proportions of natural and synthetic rubber to be used can be modified, as they have been in the past, without revoking the notorious "R.I. Instruction" under which they are issued. A modification of the quota in favour of natural rubber would be an easy method of helping Britain in the present dollar shortage, but it would have to be substantial. If the natural rubber were allowed to compete on a basis of equality with synthetic, natural rubber consumption in the United States might expand by as much as 40,000 tons a month, to nearly double the present quantity. American purchases of natural rubber have already increased, though the volume is still not large.

Distillers Expansion Programme

The Distillers Company has travelled a long way since it was first established in the whisky distilling business. The company has developed important interests in industrial alcohol, which is required for an ever-widening range of uses, and has in turn led to the development of a new, and no less important, subsidiary industry for the manufacture of chemical compounds. Johnny Walker may still be going strong, but he would hardly recognise the great extension of Distillers interests in the last decade, with its increasing concentration on the production of hydrocarbon products for industrial use.

Portable whisky distilling has recovered to about 55 per cent of the prewar level of production, and the industry is hopeful that a full distilling programme will be undertaken next year—though there will be plenty of claimants for the barley crop for feeding to cattle. The dollar-earning capacity of Scotch whisky certainly offers grounds for an increased barley allocation if it can be spared, though the whisky which is distilled from next year's crop will not mature until well into the fifties. On the industrial side, the group has made a start on its expansion programme which will cost £4,000,000, and will provide a large increase in the manufacture of plasticisers, acetic acid and synthetic resins; but progress on these extensions has been held up by shortages of materials.

The supply of molasses showed some increase during the past financial year, and the industrial alcohol distilleries were able to operate on a "substantial scale." This is an encouraging statement, for a large expansion scheme in solvents, plasticisers and other chemical compounds cannot be sustained without assured and increased supplies of industrial alcohol. Some of these compounds will doubtless continue to be derived from molasses, but others can be obtained more cheaply, and in combination with a wider range of ancillary products, from petroleum. This technical factor underlies the registration this week of British Petroleum Chemicals, which will build a new works at Grangemouth. Last July it was announced that an "agreement in principle" had been reached between the Distillers Company and the Anglo-Iranian Oil Company to establish a joint enterprise with a capital of £5,000,000 to manufacture chemicals from oil. This is a long-term project, however, and for some time Distillers earnings on the industrial alcohol side are bound to depend more on the price and quantity of molasses from the West Indies—and from Java once production is resumed on a significant scale—than on oil prices.

Other developments in the Distillers group include the purchase of the Government's penicillin factory at Speke, which the company has operated on the Government's behalf since its erection. The company's interests are now closely identified with a wide range of industrial products, and future development plans will need finance and time before they mature. The equity in this programme is essentially a long-term affair, though it will be enhanced by the decision to reduce the denomination of the ordinary stock from £1 to 4s. The present 4s. units are quoted at 27s. 7½d. to yield £3 12s. 6d. per cent.

Ashanti-Obuasi Storm

The attitude of the chairman of Ashanti-Obuasi Reefs at the annual meeting of the company on October 21st provoked bitter comment from the large number of shareholders present. It had been generally expected that the board would be at pains to meet the legitimate desire of shareholders for an explanation of the recent inconsistencies in reports from the mine in the Gold Coast. But beyond intimating that they had received a shock when the original gold-proving assay values in B shaft of the mine were contradicted in a later report, the board in effect were content to claim that shareholders must leave the matter in the directors' hands.

It is hardly surprising that the shareholders were angry. Nor were they satisfied that the appointment of an outside mining expert by the board to make a thorough investigation was so satisfactory as a shareholders' committee to co-operate with the board. In the end, after much noise, the shareholders got their way—or part of it. How their committee will go to work is uncertain, but the chairman has at least agreed to hear what it has to say and to keep contact with it. Apart from the three representatives of the shareholders who will constitute the main members of the committee, Mr Hirst, the Director-General of Geological Survey, and Mr Cunliffe, the company's broker, are to be co-opted as advisory members. This suggests a clear intention to get to the bottom of the business. In the meantime, dealings in the company's shares on the London Stock Exchange remain suspended, and doubtless they will so continue until more information is forthcoming.

* * *

Shipbuilding for Export

The volume of work in United Kingdom shipyards continues at a high level; the returns published by *Lloyd's Register* for the third quarter show an increase of almost 50,000 tons gross over the previous quarter, and the total has risen to 2,112,669 tons gross. The most striking feature of the returns is the increase in the proportion of ships being built for foreign account, which now account for 628,000 tons gross, or 29.7 per cent of the total building in the country, compared with 580,000 tons (28.1 per cent) at the end of June. By far the largest customer at the moment is Norway, which has 152,000 tons building, followed by Portugal (96,000 tons), France (90,000 tons), the Dominions (78,000 tons), and Argentina (47,000 tons). Sweden, Denmark and the Netherlands also have about 30,000 tons each under construction in British yards.

It seems that the division between ships building for export and for domestic purposes is likely to remain at about the present proportions—approximately 70 per cent for British owners and about 30 per cent for overseas fleets—for some time to come. An examination of future contracts, as recorded in the *Shipping*

World, shows that the export percentage works out at 29.62 per cent. On this basis, the shipbuilding industry should have no difficulty in achieving its export target. Moreover, British ship-owners cannot complain with any justification that their interests are being subordinated to those of their competitors under other flags. In estimating the value of shipbuilding in the export drive, it must not be forgotten that ships produced for British owners themselves play not an inconsiderable part in redressing the adverse balance of payments. With steel production at its present level, there should be no difficulty in feeding the shipbuilding industry with adequate supplies of plates, but the assurance of a steady flow of sub-assemblies and components from countless sub-contractors may present a more formidable problem. Meanwhile, costs are still mounting, as the increases in transport, coal and steel take effect; the consequences of the rise in shipbuilding costs have not so far been reflected in any serious loss of contracts, but they are not exactly propitious for the future.

* * *

Sugar Supplies Below Expectations

The European sugar crop, which was expected to reach 5½ million tons in the current season, or 400,000 tons above the 1946-47 figure, is now estimated by Czarnikow Ltd. at only 4.6 million tons. This represents a decline of half a million tons on last season's crop and 2½ million tons on that for 1937-38; in each case the figures exclude the Soviet Union. The reduction in output, which has been mainly due to adverse weather, has come at a most inopportune time, as many European countries have had to forgo their allocations of Cuban supplies owing to the shortage of dollars. The Czechoslovakian output this year is estimated at only 400,000 tons, which is barely sufficient to cover domestic requirements. Normally, Czech-grown sugar is exported to neighbouring countries, and if this policy is to be continued, home supplies may have to be rationed. Poland, on the other hand, another regular exporter, is expected to have a larger exportable surplus this year, production being 52,000 tons above the 1946-47 figure.

Cuba is experiencing considerable difficulty in disposing of its record sugar crop of 5.8 million tons. The International Emergency Food Council has announced that importing countries may purchase supplies in excess of their allocations up to the end of 1947. But as purchases have to be paid for in US dollars, customers are scarce. According to the Marshall Conference Report, European import requirements of sugar for 1947-48 are in the region of 1.7 million tons, and American aid to Europe may be partly in the form of sugar supplies in order to ease the Cuban problem. The world statistical position is, on the whole, favourable. Output for 1947-48 is estimated at 27.2 million tons, compared with 27.6 million tons in 1938-39; full details are published in this week's issue of the *Record and Statistics*

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: United Steel; Murex; Associated London Properties; Trinidad Petroleum.

Redemption yields on stocks optionally or finally redeemable within the next five years															
The above assumptions that they will be redeemed at the stated date are based on the current market price of the securities.															

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying 3 per cent or less will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or more will be repaid at the latest date (marked 'f'). (a) Net yields are calculated after allowing for tax at ½% in the £. (f) Flat yield. Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked out on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 1½ per cent). (i) To latest redemption date. † Free of tax.

Supplement. The difficulty lies, as with other commodities, in the availability of foreign exchange. The British position is as yet unaltered, as Cuban sugar is purchased under contract, and Mr Strachey recently announced that dollar contracts would be allowed to run their term. But if imports from Cuba have to be restricted, the present sugar ration could not be maintained.

Whaling Output and Profits

The net profit of United Whalers, the operating company of the Hector Whaling group, reached £310,954, after taxation, for the year to July 31st, 1947, compared with the prospectus estimate of £173,405, also after tax, which was given when the issue of £500,000 preference capital was made last December. The earnings on the 5s. ordinary shares of Hector Whaling, which holds nearly all the ordinary shares of United Whalers, increased from 14 to 210 per cent during the year. The catch in 1946-47 amounted to 30,760 tons in terms of whale oil—about a third greater than the minimum forecast. This strikingly better result is due to an excellent season in 1946-47; whales were plentiful and the number of days' fishing covered an extended period of four months compared with the normal three.

The forthcoming season's catch will again be restricted by international agreement, this time to 16,000 blue whale units, a figure which appears to have been nicely balanced with the capacity of the seventeen floating factories which will be operating. Last season ran its full span with fifteen factories, and these handled some 14,000 blue whale units. Estimates for the prospective catch are not so high as the bumper results of last season, though until the whaling grounds are reached any estimate of the catch can be only tentative. The total output of whale oil has again been sold forward to the Ministry of Food and the price has risen from £67 to £90 a ton. Last year United Whalers produced only a token quantity of whale meat but they expect to provide British housewives with up to 5,000 tons of it from the coming catch and in addition the amount of meat meal is to be increased substantially from the 1,500 tons made in 1946-47—for which farmers should be grateful. The Hector Whaling group represents rather less than one

third of the whaling capacity of this country, but its figures illustrate the vastly improved status of the industry since prewar days. Recent information also suggests that even if the killing of whales were derestricted (to which there are valid objections) there is not the present capacity of factories to deal with a much greater number than at present. The best prewar figure of 600,000 tons of whale oil in a year was produced by some thirty-eight factories—some admittedly small. All available floating factory capacity is now on its way to the Antarctic, and as it takes more than two years to build a vessel of the Balaena type, it is unlikely that fleets will expand very greatly in the next few years.

Shorter Notes

A note entitled "Prospectus and Performance" which appeared in *The Economist* of October 11th inadvertently suggested that the Capital Issues Committee took responsibility for the financial soundness of new issues. The omission of the word "no" will not have deceived those readers who are familiar with the C.I.C.'s disclaimer of responsibility on every prospectus which is issued. The function of the Committee is to exercise control over the character and timing of new issue business; its consent does not imply that it takes any view at all about such matters as profits estimates which appear in prospectuses.

* * *

The Standard Motor Company has announced a dividend of 25 per cent on its 5s. ordinary stock units for the year to August 31st, 1947, against 35 per cent, including a 5 per cent bonus, paid for 1945-46. Net profit, after providing £50,000 (£70,000), for staff funds, is given at £198,915, a decrease of £84,584 on the year.

* * *

The Royal Dutch Petroleum Company has announced from Amsterdam that it intends to make a new public issue in the near future. The amount and terms have not yet been stated. The proceeds are likely to be used for an extension of the tanker fleet and industrial projects in Holland.

A roof over
your

COMPANY MEETINGS

SOUTH AFRICAN
DISTILLERIES AND WINES,
LIMITED

DIVIDEND 21 PER CENT.

The thirteenth annual ordinary general meeting of the South African Distilleries and Wines, Limited, was held, on the 20th instant, in London, Mr H. R. Mosenthal, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1947:—

The consolidated net profits of the subsidiary companies for the year ended February 28, 1947, amount, before providing for taxation, to £768,265, South African currency, as compared with £869,299 last year, a decrease of £101,034.

The balance of net profits amounts to £137,922, and this, together with a surplus on taxation provision of previous years amounting to £12,000, has enabled the directors of this company, after providing for the Preference dividend, to propose the distribution of a final dividend on the Ordinary stock of 15 per cent., less income tax, making a total of 21 per cent. for the year.

RATIONING OF SUPPLIES

Turning to the total net profits earned in South Africa, I informed you last year that our subsidiary companies would not be able to maintain their sales at the same volume because it had become necessary to ration many of the products which they market owing to the fact that the Wine Growers Association was no longer able to supply sufficient matured brandy to make up the difference between what they had available from their own stock reserve and a figure sufficient to allow them to maintain sales at the volume then running. The position was also aggravated by a drought in South Africa which had had a serious effect upon the total grape crop. These factors are now reflected in the sales of the operating companies for the year just ended. It was not, however, until the latter half of the year under review that the rationing was imposed, so that the sales for the first quarter of the current year inevitably compare unfavourably with the corresponding period of the year under review.

Sales of gins and liqueurs are not affected, but wine sales cannot be increased until such time as the new vintage is made available, approximately in June of next year, and then only on the assumption that the vintage will be a good one. Weather conditions so far have been such that a good vintage can be expected.

IMPROVEMENT OF METHODS

During the financial year under review, some £53,000 has been spent on improving methods of production, as well as increasing their output capacity, and since the end of the financial year a further £174,000 has been spent with the same objects in mind.

In addition to sums that have already been spent in the current year, they expect approximately £60,000 worth of machinery and maturing wood to be shipped to them during this year. At the end of that period their total capacities for distilling wine, maturing and storage in the country districts, should be sufficient for all their needs. There will remain the consolidation and building of depots with railway sidings in various parts of the country as and when permits for this work are granted, as well as the building of a main manufacturing plant in Cape Town. They are also laying down additional maturing stocks to the value of approximately £100,000, which process has already commenced.

The report was adopted.

DEBENHAMS LIMITED

EXPANSION OF SALES

SIR FREDERICK RICHMOND'S STATEMENT

The ordinary general meeting of Debenhams, Limited, will be held at the Wigmore Hall, Wigmore Street, London, W., on the 6th prox.

The following is an extract from the statement by the chairman, Sir Frederick Richmond, Bt., circulated with the report and accounts for the year to July 31, 1947.

The balance of the profit and loss account for the year amounts to £1,367,560, as compared with £1,152,225. This figure includes in addition to the trading profit of the parent company, dividends from subsidiary and associated companies in so far as they have been declared, as well as rents and interest receivable. Deducting debenture interest, trustees' fees and directors' fees (£81,607) the net figure is £1,285,953, which compares with £1,069,699 last year, an increase of £216,254. After adding £344,796 brought forward and deducting £379,000 for preference dividends and £166,667 for the interim ordinary dividend paid in May, there is a balance available for disposal of £1,085,082 which your directors recommend be applied, as follows:—

To reserve for taxation	£425,000
To reserve fund	50,000
To final dividend of 11d. per share on the ordinary shares (making a total of 1s. 3d. for the year) less income-tax	252,083
To carry-forward	357,999

The transfer to taxation reserve of £425,000 compares with £350,000 last year. In the opinion of our auditors the taxation reserve, after allowance for tax deductions from prior charges, should be sufficient to cover the company's liability for a year in advance.

TAXATION INJUSTICE

Shareholders are doubtless aware that E.P.T., which was abolished as from December 31st last, has been replaced by an increase in profits tax to 12½ per cent. on distributed profits. This means in effect that the tax on the whole of the distributed profits, including dividends paid to preference shareholders, is borne by the ordinary shareholder—a particularly flagrant injustice in the case of a highly geared company like ours. All I have said in the past about the inequity of this tax applies with greater force than ever today.

In my statement last year I referred to the unsuccessful result of the directors' application to the Capital Issues Committee to convert the ordinary shares of 1s. each into ordinary shares of 2s. 6d. by transferring £750,000 from reserves and increasing the ordinary capital to £1,250,000. This would have been a purely book-keeping transaction designed to bring the nominal capitalisation more into line with the actual capital employed, and would have involved no cash payment to shareholders. The Treasury ban on capitalisation of reserves has since been removed and the Capital Issues Committee has power to approve such transactions in appropriate cases, subject to the payment by the company of a special tax of 10 per cent. of the value of what is called the "bonus element." This would cost the company £75,000 and seems to your directors a very high, not to say unjust, imposition and they have decided, reluctantly, to leave this matter in abeyance for the time being.

THE DIVIDEND

In view of the increased earnings the directors decided in May last to declare an interim dividend of 4d. per share on the ordinary shares. They have given very careful consideration to the question of a final distribution and now recommend a dividend of 11d. per share, making 1s. 3d. for the year. This is by no means an excessive rate when due

regard is paid to the highly-geared capital structure of the company and the large amount of capital employed in the business. The reserves to which I have just alluded are the result of a long period of conservative finance and represent profits retained in the business instead of being distributed as dividends to the ordinary shareholders.

Conditions ruling throughout the period under review have followed fairly closely the pattern of the preceding year. Like other distributive businesses, we enjoyed a very good year so far as sales were concerned. On the other hand, expenses continued to rise steadily, and all the well-known vexatious restrictions and controls to which we have become accustomed persisted throughout the year. I think it should be clearly understood that the rate of gross profit has been lower than in the preceding year, and that it is entirely due to the expansion in sales that we have been able, notwithstanding reduced profit margins and rising expenses, to show a further increase in our net profit.

LOWER PRICE MARGINS

In my last review I said that our West End businesses had begun to feel the impact of the lower price margins imposed during the year. Some of those, such as the fixing of ceiling prices for ready-made non-utility clothing, were obviously directed against the better-class trade. The position was worsened on February 1st this year by a 2½ per cent. cut in the rate of gross profit on both utility and non-utility merchandise, regardless of the fact that high-class fashion houses are unable to work on the same margins as those doing a popular trade. Those cuts were imposed by the Board of Trade on the assumption that a very substantial increase in the volume of sales could confidently be expected during 1947, but when, after the fuel crisis and extension of the coupon period, it was evident that these expectations would not be realised the cuts were cancelled after being in force for five months.

In such circumstances it will be understood that our three principal London businesses (Debenhams and Freebody, Marshall and Snelgrove and Harvey Nichols and Co.) have been trading under exceptional difficulties. It will be obvious to everyone that the period of austerity through which we are passing presents difficult problems for those businesses. After export demands have been met only a very limited range of non-utility fabrics will be available for the better-class trade. You may rest assured, however, that we shall do everything possible within the limitations imposed upon us to maintain the high standard of quality, style and workmanship upon which our reputation has been built.

I am pleased to be able to report that Harvey Nichols and Co. (including the furniture section at Bournemouth) has made further substantial progress during the year and is paying a dividend on the Ordinary shares (all of which are held by Debenhams, Ltd.) of 10 per cent. against 7½ per cent. last year.

Turning to the associated companies in the provinces and suburbs, I must remind you that their trading period ended on or about January 31st, when conditions were less unfavourable than they have been since. From reports that have been published shareholders will have gathered that the results of the past year's trading have been generally favourable.

Our wholesale and export business, in spite of the scarcity of merchandise and other difficulties, has recorded an increase in turnover and may be said, I think, to have more than maintained its position in the trade.

THE DISTILLERS COMPANY, LIMITED

MR H. J. ROSS'S REVIEW

The seventieth annual general meeting of the company was held in the North British Station Hotel, Edinburgh, on the 15th instant, when, in the absence of the chairman, the deputy chairman, Mr H. J. Ross, presided.

The following is an excerpt from his address to stockholders:—

Turning now to the statement of accounts you will find that the consolidated statement of profit covers a period from varying balancing dates of the parent and subsidiary companies to March 31, 1947. To comply with the new company legislation the board decided to fix March 31st as the balancing date for all the companies, and as a consequence the figures in the accounts are not comparable with those for the year to May 15, 1946. The manufacturing and trading profits, after making provision for excess profits tax, profits tax and overseas taxations, works out at £7,638,059, but while the profits of the parent company are included for a period of 10½ months, certain subsidiaries contributed for a full year and a few for fifteen or more months. From an investigation of the accounts it is estimated that for a period of 12 months the profits approximated to £7,100,000, comparing with the corresponding figure of £6,914,330 for the year to May 15, 1946.

To the profit figure of £7,638,059 is added (1) revenue from investments and other miscellaneous receipts £907,333 and (2) provision for taxation made in previous years proved to be not required and now released £395,000, making the total revenue £8,940,392. After making full allowance for income tax on these profits, all necessary provisions and adding to superannuation and sundry reserves in the books of subsidiary companies, there remains £3,428,719 as the sum available to the Distillers Company, Limited. This compares with £2,574,760 for the year to May 15, 1946. In addition, however, it should be noted that the amount applicable to the Distillers Company, Limited, but retained by the subsidiary companies is £190,728 as compared with £103,920.

The board decided to appropriate and to apply to general reserve the sum of £1,100,000 (making it £6,000,000), leaving available with the amount brought forward, and after deducting directors' fees, compensation to directors for loss of office and the interim dividends, the sum of £1,181,364.

It is proposed to pay a final dividend on the ordinary stock of 2½ per cent. less income tax (making 22½ per cent. less income tax for the 10½ months period) and a special dividend on the ordinary stock of 2½ per cent. less income tax, thus leaving to be carried forward the sum of £768,153 as against £591,654 brought in.

BALANCE SHEET

The company's legal balance sheet calls for comment on the following matters:—

(1) The increase in the amount at credit of the general capital reserve to £934,736 is due to the transfer thereto of £105,924 being profits on the realisation of certain investments during the period.

(2) The company has received a provisional E.P.T. post-war refund amounting to £910,621. This includes amounts applicable to certain E.P.T. subsidiaries.

(3) During the period under review the company purchased from the Custodian of Enemy Property the 95,000 shares in British Industrial Solvents Limited, formerly held by German interests, making that company thereafter a wholly owned subsidiary.

(4) The company also purchased the issued share capital of Gilmour Thomson and Company Limited, blenders, etc., Glasgow, and is carrying on the business.

(5) In November of last year the company acquired the unissued capital of National Chemical Products Limited, Johannesburg, South Africa, amounting to 64,850 ordinary shares of £1 each. The terms of the arrangement provide for the acquisition of further shares to enable the South African company to undertake certain new developments now under consideration. National Chemical Products Limited are distillers of industrial alcohol, and have a well established business in solvents and carbon dioxide.

(6) A further investment made by your company, jointly with British Xylonite Limited in the proportions of 60 and 40 per cent. respectively, was the purchase of the unissued share capital of Lansil Limited, consisting of 203,367 ordinary shares of £1 each and 514,000 deferred shares of 1s. each. The money thus provided will be applied by the Lansil Company in meeting the cost of extensions in the manufacture of cellulose acetate, an important plastic raw material, of which our group is a large consumer.

(7) Investments in British Government securities have risen by a little over £1,200,000 to £17,353,626. The holdings are reasonably "short dated" and a revaluation at March 31, 1947, disclosed a market valuation of £17,712,734. A valuation today, however, would show a different result, and it was to meet such a contingency that the board built up over the past few years a reserve of £1,600,000. As will be explained later round about £7,500,000 of these holdings have been earmarked for developments in the chemicals and plastics sections of the company, while over £4,000,000 may go to the group pension scheme now under examination.

The consolidated statement of assets and liabilities discloses that while current assets amount to £54,247,421, current liabilities and provisions total £9,018,961, a surplus in this respect of over £45,000,000. This is proof of the great financial strength of the organisation, and it must be remembered that the fixed assets are included at low valuations.

PROBLEM OF RE-ORGANISATION OF
CAPITAL STRUCTURE

The surplus applicable to the members of the Distillers Company, Limited, exclusive of the reserve for taxation on earned profits but not yet due, has increased to £20,669,907. The issued share capital is £17,225,847 including £2,200,000 of preference stock. As announced at the previous meeting the board had given careful consideration to this aspect, but it was not possible to obtain permission to re-organise the capital structure. Since then the Finance Act of 1947 permits the capitalisation of reserves and the issue of shares to members of the company, but on payment of a charge of duty. The amount of duty the company would have to pay has made it impossible to proceed with the scheme under contemplation.

The board have decided, however, that the time had arrived to place before the members their proposal to make the ordinary stock transferable in units of 4s. each instead of £1 units as at present. You have been asked to attend an extraordinary general meeting to be held immediately after this meeting, when full consideration may be given to the board's proposal.

The board desires me to place before you the following reports on the operations of the various branches of the company's business:—

DISTILLING

The Ministry of Food continues to exercise control of the production of potable whisky. As indicated to the meeting last year the quotas out of the 1945 allocations of

cereals were completed by the malt distilleries in June and the grain distilleries in September, 1946. In February and April, 1947, the industry was granted allocations each of 50,000 tons, while in August further licences amounting to 75,000 tons were issued. This is equivalent in all to about 55 per cent. of the prewar production. These welcome releases were not made by the Government without conditions. In the course of negotiations attention had to be given to the dire economic condition into which the country had fallen, and the Ministry would only grant licences to manufacture new whisky on the undertaking by the industry to increase exports of matured whisky to "hard currency" markets. The proportion laid down by the Ministry from May 1, 1947, was three gallons for export to one gallon released for the home market. The stock position is still such that this could only be accomplished by a reduction at the expense of the home consumer and by shipping this saving, and more, to the "hard currency" markets.

The industry is hopeful, now that the 1947 harvest has been secured, that the Ministry will be able to issue further licences at an early date to enable a full programme of distilling to be undertaken next year, and thus avoid closing down again the distilleries in January or February, 1948, by which time the present licences will be completed.

The industry is hopeful, now that the 1947 harvest has been secured, that the Ministry will be able to issue further licences at an early date to enable a full programme of distilling to be undertaken next year, and thus avoid closing down again the distilleries in January or February, 1948, by which time the present licences will be completed.

PURCHASE OF PENICILLIN FACTORY

The company has recently reached agreement with the Government for the purchase of the penicillin factory at Speke, Liverpool, which you will recall was erected and operated by the company as agents for the Ministry of Supply. The demand for this remarkable material is still increasing and it is considered that this acquisition will fit in logically and effectively with the company's research and development work in the production of streptomycin and in the field of anti-biotics generally. It is proposed to operate this new development through a subsidiary company to be formed with a capital of about £1,000,000.

PRODUCTION OF CHEMICALS FROM
PETROLEUM

An important development which falls to be reported is the provisional agreement between your company and the Anglo-Iranian Oil Company, Limited, to erect a large plant for the production of chemicals from petroleum. The capital required for this project will be of the order of £5,000,000 which will be subscribed equally by the two companies. It is proposed to establish this joint venture at Grangemouth, in close proximity to the oil refineries of the Anglo-Iranian Oil Company.

It will be appreciated that under present conditions a considerable period must elapse before this scheme can be completed, but, in view of the company's existing commitments in the chemical and plastic fields, your directors are satisfied that on a long term view this development is sound and necessary.

FUTURE PROSPECTS

In view of the difficult times through which we are passing, it is not desirable to attempt to forecast very far ahead. It may be said, however,

(1) That the financial structure of the company is solid and it has ample reserves and provisions to meet such contingencies as may arise;

(2) That many of its products, particularly Scotch whisky and gin, are of vital importance in the national drive for exports to "hard currency" markets, and

(3) That so far as the current financial year has gone the results are satisfactory. At their meeting on November 13, 1947, the board intend to declare an interim dividend on the ordinary stock in respect of the year to March 31, 1948 payable on December 17th next along with the final and special dividends for period to March 31, 1947, if these are approved today.

The report was adopted.

CHAMBERS WHARF AND COLD STORES, LIMITED

The twentieth ordinary general meeting of Chambers Wharf and Cold Stores, Limited, was held, on the 16th instant, in London, Mr Charles Goldrei (chairman and managing director) presiding.

The following is an extract from his statement circulated with the report and accounts for the period from June 29, 1946, to June 27, 1947:—

I am very pleased to present to the shareholders a satisfactory balance-sheet for the period under review. The ordinary share capital of the company was increased in April, 1947, by the issue of 68,332 ordinary shares of 5s. each fully paid. The share premium amounting to £85,415 less the expenses attached to the issue £183 is shown separately on the balance-sheet. As a consequence of this issue, the company's bank loan has been considerably reduced.

The net trading profit for the 52 weeks ended June 27, 1947 (after providing for payments to the Ministry of Food Cold Storage Control of the excess over the maximum allowed to be retained by the company) amounted to £75,804, against £62,639 for the previous period.

The net balance of profit for the period after providing for a special payment of £4,000 to a general manager for loss of office, directors' fees, depreciation and taxation as reduced by an amount of £1,991 provided previously, not now required, amounts to £29,845, against £27,938 for the previous period, an increase of £1,907.

TOTAL DIVIDEND 40 PER CENT.

Of the balance of profit available, taking into account the amount brought forward from the previous year of £7,335 after payment of the preference dividend for the year to May 31, 1947, and the interim dividend of 15 per cent. on 273,326 ordinary shares, your directors have transferred £5,000 to general reserve, £1,000 to staff pension and benevolent fund, and they recommend a final dividend of 25 per cent. on the increased ordinary share capital of 341,658 ordinary shares, leaving a carry-forward to next year of £6,343.

In my last year's report, I stated that the company had purchased Messrs John Dudin and Sons, Limited's premises, which immediately adjoined the company's riverside property, and that the necessary licence for development was obtained. I am now able to inform you that the work has been satisfactorily completed.

The company acquired from the Bermondsey Borough Council in March of this year, East Lane Wharf which adjoins the western boundary of the company's riverside property. This wharf is at present an open quay site and since, owing to restrictions and shortage of materials, it is impossible at the moment to obtain a licence to erect permanent buildings on it, the company has decided to erect temporary buildings. The licence for these has been obtained and the construction should be completed before the end of the current financial year, when the company's dry goods warehouse space will be further increased.

As soon as restrictions are relaxed and building materials are more plentiful, it is

the intention of the company to proceed with their pre-war plans for further substantial extensions and to utilise their valuable freehold sites to the best advantage.

The volume of business since the commencement of the current financial year has been satisfactory and there is no reason why the company should not continue its steady progress. Your directors have under constant review the equipment of our cold stores and warehouses and every advantage has been and will continue to be taken to maintain the company's plant and machinery in keeping with its reputation as one of the most up-to-date storage undertakings in the country.

The report was adopted.

POWELL DUFFRYN, LIMITED DELAYS IN COMPENSATION PROCEEDINGS

The annual general meeting of Powell Duffryn, Limited, was held in London on the 22nd October, Mr Edmund L. Hann, the chairman and managing director, presiding. The following is an extract of his statement which was circulated with the accounts:—

The profit on trading is £905,924 which, after charging depreciation, is reduced to £744,765. Last year the corresponding figures were—trading profit £1,135,537 and net profit £865,221.

A larger distribution could have been recommended for the year under review, but having regard to the future it was felt better to recommend the addition of the substantial amount of £358,359 to the carry-forward. It is hoped that it will be possible to maintain a reasonably steady rate of dividend in the next two or three years, but it may well be necessary to have recourse to the undistributed profits of past years.

Assets with a written-down book value of nearly £10 million have vested in the National Coal Board, while the Group figure is in excess of £12 million. The amount of compensation to be received, as stated in the explanatory note circulated with the accounts, will not be known for some years.

For two years from January 1, 1947, we shall receive an interim income based on one-half of the pre-nationalisation earnings of the assets which have passed to the Coal Board. If the assessment and payment of compensation is completed within four years I shall be agreeably surprised. The delay is no fault of the industry, and yet the industry is to receive interim income for two years only.

EXPANSION OF ACTIVITIES

The business of Cory Brothers and Company, Limited, in Egypt, which has been merged in that of Tractor and Engineering Company, S.A.E., is working smoothly and profitably.

A new enterprise of Gueret, Llewellyn and Merrett, Limited, is the development of an Air Service Agency trading under the name of Powell Duffryn (Air), Limited, managed by G.L.M. from their Cardiff office with branches at all important places at home and abroad.

Early in the new year Stephenson Clarke, Limited, will receive in compensation for its fleet of wagons well over £3,000,000, but will from January 1st next lose its substantial income from the earnings of these wagons. Losses of tonnage through enemy action are

gradually being made good and it is hoped in the next few years to restore fully the amount of tonnage owned in 1939.

Maris Export and Trading Company, Limited, the coal exporting subsidiary of Stephenson Clarke, although deprived of the opportunity of maintaining its trade in British coal, has functioned successfully in the products of other countries.

NEW ENTERPRISES

I have to report the appointment of Mr Robert Foot as a managing director of Powell Duffryn and chairman of its new subsidiary company, Powell Duffryn Technical Services, Limited. Mr Foot is now in Australia to discuss the possible use of our services in connection with the further development of the valuable coal resources in the various states of the Dominion.

Our research organisation has discovered an entirely new method of producing carbon which possesses great advantages over other methods now in use, both as regards the process of manufacture and the quality of the finished product. For commercial production we have acquired a factory at Hayes, Middlesex, and have promoted a new subsidiary company—Powell Duffryn Carbon Products, Limited—with a share capital of £500,000.

The report and accounts were adopted.

ALLIED INDUSTRIAL SERVICES LIMITED

The annual general meeting of this company was held at Bradford on the 17th instant, Mr W. H. Rhodes, the chairman, presiding.

The following is an extract from his circulated statement:—

The services we supply to industry increased in volume considerably during the twelve months, despite the continued difficulty of obtaining the materials required to maintain these services. Again, the severe weather during the winter resulted in some curtailment of customers' requirements owing to fuel and power shortages.

Your directors have had in mind for some years the inauguration of a staff superannuation fund, and, the necessary arrangements having been made, the scheme commenced on March 24, 1947. Your directors feel that this scheme, which is a contributory one, will be of benefit to the participants and the company. During the year under review we have been able to install a certain amount of new plant to replace some of our older machinery and await further replacements as soon as manufacturers can make delivery.

After making proper provision for depreciation of the company's properties, plant, etc., the trading profit (including dividends and transfer fees, etc., received) amounts to £265,097, and after provision for taxation, the sum of £121,097 is available for allocation, to which your approval is sought. The directors have recommended a similar ordinary dividend to that paid in the previous year.

In view of present conditions concerning raw materials and the shortages from which we may suffer during the months ahead, I hesitate to make forecasts, but at the same time I can state that demands for the industrial services we supply continue to be maintained at a satisfactory level.

The report was adopted.

SECRETARY REQUIRED by the Technical Managing Director of a well-known firm of clothing manufacturers. Shorthand and typing applications must be in writing.—Box 588.

CHIEF Accountant and Office Manager required by large Engineering firm. S.E. London. Industrial experience, including mechanised accounts, costing, and office organisation essential. State age, education, experience, and salary required.—Box 585.

IF you require staff advertise in "WOMEN'S EMPLOYMENT" Appointments Section. Published 1st and 3rd Fridays. Widely sought for forty-eight years by trained women seeking posts. 25 words 5/-; 50 words 7/6. Women's Employment, Terminal House, S.W.1.

YOUNG WOMAN (22), B.Sc. (Econ.) (Hons.), with special reference to sociology, commercial training, diploma from Paris University, seeks interesting appointment.—Box 591.

GOVERNMENT RETURNS

For the week ended October 18, 1947, total ordinary revenue was £49,099,956, against ordinary expenditure of £68,277,428 and issues to sinking funds £498,581. Thus, including sinking fund allocations of £9,049,891 the surplus accrued since April 1st is £186,936,495 against a deficit of £479,609,223 for the corresponding period a year ago.

UNIVERSITY OF THE WITWATERSRAND

Applications are invited for a LECTURER IN ECONOMICS: Salary scale is £550 x 25—£800 per annum, plus a temporary cost of living allowance which at present is £75 per annum if the member of staff is a married man or has dependants, £46.16.0 per annum in the case of a single man. Closing date for the receipt of applications is 24th November, 1947. Further particulars may be obtained from the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1.

THE CIVIL SERVICE Commissioners invite applications from suitably qualified men and women for the following permanent appointments: (a) Agricultural Economists, and (b) Assistant Agricultural Economists in the Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland; about 12 vacancies in all. For posts (a) candidates must have attained the age of 28 on October 1, 1947; for posts (b) candidates must have been born on or after August 2, 1910, and have attained the age of 23 on October 1, 1947. Inclusive salary scales for men are: Agricultural Economist £750 x 25—£1,000; Assistant Agricultural Economist £375 (age 23) x 25—£750, with higher starting pay for candidates over 23 on appointment. The scales shown are applicable to London posts, and are subject to small deductions for posts in Edinburgh. Salary scales are somewhat lower for women. Superannuation arrangements will be made under the Federated Superannuation System for Universities.

Candidates should have at least a Second-Class Honours degree in Economics or (where awarded) in Agriculture or Agricultural Economics, or an equivalent degree where Honours are not awarded, and should preferably have undertaken original research work in Agricultural Economics. Those qualified in Economics must have a knowledge of agricultural problems, and those qualified in Agriculture must have specialised in the economic aspect of the subject.

The Commissioners will select those candidates who appear to be most suitable, and will summon them for interview in London or Edinburgh. Candidates should write for an application form and a memorandum giving further information to the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 2023. The completed form must be returned by November 6, 1947.

CIVIL SERVICE COMMISSION.—Applications are invited for the permanent post of Statistician in the General Register Office. Superannuation provision will be made under the Federated Superannuation System for Universities. The inclusive salary scale (London) is, for men, £900 x 30—£1,000 x 35—£1,220 per annum; for women, £800 x 30—£1,050. Prospects of promotion in a few years to the post of Chief Statistician, maximum inclusive salary (London), £1,700 (men), and £1,550 (women). Candidates must have a University degree with First or Second-Class Honours (or the equivalent where Honours are not awarded) in statistics, or in mathematics, economics, or other appropriate main subject combined with statistics; or having obtained a degree with First- or Second-Class Honours (or equivalent) in mathematics, economics, or other appropriate main subject without statistics must have been employed whole-time for at least twelve months continuously on statistical work. They should preferably have had experience in the study and treatment of demographic (including fertility) statistics. The successful candidate will be expected, subject to the general technical direction of the Chief Statistician, to initiate and, when necessary, direct statistical studies in all except purely medical aspects of the work of the General Register Office. Further particulars and application forms from the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1 quoting No. 2013. Completed application forms must be in the hands of the Commissioners not later than November 15, 1947, but applications from candidates overseas will be accepted up to November 29, 1947.

ROYAL BANK OF CANADA

DIVIDEND NO. 241

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2½ per cent., being at the rate of 10 per cent. per annum upon the paid-up capital stock of the Bank, has been DECLARED for the three months ending 30th November, 1947, and will be PAYABLE at the Bank and its branches on and after 1st December, 1947, to shareholders of record 31st October, 1947.

By Order of the Board,
E. B. McINERNEY, London Manager.
6 Lothbury, London, E.C.2. October 23rd, 1947.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22 Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111 Broadway, New York, 6.—Saturday, October 25, 1947.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong.)

CAPITAL ISSUED AND FULLY PAID UP	£20,000,000
RESERVE FUNDS STERLING	£4,000,000
RESERVE LIABILITY OF MEMBERS	£20,000,000

Head Office: HONGKONG.
Chief Manager: THE HONOURABLE A. MORSE, C.B.E.

BRANCHES:

Amoy	Colombo	Kobe	London	Manila	Shanghai

Calcutta	Hankow	Kuala Lumpur	Malacca	Shanghai	Singapore
Canton	Hankow	Kuala Lumpur	Malacca	Shanghai	Singapore
Chungking	Hankow	Kuala Lumpur	Malacca	Shanghai	Singapore

London Office: 9, GRACECHURCH STREET, E.C.3.

HONGKONG & SHANGHAI BANK (TRUSTEE) LIMITED,
9, Gracechurch Street, E.C.3, a company incorporated in England, and an affiliate of The Hongkong and Shanghai Banking Corporation, is prepared to act as Executor and Trustee in approved cases. Trustee Companies, also affiliated to the Corporation, are established in Hongkong and Singapore. Full particulars may be had on application.

Latin American Trade

This bank, established in South America for over 31 years, is well equipped to serve British traders interested in this important market. Correspondents the world over.

London Offices—

6 Lothbury, E.C.2.

E. B. McInerney, Mgr.

2-4 Cockspur St., S.W.1.

L. R. Newman, Mgr.

THE ROYAL BANK OF CANADA

Over 600 branches in Canada, Newfoundland, and the West Indies. Despite the materials required, the bank is well equipped to serve British traders interested in this important market. Correspondents the world over.

MINISTRY OF NATIONAL INSURANCE

Applications are invited for a pensionable appointment as Chief Statistical Officer to the Ministry of National Insurance on an inclusive salary scale (London) rising from £1,320 to £1,700 per annum for men and £1,160 to £1,550 for women.

Candidates should be at least 35 years of age. They must have obtained a University Degree with first- or second-class honours (or the equivalent where honours are not awarded) in Statistics, or in Mathematics, Economics, or other appropriate main subject combined with Statistics; or, having obtained a first- or second-class honours degree (or equivalent) in mathematics, economics, or other appropriate main subject without statistics, must have been employed whole-time for at least twelve months continuously on statistical work. They should also have had practical experience in Economics or Statistical Analysis.

The Chief Statistical Officer will be responsible for the organization and supervision of statistical work in the Ministry, the collection and interpretation of statistics required in connection with the new National Insurance schemes, including such matters as the composition of the insured population and the incidence of claims, and for co-operation with other Government Departments and with professional and public bodies interested in such statistics.

Further particulars and form of application can be obtained from the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 2033. The completed form must be returned to him not later than November 15, 1947, but applications from candidates overseas will be accepted up to November 29, 1947.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of Fifty Cents (\$50) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable December 15, 1947, to shareholders of record at the close of business November 14, 1947.

Toronto, By Order of the Board,
October 20, 1947. J. R. BRADFIELD, Secretary.

Cripps, Controls and Construction

OF all the cold douches administered to the nation since midsummer, Sir Stafford Cripps on Thursday of last week certainly provided the largest and coldest. To find an equally astringent statement one would have to go back to the May Report of 1931. The parallel is by no means discreditable to Sir Stafford, for retrenchment is as imperative now as it was ill-advised in the diametrically contrary circumstances of sixteen years ago. But the most apposite retrenchment wants careful examination. Do these cuts reduce living standards below the minimum on which a highly organised economy can be run? Conversely, are they big enough for their job? And in providing for the emergency of the present do they also nurture a sound hope of better things in the future? Of course they are endurable. It has been thoroughly if grimly demonstrated that people can, at a pinch, live and work on diets compared to which this is luxury. Sir Stafford had the right word for the food situation: highly unpleasant, but not disastrous. Nor is it fatal, however distressing, to wear a patched shirt because the poplins have gone dollar-hunting. Unwelcome as the cuts are, they have not impinged on any vital spot.

They are not, unfortunately, adequate in total to solve the dollar problem at one stroke. The job simply cannot be done that way; no direct lateral balance between this country and the United States is conceivable. Mr Dalton has revealed that the dollar deficit is still running at the frightening rate of £900 million a year and even Sir Stafford Cripps's best efforts do not promise to reduce it below £250 million. Moreover, the promise is still only a promise; it has yet to be redeemed. The trade agreements to be signed at Geneva this week will help in redeeming it, if they really do result in an effective lowering of the American tariff. But on the other side there is the ominous fact that Sir Stafford's prognostications were based on the assumption that his export targets would be attained, which is a matter of considerable uncertainty. To budget on a dollar deficit which will reach a billion dollars a year even if all goes as well as expected, is still to take a big gamble. There cannot be any reasonable doubt that the direction in which Sir Stafford is moving is the only possible one for the circumstances in which the country finds itself today. The valid criticism of his immediate measures is that they still do not go far enough, and when Mr Churchill attacks them for going too far, when he talks about the necessity for a sound home market to support exports, the answer is that he would be compelled to sing a very different tune if he were in office.

The doubts that are widely felt about the Cripps policy relate to the longer run, and there Mr Churchill's points have much more substance—or would have had if he had made it clear that he was talking about the longer run. However right Sir Stafford is at present, it is difficult to suppress the suspicion that he is right because he is in his element, because he positively prefers an austere, restricted, controlled economy, because, like the tympanist in an orchestra, his instinct when he has

nothing else to do is to go round tightening up all the screws. There is no escape from controls and restrictions at present. But he must be a very hardened planner who never to himself has said that a few more years of this sort of thing will kill the nation. The last two years have taught many lessons about the limitations of controls and to very many people, even of those who have hitherto professed themselves Socialists, the conception (to which Mr Churchill gave some support in part of his speech) of an economy in which the basic fundamentals of social justice and economic stability would be planned, but all else would be left free to enterprise, is an increasingly attractive one—certainly more attractive than the alternative doctrine, which Mr Morrison and Mr Attlee seemed to prefer, that all forms of economic liberty are synonymous with economic piracy. The value to the community of having its economic decisions dispersed among a million heads, instead of concentrated on a hundred, has been vastly underrated. In America the one industry that has hitherto lagged has been building, the one industry still under control. That might be written off as a coincidence. But is it also a coincidence that, as a Note on a later page records, as soon as the controls were removed the activity of the industry forged ahead? In this country the basic controls cannot now be removed; indeed, they will have to be tightened. But if the process could be accompanied by some signs in the Government of an ability to discriminate between what should and what should not be controlled and to search, even now, for means of restoring a little freedom and elasticity somewhere, then one could feel a little more confident that the Government are not “now inviting us to follow them further into a dark and narrowing tunnel at the end of which there may be no daylight.”

★

Cuts and restrictions there must be; but public opinion should ask ever more insistently whether they are the right ones, and what the end of them will be. The biggest item in Sir Stafford Cripps's budget of announcements last week was that the construction programme is to be cut to the tune of some £200 million a year. Detailed comment on this must await the promised White Paper; but meanwhile an interesting controversy, of much more than academic interest, has sprung up about the principle of a reduction in the nation's rate of capital creation. Within the last fortnight three weighty statements have appeared: articles by Professor Lionel Robbins and Professor Jacob Viner of Princeton in *Lloyds Bank Review*, and a book by Mr. R. F. Harrod*, putting more fully and still more vehemently the thesis of his recent letters to *The Times*. To the two English economists the over-ambitious capital programme of the last two years is the villain of the piece. “The shortfall of exports,” says Mr Harrod, “is merely the by-product of the excessive capital outlay”; and he advocates capital cuts of £500 million accordingly. Professor Robbins similarly indicts the “economic megalomania” which has resulted in “a body of claims for resources for internal development far greater than was compatible with the attainment of the requisite degree of export expansion.” John Bull, in short, has been refusing to do a full day's work to earn a full larder on the plea of being too busy building a new wing to his house—an excuse neither reasonable nor honest. The American view, as expressed by Mr Viner, is startlingly different. So far from being megalomaniac, the capital target has been set “incredibly low.” The adverse balance of payments is really neither here nor there; the United States grew to prosperity through nearly a century of far larger adverse balances. Let Britain build up its productive capital and aid will surely be forthcoming for any purpose which will increase its productivity.

* “Are These Hardships Necessary?” by Roy Harrod. Rupert Hart-Davis, Ltd., 178 pp. 5s.

Of this latter advice one can only say, mournfully, that the universal lender in the last century was the City of London, not the Congress of the United States. But, this fantasy apart, there is surely a great deal of sound sense in what Professor Viner says. To lump all capital projects together and slash off from them—as Mr Harrod proposes—whatever amount is needed to bring them down to the level of the national savings, sacrificing them wholesale to consumption, may not merely slow up the advance of productivity but actually and fatally reverse it. In Eastern Europe after the First World War—and very likely after the Second—whole communities starved because they ate their seed corn or burned for firewood the sleepers of the railway tracks which could have brought them succour. It is true, of course, that, in the absence of foreign aid of one sort or another, the wholesale sacrifice of consumption to capital could only be achieved by planners far more ruthless and powerful than the present Government. The export policy required by Russia's Five Year Plan starved some two million people to death in a single year. Sir Stafford is not as austere as all that. But the present tendency to take the existing levels of consumption and of saving for granted and to put upon capital creation the whole burden of cutting the national programme down to fit its means is a strangely improvident policy to be advocated by professional economists. If there is a programme of urgently needed and truly productive capital projects which is in excess of the nation's rate of saving, then the first recourse ought surely to be to try to increase the rate of saving—which is the prime justification for an autumn budget to produce a large, and real, budget surplus. If one of the two—productive investment or immediate consumption—has to have the priority, it should be the one that holds out hope for the future.

But the doctors' disagreement is less acute than it looks. “Capital” is an omnibus word, and the two views could be reconciled closely enough for immediate policy. All agree, for instance, that the housing programme is a capital construction indeed, but consumers' capital long-run consumption really—was wildly over-ambitious. Some capital projects are far less relevant than others to the dollar problem, whether as dollar savers or as dollar earners; they go back in the queue. Some will produce results sooner, inside the crucial period of world recovery, others later. Some contribute directly to production, like an automatic loom, others only indirectly, like a works canteen. Some capital projects, in short, should be cancelled and some postponed, but others should be increased and speeded up. If this is what the Government are doing, well and good. But it is wrong to make a frontal attack on all capital indiscriminately, in the interests of maintaining consumption.

★

To make inroads on the standard of consumption can never be a popular policy, and, for all Sir Stafford Cripps's courage, it is still evident that the Government cannot bring themselves to face it. Mr Dalton does not yet sound like a man who will risk his popularity—on the contrary, he sounds like a man who is covering up the uncertainties in his own mind by ever more dogmatic public assertions of infallibility. And the very mild action that has been taken over housing shows that Mr Bevan has again carried the day in Cabinet. If the Cabinet is taken as a whole, it does not yet possess the lucidity of mind to grasp, nor the moral courage to proclaim, the essential principles of the national economy. One of these is that if the nation's pretensions to a standard of living are above its achievements in production, they must be cut down. And another is that the one sure way of sinking irretrievably beneath the burdens of the present is to eat up both the reserves of the past and the hope for the future. If to believe in these principles is to live mentally in the nineteenth century, then Mr Churchill will have some companions in his historical exile.

New Deal for Germany

NEITHER the debate on policy in Germany in the House of Commons on Monday, nor the report of the Select Committee on Expenditure in Germany contributed more to the question than the usual mixture of easy criticism, formal bouquets, truisms and half-truths. Mr Bevin was admirably clear and firm about one thing that the Government will not do. It will not consider reparations to Russia from current German production so long as the sums which Britain has spent on Germany are not recovered. But he was just as stubborn in defending the dismantlement of factories, 25 per cent of which will go to Russia, and a proportion of the rest to Russia's allies. Statesmanship and care for the future are overridden, it would appear, by a stubborn attachment to the letter of the Potsdam Agreement, which events have discredited, which the Russians have frequently disregarded, and the main principles of which have long ago been generally discarded.

Confusion of thought on the complex German problem is natural, but it is more than usually dangerous at this moment. Decisions of one kind or another will have to be made shortly, and the makers of policy should by now have formed a clear picture of their objectives and of the strength of opposing forces. It should by now be clear that the only acceptable objective of British policy is to create a Germany—failing that, a Western Germany—which will be self-supporting, politically as well as economically, and will be neither a drain on other countries' resources nor a menace to their security. This is an objective that is simple to state, and it would be a reflection on their diplomacy if the British and Americans allowed Mr Molotov at next month's meeting of the Council of Foreign Ministers to draw a whole string of red herrings across the path to its achievement. A real danger exists that he may tempt them out of their strong position to pursue an attractive bait that it is within his power to set before them. As Hitler lost North Africa while he chased the oil of the Caucasus, the British and Americans might lose Western Germany through attempting to gain a free, democratic, self-supporting, united Reich.

German “unity” has become a magic word, and the first condition for clear thinking on British policy is to rob it of its spell. In the long run, of course, Germany will regain its unity; nothing is more certain. Even in the short run of the Allied occupation, if the circumstances permitted a real unity, nobody (except the French) would deny the economic advantages of a united Germany. But those circumstances do not exist, and are not likely to exist, whatever the apparent concessions that Mr Molotov may make. The Germany whose unity is constantly advocated would still be a Germany without the territory which was given to Poland by the Potsdam executors of the Morgenthau Plan. This territory, a quarter of the total area of Germany, was the main surplus food-producing region and provided over a quarter of Germany's total home supplies. The Soviet Zone, with which the West might theoretically be reunited, has not now a sufficient surplus of foodstuffs to warrant vital political concessions to secure reunion; formal unity is not needed to make possible an exchange of such food surpluses as there are for the coal, steel and other vital materials which are critically lacking in the Soviet Zone. The economic benefits of unity are further limited by the fact that, apart from factories producing wholly for reparations, many key industrial concerns in the Soviet Zone are now the property of the Soviet State, which is anxious to sell their output for dollars or sterling, payable to the Moscow Narodny Bank, but not for German marks, payable to any revived Reichsbank. For the scanty economic benefits of unity a very heavy political price would have to be paid. At the very least, the whole of Germany would be thrown open to Communist political trickery and economic sabotage.

It would be unfortunate if German demands for unity were to lead the British and Americans, in negotiation with the Russians, to bargain realities for symbols and shadows. From Germans east of the Elbe, claims to unity are heartfelt and sincere; they are a plea for rescue. In the West, German democratic political leaders must echo the demand, if only to keep up the spirit of their compatriots in the East. But all the realists among them know that they would bitterly regret unity if it brought with it—as in present circumstances it certainly would—the shadow of Communist tyranny and the police state. To them, it is the German tragedy that they must clamour for what they fear. Their fate turns on the clear-headedness of the Americans and British, who ought to be able to see that if immediate unity would destroy the remaining opportunities and hopes for rebuilding a free and democratic Germany, then it is far better to postpone the one aspiration than to destroy the other.

To achieve a unified Germany worth concessions on their part, the Western Powers would have to secure a complete reversal of Russian policy. Since this is hardly likely to happen, the sooner it is understood that the partition of Germany is not necessarily catastrophic the better. Then plans may be shaped for the creation of a politically and economically self-supporting Western Germany, with fewer inhibitions, and with greater regard for urgency, than have been in evidence hitherto.

★

The first requirement for such a programme of construction is that the Germans should be allowed to govern themselves. Over the last two years, more and more responsibility has been handed over to German administrators, and the process is continuing; but it is too slow. A body of 16,000 British and 5,000 American officials still watches over every department of German life. The German Bizonal Economic Council has authority to pass laws valid for the two Zones, but each one has to be submitted, by way of the British and American bipartite officials in Frankfurt, to the two separate headquarters in Berlin, in order to return altered or quashed. True, it can be argued that the alterations and suggestions of the Americans and British usually represent improvements on the German efforts; that the inexperienced German administrators have not made successful use of their rights; and that their failure is not wholly due to the fact that the bizonal administration represents a monstrous compromise between British and American views. It is true also that an efficient civil service has yet to be created—or re-created. But these things have been said of every subject people everywhere at all times. No politicians, in Germany or elsewhere, will ever become responsible until they have full responsibility.

The present position, moreover, is too absurd to continue. In practice, the Americans and British have real control over nothing but foreign trade and, to a certain extent, over coal and food. Yet in theory military government is supreme in all spheres, and every German official or citizen has this thought at the back of his mind. Under Hitler and his Gauleiters, Germans obeyed the control regulations because there was a state to worship and a gallows to fear. Now there is no state, but an unpopular and despised occupation authority which does not, and should not, make Hitler's use of the gallows. It is, therefore, not remarkable that regulations are two-a-penny in Western Germany today. All that is remarkable is that the system works as well as it does. One reason for this gives hope for the future: the average German is profoundly unhappy,

living a life of illegality, and would gladly return to a normal, legal order if it were made possible for him to do so.

The immediate aim of the British and Americans should, therefore, be to establish a Western German state, governed by an administration which would not only be constitutionally responsible to the electorate, but freed from any but the indispensable minimum of control by Britain and America. Dismantlement of the Control Commission should have priority over dismantlement of industry. Let the troops—or some troops—remain. They provide a needed check on subversive movements, and are, by and large, a moral support to German democrats. But British interests demand that the 16,000 of the Control Commission be cut to the few hundreds who would be needed to watch over the performance of the two indispensable conditions—that is, to see that weapons of war were not manufactured and that a Bill of Rights for German citizens was maintained, as a safeguard against militarism. The new government of the State of Western Germany should have no excuse for blaming the occupying powers for hardships and breakdowns. It should have the power, and should be advised to exercise it, to impose sanctions on any of the subsidiary provincial Governments, or on individual Ministers in those governments, who disobeyed the laws of the central legislature. It is a grave weakness of the present system that only military government has the power to impose such sanctions. The day must come when the Government of Western Germany can and will cut off revenue from any recalcitrant *Land* and will issue a writ for the arrest of any Minister of Food in a *Land* who (as is happening now) issues supplementary food rations in his area, instead of pooling crops.

This policy, it should be emphasised, should be an immediate one. Anyone can see that the transfer of full responsibility must be a gradual process, and there will be no lack of excuses for delay. But time is very short. The resources of Britain in men and money—and equally the resources that the American Congress will be willing to provide—are far too small to bear the responsibility of governing over 40 millions of people who are certainly aggrieved and who have been, and will again be, aggressive and resourceful. If anyone doubts that, let him contemplate the difficulties of governing a handful of people in a pocket-sized country like Palestine, and then imagine those difficulties multiplied by a score or more. If the Anglo-Americans are themselves to decide the timetable of their withdrawal from authority, and are not themselves to provide, in a long series of reluctant concessions, the stepping stones to power of a resurgent German nationalism, they will have to hurry.

Local Financial Reform

THE Government's new Local Government Bill, of which the text has been published this week, is an important measure of reform in a field whose great influence on the pace of social progress is seldom realised. Local authorities in this country have importance not only for their own sake but also because they are the executive agents for most of the schemes of social progress that the central government devises. If the machinery of local government has been creaking in recent decades, the main reason is that the structure of local finance has not been sufficiently adapted to bear the burden of the great extensions of social legislation in the present century. The new Bill is designed to provide an instalment of the necessary reform. Though it will excite argument, the controversy will not in the main lie between the political parties. Both for this reason and also because—subject to one or two

The programme for the rehabilitation of Germany cannot, of course, be considered solely in terms of internal political responsibility. For a long time to come, the overriding question will be how Germany can be kept alive, and the answers will have to be given in dollars. To suggest at one and the same time that the process of handing the government of Western Germany back to the Germans should be speeded up and that the United States should assume the major burden of covering Western Germany's trade deficit, may not seem to Congress to make sense. In Germany, if nowhere else, it will seem natural that those who are providing the dollars should control the expenditure of them. But it is very doubtful whether this is the quickest way to make Western Germany pay its way. So long as those in office in Germany are secretly convinced that the Americans will always make good a deficit out of an inexhaustible storehouse, they will not risk unpopularity by enforcing the measures necessary to make Germany self-supporting. The way to make them responsible in their economics, as in their politics, is to give them responsibility—that is, to give them a fixed allocation of food and funds (sterling as well as dollars) and let them draw up their budget and face the consequences.

The immediate problem of the Western German economy is also that of Western Europe, and thus of the Marshall offer. What Mr Bevin meant on Monday when he indignantly denied their connection is another of the mysteries of the Foreign Secretary's pronouncements on economics. The combined Anglo-American Zone must export to a total value of \$3 billion a year in order to be self-supporting, and the greater part of these exports must be paid for in dollars. Western Europe needs German goods to play the part it promised at Paris to play. But if it is to buy German goods, it must be provided with the wherewithal from the United States. If for no other reason, Western Germany must play a part in any Marshall Plan. The task is, then, to persuade Congress that it is in the American—as well as the British—interest that the Western German government should enjoy much the same discretion in using the Marshall dollars as will be granted to the sixteen signatories of the Paris report.

To reach such a conclusion and to face its implications demands both in London and Washington a revolution in thinking about the German problem. The revolution will have to come sooner or later; it is better that it should come as the product of bold and constructive thinking than as the result of disappointment with the results of the present controls or of pressure from German nationalism clamant from both sides of the Elbe. In the present confusion, British policy has lost sight of its objectives and permanent interests. A fresh start must be made.

exceptions to be noted later—its provisions point in the right direction, it is to be welcomed.

The scope of the new Bill should not, however, be overestimated. The local authorities derive their incomes from two sources, from the rates which they themselves levy on property in their areas and from grants given by the Exchequer. The rough equality between the two sources was temporarily upset by wartime conditions, when the Government bore the burden of local authorities' emergency expenditure. Last year, however, rate income rose to £240 million, which was probably higher than grant income. Government grants can be further subdivided into those which are given for specific services, usually as a percentage of local expenditure on those services—the education grant is the largest and clearest example—and the “block grant” given under Neville

Chamberlain's Act of 1929, which is in aid of the general finances of the authority that receives it. Last year, the “block grant” amounted to £57 million, or about one-eighth of the authorities' total income. The main proposal of Part I of the Bill is to abolish the block grant and to set up a new “general purpose” grant, distributed on a new principle, amounting to £33 million. By this exchange the local authorities will be £24 million worse off. But under the National Health Service Act of last session and the Poor Law Bill promised for this session, they stand to be relieved of the responsibility for services which last year cost them £63 million. There is therefore a prospective net gain to the local authorities as a whole, on all three measures taken together, of about £39 million. This is a welcome relief; but it represents only about one-sixth of the present income from rates. Moreover, in view of the known commitments, the relief to the rates is more likely to take the form of a brake on future increases than that of actual reductions, except perhaps for a year or two. The Bill is thus far from being the major reform of local authority finance that is needed.

The main purpose of the reforms now in progress is to reduce the present inequality of the burden of rates as between one area and another. To start with, the transfer of poor relief and hospitals will on balance benefit the poorer local authorities very considerably, since these have been the items of rateborne expenditure the burden of which has shown the greatest range of variation from area to area. Domiciliary relief, in particular, has long been the most unjust item falling on the rates, hitting those authorities who could not afford it very heavily and those who could hardly at all. On top of the relative advantage that the poorer authorities will thus gain from the transfer of the poor law and of the hospital services, the new general-purpose grants proposed in the Bill are explicitly designed to bring the resources of every local authority, in terms of rateable value per head, up to a common minimum and are accordingly to be known as equalisation grants. Their distribution is complex and ingenious. Only those major authorities (counties and county boroughs) will qualify for equalisation grant whose rateable value per head of “weighted” population is less than the national average. The weighting of population is done by counting children under 15 years (who are a burden on the rates) twice over and by making further allowance for sparsely-populated areas (where highway and administration costs per head are high). It is estimated that, had the new scheme been in operation last year, seven counties and twenty-eight county boroughs would not have received any equalisation grant. This is a very different arrangement from the “block grant” division, under which even the richest authority received an appreciable sum. Some of the richer authorities, contrary to the general position, may lose more by the abolition of the existing block grants than they will gain by the transfer of health and poor-law services. The blow will be

softened to them by the payment of transitional grants which will amount initially, for each authority, to the product of a 6d. rate. But this concession is to dwindle each year and to disappear in the sixth year. It is a rather shadowy consolation prize.

Equalisation grants are to be paid on the full extent to which a local authority's “weighted” rateable value falls below the national average. After making some intricate adjustments, the Exchequer is apparently to assume—in the case of each affected authority—full liability for the deficient portion of rateable value, and to become a normal ratepayer in respect of it. Counties are to pass on an appropriate portion of equalisation grant to their constituent county districts. The total cost of the equalisation grants will clearly vary with the rates fixed by the eligible local authorities, and the poorer authorities will thus have some small financial incentive to local enterprise.

The new system will go a very long way to even out differences in the financial resources of local authorities. No authority will be allowed to fall below the national average in respect of rateable value, but at the same time the rate in the pound which it levies will remain at its own discretion. This provision of the Bill is a sound equalising measure. The chief criticism of the new system is that the financial resources of local authorities as a whole will be reduced and not increased. It is not a complete answer to say that their responsibilities will also be less; the sorry state of local finance is partly responsible for prompting these very transfers. In the future as in the past the rateborne cost of local services—in particular of education and of the health services left to local authorities—will rapidly increase. In such circumstances it is a pity that that part of Government aid which local authorities have freely at their disposal—represented hitherto by block grant and in future by equalisation grant—should be appreciably less. This cannot but dampen local initiative.

★

The second main purpose of the Bill is to provide a new basis of valuation for rating. This takes responsibility for valuation away from the local authorities and entrusts it to the Board of Inland Revenue. Local valuation Courts of Appeal are retained (with appeal from them to the County Courts) and their constitution will remain the responsibility of the larger local authorities. This is a wise and necessary reform. For various reasons there has been an increasing lack of uniformity in the valuation practices of local authorities; yet uniformity is essential not only to ensure justice to the individual householder but to provide a fair basis for the division of Government grants among the local authorities. Without such a basis, the new equalisation grants will be wrongly distributed and it is a pity that the new valuation machinery will not be working until April, 1952.

The important step which the Bill takes towards uniformity of valuation by centralising the administration of it is, however, partly vitiated by an equally significant step in the other direction. Dwelling-houses will in future be divided into three categories, each of which will be valued for rating on a different basis. The reasons for differential treatment are partly historical and partly perhaps—although this is less certain—political. It is estimated that in the years between the wars new houses were under-assessed (in comparison with older houses) to an average extent of around 20 per cent. This was done under the influence of the desire of many local authorities to stimulate housebuilding. It was a vicious type of indirect subsidy; but the fact remains that to treat all houses alike now would cause hardship to the householders concerned, and especially to the large class of owner-occupiers who started to buy their houses before the war. In addition, council houses have often received special treatment in the past, and, in the opinion of Labour politicians, deserve preferential treatment in the future.

The Government has chosen to legalise, instead of sweeping away, these unofficial distinctions and anomalies. The first of the three new categories of houses is to consist of all houses built by local authorities since 1918. For each of these houses the assessed annual gross value (from which rateable value is derived by making a deduction for repairs) is to be $5\frac{1}{2}$ per cent of the hypothetical cost of building it in 1938 plus $5\frac{1}{2}$ per cent of the hypothetical value of the site in 1938. For the second category, consisting of all those houses (but not flats) built by private enterprise since 1918 that come within the limits of the Rent Restriction Acts—that is, all the smaller ones—the prin-

ciple is the same, except that the cost of the site is to be taken at current values and not those of 1938. All other dwelling-houses—that is, all those built before 1918, and all flats and the larger houses built by private enterprise since 1918—are to be assessed on the entirely different principle of the rents which were being paid for comparable houses on August 31, 1939.

How these complex provisions will work in practice cannot be yet estimated. They are not necessarily intended to be permanent. Indeed, for all its liking for harking back to prewar standards, the Government could hardly retain 1938 capital costs and 1939 rental values as the permanent basis of valuation. Similarly, the division of houses into three categories may not be permanent—but it does set up a strong and undesirable precedent. The general intention seems to be to continue to give interwar houses an advantage over older ones, and also to give council houses an advantage over houses built by private enterprise. It is hard to justify these distinctions. If a common standard of valuation is not introduced now, it is improbable that it ever will be. In so far as its introduction has been shelved out of fear of consequent hardship to individuals, the proper way would have been to set up a fund to dispense relief in individual cases. But if the Government's aim is to assist poor householders in general, then it is setting about it in a wrong and clumsy way. Why should it be assumed that the average council tenant needs rate relief more than the occupier of pre-1914 slum property? It would be more satisfactory to permit higher statutory deductions for repairs to small and bad property. Moreover, if the intention is to give a concealed subsidy to new housebuilding, then it would be better given direct so that the whole nation can see it and examine the cost.

Patience—and Vodka

THE sensation caused by the recommendations for future American policy in Mr James Byrnes's book "Speaking Frankly"* has diverted attention from the historical record which the book contains. It is nevertheless the historical record which gives the book its main interest and importance. Mr Byrnes is out of office and "elder statesmen" do not count for much in the United States in the making of policy; it is the more unfortunate that his suggestion of an ultimate use of force should have so conveniently provided a text for Mr Vyshinsky's charges of "war-mongering" in the Western democracies. But Mr Byrnes was behind the scenes in the series of momentous diplomatic episodes from the Yalta Conference in February, 1945, to the completion of the peace treaties with the Axis satellites in December, 1946. Retiring statesmen seldom bring out their memoirs so quickly after their withdrawal from active politics, and though sometimes Mr Byrnes's frankness is a little too indiscreet, we cannot but be grateful to him for providing so soon a volume of first-hand testimony on what went on in the conclaves of the mighty during those critical recent months. It is all past now, but the *post mortem* is of no merely academic interest; the study of this experience should provide a key to understanding and practical wisdom in the time ahead. Mr Byrnes has departed from the stage, but we still have to negotiate with Mr Molotov.

Mr Byrnes's chapter on the Yalta Conference is entitled "High Tide of Big Three Unity." The subsequent history of Big Three relations was destined to be a story of deterioration from that point. But some deterioration was only to be expected, for Yalta was the last of the great wartime conferences and the tendency of victorious coalitions to fall asunder after the end of the hostilities which brought them together is so normal a phenomenon of history that it really should not have occasioned great astonishment in the year 1945. The

* New York: Harper and Brothers. 324 pages. \$3.50.

Allied Powers who defeated Napoleon quarrelled so bitterly over the territorial re-division of Europe that they came to the verge of war while the Congress of Vienna was still in session; in 1919 there were crises in plenty at the Paris Peace Conference and afterwards the Americans withdrew into isolation while British and French policies continued for years in acute conflict. In the last war the prospects of permanent harmony in the coalition were unusually slight, for not only were the major Allies separated by most disharmonious ideologies, but one of them had been in the first year of the war a partial co-belligerent on the side of the enemy and had only been kicked on to the side of the angels by a lack of honour among co-partitionists. The risks of the emergence from war were recognised by Allied leaders and it was Stalin himself who said in giving a toast at Yalta: "It is not so difficult to keep unity in time of war since there is a joint aim to defeat the common enemy, which is clear to everyone. The difficult task will come after the war when diverse interests tend to divide the Allies." These words were indeed prophetic, and Mr Byrnes—at least in his own estimation—improved on them at the Christmas Eve dinner for the Foreign Ministers in Moscow ten months later with the epigram "Whom war hath joined together, let not peace put asunder"—a stroke of wit which, he has to admit, the Russians owing to their imperfect acquaintance with Holy Writ failed to appreciate.

The decline in co-operativeness which actually took place appeared to the public in Western countries more abrupt and catastrophic than it really was because of the extraordinary structure of humbug and make-believe created by Allied wartime propaganda. Even during the war there were not that harmony of aim and elevation of purpose to question which then classified the doubter as an agent of Goebbels. The Big Three were never really banished from the Garden of Eden; they never inhabited it. But at least after the Yalta and Potsdam conferences it was possible to make a good show of agreement

and to make light of the differences which remained unresolved. But after the breakdown of the Foreign Ministers' Conference in London in September, 1945, it was no longer possible to pretend that all was well; it was necessary to tell the people. Mr Byrnes broadcast on his return to the United States and found the popular response "gratifying." He relates that he then "decided that hereafter the people would have to be more fully informed if we were to maintain a firm position in international affairs with full public support." But fully informing the people in order to get their support had its disadvantages; it certainly did not make for the relaxation of tension. On the contrary, the transfer of intractable disputes from secret conclave to open forum has put the world in an uproar in which all the diplomatic decencies have gone by the board; the public exchange of insults has been added to the irritations of bargaining behind closed doors. The world now lives under the sign of open disagreements openly arrived at.

One of the effects of turning the spotlight of publicity on international negotiations is the exaggeration of ideological issues. One of the most striking features of Mr Byrnes's record is the almost complete absence in the non-public gatherings of the Allied leaders of anything that can really be called an ideological conflict, at any rate on the Russian side. As far as the actual subjects of dispute are concerned, the great struggle of socialism and capitalism, which is supposed to be the central issue of our age, might never have existed. In the pages of Mr Byrnes's book it is only too easy to forget what century we are in; the diplomatic historian is haunted by the feeling, "I have been here before." Here are the Partitions of Poland, here is the Eastern Question, here are the Treaty of San Stefano and the anxiety of the Western Powers about a "Big Bulgaria," here is Potemkin dreaming of a Russo-Greek empire, and here is Disraeli taking a firm line on the Straits. Here in fact is the Old Diplomacy—indeed, the Very Old Diplomacy, hundreds of years of it. It is true that there are a few changes in the political landscape, but most of the old familiar landmarks remain, and the Russians in particular like doing things in the traditional way. There may have been an economic and social revolution in Russia, but for thinking about the Dardanelles the style is Nicholas I or Catherine the Great. In these last years the Russian representatives have continually been seeking definite, concrete objectives—annexations of territory, political control of certain countries, particular strategic bases, material goods ranging from machine tool plant to household silver. It is the Americans, not the Russians, who have been concerned about world organisation, abstract principles of universal application, the rights of nations and global economy.

This difference of approach has been one of the main causes of difficulty in adjustment of relations; aims have been too incommensurate for successful horse-trading. Mr Byrnes states that the "chief objective" of the American delegation at Yalta was "to secure agreement on the Dumbarton Oaks proposals for the creation of an international peace organisation," but that he was "deeply disturbed" to find that Marshal Stalin was so little interested in the matter that he had not even read the American proposal on voting which had been sent to him 63 days previously. The Soviet concern was about frontiers, the composition of the Governments of Poland and Rumania, and getting a strategic foothold in the Mediterranean.

It was no doubt largely because the Allied leaders were talking about different things that there was so much misunderstanding about the "Declaration on Liberated Territories," which was accepted by Marshal Stalin at Yalta almost without discussion. The Russians were apparently unable to imagine how anyone could take it seriously; it appeared to them merely a face-saving formula for American acquiescence in the partition of Eastern Europe into spheres of influence, on which an understanding had already been reached between Marshal Stalin and Mr

Churchill. When the Americans, basing their policy on the Declaration, protested against the Vyshinsky *coup d'état* which put M. Groza in power in Rumania, the Kremlin regarded it as a double cross. Mr Byrnes confirms in his book that the Rumanian question was the main stumbling block on which Big Three unity broke down. The issue was already acute before President Roosevelt died and in London in September of the same year (1945) the Anglo-American demand for fulfilment of the "Yalta pledge" and refusal to recognise the Russian promoted Governments of Rumania and Bulgaria caused the Conference of Foreign Ministers to break up without even a protocol on points of agreement. The deadlock then reached was subsequently broken, but nothing like "unity" has ever been restored.

To establish good working diplomatic relations Americans and Russians have to overcome differences of mental habit and outlook which have very little to do with Communism or anti-Communism. American dislike of the "Byzantinism" of Russian diplomatic technique long antedates the Bolshevik era. In 1903 Secretary Hay wrote to President Roosevelt (not Franklin, but Theodore) about the Russian Foreign Minister (not Mr Molotov, but Count Lamsdorf): "Dealing with people who make a science of mendacity is an extremely difficult and delicate matter." The Russians on their side are always afraid of being regarded as not clever enough to cope with the sophisticated West. Talking to Mr Hopkins, Marshal Stalin once burst out that "even though the Russians are a simple people, the West often make the mistake of regarding them as fools."

If one may draw a moral from Mr Byrnes's pages it is that the keys to living diplomatically in the same world with Russia are patience and unstinted hospitality. The latter is far more important than is commonly imagined. Whatever hard things he has to say about Mr Molotov, Mr Byrnes pays tribute without reserve to the qualities of the Russians as hosts whenever conferences have been in their territory. There is still in some quarters an idea that the way to get on with the Bolsheviks is by a squalid informality. Nothing could be further from the truth. The Russians like magnificence, pageantry, the circumstance of power and the lavish hospitality which they themselves provide; they believe that, whatever their disputes, princes should know how to entertain one another. Instead of studying ways and means for making diplomacy more plebeian, the Foreign Office would be better employed in finding out what was done at the Field of the Cloth of Gold. This is not a matter of rewards or privileges for a few individuals. The diplomacy of sovereign states is the pursuit of war by other means; in order that the means may remain other than war and the all-too-human participants may not lose their balance from the nervous strain, it is always good that the tensions should be offset by amenities of civilised life at a standard appropriate for the representatives of great nations. Patience comes more easily when supported by a degree of ritual and Mr Byrnes makes it clear that for negotiation with the Russians patience should be the first and greatest commandment. "If we are correctly informed about the patience exercised by Job," he writes, "I am certain Mr Molotov is one of his lineal descendants." Hurry and the craving for quick results are the greatest weaknesses of the Anglo-Saxon and especially of the American in negotiating with the Russian; in a test of endurance the hustler loses and is only too apt then to lose his temper instead of blaming his own failure of nerve. Mr Byrnes himself recognises the virtue of patience better than he practises it; he has not always been able to bear frustration. Yet he admits from his experience that when the Russians in conference "conclude that they have exhausted their bargaining efforts, that further delay will result in no further concessions and they might as well agree, the Russians suffer no embarrassment whatever in changing their position."

NOTES OF THE WEEK

Party Clash at Westminster

Mr Churchill, when he was Prime Minister, once referred to the debate on the Address as the grand inquest of the nation, as a time when nothing can be held back from discussion, when "real trials of strength can be brought about, in days of party conflict, between the Government and the Opposition." This week, he lived up to his own words and launched a full-scale attack on the Government—and he certainly held nothing back. For one hour and a half last week, Sir Stafford Cripps had lifted the tone of the debate far above all party controversy. Here at last was a speech that might almost persuade people of all parties to switch off their electric fires of their own free will—"one of the greatest speeches that I have ever heard" with "a most moving and eloquent peroration," said the leader of the Liberal party; "an important and courageous" speech said Mr Churchill himself. Why then did he choose, in this time of national danger, to use his own brilliant oratory for purely party purposes?

Perhaps the temptation was irresistible. Members of the Government, Sir Stafford Cripps excepted, have certainly laid themselves open to the charge of putting party above nation. Why should the leader of the Opposition deny himself the opportunity of pushing an advantage home? Moreover, as the leading article this week points out, there is a great deal of force in his contention that controls are stifling the national economy today. There will be many people who will sympathise with his desire to free himself for a brief moment from all controls—including the restraining influence of the younger members of his own party who are trying to reshape Conservative economic policy. Certainly, these members must have listened uneasily as he returned to the pure milk of Conservative doctrine.

Perhaps, however, Mr Churchill was right to overstate the Conservative case—no Conservative Government, if it were returned to power today, would surely abandon controls so wholeheartedly as he advocated. For it led Mr Morrison in his turn similarly to overstate the Labour party's case. At least the people of this country, to judge by the speeches of this week's protagonists at Westminster, now know what the political choice before them amounts to. The case for free enterprise and controls respectively has seldom been more forcibly put; there is apparently no half-way house. Are we really to believe that two years of Labour in power and the Conservatives in Opposition have yielded such poor fruits in the political tenets of their leaders?

Mr Morrison's Defence

In the debate this week and in an address to his constituency, Mr Morrison has attempted to defend the Government's proposal to amend the Parliament Act by claiming that it was a normal piece of legislation that might just as well have appeared in the last session's programme as in this and was totally unrelated to the decision to nationalise the iron and steel industry. One cannot, of course, give Mr Morrison the lie in the throat. One only wonders what other measures the Government may be hiding up its sleeve, which it is so afraid the House of Lords may reject that it feels compelled to bring in this amendment to the Parliament Act as a "precautionary measure." Nor do the Labour leaders' other arguments carry much conviction. It is quite true that the leadership of the House of Lords *might* fall into less responsible hands, that by using their power of veto they *might* reduce Labour's effective term of office to three years. But if the peers are ever likely to indulge in wrecking tactics, why allow them any power of veto at all? Why merely shorten the time which must elapse before their veto is overridden from two years to one? The amendment will still leave a Labour Government at a disadvantage compared with a Conservative Government.

What makes the Government's arguments so unconvincing is that the only evidence brought in support of them is the attitude of the House of Lords in the years 1906-1911. But it is quite inconceivable to the unprejudiced mind that the present House of Lords, for all the "backwoodsmen" who compose it, would reject a Labour measure unless it were quite sure that the Government had not the backing of the electorate for the measure in question. It is even—just—conceivable that in the years to come they might reject a Conservative measure for the same reasons. All things considered, the present House of Lords is probably as good a second chamber as any constitution maker could devise—at least in respect of its powers, its composition (which the

Government are not touching) is another matter. And if Mr Morrison, when addressing his constituents, to condemn the Lords' action in sitting in splendid isolation this September. If the Government had shown a proper sense of responsibility, it would have arranged for the Commons to be recalled, instead of dismissing them from early August until late in October at a time of growing economic crisis. It is this attitude towards Parliament—this tendency to regard its function as merely rubber-stamping Government actions and Government-made measures that is "constitutionally dangerous" and "contrary to the spirit of the constitution," not the well-founded anxiety of the peers to be kept informed of the facts.

The Constitutional Time-table

The time-table for the rest of this Parliament that the Cabinet has evidently planned is an interesting exercise in cutting things very fine. The calculation is, apparently, that by the end of the fourth session—that is, by August, 1949—the Bill to amend the Parliament Act will have been passed twice by the Commons and rejected twice by the Lords, while the Steel Nationalisation Bill will have been passed and rejected once. These can be slow and leisurely proceedings, but in the fifth session, which will presumably begin in October, 1949, every day will count. The first business before the Commons will then be to send the Parliament Bill up to the Lords a third time; to keep within the existing Parliament Act, it must not be passed until two years after the date on which it received a second reading. It could not, therefore, arrive in the Lords for the third time until November, 1949. The Lords cannot be said to have rejected it a third time—and the Act of 1911 makes rejection for the third time a condition of presentation of a Bill for the royal assent—until they have finished their debates on it and it might not be beyond their Lordships' powers to go on talking until Christmas. It would therefore seem possible for the Opposition, if they wish, to delay the enactment of the amending Act until the very end of 1949. Nothing that is put into the amending Bill can affect this date, for the Bill will not be law until then. Hard on its heels will be the Steel Nationalisation Bill, coming up for the second time. But this also—if the amending Act merely shortens the period in the Act of 1911, without changing its procedure—can be debated at length and might not be rejected by the Lords, and therefore eligible for enactment without their consent, until several weeks—perhaps even months—into 1950.

Thus there is only just time within the maximum lifetime of this Parliament to get the Steel Bill on to the Statute book. But getting it into effect must take a little longer, even with the utmost hurry. In fact, nationalisation might not be actually accomplished by the time of the General Election, and if the Conservatives were to win the election, they might be able to rush through a repealing Act before the appointed day. Even if the steel industry did not get its reprieve before the trap was actually sprung, it might be possible to revive the body if it were cut down while still warm. Evidently it is going to be a very close thing.

There is only one way in which the Cabinet could substantially speed things up, and that would be by obtaining from the King a mass creation of peers in order to get the amending Act through earlier. Mr Churchill recalled this week that in 1910 King George V made a prior General Election a condition of his consent. Mr Morrison was right in objecting to Mr Churchill's description of this as a ruling precedent; there are no ruling precedents in the British Constitution. But it is equally clear that the King is not bound to accept unconditionally any advice that is tendered to him on this point. Fortunately matters are most unlikely to reach the pass of forcing a personal decision on the King; for it would take a truly gigantic creation to give the Labour party a majority in the Lords, and Mr Attlee might be very hard put to it to find hundreds of Labour supporters willing to assume the ermine to please Mr Aneurin Bevan.

Last Week's Breath-taker

"Economic and financial policies should work together and supplement each other, as indeed they do under His Majesty's present Government"—The Rt. Hon. Hugh Dalton, Chancellor of the Exchequer, speaking in the House of Commons, Friday, October 24, 1947.

M. Thorez Isolated

The second ballot of the French municipal elections and the election of the mayors of the larger towns constitute together an overwhelming defeat for the French Communist party. They no longer hold the leading office in any of the major French cities, and though the final results of the second ballot are not yet known, it is already plain that their power to direct local government has been decisively reduced.

This, however, does not mean that the party has lost any substantial proportion of its former support. On the contrary, evidence from the first ballot shows that it has lost only a few per cent of its voting strength. What has happened is that anti-Communism has made immense advances, so that in almost every locality the Communists went into the fray in total isolation. In some localities the Socialists joined forces with them in the second ballot, but many Socialists, and all the other parties, when called upon to make the choice between Gaullist and Communist preferred to look to the Right. In one northern town a Socialist mayor was elected by the joint forces of the Centre and Right in disregard of a local Communist-Socialist agreement. The only Socialist to vote with the Right was the mayor-elect, who defeated his Communist opponent by a majority of one.

M. Thorez and his followers have evidently been preparing for some time to fight alone, and the violence of their invective against the "parti frère" reached new heights this week, when they devoted almost half the front page of *l'Humanité* to headlines announcing "the Socialist treason." Their policy of opposition to America, and particularly to the Marshall Plan, does in fact exclude them from any coalition. Their latest party appeal recognises this, and asks for a "determining role," and not, as before, mere participation for the Communists in a reconstituted government.

With diminished authority in local government and a permanent and derided minority in any nationally elected Assembly, the Communists have no choice but to turn now to extra-parliamentary methods. Their main means of pressure are in the trade unions, where there is a fund of discontent and distress ready for exploitation. This week the government has made new concessions to buy off a threatened railway strike which, it had been feared, would lead to a general strike. But M. Ramadier has warned the Assembly that a firmer policy will be required to save the franc, and a trial of strength between the State and the CGT, which is under intransigent Communist direction, must now be expected.

Fight Outside Parliament

On the Gaullist side there is also new evidence of a determination to resort to extra-parliamentary methods in order to establish the "strong state" which this powerful section of the community, though still decisively in a minority, believes to be the only bulwark against the Communists. General de Gaulle's own statement declares first, that it would be desirable for the Assembly to revise the constitution, to transform the electoral law, and then to commit *hara-kiri*; but, since he must know that there is little hope of getting the Assembly to comply, his conclusion—that the RPF will take its responsibilities "whatever happens"—is certainly the key to his real intentions.

This forthright denunciation of the institutions of the Fourth Republic has frightened many potential sympathisers with the

General, and he has had some hard knocks this week, even from such conservative papers as *Le Figaro* and *Le Monde*. The Socialists now seem to be taking the lead in a new effort to strengthen the shaky coalition of centre parties in defence of the political *status quo*. They have been equally outspoken this week against the RPF and the Gaullists. A leader by Léon Blum in *Le Populaire* makes it very plain indeed that they share the Communist view of the General as a potential Fascist dictator, and that no anti-Communist rallying cry will be sufficient to rally them behind the General's stern leadership. There seems good reason to hope that the recent election results and the disagreeable "incidents," which have brought Communist and Gaullist factions to blows with each other both in Paris and in many provincial towns in the last few days, will have a salutary effect on the centre parties. They certainly wish to prevent the existing tension from developing into civil war, but have been sidetracked until recently by inter-party polemics and endeavours to cadge votes from each other.

Pump Priming in Germany

The latest report of the Select Committee on Estimates is an excellent intelligent man's guide to Germany. They have unearthed only one novelty at which they "were astonished"; they discovered the Control Commission still had no branch for checking expenditure in Germany. This is being put right now. They might well be astonished, considering that the net annual charge on the British taxpayer for maintaining the late enemy is over £80 million a year, not counting the £60 million spent on the occupying forces. Of this total £71,250,000 is spent on essential imports—mostly food—and another £5 million on imported raw materials and partly manufactured goods. Against this costly pump priming there can be set only £8 million from the proceeds of exports from the British Zone in 1946.

Outstanding among the 21 recommendations of the Committee are two: a proposal that the whole question of revising the German price structure and fixing a uniform rate of exchange for the mark should be investigated by experts; and a pungent reference to the fact that more paper is used for football coupons in Britain than is available for education in the whole British Zone. Discussion about currency reform in Germany has become hopelessly complicated by quadripartite disagreements, and also by differences between those who want to defer the reform until productivity increases and those who say that productivity cannot increase until the currency has been reformed. It is time for fresh minds to get to work. Outstanding in the information provided by the report is an appendix giving a detailed study of transport resources in North Rhine-Westphalia, and another giving a survey of the food situation and recommending an immediate increase in the present ration. The first points out that only a third of the demand for extra wagons to move Ruhr coal can be met, and that transport services are only just capable of moving current coal production, leaving just under 1½ million tons of coal stocks on the ground. The second points out that, with its present agricultural production, western Germany can provide its non-farming population with only 1,000 calories a day, or barely 39 per cent of the minimum ration required for "real recovery." This crucial dependence on imported food is likely to last for years, and is something to be borne in mind when questions are asked about long-term guarantees against German misbehaviour.

Marshall Plan and Molotov Plan

In the course of last Monday's debate Mr Bevin pleaded with his critics that they should try to understand the attitude on dismantling and reparations taken by Germany's neighbours. He was obviously thinking as much of Poland and Czechoslovakia as of France. There Communist propaganda is worrying even staunch friends of the West with the persistent charge that America and Britain are building up the strength of western Germany with a reckless disregard of the risks. Czechs, Poles and Russians are told repeatedly that Germany will have, if not priority, at least equality of benefits under the Marshall Plan. In his anxiety to allay this fear Mr Bevin went so far as to say that "nothing would have been more fatal to the Marshall Plan itself" than to have linked Germany with it, forgetting that the Paris report of the sixteen Governments includes estimates of German needs and productive possibilities. This lapse only shows how difficult, how unnerving, how destructive of clear

thought and firm resolve must be any attempt to follow at this juncture the middle line between Russia and America advocated by Labour back-benchers.

It must be firmly held in mind that in Europe this winter there is a race on between the Marshall Plan for the West and the Molotov Plan for the East; that Mr Zhdanov and his Cominform have declared open war on the Marshall Plan. ("As far as the USSR is concerned it will make every effort to prevent this plan being realised.") To hesitate or delay in mobilising all the resources of western Europe behind Mr Marshall's Plan would simply be to play into the hands of a very determined opponent. If the Plan succeeds and western Europe begins its climb back to prosperity and solvency, its power to influence and attract eastern Europe will be far greater than it is now. While that process is going on the countries of eastern Europe will be learning whether their effort to reconstruct and industrialise themselves can in fact be carried out with Russian help alone. At the moment it is in the Soviet Government's interest to make the best showing it can with supplies of food and raw materials to such allies as Poland and Czechoslovakia. Whether that showing can be kept up, whether those countries can supply enough of the capital equipment that Russia needs, and whether they can dispense with either the quality or the quantity of goods that America has to offer—all this is at least as uncertain as the success of the Marshall Plan.

Nothing that Mr Bevin can do in the way of diplomacy can now undo the success won by Mr Molotov when he forced these eastern European governments to stay away from the Paris economic conference. Time, bitter experience and patience can alone heal that breach. Concessions here and compromises there to meet the complaints of Germany's plundered neighbours will not noticeably affect Russian and Communist influence on them. What will check that influence is a swift and clear demonstration that western Europe—including Germany—can recover, that acceptance of American aid does not mean political dependence, and that the Communist theory of non-Communist countries inevitably collapsing into chaos and war is demonstrably untrue.

Something else, too, is needed, so far seldom discussed in public: a serious effort, made by industrial and scientific experts, to work out simple methods by which any attempt of the Germans to re-arm or prepare aggression can be detected and checked at an early stage. So long as this is not done there will be plenty of important people in Europe ready to believe that Britain is preparing what they call "another Munich."

International Trade Agreement

The mountainous labours of the Geneva Conference are at last at an end, and all concerned are saying that what has been brought forward is much more than a mouse. But the public is to have no opportunity of judging until the middle of November, when the documents are to be published—unless there is the usual leak in Washington. Even in three weeks' time it may be very difficult to form a firm judgment, for what is to be signed this week is an immense document incorporating the results of a large number of bilateral negotiations among sixteen different nations. And even when the different concessions have been sorted out, it will still be difficult to distinguish those that open a door against which traders have been actually knocking from those whose practical effect is nil.

The Agreement will stand or fall by what happens in consequence of it to imports into the United States. Not only is it dollars that the world needs, but the American tariff is almost the only one in the world that is effective at the moment, since all others are overlaid by quantitative restrictions. The President of the Board of Trade said on Wednesday that

we have agreed to reductions in our own tariff or to reductions or eliminations of the preferences we enjoy in other Commonwealth countries only in return for concessions which we consider equivalent in terms of the trade thereby opened up to us. We have been particularly concerned to secure reductions in the tariffs of other countries, including the United States, which would provide an immediate opportunity of increasing our dollar exports.

The key word in the last sentence is "immediate" and if the immediate gain to dollar earnings is of any size, the British negotiators will deserve the heartiest congratulations. On one point, the congratulations need not have this provisional element: it is a technical achievement of a high order to have brought to completion a negotiation as complex as this must have been.

The fact that it was done reflects highly on the skill, the patience and the will to co-operation of those who have been concerned.

2,700 Calories a Day

The cuts in rations announced last week by Sir Stafford Cripps should have surprised nobody, for it was well known that dollar food purchases would have to be restricted. But, strangely enough, the cuts bear little relation to any saving in dollar expenditure. The weekly ounce of bacon is a direct result of the failure of the Danish food negotiations; so is the reduction from 3 to 2 ounces in the butter ration that will come into force in November. The maintenance of the meat ration at a shilling's worth a week, and the reduction of sugar to 8 ounces a week, are perhaps the only two items on which a few, if any dollars will be saved. On the other hand, the Ministry of Food's reported decision to ration potatoes is right. Administratively it will be difficult to work satisfactorily, but the poor potato harvest (estimated this year at 8.1 million tons, compared with 10.2 million tons in 1946), coupled with a possible tightening up of the bread ration, unless adequate supplies of Australian wheat are made available, has made it imperative to husband supplies against next spring and early summer. It is only a pity that it was not done two months ago before consumers started to husband supplies for themselves.

The reduction in the calorie value of the diet from 2,870 to just below 2,700 amounts to a 6 per cent drop in consumption—or 10 per cent lower than it was before the war. (The trend of some basic rations and the number of calories available is shown in the accompanying chart.) Of course nobody, not even the Ministry of Food, believes that calorie figures reflect the full decline in actual consumption. The figures are averages and apply to food moving into consumption and not to food consumed. The high calorific value of the national diet has been achieved by the increased quantities of bread, fish and potatoes, which make the British diet monotonous and unpalatable. Under the new cuts, the actual amount of food consumed is more likely to be four-fifths of the 1938 level.

What, however, is more serious is that British food policy seems to have gone awry. Purchases of American foods cannot be made because of the dollar shortage. Food subsidies cannot, it appears, be taken off. Nor, on the other hand, can the Government afford to increase their total amount. This means that food supplies from soft currency areas cannot be purchased because their price is too high. When such a policy reduces the quantity of a ration—the weekly ounce of bacon for instance—to absurdity, a good case can be made out for derationing and desubsidising that foodstuff and allowing those consumers who will to pay the higher price. To do this for bacon at the moment could not be said to be starving the poor.

Victory for Mr Bevan

It appears that the public have now heard all they are likely to hear about the revised housing programme and that the new White Paper on the capital cuts will add little or nothing to the brief statement made in the course of Sir Stafford Cripps's speech in Parliament on October 23rd. The next step is for the Minister of Health to issue detailed directions to the local authorities. This is a lamentably vague situation in which only the victory of Mr Bevan in the councils of the Cabinet stands out clearly.

Which way to the world?

Ask someone the way to the next street but one—and you'll find

he's 'a stranger in these parts'. But

if you want to know the Speedbird way to anywhere between Montreal and Hong Kong, or Glasgow and Johannesburg, that's an easy matter. Look for the B.O.A.C. sign outside a Travel Agency. The man inside can tell you. He'll give you not only the Speedbird routes, times and frequencies, but advice on all the angles of air travel from packing to passports. He's a man of the world—no stranger in it: and all his experience is freely at your service.

And what justification can there be for carrying on without alteration with the 90,000 houses under contract but not yet even begun? There would indeed be genuine wastage of effort if houses nearing completion were abandoned and the Government would be perfectly right in concentrating on these, provided they took steps to ensure that they were completed with due speed. But the effect of its present decision is likely to be that fewer houses will be completed over the next six months than would otherwise have been the case. Any cut in the programme must, indeed, be a very grave matter, because of its social repercussions; nevertheless, the discomforts of overcrowding are lesser evils than hunger or cold.

Mixing-up the Classes

Mr Aneurin Bevan has in the past expressed himself in favour of housing schemes which provided for a judicious mixing of the classes, so that new housing estates should no longer be filled entirely by people drawn from one section of society. So far this new policy has been implemented in the breach rather than the observance, since local authorities have not been permitted to do more than leave an open space for those houses intended to be bigger, better and more expensive for their future middle-class occupants.

It now appears that the Minister of Health is prepared to sanction the building of a limited number of these larger houses straight away, and the London County Council last week approved a number of plans for them. The houses are mostly of a four-bedroom type, with immersion heater, independent boiler, one or two radiators and in some cases a garage. It is intended that they should be built in pairs, or occasionally in blocks of four, in the same streets as the more normal type of council house. Economic rents will be charged, and it will be extremely interesting to see how these compare with the subsidised rents.

It remains to be seen whether this small concession to the middle classes will survive the cuts in the housing programme. Nevertheless, it is some cause for gratitude that Mr Bevan has even recognised their difficulties thus far. How long the gratitude of the future occupants will survive the acutest phase of the housing shortage will depend on how fast the social transformation of this country takes place. In a country so socially undemocratic as Great Britain the first middle-class tenants are likely to feel themselves isolated and lonely, and the poorer tenants to regard their more well-to-do neighbours with jealousy and suspicion. This is not to say that the experiment should not be tried, but rather to anticipate the initial difficulties which will take place. If the LCC would also experiment with building larger groups of middle-class houses, say, a street at a time, next to streets of subsidised houses, the comparison of results would be valuable.

Both Dominions thus appear to be trying to have it both ways, maintaining the principle of ruler's choice when it is to their advantage and denying it when it goes the other way. But Junagadh is a trivial matter, whereas Kashmir is of very great importance. It is the largest of the Indian States in area except for Hyderabad—it is about the size of England and Scotland—but, as it is very mountainous, it has only a small population; it is economically significant as a producer of timber and silk. It really consists of two States—Jammu, which is mainly Hindu and was made over to Gulab Singh by the Sikh ruler of the Punjab in 1820, and Kashmir itself, which was added by the British in 1846.

The issue has already nearly brought war between India and Pakistan. When the Maharaja notified his accession to India, Indian troops were sent by air to assist the State troops against the rebels ; Mr Jinnah thereupon ordered General Gracey, Acting C.-in-C., Pakistan, to cross the frontier of Kashmir and occupy Srinagar. But General Gracey pointed out that this would be an act of war against India, and asked for reference to Field-Marshal Auchinleck, the India-Pakistan Supreme Commander, who flew to Lahore and warned Mr Jinnah that, if the two Dominions were to fight each other, all British officers on both sides would resign. Mr Jinnah then invited Lord Mountbatten and Mr Nehru to a conference in Lahore, but Mr Nehru is ill, and the Governor-General cannot act constitutionally without him.

There is talk of a popular referendum in Kashmir to decide the issue, but in such a vast and mountainous territory a referendum would require hundreds of external observers if it was to have any validity, and such observation would be hard to arrange. A solution might be to separate Jammu and Kashmir, Ladakh remaining with the former and the Gilgit region with the latter. If no political settlement is reached, the local military advantage is likely to be with Pakistan, for winter snows will soon block access from India not only overland, but even by air, whereas communications with Kashmir in winter from the Pakistan side are much less obstructed.

In face of violent attacks from the Left, the Italian Government has since June been trying to strike a balance between various economic objectives. With the overriding aim of inspiring confidence abroad and coaxing out much-needed foreign loans, it has been trying to balance the budget, while at the same time taking measures to lower the cost of living and to ensure full employment. At the moment it looks as if it is having some success in one effort: after a steep rise in the cost of living between June and September wholesale prices of certain foods—meat, sugar, olive oil and vegetables—have shown a tendency to fall. It is too early to say whether the tendency is merely a passing one.

As part of his measures against inflation, Signor Einaudi has been trying to restrict credit. The ultimate results of this policy cannot yet be gauged. But, taken in conjunction with the lifting of the ban on dismissal of workers—at last coming into effect after prolonged negotiations—it is now possible to see some immediate consequences in industry. That ban, introduced after the liberation and nominally suspended in August, 1946, has, in fact, remained effective until now, owing to the difficulties of reaching agreement between the Industrialists' Confederation and the CGIL (the Italian Trades Union) on the method of dismissal. So industrialists have had to meet very heavy wages bills, irrespective of whether or not there was the work for the many hands to do. In the iron, steel and engineering industries, where recovery has been considerably slower than in the textile industry, the

burden has been particularly heavy. Firms found themselves compelled to depend on Government subsidies or bank credits to meet their obligations.

Now the Government is trying to regularise the position. On the one hand, banks are no longer authorised to lend sums above 70 per cent of a firm's deposits. On the other hand, it has established a fund for the assistance of the engineering industry, to be known as the "Fondo per l'industria meccanica" or FIM, which is to be held by the semi-official Instituto Mobiliare Italiano and administered through a committee which will examine firms' applications for assistance. It has been specifically stated that small firms will be as eligible for assistance as large concerns. This policy may take some time to put into effect. For the time being, while Fiat and Isotta Fraschini have between them just received advances amounting to 1,250 million lire, many other firms—large and small—cannot find the money to pay their workers.

Berlin Bait Refused

The sixth interzonal conference of German trade unions, which ended its session at Bad Pyrmont on October 23rd was an occasion of some importance. The delegates, behind closed doors, discussed two main questions: the first was whether the unions should fuse, and the second, what their attitude should be to dismantlement. That they came to no sensational decisions on either is a matter for satisfaction.

The conference's resolution on the formation of a united German trade union organisation did not carry things much farther. The working committee which has been considering it for some months will continue working, and a "trade union congress" will meet next spring. It was suggested at the conference that the World Federation of Trade Unions might be asked to consider this convention sufficient evidence of unity to permit the German unions to be affiliated to it. The WFTU's offer of affiliation, made on the condition that a single German organisation should be established, was a bait which Moscow has long dangled before the Germans. There has been a fresh ribble at Bad Pyrmont, but no bite on the hook.

The organisation of the trade unions in the West and East of Germany is fundamentally different. In their Zone, and in Berlin, the Soviet authorities sponsored a single union on the Russian model, strictly controlled from the centre, and under Communist domination. Attempts to do the same in the West were frustrated by the rules of British and American Military Government, which insisted on the democratic growth of unions from the bottom upwards, based on free elections. No aspect of British policy in Germany has been so unfairly criticised as this. Without those SHAEF regulations the entire German labour movement would today be under Communist direction from Berlin. Instead, unions in the British Zone, formed on an industrial basis, are now autonomous organisations grouped in a zonal federation. In the American Zone, the unions are also autonomous, and are still not combined in a zonal federation. The Americans are less neutral than the British in opposing the formation of a single organisation holding financial, and thus policy, control at the centre but they have encouraged the establishment of a bizonal trade union federation of autonomous unions.

The conference's resolution on dismantlement, passed by the Western unions only, was a very mild protest, which closed with an appeal to German workers not to despair, or to take any desperate action. This does much credit to the moderation of the non-Communist leaders, and also reflects the dilemma in which Communists from the well-stripped Soviet Zone are placed when they agitate against dismantlement in the West.

* * *

The TUC and Wages

It could hardly be expected that the Trades Union Congress, which has so frequently and so adamantly refused to admit the necessity for any kind of wages policy, would respond with alacrity to the Government's recent approaches on the subject of wage stabilisation. It is perhaps remarkable that the General Council should have gone as far as it has, in discussing the issue at all and in agreeing to call a special conference of trade union executives to consider what, if any, action to take. Two months ago, any such suggestion would have immediately been ruled out of court. The General Council is, of course, quite correct in insisting that it cannot speak for its affiliated unions and has no authority over them in matters of wages and working conditions.

But this does not preclude it from giving a lead, which individual unions could follow, as it did in the case of staggering working hours.

The discussions have been proceeding behind an iron curtain at Transport House and no definite facts have yet been given. It is, however, known that among the tentative proposals put forward by the Government is one for a "points" scheme for wages, under which the deserving undermanned industries would rate high for increases, while industries already fully manned or in non-essential categories would not qualify. The conflict over this proposal has appeared before—at the Margate conference, when Mr Deakin, on behalf of the General Workers' unions, rejected categorically the idea of any wage discrimination in favour of any particular section of industry, whereas Mr Lawther urged special incentives for the miners.

Whatever divisions may exist on wages, however, there is complete unanimity among the unions on the limitation of profits, and on their opposition to the reduction of subsidies. That is why the TUC is anxious that the unions' views should be clarified and presented to Mr Dalton before he finally determines his autumn budget.

Budget apart, the need for speedy decision is emphasised by the imminence of a number of wage claims. That of the Post Office workers, who are seeking a minimum rate of £5 a week and an increase of £1 all round, may be regarded as something of a test case. Consideration of the miners' claim for £1 increase in the weekly minimum was only postponed because Lord Hyndley, wisely and firmly, refused to negotiate while there was a stoppage in the Scottish coalfield. Meanwhile, figures published in the *Ministry of Labour Gazette* show the extent to which wages have risen. The average weekly earnings of nearly 6,000,000 workers in manufacturing industries in April, 1947, were 103s. 6d., or 94 per cent above the 1938 level. When the last return was taken, in October, 1946, the increase was 90 per cent, and in January of last year it was only 74 per cent. Since April there has been a further upward movement in wages in a number of industries.

* * *

Service Strength

The process of clarifying the present strength of the Services has been carried a good deal farther over the last week, to some extent by the Minister of Defence in the House of Commons, to a greater extent by Lord Hall in the House of Lords. Public attention had been mainly attracted by the allegation that the effective striking force of the Home Fleet at the moment was reduced to one cruiser and four destroyers. Mr Alexander in his explanation was far from clear. In the end he admitted that substantially the position was as alleged, but he quite failed to give the man in the street any clear grasp of why such a state of affairs existed. Lord Hall, on Tuesday, was more frank and as a result more effective. The Admiralty have faced the fact that the manpower of the peacetime Fleet is never likely to exceed 147,000 men—maybe the Navy will be fortunate to retain that number for any considerable period—and that in consequence the Board of Admiralty decided to make at once a complete reorganisation in the deployment of that number of men. Inevitably, some portion of the total Fleet had to be laid up while the process was in operation, and it was the Home Fleet that was chosen for that purpose. As Lord Chatfield put it, if the Foreign Office were prepared to advise the Admiralty that the Home Fleet could be laid up for six months—and it is unlikely that the Admiralty took action without that assurance—he was prepared to accept that decision. Few would disagree with him. It is rarely possible to make an effective reorganisation of anything without making some section of the machine stationary for some period.

In the long run the most disquieting feature of the information extracted from the Government is the comparative failure, so far as the Army and Air Force are concerned, of the recruiting campaigns for the auxiliary services. The figures speak for themselves. The present totals are: Territorial Army, 32,000, Naval auxiliary forces, 11,800, Auxiliary Air Force, 1,800.

This is not a matter of immediate concern. The country still possesses a very considerable number of trained men and women still of military age. No doubt they do not join any voluntary service because they know that if trouble arose they would be called back without delay. But every year a percentage of them ceases to be of military age. The voluntary organisations exist to make good this wastage and that they clearly are not doing at the moment. Since the problem is essentially a long-term one it is easy to dismiss it now, only to find it all the more difficult

to solve when a scare comes. It is as important as any that the Service chiefs have to solve.

* * *

"Exploiting" the Colonies?

One of the first Bills of this session to be published is the Overseas Resources Development Bill, which gives legislative form to the Government's proposals for the East African groundnut scheme and the £100 million Colonial Development Corporation. Two corporations are to be set up: the Overseas Food Corporation, with total borrowing powers of £55 million, whose sphere may be anywhere outside the United Kingdom and which will, among other things, carry out the groundnut scheme; and the Colonial Development Corporation itself, whose total resources will be £110 million. The first corporation will be responsible to the Minister of Food, the second to the Secretary of State for the Colonies—a division of responsibility which may be unfortunate. It is quite true that the Overseas Food Corporation has to be invited by the Colonial Secretary before it initiates a project in any colonial territory, and both corporations will have to consult with local interests and wishes. There is also a clause in the Bill designed to safeguard the interests of the employees of the corporations' undertakings. But there are already suspicions enough among colonial peoples about the real purpose of the corporations without the entry of the Ministry of Food, whose primary function is to fill the stomach of the British consumer at the lowest possible price and which is sure to be accused of keeping down producers' prices.

These suspicions arise mainly from the emphasis that was laid, during the 'thirties and early 'forties, on the need to diversify the colonies' economies, to prevent them from specialising on one or more export crops which made their prosperity dependent on world markets. What those colonies, where big production schemes are contemplated, are asking is whether, in its own interests and because of its own crisis, the United Kingdom is now changing its mind and imposing a policy of agricultural specialisation on them. "Industrialisation" has become a political catchword in the colonies, especially in parts of Africa, and though industrial projects are not ruled out for the Colonial Development Corporation, its activities will be mainly agricultural.

It is true that official policy always emphasised that what industry would be started in the colonies would be mainly the processing of raw materials and that industry needing protection or subsidies would not as a rule be encouraged. It is also true that the secondary effects of the introduction of capital on a large scale, implicit in the new policy, may well be a broadening and diversification of colonial economies and even a certain amount of industrialisation. Nevertheless, the colonies may well insist on more tangible evidence that they are not being "exploited" at a time of shortage, only to be abandoned when the shortages are over. And however unjustified their suspicions, and however justifiable the new policy in their own interests, it will be very difficult to provide this evidence.

* * *

Right Revival in Norway

The municipal elections in Norway on October 20, like those in France, were significant because the issues were not local but national. If it were otherwise, the swing to the right which has taken place would not call for attention. So far results are available for only 640 of the 744 districts, and in those Labour, with 536,000 votes against 487,000 in December, 1945, has made some gains. But the comparative gains of the right-wing parties have been far larger. Most important are the well-organised Conservatives, with 197,000 votes so far against 124,000 in the previous elections; the Liberals come next with 130,000 votes against 99,000; then the right-wing joint list with 107,000 votes against 74,000; and the Christian Popular party with 103,000 against 98,000. With 80 per cent of the electorate polling (against 65 per cent last time) all the important parties, except the Communists, increased their poll.

The main cause of the swing to the right against the government was probably resentment at recent proposals for increased taxation. But in agricultural districts there is also much dissatisfaction with the level of controlled prices for farm produce. General opposition to price control, centralisation and expensive administrative machinery has concentrated on the controversial *lex Thagard*, the key to the Government's power to impose controls. But in spite of these grievances and cuts in imports and rations, Labour remains by far the largest party.

500 years ago the natives of central America flavoured chocolate with vanilla extracted from wild orchids

Today vanilla is not only the popular flavouring for chocolate, toffees, custard powders, biscuits, ice cream and many other foods, it is also used as an odorant in perfumes, soaps, cosmetics, rubber and printing ink. Vanilla is now obtained from natural oil of cloves in the form of vanillin. Vanillin Monsanto is 100% pure and is 40 times stronger than vanilla.

SERVING INDUSTRY . . .
WHICH SERVES MANKIND

Letters to the Editor

End of Act Two

SIR,—I was very interested to read the letter from Mr Timms in your current issue, especially as I was expecting that before long an attempt would be made to discredit the recent Government debacle in the Cambridge Union. I do not seem to remember that before 1939 the anti-Conservative majorities in the Oxford and Cambridge Unions were regarded as composed of "partially developed critical faculties" by those who shared their views outside the two Universities. On the contrary, they were hailed as the outward and visible sign of youth's determination to resist Fascism, to abolish national armaments, and to uphold the League of Nations. Support of these causes was regarded as the hall-mark of sane and progressive thinking.

Nor do I remember hearing, from the same source, the supporters of Mr Chamberlain praised for their "firm conviction," and their stability and firmness favourably contrasted with the vacillation and loose thinking of their Socialist opponents. If Mr Timms desires to make a sacrifice for once to consistency, a post-date tribute to those Conservative undergraduates who did not "change colour" during their term of service in the recent war would not be altogether out of taste.

It is a pity that the Left are unable through their self-inflicted blindness to see the writing on the wall. It only means that the eventual disillusionment will be unnecessarily painful, but if it is not to be unbearable it should not be assumed that young Conservatives and their allies at the Universities do not mean what they say.

Mr Timms seems to forget that there are subtle differences between Oxford and Cambridge. In my experience, the members of the Cambridge Union vote for measures rather than for men.—Yours faithfully,

RICHARD FIELDEN,

Ex-President, Cambridge Union Society

11 Cheyne Place, S.W.3

SIR,—The prospect of forming a new party, as mentioned by a correspondent in your issue of October 25th, must have excited the interest of many who like to think themselves impartial. Having been labelled a "nation of compromisers," Britons proudly try to live up to that epithet, often using extreme and eccentric methods to prove it.

But no middle party of compromise would stand a chance now for three reasons. First, the parliamentary system in this country favours the two-party House—for which we may be devoutly thankful as we watch the fluctuating coalitions and *coups d'état* in our European neighbours. Hence a third party would have small chance of success indeed unless it appealed to a new and hitherto ill-represented class of the community, as the Labour Party did at the turn of the century.

Second, the moment is inopportune to create a central party when the swing of the electoral pendulum is considerably to the left of centre.

Third, there is already a central party, the Liberal Party, and the extent of its support is the measure of the popularity of political compromises.

The only hope for a new and more moderate party is from a cleavage in the ranks of one or both of the two main parties, causing a breakaway and the formation of rival groups. But divided loyalty has always proved fatal, and when the parties resolved themselves into two large ones at the expense of one "splinter," we should again be faced with the choice of right or left.

It seems that in politics there is no compromise, only a choice between two evils, and he who has no axe to grind had better not vote at all.—Yours faithfully,

J. W. N. RIDDELL

20 Moor Lane, Rickmansworth, Herts

SIR,—Your leader of October 18th asserts that

it is difficult to believe that, had the crucial two million voted the other way in 1945 the position of the country would have been substantially different to-day.

I dissent wholeheartedly from such a concept, for have we not witnessed during the two years of Labour administration the gradual supersession of private trade, the emphasis on planning and the subordination of the individual, the immense increase in bureaucracy, the steady appropriation of wealth and the extinction of liberty, the virtual sterilisation of the middle classes and the

multiplication of officials, the slackening power of production and the lack of incentives to industry.

Can you, Sir, imagine that similar results would have accrued from a prudent and far-seeing Government, intent on the all-important work of restoring our weakened economic fabric?

What incentive did the Government give to the people to go all out in a determined effort to restore production? Did they not lull the nation into the mood of slothfulness by promising them the moon and by failing to point out the serious position into which our finances had sunk?

No, Sir, I do not think "it is a good thing that Labour has been in power these last two years." The facts belie such a belief.—Yours faithfully,

A. WIGGLESWORTH

Port of London Building, Trinity Square, E.C.3

Political Plague

SIR,—As one who deplores "anti-semitism," may I protest at the way this term is used in the article in your issue of October 18th? Since you support the tightening-up of the operation of the law against racial incitement, clarification is most necessary.

The decision to send the *Exodus* immigrants to Germany may indeed have been a wrong and disastrous decision. But in arguing that the decision was the result of "anti-semitism in high places" such as the Colonial, War and Foreign Offices, you are on less firm ground. Are we not entitled to be given the evidence of this? It should be recalled that General Morgan was accused of "anti-semitism" when he first revealed the existence of organised Jewish emigration from Europe. Is there not a danger that those who call attention to the rights and views of the Arabs may, if judged by *The Economist's* standards, also find themselves accused of this? *The Economist* continues,

... an anti-Jewish policy in Palestine is inseparable from the growth of anti-semitism in Britain. It will not be possible for the Government effectively to check anti-semitism in London or Manchester while the newspapers continually carry reports of violence, reprisal and repression in the Government's campaign to enforce its immigration laws in Palestine.

If this is to be the criterion, the Arabs can hardly expect the Mandate's administration to be impartial.

You contend further that it was the anti-semitism of Hitler's rise to power which has defeated assimilation. Yet surely the 1917 Balfour Declaration and the rise of political Zionism had already defeated the cause of assimilation, even if it ever stood a chance of victory in view of the age-long Jewish antipathy to marriage with Gentiles. This antipathy can no longer be attributed solely to religious sanctions by which other faiths protect their beliefs, for, as your article indicates, the Messianic hope and moral fervour springing from the Jewish religion has become secularised with the decline of religious belief. The other side

From *The Economist* of 1847

October 30, 1847.

THE act of the Government on Monday last must be looked upon, not alone as a suspension of the Bank Bill of 1844, but virtually as an abandonment of its principle. It is quite true that the letter from Lord John Russell and Sir Charles Wood to the Governor of the Bank, describes it as an "extraordinary and temporary measure"; but it is impossible to deny that, whether the act be of itself good or bad, the abandonment of the bill at the only moment when its provisions really became effective, must for ever destroy confidence in its virtue to protect the public interest. Its power for good in the future—even in the eyes of its warmest friends and supporters—must be felt to have received a shock which no vote of Parliament can possibly repair. But we fear that the circumstances and the avowed motives under which this policy has been adopted, will go far to destroy the influence of the legislative in any future course which it may adopt in reference to this important question. Whatever law is passed—whatever restraints are imposed in order to protect the convertibility of the notes of the Bank—it will be impossible to destroy a feeling which for many years must pervade the public mind, that the pressure must only be severe enough, and the demands loud enough, in order to procure a suspension of any restriction which may exist.

of the medal must also be shown if *The Economist* is to maintain its impartiality. Could not *The Economist* make a stand against all forms of racialism?—Yours faithfully,

Pharos, Fairmile Lane, Cobham, Surrey JULIAN BADCOCK

SIR,—May I query the statement in your article in your issue of October 13th, that "in our time anti-semitism has defeated assimilation." Assimilation and absorption are, in fact, proceeding apace under our eyes and remain the solution of the Jewish problem, despite Hitler and also despite the efforts of some Jews to prevent it. Religious practice has decreased to such an extent among Christians and Jews alike that religious differences have become less important and intermarriage easier. Unfortunately it is mostly forgotten or altogether ignored when anti-semitism is discussed that practically all the Jews against whom it is directed are only the first generation of Jews born in this country—if not themselves immigrants!

Racial anti-semitism can be traced to the influx into a country of large numbers of foreign Jews (Eastern Jews from Poland and Russia in the case of Germany and Austria, Central European Jews in the present case of Britain where even the Eastern Jews who came here round the close of the last century are only just about to be assimilated). Hitler's extermination policy has ever destroyed the reservoir of Jews in Eastern Europe (a miserable remnant survives in the DP camps on the Continent and desires to settle in Palestine). Thus, with the exhaustion of the

big reservoir of Jews, the prospects for assimilation and absorption are surely better than they have ever been before and need not be ridiculed as an unattainable "comfortable ideal."

As far as Britain is concerned, the influx of Jews from Germany and Austria between 1933-39 was one of Jews in most cases already assimilated in those countries and thus comparatively easy to absorb here. It is significant that a large proportion of those who came over here as children or adolescents and who have since had a British education or served with the British Forces are marrying Gentile partners and will thus be completely absorbed into British life.

Unless Britain ever were to adopt Nazi methods of investigation into the "racial purity of ancestors," the children and grandchildren of these marriages may grow up without even the burden of the knowledge of Jewish blood in their veins.—Yours faithfully,

REFUGEE WORKER

Sharing *The Economist*

SIR,—Would any of your readers like to pass on their real copies of *The Economist* to English reading Germans? During my recent stay in Germany I have met many persons, students of economics and others, who would greatly appreciate the chance of reading it. I shall gladly supply an address to anyone interested.—Yours faithfully,

L. BUCKNER

THE WORLD OVERSEAS

For and Against MacArthur

(From a Correspondent recently in Japan)

ALMOST every day some Minister rightly reminds us that we must export to live. The trials that beset British merchants in the Far East are a reminder of how difficult it will be, once the temporary shortages have been met, to find buyers for our exports. In China, the continuing civil war has led to such a growth of corruption and incompetence that years must elapse before that huge market is reopened. Even then there will not be the increase of purchasing power for which one hoped twenty years ago, when Chiang Kai-shek marched north and gave China an astonishing and encouraging sense of national unity. Today egg-processing factories in Nanking are closed down—when so many of us would wish to buy eggs—because a ridiculous regulation forbids British refrigerator ships to trade up Chinese rivers. It is far cheaper in Hongkong to buy tea from Ceylon, three thousand miles away, than from Foochow, less than five hundred miles away. Merchants are apt to find that the cost of carrying cargo all the way from Britain to Shanghai is less than the cost of unloading it when it arrives, and storing it in their godowns.

The Americans have burnt their fingers in China. They have trained and equipped Chinese divisions for Chiang Kai-shek, and

these divisions have deserted to the Communists, equipment and all, at the first possible opportunity. In its impatience, and its growing anxiety over Russia, the United States government seems to be in process of transferring its support from China to Japan; it seems heedless of the danger of restoring to power the "Zaibatsu," the leaders of big business, whose desire for world domination was hardly less than that of the militarists, even though they favoured milder methods of obtaining it. To what extent then, pending the recovery of China (where cordiality towards the British survives to an unexpected and encouraging degree) can or should the British turn their attention to Japan? To what extent will the Japanese want to buy British goods? To what extent have they lost their old ambitions, and become "safe for democracy"?

Grievances of British Traders

General MacArthur has in many ways done a remarkably good job. Compared with the chaos of four-power control in Germany, one-power control in Japan is magnificent. But the British business-man who hopes for a share in Japanese trade will meet

many disappointments. The entire administration of the country, even in the small south-western zone of the British Commonwealth Occupation Force, is in the hands of SCAP—Supreme Command for the Allied Powers—and SCAP is American. There can be no British complaint about this, for the responsibility of controlling Japan was placed on American shoulders at the Potsdam Conference, and our lack of men and money has compelled the British to withdraw even the one brigade which took part in the occupation. And the Americans would be more than human if they were to give no advantages to business men of their own nationality. For example, British shipping firms with generations of experience in the Far East were told that all SCAP supplies would be carried in American bottoms. This is natural enough, since the Americans pay the bill and the officials are American. But the bitterness of these British firms is also natural.

Now that Japan is being opened to the private trader, even the most scrupulous effort by the SCAP officials to be impartial will not enable them to give to foreign firms they do not know the same opportunities as they give to American firms with which they may have dealt for years. And the immense predominance of Americans in the forces of occupation tends to make the Japanese forget that the British Commonwealth played a considerable part in their defeat, and still exercises great influence in world politics and commerce.

Years Needed to Rebuild

Quite apart from these handicaps in the way of the British business man, there is the far larger problem of Japan's recovery. The material destruction there is much greater than most British people imagine. Superficially the damage is not nearly so great as the damage in the Ruhr, for the wooden buildings of Japan went up in smoke and left none of those appalling piles of rubble Europe knows so well. But it must take even so industrious a people as the Japanese many years to rebuild their industrial areas. When they have managed again to step up production, it may take them many years to recover lost markets, either because they have left such a heritage of hatred or because these markets—such as China—have themselves suffered destruction. Meanwhile, more Japanese will have to live in greater poverty in a smaller area; for Okinawa, Formosa and other lost islands provided homes for many, and Manchuria provided invaluable raw materials without currency complications.

There are at present very few signs of malnutrition in Japan; but that is because the occupation is costing the Americans some £80 million a year, most of which goes on food to keep the Japanese alive. Also the proverbial but haphazard generosity of the GI provides masses of young Japanese with chocolate, coca-cola and chewing gum. SCAP itself has done an admirable job with injections and vitamins. Before the war Japan was the foremost fishing country in the world; and, although the best fishing grounds have been lost, negotiations with the Russians and others might restore very quickly this invaluable source of food. Japan is so mountainous that, although 47 per cent of the people have to depend on agriculture for their livelihood, only 16 per cent of the country is under cultivation. But SCAP officials have reclamation and other plans which should bring another four million acres into production. All this help, however, does not remove the fact that there is a population of seventy-six million people to keep alive, increasing annually by roughly one million.

Freedom Thrust Upon Them

In such circumstances it would be absurd to expect the Japanese to come through the next decade without the gravest difficulties; although they will inherit from General MacArthur the most democratic constitution in the world, they will also inherit formidable economic difficulties. Many SCAP officials, including the Supreme Commander himself, are very confident that Japan is already safe for democracy; but one dare not forget that the Germans after the first world war had the most democratic constitution in the world, and made singularly little effort to defend it when there appeared both a ranting demagogue and an economic slump. The present Prime Minister, a Socialist lawyer who has spent a good part of his life in prison for his political opinions, does not impress one as a man who will show unflinching energy; other men who have now come to the top are far less experienced than were the members of our own Labour Government. They have to control a population that has not achieved freedom; it has had freedom thrust upon it and therefore may not value it very highly. Even these new democratic

ministers are so surrounded by bowing and sycophantic secretaries and assistants, that one is left wondering whether any change at all has taken place since the days before the war.

SCAP's educational department has done its best. Under its fairly remote control a Japanese committee has "screened" all the teachers, and more than a quarter of them have been removed. In selecting those who are to remain, great pains are taken to get rid of the "skilled mechanic" from the class room. Teachers are themselves preparing their new text books. On a different level editors and political writers are lectured *ad nauseam* on their duties and responsibilities. General MacArthur bases his terrific optimism on the many Japanese who are being given a vested interest in the maintenance of a democratic regime.

Vacuum in the Pacific?

For three reasons some of his subordinates, especially those who lived in Japan before the war, do not share that optimism. One is that so inexperienced a team of men will almost certainly have to turn, after American advisers have been withdrawn, to the Japanese "Zaibatsu," whose past does not lead one to expect from them much resistance to a possible revival of militarism. The second reason is that people so little accustomed as the Japanese to the idea of democracy are likely to pay too much attention to their rights and too little to their obligations. The third reason arises from American fears of Soviet intentions.

These fears are likely to distort the American conception of what kind of democracy would be good for Japan, and of this the Japanese are of course well aware. Those of them who have been pushed off their pedestals by the evidence of their past megalomania may hope to win back the Americans' favour by expressing a distrust of Russia as intense as their own. It can be suggested, ever so delicately, that if only Japan were again a strong military power she could be an invaluable ally in the Pacific. Have not some American papers already gone so far as to suggest that a new Japanese army should be organised under American officers? But then, an army is of little use without heavy industry to keep it supplied; and, after all, the past is past and best forgotten.

Such arguments will find increasing response in the United States as the responsibilities of a Great Power become more obvious and irksome to its remoter citizens. And, if they are allowed to influence American policy, one of two unpleasant consequences is probable. Either the "old gang" in Japan will regain power and will crush the timid and delicate democracy the Allies have fought so hard to introduce. Or the younger generation of Japanese, increasingly resenting American encouragement of reaction and increasingly tempted by the forbidden fruit of Communism, will look to Russia for guidance and inspiration, as the peoples of Eastern Europe looked to England and France during the nineteenth century. That is why many observers in Japan, while paying tribute to MacArthur's sincerity, wish that he were not so addicted to wishful-thinking and were not so surrounded by men who encourage him in this vice.

Socialist Strength in Europe—II

Old and New Currents in the West

[BY A CORRESPONDENT]

AMONG the Socialists of Western Europe there are marked contrasts with both Eastern Europe and Scandinavia. Preoccupation with doctrine and theory, a serious division between Socialist Ministers and party militants, and the competition under democratic rules of strong Communist parties distinguish the situation in Belgium, France and Italy. In the last two the Communists' part in the resistance left them firmly established in 1945 as major political parties, and the Socialists have never recovered among the workers the ground then lost. Intellectuals from the middle classes preponderate in the party executives, while the remaining Socialist influence in the unions is inadequately represented. The embarrassing central position that Socialists now occupy between Catholics and Communists is the result—not the cause—of their inadequacy.

With every new compromise made by the Socialist Ministers in France, the tension between them and the party executive

grows more dangerous. The tragedy of French and Italian Socialism is that the present situation demands collaboration with the Communists, while the Communists have repeatedly demonstrated that collaboration with them is impossible. In despair, some Socialists are turning to the idea of a Socialist International as the only means of regaining lost prestige. Nenni's party in Italy, however, has identified itself in this, as in other matters, with the East European parties, so as not to complicate its relations with the Communists.

In the French and Italian parties a kind of revolutionary socialism is emerging as a dominant current. This has many causes besides the national temperament: the desire to outflank the Communists on the Left, is one; an ingrained mentality of opposition is another. But there is also the fact that thousands of people who would have joined a Communist Party in similar circumstances after 1917 now consider the Communist parties as instruments of a bureaucratic and imperialist tyranny. Some of them flirt with Trotskyism and anarchism, but many have joined the Socialist parties in the hope ultimately of capturing or converting them. The British ILP was such a group before the war. Today, the *Iniziativa Socialista* in Signor Saragat's party and the most powerful group supporting M. Mollet, the French Socialist Party secretary, are composed largely of such elements. These "neo-maximalists," "impossibilists," or "Trotskyists" as they are variously called, tend to be anti-British as well as anti-Russian and anti-American, and their influence is already important. They want to establish a Socialist International as the instrument of a co-ordinated offensive for world Socialism.

The success of the French Socialists in capturing some areas from the Communists during the current municipal elections, suggests that, if the Cominform leads the French and Italian Communist Parties into suicidal adventures, this revolutionary anti-Stalinism in the Socialist Parties may prove a valuable asset.

German and Austrian Parties

It is much too early to predict the future behaviour of the Social Democratic Parties in a free Germany and Austria. Their present importance in European Socialism lies mainly in the embarrassment which their existence causes in Eastern, and parts of Western, Europe. The Austrian party will almost certainly win the next election—after the ratification of the Austrian Peace Treaty. It has made striking progress in the rural areas previously monopolised by the Catholic parties and its prewar rigidity of doctrine is much relaxed. Both German and Austrian parties have identified themselves completely with Western Europe and are in good relations with the British Labour Party.

Holland is an entrepôt of Socialism, as it is of commerce. The anti-clerical Marxist NSDAP gave place in 1946 to a Labour Party more on the Scandinavian or British model; but disappointing election results and the Indonesian issue have made the older members restive. The Party secretary, Koos Vorrink, who was mainly responsible for the new form of the party, is the protagonist of another important current in postwar Socialism—the attempt to present Socialism as a Christian faith. This current is active also in France, Germany and Austria.

The sketch of European Socialism given in this article and the previous one may justify certain conclusions. Firstly, that Socialism is an international political force comparable in importance with Communism and Catholicism; it is, moreover, a force making for European unity. Secondly, Socialists exercise decisive power at the moment only in Scandinavia and Britain; they are unlikely for some time to form majority governments in any other area. Thirdly, so long as America and Russia are divided on all important European issues it will be difficult, if not impossible, for the European Socialists to formulate a common policy in public. Finally, the survival of Socialism in Europe depends primarily on Britain's success in establishing its economic and diplomatic independence; the solidarity of the parties cannot be exploited on a major scale until the material resources are available to support it. Above all, the European Socialists cannot be considered as an anti-Soviet force; any attempt to organise them for such ends would fail or lead to their division and destruction. The men who organised the Cominform, with its abusive and indiscriminating challenge to Socialist leaders and parties, seem unable to understand this.

On the other hand there is a real danger that the Americans in pursuing their cold war against Russia will consider the European Socialists as expendable. Such an attitude would be ill-advised if the aim of American policy is ultimately to produce the conditions in which Europe can recover her unity without a war.

No Headway on Indonesia

[FROM OUR CORRESPONDENT AT THE HAGUE]

"It should be quiet in Holland now that all Dutch fools are in London," said a cynical commentator on his return from Sjahrir's headquarters in a London hotel. Not all Dutchmen who paid a visit to the former Indonesian Prime Minister during his recent stay at Claridge's are "fools." But it is a fact that all Dutchmen who went to see him were private emissaries negotiating on their own behalf; neither the Dutch Ambassador in London, who "could perhaps see Sjahrir"; nor Dr Koets, right-hand man to the Lieutenant-Governor General Van Mook; who was "accidentally" in London; nor Dr Joekes and Professor Logemann, who came over as representatives of the Dutch Labour Party, had any official authority. Sjahrir was growing somewhat sceptical about the chance of new negotiations with the Dutch—and who will blame him?

Some of the private politicians who went to London, particularly Dr Otten, head of the Philips Works at Eindhoven, published a joint manifesto with some Indonesians, asking for fresh co-operation between the Dutch and the Indonesians. Apart from the merits of the manifesto (which were small) two things aroused comment in connection with it.

One of the Indonesian signatures under the manifesto was that of Soekawati, the moderate, co-operative head of the new State, "Eastern Indonesia," that was created six months ago. It is rumoured at the Hague that an official of the Ministry for Foreign Affairs sent Soekawati a cable asking for the withdrawal of his signature. . . . If the story is true, it illustrates rather well the actual position of such creations as "Eastern Indonesia"; Soekawati's position is more like that of the mayor of a fairly large municipality than that of head of an "independent State," member of the future "United States of Indonesia."

Internationally, the Indonesian problem is not making very much headway so far as Holland and the Republic are concerned. All hope is centred now on the "commission of three" approved by Uno, which will perhaps be able to bring both parties together.

In Holland no progress to speak of is being made on account of the international political difficulties. The Cabinet has been divided on the Indonesian issue, and the Prime Minister has openly said so. He added, however, that an agreement had been reached by the Cabinet; but the relevant Government statement gave a history of the conflict from the Dutch side rather than constructive suggestions for further action. Neither the Government's own statements nor lobby rumours give hope that any progress is being made at the Hague.

Waiting for the Cat to Jump

Meanwhile, a silent struggle has been going on over the portfolio of Overseas Territories. Dr Jonkman, its present occupant, an extreme right-wing Labour man, has been ill for a considerable time, and during his absence from office Dr Beel, the Catholic Prime Minister, acted for him. But what lies ahead?

Dr Beel seems to have thought of taking over Overseas Territories himself, whilst shifting Jonkman to a new, less exacting portfolio for "constitutional reconstruction." The Labour Party intimated, however, that such a step would end the delicate balance between Labour and the Catholics in the coalition, and would be unacceptable to them.

A second possibility was that Jonkman should either remain in full charge of Overseas Affairs or resign definitely in favour of another—and possibly more radical—Labour Minister.

As nearly always happens in such situations, a compromise solution is most probable. It is said that Jonkman is to remain, officially, Minister for Overseas Territories; but Dr Beel, who has recently been relieved from his departmental duties for Home Affairs by the appointment of a new Catholic Minister, will from the Prime Minister's office exercise considerable influence on the Indonesian policy of the Government. In order to make this *quatre-mains* even less burdensome, two "Government commissioners" (under-secretaries) will be appointed to look after special sections of the Indonesian, and perhaps also the West Indian, questions. It is said that, in accordance with the compromise nature of the solution, "neutral" persons are to be appointed to the two new posts.

Now, three months after the beginning of military operations on July 20th, the Dutch Government is still looking which way the cat will jump. So far the cat does not jump. In some quarters it is even said there is no cat.

AMERICAN SURVEY

Special Session

VICTORIES for statesmanship over politics are rare enough to be worth applause even if they appear to be belated, as Mr Truman's decision to call a Special Session certainly appeared to anxious Europeans to be. It is doubtful, however, whether anything would have been gained by making the announcement sooner, although even in Washington there were many who were beginning to despair. If the President was in fact determined to act sooner or later, there was everything to be gained from calling Congress for the first possible moment, but delaying the call until the last.

Mr Truman has maintained all along that the effects on European morale—and on the Administration's long-term plans—would be worse if a special session refused his programme than if he never called it. There is no way of limiting the subjects that Congress can debate when called into session. A Republican Congress could, if it liked, refuse to consider the measures for which a Democratic President had called it together, and go on a spree of tax reduction and labour-baiting. The President therefore had to be certain of two things before taking the risk. He had to have his legislation ready for Congress when it met and he had to have some assurance that it would be considered. There had also to be some sign that the Marshall Plan was a practical proposition—that there was the firm ground of recovery on the other side of the gap the United States was being asked to stop. This could only come after the Paris Report had been examined and digested and when the talks with Sir Oliver Franks and his technicians had shown that it was a genuine plan with a bone structure able to carry the flesh of American aid. Before he could know whether Congress would be prepared to discuss the European recovery programme and that it had a reasonable chance of success, Mr Truman had to wait until 215 peripatetic Congressmen had returned from collecting their own evidence. The President's proclamation of a special session is thus a sign of confidence in the work of the Paris Conference and an announcement that the Congressmen who went and saw also learned.

November 17th is the day when action begins, but no one knows how it will develop. The Administration will request, in all likelihood, something over a billion dollars for stop-gap aid, on the assumption that the gap will end on March 31st: some \$642 million for France and Italy, and about \$430 million for the occupied territories. It is also expected to submit to the Congressional committees and then to Congress estimates for the first year's working of the Marshall Plan itself, thought to be in the neighbourhood of \$7 billion.

Relief is a simpler and more popular project than recovery, and there is no reason to doubt that the funds will be voted to keep Europe from starving and freezing this winter, though they may not arrive in time for Christmas. For Mr Truman sprang a surprise in his proclamation by coupling the need for stop-gap aid with the equally urgent need for legislation curbing high prices, and there can be no firm pledge, but only a hope, that the Bill to provide aid for Europe will be given priority over the domestic cost of living, which most Americans regard

as their most pressing problem. The "startling price rises" which the President pointed out were causing hardship, include a 40 per cent rise in the cost of food since mid-1946, and 18 per cent increases in the retail prices of clothing and household furnishings.

Throughout the spring and summer, the Administration has clung desperately to the belief that an already top-heavy boom was on the point of collapsing beneath its own weight, and that any drastic measures to curb inflation could only bring about a decline in productivity which would be worse than the boom itself. Now the trend of banking and industrial opinion is changing fast, and it is becoming quite evident that fresh controls of one sort or another must be imposed within the next few weeks if the situation is not to reach a stage where nothing at all can be done except to wait for an inevitable crash. President Truman in his proclamation gave no precise indication of what the domestic steps would be, but there can be little doubt that his Message to Congress will embrace most of the steps advised by the Council of Economic Advisers at the beginning of October; retention of tax revenues at present levels, tighter regulation in the commodity markets, extension of export controls, and the imposition of new priority and allocation powers for key materials. The Council is known to hold the view that the foreign aid programme is not the primary cause of the inflationary movement, and, moreover, that whatever may have been true in the past, it is now prices that are leading wages, rather than the reverse, so that, given an attempt to hold the price line, there is no case for controls on wage rates.

★

The President is unlikely to press for more than a return to indirect controls and the powers granted in the Second War Powers Act. At a press conference recently, Mr Truman created a small sensation by denouncing price controls and rationing as "police-state methods." This was a political mistake from the point of view of those Democrats who wish to fight the battle of price control all over again, and it is also a quite untenable thesis, but it suggests that Mr Truman has digested the lesson of a recent Gallup poll that 68 per cent of the American people disapprove of a return to rationing to save food for Europe. This is a sharp reversal from a similar poll last year in which 65 per cent were willing to return to rationing. Even so, the political battle on the price-control programme threatens to be bitter and prolonged. Any programme to curb prices in an election year is bound to revive the old controversy of which political party is chiefly responsible. Is it the Republicans for destroying price control last year? Or is it the Democrats for sponsoring foreign aid and turning a blind eye to the consequences of wage increases? Last week Senator Taft suggested that the chief issues in the 1948 campaign might well be high prices, the issue of more or less Federal government interference, and foreign relief. The President's anti-inflation programme, which embraces all three, may thus inaugurate the official opening of the 1948 campaign; the Republicans are likely to have their own prescription for the country's economic ills and it will certainly include tax reduction.

Even indirect controls, which do not affect the voter directly, may be highly controversial. The steel industry, for example, has constantly resisted efforts to impose Federal control on its programme of plant extensions, and while a number of its spokesmen admit that the problem of directing home and foreign buying must involve an extension of priority powers, there is a fear that any programme of allocations must gradually and consistently spread. The imposition of penal restrictions on commodity exchange speculation is another example. At the urgent

request of the President, an attempt has been made to curb speculative activity by the increase of margin requirements, but any suggestion of the creation of a body with powers over the commodity markets equivalent to those of the Securities and Exchange Commission over the Stock Exchange will be met by the united resistance not only of the commercial interests, but the farm producer organisations as well.

An anti-inflation programme, overdue from the domestic point of view alone, is equally essential for the sound economic and political functioning of any long-term programme of foreign

relief. The Marshall Plan is most vulnerable politically on the score that it fosters scarcities and high prices at home. Mr Truman has had the courage to ask Congress in its special session to approve not only the financial cost of stop-gap aid, but the moderate programme of domestic restraints which are the true economic price of America's foreign policy. The Administration's plans must be ready by November 10th when the Congressional committees meet. All that will be needed then, as the *New Yorker* says, is "the proper mixture of charity, austerity, and prosperity."

Low Prices for Shares

(From Our US Editorial Staff)

INFLATION and boom are abounding in the American economy in every sector but one. Commodities are dear, many unprecedentedly so; housing is exceedingly high in cost; the size of incomes in dollars is unparalleled; profits are very large; entertainment and travel are decidedly costly; bond prices are very high and their yields very low. The one major exception is the price of American industry, which preponderantly supplies the country's goods and services and is the source of employment and markets. The valuation which American investors place upon American business is distinctly less optimistic than the price which American buyers are placing on everything else. This is not according to the traditional pattern or the popular concept of booms and is indeed one of the most peculiar aspects of the current American scene.

This low evaluation of American business is not a momentary condition in a fluctuating stock market. It has now persisted for more than a year—and has become steadily more pronounced during that time. The market for industrial stocks made a high since 1937 in the spring of 1946 and was about 15 per cent below that high at the beginning of October. While the present prices are somewhat above the lows of last spring, earnings and dividends have been rising substantially, the latter being about 20 per cent above a year ago.

But the peculiarity of the present condition is more clearly visible in a longer perspective. An average of representative good industrials is now priced at a little less than ten times their annual earnings, which is about the same as at the bottom of the three year decline in stock prices in 1942 and at the bottom of the drastic 1937-1938 break. The evaluation of earnings was much higher than this rate at major market peaks: prices were 16 times earnings at the end high of 1946, and 19 times earnings at the high points reached in 1936, and in 1929.

All dividend paying stocks on the New York Exchange provide an average return on current prices of close to 6 per cent, thus being priced about 17 times dividends, while at the high of last year prices were, in the average about 30 times dividends. The decline in the past year has been greater in magnitude than any in this century, except for the one from 1929 to 1932. The present level is far below that which prevailed in 1939, from mid 1933 to mid 1938, during the latter 1920s, and virtually the whole period from 1900 to 1913. Furthermore, dividends constitute a somewhat smaller proportion of earnings than has been customary: stockholders are being paid somewhat less than half of earnings, while the rule has been somewhat over half. While the average yield on all listed dividend paying stocks is nearly 6 per cent, many investment quality issues provide 4½ per cent to 5½ per cent.

But the meaning of earnings and yields on stocks needs to be put not only in a time perspective, but as well in an "alternative use of funds" perspective. The most generally available alternative investment is bonds—and bond yields, despite the recent rise, are exceptionally low as a result of prolonged easy money conditions. The earnings and dividends on stocks, unusually generous in themselves, are extremely generous historically in terms of bond yields. Yields on good stocks are presently more than 1½ per cent in excess of those on good corporate bonds, while the excess was only 0.64 per cent at the end of May, 1946,

and 0.75 per cent at the high in 1937. To measure it differently, the rate of earnings on good stocks at present, relative to the yield on good corporate bonds, is higher than it has been at the lowest market price in any calendar year of peacetime since 1908.

Still another perspective suggests relative cheapness. The market prices of today are substantially below the valuations shown by the accounting statements of the corporations in a large proportion of cases: differences of 25 per cent to 40 per cent are not uncommon. Yet after the extensive squeezing of water out of capital structures in the 1930s and the rapid depreciation during the war and recent years of high earnings, these book values which the market is so greatly discounting are probably the most conservative in all history. But, in addition, commodity prices are high so that the cost to reproduce present plant and equipment at current prices is very substantially in excess of the depreciated valuations shown by company books.

Why these low valuations are placed on business is one of the most perplexing questions for analysts of the American situation. Three widely differing explanations are offered.

1. A slump in business is coming which the market even at these levels has not discounted. Fixed costs of business are very high and will prove very stubborn to change, so earnings will melt away much more rapidly on decline in volume than in past experience. Profits are inflated by gains being taken on goods acquired at lower prices, which will give way to inventory losses. A low evaluation of earnings is to be expected under present conditions, and existed in 1919 and 1920 when conditions comparable as to commodity prices prevailed. Reproduction costs will look very different when the slump comes and, regardless of book values, property is worth only what it will earn over a period of years. World affairs are moving rapidly in a direction basically deflationary. The view that the market is cheap is an illusion which arises from being too literal-minded about figures.

2. Present prices adequately discount any readjustment which is to come. The readjustment will be small at worst, because of vast unsatisfied demands internally backed by the enormous money supply. Conditions abroad are at a crisis, and with American aid and improvement from expanding efforts in other countries will before long look better; in the long run foreign demand for American products is very large. The price level remains high and existing business at depreciated values will for a long period of years have a great competitive advantage over new plant and equipment. The statistically low valuation of American business represents an extreme and invalid fright psychology; foreign liquidation may also be a temporary factor.

3. The United States is suffering from a serious shortage of funds available for equity investment. While aggregate savings are adequate, the savings-investment mechanism is badly warped. The long continued extremely high progressive income tax structure has drastically reduced savings in the higher income brackets which have traditionally supplied equity funds. The high rates have reduced incentives to take risks. High margin requirements have almost eliminated loan funds, and regulation has removed trading capital. Persistent labour demands make it impossible to benefit from new investment.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Savings preponderantly now arise from the lower and middle income groups, which entrust them to fiduciary institutions prohibited by law and custom from equity investment. Egalitarian and high consumption economics, therefore are inexorably shutting off the sources of the funds for equity investment. Business cannot be dynamic on loan capital, and a deepening shadow is being cast over the future of American enterprise.

These explanations are, of course, not mutually exclusive, and they appear in various combinations. But they are different in nature: the first two are essentially shorter term, the third of a more enduring and pervasive character, of the type suggested by Sir Henry Clay at the University of Pennsylvania early this year: "The so-called capitalist system, so far from failing, has been almost too successful in the interests of its own survival; it has encouraged the great mass of our population to believe that the increase of wealth is easy and inevitable, and depends no longer on incentive and appropriate organisation. . . ."

Whatever judgment may be passed on the merits of the first and second, the third clearly has considerable validity and is the important one regarding the future role and quality of this economy. Either this country will presently have a slump or it will not, and the market will go up or down in the short run. But the constriction of that part of saving which has made this economy so dynamic needs to be cured by public policy and action primarily in the area of tax structure and fiduciary regulation and operation. If egalitarian taxation is to persist despite its dangers, it must be compensated by new fiduciary institutional methods—or by outright public entrepreneurship.

American Notes

New Monetary Controls?

Towards the close of September, Mr Marriner Eccles, the chairman of the Board of Governors of the Federal Reserve System, launched an unusually outspoken attack on the lack of direction in national economic policy. His speech contained no explicit demand for reconsideration of the new credit control powers sought by the Board a year ago (and subsequently ignored) but Mr Eccles did declare, quite bluntly, that the Reserve system is now quite powerless to restrain the inflationary tide.

Most observers assumed that, even at this stage, the speech would not receive any particular degree of consideration. But the pace of events in recent weeks suggests that Congress may fairly soon be forced to consider whether or not the restoration of more traditional controls over demand and purchasing power contain some advantages which cannot at this stage be ignored. It is true that the Treasury has in recent months sanctioned a timid retreat from the unprecedentedly low money rates established by the wartime pattern of finance, and is now willing to permit this retreat to continue to a point where yields on short-term Treasuries may discourage the commercial banks from further heavy purchases of long-term maturities.

This procedure, however, has quite clearly failed to arrest the cumulative expansion of credit. Over recent weeks, the total of the loans and investments of the commercial banks has been expanding at a rate fully equal to \$10 billions yearly, and a new element of expansion has been introduced by the resumption of a substantial gold inflow. Since the end of the March quarter, the inability of foreign nations to obtain adequate supplies of dollars has resulted in gold imports which have raised the monetary gold stock by about \$2 billion to \$22 billion—little short of the all-time peak touched early in the war. These gold balances provide reserves on a dollar-for-dollar basis, and are capable, under present reserve requirements, of credit expansion ranging from six to ten times as great as the newly created reserves. The commercial banks, meanwhile, have on hand abundant supplies of shorter-

term Treasuries which can be turned over to the Reserve system as an additional base for credit expansion, and unlike earlier periods of inflation, they are not generally subject to the check imposed by being already in debt to the Reserve system. And while, in theory, the Reserve Board could reverse the process by sustained and heavy liquidation of Federal securities, it has held consistently to the view that any such process, drastic enough to break the boom, would bring not only a general collapse in the securities markets, but serious injury to the level of industrial activity.

At this stage, the situation may rightly be termed explosive because, in the absence of special controls, gold imports may be expected to swell bank reserves by further substantial amounts, while the cumulative process of inflation demands steadily more accommodation in order to finance inventories and provide working capital for industry. In calling upon Congress for new powers, the Board may now be willing to relinquish demands for overall powers over the commercial banks which brought such controversy a year ago. But a simple reinforcement of reserve requirements, coupled with provision for much greater flexibility in administration might be sufficient to restore some sort of order. The collapse of an earlier post-war boom showed quite clearly that it is by no means essential to insist upon a drastic deflation of banking credit in order to bring a salutary correction of price levels over the wider industrial field.

Labour's Political Drive

The convention of the Congress of Industrial Organisations this year was remarkable for the firm hand with which Mr Murray handled the left-wing, playing the trump card of Mr Marshall's speech to align the CIO with the American Federation of Labour on aid to Europe. But the Taft-Hartley Act inevitably constituted the main business of both the labour conventions. Present compliance, made easier by the retreat of the Labour Board on the issue of anti-Communist affidavits, is to be coupled with political defiance. The reaction of both federations is on parallel lines—which by definition never meet. Not even the "slave labour Bill" has buried the hatchet between the AFL and CIO.

Both organisations have repudiated the suggestion that they should form or support a third party, thus finally taking the reality out of Mr Wallace's repeated threats of secession from the Democratic party. But political ill winds have led the AFL to set up a body similar to the CIO's Political Action Committee, to be known, more discreetly, as Labour's Educational and Political League. Both organisations are conducting vigorous drives for campaign funds. The AFL has levied an emergency assessment of a cent a week on its members and increased its monthly *per capita* levy in a drive to raise a million dollars. Under the Taft-Hartley Act, organisations like the PAC are immune from the ban on political contributions by labour, but this does not necessarily mean that they can be nourished by compulsory assessments on union members. Senator Taft has already denounced the compulsory scheme as a violation of the Act.

Both the AFL and the CIO are publicly pledged to defeat every member of Congress who voted for the Taft-Hartley Act and to bring out a record vote to guarantee a Congress sympathetic to labour in 1948. The AFL has already endorsed Mayor Humphreys of Minneapolis for Senator Ball's seat. The 1946 campaign, in which the total vote totalled only 35 million, has given the unions a costly lesson, and 1948 will see labour ringing door-bells on an unprecedented scale. It would be a mistake to underrate the influence of organised labour, divided as it is, under so strong a spur to political action as the Taft-Hartley Act. But in assessing its potentialities, it must be remembered that only 28 of the 68 Senators who voted for the bill are up for re-election in 1948, and only a proportion of these are from States where labour is strong. And of the 331 Representatives on the union black list, many come from seats beyond labour's reach.

World Market Place in 1948

Attend the
CANADIAN
INTERNATIONAL TRADE FAIR
Toronto, May 31—June 12, 1948

Follow the trade offerings of the world. Visit Canada in 1948. At the Canadian International Trade Fair, sponsored and directed by the Canadian Government, you will find the goods of many nations—hundreds of industries—on display.

You can meet manufacturers, exporters, importers—buyers and sellers. You will get new ideas, find new products, make valuable contacts.

Plan NOW to attend the Canadian International Trade Fair in 1948—or to send a representative. Full details, including information on transportation and accommodation, are available from—

LONDON: R. P. Bower, Commercial Secretary, Office of the High Commissioner for Canada, Canada House, Trafalgar Square, S.W.1.
LIVERPOOL: M. J. Vechsler, Canadian Government Trade Commissioner, Martins Bank Building, Water Street.
GLASGOW: G. F. G. Hughes, Acting Canadian Government Trade Commissioner, 200 St. Vincent Street.

EAST or WEST—Around the World

NOW you can fly by Clipper, East or West, to the United States—by way of India and Hawaii to San Francisco, or straight across the Atlantic to New York. In the whole history of aviation, this is the first round-the-world, single-carrier, regularly-scheduled air service. Flying-time for the whole route is less than 100 hours! Stop-overs easily arranged. All planes used are 4-engined Clippers.

For information consult your travel agent, or our general agents, U.S. Lines, Arlington House, Arlington Street, Piccadilly, S.W.1 (REgent 7292). For Clipper Express (Air Freight), 50 Pall Mall, S.W.1 (WHitehall 3311).

be able to inscribe over his door, "Through these portals have passed the most beautiful Reds in the world." It is hard to believe he would have brought the same gusto to less glittering fellow-travellers. The industry has been brought to judgment on a charge of having suffered Communist infiltration into its ranks; or rather it has been pre-judged and convicted, for Mr Thomas came equipped with a list of 79 prominent personalities alleged to be subversive—all the way from Charlie Chaplin to Donald Duck, presumably.

Hollywood, which in recent years has closed its ranks so effectively against the charge of corruption of public morals, has split wide open at the sight of Mr Thomas's witness stand. Stars who might reasonably be expected to be sated with publicity have tumbled over each other to denounce, without a shred of evidence, long lists of their fellow workers as Communists. (You can kind of smell a Communist, said one witness.) This is licensed slander on the grand scale, from which there is no recourse, for witnesses testifying under oath are protected by Congressional privilege, and their victims are barred from cross-examination, as well as from legal representation.

Hollywood, no doubt, has its share of "surtax-paying" pinks. What no member of the committee has dared to suggest—lest the whole investigation be dissolved in one great shout of public laughter—is that they have ever succeeded in getting the party line on to celluloid—which would surely provide the only excuse for such an investigation. Casting a banker as a villain is not, as one member generously conceded, necessarily evidence of enmity to the American way of life. The doubt, however, raises the spectre of an even grimmer strait-jacket of ideas than that which the industry has voluntarily adopted to safeguard its box-office receipts from the ire of organised pressure groups.

Where the Committee may have made a serious mistake is in the suggestion that the industry should make a quota of anti-Communist pictures, as its contribution to the American way of life. Mr Johnson and Mr McNutt, president and counsel to the Motion Picture Association, have been quick to raise the issue of the freedom of the screen, and to point out that it is a short step from films to radio, the press, and books. This is a discreditable performance from first to last.

* * *

Construction Recovery

A glance at the business record suggests that the reinforcement of what has become known as "boom psychology" during the last two or three months has been quite largely due to an unexpected revival in construction contract awards. Although dollar values for 1946—\$10 billion—made quite an impressive showing, the physical volume of construction was not significantly larger than in 1939, despite a tremendous increase in national income and general productivity. The Department of Commerce at first suggested a total of \$15 billion for 1947, but awards were sluggish through the Spring, and the half-year's dollar total, at \$5.3 billion, showed relatively little change. The Federal agencies were generally united in deploring high costs as a restrictive factor, while the construction industry itself declared that progress must wait on the abandonment of price controls, priorities, and material allocations.

Controls were duly abandoned and rent regulations relaxed. And August and September were good months for construction, with the dollar value for the first nine months of 1947 rising to \$10.5 billion, against \$8.2 billion for 1946. Recovery in this field has been marked by a belated spurt in residential building, and the year's total will certainly be very much better than the 1946 record of about 450,000 permanent units. In view of the shortage of materials and manpower, the failure of the building boom to attain the predicted levels earlier in the year is certainly far from catastrophic. But residential building usually falls away in late summer, and with other evidence suggesting that American industry may lose some of the "temporary props" to which President Truman referred in his mid-summer report to Congress, there is an atmosphere of some concern in trade reports from Washington.

Building costs are now held to be at least double those in pre-war years. The late summer boom followed an interval in which it looked as though costs might be settling down at a new postwar level, but evidence in recent weeks suggests that some basic material costs are higher again, and that labour is becoming aggressively conscious of the overall advance in living costs. It is true, of course, that building costs (in so far as they are directly measurable) are not far out of line with those in other important sectors of industry, and it is also true that, in the past, sharply rising costs have coincided with a rising volume of construction. But whatever may be the general trend of public opinion on the

duration of the industrial boom, there is an obvious reluctance at this stage to press forward with non-residential work, and for home building there is an equally stern resistance to increased rental charges. In recent months, advancing wage rates have not kept pace with the general trend of prices, and the lower-income groups have been sharply affected. Because of rising population, it has been estimated that more than one million new residential units will be needed for several years merely to maintain prewar standards which were by no means good over vast areas of the United States. It is becoming increasingly debatable whether the building industry, as it is now organised, will be able to supply these needs and make its due contribution to national income when other demands on resources will be far less urgent than they are today.

Taft's Hat In the Ring

Senator Taft has at last conceded what most Americans have suspected for some time: that he is a candidate for the Republican nomination for the Presidency. This is Mr Taft's third attempt; in 1936 he was defeated by Mr Landon and in 1940 by Mr Wendell Willkie, after a bitter fight on the convention floor. Senator Taft has drawn from his tour of the Far West an encouragement not so perceptible to disinterested observers. At present it still seems unlikely that he can accomplish more than prevent Governor Dewey's nomination, with the aid of Mr Stassen and a handful of favourite sons, thus deadlocking the convention and throwing the nomination to some less familiar candidate. Whether that candidate might be General Eisenhower is still an open question. The General's position seems to be that while he will not campaign actively for the nomination—indeed he cannot until he returns to civilian life early in 1948—he would not refuse the honour were it thrust upon him. But the legend of the unsolicited draft is a myth convenient to politicians which has very little basis in political history.

Regardless of Senator Taft's convention chances, what he has to say is well worth study, for both by his unusual campaign candour and by virtue of his position in the Senate, he not only has a determining hand in writing the record on which the party will be judged in 1948, he is shaping up the campaign issues. Other contenders may deprecate his initiative, but they cannot ignore it. In his latest speech he has accused the Administration of a "riot of inconsistencies" in foreign policy, of selling the American tax-payer down the river to grant aid abroad, and of harbouring such a hankering after "police-state" methods that they cannot make voluntary methods of food conservation work.

Mr Taft's hat has landed in the ring at a moment when the cheering seems to be all on Mr Truman's side. The latest Gallup poll registers a strong Democratic come-back, with 56 per cent of those questioned saying they would vote Democratic today and only 44 per cent plumping for the Republicans. In October, 1946, the Democrats showed only 47 per cent support, the lowest point in sixteen years, the Republicans 53 per cent. Yet this striking change since last autumn is itself a warning against giving too much importance to such early soundings. The knowledge that public opinion at the moment is unfavourable is likely to encourage the Republicans to create an issue where they may shine and so to embitter their campaign that bipartisanship in foreign policy becomes too expensive a luxury.

Shorter Notes

The Commodity Credit Corporation is now buying tobacco stock on offer at the present "parity" support level of 40c per lb., and is expected to spend up to \$25 million between now and January. The present crop is 1.3 billion lb., and sales now total about 850 million lb. Unconfirmed reports suggest that the CCC may be prepared to store this tobacco until British buying is restored. A year ago tobacco prices were fully one-third higher than the present support level.

*

Before an appreciative audience of Dutch business men, Mr E. Schnellbacher, of the Intelligence branch of the Commerce Department, declared last week-end that to restore the "dollar deficit" among nations abroad the United States would not cut down exports from \$16 billion to \$7 billion, but would "raise imports to \$16 billion." This pace of expansion, said Mr Schnellbacher, "promised many new markets for Holland." So far there has been no reaction from Washington, but if Mr Schnellbacher is correct in his interpretation of US policy, apoplexy seems likely to become an occupational disease among Congressmen of both parties.

THE BUSINESS WORLD

Dollar Arithmetic

THE debate on the Address, and in particular the speeches of Sir Stafford Cripps and Mr Dalton, brought to light a wide array of new facts and figures bearing on the dollar gap in Britain's balance of payments. The Chancellor helped to explain the past, with particular reference to the manner in which the dollars drawn from the US line of credit have been used. The Minister for Economic Affairs was mainly concerned with the future, with the plans made to narrow the gap, the likely size of the dollar deficit that will still be running at the end of next year, and the estimated size of the reserve of gold and dollars that will then remain available.

The Chancellor's account of the "dollar events" in the period July 15, 1946, to August 23, 1947, concerned itself solely with the analysis of US dollar expenditure. By excluding the Canadian dollar loan from his calculations the Chancellor veiled part of the problem under discussion. No serious distortion of the picture can, however, arise from this decision, because the dollars drawn from the Canadian credit have in effect been used almost entirely to meet the United Kingdom's Canadian dollar deficit. Indeed, they have not been adequate to meet that deficit, and the Canadian Government have, since the early months of this year, required half of the net payments by Britain to Canada to be made in US dollars.

In accounting for the use of the US dollars drawn from the line of credit the Chancellor gave the following main heads of expenditure:—

	\$ mn.
Direct UK purchases from US	gross 1,800
Less dollar earnings	450
	net 1,350
Direct UK purchases in rest of Western Hemisphere	960
UK subscription to International Bank	35
	2,345
Total direct UK dollar expenditure	620
Other sterling area purchases in Western Hemisphere	150
All sterling area dollar purchases outside Western Hemisphere (mainly Europe)	3,115

The total of \$3,115 million falls short by \$235 million of the amount of \$3,350 million actually drawn from the line of credit. This difference was explained by the Chancellor as being the amount drawn before, but spent after, August 20th. It would have improved the factual presentation if the Chancellor could have subjected this figure to the same classification as he gave to the amounts actually spent before August 20th. There is a strong suspicion that by far the greater part of this \$235 million was in fact drawn from the loan in order to meet convertibility demands lodged, mainly by countries outside the sterling area, on or about August 20th. If this be so, the figure of \$150 million shown in the above table as that part of the loan spent outside the Western Hemisphere, mainly in Europe, may well have to be doubled. To that extent, therefore, the cost of convertibility is under-stated in the table above. Reservations on this point do not, however, seriously affect the main outlines of the picture presented by the Chancellor. Even if the whole of the \$235 million is added to the cost of convertibility, the fact remains that 70 per cent of the dollars drawn on the credit were used for direct purchases by Britain in the Western Hemisphere.

The other 30 per cent is equivalent to \$1,000 million, or £250

million. This is the maximum figure at which the "gap" or "leakage" can be put. Some of that £250 million represented duly sanctioned and planned expenditure by sterling area countries, a burden which the authorities were evidently prepared to assume. Hence the criticism of the technical advice given to the Chancellor relates to a residual "leakage" of dollars whose magnitude hardly justifies these strictures which the Chancellor, in his speech, diverted wholly to himself with a pointed gallantry which must surely have been meant primarily for other Ministerial ears.

There can be no quibbling about Britain's direct expenditure of \$2,345 million. There may be some criticism of the figure of \$150 million spent by all sterling area countries outside the Western Hemisphere, mainly in Europe. A substantial part of the \$235 million spent after August 20th may have to be added to this item. It is in this particular segment of dollar expenditure that the final spurt in drawings from the US line of credit must in large part be placed. The Chancellor pointed out that practically the whole of the dollar drain under this heading was concentrated in the last six weeks of convertibility. During the second half of 1946 Great Britain actually acquired \$40 million from these countries outside the Western Hemisphere. In the first half of 1947 they made a net withdrawal—but only of \$35 million. Yet between July 1st and August 31st they drew \$150 million, a movement in which conversions of sterling on Belgian account are known to have played a preponderant part.

In trying to exonerate the countries outside the Western Hemisphere from serious blame in the convertibility drain on sterling, the Chancellor pointed out that during the period from the middle of 1946 to the suspension of convertibility the total sterling balances of all these countries, in Europe and elsewhere, increased by about £70 million. This revelation, however, is not as reassuring as might at first sight appear. It is known that some of the countries in question, notably France, increased their sterling balances, partly as a result of sales of sterling securities, the proceeds of which have not been regarded as convertible sterling. It is probable that a more detailed analysis of the movements in these sterling balances would reveal that one or two countries have in effect drawn their balances down appreciably in order to convert them into dollars.

The dollar expenditure of sterling area countries other than Britain—namely, \$620 million—must be viewed in conjunction with the Chancellor's somewhat more detailed exposition on the running down of sterling balances held by these countries between July 1, 1946, and August 31, 1947. The total reduction for this group of countries was £230 million, of which India accounted for £135 million, Egypt and the Sudan for £40 million, Ceylon £25 million and Australia £25 million. It should immediately be added that as regards Australia the decrease was almost wholly attributable to the generous gift of £20 million to the British Government. There were no substantial capital items, such as repayment of sterling obligations, to account for the running down of sterling area countries' sterling balances. It may therefore be assumed that the figure of £210 million (allowing for the Australian gift) measures the extent to which these balances were run down as a result of drafts on the sterling area dollar pool and by "unrequited" exports to them by other sterling area countries. Since the net

drawings from the pool amounted to \$620 million, or £155 million, exports to these countries, financed out of accumulated sterling balances, would appear to have been in the neighbourhood of £55 million over this period.

It is on this figure of sterling area drafts on British resources and reserves, whether through "unrequited" exports or net drawings on the dollar pool, that the main criticism of past policy must fall. The authorised releases of sterling balances which made the net drawings on the sterling area dollar pool possible, and the extent to which the running down of these balances was allowed in payment for sterling area exports to countries like India and Egypt, must in retrospect appear over-generous and certainly excessive when related to all the other strains to which Britain's balance of payments and the central dollar and gold reserve were being subjected. But the motives which prompted the decisions about these releases were matters of high policy rather than of technique, and the blame for them must be apportioned in appropriately high quarters.

The Chancellor gave some detailed figures to illustrate the fact that the running down of sterling balances was no criterion of the drafts made by the country concerned on the sterling area dollar pool. In the case of Ceylon the reduction of £25 million in sterling balances between July, 1946, and the end of August, 1947, was accompanied by a net payment into the dollar pool. Only £40 million out of India's sterling draft of £135 million could, "even on the most pessimistic reading of the position," be attributed to drawings on the dollar pool. In Egypt's case, only £10 million out of the £40 million reduction in sterling balances could be similarly explained. In explaining these figures, the Chancellor pointed out how difficult it was to distinguish between dollars earned by the conversion of currently earned and of accumulated sterling. This distinction, however, is surely equivocal. In so far as India, for example, used her current sterling receipts for conversion into dollars, she undoubtedly diminished the extent to which she had to dip into accumulated balances in order to obtain dollars; but to that extent she ran down her balances in order to pay for imports from the rest of the sterling area. In other words, to the extent to which India abstained from drawing on sterling balances to finance her dollar deficit she increased her "unrequited imports" from the United Kingdom and other sterling area countries. The Chancellor's contention, therefore, that India and Egypt between them drew on the sterling area dollar pool by using their accumulating sterling balances to the tune of only £50 million is not particularly impressive or relevant. Moreover, that figure of £50 million, or \$200 million, is not easily reconcilable with the much firmer figure of \$620 million, which is the amount by which the sterling area countries other than the United Kingdom drew on the dollar pool.

Another complication in analysing details of sterling area

expenditure of dollars is introduced by the fact that during the period in which the sterling area countries drew the \$620 million net from the reserves, they handed over to these reserves rather more than \$400 million of gold. The bulk of this—namely, \$350 million—came from South Africa. For purposes of his calculations the Chancellor did not include this contribution in the net drawings on the loan. The greater part of the gold in question was presumably added to the metallic reserve, which, as was earlier announced, rose in 1946 by over £60 million to a figure of £642 million, from which there has been an appreciable decline. By keeping the arithmetic of the dollars obtained by sales of gold separate from those obtained from the line of credit many uncertainties are raised. The complete picture of the dollar expenditure cannot be presented without taking into account changes in the gold reserve; and on that there is no up-to-date information. But it must be admitted that to have credited the proceeds of the \$400 million gold sales to the sterling area transactions with the dollar pool—a procedure which would have reduced to a mere \$220 million the net drafts on dollars by sterling area countries—would certainly have made the present confusion worse confounded.

So much for the past. What of the present, and of the prospects for 1948? On current and future events it was Sir Stafford Cripps rather than Mr Dalton who offered the greater information. The Chancellor, however, announced in his speech that the drain on our gold and dollar resources, which averaged \$150 million a week in the four weeks to August 23rd and touched its climax on \$237 million in the last of those weeks, has been running "in recent weeks" at about \$70 million a week.

On present plans the dollar deficit of the sterling area as a whole will still be running at the rate of \$20 million a week or £250 million a year by the end of 1948. It was Sir Stafford Cripps who detailed the various measures by which this reduction is to be achieved. He estimated that, if no further steps were now to be taken, the dollar deficit of the sterling area for 1948 would be at the rate of £475 million. The British contribution covering the difference of £225 million between this figure and the £250 million at which it is expected the deficit will still be running at the end of 1948 includes the following items; increased exports to dollar countries, £45 million; reduction in raw materials imports, £25 million; saving on overseas Government expenditure, £10 million; reduction in manufactured imports from the United States, £10 million; supplemental reduction in raw materials programmes (mainly steel and timber), £25 million; tobacco, £10 million. The cuts in imports on this list amount to £80 million. They are rather optimistically rounded off by Sir Stafford by the addition of "bits and pieces" to a total of "rather over £100 million." Adding to this the £45 million from increased dollar exports,

and the £66 million cuts in dollar foods, a total of £211 million is reached—£14 million short of the necessary figure, a meagre measure of what is evidently expected of the other members of the sterling area.

If all these plans are realised, Sir Stafford Cripps estimated that there would be left at the end of 1948 gold and dollar reserves in the region of £270 million. This figure Sir Stafford Cripps described in a paroxysm of understatement as "a minimum, when it has to serve as reserve for the whole sterling area." The effective minimum reserve, if the machinery of sterling payments is not to break down, is surely well above this figure. Whether the Government and its advisers wish it or not, sterling is still the currency of a large part of the world and London is still banker to the sterling area. Those functions cannot be performed on a reserve of £270 million, especially if, at the same time, the dollar deficit of the sterling

Should Electricity Be Taxed?

LAST Thursday week, Sir Stafford Cripps painted a grey picture of Britain's economic difficulties in which he blended fact, exhortation and policy in honest and realistic terms. Yet on one question at least Sir Stafford seems to have been too impressionistic to be convincing. When he was dealing with the programme for electric generating plant, he declared that, apart from some trimming here and there, the programme was to be maintained with its present priority. He coupled this disclosure with yet another appeal to domestic consumers to exercise the very greatest restraint and care "even to the extent of occasional discomfort." The decision to go forward with the full electricity generating programme suggests that the planners have not looked very closely at the factors behind the present inordinate demand for electricity. Instead they appear to have concluded that only by satisfying the domestic consumer's demand can industry be preserved from cuts in supplies. The result is a programme of unprecedented capital expenditure, so that the maximum load which consumers would like to inflict upon the generating system can be satisfied.

Last month the Central Electricity Board announced a five-year plan for the expansion of generating capacity which contemplates the provision of nearly 10 million kilowatts of capacity (the installed capacity at the end of 1946 was 11.3 million kw.), including 31 new power stations, at an estimated cost approaching £450 million. In July, the Ministry of Works gave priority for building and civil engineering work valued at £75 million on power stations to be undertaken during the next two years, while site work is proceeding on 63 projects capable of housing plant with a capacity of more than 5,500,000 kw.—a figure which is little short of the Central Electricity Board's programme of 5,900,000 kw. to be completed by 1950. The latest statement from the Electricity Commission of loans sanctioned for electricity purposes discloses that the total for six months to the end of September amounted to £54.2 million compared with total sanctions for the year to March, 1947, of £44 million. These are first instalments and meanwhile the output of electricity generating plant will have to be built up to a rate which will satisfy the needs of the development programme. The capacity of large steam generators produced in 1946 was 810,000 kw., of which 275,000 kw. was exported; for the first half of 1947 output was equivalent to 520,000 kw., of which 240,000 kw. was sold overseas.

These figures give some hint of the burden which the country with Government support, is assuming in the electricity programme. On the present facts of the situation a simple case can be made for the programme. Any competent statistician could extend into the future the trend-line of demand on generating capacity (making due allowance for plant which is rapidly be-

area is still running at a rate of £250 million, a rate which will swallow that reserve whole in just over twelve months.

These two figures are, therefore, too bad to be true. Either they imply that the Government is still banking on Marshall aid or else they foreshadow still more cuts in imports and more diversion of production to hard currency export markets. Sir Stafford Cripps expects the global balance of payments of the United Kingdom to be in equilibrium by the end of 1948. If within that equilibrium there is a continuing dollar drain equivalent to £250 million a year, either Britain will be making "unrequited" exports on that scale—which is inconceivable—or the dollar deficit will not in fact be a deficit, but will be covered by surpluses with countries which as a result of Marshall aid will, in effect, be paying in dollars for their imports from sterling area countries. That is the big gamble on which the plans for balancing Britain's payments appear to be based.

coming obsolescent) and the result would not differ materially from figures which the CEB and the Government are using as the basis for their plans. The question which never seems to be asked, however, is whether the recent trend of demand—and in particular of domestic demand—is a reasonable basis on which to calculate future requirements for electric plant. Yet there is every indication that the domestic consumer is using too much electricity because it is too cheap; what follows in this article is an analysis of the character of domestic demand under present conditions and of the cost of satisfying it.

During the war the demand for electricity was greatly expanded, owing to the growth of industrial activity and also to the shortage and increasing cost of house coal. The coal factor, coupled with increased personal incomes and virtually stable prices for electricity, has intensified the growth of the domestic load. The consequences are strikingly shown in the chart. Sales

of electricity to domestic consumers rose between 1938 and 1946 by 109 per cent, compared with increases of 75 per cent in industrial consumption and of 70 per cent in all cases. Moreover the share of domestic consumption expanded from 26.3 per cent in 1938 to 32.3 per cent in 1946, whereas industrial consumption remained virtually unchanged at little more than half of the total in each of the two years.

Unfortunately no official figures are published of the average price per unit paid by domestic consumers. An attempt has, therefore, been made in the following table to give an estimate of the revenue per unit sold for domestic purposes, largely on the basis of consumption figures for 1937-38. This information is somewhat old, but it is thought that the estimate for revenue from domestic supplies should not be too wide of the mark.

Year	REVENUE PER UNIT SOLD		
	Domestic, etc.	Factories, etc.	All Supplies
1938-39	1.5d. est.	0.655d.	1.04d.
1945-46	1.4d. est.	0.87d.	1.13d.
Variation %	-7	+33	+8½

The figures suggest that, over the war period, domestic consumers paid on the average 7 per cent less per unit, whereas

OSLO**

Established 1848

Every banking facility

Paid-up Capital and Reserves - Kr. 43.000.000

factory consumers paid one-third more than they did in 1938-39. It seems probable that in 1946-47 this fall in revenue per unit from domestic consumers and the rising average for industrial consumers has continued. For the domestic consumer, the operation of two-part and similar tariffs has continued to reduce the average cost per unit as his consumption grows. Moreover, he is still protected by a war-time Government decision that domestic tariffs should be more or less "frozen" by the Electricity Commission. The main increase in the prime costs of electricity generation—arising largely from coal—has been shouldered almost entirely by industrial consumers who take supplies under agreements incorporating a "coal clause." By an additional irony, the typical coal clause was not designed to cope with the great advance in coal prices that has occurred and has even led in some cases to a larger increase in the price of electricity to industrial consumers than is justified.

*

Between 1938 and 1946, the average cost of power station coal rose from 20s. 3d. to 45s. 3d. per ton and it is now approaching 50s. During the same period, the calorific value of the coal deteriorated by about 4 per cent. In 1938 the coal consumed per unit sold was 1.63 lb., and it cost 0.18d. per unit; in 1946 the coal consumed per unit had increased to 1.67 lb. but the cost per unit had reached 0.40d., and the recent increase has further raised this figure to approximately 0.43d.

Here is a sharp contrast with the figures in the table on page 731. While total revenue per unit sold rose over the war years by less than one-tenth of a penny this was less than half of the increase in the cost of coal—to say nothing of increases in wages and materials. Higher costs of coal have been largely masked from the domestic consumer because the generating plant has been more intensively used. The grid system operated on a load factor of about 36 per cent in 1938 but in 1945, when load shedding had not reached serious proportions, it was working at 46 per cent and in 1946 at 47 per cent. The last figure, however, is based on the demand which was actually met by the grid system and this was short of the estimated potential load by nearly 1,000,000 kw. Even so, if the load which was shed is taken into account, the load factor would still be as high as 43 per cent. For the current year the corresponding figures might easily be as high as 50 per cent, and 42 per cent after allowing for load shedding. Whatever the figures may be it is clear that there has been a substantial improvement in the load factor on the grid system as a whole since 1938.

But this is not the whole story. Last winter nearly 2,000,000 kw. of peak load were shed and when allowance is made for plant which is over-age, the total present deficiency of generating plant, compared with the peak load, can be put at 3,000,000 kw. or more. To instal capacity of this magnitude would cost at today's prices £150 million. The total capitalisation of the entire electricity supply system in 1943 was no higher than £746 million and total compensation to be paid to the industry under nationalisation will be no more than £550 million. But for the war, some part of the capacity which is now required would already have been provided, and it would now represent an effective charge upon the industry's revenue. Instead the present revenue of the industry, which is satisfactory enough in itself, is based on an artificially inflated load factor (47 per cent instead of 43 per cent in 1946) and is only achieved at the cost of cuts in industrial power supplies.

The electricity cuts and the huge programme of capital expenditure which is contemplated for the industry converge in a point of major public interest. The seasonal peak of electricity demand must somehow be reduced; and at the same time, the development programme ought to be kept to the minimum which is compatible with sound long-term development. The matter is the more urgent because the spreading of factory loads (which in any case has other disadvantages) has not been con-

spicuously successful. The first need is to fix attention on domestic, shop and office consumption, for the latter groups, though described as commercial consumers, have turned to electric space-heating no less than the first. The arguments about domestic consumption which follow, therefore, apply correspondingly to other non-industrial groups.

Most domestic consumers are now supplied under two-part tariffs which comprise a quarterly fixed charge and a charge per unit consumed (sometimes stepped according to quantity) or variable block tariffs in which there are two or three quarterly blocks of units at descending prices. The principle underlying such tariffs is sound, because it matches the structure of the industry's costs; the latter contain a high proportion of fixed charges which do not vary with the amount of electricity consumed per consumer. But even before the war there was an occasional tendency to fix the unit charge (or the tariff for the last block) below the marginal cost of supply, on the ground that this would encourage consumers to take more current for cooking and water-heating purposes, which would tend to fall, at least in part, at off-peak periods. In effect, however, a disproportionately large load for space heating has been built up, especially since the war, owing to the scarcity and dearth of coal and the undue cheapness of electricity. At present prices of house coal, assuming an efficiency of 20 per cent for open grates, it positively pays the consumer to use electric fires so long as the unit charge is not higher than about 0.62d—which is certainly the case for millions of consumers. It happens that the coal-using efficiency of electric fires itself is of the order of 20 per cent, so that no higher rate of coal consumption is involved by burning electric fires. But in present circumstances, to use heat via the electric generating system instead of burning coal direct on the grate means that factories are liable to be shut down and that large additions of plant are required to avoid the shedding of load. More serious still, an appreciable number of supply undertakings still maintain tariff charges which are lower than the present cost of coal of 0.43d. per unit.

*

Clearly this is a fantastic situation. It could be remedied, in part at any rate, by an increase in charges per unit consumed by domestic and commercial consumers. But the accounts of the supply industry are, broadly speaking, balanced and the surplus of revenue would result from an increase in charges to domestic consumers could not very readily be left in the hands of the industry. Nor would a compensating reduction in the industrial tariffs for electricity seem to be justified under present conditions. In principle it seems desirable to build up funds in anticipation of the extra charges that will be involved by the additions to generating plant—even if, as may be hoped, these are somewhat scaled down. A flat rate levy on all domestic and commercial charges would certainly go a long way to meet the case. If it were made in the form of a purchase tax and the proceeds specifically earmarked for capital expenditure so much the better. Doubtless, it would be necessary to allow each consumer a basic minimum reckoned per head or per square foot of his premises, and also a minimum quantity for electric cooking. But there is certainly no justification at all for selling electricity so cheaply that the consumer escapes the extra cost of coal of ½d. per unit simply because the industry has so greatly improved its load factor as a result of lack of replacement and normal expansion of plant, and is forced to shed the load during the winter. This is sheer capital consumption. No argument has yet been advanced that a purchase tax on electricity is administratively unworkable; there is every reason, in present inflationary circumstances, that the electricity consumer should pay at least a fair price for his current, and should also make a sizeable contribution towards the replacement and expansion of plant which, but for the war, would already be reflected in his electricity bill.

Business Notes

Red Herrings for Patriots

Although an emergency Budget is to be introduced in a few weeks' time, Mr Dalton is still convinced that his financial policy is in complete harmony with the Government's wider economic policy. Indeed, in last week's debate, he was "very proud of any part he has had" in bringing about the relatively full employment which now exists. But even if a financial policy as lax as his had been desirable, is it really to be supposed that, in a phase of such acute and all-round shortages, the Chancellor would be entitled to any share in the credit for the high level of employment? As usual, he "answers" his critics by first misrepresenting their criticisms or by "replying" to matters which had never been raised. For once, even Lord Hinchinbrooke knew better than the Chancellor by implying—which is certainly the fact—that it is for the level of "misemployment" that financial policy may now take the credit. And Mr Butcher, too, came near the hard core of truth when he upset Mr Dalton's lyrical contrast between full employment today and bleak unemployment before the war by remarking that in those days we had more than one ounce of bacon each week. It is a commentary upon the growing disfigurement of the normally self-possessed Chancellor that he thereupon mixed metaphors as well as logic by calling this—a red herring.

Ever since the extravagances of the cheaper money drive produced their inevitable reaction in the market—so that the authorities themselves no longer dare to use the sheer weight of their resources to push prices to the levels Mr Dalton would like to see—the best he has been able to do has been to rely upon spasmodic appeals to what he regards as patriotism. The speculators, as recent experience in the market has shown, are no longer the whole-hearted collaborators which he found them to be in the phase of shameless bludgeoning last year. So the campaign, lacking both ammunition and lusty mercenaries, is lifted to the high moral plane of a national crusade.

Mr Dalton now tries to identify the level of gilt-edged with "the national credit," implying that the interest yield basis in this closed capital market is a measure of Britain's determination to meet her obligations abroad and of the readiness of the British people to buckle to and restore equilibrium by their own exertions. Obviously there is great virtue in genuine voluntary saving, and the Chancellor is not merely entitled but has a positive duty to appeal for the maximum response. But that does not mean he is entitled to expect people, on grounds of patriotism, to lend to the Government at any particular rate of interest which he chooses to name. The British people could discharge their whole patriotic duty simply by abstaining from spending. And if, having done so, they turned their backs upon gilt-edged and upon Savings Certificates, the Chancellor's borrowings would cost him only the ½ to ¾ per cent which he pays to the banks or—in the most extreme case—simply what it costs to print new notes. In such circumstances, given only the required self-discipline, the national credit would stand incomparably higher than it does today, though the level of gilt-edged might be lower. Yet the economic journalists who point out these home truths are, in Mr Dalton's judgment, "bad citizens," and the eminent dons who agree with them are "misinformed." Their crime lies in demanding a financial policy which will help to reduce the misemployment against which Sir Stafford Cripps and the whole apparatus of planning are so laboriously and rather unhelpfully striving.

* * *

Can Exports be Directed?

The "planning" of exports has reached a perplexing stage. Sir Stafford Cripps last week, and Mr Harold Wilson this week, both emphasised the difficulties of even making a statement about the direction of exports—though that is a mere preliminary—setting up the elaborate system of new controls which direction appears to require. So far, the only recommendation which has come from the Government is the self-evident proposition that exporters should concentrate on the dollar markets. But Sir Stafford suggested ten days ago that "when our bilateral arrangements are further advanced, we hope to get a much more accurate idea as to what exactly we can sell and where." This may have a negative value in preventing the shipment of an undue amount of so-called "unrequited exports" but surely it will be of very limited use for the expansion of exports to dollar markets, since it is of the essence of bilateralism that trade should be switched to non-dollar channels.

Successful bilateralism—as recent trade discussions have abundantly shown—does involve the creation of administrative controls sufficiently strong to ensure that the required British exports are shipped at the right time and in the right quantities to the other party to the agreement. Mr Wilson appears to contemplate some form of control in this sense, "when certain of the bilateral negotiations have made further progress," for he has stated that countries with which no agreement exists "will occupy a much lower priority in terms of British exports." It is difficult to interpret these words in the ordinary terms of export business and of a production process which takes time and the co-operation of large numbers of suppliers and manufacturers at each stage. Can these matters in fact be effectively controlled at all? Is it seriously supposed that the allocation of raw materials to firms "in accordance with their past export performance"—with allowance for the beginners at the export game and the supporters who do not export directly themselves—can be made to work, at least without an immense Governmental apparatus? How much less promising would be an attempt to add a further layer of discrimination to the controls in order to favour exporters to hard currency countries?

If the Regional Export Committees, whose functions Mr Wilson described on Wednesday, succeed in solving these problems, they will have to show superhuman insight, flexibility and speed. Yet, six weeks after the export targets were originally announced, discussions are still proceeding with certain industries in order to obtain agreement on them. It is, indeed, a heavy task to get through discussions with so many industries and sections of industry. The task of securing the performance of the promises which have been given by industry will be even more arduous, if the Government attempts it.

* * *

What Form of Aid?

With the US Congress about to begin its consideration of the European recovery programme, ideas as to the manner in which aid should be provided are beginning to clarify. Immediate assistance provided independently of Congressional appropriations is being given by freeing looted gold and also by anticipatory purchases of European currencies by the US Army authorities. Both these will provide free dollars. There is, however, a danger that the large-scale assistance which may be provided with Congressional sanction will be far from free. There have even been suggestions that it may be provided not by financial grants but by allocation of specific tonnages of commodities. Where dollars enter into the recovery programme they are all too likely to take the form of rigidly tied loans. It is of course inevitable that a great deal of the goods required under a Marshall aid scheme must come from the United States. To that extent the assistance will in fact, if not in word, be in "tied" form. It also seems equally inevitable that the United States should exercise a close and direct scrutiny over the manner in which the dollars it makes available are spent. But it will be unfortunate if the whole of the aid appropriation is so earmarked and if nothing is left in the way of free dollars that might be used in order to re-establish some form of inter-European currency convertibility and so save from paralysis the pattern of multilateral trade within Europe.

Reports from Washington also suggest that if the European recovery programme goes through, the administration will insist on making the recipient governments in Europe segregate the sums which they would normally pay for supplies from the United States. This, it is argued, would have a deflationary effect by compelling these governments to levy taxes for an equivalent amount. The funds so accumulated in local currencies would then be available for expenditure on capital projects and other objects sanctioned by the United States and the government concerned. The arguments that support a scheme of this kind are strong. Payment in local currencies would undoubtedly make European recovery programme far more acceptable to Congress than it would be if it were a question of outright gifts. If the recipient countries paid in local currencies for goods received from the United States this temptation to use the proceeds of sales of these goods in their budget accounts would be removed, and they would be less able to postpone the financial reforms which, in nearly all cases, are an urgent condition of their economic rehabilitation.

Australian Bank Bill Details

The text is at last available in London of the Australian Banking Nationalisation Bill, the general principles of which were fully discussed in a leading article last week. On certain vital matters, the provisions prove to be extraordinarily meagre. The only safeguards against abuse of the monopolistic banking system which the Government envisages, and the only new regulations for the conduct of the Commonwealth Bank, are contained in a single brief section (Section 11) incorporating the injunctions to the bank quoted last week—to provide adequate banking facilities, to do so without discrimination, to observe normal bank practices and especially to maintain proper secrecy. Nine lengthy sections take great pains to protect the interests of employees of the banks to be absorbed. This is a very proper objective, but the care which the Government has lavished upon it stands in glaring contrast to the single-sentence clause which is supposed to protect the rights of customers: Section 58 provides—

Nothing in this Act shall require a State or person, being a customer of a private bank, the business of which in Australia has been taken over by the Commonwealth Bank under this Act, to continue as a customer of the Commonwealth Bank.

Those in Australia who feel most heatedly about the whole scheme will certainly regard this as adding insult to injury. The consumer who thinks himself victimised by the monopoly is graciously permitted to refrain from consumption. Or is it to be supposed that an Australian resident would be permitted to place his account abroad, and to conduct his whole business in Australia through some far-fetched agency arrangement made by his bankers with the single bank within Australia? If so, the London-registered Australian banks might yet do a roaring trade within the Commonwealth!

Among the general provisions there is ample evidence of the motives behind the plan and of the Government's fear both that it might be upset on constitutional grounds and that there might be obstruction from within the banks. On the issue of motive, the language in which the objects clause is clothed bears striking resemblance to Mr Chifley's own words in his dissentient memorandum to the Commission of 1936: the first object is to expand the Commonwealth Bank "as a publicly-owned bank conducted in the interests of the people of Australia and not for private profit." On the legal issue, there is an extraordinary clause which provides that, if any part of the new Act proves to be unconstitutional, the remainder shall operate to the limits which the Constitution permits, and shall do so even if the results of that operation are or appear to be different from those apparently intended by the Parliament when it passed the Bill. Penalties are prescribed (fines of £1,000 per day for a director or employee) for any obstruction from the banks.

Methods of Acquisition

The Bill sheds no light at all upon the vital question of the principles by which compensation is to be determined. The only requirements are those set out among the objects, that the acquisition is to be "on just terms" and also in two virtually identical sections (15 and 25), relating to compulsory acquisition, that "fair and reasonable compensation" shall be paid. The provisions governing the method of acquisition show that most of the cabled reports were confused or misleading. The two methods, as already known, are acquisition of shares or of businesses. It is evident from Section 13 that the former is exclusively a process of compulsory acquisition and may not be applied except to banks formed within Australia the majority in number of whose shares are, or in law are deemed to be, "situated" within Australia, and then only to such shares. The only other provision for share acquisition is Section 12 which permits but does not oblige the Commonwealth Bank (with Treasurer's approval) to buy shares in local or London-formed Australian banks at prices not less than those ruling on August 15th last. The intention here is presumably merely to validate the Government's action in giving support to the market to allay public fears. On a lay interpretation of the Bill it does not seem that this minimum price has necessarily any legal force in relation to compensation payable where acquisition takes place by compulsion under the principal Section 13, cited above.

The alternative procedure, acquisition of businesses, is in principle applicable to any of the categories of banks affected, but is the only method which can be applied to banks formed in the United Kingdom or elsewhere outside Australia. This process may be either voluntary or compulsory. It should be noted that banks are not given any legal right to take the initiative in negotiating a voluntary arrangement, but the tax conces-

sions (the quantitative effects of which are still obscure) granted where such arrangements are made show plainly what the attitude of the authorities will be. Strictly, however, the procedure is for the Treasurer (under Section 22) to invite a particular bank to make within a specified period an agreement with the Commonwealth Bank for the taking over of the business. The Treasurer may extend the time limit, but no voluntary agreement may be reached after its expiry and the assets and liabilities concerned become automatically vested in the Commonwealth Bank on the following day.

Where that happens, if the bank cannot agree with the Commonwealth Bank the amount of compensation, it may lodge with it its own claim, to which the Commonwealth Bank must respond by saying what it is prepared to pay. This offer will be deemed to be accepted unless the bank within two months requires the Commonwealth Bank to refer the case to the Federal Court of Claims, which will consist of one chief judge and at least two other judges nominated by the Governor-General. There will be no appeal from the Court's findings: the Bill says so comprehensively in five distinct sub-sections, the essence of two of which is that its decision "shall not be challenged, appealed against, reviewed, quashed or called in question in any Court upon any account whatever" or be subject to "prohibition, mandamus or injunction." More neatly, the banks will have "had it."

* * *

New Union Questions

The final bursting of the New Union Goldfields' bubble has not taken the mining share markets completely by surprise, but considerable alarm has been caused by the amount of capital involved and by the trend of events leading up to its disclosure. It has been revealed, after a quite unjustifiable delay, that New Union had borrowed some £5,000,000, repayable on demand, from its associated companies in excess of its legal borrowing powers and that its present available resources are totally inadequate to meet probable calls (the unaudited balance sheet at June 30, 1947, shows cash at £177,500 and shares in other companies then valued at £4,420,684 but now having a market value of approximately £2,400,000). Anglo Transvaal Consolidated who were appointed (at a high fee) to be managers of New Union as from October 8th in place of the old board, whose chairman was Mr N. S. Erleigh, have successfully applied to the South African Supreme Court for the appointment of judicial managers, in order to legalise the deferment of claims for the repayment of these inter-company loans and to safeguard the position of other creditors and shareholders. Mr J. Milne, who managed early last month to form the Free State group out of various remnants of New Union, has subsequently decided to apply to the court to have representatives of the creditors and large shareholders appointed as additional judicial managers.

This week's disclosure of the financial predicament of the New Union group comes nearly three weeks after Anglo-Transvaal assumed control; as recently as October 15th they announced that the dividend declared on September 2nd and payable on November 7th would be met. But the auditors of the New Union accounts had, as early as July, made it known to the company that underlying difficulties, albeit in embryo, were evident from the books. To whom did they pass this information? Was it considered by the board of New Union at the time? Has it any connection with the strong differences of opinion which for a long time were known to exist between Mr Milne and Mr Erleigh? To say the least, it is astonishing that these early doubts were not regarded as being sufficiently serious to prevent an announcement of an increased dividend and a forecast of higher profits. But the directors have more to answer for, because later in September, as it now transpires, the auditors made their démarche by refusing to certify the accounts, and even then the board failed to make a frank statement of the position. Questioned by the press about that time Mr Erleigh said he was too busy to talk; in the light of later information, this is a masterpiece of understatement.

*

Obviously the fullest inquiry will have to be made into these and other matters—including the turnover in the shares of the group. Owing to the complication of nominee holdings and London and South African registers, it is impossible to establish whether the principals in the case have retained or sold their interests during the last eighteen months, and how far Anglo-Transvaal may have purchased shares from them. Both New Union and Rooderand shares have been dealt in on the London

fresh fields for endeavour

Because of their great importance in the economic life of the world, the Dominions of Australia and New Zealand afford many opportunities for commercial development and expansion. The British industrialist who contemplates establishing a branch or a business 'down under' will find ready help at The Bank of Australasia, where an extensive fund of up-to-date commercial information and complete banking facilities are at his disposal. Please address enquiries to the Overseas Department.

B. T. THAKUR, General Manager.

Stock Exchange under the old Appendix 34E; slightly more than 40 per cent of the shares of these two companies are now held on the London register.

The last of this questionable affair has certainly not been heard, and it may have serious implications for the South African mining industry. If confidence in the Orange Free State gold-field, now well furnished with capital for the primary stages of its development, is to be preserved, the financial operations which led to the cracking of the New Union edifice must be probed and made public, for though the group had its eggs in a hundred or more other baskets, its origins lie in the yet unmined leases in the Orange Free State. It would be grave indeed if mining enterprise in this region, whose promising future has been described by General Smuts and Sir Ernest Oppenheimer among others, should be retarded by the questionable financial methods of one of the least important mining groups.

Report on Light Clothing

The Report of the Working Party to investigate the light clothing industry takes much space to define precisely what the light clothing industry is and to distinguish it from the heavy clothing industry, which has already undergone ordeal by Working Party. Light clothing includes all women's clothing (apart from tailor-made outerwear, millinery and rainwear), infants' wear, and men's underwear when it happens to be made by firms specialising on women's clothes. Much might have been gained in clarity, time and paper if the two sections of the clothing industry had been subjected to a single investigation. The light clothing industry is small; of the total of 53,400 factory workers in 1942, nearly one-third were working in London, and probably more than half of the firms in the industry employ less than 50 workers.

Within the limits of a specific assignment to study this sub-industry, the Working Party has produced a useful report, though it is marred by traces of superficiality and rotundity. All the familiar recommendations appear—it is surprising, indeed, that the standardised formulae are held to apply so uniformly to such a diverse range of industries. They include uniform costing, more generous taxation allowances, better maintenance of equipment, improved design and greater attention to training. A Development Council is proposed on which both the heavy and light clothing industries should be separately represented by a Directorate, each of which would presumably press its own claims for labour, materials and machinery. The functions of the Council, however, would need to be made a good deal more precise than is suggested by the following extract from the Report:—

The most important function which should be performed by such an organisation is that of planning—in its widest sense. It is, in our opinion, essential that the Light Clothing Industry should, in future, be able to base its activities on over-all planning which would cover the supply of sufficient and suitable materials to ensure an abundance of light clothing to meet public demand, and promote arrangements for co-ordinating production and marketing, whilst preserving the individuality of the producers and promoting their efficiency.

Some of the industry's problems have received rather scant treatment—for example, its machinery requirements and its export programme. Moreover—and this seems an unfortunate omission—there is no statistical analysis of the fall in the industry's productivity compared with 1939. This fall is indeed implied in the Report, and such statistical material as is already available suggests, on a rough-and-ready basis, that output per man-hour in the industry has fallen by at least 12½ per cent since 1938.

* * *

The Problem of Price Control

One of the most interesting sections of the Report is the discussion of the working of the price control scheme for utility clothing. Under this scheme, garment-makers must not exceed the ceiling prices fixed for each line, or, alternatively, they must accept a price equivalent to their cost of production plus a fixed percentage of profit, if that is lower. Presumably the ceiling prices allow a good deal of slack, for it has been found that this system provides a positive incentive to firms to raise their costs by hoarding labour or by adding unnecessary frills to garments solely with the idea of increasing their return of profit. Moreover, since the wholesaler and retailer in turn add a fixed "mark-up" to the price which they pay for garments, traders are disinclined to take cheap garments when they can get identical ones at a higher price.

But it is doubtful if the Working Party's solution of this problem—which is to set up a system of standard prices for specific articles which would be below maximum utility prices for their class—would be effective. It would be a scheme, so to say, of utility within utility; it would involve distinctive marks and the allocation of material specifically for the manufacture of cheaper goods. It could put an end to the waste inherent in the cost-plus system only at the expense of a great multiplication of maximum prices at different levels, coupled with the necessary controls to keep the new price structure intact. If the gaps in the utility system are now so wide that the manufacturers can make inordinate profits, surely the answer is to reduce the general level of the utility price ceilings, to reduce the essential ranges of utility clothing to the minimum, and to put an end to the "cost-plus" system. These steps might have more practical results than the Report's odd declaration that "it should be the objective of Government policy to ensure that the public should be able to buy the goods which the public produces."

Stock Exchange Commissions

The Stock Exchange Council proposes, subject to confirmation on November 24th, to amend Rule 197 by raising the amount of consideration money which is to bear full commission from £2,500 to £5,000. This is the first move to change brokers' charges since immediately after the 1914-18 war, when the minimum figure above which half commission might be chargeable was raised from £1,000 to £2,500. Other commissions have not been altered since 1912. The Council has allowed full time to test the reaction of opinion to the proposal before it becomes operative. To judge from the City's comments, both for and against, it has acted wisely.

The case for an increase in commission rests on the narrowing gap between the higher costs which stockbroking firms, like all other businesses, have had to face following the rise in prices since 1939. All are agreed that costs have risen, but so far it has been assumed that the increased turnover of recent years, which is due in no small part to the Government's cheap money policy, has enabled the brokers to make handsome profits in spite of their higher expenses. The lull in business in recent months has no doubt prompted the thought that the time has come for brokers to safeguard themselves. Certainly the high level of taxation in the last few years has limited their capacity to make provision for a lean period, and precedents for the Council's proposal can be found in the recent action of the New York Stock Exchange in raising commissions by 20 per cent and in the increase made in London after the first world war. It is maintained, also, that the change will affect only the larger investor and that the small man will not suffer. But £2,500 is not a large order, even in this democratic age, and the effective rise in the scale of commissions which the Council suggests does contrast a little oddly with its own postwar efforts to popularise and cheapen the facilities which the Stock Exchange has to offer to the public.

A rise in charges can hardly be justified until it has been clearly shown that every possibility of making further economies has been exhausted. As it is, the proposed increase will add its small contribution to the inflationary rise in costs, and it will be a further deterrent, coupled with the recent doubling of the Stamp Duty, to the readiness of the average investor to deal freely. It would be easy to exaggerate the importance of the new proposal on Stock Exchange business, but it would be no less dangerous to forget the fact that any additional shrinking of turnover would react to the disadvantage of the Stock Exchange as a whole.

Note Circulation Landmark

Wednesday of last week ought surely to be a red letter day in the calendar of postwar inflation, and it is surprising that Mr Dalton does not seem to have noticed the fact. Among all the various indices of domestic finance, only one—the note circulation—has lately been showing a genuinely reassuring trend. This week, apparently for the first time since the whole phase of war-time currency expansion began, the active circulation of Bank of England notes has actually dropped below its level at the corresponding date of the previous year. Although the rate of expansion of the circulation slackened appreciably after the end of the war, it was not until quite recently that any signs emerged that the trend might at last be turning downwards. From 1939 to 1946, each successive Christmas peak was higher than its predecessor,

and until the current year each August holiday peak was higher than the preceding Christmas peak. In 1946, it is true, the expansion in the first seven months of the year amounted to only £11 million, in contrast with £75 million in 1945. But this year, the summer's peak circulation of £1,422 million was £6,000,000 below the record level reached last Christmas.

The reassuring contrast was rather unexpected, but even more surprising is the rapid rate at which the notes have been returning since the holiday season ended—£28 million came back in August, £17 million in September and £16 million last month, a total reflux of £61 million. In the corresponding period of last year the reflux was only £29 million. In consequence, the total circulation, at £1,361 million, is just £1,000,000 below its level at this time last year. Moreover, of this year's improvement in the trend compared with that of 1946, more than two-thirds has occurred within the past three months. Is this still another sign that "natural" forces—from the stock market collapse at one extreme to the exhaustion of war service gratuities and industrial dislocation at the other—are at last dictating caution? The National Savings figures hardly align with these trends, but is it possible that the prevalent "dis-saving" reflects financial pressure rather than over-eagerness to spend?

Filling a Financial Gap

Twelve months ago the chairman of the smaller of the two new finance companies, the Industrial and Commercial Finance Corporation, Ltd., suggested rather cautiously that experience had proved the existence of a gap in financial facilities and the Corporation's ability to fill part of it. If one judges simply from the results now shown by the accounts to end-September last, covering the company's first complete year of trading, this opinion actually seems to have been excessively cautious. In the past year the net amount of proposals approved by the company has risen from £4,048,000 to £10,501,000. Necessarily, only a part of the finance sanctioned has yet been taken up, but the proportion is very much larger than it was twelve months ago, the net amount of advances actually drawn and investments made being £5,716,000 compared with £1,239,000 twelve months ago. But, if this noteworthy expansion proves the existence of a "gap," it is far from clear whether it is the kind of gap which most people had in mind when the company was formed. Even in the initial period, approved finance to the really small man—for amounts between £5,000 and £10,000—accounted for only a little more than a quarter of the total number of cases and for only one-twentieth by value. Now, however, in the past year, the proportion by number has dropped to less than one-twelfth and by value it is actually less than one per cent. At the other extreme, the proportions for transactions above £100,000 (this category is no longer described as between £100,000 and £200,000) have risen from 7 to 22 per cent by number and from 28 per cent to 56½ per cent by value. Almost four-fifths of the total operations have taken the form of transactions above £50,000. The Board states that this decline in the smaller advances is "a statistical fact and does not denote any change of policy"; but it does seem to prove that credit-worthy small borrowers have been coming much less readily to the Corporation in the past year than they did at the outset.

The difficulties of the postwar transition phase are plainly to be seen in the Corporation's profit and loss account. It made a modest net profit of £23,965, but it has been thought advisable to provide £140,000 against bad and doubtful debts and investments. There is no suggestion that this experience was particularly attributable to the economic crisis, but the chairman states that during the transition period the Corporation thought it right "to take a certain risk in facilitating the transition" and that some of the ventures which it has financed have not been successful. That, it is said, explains the bulk of the amount reserved; the bulk of the outstandings are regarded as "good or very good." In this context it is reassuring to have Lord Piercy's opinion that no large proportion of the Corporation's customers is likely to be "injuriously affected" by the increasing concentration of the national effort upon essential production. The industrial spread of the company's interests has, however, widened perceptibly; the mechanical and electrical engineering groups, which last year accounted for 31.8 per cent of the whole, now absorb 27.6 per cent.

Undermanned Industries

It is too early yet to form any idea of the effect of the Control of Engagement Order on the distribution of manpower, or to estimate the prospects for large-scale releases of labour for the undermanned industries through the cuts in the capital investment programme—though scepticism is probably justified on both counts. Sir Stafford Cripps, at his press conference on Wednesday, reaffirmed the Government's intention to proceed by voluntary methods and to avoid using compulsion. He did, however, admit that if the existing methods should not prove sufficient, further and more drastic measures might have to be introduced.

The urgency of the problem is emphasised in the figures which the Minister for Economic Affairs gave on the labour position in the undermanned industries. The main "problem industries" are agriculture, coal, tinplate, and textiles. Faced with the loss of prisoner of war labour, agriculture will need at least 60,000 recruits by next summer. Coal mining, with 715,000 men, will fall far short of the target of 730,000 by the end of the year, for, in spite of the high rate of recruitment of 1,700 a week, wastage of departing Bevin boys and old miners has been running high. Employment in tinplate, iron founding and the steel sheet section has been stationary since December, 1946. The textile trades need in all about 100,000 workers, and the most serious and disturbing feature is the failure of cotton spinning and weaving to show an improvement in manpower. Labour in wool and worsted has increased by only 3,000 since March. Since the success of the export drive depends in large measure on textiles, and since they can only reach their export targets if they have sufficient labour, the problem of labour in the cotton industry becomes one of overriding importance.

Urgent discussions on wages policy are now proceeding with the TUC, but it is unlikely that they will lead to any major change of attitude. It is tragic, and typical of the Government's timid handling of the labour problem that it has taken more than two years to grasp this nettle. Whether at this late stage of the process of inflation special incentives would make much difference must be doubted; it seems inevitable that the other

alternative, more direction, will have to be adopted—in spite of Sir Stafford's declaration on Wednesday that the Government will not resort to it.

Recruitment for the Mines

Sir Stafford Cripps's statement on Wednesday that the whole production programme might be "in jeopardy" because deep-mined coal output is running at a level which is insufficient to maintain winter supplies has once more emphasised the need to step up production by overtime and increased recruitment. Six months ago, there seemed to be every likelihood that the target proclaimed in the "Economic Survey" for a labour force of 730,000 in the coal mining would be reached by the end of this year. But during the summer net recruitment took a decided turn for the worse and in recent weeks, numbers on colliery books have actually declined.

A possibility of a better trend in recruitment in the near future is suggested—though as yet only tentatively—in the latest coal production figures. Between the second and third week in October, numbers on colliery books declined from 715,300 to 715,200. On the other hand, face workers increased from 289,900 to 290,100. In a comment on these figures, Sir Stafford Cripps has attributed the current high rate of wastage partly to "Bevin boys" who have completed their period of service in the mines and partly to the high rate of retirement among older miners. This wastage is in fact masking a high level of recruitment, and it is likely to continue until the spring. It is to be hoped that this forecast proves reasonably accurate. Meanwhile the up-grading of workers at the coal face from this year's recruits is already bringing increased mining labour to work on direct production.

Probably this increase in work at the face was already clear when Mr Gaitskell announced the production requirements for the winter period at an average, including holidays, of 3,750,000 tons a week. Even with this prospect of improvement in labour, the average will not be easy to sustain. Meanwhile, the coal stocks of 15.7 million tons at October 18th—compared with the budgeted 15 million tons for October 31st—were something of an antidote to the disappointing production figures of 3,900,000 tons announced for last week compared with the 4,000,000 tons for the previous week. Next week's figures should, of course, show the benefit of the longer working week.

Gold Dealings in New York

New regulations covering the export of foreign gold from the United States have this week been issued by the US Treasury. The previous regulations permitted the re-export of gold previously imported from other countries, subject to licences. These

were readily given. A considerable market in foreign gold had developed in New York and a substantial proportion of the gold reaching the free markets in the Middle and Far East was exported from the United States. Much of it was metal of South American origin, refined in the United States and exported at prices well above the official \$35 per ounce. The position of this market in foreign gold in the United States was called into question by the request from the International Monetary Fund to all its members to suppress international dealings in gold at prices in excess of the official quotations. It was to meet this request that the US Treasury was led to amend its regulations dealing with the re-export of gold. In their amended form the regulations, which come into effect on November 24th, will only allow the export of "semi-processed" gold for use abroad. Previously most of the gold re-exported from the United States was in the form of refined bars. As from November 24th the export of foreign gold in bar form will only be allowed if the gold is intended to be processed abroad and then returned to the United States.

In their amended form the regulations are unlikely to place serious obstacles to the traffic in free gold which has flourished in the New York market. The "semi-processed" gold that may still be exported generally takes the form of sheet gold, rolled in one- or two-millimetre sheets for industrial purposes. But there is no standard sheet thickness and there is no reason why "semi-processed" gold should not take the form of quarter-inch sheet which could then be cut up in 10 or 20 ounce strips that would provide an acceptable substitute for the convenient 10 and 20 ounce bars in which much of the international traffic in free gold has taken place. A more serious threat to the traffic in free gold is the trend towards stricter import regulations by the countries in which the principal free markets have been located. The latest development of this kind is the embargo on gold imports announced this week by the Government of Siam. Sales of foreign gold are still being arranged from New York to the Far East and this week's price has ranged around \$42.50 per ounce. Most of the metal is ultimately destined for China, but finds its way there through the Philippines.

Hard Money in Italy

The one country in Europe where the "hard money" school has taken charge of credit policy is Italy. Faced with an inflationary situation, with an economy littered with a great many uneconomic industrial plants—the now "dead branches" that had grown up during the Fascist era of autarchy—and with a mounting wave of speculative activity, the Finance Minister, Signor Einaudi, decided to put into operation the long forgotten weapons of credit restriction. This was done by compelling all banks to restrict their credits to industry and to all clients suspected of using bank facilities to finance speculative positions, whether in materials or securities. The effects have been dramatic and flattering to what

were deemed to be outmoded instruments of economic control. The stock exchange speculative bubble of the summer months has been effectively pricked. The white elephants in the industrial menagerie are being starved out. The process is causing some temporary unemployment, but there is no lack of alternative work and what is being tested now—with some friction and discontent—is the mobility of labour. Prices of commodities, and particularly of foodstuffs, have been falling. At its new devalued level, fixed last August, the lire is looking stronger every day. In the black market for foreign currencies, rates have been moving steadily in favour of Italy. The Swiss franc which touched 230 lire last May has come down to 150 lire (official rate 83 lire); the dollar has fallen from 800 lire to 600 lire (official rate 350 lire); and most impressive and significant of all, the pound sterling has fallen to a discount on the official rate, namely to 1,350 lire as against the official quotation of 1,400 lire. The Chancellor of the Exchequer may draw some instructive deductions from this experience and these figures.

Montevideo Tramways Sale

Uruguay may yet be the first South American republic since the war to make a sterling capital payment for the acquisition of a British-owned public utility. The Anglo-Argentine sterling talks, which are linked with the completion of the railways purchase scheme, have again been delayed, this time by a visit of the leading Argentine personages to Bolivia, while the San Paulo payment, of which strong hopes were entertained in the City last week, is still being debated by the Brazilian Congress. But in Uruguay, the Senate has now approved the agreement made last February for the purchase of the tramway of the Sociedad Comercial de Montevideo, whose capital is owned by the Atlas, Electric and General Trust. The agreement has now to be formally approved by the Chamber of Deputies, but since the matter has already been discussed and the purchase sanctioned there, the completion of the purchase is not likely to be long delayed.

The sum involved totals £2,248,000, calculated at the rate of 6½ pesos to the £; it consists of 11,700,000 pesos for the tramway and physical assets pertaining to it and 2,800,000 pesos for

items such as stores, which have been mainly acquired since the original agreement was reached on February 14th this year. Payment will be made to the Atlas, Electric and General Trust out of Uruguay's sterling balances, which have recently been estimated at £17 million. The sum to be received is considerably less than the book value placed on the investment by the trust, and in the latest balance sheet £1,500,000 has been applied out of capital reserves to write down this valuation. The tramway has not been able for many years to earn sufficient revenue to meet depreciation or interest on the prior charges of the Sociedad Comercial de Montevideo, and the trust has received nothing on its investment since 1930. This suggests that, although the amount of capital originally put into the undertaking greatly exceeds the purchase price, Atlas, Electric and General will now be able to apply at least part of what has long been an unprofitable investment to more remunerative purposes. The ordinary capital of the trust has not received a dividend since 1933, when 1 per cent was paid. Part of the purchase money might perhaps be applied to the redemption of £750,000 5 per cent debentures which are at present outstanding, but there is still the heavy cost of dividends on £3,000,000 of 7 per cent cumulative preference capital. The equity capital of the trust stands a better chance of receiving a payment than for many years past, but hopes should not be exaggerated.

Shorter Notes

The London rubber market has been quiet over the past week, but the tone has remained steady. The average spot price for the week ending October 28th was 11½d. per lb. compared with 11½d. in the previous seven days.

The United States Department of Agriculture has announced that it will support the American tobacco market to compensate for the cessation of British purchases of flue-cured tobacco. The price will be maintained at 90 per cent parity as laid down by law. The tobacco will be packed as for British shipment in case British purchases are resumed at a later date.

SECURITY PRICES AND YIELDS

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. (g) Year worked out on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7½ per cent).

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (g) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (h) To latest redemption date. + Free of tax.

Abridged Particulars.

AMALGAMATED ROADSTONE CORPORATION LIMITED

(Incorporated under the Companies Act, 1929.)

SHARE CAPITAL.

Authorised:	Issued or to be issued:
£2,750,000 in 750,000 6½ per cent. Cumulative Preference Shares of £1 each	£526,680
1,250,000 in 1,250,000 5 per cent. Cumulative Second Preference Shares of £1 each	1,000,000
750,000 in 1,500,000 Ordinary Shares of 10s. each	750,000
£2,750,000	£2,276,680

The Subscription List will open and close on Wednesday, November 5th FOR AN ISSUE OF 1,000,000 5 PER CENT. CUMULATIVE SECOND PREFERENCE SHARES OF £1 EACH AT 21/- PER SHARE

The prospectus shows, inter alia, that:—

- The purpose of the present issue and the issue of 186,714 Ordinary Shares to Ordinary shareholders is to repay the outstanding £217,142 4½ per cent. First Mortgage Debenture Stock and the 250,000 7½ per cent. Cumulative Participating Preference Shares of £1 each of British Quarrying Company Limited, a wholly-owned subsidiary of the company, to repay an outstanding 5 per cent. Debenture for £50,000 of St. Keverne & Associated Quarries Limited, a wholly-owned subsidiary of the company, to finance the development and mechanisation of existing quarries, and the development and equipment of a Wharf and Depot, approximately 3½ acres in extent, on the Thames at Greenwich, and, subject to repayment of Bank overdrafts and loans, to provide additional working capital.
- Profits of the group of Companies for the accounting periods ending within the calendar years 1937 to 1946 inclusive, on the basis set out in the full prospectus, were as follows:—
Financial Year ended within Calendar Year

£	1942	1943	1944	1945	1946
£	178,556	154,699	150,083	156,229	197,798
£	117,631	184,880	179,793		
- *Include an accounting period of 19 months for Amalgamated Roadstone Corporation Limited and its Subsidiaries.
Recovery is now well under way, and the Directors are satisfied that the net trading profits for the now completed financial year will exceed £200,000, after meeting interest charges of over £30,000 on Debentures and Bank Loans which will be repaid out of the proceeds of the present issues, leaving, after Profit Tax and dividend on the British Quarrying Company Limited Preference Shares (which are now to be repaid) and the existing Preference Shares of the Company, £133,042 available for Ordinary Dividend, carry-forward, and reserves.
The dividend on the Second Preference Shares now being issued would be covered on the basis of the estimated profits shown above more than 3½ times and the balance would amount to more than 17% on the Ordinary Share capital as now increased to £750,000.
- Copies of the full Prospectus, on the terms of which alone applications will be considered, will be obtainable on Monday from

CAWOOD WHARTON AND COMPANY, LIMITED

SATISFACTORY RESULTS

DIVIDEND OF 125 PER CENT.

MR. E. W. TOWLER'S REVIEW

The twenty-fifth ordinary general meeting of Cawood Wharton and Company, Limited, was held, on the 29th ultimo, at the Great Northern Hotel, Leeds, Mr Eric W. Towler, the chairman, presiding.

The secretary (Mr Edward Binks) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts:—

This is my first statement to you since the company was converted to a public company in April of this year, and as the accounts under review are for the year ended March 31, 1947, it might be appropriate at the outset to refer to the changes in the capital structure which have taken place since that date.

In April of this year the authorised capital was increased by the creation of 200,000 Four and a-Half per cent. "B" Cumulative Preference shares of £1 each, 20,000 of these shares were absorbed by the conversion of the 20,000 Seven per cent. Redeemable Cumulative Preference shares of £1 each, 152,000 were offered to the public at par (which it is gratifying to note were heavily oversubscribed, the issue attracting applications amounting to £1,457,800), leaving a balance of 28,000 unissued shares. At the same time a placing of 10,000 Ordinary shares of £1 each was arranged; on June 25, 1947, the Four and a-Half per cent. "B" Cumulative Preference shares and the 24,650 issued Ordinary shares of £1 each were converted to stock, the Preference stock being transferable in units of £1, the Ordinary stock in units of 1s.

You will see on the following pages that we show the balance-sheet and profit and loss account of the parent company, followed by a consolidated balance-sheet and profit and loss account of Cawood Wharton and Company, Limited, and its subsidiary companies. All the subsidiary companies are wholly owned and their trading results have, therefore, been included in the parent company's profit and loss account.

PROFITS AND DIVIDENDS

The profit of the group is £84,324, from which has been deducted £28,108, reserved for depreciation and amortisation, and directors' fees £830, leaving a profit, before taxation, of £55,386. £24,879 has been reserved for taxation, to include income-tax and N.D.C. on the profits for the year ended March 31st, 1947, and profits tax in respect of the proposed dividends, and the balance together with the amount of £16,425, brought forward from the previous year's accounts, leaves £46,932 available for appropriation. Dividends on Preference shares absorb £2,170; £1,500 is transferred to Preference share redemption reserve account (this will not be required in the future) and it is proposed to pay a dividend of 125 per cent., less income-tax, on the Ordinary shares, which will absorb £16,947, leaving a balance to carry forward to next year of £26,315.

The group profits of £55,386 (after depreciation and amortisation of £28,108, which in the opinion of the directors is a generous reserve) are in excess of the average for the five years to March 31, 1946, referred to in the prospectus. These results can be regarded as satisfactory, particularly in view of the abnormal weather experienced in February and March last. The amount proposed to be distributed to the Ordinary stockholders as dividend on the issued capital

represents only a modest return on the much greater figure of capital actually employed within the group.

CONSOLIDATED BALANCE SHEET

The issued capital of £72,650 is of course before the changes in the capital structure to which I have referred earlier. The reserve for Preference share redemption is no longer required as the Redeemable Preference shares have meantime been converted. The amount of £16,500 standing to the credit of this account, which has been reserved out of profits, has therefore been added to the general reserves of £22,773 (being appropriations over a period from profit and loss account) making a total of £39,273. Capital reserves at £40,305 represent profits on sales of plant and equipment, profits on surrender of the debenture sinking fund policy, and profits on repayments of debentures in subsidiary companies.

Plant and equipment has increased during the year from £165,749 to £205,157 in pursuance of the company's policy of modernisation and mechanisation, and includes additions, less sales, during the year of £64,108; the plant and equipment continues to be well maintained. Trade investments at cost, at £5,454, are lower by the sale of shares in associated companies during the year—today's value being in excess of the amount at which they are shown. The excess of current liabilities over current assets of £10,296 does not take into account the proceeds of the Preference share issue which was made subsequent to the date of this balance-sheet.

FUTURE PROSPECTS

While we are dependent upon our suppliers to a large extent for deliveries, the Board is continuing to pursue a progressive policy of expenditure on capital equipment, designed to increase the productive capacity, and towards a still greater degree of mechanisation.

The results for the current year, already so far advanced, show material improvement over the corresponding period of the year under review, and it can reasonably be expected that the group profits for the year ending March next should exceed those of the previous year; the North-Western group of quarries is now making a satisfactory contribution to the profits.

The general economic situation makes it impossible to forecast very far into the future; who can tell whether we shall be permitted to make our contribution towards the housing problem—to export British coals—or indeed on what scale we shall be permitted to continue to engage in any one of the activities we presently pursue? Our interests are, however, so widely diversified, our organisation so flexible and efficient, that I feel confident we should be able to meet the problems that most surely lie ahead.

The greatest credit and thanks are due to our management, staff, foremen and workpeople for their loyal and efficient services, under conditions which during the year under review were particularly difficult and exacting.

The report and accounts were adopted; the proposed dividends were approved; the retiring directors, Mr W. M. B. Burnyeat and Mr Roland Thompson, were re-elected, and the auditors, Messrs Knox Burbidge Henderson and Company, were reappointed.

FERRANTI, LIMITED

OUTPUT DOUBLED

The forty-second ordinary general meeting of Ferranti, Limited, was held on the 23rd ultimo, at Kern House, London, W.C., Mr. V. Z. de Ferranti, M.C., M.I.E.E., chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1947:—

The profit for the year, after providing for taxation, depreciation and directors' fees, is £105,293, as against £77,007 a year ago. The figures are not really comparable, as our accounts last year mainly reflected the financial results of the transitional period after taking credit for £225,000 estimated taxation relief. This year's results include the final settlement of most of our war-time contracts.

The total net assets of Ferranti, Limited, amount to £1,636,742, which is represented on the other side of the balance-sheet by the issued capital of £800,000, and the reserves and surplus of £836,742, including the transfer of £60,000 to general reserve account recommended by the directors, and the excess profits tax post-war refund suspense account. The latter account remains at the same figure as last year, £219,235. It is, of course, subject to adjustment on final assessment of our liability in respect of excess profits tax for the whole of the chargeable accounting periods.

LARGER NET PROFIT

The consolidated statement of profit and loss shows a combined net profit for the year of £134,537 as compared with £98,170 for the year ended June 30, 1946. The consolidated balance sheet shows net current assets of £1,158,684 as compared with £878,489 a year ago, and an increase of £38,773 in fixed assets after depreciation. The considerable increase in the subsidiary companies' stocks and debtors is occasioned by the marked expansion in their activities in the North American continent, and reflects their need of further working capital, which has been provided up to date by their bankers.

The total net assets shown on the consolidated balance-sheet amount to £1,804,128 compared with £1,704,295 a year ago, which is represented by the issued capital of Ferranti, Limited, of £800,000 and by reserves and surplus of £1,004,128.

ALL DEPARTMENTS BUSY

During the year the output of our commercial departments has been doubled. All departments have contributed to this increase, both those producing transformers, electricity house-service meters and instruments for the electricity supply industry, and those producing radio, television, domestic electric appliances and clocks for the general public. One-third of this output has been exported. Of our unexecuted orders for the electricity supply industry, 48 per cent. are for the overseas market. The total volume of our export orders shows an increase of two and three-quarter times over that of the last year before the war.

There has been more rearrangement of our manufacturing facilities, and in particular the giving up of a requisitioned factory in which we made valves and cathode ray tubes. The expedition with which this department was moved to our Moston factory reflects high credit upon all concerned. Development work on radar navigational aids and certain applications of electronic devices to industry have been concentrated in the Edinburgh factory.

We are now faced with further rearrangements as the result of the concentration on heavy plant at the expense of electrical appliances for the public. Considerable capital expenditure will be involved to deal with the increasing demand for heavy plant. We are building a new transformer factory and also a new foundry. The Canadian company has increased its output by 40 per cent. over the previous year.

The report was unanimously adopted.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LIMITED

TRINIDAD OIL AND DOLLARS

MR KENNETH MOORE'S REVIEW

The annual ordinary general meeting of the Trinidad Petroleum Development Company, Limited, was held, on the 23rd ultimo, at River Plate House, Finsbury Circus, London, E.C., Mr Kenneth A. E. Moore, F.C.A. (the chairman), presiding.

The secretary (Mr J. Mytton) read the notice convening the meeting and the report of the auditors.

The chairman said: Gentlemen, in times like the present we must count ourselves fortunate to be engaged as a company in work of vital importance not only to Trinidad but to this country and to the sterling area generally, for oil is in insistent demand all over the world and likely to be, and as it can be shipped and sold for the currency of any country, it is in itself the equivalent of foreign exchange. In fact the oil which we produce is sold under our existing contract in terms of United States dollars and by reference to Gulf Coast export prices, which are, in effect, world prices.

Moreover, it is not only in the financial sense that Trinidad oil is of value. Trinidad occupies a strategic position of ever growing importance in an unsettled world of which that great oil-producing area, the Middle East, is a potential storm centre.

EFFECT OF COAL SHORTAGE

For all these reasons it is unfortunate that the pace at which we and others can develop in Trinidad, thousands of miles away, is adversely affected by the disappointing pace of coal production at home. When I addressed you a year ago I explained that the shortage of coal was delaying the production of British steel and engineering equipment which we urgently needed. It is now clear that inadequate output of coal has had a much more serious secondary effect.

Largely because sterling will no longer buy coal (there being none available for export) sterling has become an unpopular currency. The consequent "flight from sterling" has resulted in the premature exhaustion of the American Loan; this in turn has precipitated the so-called dollar crisis both here and in Western Europe, whose recovery has been retarded for want, among other things, of British coal.

I mention this sequence not as a matter of politics, but of economics and because it has repercussions on our superficially remote operations in Trinidad. We are having increasing difficulty in obtaining adequate supplies of British steel and engineering equipment and increasing difficulty in getting permits for dollars for American equipment to make good the shortage. I trust that the authorities will appreciate that dollars used to increase oil production in Trinidad will bring—like bread cast upon the waters—a rich return.

THE YEAR'S RESULTS

As you will have seen from the directors' report, we have had a satisfactory year as regards drilling experience and production. The rise in Gulf Coast prices following the lifting of wartime price controls in the United States last summer has substantially increased our financial receipts, and in spite of mounting costs the balance available for reserves and dividends is larger this year. At the same time it has been possible to compute our liabilities for taxation more accurately than in recent years.

Out of the available profits we have ploughed in £200,000 by way of transfer to reserve for future taxation and contingencies, and having done this we feel able to recom-

mend a modest increase in the final ordinary dividend, making the total for the year up to 16½ per cent., free of tax, leaving £140,569 to be carried forward on profit and loss account.

From the balance sheet you will see that the total capital employed is of the order of £1,900,000, consisting of the share capital £1,200,000 and some £700,000 of accumulated reserves and undistributed profits. In round terms this figure of £1,900,000 is represented as to £1,500,000 by fixed assets in the shape of our properties and all the development work, buildings, plant and equipment which go to make an oilfield, and as to £400,000 by net current assets, representing the excess of cash, tax reserve certificates, etc., over current liabilities.

The increase of £217,000 apparent in the balance sheet under the head of plant, buildings, etc., is largely accounted for by the cost of the new electrical generating plant, while the increase of £52,000 under sundry creditors reflects a provision for the retrospective increase in Trinidad Government royalties at present under negotiation between the oil companies and the Government. The Governments of Trinidad and the United Kingdom continue, I need hardly say, to take the lion's share of our revenue, while our shareholders take part of what remains and the whole of the risks.

One can quite understand that the risks are sometimes forgotten, because only the successful oil companies survive, but it is a matter of history that Trinidad, like other oil countries, has been the graveyard of many companies and many millions of capital lost in the search for oil. The few that survive deserve and sometimes reap a rich reward, but in the earning of it they make an immensely greater contribution to the community at large.

OIL RESERVES

You may have noticed recently in the newspapers references to what have been interpreted as gloomy statements about oil reserves in Trinidad. I can only speak for our own company of course, but our experience has been that as each year goes by and we increase our accumulated knowledge of our field our confidence in the reserve position has been strengthened, in spite of the absence of any spectacular discoveries.

This is again the case in regard to the past year, during which a gravimetric survey has been carried out over the whole of our land areas. This has yielded extremely interesting results, which, however, have yet to be tested by actual drilling.

TRINIDAD PRODUCTION COSTS

It is, in our case at any rate, not the reserve position which worries us, but the ever mounting costs of production coupled with the knowledge that for geological reasons the drilling involved in oil production in Trinidad is relatively greater, and therefore more expensive, per unit of production than in most important oil producing countries.

In Trinidad we have to keep on drilling well after well to find and tap the more or less disconnected pools of oil. In other more favoured countries the deposits of oil are in such extensive and continuous formations that, once located, they only need comparatively few wells to secure immense and sustained production, and additional wells are normally only required to increase the rate of flow from the same source.

It therefore behoves all who have the long-term interests of Trinidad at heart to bear in mind that if production costs, particularly those for wages and royalties, get unduly inflated in times of high world oil prices, Trinidad oil may well have difficulty in competing in world markets if and when prices fall.

FUTURE DEVELOPMENT

Mr Tweed and I have both been out to Trinidad this year. You may rest assured that the company's affairs out there are well managed and in excellent shape. It is clear that years of development work lie ahead of us. Our present production operations are confined to about one-third of the mainland area over which we hold oil rights and the gravimetric survey to which I have already referred, together with a geological survey carried out recently in what we call the Moruga area—an area of several thousand acres about 30 miles east of our main operations—lead us to think that a major effort is called for in that hitherto undeveloped part of our territory.

Then there is the question of the marine areas. One of the exploratory wells now being drilled—that at Erin near the seashore—is intended to go down to 10,000 ft. and will, we hope, give us useful information in this connection. As you can imagine, the technical difficulties and expense of drilling down nearly two miles are very great, and it requires, in addition to human skill and ingenuity, a formidable array of highly specialised engineering and drilling equipment and large quantities of steel for drill pipe and casing.

The pace at which we can proceed with all this work of development depends upon our ability to get delivery of machinery and steel, and I have already indicated the difficulties in that connection.

TRIBUTE TO STAFF AND WORKERS

I am sure you will wish to be associated with the directors in expressing thanks to all who work for the company for their contribution to the success of our operations during the past year. I desire to place on record also our particular gratitude to our staff and many loyal workers in Trinidad for having maintained production during the disorders early this year in face of very difficult circumstances.

In this connection, you will be glad to know that the increasing prosperity of our enterprise enables us to pursue an enlightened policy in regard to the medical and welfare services available to our staff and workmen and their families. These have been substantially improved in recent years and we have now embarked on a scheme for a model village at Santa Flora at which, in the first instance, 54 workmen's houses of various types are to be erected, and if the company continues to prosper we look forward to sustained progress along these lines.

The chairman, in reply to a question, said that the oil which they produced was sold under contract by reference to its analytical content. Gulf Coast export prices were quoted under various heads and the company sold on what was known as the gasoline, gas-oil and fuel-oil content. In other words, they were paid accurate market prices for the exact things which they produced and sold.

The report and accounts were unanimously adopted and the recommended payment of a final dividend on the ordinary stock of 12½ per cent., tax free, making 16½ per cent., tax free, for the year was approved.

The retiring director, Mr Kenneth A. E. Moore, F.C.A., was re-elected; and the auditors, Messrs Joselyne Miles Page and Co., were reappointed.

The proceedings terminated with a vote of thanks to the chairman, directors and staff in Trinidad and at home, which was carried by acclamation.

COMPANY MEETINGS - - - 778

STATISTICAL SUMMARY - - - 783

The Parliament Bill

THE text of the Government's Parliament Bill is now out and it is seen to be a very simple measure, with only one clause of importance. This contents itself with substituting "two sessions" and "one year" for the "three sessions" and "two years" which, in the Act of 1911, regulate the period of delay that the Lords can impose on the Commons. The Government might have been better advised to keep the Bill strictly to this one clause, since the only other non-formal clause brings in the very objectionable principle of retroactive legislation—and does so for little or no gain. The clause says that any Bill which has already passed the Commons twice when this amending Bill becomes law shall be presented forthwith for the royal assent. But, unless the Cabinet change their minds and bring in their steel Bill this session after all, it is most unlikely that there will be any Bill in this position when the amendment takes effect, which will presumably be at Christmas, 1949, at the latest. The retroactive clause can be taken as another illustration of the present Government's curious obstinacy in putting the worst possible face on their actions.

It is obviously the Government's hope that the controversy can be confined to the narrow issue they have chosen. This is unlikely to commend their action in any greater measure to public opinion. It is the timing and the circumstances of the proposal that have kindled objections far more than its substance. To tamper with the constitution merely in order to forestall a possible opposition of the Upper House to a Bill which must be highly controversial is hardly an indication of much confidence either in the virtue of the legislation to be proposed or in the solidity of the British parliamentary tradition. Nor can it be argued that the behaviour of the Lords has in any way resembled the deliberate obstructionism that led to previous constitutional crises. There has been, to use the phraseology of 1910, no "filling of the cup," nor has a Socialist Government been reduced to "ploughing the sands" by the rejection, or by the serious amendment, of a single measure.

Nor is it at all likely that the Government will succeed in confining the controversy to the narrow issue of one year against two, of two sessions against three. The Second Chamber issue was dormant, but now that it has been aroused, it is likely to be aroused in its entirety. If the eventual effect is to create, by the action of this Parliament and the next, an Upper Chamber that imposes a far more intractable obstacle to hasty legislation than the present House of Lords—a contingency that cannot be excluded—then the Labour Party will have only itself to blame.

Second Chambers are almost universal in democratic constitutions. And if there was a case for a Second Chamber in Britain a generation ago, it is certainly stronger today. In the past generation the House of Commons, regarded simply as a machine for turning out legislation, has unquestionably deteriorated. Bills are hastily drafted and they are rushed through in rapid succession by a procedure that allows wholly inadequate time for discussion and reflection. There has hardly been an important Bill of the present Parliament which, in the state in which it left the Commons, did not require improvement, and has not received it at the

hands of the Lords. The House of Lords has been improving as the Commons has deteriorated. If its political importance has fallen, its legislative skill has risen to a premium. There is no case at all for abolishing the House of Lords—as, indeed, the Government concede by not raising the issue. But if there is to be a House of Lords, then its function can hardly be better defined than in the terms agreed between the parties in the Bryce Conference at the end of the first war—namely “the interposition of so much delay (and no more) in the passing of a Bill into law as may be needed to enable the opinion of the nation to be adequately expressed upon it”—a delay which was considered to be especially needed in respect of Bills which affect the fundamentals of the constitution or introduce new principles of legislation. Indeed, as was recognised in this connection by Mr Lees Smith, who could hardly be classified as a right-wing constitutional theorist, a section of a party which is no larger than an insistent minority may often succeed in eventually forcing its proposals on to the statute book and so in imposing its views upon an entire nation. Or as Dicey pointed out:

Party government leads to the strange but acknowledged result that a not unfairly elected legislature may misrepresent the permanent will of the electors. The party machine may be made the instrument for foisting upon the people of England changes which revolutionary radicals or enthusiasts know to be reforms, but which the majority of the electorate, if they understood what was being done, might condemn as revolution or confiscation.

It is precisely the recognition of this fact that appears to have prompted the present Parliament Bill. In spite of the attempts made by various Government spokesmen to minimise its purpose as a mere clipping of the wings, there can be no doubt that the real effect of this tinkering with the escapement of the constitutional watch is deliberately designed to prevent the interposition of such delay as would enable public opinion to be adequately expressed upon the nationalisation of the iron and steel industry. Delay may, of course, be most damaging to a party in office, and is always infuriating to men in a hurry. But the Lords not only have been most chary of using their powers of delay—the Parliament Act has not been invoked for over thirty years—it is of the essence of things that the present House always will be chary. It will always be frightened of the cry of “The Peers versus the People.” It will not challenge the majority of the House of Commons unless it is clear beyond a peradventure that the majority of the Commons no longer represents the people. And when a Government gets into that position, surely its partisan measures ought to be held up for the decision of the electorate.

*

A Second Chamber which can, in effective practice, impose delay only when a majority of the electors want delay ought to be in an impregnable position. And in fact the Labour Party's real complaint against the House of Lords is not that it exercises its powers too much but that it exercises them too little—that though it might hold up the progress of a Labour Government that had become unpopular, it would never do the same thing to a Conservative Government that had outstayed its welcome. This is a fully justified complaint. Even if the powers of the Lords were exactly what they ought to be (as, by a set of historical accidents, they almost are), it would still be wrong that they should not be used against all governments impartially. But, if that is so, then the remedy is not to tinker with the powers of delay possessed by the House of Lords, but to alter its composition.

Alteration of the composition of the House of Lords has been on the agenda ever since the preamble to the Parliament Act of 1911 put it there. The hereditary principle, in these days, is absurd. Nevertheless examination of the alternatives proposed, and of the constitutional practices of other nations both within

and without the British Commonwealth, would not suggest that there are any ready-made solutions to the problem of the composition of a Second Chamber that would command general agreement—and it is worth emphasising that it would be very rash for any party government to attempt to impose a solution without first trying to secure general agreement, as Asquith did repeatedly in 1909-11. Direct election, whatever its theoretical attractions, tends to produce a body that is merely a duplicate, and often a rival, of the lower House. Indirect election, either by the members of the lower chamber or by local authorities, tends to place too much power in the hands of the party managers, and was for this reason abandoned in the United States. Nomination by the Crown of a certain number of Lords of Parliament, who would hold their seats for life, would entail the smallest departure from present practice, and could be made to contribute a chamber of varied and valuable accomplishments not very different in character from the effective portion of the present House, though more equal in party strength. It ought not to be impossible, given agreement among the parties, to ensure that the initial nominations of Lords of Parliament properly reflected the strength of the parties, and thereafter each party could fill up the vacancies that occurred during its term of office.

*

But any attempts to reform the composition of the House of Lords come up against one objection. Part of the utility of the present House of Lords as a revising chamber arises precisely out of the fact that the method of selecting its members is ridiculous. If the members of the Second Chamber became any more sure of themselves, they might take to rejecting Bills because they themselves did not like them instead of rejecting them because they were sure the electorate did not like them—which is the only reason that would embolden them to action now. Reform of the composition of the Lords is the only reform for which a case can be made out—but perhaps the prudent politician ought to conclude now, as on every previous occasion in the last thirty years when the matter has come up, that an adequate case cannot be made out even for that. If that were so, the best thing would be to leave the House of Lords as it is and to concentrate on getting more members of the Labour Party into it, which would be facilitated by the institution of life peerages, and possibly by giving Ministers the right to speak, but not to vote, in both houses.

That does not mean that the attempt to reform the House of Lords should be postponed indefinitely, but it does mean that it should be undertaken only as a response to some powerful demand on the part of the public, and that when it is undertaken it should not be smuggled in by the back door piecemeal in order to ensure the enactment of highly controversial measures the difficulties of which have already given rise to sharp differences of opinion in the Cabinet itself. At this time of acute anxiety, when the Government should be making every effort to recreate the unity of national spirit characteristic of the war years, it is surely something worse than folly to introduce a highly controversial issue upon which it has received not even the vestige of a mandate from the electorate. When the pressing problem of the moment is how to restore the faltering national economy to a condition where the British people will be able to buy enough food to keep them alive and enough raw materials to keep them at work, political luxuries like the reform of the Lords must for the moment take a low place in the list of priorities. And if there were any section of the Government or its supporters who imagined that, in these days as of old, the slogan of “Peers versus People” could be relied upon to make the people forget all the complaints they might otherwise have against a Government of the Left, the results of last week's municipal elections ought to have made them change their minds.

Who is for de Gaulle?

IF General de Gaulle were to come to power in France, there can be little doubt that the first reaction among most people in Great Britain would be one of alarm and anxiety. Strong regimes of the Right are rightly suspect among democrats. Yet there is, with each week that passes, less and less room for doubt that the General's accession to power by constitutional means (the qualification is important) is the solution of the French crisis that ought to be the most welcome—or the least unwelcome—to France's neighbours. It is time this was said, for there has been too much humming and hawing about the General, and about his foibles and his followers. Much has been argued and asserted about the beating that his party gave the Communists and the progressive Catholics in the municipal elections a fortnight ago; but the question of what is the best solution to the French moral and economic crisis has not been put, in this country, in the form that all foreign political questions should be put, at one stage or another: what is the British interest in the matter?

With the question in such a form the simple answers suggest themselves. It is a matter of eliminating the alternatives. Is it a British interest that France should be ruled by M. Thorez and M. Duclos, with an internal policy of social revolution and a foreign policy of hostility to America? Clearly the answer is No. Is it then a British interest that the government of France should be continued by coalition, with the present Socialists and men of the centre, propped up between the militants of Right and Left and trying with inadequate powers to stop inflation, save the franc and prepare the way for participation in a Marshall Plan? All instinct answers Yes; the middle way is generally to be preferred, and the majority of men and women in France are showing their usual preference for it; some who voted for General de Gaulle only a fortnight ago have got nervous since. But in France today the continuance of the middle way means a continuance of the ineffective, spineless Government that the Fourth Republic, like the Third, has hitherto exhibited. Another winter's nerveless wrestling with food shortages, selfish farmers, discontented workers and housewives, dishonest taxpayers and well-drilled trade unions might so sharpen the public mood that a constitutional solution might be impossible, and either Right or Left would be led to take measures of the kind which provoke civil war. If there must be a new start in France, the sooner it comes the better. To delay it too long might make bloodshed inevitable. In that case, if coalition government by discredited representatives of the prewar party system is likely to prove dangerous as well as futile, the third question presents itself. Is it a British interest that France should have a government that would provide

leadership, overcome disunity and concentrate the national energies on restoring health and strength to the French state? The answer is clearly Yes—provided that the process can go forward without seriously curtailing the Frenchman's rights and liberties, and without a foreign policy on Russia and Germany so inflexible and so narrow that it threatens the Dunkirk pact. Both conditions could be met if General de Gaulle were to come to power soon rather than late, by vote of Parliament rather than by the authority of a *coup d'état*, pledged to amend the constitution by constitutional means rather than to overthrow it by force.

*

It is unfortunate that the French Communists, for different and tactical reasons, may also prefer the promotion of General de Gaulle to the confirmation of M. Ramadier. They see danger for themselves in the General's present tactics; which are to bide his time, to watch the hunger and confusion spread, and to await the surge of demand for order and authority which would carry him to power with unmistakable popular support. They would like to make him fight now on ground chosen by them: over wages, over food, above all over the issue between east and west, between American aid and dollar dependence on the one hand, and Russian aid and independence of America on the other. The Communists have put their calculations quite openly in their weekly paper *Action*:

If the General were obliged, here and now, to enter the lists on parliamentary ground which is unfavourable to him? If he were put against the wall? If he were compelled at an unfavourable hour to enter the battle on ground which he has not chosen?

This is a reckless challenge to the leader of the Fighting French. Taken with M. Thorez's public confession of changed views to his central committee last week, it means a declaration of war, a threat of “direct action” outside Parliament. M. Thorez, who has now departed with his wife for Moscow, there to celebrate the thirtieth anniversary of the October Revolution, has thrown overboard the policy of collaboration with other parties of the Left which he maintained during the resistance and after the Liberation against his party's extremists, MM Fajon and Marty. Before he left, his Central Committee pledged themselves to follow the Bolshevik precedent of 1917, when “the struggle was waged simultaneously and victoriously against counter-revolutionary Kornilov as well as against Kerensky.” In other words, the government of M. Ramadier or his successor will be fought as ruthlessly as the Gaullist Rally. The tradition of the *Front Populaire* is dead and buried; Mr Zhdanov read the funeral service over it at Warsaw in July.

The portents, therefore, are that the Communists can and

will make coalition government unworkable. Their future action is likely to be concentrated in the trade unions and in the "committees for the defence of the Republic" which they are setting up, presumably as embryo Soviets, in factories and villages all over France. They will be able to mobilise much inarticulate resentment and open discontent about wages, the cost of living, the bad distribution of food, and the social inequalities which the black market brings into such startling relief. Every hesitation of American Congressmen to press on with aid to Europe, every hint that strings may be tied to loans and to the Marshall plan will be used to feed the inflammatory slogan that France's independence is threatened by American capitalism. And, should the Foreign Ministers' conference at the end of this month fail, British and American efforts to get on with the rehabilitation of western Germany will be represented as a betrayal of France's security.

This is a powerful array of weapons and one can only wonder how M. Ramadier can fight back effectively. The majority of twenty granted to his present Government last week was nothing but a postponement of the verdict on ten months' desperate grappling with crisis after crisis. M. Ramadier is already looking for an heir and finding only a familiar trio of aspirants: M. Blum on the Left, M. Herriot in the centre, and M. Paul Reynaud on the Right. If the overriding need is for a Cabinet that can command national unity and enforce new and unpopular plans to cut expenditure and extract more taxes, where is the personality who can divert emotions as well as convince minds? Not, surely, either in the Socialist or the Progressive Catholic or the Republican ranks.

*

Admittedly, the Left section of the Socialists has become more conciliatory towards M. Ramadier since the municipal elections. Conceivably there may still arise what Frenchmen are calling a "third force," strong enough to reject the choice between Right and Left, between west and east, which the Communists and some of the General's supporters are trying to force on the French people. The appearance of such a strengthened coalition would be in the French tradition; but its prospects are weakened by two factors: the desertion to General de Gaulle of a great body of progressive Catholic voters of the middle class, and the unsatisfied longing of the people for that renovation and break with the Third Republic which found expression in the Resistance. To those who feel this way the soil in which the Fourth Republic was planted is still sour; and every peasant knows what the cure should be.

What happens in France will be anxiously watched by a

Europe in which the first stirrings of a revival of the Right can be heard. If that revival gathers momentum, it will be due as much to the Zhdanov doctrine as to the Truman doctrine. Whatever may have been thought of it in this country, Mr Zhdanov's speech and the manifesto which accompanied the formation of the Cominform have been taken seriously on the Continent. It is virtually a declaration of political warfare against the moderate Socialists and centre parties of the principal western nations. Its first aim is the frustration of the Marshall Plan: "as far as the USSR is concerned"—so runs the Zhdanov declaration—"it will make every effort to prevent the plan being realised." That, it seems, is now also M. Thorez's first objective; and the persistent reports that Russia has wheat to offer France may point to the tactics that are to be followed. France looks like becoming the centre of the European arena in which the battle of the Marshall Plan is to be fought. If that happens, France's neighbours cannot take a strictly disinterested view of the contestants.

At the moment the initiative lies with the French Communists. Something of significance for them will assuredly come out of the Moscow celebrations which M. Thorez is attending. If it is to be a signal for direct action, to be fought on the wages question—which comes up on December 1—then one must expect deadlock between Government and trade unions. If it is to be moderating advice, a warning against forcing General de Gaulle into action of a kind which might ruin the French Communist Party, then there are some prospects of a "third power" government getting through the winter. In the first case, the politicians in the centre will be driven to make common cause with the General. In the second case, he will be able to choose his time—and his method—for taking office. But in either case a great responsibility rests on the General. He is not a Fascist and should beware of acting like one. He has always stood for a stronger constitution, but there is no reason why it should be authoritarian. He believes in leadership, and leadership is what France needs, but he should school himself to working with elected politicians, and with politicians elected by parties other than his own.

Unfortunately, it looks as if the choice will not be left to the General, as if his hand will be forced. If it is, there should be no doubt about where the responsibility lies and nothing done, either in this country or in America, to make his task more difficult. It is a common interest of all three nations that the Marshall plan shall be adopted and that it shall succeed. One condition of success is that there should be order, confidence and firm, popular government in France.

The New Poor Law

FROM one point of view, the National Assistance Bill can be regarded as the logical completion of the new system of social security of which last year's National Insurance Act provided the main framework. Social security was never intended to be achieved by insurance alone. It was never, that is, contemplated that insurance benefits would in every case be adequate to provide the minimum income necessary to prevent poverty. That minimum was to be secured by the supplementation of insurance benefits by assistance, and in some cases, which did not qualify for insurance benefit at all, assistance payments would alone provide the whole of the minimum income.

This mixture of insurance plus assistance is indeed the basis of the present system of social security. The difference between the present system and what will come into force next July is, first, that insurance benefits will be much higher than they are at present and will cover far more classes of people—

almost the whole population over the age of 16 will be eligible to qualify for insurance. Thus the scope remaining for assistance will be narrowed. The second difference is that at present assistance payments are made through two different agencies—the Assistance Board, which provides payments for the unemployed, old age pensioners and widow pensioners with dependent children; and the public assistance committees of local authorities, which are responsible for all other classes.

For a uniform system of social security to be achieved, it was therefore necessary for all assistance payments to be centralised, so that whatever the cause of a person's need, he would be assisted on the same basis as his neighbour. Part II of the National Assistance Bill, therefore, rounds off the social security system by transferring all assistance payments, and all other special payments (such as those made to blind persons) to the Assistance Board, which is to be known in future as the National Assistance Board.

But a far deeper purpose lies behind the transformation of public assistance into national assistance than a mere tidying-up process. Part I of the Bill, consisting of one clause, formally declares the death of the existing poor law, and for many people the symbolic passing of this three hundred and fifty year-old piece of social legislation will be the most important feature of the present Bill. For the poor law is unpopular—much less so than it used to be, yet unpopular enough for a widespread reluctance to receive assistance under it to have grown up among the population at large. The tradition that it is a crime to be poor has long since departed from the administration of the poor law—with a few exceptions perhaps—but the stigma which this tradition had imparted to the poor law remains to this day.

Yet, with all its faults, can this country afford not to have a poor law—by whatever name it is called? Its supreme virtue was its simplicity; not indeed that the poor law code itself was simple, with its complicated provisions regarding removal and settlement, the right of recovery and so on, but the obligation that now rests on local authorities could hardly have been made clearer or more unequivocal. They have to relieve the poor. No matter whether the need for relief arises in the middle of the night, whether it is a temporary need, whether it is for money, for food, for medical services or for accommodation—the duty of the poor law officers is clear. They have to provide relief first, and ask questions later. How important this overriding obligation is can be seen by reference to the National Assistance Bill. Notwithstanding the death sentence on the poor law, it has been found necessary to incorporate in the Bill the poor law's outstanding virtue. Thus among all the clauses and sub-sections dealing with the powers and duties of the Board regarding a person's application for assistance, there will be found such phrases as the following:—

Nothing in the two last foregoing sections . . . shall prevent the Board's making an assistance grant in an urgent case, and in the making of a grant by virtue of this subsection the Board shall not be bound by any regulations . . . which appear to them inappropriate in the circumstances of the case.

Or again,

in giving assistance in accordance with this section to meet sudden and urgent need the Board may dispense with inquiry into resources or other circumstances and with compliance with any regulations of the Board.

*

"Sudden and urgent need"—there are no office hours under the poor law, and, like its officers, the Assistance Board will have to maintain a 24-hour service. But perhaps the full force of the obligation to provide for "sudden and urgent need" can be seen when Part III of the Bill is examined. Outdoor relief, or domiciliary relief, is only part of the relief given under the poor law. Equally important is the provision of shelter to the destitute in an institution. Much has been written recently about conditions in the workhouses today, of the hotch-potch of humanity found in them, the bareness and bleakness of the surroundings, the old-fashioned rules governing them; and much indignation and pity have been aroused at the thought of old people having to end their lives in them and of young children having to start theirs. To do them justice, however, it was never intended by the poor law commissioners of a hundred years ago, when the workhouses were first established, that the aged poor, who today make up by far the greater part of their inmates, should solely be relieved by workhouse accommodation. It was always intended that the prime function of the workhouse was the relief of the able-bodied poor, and that eventually special provision should be made for the old and infirm.

Under the new Bill this intention will at last be achieved. The tendency among progressive local authorities in recent years to take old people out of their mixed institutions and place them

in special hostels is made obligatory on all. The classification of a workhouse's inmates is thus carried a stage further. But once again it is recognised that need and destitution know no official demarcation lines. As with outdoor relief, the supreme virtue of workhouse relief is that it has to be given to anyone who is found destitute and without shelter, no matter where his ordinary place of residence may be and no matter what the cause of his destitution. Whole families may be brought to a public assistance institution, and frequently are, at any hour of the night, and they cannot be refused shelter. A hospital may refuse a bed to a sick or dying person but the public assistance institution turns no one away.

*

This statutory roof is so valuable, so essential a part of any system of social security, that, as with the overriding obligation to give outdoor relief, it has been incorporated into the new Bill. Local authorities have, therefore, to provide

temporary accommodation for persons who are in urgent need thereof, being need arising in circumstances which could not reasonably have been foreseen . . .

The big difference, however, between the overriding obligation to give relief in Part II of the Bill and that in Part III is that in the first case it is made the responsibility of the Assistance Board and in the second that of the local authorities. This reliance on local authorities, even were it undesirable, which it is not, is inevitable, for the Assistance Board has no statutory roof and could not undertake the management of the local authorities' institutions for many years to come. But will the taint of the workhouse be removed by the new legislation? One cause for the taint will be removed. People to whom shelter is given will be required to pay for it according to their means, and since nearly everyone, in particular every old person, will be assured of a minimum insurance benefit of 26s. a week, a minimum charge of 21s. a week will be made for accommodation, leaving the beneficiary five shillings for pocket money. (This charge of 21s. will not nearly pay the cost of his keep, which is nearer £2 or more in large institutions and will be higher in the smaller hostels that are contemplated.) The abolition of the workhouse disqualification for old age pension will go a long way towards removing the stigma of charity.

Nevertheless, the old mixed institution will remain—is, in fact, bound to remain, if the statutory roof is to be maintained, for classification and segregation cannot be carried out at three o'clock in the morning. Thus, even if it could be assumed that old people's hostels will be proceeded with at once—which is unlikely under present conditions—there will remain the old building containing a motley collection of the destitute. Moreover, it is also provided in the Bill that if a person is found unsuitable for the type of accommodation provided for him, he, or she, may be transferred elsewhere. The "difficult" workhouse inmate, who will not fit easily into hostel life, is thus recognised. But is there to be special accommodation provided for all the "difficult" cases?—if so, who will staff it?—or will they be returned to the big, mixed institution? A further point is that although the local authorities are responsible for establishing and running all the accommodation to be provided under Part III, the Assistance Board may, under Clause 24, make use of it, and require a local authority to provide accommodation for persons whom the Board consider to be in urgent need of it. Nor can they be required to leave it except with the Board's consent. Thus, the local authority, which will have to exercise disciplinary functions on behalf of the Board, will get all the kicks.

It is not intended in this article to prove that the National Assistance Bill is a bad Bill. On the contrary, it is a good Bill. A great deal of imagination has gone into the framing of it. The welfare of the unfortunate sections of humanity—the blind, the deaf and dumb, and the otherwise disabled—

is to be provided for. And although the local authorities lose their function of giving outdoor relief, their functions in respect of accommodation and welfare generally are enormously widened. But let it not be assumed too readily that the poor law is being abolished, except in name. Very wisely, those responsible for the Bill have realised that its essential principle is indispensable. The danger, however, remains that, with the retention of that principle, some of the stigma of the poor law will be retained also. When old age pensioners, widows and sick people find that they have to go to the same building to receive supplementation for their benefits, enter by the same door, and have the same inquiry into their needs, as the work-shy, the vagrants, the down-and-outs, and other ragtag and bobtail of the poor law, will the same cry of "stigma"

Criminal Justice

THE text of the Government's Criminal Justice Bill has now been published and it is in consequence possible to see the scope of the amendments to the criminal law that are likely to be made before the session is over. In the main, the Bill, which bears a close resemblance to Lord Templewood's prewar Bill, is concerned with administration, and most of its proposals are likely to prove non-controversial. But the Bill is a composite affair and it does involve certain changes in what may be called the principles of criminal justice as well as in the machinery which the state has for the prevention and punishment of crime.

The Bill proposes that the punishments of "penal servitude" and "imprisonment with hard labour" shall be abolished. Instead, there will in future be only one category of imprisonment, so far as sentences are concerned. The existing statutory prison divisions are also to be formally abolished. Thus every offender sentenced to imprisonment will start on the same footing. This does not mean that there will be no classification of prisoners. On the contrary, the Home Secretary may make rules for the classification of prisoners and any rules that he does make shall provide for special treatment of special classes of prisoner, including those in prison for sedition, seditious conspiracy or seditious libel, or because they have failed to pay a money fine. The intention is to give statutory sanction to what is already, in large measure, an administrative *fait accompli*, that is, classification according to the character of the offender and not according to the character of his offence. This is a great step forward in the modernisation of the penal system. So, too, in the opinion of most people, is the clause which would abolish the sentence of whipping. The Bill makes no proposal to abolish capital punishment, but it is believed to be the Government's intention to leave this, if it is raised (as it certainly will be), to a free vote.

These alterations in punishments are interesting and important. But the real importance of the Bill lies in the progress it makes towards converting the criminal law into a rational machine for both punishing and reforming the offender, two objects not easy to merge into the one system. Perhaps the clearest way of looking at the resulting picture is to consider the offenders by age groups.

The first main change is with the young. Capital punishment is not in future to be imposed on anyone under the age of 18. If the offender is under 17 he may not be sentenced to prison by a magistrates' court, nor by any court if he is under 15. Imprisonment for any offender under 21 is to be a last resort; it can only be imposed if the court considers "that no other method of dealing with him is appropriate." Instead, it is intended that all offenders under 21 shall be sent to a "detention centre," which is to be a new creation. Also the powers of

be raised as is raised now about the poor law? And, in these circumstances, will it be a national advantage or disadvantage that an unpopular service is centralised in a department under a Minister responsible to Parliament on whom all the force of parliamentary pressure can be brought to bear? Again, will it be to the advantage or disadvantage of the recipients of assistance that responsibility for them may be banded between the Assistance Board, the local authorities, and the various health authorities? It will be many years before it can be said for certain that the high aims of the National Assistance Bill are fulfilled and that for the needy the multitude of commandments which it proposes have any virtue not inherent in the simple commandment of the poor law—"Thou shalt relieve the poor."

supervision over a person under 21 are to be extended to cover him after release. Borstal training is revised, to some extent. The upper age limit at which anyone can be sent there is restored to 21—the increase to 23 not having proved successful. But it will be permissible in future to impose a Borstal sentence in more cases than previously. Under the present law the offender must be shown to have criminal habits, tendencies or associations. Under the Bill he can be sent to Borstal if the court thinks it expedient that he should be.

The probation system will be considerably extended and improved. So far as the court is concerned, the main change proposed gives the court power to require anyone placed on probation to submit to medical treatment for a period not exceeding twelve months. But a wider change is in the considerable improvement proposed in the organisation of probation officers and their work. Their numbers will be increased; more women will be brought into the service; and the work of the probation committees of magistrates will be overhauled and improved. In short, every encouragement will be provided to keep the first offender out of prison and to help him to find his way back to an acceptance of his social responsibilities.

If probation fails, and if the offender is over 21, the proposals in the Bill make very little change in his subsequent criminal history unless and until he becomes a persistent offender. In that case more can be done for—or, at least, about—him. At the moment, a sentence of preventive detention on a persistent offender can only be passed in addition to a sentence of penal servitude and then for periods of not less than five nor more than ten years; and it is consequently not often used. Two new types of sentence are contemplated by the Bill. After two previous convictions for serious offences, an offender may be sentenced to corrective training for not less than two nor more than four years. An offender who is over 30, who has three previous sentences against him, of which two were sentences of imprisonment, Borstal training or corrective training, can be sentenced to preventive detention for not less than five nor more than fourteen years.

Powers to deal with mental cases are greatly increased. Courts may obtain medical reports without remanding a man in custody. Powers to make reception orders for insane offenders are widened and the whole supervision of criminal lunatics is transferred from the criminal authorities to the Board of Control, reserving, however, to the Home Secretary the power of discharge.

There are many other points covered by the Bill. The power to impose fines instead of prison sentences is extended to include all serious offences. The powers of the High Court to grant bail are increased. Finger-prints can be taken before trial in magistrates courts (which may induce magistrates to grant bail

more freely). Some forms of written evidence may be used in magistrates' courts in traffic offences. Loss of state pension rights on imprisonment for more than one year will no longer be automatic. All three points are of importance.

But the state of criminal law still remains a matter of men, not of machinery. The state may provide remand and detention for those who, even if offenders, are not yet criminals. It can give magistrates wider powers to put offenders on probation. It can abolish hard labour. But the problem still remains one of personalities: the personalities of the offender, the magistrate, the probation officer, the head and staff of the centres, the prison governor and his warders. Their outlook cannot be changed by Act of Parliament.

On the question of magistrates, there is little that need be said here until the work of the Royal Commission on that subject is completed. Probation officers need little comment for another reason, the general agreement over the very high quality of their work and on the standards of human sympathy and understanding that the profession as a whole has reached. It is

NOTES OF THE WEEK

Local Elections—Portent or Warning?

The municipal election results came as a severe shock to the Government, and second thoughts about them can have been no more consoling than the first. The size of the poll—in many areas sixty to seventy per cent as against a normal poll of thirty to forty—the effect of the middle-class vote in such suburban areas as Wembley and Wood Green, and the swing in the industrial areas in Lancashire and the North are causing some hard thinking. Even the Conservatives have been taken by surprise and are now cock-a-hoop.

The swing is almost certainly mainly the work of that disregarded "submerged tenth"—the middle class, middle-of-the-way section of the electorate, whose feelings and voting influence have been so studiously ignored by the Government. The marginal voters—marginal in the two senses of being doubtful about their political affiliations and dubious about voting at all—have been driven to the polls by a long succession of political and personal irritations. The risks run by the Government in ignoring them have frequently been pointed out in these pages. Perhaps the Government will now adjust their tactics. If so, the shock will be salutary and may save them from an unwise reliance on a long run of by-election successes.

A comparison of the parties' successes in the municipal elections this year and at the last contest is particularly interesting. Owing to the moratorium in elections during the war some of these seats were last contested in 1945—probably rather more than half—and the rest have not been contested since before the war. The first column below is therefore a mixture of prewar and postwar results.

	Results When Last Contested		Results in 1947	
	Seats Won	Percentage	Seats Won	Percentage
Conservative.....	648	19.5	1,273	38.3
Labour.....	1,483	44.7	831	25.0
Liberal.....	141	4.2	140	4.2
Communist.....	9	0.3	...	...
Independent.....	1,041	31.3	1,078	32.5
	3,322	100.0	3,322	100.0

While the position of the Liberals and Independents remained almost unchanged, the swing from left to right between the Conservative and Labour seats is very marked.

It is dangerous to argue too much from local election results. A reaction against the Government in power is inevitable and elections have a much weaker sense of responsibility than at general elections; there is a natural desire to give way to spleen without fear of dire consequences. But for all this the Government should take warning that if they hope to win the next Parliamentary election they will have to take the feelings of the country—particularly those of the middle-class voters—much more to heart than they have been willing to do hitherto.

to be hoped that the new remand and detention centres will attract the same kind of men and women into their service. The prisons themselves are a more difficult problem; certainly one that is not yet solved and which this Bill cannot solve.

Perhaps the greatest disappointment in an otherwise excellent and overdue Bill is to be found in the Government's acceptance—necessary perhaps, but no less deplorable—of the delay which lack of suitable premises imposes upon even the start of many of these reforms. The explanatory memorandum published with the Bill contains the following sentence: "the building of these institutions cannot be undertaken until the need for other building of higher priority on the national building programme has been met." The total of offenders is rising. In 1939 there were 78,463 convictions for indictable offences; in 1945 115,974. Ten years ago the proportion per 100,000 of population was 157.8. In 1945 it was 223. It is to be hoped that when the Bill is debated the question of what priority should be given to this kind of building will be thrashed out. It should not be set on one side without full examination.

Good News from the Mines

The last few days have produced a record output of encouraging news about coal. British miners last week produced over four million tons, their best performance since May. The Ruhr miners averaged 246,587 tons a day for October, far and away the highest and most even performance since the war. The Saar miners have got within 9 per cent of their prewar output, and in Poland 43 million tons were mined in the first nine months of the year.

Such news has important implications. The average daily output of the Ruhr and Saar mines last month, added together, made a total of 284,687 tons, thus bringing into action for the first time the sliding scale for allocation to export which was conceded to M. Bidault in April. This scale provides that when output in Western Germany exceeds 280,000 tons a day, 21 per cent shall be allocated to the European Coal Organisation for distribution to its members. Thereby the French should see an increase in those imports from Germany so ardently demanded by all parties. The fact should not go unnoticed in France, where it is customary to regard British handling of the Ruhr miners as incompetent. Nor should it pass unnoticed in this country, as an example of what incentives in the shape of extra food and consumer goods can achieve in a short time.

The fact that British miners have again passed the four million ton mark will certainly not pass unnoticed in Europe, where there is growing impatience at the price that has to be paid for American coal: \$21 a ton in France, \$22 in Italy, \$23 in Sweden, against cheaper and better British coal, if it were available. In at least five European countries the impression is growing that it will be available soon. Count Sforza has been told Italy may get some; Sweden and Denmark believe they will; and Eire appears to have got a promise of coal—as well as agricultural machinery—in exchange for the offer of more food. France, too, certainly expects to be near the head of the formidable queue which is now waiting for Mr Gaitskell to raise the shutters. Fortunately or unfortunately for the Minister, there has been a notice on the shutters for the last two months saying that some six million tons of British coal will be available next year; for that is the figure to which the British delegation at the Paris economic conference was allowed to pledge itself—six million tons in 1948 and 29 million tons in 1951.

It seems fairly clear that unless British production can be kept steadily above an average of 3½ million tons a week throughout the winter, there will be nothing to export in the spring. Unless, of course, the household and non-essential industrial consumer is to be drawn into the export drive by accepting smaller rations. The problem remains of finding incentives to produce and, above all, incentives to take up mining. Count Sforza has made his contribution by suggesting, not only that Sardinian miners should take a hand in Britain, but that British miners should take a holiday in Italy. Mr Bevin's hands must be itching to hold the cards which higher British output throughout the winter would give him.

Inflation and the Franc

At long last the French Government has come to grips with inflation and decided to reverse its policy of printing more notes to cover its expenses. At a four-hour Cabinet meeting on Wednesday it was decided to raise the price of coal from 1,350 francs a ton to 2,160 francs (90s.) and to permit dependent industrial prices to rise accordingly. A new series of products will now be added to the great "free sector," and it is generally assumed that a devaluation of the franc will be required to save France's export trade.

The only alternative to this momentous decision was to appeal to the National Assembly for a revival of the suppressed coal subsidies, which were allowing French coal to be sold to consumers at a loss to the state of about 900 francs a ton.

The decision is part of a concerted effort to balance the budget by 1948. Consequently the Communists, who are making every effort to force inflation on and the Government out, are its principal opponents. They are now trying to persuade the public that the increase in prices is part of the French authorities' effort to reduce the standard of living and to make French workers more pliable to American domination.

For the rest, there is unanimous agreement on the importance of the new decision, but some hesitation about the psychological effect. While orthodox economists are welcoming the return to wisdom others forecast that the conversion has come too late to save the franc. The crux of the matter is whether the Government has the will and power to prevent a simultaneous jump in food prices. In theory there is no reason why they should rise: last summer food prices were at a level of 1,367 (1938=100), while industrial prices had only reached the figure of 813. On the contrary, the absorption by industry of a greater proportion of the money in circulation should be left to have its effect on food prices. In fact, however, the decisive factors are far more psychological than economic, and everything will depend on whether the food producers can be given confidence in the future. The authorities plan to extend their control over basic food products at every stage between the farmer and the consumer, while freeing non-basic food commodities from all control whatsoever. The idea here is to concentrate administrative effort; but the danger, as before, will be that the producer may be encouraged to produce non-controlled, i.e. non-essential, foods.

In any case, if food prices do slip out of control, it seems almost certain that the franc will collapse. The Government is pledged to adjust the wage level to the increased cost of living by December 1st. If at that moment food prices are swerving upward, the workers will very naturally take the opportunity, while everything is in the melting pot, of driving a hard bargain. But by that time a few thousand francs more or less may no longer be worth arguing about.

Irish Trade and Politics

The trade negotiations between Britain and Eire, which brought Mr de Valera back to London this week, have ended in a general but loose agreement to expedite trade between the two countries. A joint committee of officials is to be set up which will work out details from time to time. Meanwhile, there can be no doubt that the first instalment of the agreement, behind its vague phraseology, gives the Irish Ministers much of what they wanted. They have, it is true, accepted the need for Eire to economise drastically in its use of dollars on the condition that supplies from sterling sources are greatly augmented. Definite, though small, quantities of coal, agricultural machinery and fertilisers have been earmarked for delivery by Britain next year, and the prices offered for Irish farm produce have been considerably increased. The latter concession is said to be necessary to prevent the diversion of Irish livestock to the Continent. This may be so. But the great bulk of Irish exports a ways have been, and still are, sent to this country, and there is no doubt that in the long run their quantity must be greatly increased, not diminished, if Eire is to redress its adverse balance of payments and raise internal prosperity. In these circumstances it is a pity that Britain has not asked Eire to take more positive steps to increase exports of farm produce to Britain—for instance, by imposing much more stringent domestic rationing, a step which the Irish Ministers seemed at one time prepared to take.

In any event, the successful outcome of the trade talks should assist Mr de Valera's party, the Fianna Fail, in the general election which is to be held in Eire in the New Year. Some boost for his party is badly needed. It has suffered a serious reverse in the recent by-elections, two of which were won by the new

Republican Party, whose policy is more romantically nationalist even than Mr de Valera himself. It is now thought unlikely that Fianna Fail, who have been continuously in power for fifteen years, will again get a clear majority. To date, Mr de Valera has succeeded in avoiding serious enemies on his left, but a Coalition Government of the Republican Party and Labour now becomes a real possibility. Such a combination would be less likely to follow a rational trade and economic policy than Fianna Fail, and Britain may find itself, after the many years of mutual hostility, in the strange position of wishing success to Mr de Valera—a twist of events which is not without its good points as well as its irony.

Dishonourable Members

Comment on what has come to be known as the Allighan case is not only superfluous. It is also unseemly, for the House of Commons itself, sitting in a judicial capacity, has passed judgment and pronounced sentence, and Mr Allighan, Labour MP for Gravesend, ceases to be a member of Parliament. But since the case will be cited as a precedent in future histories of Parliament—its constitution, procedure and powers—it is worth placing on the record exactly what the House of Commons decided in his case and how it differed from that of Mr Evelyn Walkden, Labour MP for Doncaster.

The Government asked the House to approve four motions in regard to Mr Allighan. The first was that he was guilty of gross contempt of the House because of an article which he had written and which appeared in the *World's Press News*, making unfounded charges against the conduct of members of Parliament. This article had been referred to the Committee of Privileges, and the second charge against Mr Allighan was that he was guilty of grave contempt of the House in misleading the Committee when giving evidence before it. Both these motions were carried by the House *nem con*. The third motion, however, was more complicated and led to considerable argument. The House was asked to approve that, in corruptly accepting payment for the disclosure of information about matters relating to future proceedings of Parliament, Mr Allighan was guilty of dishonourable conduct and deserved to be severely punished. It was this charge alone that also applied to Mr Walkden.

It will be noted that in framing this motion the Government explicitly did not endorse the majority view of the Committee of Privileges—that the disclosure for payment of confidential information relating to a party meeting might in some circumstances be a breach of privilege. In this motion there was, therefore, no question of contempt or breach of privilege, and some members consequently argued that the motion should not be carried. Felony automatically vacates a seat. Misdemeanour is a ground for expulsion. Contempt and breach of privilege are offences against recognised laws of parliamentary conduct and are punishable. But is dishonourable conduct? The majority view, taken after a free vote, was that it is and that in proceeding on this charge against both Mr Allighan and Mr Walkden the House was adopting the same attitude towards a member as any profession exercises with regard to professional misconduct by any of its members.

The fourth motion related to the punishment to be imposed. The Government's proposal that Mr Allighan should be suspended for six months was defeated by 175 votes to 75, and an amendment substituted that he should be expelled. The punishment for Mr Walkden's smaller offence—dishonourable conduct—was, however, limited to a severe reprimand.

Whose Chores in Palestine?

Mr Bevin, soon after taking office, was incautious enough to stake his reputation on solving the Palestine problem. America's spokesmen seem bent on ensuring that they shall have no reputations to lose. The performance of the major World Power in the Palestine Committee of the United Nations is depressing for those who want to see leadership at the top and a world well run. America's steady evasion of the question how partition is to be enforced, joined to partisan insistence on a plan requiring enforcement, culminated last Friday at a closed meeting of the Committee in modified proposals, afterwards revealed by Mr Herschel Johnson at a press conference.

These were that the transition period in the partition plan of the Special Committee should be shortened from two years to 8 months, so as to enable the British to speed up their withdrawal and, while withdrawing, to carry out the partition scheme. This

would then become effective on July 1st next year. This casual fashion of dismissing partition as a minor chore, to be done by the housekeeper on the way out of the house, is nothing better than frivolous. It is not made more realistic by the additional proposal that, instead of the international gendarmerie originally suggested by America, a three-man commission of the United Nations should go to Palestine to advise the British during this period. What could be done by such a commission without responsibility? It could only exacerbate tension and stiffen the obstinacy of the parties whom the British were trying to reconcile. It is not good advice which has been wanting in Palestine.

The British Government will have no difficulty in pointing out the flaws in these proposals. But it is to be hoped that in so doing they will not, as some British comment has already done, stress the time which it will take, as a mere matter of logistics, to get the British forces out. The forces can still be in Palestine and yet be not responsible for internal security there. So long as they are there, they will look after their own security in their chosen areas of concentration, but there is no reason why that should hold up the transfer of responsibility to Palestinian forces. The Soviet delegate's improvement on the American proposals, which would terminate the Mandate before 1948, and leave the Security Council in charge for a transitional period of one year, would introduce the veto into an issue which is already intractable enough. But, however impracticable, it does suggest further good cause why Britain should not plead administrative difficulties as a reason for delay.

The fact must now be faced that the United Nations may very well end their discussions of Palestine by recommending a partition scheme, which they will, however, simply leave the British to enforce. This would be the most unhelpful contribution they could possibly make, since it would deprive the Mandatory Power of all the advantage to be gained in negotiations with Jews and Arabs influenced by the prospect of its own impending withdrawal. Instead of being able to move step by step towards the transfer of power, with complete freedom to make any adjustments which might at any stage offer hope of agreement, it would have its every move measured against a rigid scheme. Any departure from the scheme in the interests of co-operation would be criticised as being in conflict with the will of the United Nations. The temptation would be strong for the aggrieved party to try to enforce what the United Nations had failed to enforce, thus starting the bloodshed which there might still be a hope of avoiding.

* * *

Programme of Withdrawal

Partition is in danger of becoming a slogan. The Zionists are for it and the Arabs against it, and nobody stops to consider what it is. If it means division of Palestine into two sovereign states, then the United Nations majority scheme is not a scheme of partition at all. Its Arab "state" would have no economic basis of existence, while the territorial interlocking and the provision of economic union of the two states, if adhered to, would effectively dispose of sovereignty. The advantage that a practical programme of British withdrawal has over all plans and solutions is that it is empirical. At every stage there is always the choice, for either party, between co-operation or acquiescence and non-co-operation or rejection. And at every stage this choice has certain practical consequences which, as they accumulate towards the date of withdrawal, will ultimately make the difference between a partitioned and a unitary Palestine. They will also make the difference between order and disorder.

Whatever the United Nations may recommend, if they fail to provide an alternative non-Palestinian authority to which power may be handed over, Britain will have to work out its own programme of withdrawal. This will be a major operation which, as the Indian precedent suggests, should best be carried out on the spot by a special mission or a single commissioner of high standing. Unless evacuation were to be a surrender to chaos, it would be necessary—again as in India—to set up some provisional Government representing both sides, in which some special voting procedure would have to be devised to circumvent communal deadlocks—perhaps by adding a proportion of British official members. This authority would be transitional, and its existence would in no way imply that the future Palestine was to be governed by a binational authority in Jerusalem. If the Arabs chose the Mufti, it would be necessary to allow him back into Palestine. Distasteful though this might be for those who remember his past, it would be better than having him make mischief in Cairo or Damascus. The responsibility for deciding how—or whether—Palestine should be divided, and of facing the

consequences of a failure to decide, could then be squarely placed on this body.

A programme of this kind should not be too rigid. The essence of it is that nothing is imposed—unless by the Arabs or Jews themselves. If all fails, and Arab or Jewish force is finally used, then it should not be through any prejudgment by the British of the basic communal issues.

* * *

Flaws in the Arab League

If proof be needed of the inability of Arabs to sink their internal quarrels in order to present a united front over Palestine, it is amply to be had in the decision of the Syrian Government to pick a quarrel with the Jebel Druse at this moment. The Druse sect occupies a strategic position of the utmost importance and value on the Palestinian border. Its hard core—containing its chief religious leaders and its chief warrior and political figure-heads of the Atrache family—lives in the Jebel, or mountain citadel, which commands the upland plateau on which the Syrian, Palestinian and Transjordanian frontiers meet. Here the Druses number perhaps 67,000. Farther west, Druse settlements, containing nearly as many inhabitants again, stretch along the frontier slopes of Mount Hermon and into the southern Lebanon. Druse fighting qualities are proverbial. They were a match for the French Army in a rebellion of 1925; they are the toughest strain in Syria. They are self-reliant and insular. They possess, at the moment, excellent small arms equipment and even anti-tank guns, which they secured during the confusion that accompanied the French departure in 1945. Their value would be great in any attack on Palestine. Their nuisance value would be equally great in the event of operations in the area they inhabit by armies with which they are not friendly.

The Druses have never readily acknowledged the Damascus Government. In particular, the Atraches cherish a permanent disdain for town-bred politicians. Nevertheless, they have lately borne with them, and took part willingly enough in the Syrian elections of last July. In these, to the chagrin of Damascus, the Atraches beat by a two-thirds majority the less feudal and more amenable party sponsored by the Central Government.

The Damascus Government, undeterred, it seems, by any thoughts about the need for security and solidarity on the Palestinian border, chose the last week of October as the moment to announce the annulment of the Druse elections and the holding of a fresh poll. The Atrache Party retaliated by cutting all telephone lines with Damascus, by digging trenches across the main road into their territory, and by threatening to fight any force sent to organise a new vote. The Atrache Party declares that, if this is Damascus policy, nothing will induce the Druses to fight alongside the Syrian Army for the present.

A motive more ill-judged and more parochial than that which prompted the Syrian Government to act in this way could hardly be imagined. Only a week earlier it was closeted in the Lebanon with its Arab League colleagues promising military action or a united front. What future has the Arab League if the home policy of its individual members, let alone the jealousies between its member states, disrupts every plan to which it lays its hand?

* * *

The Commons and Labour Control

Criticisms of the Control of Engagement Order, debated in the House of Commons on Monday at the instance of some of the Government's own back-benchers, carry more weight when they are directed, not so much against the so-called "totalitarian tendencies" of the Government, as against the limited effectiveness of the Order as a means of redistributing manpower and the lack of policy which has led to its introduction. In the first place, it was clearly foolish to abandon prematurely an Order which at its lowest provided a useful register of workers and at its highest would have enabled the Government to guide workers into essential trades. But having dropped the Control of Engagement Order and proclaimed the horrors of peacetime direction of labour, the Government put nothing in its place. Had it been prepared to follow the policy of incentives, which was actually agreed at the Margate Labour Party conference, and had it exerted its influence to speed up what Mr Isaacs referred to in the debate as the "too slow play of economic forces," the essential industries might not now be so starved of labour, and the need for the present measures would never have arisen.

Little of concrete value emerged from the debate—though the reduction in the Government's usual majority was interesting—

for it was largely concerned with the future dangers of direction as an instrument of peacetime policy. There was, however, the now familiar reiteration of the Government's desire to avoid using compulsion and to rely on voluntary methods. It was also interesting to learn that the powers of direction have not in fact yet been applied although the Order has been in force for a month, and the figures given of recruitment to the textile industries were encouraging. The average weekly intake has increased from 892 before the Order to 2,894 after its introduction, without any use of direction. It is, of course, too early to form any estimate about the effects of the Order in industry generally. It is, however, certain that the Ministry of Labour will meet with very much less smooth sailing when it comes to deal with the workers from the "non essential" industries and occupations—the pools, gambling houses, night clubs and other activities which generically are said to belong to the spivs. The main obstacle will undoubtedly arise over trade union membership, which provides an easy loophole for evasion. Mr Isaacs's reply on this point was far from elucidating.

Narrow Squeak on Basic

Mr Boyd-Carpenter nearly pulled it off. His plea for the basic petrol ration must have caught the Government whips unaware, or at least only partially aware, of the strength of opposition on their own as well as the Conservative benches; even so, its near-success in these days of steamroller majorities must have cheered him considerably. None of the points he made, apart perhaps from his championship of the motor cyclist, were actually new to the controversy. The discrimination which flattens by a 100 per cent prohibition one form, and one form only, of the individual's chosen expenditure; the question-begging use of the expression "pleasure motoring" (or, as Mr Gaitskell has elegantly put it, "gadding about"), the refusal to consult either the motoring associations or the Petroleum Board; the incredible shilly-shallying evidenced in successive Government announcements; these are matters which can bear repeated emphasis.

Nevertheless the Government's decision to remain firm is difficult in principle to oppose, whatever criticism may be brought against their obvious ineptitude in handling the whole question. Even if the dollars actually saved fall far short of the estimate of thirty-six million dollars produced by Mr Gaitskell, a dollar saved is a dollar saved, and in these days that at least is something. Moreover, as Mr Gaitskell took the occasion to point out, dollar saving is not by any means the whole issue. Petrol imported from non-dollar sources has still to be paid for, and any reduction in imports is bound to save some foreign currency, and to assist in the battle of the balance of payments. Moreover any saving that we fail to make by the petrol cut will ultimately mean an increase in food cuts. No answer was, however, returned to Mr Boyd-Carpenter's eminently reasonable request for information on the directives issued to local petroleum offices about the grounds on which supplementary rations are to be granted. Ominous evidences of inconsistency are not lacking. Church-going for instance (and social calls on the way) constitutes a ground for granting petrol; shopping (under certain unspecified distances) does not. A detailed statement would not merely save car-owners a lot of uncertainty, disappointment and actual loss—an advantage for which the Government presumably does not care a Shinwell—but would also ease the work of the frenzied and nearly-submerged regional petroleum officers, and, by giving them a little time to consider, enable them to avoid some of the anomalies which are accumulating to their discredit. Altogether, the Government has laid up for itself a quite astonishing fund of ill-will.

Kashmir Crisis

The Indian troops sent by air to Kashmir have so far succeeded in holding the approaches to Srinagar and its airfield against the invading Pathan tribesmen and their Kashmiri rebel allies. Meanwhile relations between the Pakistan and Indian Governments remain tense; the Pakistan proposals, which require withdrawal of the Indian troops from Kashmir, immobilisation of the Kashmir State troops and suspension of Sheikh Abdullah's Kashmir Government, have been rejected by New Delhi.

It is agreed between the two Dominions that the destiny of Kashmir should be decided by its people by a referendum held under neutral auspices. Mr Nehru has not tried to take his stand on the legality of the Maharaja's notice of accession as

putting the matter beyond dispute, for the right of autocrats to dispose of their subjects in this way is repudiated on principle by Congress, even though it was formally accepted in the partition agreement. After what has happened in Kashmir, however, it will not be easy to ascertain the people's will. Simply on the ratio of Moslems to non-Moslems—nearly 80 per cent—the State might be expected to adhere to Pakistan. But the movement for constitutional reform in the State—the "National Conference" led by Sheikh Abdullah—has been built up with Moslems, Hindus and Sikhs in its ranks; it is strong in the towns and is opposed to the Moslem League, which has influence mainly among the hillmen and poorer peasants.

Sheikh Abdullah has now been charged by the Maharaja—who cautiously remains in the Hindu stronghold of Jammu—with forming a Government in Srinagar and power has thus been transferred to hands which are no longer exclusively Hindu. Sheikh Abdullah has avoided taking a definite line on the choice between India and Pakistan; he says it is for the people to decide. He is doubtless conscious of the fact that Kashmir can carry on a sort of political auction and invite bids from both sides. The Pakistan leaders dislike him, as they dislike all "traitor" Moslems, and maintain that no referendum should be held without a widening of the present restricted franchise in Kashmir, for the hold of the Moslem League is strongest on classes now outside the electoral list. But in spite of the difficulties, a plebiscite seems to afford the best hope of a peaceful solution of the issue.

Last Thoughts on Burma

Mr Henderson's reply to Mr Churchill's rather inflammatory criticisms of the Government's policy in Burma did little to dispel more level-headed anxiety about two things: the future of British commercial and financial interests in Burma and the limits to be set to the tactic of meeting political difficulties by setting a date by which British Ministers turn their backs on them. The economic prospects are reviewed in an article elsewhere in this issue (p. 763). They cannot be lightly passed over, for British investments and a debt of £30 million are involved.

On the political question it is necessary to qualify praise for the friendliness with which the Burmese leaders begin the new era by a reminder that threats were used to hasten the British decision to withdraw. It is arguable whether or not the Burmese might have accepted, at one stage, Dominion status; but there is no doubt that the elections to the present Constituent Assembly were held under threat from Aung San's private army. Their results were, in fact, as much a foregone conclusion as one or two recent elections in Eastern Europe. For the future, experience should bring wisdom and tolerance to the new Government, but the totalitarian tendencies are there.

Mr Churchill would have been on stronger ground had he said less in recrimination about the past and more about the possibility of similar difficulties arising in other parts of the Empire, for example in Malaya. It is not difficult to raise terrorist groups in Asiatic countries, and recent British policy in Burma might well seem to some agitators an invitation to more ambitious activity. "A date for withdrawal" makes a very useful slogan for the other side.

Dane Meets Dane

The resignation this week of the Danish Prime Minister, Mr Knud Kristensen, is a public-spirited act which should afford a way out of the political deadlock which the elections to the Lower House on October 28th failed to solve. For it was Mr Kristensen's policy on South Schleswig which caused his government's fall and brought on the elections. Yet, in so far as the votes of his party, the Agrarians (*Venstre*), have increased by 96,000 to 575,000 and its seats from 38 to 49, this policy has met with wider popular support than was expected.

The results belied Social Democrat hopes. Gaining 834,000 votes compared with 672,000 in the elections two years ago, and 57 seats against 48, they failed to obtain a working majority. Of the other parties, only the League of Justice, with its single tax programme, advanced its position and now holds 6 seats compared with 3 previously. The extreme parties of both right and left suffered considerable losses. The Communist vote fell from 255,000 to 141,000 and its representation at 9 seats dropped by half. Corresponding figures for the Conservatives are 264,000 votes compared with 374,000 and 17 seats instead of 26. The Danish Unity party, which holds the most extreme views on South Schleswig, lost all its 4 seats; while the Radicals, whose

votes fell only from 167,000 to 144,000, still have sufficient strength with 10 seats to hold the balance in this Parliament as in the last.

The basic differences between the main parties were thus merely clarified by the elections, and the parties confirmed in their adherence to them. All desire a coalition, since none could share in the Government without it. But each desires it on its own terms. And those terms cancel one another out—or did so until Mr Kristensen resigned. It is the Radicals who, having forced the election in the first place, have now deprived the Agrarians of their chances of a further term of office. For this would be impossible without the backing of the Radicals, who will not support Mr Kristensen. They are now likely to support the Social Democrats. But whether the new Danish Government is entirely Social Democrat or, as is widely recommended, a broad coalition under their leadership with Mr Kristensen excluded remains to be seen.

Unravelling the Red Tape

It is a well-known and lamentable fact that exhortations and incentives offered to manufacturers to concentrate on export markets have very largely failed of their full effect not—as yet—because the seller's market is over, not because profits are too low, but simply because, harassing as are the formalities of home commerce, those involved in the simplest export transaction are a great deal worse. Exporters, indeed, have to hack their way through even more red tape than do importers; the actual expense and loss of time involved are often more than any business man can be reasonably expected to face. Particularly where the exports concerned are of a speciality or fashion type—the dollar earners *par excellence*—the controls in their existing form, and particularly the system of allocations, constitute a very real obstacle to progress and penalty on initiative.

The proposed working party on forms and procedure generally, announced last week by Mr Harold Wilson, will be particularly welcome to the export trade, as will the measure of decentralisation involved in the setting up of regional export committees. But it is not only the exporter who needs disentangling. A spokesman for the fishing industry has lately announced—pre-

sumably with a certain amount of hyperbole—that the fishermen can deliver either forms or fish, but not both, and the Government must choose; the complaint of the farmer is perennial; while the hopes both of these and of other producers have been raised by the signal success of the departmental attack on forms for builders, which (as reported in evidence to the Select Committee on Estimates) reduced the number of documents to be filled in in the course of a twelvemonth by some 70 per cent. Even if equally spectacular improvements cannot be achieved everywhere, every little helps. Any unravelling that may be accomplished will be especially welcome to the small firm, which is now getting a disastrously raw deal in almost every respect. It is easier to negotiate with big combines or with associations on which the small man has little say; the big firm is a tidier and more dignified economic entity; its leaders are established big men whose interests and opinions are likely to be treated with respect. The small man cannot afford to employ a specialist in form-filling and in contact work; he gets "concentrated," put at the end of the queue for allocations, and generally overlooked. This is short-sighted, even in crisis. At any given moment any given small firm may be unimportant; so is any given sapling in a forest of full-grown trees. But today's sapling may be tomorrow's timber. Not the least disadvantage of the over-controlled, red-tape-enwrapped economy of today is the way in which it discriminates against its own dynamic elements.

Continuity in Housing

The watchword of the revised housing programme is "continuity." No sudden changes are to be made, and existing buildings and contracts are to go on. This attitude is visible throughout the circular sent to local authorities by the Minister of Health at the end of last week.

The arrangements . . . are intended to promote speedy completion and occupation of houses and to mark the Government's sense of the need for continuity. . . . Most local authorities have enough work in hand to keep them busy for the next year at least.

Such phrases crush any lingering hopes that performance might be more ruthless than promise. With their local electors

Decca Navigator

unanimously adopted by 32 nations
at the Second International Meeting
on Marine Radio Aids to Navigation
held in New York, May, 1947

THE RESOLUTION submitted to the conference
and unanimously adopted reads as follows:

"That Decca, provided that it continues to give
operational satisfaction and that the application of lane
identification proves effective, appears to provide a position-
fixing system of an accuracy which meets the
mariner's requirements and therefore should be improved
and expanded in regions where the nations concerned
consider it desirable."

TWO IMPORTANT BOOKS ON

Industrial DESIGN

Design This Day

By WALTER DORWIN TEAGUE

President of the American Society of Industrial Designers

This book is a challenge. Shall the machine dominate or serve? The author opens up a new and exciting vista of development through the right use of design and the direction of machine capacity to service. It is perhaps the most important work of its kind yet produced. 232 pages of text supported by 128 pages of illustrations. Size 9½ x 6½ inches. Price 35s

The Industrial Design Consultant

By F. A. MERCER

Who is the industrial design consultant and what is his job? In this book F. A. Mercer, Editor of *Art and Industry*, brings him beneath a searching scrutiny. His exacting task, the scope of his services and his qualifications are here clearly analysed in relation to the revival of prosperity. 144 pages. 161 illustrations. Size 7½ x 4½ inches. Price 10s 6d

THE STUDIO LIMITED 66 CHANDOS PLACE LONDON WC2

in mind it is obvious that few local authorities will do more than the minimum scaling down of their plans. The Ministry, it is true, suggest a number of ways of concentrating work in order to accelerate the numbers of houses to be completed, but their suggestions are matters of ordinary routine, which any sensible local authority should have thought of already. Even for future contracts there are to be no drastic changes, and the restrictions in timber imports in 1948 are not expected to affect the number of houses built in 1948, since the timber for these is already available. Mr Bevan's victory appears to be more complete than ever.

There were at the end of September 71,000 houses already roofed, and of these 31,000 had been plastered. This situation is reflected in the marked upward turn in the numbers of houses completed during that month. Until then, July was the month with the highest number of houses completed by local authorities—8,333. In September local authorities completed 10,337.* This is an improvement, though still out of step with the continued rise of houses under construction. Full figures are given in the *Records and Statistics Supplement*.

War Damage

On Monday the War Damage Commission pays out some £100 million, this being its first substantial issue of what are known as value payments. The recipients are those whose premises have been completely destroyed by enemy action and they receive the prewar value of their premises plus an increment of 45 per cent. They do not, however, comprise the total of those whose premises were similarly lost in this war. The claimants to another £70 million are not included in this disbursement simply because they have so far failed to agree among themselves how the money in each case shall be shared between the owners of the various interests in each piece of land. Further, those whose destroyed buildings were houses of 1914 construction, or later, are entitled to a cost-of-works payment; that is, they are entitled to have their house rebuilt and to be indemnified by the Commission against the cost of so doing. There were 40,000 in this category and in the cases of 32,200 of them the Commission has already approved the plan, specification and price for the new house.

It is still impossible to calculate the total cost of the war in material damage to property in Great Britain and Northern Ireland. Cost-of-works payments made and value payments notified total nearly £600 million. The receipts from property owners' war damage contributions totalled £200 million, so already the State stands to find £400 million. The extent of the remaining liability, mainly cost-of-works repairs, depends very much on when the work can be done. In July Mr Glenvil Hall gave £60 million as an estimate of the remaining liability. It is not likely to be less.

Next week's payment is a Government decision. Last year the Chancellor promised that value payments would be made in 1947. No one can say that a payment in November is an excessively early discharge of that promise. Nor can anyone seriously claim that the promise should not have been given. The claimants have suffered loss of capital and income since

*Cmd. 7242, 7243.

the damage was done, in many cases seven years ago, and it is unfair to single out any one class of property owner even for such a mild penalty as the compulsory saving of his capital by Government decision. Yet the fact remains that this £100 million payment, except in so far as it is used to repay bank loans, can at this moment have nothing but an inflationary effect. It is impossible for the majority of the recipients at present to spend it on building. It is not particularly desirable that all of them should. Yet their purchasing power is increased by the amount of the total disbursement and not all of them may immediately reinvest it in government securities. In one way the payment is a test of the National Savings Campaign. It is difficult to imagine any set of people to whom the arguments for saving should today have a stronger inherent appeal. The result in the savings figures for the next fortnight or so will be interesting, whichever way it goes.

Shorter Notes

On Monday representatives of thirteen governments begin work in Brussels on a study of how a customs union for Europe might be formed. Norway and Sweden still take towards this idea the very cautious view that they took during the Paris economic conference two months ago, and will send only observers; but it is a gain that the Swiss will take part and that the British Dominions will be represented by observers. This first meeting is expected to last about a week and to result in the formation of expert committees to plan and develop the study. They would do well if they finished their work in three years. Meanwhile, much has been done in London to work out various ways in which Britain, as a European and a Commonwealth Power, could take part in customs unions. The problems that have arisen are numerous and complex; and it is already clear that, however desirable customs unions may be as long-term objectives, the effort to achieve them can have little relevance to the present economic difficulties of this and other countries.

The worse the economic plight of this country the greater the pressure which will come from those wishing to emigrate to less austere parts of the world. This pressure was much in evidence during the debate on emigration in the House of Lords on Wednesday. Increasing pressure is also coming from the Dominions, whose difficulties in meeting the demands for skilled craftsmen and technicians are as acute as in this country. The Government still adhere to the principle of free movement, and rightly, but they must be privately thankful that shipping shortages make it impossible to turn principle into more than a trickle of practice.

In a chart on page 714 of *The Economist* last week, the fats ration was shown as dropping from 7 ounces a week to 6 ounces in 1946. This is incorrect. In March, 1946, the ration of cooking fats was reduced from 2 ounces a week to 1 ounce, bringing the total fats ration down to 7 ounces, at which amount it has since remained.

The appeal of Mr Higgins, landlord of the Cock Hotel, Epping, who was convicted at Essex Quarter Sessions last summer of failing to supply a traveller with refreshment, has been allowed by the Court of Criminal Appeal. In a reserved judgment, the Appeal Court held that the directions on law given to the jury during the course of the trial were not sufficiently accurate to allow the jury's verdict to stand. Accordingly the conviction was quashed.

Letters to the Editor

Local Financial Reform

SIR,—In your comments on the valuation provisions of the new Local Government Bill, which seems on the whole to be a very competent piece of workmanship, are you not a little over-suspicious?

It has surely to be recognised that in these days of almost universal rent restriction and widespread subsidisation, the rent of a house has altogether ceased to be a generally applicable measure of the value of the services which a house is capable of rendering to its occupier. If it is this value which we desire to tax (and on this fundamental principle the Bill evidently intends to make no break with tradition), we must, for large classes of houses, be prepared to rely upon indirect, rather than direct, evidence. That is what, in fact, has been happening; but because there have been no firm rules in the matter, there has been no clear guidance as to the type of evidence which should be decisive in each particular case. This has been one of the main causes of inequalities and arbitrary assessments. Now the Bill is seeking to prescribe such rules; by distinguishing different classes of houses, and laying down the type of evidence which should be decisive for each class, it should surely make for objectivity and for fairness, provided that the types of evidence to be preferred for the various classes are broadly consistent with one another.

Save on one point, it looks to us as if the rules which have been proposed do have this sort of broad consistency. To base the valuation on values at a single particular date will make for consistency, though it is unfortunate (of course it is obviously inevitable) that the base date has to be so remote in time as 1938 will have become by the time the first revaluation under the new scheme is completed in 1952. In any case, it is to be hoped that the authorities do not envisage the 1938 basis as a permanency. It will be just as important to revise the valuation base date from time to time as it is to revise the basis of the cost-of-living index.

The one point where the scheme does involve some element of discrimination is with respect to the provisions about site values. The valuation of council houses is to be based upon 1938 construction cost and 1938 site values, while that of other "small" post-1919 houses is to be based on 1938 construction costs and current site values. In practice, one would guess that this provision will be most important in its bearing on the valuation of such houses as may be put up by the private builder in the future (perhaps the near future). One can well understand that the estimation of 1938 site values for the council houses now being erected has been judged to be a practical proposition, while the estimation of 1938 site values for houses to be erected by the private builder ("you can't tell where he might put them") has been thought to be less possible. Yet since the current site values are likely to be systematically higher than 1938 values—it should be noted that direction is given to ignore development charges under the Town and Country Planning Act—this does seem to involve some real discrimination. Would it be impossible to write down the site values of non-council houses by a percentage based upon the general rise in site values in the locality, and thus put all "small" houses on what would be substantially the same footing?—Yours faithfully,

J. R. HICKS
151 Woodstock Road, Oxford

URSULA K. HICKS

Should Electricity be Taxed?

SIR,—Surely the main point that emerges from the article is the unreal basis on which depreciation of plant is measured—a fault that is by no means confined to electricity companies.

If depreciation was based upon replacement cost instead of the out-of-date and wholly artificial basis of past cost, current production costs would be faithfully reflected in the price per unit.

This point is particularly important to companies whose total assets consist of a very high percentage of fixed capital in relation to floating capital. Perhaps, this is most marked in the case of statutory companies like electricity, gas, water and railways, etc., where the companies concerned do not possess the same freedom of action to build up reserves out of revenue, as companies incorporated under the Companies Act, 1929.—Yours faithfully,

R. W. MOON

University College, Oxford

End of Act Two

SIR,—Mr Timms is an Oxford man, and (to judge from his letter) a socialist. It is of little importance to me (and, I suspect, to many of your readers) whether or not a vote in the Cambridge Union, hostile to the Labour Government, has any political significance for the country. I can hardly quarrel with anyone who asserts that it has none. I (unlike Mr Timms) adhere to no political party, and would have gladly seen the vote go either way. But I cannot remain unmoved by the strictures which Mr Timms implies against the integrity, sagacity, and general intelligence of those who attend debates at the Cambridge Union.

Mr Timms says "doubtless you would have preferred the Oxford figures if they had been available in time." He then goes on to give what seem to me some very cogent reasons why you should not have preferred the Oxford figures. I cannot quarrel with Mr Timms's analysis of the Oxford debates; what I find very hard to swallow is the implication that his analysis applies also to the Cambridge Union.

So far as my own observations go, I should say that there is a large number of intelligent members of the Cambridge Union who are not misled by oratorical virtuosity, but who vote on the merits of the case as presented by the speakers and as they understand it from their own sources of information. A man who is good "entertainment value" (to use Mr Timms's expression) certainly gives great enjoyment. But if his task is to get as many votes as possible, he makes that task harder, since his sincerity may well become suspect. It may be, as Mr Timms seems to think, that we are all very gullible, and mistake rhetoric for sincerity. But since the majority of members at the moment are both scholars and ex-service men, it seems likely that they, as an audience, are far less gullible than most political audiences in this country. Mr Timms would perhaps be surprised to know how well they receive a moderate and reasoned speech. And if they do not all sit through the debate to the bitter end; well, many of them have work to do, and many of the speakers from the floor are beginners.

Perhaps this very lack of gullibility disqualifies the Cambridge Union as a political barometer. But this was not Mr Timms's argument. Many others hold that what thinking people think today is thought by the unthinking tomorrow.—Yours faithfully,

R. C. M. YOUNG, President,

Cambridge

Cambridge Union Society

From The Economist of 1847

November 6, 1847

Majorities can be in error, and minorities can be right. In fact, improvements in Government, as well as in mechanics, begin with individuals. They are at first the conception of a single mind. In 1819 the great majority of our community was opposed to parliamentary reform, and duly sanctioned—by the authority of King, Lords, and Commons—that little massacre at Manchester, which in due season led to the Act of 1832. Swollen with pride, confident in their strength—there being no power on earth capable of offering resistance to a great majority—the more numerous are majorities the more likely are they to conclude, with Mr Carlyle, that might is right, and that what it resolves has the sanction of divine authority. We need not, however, quote numerous examples from history to prove that minorities are very often right, and majorities wrong. The former are not justified in submitting to, nor the latter in enforcing, an erroneous decree. To assume, therefore, that the Diet in Switzerland is right, because it has the majority on its side, is to beg the question. Practical politicians, however, know that the government of political societies is not carried on either in obedience to the will of the majority, or on any such abstract principles as those we have been discussing. Laws, whoever may be the law-givers, are always made in conformity to the pre-existing usages of society, and to its present habits, which are rather felt and acted on than studied and consulted. No laws can be enforced, or will be obeyed, which do not conform to this principle, and it is a *prima facie* condemnation of the men at present at the head of the government in Switzerland, that their measures, taken in a spirit of hostility to large bodies of their countrymen, are resolutely opposed.

SIR,—The Cambridge Union's refusal of confidence to a Labour Government which you adduce in support of your contention that "the young people" have turned against the Government is surely hardly as significant as the prominence you give it would suggest.

The Union Debating Society here at Cardiff expressed their confidence in the Government by a vote of 211 to 123, a considerable increase in support for the Government over last year, when the vote was 164 (for), 117 against.

It may be that Mr Ness Edwards was a more persuasive advocate than Mr Strachey; but the point is that if the figures were taken for all College Unions, Cambridge might well be found to represent only a minority view. It seems unwise to ignore the Provincial Universities; but it is quite inexcusable to ignore the great mass of "young people" who never go to a University at all.—Yours faithfully,

NIHAL CANEKERATNE,

Hon. Secretary, Union Debating Society, University College of South Wales and Monmouthshire

Cardiff

Political Plague

SIR,—The letters criticising your article have been written under the assumption that assimilation is an "ideal." Refugee Worker seems to think it both "comfortable" and realistic, yet fails to give any evidence that at any time or period it has been successful. As for the specific case of England need he be reminded that there still exists a flourishing "Sephardic" Jewish community who began to settle here some 300 years ago, at the time of Cromwell.

Further I do not understand what Refugee Worker means by

"racial anti-Semitism." Racism is only one factor in the complex problem of anti-Semitism, which is excellently analysed in an essay by Professor Morris Ginsberg in the book "Reason and Unreason in Society," recently reviewed in *The Economist*. Anti-Semitism has always existed where Jews have at any time lived. Thus some 300 years after the expulsion of Jews from England, the "Merchant of Venice" was written, a period during which, officially at any rate, Jews were not living in this country. Nevertheless Shakespeare, who had great insight into the Jewish character, was forced to pander to the public prejudice by painting the commonly understood picture of a Jew.

Mr Julian Badcock seems to think if only Jews would intermarry, this whole problem, which is such an irritant to world conscience, might solve itself. It is, of course, fantastic to expect a nation to commit national suicide; nobody would make such a suggestion except in the case of Jewry, for in all other cases it is well understood that no nation will voluntarily agree to its own dissolution, however peaceful the transition period might be. The whole trend of your article and correspondence shows that most Gentiles and many Jews do not yet realise that they are a nation like any other. Zionism may only have become a political force recently, but its potentiality has always existed in Jewish tradition, ever since the enforced exodus from Palestine. When a Jewish State exists, the national problem of Jewry will be solved; then the world will continue to eat the fruits of Jewish culture, fruits which would die should assimilation succeed. Moreover the individual Jew outside Palestine will look upon his nation as the Irish American looks upon his at the present time.—Yours faithfully,

W. KOENIGSBERGER

70 Brondesbury Park, N.W.2

Books and Publications

Capital versus Consumption

"Are These Hardships Necessary?" By Roy Harrod. Rupert Hart Davis. 175 pages. 5s.

THE answer, Mr Harrod most powerfully believes, is No. Present troubles, and the worse things to come, are the result of a single gross but eminently remediable error; that of embarking on a programme of capital construction for which neither home savings nor foreign loans provided adequate backing. The surplus of investment over saving and the deficit on foreign trade account are two sides of the same coin; disappointing as it may be to axe the capital programme—every one of whose items may be, separately, desirable—both common honesty and self-interest demand that the axe be applied forthwith and with more than Crippsian severity. This explosive essay in economic polemics was written last August in a ten-day burst of sustained and fluent indignation, and combines the best qualities of an election manifesto and a primer of economic horse-sense. (There is a chapter, almost parenthetical, on the Price Mechanism, which states the case for free choice versus allocation with a neatness, force and realism in places unsurpassed since—one is almost tempted to say—Adam Smith.)

With much of the argument it is impossible to disagree; there is no over-colouring in the picture of our present discontents or

in the analysis of their cause. But Mr Harrod's remedies suffer from a certain lack of discrimination, not to mention over-optimism. Productivity may indeed, in the vital short run, be far more rapidly increased by "filling the pipe-lines," and so doing away with bottlenecks and with the wasteful controls which they make necessary, than by more impressive schemes of re-equipment and expansion. Starving a horse to buy a new set of harness is poor economy. But Mr Harrod never investigates the possibility that a substantial part of that deplorable surplus of capital expenditure over savings may represent not new harness but, so to speak, horseshoe nails—investment required not merely to increase productivity but to prevent its actual collapse. There are limits to make-do-and-mend, and if the things which can no longer be made-done-and-mended with are essential parts of the productive system, then any hardships entailed by their replacement are emphatically necessary. Savings and investment must indeed meet; but Mr Harrod offers no proof for his proposition that investment should come the whole way down while nothing is done to bring savings up.

Closely linked with this main argument is a plea for a liberal trade policy and the quickest possible return to convertibility, coupled with a resounding attack on Dr Dalton and the dollar muddle of last summer. (His ensuing statistical brawl with the Chancellor leaves his basic position intact, though certain out-

posts have had to be given up.) His arguments here are convincing enough on certain assumptions as to the mobility of resources within Britain and as to the terms of trade. Both, however, are open to question. Classical remedies apply where classical conditions obtain; fluids behave differently from solids. To which Mr Harrod would doubtless reply that what this country needs is, precisely, a thaw. How true—but the meteorological indications are not hopeful.

Longlegs and Shortlegs

"Grandfather Longlegs." The Life and Gallant Death of Major H. P. Seagrim, G.C., D.S.O., M.B.E., by Ian Morrison. Faber and Faber. 12s. 6d.

AMONG the Karens of the eastern border hills of Burma three years ago the Japanese were "Shortlegs" and the British were "Longlegs." The title of "Grandfather" suggests advanced age, but its bearer was only thirty-five when he was executed by a Japanese firing squad at Kemmendine cemetery near Rangoon in September, 1944. He was Major Seagrim who stayed behind in the Karen country after the Japanese overran Burma and organised a guerrilla resistance against the conquerors which was among the most remarkable episodes of the war in the Far East and challenges comparison with the record of Lawrence of Arabia.

The resistance of the Karens to the Japanese invaders and their steady loyalty to Britain during the war were in striking contrast to the oscillations of the Burmese and are politically explicable by the history of the Karens as a people formerly oppressed by the Burmese and given security and protection by British rule in Burma. The Karens are primarily a hill people, though many of them have settled in recent times in the lowland delta of the Irrawaddy. What distinguishes them most from the Burmese in appearance, according to the author of this book, "is the expression of the face, open, honest, lacking all guile." To offset these qualities he admits that they lack initiative and are "often extremely stupid." They are clannish, exclusive and reserved. But they are capable of unshakable devotion to a man who has won their confidence, and this is just what Seagrim did. Though history and politics inclined the Karens to the British side, the resistance described in this book would not have been possible but for the special personal contact which Seagrim had with the Karen people.

Seagrim was the ideal guerrilla commander for this primitive folk. He went bare-foot in the jungle and ate all the things which the hillmen ate, "even rats and frogs and snakes." He passed through the Japanese lines carrying neither rifle nor revolver, but only a couple of grenades. He never gave the Karens drill, but taught them always the arts of infiltration and ambush. His supply of modern arms was very small, and the Karens often inflicted casualties with their crossbows, which were effective up to seventy yards. Seagrim perished in the midst of the struggle and never lived to see its climax—"Operation Character." But his heroic fight was all the more remarkable in the circumstances of the period which followed the first heroic onrush of the Japanese through the Far East, and it is interesting to learn on the evidence of an officer who knew him that he had determined to stay behind if the British evacuated Burma "as a matter of principle"; also that he held that the British were suffering from a general lack of principle, for which he thought they "deserved to lose the war."

Two Facets of Fuel

"The British Fuel and Power Industries." A Report Published by PEP. 406 pages. 30s.

THIS is a formidable report on an immense subject—so formidable that to show what the report is about there is first a full summary of contents, then fifty pages summarising the argument and finally five pages of conclusions. Between the summary and conclusions there is a mass of information of every conceivable kind, some of which is technical or scientific, some statistical and a great deal historical. And in spite of the fact that this single report struggles to cover the whole fuel industry since the publication of the three separate PEP reports on Gas, the Coal Industry and Electricity Supply, there is a considerable quantity of detail which is barely relevant to the main argument.

The trouble is that it is impossible to see the wood for the trees. Much of the material is extremely interesting, but a great deal of it is ill-digested and at places even sketchy. The effort of squeezing so much in has necessitated leaving so much out that the balance is destroyed. The conclusions tend to strike one by surprise and not to flow from the previous argument, so that it

is difficult to follow the sequence and to derive any firm impression of what the report is leading to. This is the more disappointing since the standards set by PEP for itself in the past have been so high. The discussion of the crucial question of price structure is an example of this failure. It is stated that "The first essential is that the prices at which fuels are offered to the consumer should so far as possible correspond to the true cost of production." This is a very important economic problem, and the authors may or may not be right, but no space is given to the discussion of alternative policies. In a planned economy a deliberate discrimination in favour of essential industries may sometimes be very desirable.

The most interesting parts of the report are those concerned with the technical aspects of fuel utilisation and with two valuable inquiries into fuel consumption in the textile and iron and steel industries. The authors of the report are at home among technical questions: it is when they come to political and economic ones that they fall down. Unfortunately for them the report has appeared at a very awkward time for much of its subject matter ends with the end of 1945. At present the main centre of interest in the fuel and power industries lies in the problems of the changeover from private to public ownership. The report will certainly make a contribution to the background of this change and contains valuable material. What it fails to do is to provide a lucid exposition of the state of the fuel industry on the eve of nationalisation, which might serve as a guide to the solution of its problems in the future.

"Meet the Miner." By E. R. Manley. Published by the author 3, Leeds Road, Lofthurst, near Wakefield. 120 pages. 6s. 6d

NO greater contrast between this small and unattractive looking book, and the PEP report could be devised. The report is large, handsome and ambitious. Mr Manley's book is small, full of childish pen and ink drawings and unambitious. But in spite of these initial disadvantages it is a really valuable contribution to an understanding of the problems of the coal industry. Simply and sympathetically it describes the daily routine of the miner in the mine and the isolation of his life both socially and industrially. The descriptions of the conditions at the coal face, the physical and psychological strains of work underground and the human problems of mechanisation are vivid, and the sincerity of the account is very telling. Mr Manley is a village schoolmaster and he is writing for workers in other industries. The book does not attempt to deal with the larger problems of the industry, but unconsciously it does a great deal to explain why nationalisation cannot transform the industry overnight. To meet the miner is to meet an individualist.

Shorter Notices

"Money and Banking: A First Course." By Weldon Wellding. F. S. Crofts, New York. 631 pages. \$4.50.

THE great changes of the interwar years, as a result of which monetary theory has ceased to be a side-line, and has been incorporated into the general body of economic theory, penetrated into the text-books some years ago. Now, the problem is not so much to find good books on monetary theory as to cover the revolutionary events of the last few years in the monetary field without referring the student to an unmanageable number of original documents and articles. Mr Wellding's book has the great merit of not only discussing Keynesian theory in a highly competent way, but of presenting the student with a summary but coherent account of the financing of World War II and of Bretton Woods. Unfortunately for the British student the discussion of war financing, like the longer discussion of monetary and banking institutions in general, is mainly concerned with United States experience—this could hardly be otherwise in an American book, which could not conveniently have been made longer and is, indeed, already open to the charge of excessive length. Nevertheless, a judicious selection from it would form a very useful constituent of a British student's reading.

"La Civilisation de 1960." By Jean Fourastie. Presses Universitaires de France. 115 pages.

THIS stimulating little book is one of a popular series whose 200-odd volumes deal with subjects ranging from astrophysics through practical beekeeping to the Papacy; and its author would probably have felt quite at home as a contributor to the Today and Tomorrow library. His object is to trace the grand lines of world economic evolution and to project them, with due warning as to the varying likelihood of error, up to 1960 and even beyond; his methods are statistical, his reliance on theory minimal. He is somewhat hypnotized by the prestidigitations of Mr Colin Clark, and a certain rather naive fatalism raises doubts as to his judgment; but his fresh, civilised and highly individual approach to the economic problem is something for which to be grateful.

Carefree Carlos

is not the least bit disturbed by bold stripes and a thick murky "fug."

The rather more harassed business executive however will undoubtedly appreciate the calming clear tones of Powley Distemper.

AMERICAN SURVEY

Loyalty in Technicolour

(From Our US Editorial Staff)

THE Congressional attempt to find Communist influence in the cinema industry, which filled ten recent days with Technicolour and sound effects, has lighted anew the difficulties which a democracy must face if it tries to discipline supposed subversive elements within the population and at the same time to cherish civil rights.

For better or for worse, this particular attempt was undertaken with a wide-mouthed blunderbuss; the air was showered with epithets, but the target continued to fade. Even the intentions of the Committee on Un-American Activities of the House of Representatives, which had called the hearing, became obscure as observers, noting that there was some difficulty in keeping a quorum to sit in judgment on the visiting stars, fell to speculating on the publicity value which such a show might have for a chairman with Senatorial ambitions.

But these reflections are beside the point. The attempt was made, and properly combatted. The cinema industry took the Committee's charge of Communist infiltration with the seriousness to be expected of a body dependent for its very life on public support. The leaders of the industry and their train of advisers were almost subservient in their attempts to find out what it was that Congress wanted said in the films. Testifying stars were meek or belligerent according to their individual temperaments, intelligence, or ability to remember roles they had rehearsed; some of them embarrassed the Committee by exhibiting a degree of wisdom in regard to the variants and values of liberal thought that is seldom found on Capitol Hill.

In the course of the investigation half a dozen witnesses who tried to claim in Congressional inquiry the same safeguards that would have been thrown about them in a court of law were cited for contempt. Otherwise, any proof that they or their fellows were or were not Communists must be distilled from the record; it did not come clear in the proceedings. That the show petered out towards the end was not the fault of the film industry; it was the Committee which failed to understand the disintegrating effect of anti-climax.

As for the public, the general feeling was expressed in a phrase coined by the President's Committee on Civil Rights, which by happy coincidence presented their report to Mr Truman in the same week; they found that "a state of near hysteria now threatens to inhibit the freedom of genuine democrats," and recommended "a long-term campaign of public education to inform the people of the civil rights to which they are entitled and which they owe to one another."

The circus on Capitol Hill and the report which earnest thinkers presented to the White House represent the two poles between which American opinion on Communist activities within this democracy currently swings. That the two poles should exert an equal pull on public sympathy is perhaps too much to expect. That they both continue to exist is a measure of the present state of the national sanity.

The pressure put on that sanity by daily doses of vituperation on the part of Soviet and satellite representatives at Lake Success is of course a factor in the mounting antagonisms. The American tendency at first was to bristle, but usage dulls even the galvanic effect of Soviet invective. What simmers under the surface is a complex emotion compounded of many things—surprise that a great Power finds it politic to discard verbal courtesies; disgust at gutter tactics in international discussion; a deep resentment at the perversion of words like "freedom," "liberty," "democracy" which beat in the American blood and need no Russian exegesis to make them understandable; a

growing weariness at the continued postponement of agreements which might make it possible for the world to get back on its feet again. All this results in a hardening of the public attitude toward fellow citizens suspected of sympathy for such anti-pathetic ideas.

★

It is this irritation on which the government depends in its attempts to protect itself against internal enemies; the problem of how to do it without injuring those institutions which its citizens most deeply cherish is less well served. The task is not made easier by the fact that the most valuable and fragile of those institutions—freedom of speech, of assembly, of petition, the right of trial by jury, security against search and seizure—are of course the guardian thickets in which rebels against authority traditionally take refuge. Communists are no exception—the dexterity they show in exploiting those safeguards for their own purposes is notable from Lake Success to the newest soap box in Union Square, New York's Hyde Park.

★

Attempts at solution thus far take two main lines—direct efforts to destroy Communist influence by exposing citizens who wield it, and plans for attaining the same result by strengthening the democracy which now finds itself in competition with Communism for the loyalty of its own citizens. The vast middle ground is peopled by persons of good will who would do both; there is, of course, a lunatic penumbra which is still devoted to the proposition that the really vital thing is to trace a link between Moscow and the Roosevelt family.

Three government agencies have taken an active hand against domestic Communism this year. The House Un-American Activities Committee has now been given permanent status, with the catch-all files of the old Dies Committee to play with, and an elastic mandate to expose subversive activities "in the interests of national security." The President issued last March an executive order "prescribing procedures for the administration of an "employee loyalty programme" in the Executive Branch of the Government"; it was hailed with mixed emotions on the part of the more thoughtful, who observed that the order failed to define the "reasonable grounds" on which persons were to be judged disloyal and to be dismissed; that it failed to give to the dismissed the right of hearing and defence, that it set up techniques of identification from which this country has always shrunk as symptomatic of the police state. Early in October the State Department, feeling itself highly vulnerable as "a vital target for persons engaged in espionage or subversion of the United States Government," declared that it would employ no one "who constitutes a security risk." Such persons were classified in five categories, ranging from actual espionage to weakness of character and lack of judgment. The baiting of State Department personnel

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

under the fifth category made Washington merry for a week. Ten persons were actually dismissed, but whether for espionage or betting on the wrong horse was not revealed.

The other horn of the dilemma is less adequately cushioned. Plans for strengthening the democracy are quite properly in the hands of private groups; some of these are unfortunately not always above suspicion. The President's Committee on Civil Rights recommends, in addition to a programme for combatting corrosive discrimination against minorities, the creation of a Division of Civil Rights within the Department of Justice, but no action has yet been taken.

Fortunately both courts and citizens have stronger safeguards against unwarranted attacks than those which went down after World War I under Attorney-General Palmer's furious red-baiting. Neither the Fourteenth Amendment nor the acid test of Justice Holmes's "clear and present danger" had then been established as bulwarks to save free speech. Communism was then a new menace, and there has since been a quarter of a century of personal experience to help Americans in figuring out ways and means of meeting the challenge of its tactics and its language without doing harm to themselves. The struggle with Communism is as yet unresolved, but not for lack of knowledge of its aims and methods. Whatever their other faults, the Communists have been pervasive and highly educational. It is the labour leaders and the cinema writers, the welfare workers and the business men, the educators and the philanthropists who have by this time met Communist attempts to control their organisations and have learned how to handle them. So far, the sober influence of these sober citizens has managed to stifle the more spectacular types of witch-hunting which would make martyrs out of the merely maladroit.

American Notes

CEA on Foreign Aid

The report by the Council of Economic Advisers on the impact of the foreign aid programme is a decidedly workmanlike document which can provide President Truman and his officials with plenty of material for the Congressional battle ahead. From its establishment in 1946, the CEA has been conscious that its mandate does not sanction the creation of yet another policy-making arm of government, and its recommendations have been presented with, perhaps, an excessive caution. But on this occasion specific authority as one of the three committees to assess the implications of continuing aid for Europe, has enabled the CEA to present a definite programme of action, and to underline the advice, given only a few weeks ago, in relation to the purely domestic picture.

From the outset this report is noteworthy because it recognises quite simply that the right question to be asked is not—How much can America spare without discomfort? but—What does Europe really need, and what are the consequences of refusal? And, in determining its answer, the CEA is realistic enough to draw a direct comparison between the relatively small volume of goods which may now be needed, and the huge amounts that were diverted by war. It declares to Congress quite bluntly that the price of any refusal to face a relatively modest degree of discomfort is, in all probability, "industrial paralysis, with the possibility of serious social disturbance and political reorientation." And it goes beyond this point to pose as alternatives, the inevitable loss of any hopes for world economic stability, the implicit risk of vastly increased military expenditures, and "the serious problems of industrial readjustment, due to a drastic falling off in exports."

The conscious belief of the CEA that such industrial readjustments may not be so very far away pervades the whole of the present report. It is contained in the statement that the

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to The Publisher: *The Economist*, 22, Ryder Street, St. James's, London, S.W.1.

American people can well expect to increase their present standard of living through the term of the programme for aid to Europe, and in the declaration that even the full grant of aid, right up to the levels set by Europe itself, would not bring the return of a net export surplus at the peak rate touched last spring. For Congress in 1947, however, the CEA returns with eloquent insistence to its former declaration that "the inflationary situation, due primarily to domestic demand, would necessitate action for its own sake, apart from foreign aid."

The report declares against any general regimentation, but for the imposition of selective controls over key materials, for domestic allocation and export control, for curbs against misuse, for new checks on speculative activity, wherever present scarcity weights the scales unduly against the consumer, for the retention of the tax pattern generally at current levels, and for the "aggressive use" of enlarged powers for the control of credit expansion. Wheat, steel and coal are singled out for particular mention. It seems reasonable to believe that, whatever may be the trend of the American economy six months hence, this is the minimum programme which can hold the line over the rest of the winter. The Council of Economic Advisers commands the consideration even of those Congressmen most unsympathetic to regulatory action, and its chairman, Dr Edwin G. Nourse, is certainly not an advocate of any purely experimental extension of Federal controls.

Next week the scene will shift to Congress. The final report on Marshall aid, by the Harriman Committee of Nineteen, will be published this week-end, and on Monday the Foreign Affairs Committees of both House and Senate will meet in public session to hear Mr George Marshall present the formal programme. His speech will cover plans for interim aid, and the longer-term pattern. Latest reports suggest that the Administration will press for a total appropriation of \$16.5 billion, with a first-year limit of \$7 billion, plus \$3 billion as a stabilisation fund for Europe. These totals exclude possible loans from the World Bank, in turn dependent upon Congressional approval of Mr Truman's aid programme.

Apart from the extent of aid for Europe, the President is certain to face sharp controversy on the method of supervising the loan and relief programme.

Taft on the Marshall Plan

Senator Taft, according to unfriendly sources, has one of the best minds in Washington—until he makes it up. The attempt to make up his mind on the Marshall plan has led Mr Taft into some strange contradictions. Early last week the Senator both heartened and startled the Administration by suggesting that the special session might approve not only interim foreign aid, but the Marshall plan itself, by December 10th. If Senator Taft was correctly reported—and though there is some controversy between him and the newspapermen who reported him, this seemed to be the sense of his remarks—it shows a singular misapprehension of the issues involved. A plan of the character and scope which Congress would accept by Christmas could be the Marshall plan only in name.

What Mr Taft gave with one hand he took away with the other. A day later he declared that the Marshall plan on the Paris scale was "beyond all reason"; that in its present form it was a serious threat to the anti-inflation programme; and that he would put a ceiling of \$4½ billion on any foreign aid plan. "The export flow should certainly be rationed before we ration our own people, even on a voluntary basis." On the issue of high prices to be raised at the special session, Senator Taft is even less helpful. Senator McGrath, the newly elected Chairman of the Democratic National Committee, made his first act a peace gesture by insisting that the committee withdraw a resolution criticising the Republicans for "placing the nation's welfare in jeopardy when the economic health of the United States is the very foundation of world peace." This peace offering, and Mr McGrath's hope that both foreign aid and high price could be approached in a non-partisan spirit have been declined by Senator Taft, who insists that the Administration's economic measures have always been so unsound that it was impossible for him to support them. As an anti-inflation programme of his own, Mr Taft has suggested: cutting government costs, cutting taxes, limiting foreign aid, persuading labour to refrain from asking for more wage increases, instituting more efficient purchasing methods by the government.

Senator Taft's calculation is that by June 30, 1948, there will be,

a budget surplus of \$6-7 billion, on the assumption that business remains at present levels. This is no pint-pot by ordinary standards, but it can hardly suffice to cover foreign aid, to permit of any tax reduction or of any debt-reduction, unless there are to be crippling limitations on the Marshall plan. This may, however, be the way Senator Taft's mind is working.

* * *

Bankers on Trial

Belief in anti-trust procedure through the Department of Justice as a panacea for present industrial problems seems now to be reaching the stage where the Truman Administration is preparing the ground for a first-class election campaign. Definite moves have been made against steel, rubber, and specialist film manufacturers, and at least a dozen other industries are waiting on the sidelines. Last week the Attorney-General, Mr T. C. Clark, filed a civil suit against the Investment Bankers' Association, and seventeen prominent member firms, charging violation of the Sherman Act by "restricting, controlling and fixing the channels and methods, the prices and terms, and conditions upon which security issues are merchandised."

Wall Street has not been taken by surprise, since such a suit has long been rumoured—indeed, some columnists such as Mr Drew Pearson allege that it has been delayed because it covers prominent banking undertakings formerly associated with members of the Truman Cabinet. The "concentration of power" in the hands of the IBA was a feature of the hearings before the Temporary National Economic Committee in 1938, and bankers do not deny the grip held on this market by such leaders as Morgan Stanley and Co., Kuhn Loeb and Co., Lehman Brothers, Drexel and Co., Harriman Ripley, and Stone and Webster Securities. The schedule, as Mr Pearson notes, reads like an Astor dinner party list.

However sweet may be the memories of earlier New Deal "witch-hunts," there is nothing in the present allegations to suggest that the Attorney-General is preparing to unearth widespread banking scandals, and certainly nothing to suggest that the banking community will suffer from a renewal of the complaint which became known as *angina pecora* in the New Deal days when Mr Ferdinand Pecora, as counsel to the Senate Banking Committee, was laying foundations for the Securities Acts, and for the establishment of the Securities and Exchange Commission. The SEC, it is true, dislikes the way in which certain banking firms have sustained their security operations through new affiliates, but there is nothing illegal in that action, and nothing which suggests a repetition of any of the malpractices so common in the booming twenties.

The basis of the present charge is the fact that from 1934 to 1937 about \$10 billion worth of new securities were registered with the SEC, and that about 5 per cent of the houses in the IBA accounted for 90 per cent of the business passing. Over ten years, Mr Clark alleges, seventeen firms handled more than \$14 billion, or more than two-thirds of securities issues handled by banking syndicates. He is calling for dissolution of the IBA, and for a number of restraints, including a formal ruling that the firms now cited must in future desist from associating together for issue purposes. Whether any degree of collusion, sufficient to warrant the present charges, exists cannot be judged from this distance in the absence of evidence which may appear at some later stage. But at least it can be said that the IBA has enforced a code of conduct for the recalcitrant type of member, and has provided a vastly improved service for the institutional borrower. Nor can it be denied that such houses as Morgan Stanley, Drexel and others are entirely prepared to sponsor and to support given projects rather than to assess issues merely from the viewpoint of a profitable and readily forgotten share deal. Some of the present complaints, indeed, suggest that the Department of Justice, in a well-meant zeal for steps against "price-fixing" is in a large measure denying precisely that degree of "nursing" which, on this side of the Atlantic, is accepted as the hall-mark of the responsible issuing house. Nor does it seem likely that any marketing methods of the IBA have any particular relevance to those wider economic abuses against which the Department still moves so slowly and so ineffectively.

* * *

Civil Liberties for All

The report of the President's Committee on Civil Liberties, though published most opportunely at the height of an anti-

Communist scare, is a useful reminder that civil liberties are constantly being abridged in cases where there arise none of the puzzling problems of reconciling democratic processes with defence against a totalitarian enemy. The Committee was established last year after a particularly atrocious lynching in Georgia had once more demonstrated the inability of the Federal Government, under present statutes, to protect the lives of American citizens and punish their murderers. In ten months it has amassed a formidable amount of information on the violation of the four basic civil rights, which it names as safety of the person, the right to citizenship and its privileges, freedom of conscience and expression, and equality of opportunity.

The report pays a deserved tribute to such signs of progress as the decline in lynchings to no more than six a year since 1940, to the acceptance of negro members by many unions, the increase in negro voting, the improvement in educational facilities for minorities. The Committee's task lay, however, with the black spots that remain. The protection of civil liberties in the past has often split on the issue of method: should it be a function of the Federal Government, or of the States, or should it be left to education to produce greater tolerance? The Committee has very rightly decided to advocate all three approaches toward a comprehensive programme, but it insists emphatically that it is the government which must "referee clashes which arise among the freedoms of citizens."

On the Federal level, it recommends the creation of a permanent civil rights commission; the strengthening of the civil rights laws to give the government in Washington the right to intervene in civil rights cases; heavier penalties for infringements; the barring of Federal assistance to States which practise discrimination and segregation; a Federal Fair Employment law; a ban on discrimination in public services and on segregation in inter-state transport. In particular it recommends that the District of Columbia, where the issue of States' rights does not arise (as it is governed by Congress), should be made a model to the nation instead of remaining the "beginning of a Jim Crow road to the South." The States are recommended to deal with such issues as restrictive housing covenants, fair health and education practices, and poll taxes. Facing the danger that Communists and native Fascists may exploit democratic rights to their own ends, the Commission recommends that they be compelled to register in the same way that lobbyists and agents of foreign powers now register their aims and activities.

Few of the Commission's recommendations are completely new, and none of its members can have any illusions that they will be put into effect overnight. The "right" to filibuster alone makes for intolerable delay. The Commission's achievement is the writing of a comprehensive and vigorous Charter of civil liberties which will serve as a guide for years to come.

Shorter Notes

Though some hesitation has been noticeable in commodity markets following President Truman's appeal for deflationary measures, trading remains heavy and Chicago wheat is still quoted near \$3. The Chicago authorities have doubled margin requirements in an effort to curb speculation, but there is a growing belief that Congress will be asked to sanction cash dealings only, and that commodity exchanges may in future be subject to Federal authority along lines established by the Securities and Exchange Commission.

*

In advance of his report to the President on Marshall aid proposals, Mr Averell Harriman, Secretary of Commerce, has asked Congress for an extension of the export control powers which would otherwise lapse on February 29th. He is also asking for "priorities where necessary to make critical materials available." The Secretary of Commerce thus makes it clear that his committee will reinforce proposals already made by Mr Krug, Secretary of the Interior, and the Council of Economic Advisers.

*

The Democrats have decided to follow the Republican lead in holding next year's convention at Philadelphia. One reason is said to be that both parties are attracted by the fact that Philadelphia is the centre of a television network covering the East. It will hardly be the most characteristic projection of the City of Brotherly Love.

THE WORLD OVERSEAS

Burma Prepares for Socialism

(By a Correspondent)

THE debate on Wednesday in the House of Commons did little to clarify the prospects of British commercial interests in an independent Burma. Existing interests are to some extent safeguarded by a procedure laid down in letters exchanged between Mr Attlee and the Burmese Prime Minister. But the future remains uncertain for fresh enterprise, whether from Britain or from other countries: Examination of the new Constitution shows how uncertain.

In its new Constitution the Union Parliament takes power* to nationalise "any single branch of the Union economy or single enterprise"; to expropriate or limit private property with or without compensation, as the law prescribes; to forbid the use of private property "to the detriment of the general public"; to nationalise the land and abolish all large land holdings "on any basis whatever," as soon as circumstances permit; to provide Government assistance to workers to organise themselves "for protection against economic exploitation" (Gilbertian, this, for the State itself seems destined to become the greatest employer of labour); to plan the "economic life of the Union"; to assist "economic organisations not working for private profit"; to nationalise all public utilities and exploit natural resources through State—or co-operatively-owned organisations.

Later sections of the Constitution modify Section 44 slightly by including, among the groups permitted to operate in the last-named spheres, companies of whose capital not less than 60 per cent is owned by citizens or local authorities of the Union. Section 220 severely restricts the grant of land for any purpose to any but citizens of the Union. Section 4 (Finance) of the Third Schedule makes provision, in addition to income tax, EPT, sales tax, royalties, taxes on railway fares and freights, for terminal taxes on goods by land, sea and air, customs and excise—for taxes on companies (item (5)), taxes on the capital value of the assets of individuals and companies (item (7)), and taxes on the capital of companies (item (8)).

Which Measures First?

British investors are asking how soon, and in what sequence, will the new Government execute this formidable programme of economic reform, and how will it affect British interests. There need be no illusions about the Burmese leaders' determination to make themselves masters of their own economy without delay. They are irretrievably committed by their election promises to bear Left, and are solidly supported by public opinion too uninformed to distinguish between what is theoretically and what is practically possible in economic policy. But the hard facts standing in the way of recovery are obvious in the present state of the country's major industries, and must be faced sometime.

Against a 1939-40 figure of 3,500,000 tons of rice, this year's estimate of Burmese exports is just over 750,000 tons. Against a prewar annual production of 270 million gallons of oil (most of which went to India), Burma has been importing oil from India. Against a prewar export figure of 140,000 tons annually for lead and zinc alone, only 5,656 tons of ore and base metals were exported from the date of re-occupation up to April, 1947; and against 214,000 tons of timber annually exported before the war, the total for the seven months from October, 1946, to April, 1947, was only 17,209 tons. None of these industries can be re-habilitated without great capital expenditure to repair the damage and neglect of war; this expenditure, in the continued absence of a decision concerning "denial" and other war claims, must be found afresh by the companies concerned. Affecting every one of these industries is the wreckage of communications: the 600-ship Irrawaddy Flotilla fleet at the bottom of the rivers, the damaged roads and railways—all essential for the movement of trade, all requiring capital expenditure on the grand scale.

* See Sections 23, 30, 31, 41, 42 and 44.

Need for Capital and Skill

The speed of Burma's recovery under nationalisation, therefore, depends on whether the Union Parliament can raise at home or attract from abroad the requisite capital and technical skill. It is no good assuming that lack of internal capital alone will hurry the Burmese into bad economic bargains. They are prepared to wait. The widespread net of taxation and the expressed intention to reduce administrative costs indicate a will to solve their own problems in their own way. In this task they will be aided by a country and climate which together make possible a high degree of self-sufficiency without dangerous austerity and by a national genius for improvisation and "making-do." The dearth of technical skill will be harder to make good, and this fact may well direct nationalisation along the lines of least "technical" resistance.

Bargaining with India

Land and the rice industry seem likely, therefore, to be the first tackled, not only because the predominant rural vote is most interested in these, or because rice growing is Burma's greatest industry, but also because it is the one economic sphere (timber possibly included) in which indigenous technical and commercial knowledge is wholly adequate to the task involved. On this last criterion the timber industry and public utilities may be expected to come close behind, with the heavily capitalised and technically difficult oil and deep-mining industries a long way to the rear. It has been argued that to nationalise the land, involving expropriation of extensive Chettyar (moneylender) holdings, would alienate Indian opinion and lose Burma its best customer. But India is threatened with famine, and Burma is now well placed to strike a good bargain on this ground: that to reallocate the land to the dispossessed peasantry would go far towards ending agrarian unrest, and thus bring back into cultivation for India's needs the vast areas at present lying fallow. Incidentally, a revival in the rice trade would do more than anything else to free Burma from its present difficulties and to enable it to accelerate imports of the foreign transport and machinery it needs to stimulate full recovery. And full recovery would put Burma in a position to finance further stages of nationalisation schemes if so desired.

Ample Signs of Confidence

It says much for the country's commercial potential that, in spite of the present gloomy situation and the uncertainty inseparable from any economy threatened by an unknown degree of Socialist planning, there are ample signs of confidence in Burma's ability to triumph over its troubles. Most of the larger British and Indian companies have pressed on with their reconstruction programmes, as a public expression of their belief that they will get a square deal. The US Consulate has been raised to the status of a Consulate-General, and its commercial activities have been greatly expanded in anticipation of a healthy trade recovery. Continuance of this confidence and readiness to help the country's new rulers through their difficult and dangerous experiments would be the best guarantee of security for all those who have a stake in Burma's future. Its leaders may find, as other Governments have found, a hollow gap between nationalisation plans on the blue print and in practice. They may reassess, in the light of experience, their present somewhat reserved attitude towards the great part Britain has played in their country's development. For example, 80 per cent of the pioneer oil companies went bankrupt in the fierce struggle against world competition to establish Burma's infant oil industry. It would be a pity to lose the lasting goodwill that would spring from such a change of mind by condemning too hastily their desire to stray awhile after Britain's own leaders along the primrose path of Socialism.

Soviet Stakes in Hungary

Control Through Reparations

(By a Correspondent)

WITH the ratification of the Peace Treaty Hungary regained its sovereignty. The Allied Control Commission has been dissolved and the Russians are withdrawing their troops. The evacuation of the Red Army should be completed by December 16th, leaving behind only such troops as will remain to guard lines of communication to the Russian Zone of Austria. It is unlikely that these facts will much affect the course of Hungarian policy. The Russian occupation as a determining factor in Hungary can and has been overrated. Economic factors have had a more decisive influence than the presence or absence of Russian troops on Hungarian soil. Foremost among these are Hungary's obligation to pay reparations and the transfer of former German property to the Soviet Government.

The nominal amount of reparations due to the Russians, the Yugoslavs and the Czechs is £75 million. But the actual burden is more like £300 million. The Soviet Union, Yugoslavia and Czechoslovakia are thus not only the largest mortgage holders in the Hungarian economy, but also have a determining influence in the planning of production; because reparations are paid in kind and they have the right to say what commodities should be supplied.

Hungary's first stabilisation budget provided 400 million forints for industrial reparations to be paid to the Soviet Union. In fact, the amount foreseen in the budget did not cover the actual expenditure for this purpose, which amounted to 535 million forints. Hungary's obligations during this year were \$18,100,000, based on 1938 prices. Thus the value of the industrial reparation dollar is almost 30 forints per dollar, whereas the official dollar rate is about 11.50.

Reparations from Industry

In addition industrial reparations were paid to Yugoslavia and Czechoslovakia. The Hungarian budget provided 212 million forints for industrial reparations to Yugoslavia to cover its obligation of \$6,400,000 at 1938 valuation. In fact only 188 million forints were spent. Thus the rate of the Yugoslav reparation dollar is about the same as that of the Soviet reparation dollar, i.e., about 30 forints per dollar. In the budget for industrial reparations to Czechoslovakia 50 million forints were estimated to cover Hungary's obligation of \$2,300,000. In fact only 36 million forints were spent, as Hungary was unable to meet its obligations in full.

In the first year of stabilisation, therefore, Hungary spent 760 million forints on industrial reparations. Its industrial production during the same year was assessed at 4.1 billion forints*. Thus, about 18 per cent of Hungary's industrial output went in reparations. Industrial and agricultural reparations together from August 1, 1946, to August 1, 1947, totalled 943 million forints, or about \$80 million at the present rate of exchange.

To sum up, in relation to the budget, reparations represented about 26 per cent of the total state expenditure. If Hungary's additional obligations for maintenance of the Red Army and of the Allied Control Commission are added, then the total burden exceeded 1,400 million forints, or over 39 per cent of expenditure. If one compares these reparations in kind with Hungary's foreign trade during the same period, it will be seen that the total of reparations at 943 million forints exceeded the total of Hungary's exports, which amounted to 835 million forints during the same period.

These figures are sufficient to show that the requirements of the Powers who are owed reparations have a decisive effect on the production plans of Hungarian industry. No detailed lists of Hungary's industrial deliveries have been published; but it is known that those to the Soviet Union include: machinery, railway equipment, ships, electrical equipment, metals, bauxite and oil. Deliveries to Czechoslovakia and Yugoslavia were similar. Hungarian heavy industry, machine making, shipyards and the electrical industry are those which contribute the largest share to reparations.

The pressure for reparations must have contributed to the com-

paratively quick reorganisation of Hungarian industry, the present figures of which compare as follows with those of 1937-38: coal-mining, 109 per cent; pig-iron, 92 per cent; steel, 91 per cent; and power, 101 per cent. This pressure was exercised in two ways: first of all the Soviet Union had to provide Hungarian industry with raw materials, otherwise it would have been unable to start reparation deliveries. Raw materials were delivered only partially by the Soviet Union itself; the larger share was provided by other Eastern European countries closely connected with the Soviet Union, such as Poland, Czechoslovakia and Yugoslavia. This explains why Czechoslovakia has had almost the largest share in Hungary's foreign trade since 1945, in spite of the political tension between the two countries.

Penalties for Late Delivery

The other way in which reparation deliveries affected Hungary's industrial production was the provision for a penalty of five per cent per month for deliveries which were behind schedule. This compelled the Hungarian Government to speed up production, cost what it might. Questions of profit became secondary. As reparations were the main incentive for the revival of industry, industrial production had to be planned largely in accordance with the requirements of the neighbouring countries claiming reparations, and not in order to meet the requirements of the home market or in order to earn profit.

While Hungary's reparation obligations give a considerable influence to all three creditor countries, Soviet economic influence is exercised also through direct participation in Hungarian economic life. This is a consequence of the Potsdam agreement, in accordance with which former German assets have been transferred to the Soviet Union, now the largest single shareholder in Hungarian industry. The arrangements are still not final, as this agreement, the inept wording of which has been the cause of so many feuds, is still open to different interpretations.

Share in Management

No figures are available for Russian participation in Hungarian economic life, but the pre-war statistics of the part played by German capital may give some indication. The approximate percentage of German capital's part in Hungarian banking was 4.2 per cent, in mining and iron foundries 7.3 per cent, other industries 5.7 per cent and in trade 5.2 per cent in 1939. Altogether roughly 5 per cent of Hungary's economic life was controlled by German capital. So it is not so much the extent of Russian participation in Hungary's economic life which gives influence as the way that it is exercised. The Russians are not satisfied with exerting a controlling interest through their holdings; they also wish to have a decisive influence on management. All those Hungarian companies and factories which were fully German-owned were taken over by a newly-established bank, the "Bank for Trade and Industry." This bank was established by the Russian authorities, and is in fact a holding company for the formerly German-owned enterprises in industry and commerce. It is a company founded under Hungarian law, but so far no report or balance sheet has been made available to the public.

Special arrangements were concluded for the exploitation of certain industries and communications by the establishing of joint Soviet-Hungarian trading companies. The four sectors of economic life which are exploited by these joint companies—civil aviation, navigation, oil and bauxite—have obvious strategic importance. The companies were founded on the principle that the Russians brought in as their share such assets as were claimed by them under the Potsdam agreement. As these companies have not yet published a balance sheet, it is difficult to assess how the respective Hungarian and Russian (former German) assets were valued. Civil aviation is an obvious exception, as all the aeroplanes which now operate in and from Hungary were contributed by the Russians. Only in the sphere of civil aviation do the joint Soviet-Hungarian companies have a monopoly.

In oil production the joint companies' share does not exceed 40 per cent of the total output, the balance being still under

"In times of scarcity, for the simple reason that everybody wants it, the best becomes scarcest of all."

If your White Horse Whisky seems rarer than ever, it is partly because so many people prefer it.

ESSENTIAL TO PRESENT-DAY DIET

Imperative to your body's welfare is an adequate supply of those essential vitamins, A and D. You can take these two in concentrated and convenient form in Crookes Halibut Oil. Nowadays, as much as during the war, this is a wise precaution against diet deficiencies.

CROOKES HALIBUT OIL

OBTAINABLE ONLY FROM CHEMISTS

FREE — an illustrated booklet showing you the relative vitamin values of your everyday foods. Write to The Crookes Laboratories Ltd., Dept. H.193, Park Royal, London, N.W.10.

Figure Heads

Figure heads have been a feature of ships since the earliest times when they were intended to ward off evil spirits. Later, they were purely decorative and Ships' Masters took great pride in them. Famous clippers often wore a figure head said to represent the owner, his wife, or a friend.

THE "THREE CASTLES" CIGARETTES

20 for 3/8
MANUFACTURED BY W. D. & H. O. WILLS

Branch of The Imperial Tobacco Co. (of Great Britain & Ireland), Ltd.

At last — Parker "51"

TESTED and treasured by millions throughout the world, here is the incomparable Parker "51."

Touch point to paper and it writes unflinchingly — the patented ink-trap maintains an even flow. The unique tubular nib of 14-ct. gold is hooded against dirt and damage. Fused to its tip is a ball of osmiridium, micro-polished to jewel-smoothness.

The gleaming Lustraloy cap slips on securely without twisting. The patented filler is hidden within the barrel.

In Black, Dove Grey, Cedar Blue, and Cordovan Brown. 62/6 (plus tax 13/11).

THE PARKER PEN COMPANY LTD., BUSH HOUSE, LONDON, W.C.2

* This figure does not include production from mining and iron foundries, nor from the work of small craftsmen and artisans.

American control. Hungary's total oil production was about 700,000 metric tons a year, of which about 280,000 metric tons are controlled by the joint Soviet-Hungarian companies. In bauxite production the joint companies' share is about 60 per cent. The mining of bauxite practically stopped in 1945 and 1946. In 1947, however, the production was raised from 100,000 quintals for January to 370,000 quintals in July, i.e. almost 82 per cent of the 1937-38 production. Peacetime production of Hungarian bauxite was about 550,000 quintals a year. It is about 60 per cent of this potential output which is controlled by the joint company. The actual tonnage owned by the joint Danube River Navigating Company is not known, but the company's participation in navigation on the Danube is estimated at about 80 per cent.

(To be concluded)

Second Thoughts in Sweden

[FROM A SPECIAL CORRESPONDENT RECENTLY IN SWEDEN]

THAT the current "best-seller" in Sweden is a volume of memoirs by a renegade Soviet official probably reflects less the book's literary merits than Sweden's present concern with Russia. The focus of that concern is the trade and credit agreement concluded with the Soviet Government a year ago. Economically, this agreement represents the largest item—1,000 million kronor—in a post-war insurance policy against depression in America and unemployment in Sweden. The premiums on this policy are foreign credits which now amount to no less than 4,200 million kronor, or nearly £290 million.

Politically, the agreement is intended to strengthen Sweden's position as a neutral. Chronologically, it is the last credit to be taken up; of just over 1,000 million kronor in unused credits some 950 million are earmarked for Russia. And it is being taken up at a time when many of Sweden's economic policies are being proved wrong by the swift deterioration in the country's position. The extra burden it will impose on an already overloaded economy is accordingly resented; and to this resentment is allied the Swede's widespread deep and ancient hostility to Russian absolutism, whether Czarist or Communist.

This general and very vocal tendency to blame the Government for the Russian agreement and the Russian agreement for all shortages and present difficulties, should, however, be discounted in attempting to analyse Sweden's position. In fact, all the political parties have long been agreed that they want to increase trade with Russia to a figure above the prewar average of less than one per cent of Sweden's total foreign trade. Indeed, there is reason to believe that preparations for last year's agreement began as far back as 1941. Certainly the matter was broached officially in 1943. Similarly, the Russian credit is only one factor of many. It is an adverse factor primarily because it is too big to be accommodated to Sweden's other commitments. The reasons why Sweden took on a task beyond its strength must therefore be investigated.

Doctrinaire Optimism

It cannot be denied that Sweden over-estimated both its own strength and the speed of European recovery. Under its "pre-Marshall Plan" it thus extended credits bigger than events proved it could afford. Moreover, although normally running a dollar deficit, it did not take into account the difficulties which would arise if, as was very probable, the proceeds from its other markets could not be converted into dollars. A particularly Swedish factor, however, is the extent to which the belief in an imminent American slump affected the formulation of policy. Theoretical and doctrinaire considerations also played a large part in deciding on the appreciation of the krona in July last year, and the control of timber prices at a level below that obtaining in the world market. But it is in internal policy that such considerations are most clearly seen. In particular, ambitious schemes of social reform have led, at home as well as abroad, to excessive demands being made on the Swedish economy. The result has been over-employment and a fair measure of inflation. Accordingly surplus purchasing power has sought goods in the only countries it could find them, which for practical purposes means the United States.

Retrenchment under Way

So, in recent months, Sweden's reserves of gold and foreign currency have been used up at an alarming rate to finance imports from hard currency areas. In June last year these reserves amounted to 3,229 million kronor. By the end of the year they were dwindling rapidly, and in October the Opposition, having earlier succeeded in abolishing import licences, proposed a stricter

control of imports. Fearing other countries' reactions, and having a "song in its heart," the Government delayed action until March 15th, when all imports were suddenly banned. Gold and foreign currency holdings then amounted to 1,675 million kronor (a loss of 182 million being due to the appreciation of the krona the previous July). The ban, however, was interpreted in a liberal spirit, all holders of outstanding licences being permitted to make use of them (probably because it was not known exactly how many licences had been issued). The resulting scramble led to an even swifter loss of reserves, which by the end of September amounted to less than 600 million kronor.

It is probable that this trend is now almost checked; but, to make sure and to regain lost ground, the Government has adopted various measures. The generous number of items on the "free list" for imports has been reduced. The whole system of granting import licences is being revised. The allowance for foreign travel has been reduced by two-thirds. A fortnight ago the seizure of liquid holdings of hard currencies was authorised; at the same time, the Commissioners of the Riksbank recommended a flat rejection of new credits, a reconsideration of outstanding credits and a review of their conditions of repayment. This was immediately interpreted as a disguised proposal for revising the Russian credit. But the Minister of Finance, the redoubtable Mr Wigforss, was quick to explain that it could not apply in that particular case.

Corresponding measures are being taken internally. The housing programme has been cut by a quarter. The Swedish TUC has appealed to its members not to press for higher wages. A voluntary savings campaign has been inaugurated. Banks are scrutinising most carefully all demands for loans and so forth. Thus the Swedish Government, although it will proceed with its new pensions scheme which starts next year at a cost of 600 million kronor is attempting to set its house in order by restricting purchasing power in various ways and thus, for the first time, attacking the cause not the symptoms of inflation.

Why No Coal from Britain?

The remedy to many of its difficulties, however, is beyond its control. The sudden suspension of the convertibility of sterling was a serious blow. Similarly, Britain's failure to export coal and, more particularly, coke has caused much trouble. Alternative supplies from Poland or the United States are inadequate, of poor quality and very costly, both absolutely and also in that all the American coal must be paid for in dollars and nearly half the Polish may be. Recently shipments of anthracite arrived all the way from Peru. Moreover, about 30,000 men who could be better used elsewhere are employed on producing fuel at home.

Last summer's drought has also added its quota of troubles. Crops are the poorest for many years; and the parched ground retards the sowings of winter wheat. Streams are too low to float down the record timber cut before they freeze. And there is so little water in the hydro-electric dams that for the last few weeks electricity has been rationed—the more strictly when a burst turbine put out of action the main coal-burning reserve station.

In the long term, however, Sweden's economic position is much stronger than its recent swift deterioration may indicate. Its industry is undamaged by war. But from the standpoint of competitive exports it should be noted that the rising costs of labour for forest work and advances abroad in the production of alloy steel, however, have deprived Swedish charcoal steel of its former supremacy. Sweden still possesses considerable foreign assets. Large payments on account of freight—the Swedish merchant navy is now bigger than before the war—and also of exports have still to come in for the period over which holdings of foreign currency dropped spectacularly. The import restrictions have yet to make their effect felt; September showed a record import of 549 million kronor. And the record imports include much capital equipment and necessary consumer goods. Exports, which will soon enter on a seasonal decline as the Northern ports freeze, remain meanwhile at a high level and prospects are good.

This then is the state of the economy on which the demands of the Russian agreement will impose additional burdens. It is therefore not surprising that influential voices are raised in favour of revising the agreement. It certainly would be surprising if the Swedish Government opened negotiations to do so—particularly when it is recalled that the agreement as signed was much more favourable to Sweden than the one originally discussed. Yet it is virtually certain that Swedish industry will be unable to carry out its Russian order. If so, the Russians, particularly if growing difficulties impel Sweden to participate more fully and more formally in the Marshall Plan, may try to exert pressure to get their orders executed.

THE BUSINESS WORLD

Mr Dalton's Opportunity

MR DALTON came all too tardily to the view, long urged upon him, that budgetary action would have to play its part with the other measures the Government is taking to meet the problem of Britain's economic disequilibrium. He now seems anxious to make up for lost time. By introducing his emergency Budget next Wednesday, a little sooner than expected, he will check the orgy of anticipatory spending in which the public is now indulging. If equal realism inspires the Budget itself, the Chancellor will undoubtedly make a vital, perhaps decisive, contribution.

The case for enlisting all-pervading financial pressures in the drive to concentrate effort upon essential tasks, and thus to relieve the strain on the balance of payments, is now familiar. Such overall pressures afford the only possible means of disciplining the wide sectors of the economy which lie beyond the reach of the physical controls. Yet, in the past two years, instead of screwing the economy to a pitch of efficient tautness, financial policy has permitted and even accentuated a dangerous slack. The stream of money incomes, after all taxes have been paid and voluntary savings made, has remained far in excess of the stream of consumers goods, even though that stream has been inflated to a far greater volume than the community could afford. Moreover, the cheaper money policy has recklessly augmented the excessive income-spending by offering inducements to spending out of capital. In consequence, the uncontrolled or uncontrollable sectors of the economy have been extravagantly swollen, and the profits (and wages) they offer have made it ever harder for the vital sectors to secure manpower and materials for expansion. Indeed, even specifically allocated resources have been attracted away from them because the controls cannot operate in such detail as to follow allocations through to end-users. Finally, stocks of materials and components have been so far exhausted that a smooth and balanced flow, even to work of the highest priority, has become impossible, so that stoppages and short-time working have become general.

It is true that the perilous situation to which the economy has thus been brought is not wholly attributable to mistakes in financial policy. The excessive strain derives fundamentally from the grandiose scale upon which the capital programmes had been planned. But, given this over-ambitious planning, the cardinal mistake in financial policy lies in its failure even to try to reduce the flow of net spendable incomes to conform with the very low level of consumption which these capital targets in effect postulated. Now the capital programmes are being cautiously pruned. But it would be wrong to suppose that even a substantial pruning would remove the need for drastic financial action. If the excess of public spending power remains, the main effect of the pruning would be to make the process of attracting resources into non-essential uses easier than it was before. The wastages would continue.

That is the real case for an emergency budget, and the success of Mr Dalton's proposals will be judged by the extent to which they acknowledge it. Unhappily, there is no sign yet that his approach will be on these lines. According to him, the budget

is required merely to meet the new financial situation created by the cuts in imports and the intensification of the export drive. Only a few weeks ago, he was still taking pride in the felicitous contrast between the ease in his domestic finances and the difficulty of the overseas problem. And he still professes unswerving adherence to cheaper money.

But, even if such wrong-headedness (not to say pig-headedness) may enfeeble it, this budget will still mark an important advance. It will be the first emergency budget ever introduced to cope solely with general financial disequilibrium, as distinct from disequilibrium of the Exchequer itself. The austerity measures and the diversions to export will admittedly have repercussions on the revenue, but there will be significant economies from the reductions in the armed forces and in expenditure overseas. The net impact upon the Exchequer during the rest of this financial year is likely to be relatively small, certainly not large enough to upset the accounting structure which satisfied Mr Dalton (though hardly anybody else) last April. Indeed, even without any further budget measures, he would probably have been able next April to show on paper most of the spurious surplus of £270 million for which he budgeted—after including, of course, the £400 million or so of non-recurring or merely nominal receipts from miscellaneous sources, war surpluses and trading profits, and ignoring "below-line" expenditure originally estimated at not far short of £1,000 million. To date, with the main revenue season still ahead, the nominal surplus "above the line" is £223 million, after crediting £344 million of special "receipts." Below-line expenditure, excluding the Bretton Woods contributions and the small savings items, has now reached about £315 million, but heavy outgoings (particularly for war damage, housing, postwar credits and encashment of tax reserve certificates) have still to be faced.

*

If Mr Dalton were really to come to grips with the task of restoring financial equilibrium, the whole of the curious accounting of last April would come under review, including the incredibly optimistic estimates then made about the level of voluntary savings. Budgetary policy would then be framed solely by reference to the size of the inflationary gap in the whole economy—to the deficiency of voluntary savings, realistically estimated, compared with the true total demand for capital, after allowing for the portion to be financed, so long as any overseas deficit remains, by borrowing abroad and sales of gold. The capital demands, needless to say, would include not only the pruned-down capital programme for the economy as a whole, but all net expenditure by the Government and governmental agencies not already embraced in that programme; and all nominal items would be rigorously excluded from both sides of the account. The shortfall of savings, thus computed, would be the amount required to be provided by budgetary action, either by new taxes or new cuts in expenditure.

Without access to official figures, it is impossible to frame any dependable estimate of this deficiency. On many vital matters, the only available official data are those given in the

now obsolete *Economic Survey*, and recent experience has shown that many of those estimates were wide of the mark. The lack of data for direct estimate of the gap has led some commentators to concentrate instead upon the inflationary effects of the crisis measures. It has been suggested that the formula for sound budgeting now can be found by looking merely at the prospective reduction in the overseas deficit (which is a measure of the prospective reduction in the supply of goods at home, on the assumption that production is not increased) and at the cut in the capital programme (which measures the reduction in domestic demand for goods on capital account). The difference between the two, it is suggested, is the amount by which taxes must be raised or government expenditure further reduced. In fact, this calculation measures only the extent to which the inflationary gap will be widened by the crisis remedies; it wholly ignores the existing gap which has done so much damage.

On such an approach, only quite moderate fiscal changes would be needed to absorb the additional inflationary pressure even for so long a period as the next twelve months. Even if the target of equilibrium on the global external account were to be achieved by the end of that period, the year's external deficit would still be well over £300 million—a reduction of, say, £250 million from that for the past year; and, on paper, a large part of that loss might appear to be offset by the projected capital cuts. If Mr Dalton proceeds by this argument (and there is certainly a risk that he may try), he would produce a milk-and-water budget which would be more dangerous than no new budget at all.

*

An honest approach would start from the opposite assumption, that the real problem is the gap which already exists, a gap which is so large that in the short run the prospective addition to it might be regarded as scarcely more than marginal. From such figures as are available, the total gap seems most unlikely to be less than, say, £400 million per annum, and it could conceivably be almost twice that sum on, say, a twelve months' view, if production does not expand. If the mid-point—the much-canvassed figure of £600 million—indicates the broad order of magnitude, by what means ought the gap to be closed?

For tax measures, four principles must be observed. Any new taxation must not have important "disincentive" effects, must strike at mass spending, must absorb and not merely divert spending pressure, and must operate rapidly. The first principle rules out almost the whole field of direct taxation, except perhaps taxation of unearned income. The second implies that there is no easy way out for a Labour Chancellor by staging a drive against "the rich": profits tax, surtax, death duties or novel forms of capital taxation could not provide either the volume or kind of savings which is needed. Their proper function would be the limited one of ensuring that all classes share equitably the burden of sacrifice. For this purpose the best device would probably be a differential tax on unearned income. The profits tax, which is more likely to be Mr Dalton's choice, is the worst of such taxes since it falls exclusively upon risk-bearing capital. The prospective yield from the existing tax in a full year (with EPT tapering off) is probably larger than is generally supposed, and might be in the region of £90 million, so that if Mr Dalton were to double the rate he might secure about £50 million net (after allowing for loss of income-tax)—but the time-lag would make this an almost worthless device as a crisis measure.

To strike at mass spending the obvious weapons are the familiar instruments of indirect taxation—especially the tobacco, beer and purchase taxes. But here the Chancellor must beware of merely diverting spending power, which is what will happen

if tax increases are imposed on goods which, at present levels, have an elastic demand. Tobacco may still look attractive from this point of view, for such figures as are available show that consumption recovered sharply from the shock effect of the April impost, and total monetary expenditure seems to be running now well above its pre-budget rate, so that Mr Dalton should easily achieve the additional £75 million (making £525 million) for which he budgeted. The duty may be raised again, to conserve stocks; but it would be optimistic to suppose that the total yield can be raised much further at any level of tax. By analogy with recent experience with tobacco, however, it might be possible to screw a further worthwhile sum from beer—if grain shortage does not further reduce the amount available for sale.

*

The principal remaining tax possibility is the purchase tax, and this will certainly be expected to make an important contribution. There are two basic difficulties. Purchase tax is obviously the perfect fiscal device for diverting specific supplies to export, by recourse to a penal rate. But this technique is of only limited application. If it succeeds, no revenue is collected; the spending is diverted elsewhere, possibly to articles not subject to tax. Secondly, the supplies of goods of the type to which the tax has been applied in the past will in any case shrink drastically. For the current year Mr Dalton budgeted for an additional £80 million (making £271 million allowing for certain tax increases) because of the expected increase in the flow of supplies. Presumably, his expectations have been disappointed already, but this £80 million can probably be regarded as the minimum prospective loss, once existing domestic stocks have been exhausted. To make good this loss and provide any substantial new contribution to the revenue, mere increases in existing rates obviously would not suffice; a wide extension of the range—perhaps even into the utility goods sphere—would be imperative. Finally, there is the much-discussed fuel tax. If this is imposed, its object would be purely to check consumption beyond a basic level; the rates ought therefore to be prohibitive, and its success would be judged by the smallness of the revenue yield.

It is not easy to guess how much might conceivably be raised in these various ways. But if the Chancellor aimed at more than £250 million or so (say, £50 million from unearned incomes or profits tax; £100 million from beer, tobacco and entertainments; £100 million additional from purchase tax), he would probably begin to encroach heavily upon so-called cost-of-living expenditure. At that point the problem of finance by indirect taxation merges imperceptibly into the vexed problem of finance by cuts in subsidies. The blunt truth is that it is impossible to come within striking distance of the minimum gap which has to be closed without grappling with this problem. The danger is that political fear will lead the Government, even at this late stage, into half-hearted measures which Mr Dalton, with book-keeping dexterity and booming rhetoric, will try to present as a massive assault. Yet this is almost the last chance the Government will have to bring the financial situation under control. If finance does not come powerfully to the aid of the physical controls, one of two things will shortly happen. Either the economy will come again to the point of general stoppage, with the controls paralysed; or the controls will be overwhelmed in a rising chaos of overt inflation. In either case, the Government's mass supporters would be the hardest hit. The honest and the courageous route, which involves not only heavy increases in taxation but also an assault upon the subsidies combined with a "deal" on wages, would in fact prove to be the route of minimum real sacrifice for all.

Is Cocoa Too Dear?

MUCH excitement was caused last week by a further jump in cocoa prices on the New York market to £255 a ton. This latest increase, however, is only one of a series which began with the removal of ceiling prices in America in 1946; it reflects a sustained demand for cocoa in the United States, which has itself been reinforced recently by the attempts of many manufacturers to increase their depleted stocks. Rather unreasonably, American buyers have connected this latest rise in cocoa prices with the introduction of the new marketing scheme for West African cocoa which came into full operation at the beginning of October. But it is coincidence, and not design, which has produced the new marketing organisations and a steep rise in world cocoa prices at the same point of time.

The chocolate manufacturer and the consumer are vitally interested in the price and quality of West African cocoa, for nearly 70 per cent of world cocoa exports come from that area. British West Africa alone supplies over 60 per cent of world exports, of which 45 per cent comes from the Gold Coast and 15 per cent from Nigeria. The new marketing scheme applies in both these colonies; thus the organisations' price policy, and the reactions of that policy on cocoa harvesting and the methods of the native farming community, will be a major factor in the world cocoa situation.

Those who have viewed the new marketing scheme with reserve—they include a most vocal contingent from the New York cocoa futures market—have some *prima facie* ground for their attitude, for the scheme frankly takes as its starting point the viewpoint of the producer, the African native farmer who cultivates a few scattered acres of ground. The marketing scheme is intended to strengthen his position and to give him some measure of security. Such an idea is likely, even if it is not bound, to conflict with the interests of the consumer at some point. It certainly raises the question, on what conditions should the cocoa grower be granted a measure of security in the form of a stabilised price for his product? Can a particular dispensation be justified for West African cocoa growers?

The plea of special circumstances rests on two main considerations. First, it is said that cocoa in West Africa is a peasant proprietors' crop, that there are no plantations run by managers or owners who can appreciate the world price situation, and that there is no one capable of giving an intelligent lead on marketing policy to the small producers. The farmers are illiterate and unorganised, a prey to rumour and violent fluctuations in price. Since they are settled closely together, the wide fluctuations in their prewar incomes which arose from violent extremes of prices affected the entire economy of a territory where they form a large proportion of the population. The statistical evidence which can be marshalled to support this view is impressive. It is reproduced in the accompanying table which shows the annual sales of cocoa from the Gold Coast from 1926-27 to 1946-47, and the proceeds realised by the farming community. Comparable figures for Nigeria are not available, but they would have shown very much the same sort of fluctuation.

During the twenty years, incomes from cocoa accruing to the farming community (including the African cocoa brokers as well as the farmers) fluctuated from £11 million in the season 1926-27 to under £3 million during the worst period of the depression, soared again to over £10 million in 1936-37, and returned to less than £3 million at the height of the sub-marine menace. The national income of the Gold Coast was calculated, in 1931, at £59 million; so, in very round figures, it would seem that before the war cocoa accounted for anything from 6 to 15 per cent of the national income. Every time that cocoa prices moved considerably in either direction, they would,

of course, alter the size of the national income and also the proportion of the income accounted for by cocoa.

Figures such as these do show the appalling social and economic strain which violent price changes before the war inflicted on the colony. Both the Colonial Office and the Gold Coast Government have argued that since the narrow structure of the world cocoa futures market in New York predisposes the world cocoa price to violent changes, the only solution is to fix the price of cocoa to the farmer at the beginning of each season, in the light of conditions in the world market. They have therefore, set up, under the new scheme, a statutory purchasing board, modelled on its wartime predecessor, which has been buying—as from October 1st—all Gold Coast cocoa at a fixed price of £75 per ton, announced in advance and payable at up-country buying stations. The board sells its cocoa at the world price to the Ministry of Food and to overseas buyers through its own marketing company which will operate in this country. A similar arrangement applies in Nigeria. In good years, the board will make a profit which will arise from the difference between the average price which it receives from its sales in the world market and the price which it fixes seasonally in advance and pays to the farmer; this margin will be used as a cash buffer in bad years to cushion, though not to extinguish, the effect of falling world prices on farmers' incomes.

GOLD COAST. COCOA SALES AND PRICES 1926 TO 1946

	Firms' Purchases	Price to Farmer	Value of Crop to Cocoa Community	Price Ex-quay New York*
	(tons)	(£ per ton)	(£ '000)	(£ per ton)
1926-27	237,000	45.70	11,334	73.04

The second consideration, it is argued, is the fact that the cocoa trees are dying of disease. The loss of cocoa production caused by a virus called "swollen shoot" and by other infection is thought to be about 40,000 tons a year. A loss of such proportions is roughly corroborated by the export figures in the table which show a noticeable decline in shipments from 300,000 tons in 1938 to less than 200,000 tons in recent years—though last year's crop was also affected by drought. Evidence from various sources is sufficient to dispose of the theory that this falling trend of exports (and hence of production, for there is no local market for cocoa) is due entirely to price factors. Perhaps half the fall might be ascribed to the low level of prices during the war; if so, disease is making off with about 16 per cent of the cocoa crop in the Gold Coast alone and it is known to be spreading in Nigeria. Botanical research has found a prescription for "swollen shoot," but it is a drastic surgical remedy of cutting out the dead and dying trees.

The Government agricultural departments seem to be agreed that there is little prospect of persuading an illiterate native

farming community to adopt such a drastic cure unless cocoa prices are remunerative and stable. Time is required to teach the farmer better husbandry; oscillating prices will only distract him from the task of saving Gold Coast cocoa from the destruction which has already overtaken the cocoa industry in Trinidad. So runs the argument. But it might also be argued that if prices are too high, farmers will have some incentive for cropping diseased trees as long as they will bear pods.

In the long period, the question of monopoly is fundamental to the whole scheme. In the short-run it is quite impossible to tell whether the activities of the two boards, one for Nigeria and one for the Gold Coast, will be monopolistic or not. The marketing boards can argue that they are selling at the world price and that if, as at present, inflationary pressures in America are raising the price of cocoa to fantastic heights, that is the fault of the United States economy, not of the cocoa boards. The boards are not to be blamed for the running down of American stocks to dangerously low levels. The world demand for cocoa, even after it has been scaled down, is well over 700,000 tons; the crop estimates are some 70,000 tons below that figure. This, in itself, means high cocoa prices.

In the longer run of a decade or so, the issues will be more clearly defined. The whole scheme will then be judged by two criteria: first, the relation of cocoa prices to the movement of prices in general; and, second, the supply of more and better cocoa to the consumer. If the scheme does not satisfy these tests, it will fail, just as other schemes have lost their original purpose and have declined into mere producers' monopolies.

What are the prospects, looking forward from 1947? The amount of pressure which the consumer will be able to bring to bear on the boards' policies over the next few years is problematical. A consumer's committee is to operate in London

in an advisory capacity, but its weight in council has still to be proved. The real crux of the matter is how quickly can the farmers in Nigeria and the Gold Coast be educated to cut out sick trees, to plant new ones and to increase the yields of their trees. It should be pointed out to them clearly and frequently that the cocoa consumer will accept a marketing organisation, heavily packed with representatives of the producers' interests, only if the industry is made more efficient. The farmer must not be allowed to delude himself that because the new scheme has statutory backing it is immutable. If cash incentives are needed to speed up the rate of "cutting out" dead trees, the two boards already possess £20 million from the last five years' operations of the West African Produce Control Board which might be used partly for that purpose.

How long should the period of trial last? Perhaps five years will be needed to give the "cutting out" campaign a chance of success, for the farmers have to be educated to this drastic prescription. New trees take seven to ten years to mature, so that improvement should be evident ten or fifteen years from now. If, however, the dead trees are not cut out, a much more rapid—and censorious—judgment will be given by world cocoa consumers.

In five to ten years' time the consumer may not be in as weak a position as he is today. Cocoa is being grown experimentally in other parts of Africa by plantation methods, which may provide better and cheaper cocoa than the peasant proprietorship system. The West African farmer is, in fact, under notice that his entire system of land tenure is on trial. He will have a remunerative market for several years to come, but if he cannot produce and sell cocoa more efficiently under the new system than under the old, he, or his succeeding generation, may find that West Africa is priced out of the world market.

Business Notes

Before the Budget

To disentangle the motive forces behind this week's recovery in the security markets is not a simple job. No doubt the Chancellor of the Exchequer would welcome anything which assisted him in his self-allotted task of raising the level of gilt-edged prices, but he must have found the favourable response to the municipal election results rather bitter-sweet. Gilt-edged investors have been concentrating their attention mainly on the short- and medium-dated stocks, and the more pronounced recovery in the "longs"—both Old Consols and Treasury 2½s rose to 89½ on Wednesday—seems to have been due more to the effect of bear covering in a narrow market than to the pressure of public demand. Despite the New Zealand repayment and the imminent distribution of £100 million for war damage claims, the attitude of the general investor towards the merits of long-dated stocks remains cautious.

Paradoxically, the approach of what ought, in principle, to be the most austere Budget in the history of peace-time public finance in this country has been marked by a broad improvement in equity shares. In the free backing of pre-Budget hunches, tobacco shares have been most prominent, on the view that the Chancellor, when the time comes, will be less severe on tobacco than the recent prophets had forecast—or than the situation truly demands. But the recovery in equities, partly technical and partly a reflection of the guess this week that Mr Dalton will produce a soft Budget, has spread well beyond the immediate range of Budget hopes and risks. From steel shares to cinema issues, and from motors to textile shares, the story of improvement has been almost uniform. Is this the market's first reaction to the possibility of further inflation in store? One hopes not—for the sake of the equity shareholder, who will be a positive Bourbon if he forgets for an instant the industrial risks of the coming winter, and for the sake of the economic health of the country.

It is probably true that current equity prices, even after this week's rise (from 111.5 to 114.5, according to the *Financial Times* index), discount the most that Mr Dalton is likely to inflict by way of increased taxation on company profits. But they certainly leave no room for any general interruption of industrial output,

as a result of shortages of power, transport, steel, raw materials, or manpower. Nor, in particular cases, do they seem to measure the consequences of a change-over in production on the scale which will be necessary if the export targets are to be hit. An export drive "with teeth in it" might not stand any greater chance of success than the present export drive by exhortation; but it might be infinitely more disturbing to equity share values.

Spotlight on the Rand

The spotlight in the Kaffir market has this week been switched from New Union Goldfields to the far western Rand. Middle Witwatersrand, a development company of the Anglo Transvaal Consolidated group, has successfully diverted attention from the New Union affair by announcing a series of remarkable assay values—including one borehole assaying 12.2 dwts of gold over a width of 135.2 inches. It seems that this news was more than enough to dispel any lingering qualms felt by the market over the New Union disclosures, but the support given by the mining houses and the strong recuperative powers shown by the shares of New Union and Roodeerand which have resulted, directly or indirectly, from it, raises the question whether such a large dose of tonic need have been administered. This doubt is quite independent of the inquiry which has been ordered by the Johannesburg Stock Exchange into last Monday's dealings in Middle Witwatersrand shares before the official announcement of the borehole results; the sharp rise in the price of the shares from 13s. 3d. to 23s. 9d. at the close of that day's business strongly suggested a leakage of information in Johannesburg, but the decision of the Stock Exchange authorities there to investigate whether a leakage did in fact occur only temporarily halted the upward course of the shares, which have since risen to 26s. 6d.

Memories in the mining market are proverbially short, and it may be that the collapse of New Union will be quickly forgotten. But the recovery of the patient has been surprisingly quick—

so quick, indeed, that it does invite some doubt whether a relapse may not occur. It would in fact be unhealthy if the uneasiness left by the New Union affair were too hastily dispelled. The judicial managers who are now investigating the affairs of the group will certainly require all the support of investors to get at the truth, even if it is too late to get their money back. Mr Kavanagh, who is a champion of lost investment causes, has seized the baton for the shareholders of New Union on the London register, and his move to form a committee to represent them in South Africa may serve the purpose of keeping public consciousness awake until the affair has been fully investigated.

Meanwhile the shares of Roodeerand have risen above the price at which the new issue had been planned before the difficulties of New Union were revealed. This is not so surprising as it might seem, in view of the buying of the shares by the big mining houses during the past week, although it is perhaps rather odd if, as is said, this company is one of the largest creditors of New Union. If the investing public's confidence can be maintained in a company whose recently retired chairman has been the centre of the biggest mining furore for many years, it is likely that the new issue of 2,000,000 5s. ordinary shares will be made, for these were to be offered to shareholders only. For the future development of the Orange Free State goldfield it is important, especially at this stage, that the development companies should have access to sufficient funds. Yet it is surely desirable, in return, that the capital should be administered under auspices free from any suggestion of criticism. The interval between the fall of the New Union edifice and the forthcoming issue of Roodeerand shares is certainly astonishingly short.

Two Views on Rubber

It is generally assumed that the United States has undertaken, as part of the bargain on tariffs and preferences which was recently signed at Geneva, to increase the proportion of natural rubber used by the American rubber manufacturing industry. No confirmation of this report is to be expected before November 18th, when the tariff agreements are to be published, but it has been accompanied by a confident wave of buying on the London rubber market. American rubber consumption, measured by the first eight months of this year, is running at an annual rate of 1,100,000 tons, divided between 520,000 tons of natural and 580,000 tons of synthetic rubber. Some observers have suggested that the modification of the "R.1" order under which the American Government controls the proportion of synthetic rubber to be used in rubber manufacture, might result in the expansion of consumption of natural rubber in the United States by 250,000 to 300,000 tons a year.

The importance of natural rubber in Britain's dollar earnings has been stressed by two expert spokesmen for the plantation industry during the past week. Sir John Hay estimates that rubber exports from British territories to the United States may well reach 550,000 tons this year, which represents a "considerable sum" in dollars—a rough estimate suggests between £40 and £60 million. Sir John claimed that the dollar value of rubber exports this year might well exceed the total of all manufactured exports sold by Britain in the United States. And he scored an effective point about prices, which, "although above the miserable level that was current a few months ago," show only a "slender profit" on present-day costs, and are "far remote" from the high prices which have to be paid for essential imports from the United States.

The Kamuning company, whose shareholders Sir John was addressing, is one of the more efficient plantation companies, and the fact that it has done relatively well during the past year through good management and special exertion to overcome the difficulties left by enemy occupation provides no valid argument that the rubber estates as a whole are making handsome profits at the expense of consumers. Mr Eric Miller, at the Harrisons and Crosfield meeting this week, has declared that "at the average price realised, even the most efficient producers are having a lean time," unless they happen to be marketing crepe rubber which commands a welcome premium. An increase in American consumption would certainly lead to a further rise in rubber prices, because at present the supply of natural rubber cannot rapidly be expanded. Mr Miller disclosed that since the "Cease Fire" order in Indonesia on August 4th more factories on the group's rubber and tea estates had gone up in flames than during the whole period of Japanese occupation. No great increase in rubber

supplies from estates in Java and Sumatra is to be expected, at least until the second half of next year.

But, as Sir John Hay argued, the present predominance of British territories in rubber production cannot continue indefinitely. The rubber industry has sometimes entertained the feeling that it is being thrown to the wolves in order to placate American opinion. But there is a distinction to be drawn between getting a fair share of the benefits of a rising market in the short run and devising a price policy to ensure that the plantation industry—or at least its more efficient units—can survive in its present form. For the threat is not merely from a Government-supported synthetic rubber industry in America; it will come, perhaps quite soon, from native producers in territories where the tide of self-government is running high and the influence of the plantation industry towards co-operative marketing or actual restriction of output has been correspondingly weakened. The industry can properly demand its slice of the inflationary cake—after all, its own costs have greatly increased as a result of inflation. But it must also recognise—as this week's spokesmen certainly recognise—that low costs are the price of survival.

Argentine Sterling Talks

The negotiations on commercial and financial questions between Britain and Argentina continue in Buenos Aires at "embassy level." The personnel available for trade discussions will, however, soon be strengthened by fresh arrivals from London. The main issue is the interrelation of the various strands of the negotiations, those relating to the balances arising from current Anglo-Argentine trade, the railway deal and the meat and other commodity contracts. It had been hoped that these various strands could be kept separate, but with negotiators as hard bitten as Argentina this hope was always rather precarious. Most uncertainty exists about the nature of the payments arrangements between the two countries. The earlier agreement under which Argentina could, and most certainly did, transfer its current sterling earnings into dollars was superseded by British unilateral action when the convertibility of sterling was suspended.

New arrangements have to be negotiated and, since these will involve an undertaking by Argentina to hold additional sterling balances, it may be assumed that there will be demands for the most cast-iron exchange guarantees in relation to these holdings. In pressing for this point and for the maximum degree of convertibility for current sterling earnings, Argentina will certainly keep the railway agreement open and available as a bargaining weapon. The deal still requires ratification, though this is a formality which the Argentine administration have in their pocket. It is, however, a convenient card to keep unplayed, since the railways could, with appropriate help from the Argentine authorities, cease to be an earning investment for Britain and become a substantial net drain of funds to Argentina. That the dice are already being loaded in this way is perhaps indicated by the increasing reluctance with which the Argentine authorities are allowing financial remittances to Britain. The immensely strong card in the other hand is the fact that nearly £140 million of Argentine sterling is held in Britain and cannot be freely used. The next strongest card is the importance of the British market as a long-term and assured buyer of the basic produce of Argentina. With these powerful bargaining counters in their respective hands, and with the mutuality of interests that exists between the two countries, some reasonable compromise arrangements should be reached. According to some reports, the prospects of ratification of the railway agreement have become rather brighter in the last few days. If agreement is, in fact, reached on the financial talks, the railway pact would follow as a matter of course. But before this result is attained there may still be much hard negotiating to endure, in the course of which the nerves of Argentine railway stockholders might be severely shaken.

The Converters

Interesting information was given by the Chancellor of the Exchequer this week concerning the identity and operations of the individual countries mainly responsible for the convertibility run on sterling in July and August last. The details of these conversions of sterling into dollars over the first half of the year and for the next 51 days together with the accompanying changes

in the sterling holdings of the countries concerned may be summarised as follows:

STERLING AND U.S. \$ TRANSFERRED
£mn.

	Jan. 1 to June 30	July 1 to Aug. 20	Total
Argentina	18.7	23.3	42.0
Belgian monetary area	18.3	34.4	52.7
Brazil	5.0	7.5	12.5
Finland	...	2.8	2.8
Italy	1.3	1.3	2.6
Netherlands monetary area	1.1	2.7	3.8
Portuguese monetary area	4.7	2.9	7.6
Other countries	0.2	0.9	1.1

CHANGE IN STERLING LIABILITIES
£mn.

	Jan. 1 to June 30	July 1 to Aug. 31	Total
Argentina	+ 9.3	- 7.5	+ 1.8
Belgian monetary area	+21.6	-23.2	- 1.6
Brazil	+ 5.0	- 2.9	+ 2.1
Finland	+ 2.9	- 2.2	+ 0.7
Italy	- 7.7	+ 4.1	- 3.6
Netherlands monetary area	+ 4.3	- 4.0	+ 0.3
Portuguese monetary area	- 1.8	- 0.6	- 2.4

The two tables must, for obvious reasons, be read together. Their juxtaposition brings out the fact that though the countries, or monetary areas specifically mentioned, converted £124 millions of sterling into dollars from the beginning of 1947 to August 20, 1947, their sterling balances only declined by £2,700,000 over this period. The conversion, therefore, applied almost wholly to currently earned sterling.

The Belgian monetary area takes pride of place in the list. This is because a large part of the current sterling accruing to the whole transferable account group of countries through the deficit in the British balance of payments was persistently canalised to Belgium as a result of that country's export surplus with these other countries. For example, Italy's "creditable" convertibility behaviour was largely due to the fact that sterling earned by that country was used to finance the Italian deficit with Belgium. Argentina, which was building up sterling balances over the first part of the year, presumably in preparation for the railway deal, liquidated the greater part of that increase in July and August.

Film Tax Developments

This week has brought further developments in the disputed progress of the *ad valorem* tax of 75 per cent on imported feature films. Last Monday's debate in the House of Commons made it quite clear that any attempt to pass on the increased tax to the cinema-going public would be resisted by the Board of Trade, who, according to the Financial Secretary of the Treasury, "will not hesitate to stabilise rentals at their present level."

Meanwhile, it is expected that talks on the film tax will open next week between the Treasury and representatives of the Motion Picture Producers and Distributors of America to see if an alternative to the 75 per cent duty, acceptable to both sides, can be discovered. The Financial Secretary opened the door for discussion with foreign producers—in effect the American industry—by remarking that the Government were prepared to meet the Americans "more than half-way," provided that the required saving in dollars was effected. The sting, of course, is in the proviso, and it will not be easy to find a compromise which satisfies it. Many ideas canvassed hitherto for altering the basis of the new duty or for substituting a quota arrangement hardly take matters much further than the *ad valorem* duty itself. For instance, the suggestion for a specific tax based per foot on imported film would divorce the incidence of the tax from its earnings in this country, and thus destroy one of the merits of the *ad valorem* duty. Again, the suggested quota arrangement by which imports of American films to Britain might be balanced against a corresponding number of British films for America is not likely, under present circumstances, to make much appeal to the Americans, for a reciprocal quota tied to the total capacity of British production of feature films would be too small.

Meanwhile, the dollar shortage is responsible for considerable dislocation to British film production. According to one speaker in Monday's debate, 30 per cent of studio space is now unoccupied; this figure gives some measure of the rearrangement which has been required in production plans now that British

films are faced with a far bleaker prospect abroad than was evident when Mr Rank drew up his plans for the wide exhibition of British pictures in the United States.

France's £50 Million

The routine meeting of the Anglo-French Economic Committee, which opened in Paris last Monday, has a fairly full agenda before it. This standing committee has the task of keeping the economic relations between the two countries under constant review. The initial objectives of this exchange of views between officials of the two Governments were rather ambitiously conceived—at least on the French side, which envisaged nothing less than an integration of the two economies and the dovetailing of economic planning in Britain into the French Monnet plan. So little of that plan now exists, save in the realm of fantasy, that the scope of these meetings has had to be recast in more sober terms. The discussions of the committee have lost nothing of their true value from this realism. The latest of these meetings has split into two sub-committees, one dealing with financial and the other with commercial questions. The balance of payments between the two countries is in reasonable equilibrium, but the volume of their mutual trade could with advantage be expanded. The balance is running slightly in favour of France as regards direct trade between the United Kingdom and metropolitan France. But including the trade of the sterling and French franc currency areas, the global balance breaks about even. That leaves France with the £50 million-odd of sterling accumulated partly as the result of past current transactions, partly by sales of sterling securities requisitioned from French nationals.

France would still like to convert part of this sterling into dollars. The British attitude has been to refuse such conversion rights and to argue that the balances should be left here in anticipation of the repayment, due to begin in 1951, of the £100 million debt owing from the French to the British Government. Within the limits of approximate equilibrium in sterling-franc payments, both sides are seeking the means of expanding the mutual trade of the two areas. Unfortunately, France needs essentials like coal, wool, rubber, copper, and has few essentials to offer, save the phosphates and iron ore of North Africa. One of the exports France is most insistently offering is the services of her tourist industry. To convert the complete suspension of tourist traffic from the United Kingdom into a partial ban con-jures up all the bogeys of discrimination—bogeys which exist not merely in the minds of doctrinaires and in their charters, but in the much more solid consciousness of Swiss and other hotel keepers who would shout their disapproval of any bilateral deal by which British tourists were allowed to visit some countries and not theirs. This issue raises matters of high policy, and though it has been raised in the Paris talks it will have to be carried to much higher levels before a decision on it can be taken.

More Gold Sales

A statement issued by the Treasury at the end of last week announced that gross sales of gold during October amounted to £35 million. This included the sale of £30 million already announced in a Treasury statement issued on October 21, and therefore indicates that a further £5,000,000 was sold between then and the end of the month. This announcement is the first of a series of monthly statements in which gross sales of gold will be disclosed. This latest gold operation brings to £55 million the total gold sold since the suspension of sterling convertibility on August 20th. It does not follow that the whole amount was sold in the United States. There have, in fact, been reports of small shipments of gold from this country to Sweden to discharge sterling balances held by the Swedish Riksbank in excess arrangements.

No further gold is, apparently, being lost to Belgium. The conversations which were completed in Brussels last week between representatives of the British and Belgian Governments were intended mainly to clarify the technical details of the monetary agreement initialled in London in September. This was the agreement under which Belgium undertook to hold up to £27 million of sterling before insisting on her rights to convert sterling into gold or dollars. Although that limit was quickly reached, and is understood to have been passed, the conversion rights have not been implemented. The object of the commercial negotia-

November

November is the month when preparations for Christmas are made and many thousands of manufacturers, wholesalers and retailers are then working to capacity. Christmas stocks are being produced and delivered, a great nation of shopkeepers is preparing to put goods into its shop windows, and bankers make ready to meet heavy seasonal demands upon their services. Whichever side of the counter will be your concern during the Christmas shopping season, you can depend upon assistance from the Midland Bank, whose wide commercial experience is available at more than 1900 branches throughout England and Wales.

MIDLAND BANK LIMITED

AFTER 1918 the demand for rayon soared and, to meet it, Courtaulds built new factories. The largest of these was at Dunstall Hall, Wolverhampton, bringing to the town an entirely new industry. Building operations began in 1924, and the first viscose rayon yarn was produced in 1926.

Later the works were doubled in size, and in 1937 the present warp-knitting mill was added to make knitted rayon fabrics; this is now in process of being re-equipped with new British machines, fastest of their kind in the world.

The Second World War brought upheaval. Large areas of the factory were requisitioned for Admiralty and other purposes. The knitting department was moved to one of the Company's Essex mills. Bomb-filling at the factory kept some hard at work, while largely from Wolverhampton the Company provided personnel for a complete Royal Ordnance factory a few miles away. Most of such rayon yarn as was still made at Dunstall Hall went into aeroplane and vehicle tyres.

Now this great factory is again getting busy on the spinning of viscose rayon yarn for the manufacture of dress goods, furnishing fabrics, tyre cords and other purposes; it is also employed on winding and warping, and on the production of knitted fabrics.

In 1939 over 3,000 people worked there. During the war, the number fell to below 1,000; now it is gradually rising, though many more vacancies need to be filled before the management is satisfied with progress. Of over 21,000 people employed by Courtaulds in the United Kingdom, to-day about 1,900 are getting on with the job at Dunstall Hall.

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

Issued by Courtaulds Ltd., 16 St. Martins-le-Grand, London, E.C.1

tions was to establish an approximate equilibrium in the balance of payments between the sterling area and the Belgian monetary area in 1948. Plans are now being made for a substantial increase in sterling area exports to Belgium; if this can be achieved, Belgium's accumulated sterling balances should decline well below the inconveniently high figure to which they have recently climbed.

* * *

Labour's Reward

The Ministry of Labour's latest review of earnings provides further evidence of the upward course of wages since the end of the war. The survey, which is based on data collected at six-monthly intervals, relates to the last week of April, 1947, and covers nearly 6,000,000 workers in manufacturing industries. Non-manufacturing industries, such as coal-mining, docks, railways, agriculture, distribution, commerce and entertainment are excluded; their addition would tend slightly to raise the average. Since April there have been further wage increases in a number of industries, mainly in the non-manufacturing groups.

The average level of earnings in April was 103s. 6d., nearly double that of October, 1938, when it was 53s. 3d. The rise has been progressive. In July, 1943, it was 76 per cent above October, 1938, and in July, 1945, 80 per cent higher. Between October, 1946, and April of this year, the percentage increase over 1938 increased from 90 to 94. The earnings of women and girls increased relatively more (81 and 117 per cent respectively over prewar) than those of men and boys (79 per cent and 107 per cent). The gap between the sexes, however, is still very large—average earnings for men are 123s. 5d., compared with 67s. 4d. for women.

There is still a wide margin between earnings and wage rates, which increased by only 60 per cent over 1938. The gap is due largely to overtime and piece work payments. One of the reasons for the unions' pressure for higher wages springs from their desire to narrow this gap and raise the level of day wage workers. But while wage rates have not kept pace with earnings, workers have benefited by a very considerable reduction in working hours. The average working week was 45.8 hours in October, 1938; it rose to 50 hours at the peak of the war effort, but then dropped progressively to 45 hours in April, 1947, while for women the standard week was only 41½ hours.

Of the individual industries covered in the survey, the highest average earnings are found in the printing and engineering groups, with 134s. 8d. and 134s. 6d. respectively for men. Men's earnings in textiles were only 113s. 6d. and those of women 66s.—the latter figure compares with 72s. 2d. in engineering. The lowest paid groups are the clothing and other Wages Councils industries, which predominantly employ female labour—for the whole clothing group, average earnings were 71s. 10d. Average earnings in pottery were 83s. 2d., with 63s. 5d. for women. The highest paid group of all, which is not included in the survey, are dockers. They averaged 152s. 11d. a week in the three months April to June, 1947. The largest proportionate increase recorded was for the miners, whose average earnings rose by 140 per cent from 53s. 10d. a week in the three months ended June, 1938, to 129s. 4d. in the same period of 1947.

The conclusions which the survey suggests are that although wage earners as a whole have benefited from wage advances and reduced working hours, there are still wide discrepancies between different industries, which are due as much to the strength and organisation of the unions, and their pressure to maintain the traditional differentials between different grades of labour, as to the relative skills which those grades exercise or to the importance to the national effort of particular industries.

* * *

Britain's Dollar Stocks

Dollar securities held by residents in Great Britain were estimated by the Chancellor of the Exchequer this week at \$58 million. These include "many not readily marketable." The Chancellor has been asked in the House of Commons whether it would not be preferable to sell these securities, and any other assets owned by British residents, in the United States and Canada in preference to selling gold. The Chancellor thought that the suggested action would not be advantageous in present circumstances. This total of \$58 million is, therefore, the limit within which the existing switching facilities can be exercised, though

it is, of course, always possible that judicious and intelligent switching may succeed in raising the market value of that body of investment well beyond this figure. Conversely, it may suffer if holders of the securities do not use their new freedom with the acumen expected of them.

The total does not include those securities which have either been bought outright from their previous owners by the British Treasury or borrowed by the Treasury for use as collateral for the loan from the Reconstruction Finance Corporation. The value of those assets, many of which are, of course, wholly unmarketable and would have little value if separated from their present owners (as for example, certain American subsidiaries of British concerns), has recently been estimated in the United States—where all the essential details are published—at over \$700 million. Discussions of Marshall aid in the United States have led to suggestions that immediate emergency assistance to Britain could be provided by increasing the loan now secured by this collateral. For that purpose, however, the resources of the Reconstruction Finance Corporation would have to be reinforced, since the margin of unutilised lending power now at the disposal of the RFC would be quite inadequate to meet these needs.

* * *

Record Bank Deposits

The phase of relative stability in the level of bank deposits seems to be ending. In the first nine months of this year the total net deposits of the clearing banks—that is, after allowing for items in course of collection—rose on balance by only £17 million, but last month the total shot up by £54 million to a new peak, at £5,510 million. The change in trend is not, however, unexpected, because the moderate rate of increase in recent months and the small decline achieved in September were very largely due to the rapid rate of exhaustion of the dollar credits. Reliance upon these brought relief to the domestic financial position because the sterling which the Treasury received for its sales of dollars to importers and others enabled it correspondingly to reduce its normal borrowings through the banking system. Receipts from sales of dollars acquired by selling gold or by drawing on the International Monetary Fund naturally operate similarly, so that there will be no violent impact upon the banking system unless and until the external balance of payments approaches equilibrium. But already the banks seem to be feeling the effect of the reduction from the peak rate of dollar expenditure reached two months ago. During September, Treasury receipts from overseas sources of finance were so large that, despite substantial expenditure both "above the line" and below it, the Government was in a position to repay debt to the banking system. Last month, however, although both the ordinary deficit and the "below-line" expenditure declined, the total was appreciably more than the finance apparently provided by sales of dollars, after allowing for the effects of changes in certain sources of domestic finance, including the reduction in the note circulation. On the basis of Mr Dalton's recent disclosure that the actual dollar outgo was running at about \$70 million per week, the Treasury apparently needed to borrow on balance about £20 million from the banking system.

For the first time for some months the Treasury's net demand for bank finance, thus computed, neatly aligns with the banking figures. It implies that £34 million of the £54 million expansion in net deposits during the month was available to finance non-Governmental requirements—and this proves to be precisely the amount by which the banks increased their advances and investments. The expansion of no less than £27 million in advances suggests that the slackening of their growth in the previous month was purely fortuitous, especially as the latest increase is evenly spread among the individual banks. The modest further expansion—£6,500,000—in the investment portfolio is, however, attributable mainly to the operations of one bank, the National Provincial, which earlier this year had reduced its portfolio against the general trend.

The effects of the mainly seasonal switch from Treasury deposit receipts to bills were naturally more marked in October than in the previous month. The banks' money market assets (bills plus call money) have risen by a further £61 million, while their Treasury deposit receipts have receded to £1,147 million, the lowest total since the summer of 1943. It is noteworthy that, for the first time for five years, the TDR total is now less than that of advances. But the impending war damage payments, which will swell the Treasury's need for finance, make it unlikely that this relationship will persist for long.

Capital Movements in the Sterling Area

The Chancellor of the Exchequer has announced this week that the amount of capital transferred by British residents to South Africa and Eire in the twelve months ended June 30, 1947, totalled £35 million and £10 million respectively. The Chancellor added that the current trade balance in both countries was favourable to the United Kingdom. He refused to consider suggestions that British residents' assets in those countries should be registered and further transfer of capital to them suspended. These figures of capital transfers within the sterling area are appreciably smaller than estimates made in usually well-informed quarters have recently suggested. None the less, the figures given by the Chancellor are arresting enough, and viewed in conjunction with the current British trade surplus with those countries, they underline the fact that "unrequited" exports can be financed not merely out of accumulated sterling balances held by the overseas countries but by allowing capital transfers on the part of British nationals. The Chancellor's answers gave no hint of a change in the present system, which allows complete freedom of capital transfers within the sterling area. He referred to the recent helpful action of the South African Government in arranging for exchange of information on capital sent from the United Kingdom to South Africa. Although the Chancellor did not refer to the matter, there have been reports that the South African authorities have undertaken to leave in London any sterling which is accumulated by the Reserve Bank of South Africa as a result of movements of capital between the two countries.

Misleading Profits Statements

The Stock Exchange Council has always been alert to the danger of a false market developing in shares either as a result of inaccurate, incomplete or misleading information, or of the utilisation of inside information. Yet before May this year the only directive in the hands of companies to guide them in framing preliminary statements was a letter from the Stock Exchange Council written on December 12, 1938, which was mainly directed towards greater uniformity in these statements and not to their content. The Stock Exchange was at first willing to rely on the

co-operation and good sense of the companies in publishing all necessary information, but the inadequacies of this policy had become apparent since the end of the war, and to meet them the Council decided last May to incorporate in Appendix 34, Schedule VIII, Part I, of the Rules and Regulations a requirement that companies would notify the Share and Loan Department immediately a board meeting dealing with such matters had been held, of dividends and cash bonuses to be declared, of the net profit figures with comparisons for the year, even if subject to audit . . . and of "any other information necessary to enable the shareholders to appraise the position of the company and to avoid establishing a false market in the shares."

The preliminary statement recently issued by the Standard Motor Company shows that some companies are content to interpret their obligations in this matter strictly according to the letter of the Regulation. It could hardly be claimed that the recent Standard Motor preliminary statement (which gave net profit for 1946-47 as £198,915 against £283,499 for 1945-46) succeeded in conforming to its spirit, for the full accounts of the company have since revealed that trading profits actually rose by 30 per cent and the fall in net profits was due, not directly to trading conditions, but to the heavy increase in provisions for taxation and depreciation. Many Standard Motor shareholders would hold that, on a reasonable interpretation of Appendix 34, these facts might have been incorporated in the preliminary profits statement. It is certainly true that the risk of a false market is increased when large and undisclosed provisions are first deducted before striking the net profit figure, more particularly since these provisions are, to some extent, matters at the arbitrary discretion of the directors. Electric and Musical Industries, which published a preliminary statement a few days later, also preferred to leave the disclosure of increased provisions for taxation and depreciation until the full accounts, with the identical result that the published fall in net profit masked the actual trading results. For a different reason, last year, the preliminary statements of Austin Motor and British Celanese misled the market by bringing EPT credits into the profit and loss account as part of profit without any safeguarding statement—with the result that in both cases an actual deterioration in trading results was not revealed until the full accounts.

F.I.C.

All of these cases, it will be observed, arise from special credits or special large provisions from gross profits for depreciation or other purposes whose omission has altered the sense and the direction of net profits compared with those of the preceding year. Such information is surely a necessary adjunct to the bare announcement of net profits "to enable the shareholders to appraise the position of the company." Cases may be rare where a false market in the shares has resulted, but the risk has been considerable and quite unnecessary. Improvement does not require the laying down of hard and fast rules. The Council's requirements could hardly be better defined nor more easily satisfied by the exercise of a little forethought and commonsense. It must be hoped that leading industrial companies will set a better example by observing them.

Rising Costs of Shipbuilding

Estimates of shipbuilding prospects in recent months have generally been fairly optimistic, but they have always paid regard to the dangers of mounting costs. The tide of costs is still rising, and there is increasing evidence that it is over-reaching the power of shipbuilders to stem it or the ability of shipowners to ride it. Shipbuilding costs, in fact, are rapidly approaching the level beyond which owners can see little reasonable hope of earning an adequate return on capital invested in new tonnage. Shipbuilders set much store by the recent visit of Mr William Neal, chairman of the Canadian Pacific, who was known to be considering the placing of contracts for new passenger liners to replace war losses. Mr Neal left the Clyde after publicly stating that costs were too high, despite the urgency of his company's needs; and he left Belfast without saying a word. He has returned to Canada without placing the expected contract, although it is understood that negotiations are still continuing. Mr I. C. Geddes, chairman of the Orient Line, announced at the launch of the 31,000-ton *Orcades* at Barrow that a sister ship would be laid down on the vacated berth, but he pointed out that the two ships would cost more than £6 million. Thus, apart from covering running costs far in excess of prewar levels, each ship will have to earn about £300,000 a year to cover interest and depreciation, although it should be possible for them to make four round voyages every year instead of three. At Clydebank last week, however, there was no repeat order to follow the launch of the *Caronia*, and an empty berth once more on the Clyde tells its own story. The *Caronia* is expected to cost about £3,500,000, compared with about £1,600,000 for the larger *Mauretania* built just before the war.

Shipbuilders themselves recognise the force of owners' arguments about the risks of placing orders in the face of rising costs,

but builders have no control at all over some two-thirds of the total cost of a ship, which depends on the prices of materials, sub-assemblies and equipment. The recent increase in the price of coal has been followed by a subsequent advance in the cost of steel plates and angles, and this process is reflected in every item of the ship's structure. In today's circumstances, it is not possible to quote a firm price until the work is finished. The problem is to find some means of reducing the costs of shipbuilding by an increase in production, so that continuity of employment may be assured when the immediate and urgent task of replacing specialised tonnage has been satisfied. In the long run, cargo vessels are likely to provide the bread and butter of shipbuilding, but no tramp shipowner is likely to place a contract until he is convinced that freight levels, which are satisfactory enough at present, are likely to maintain over a period of years a reasonable relationship to current building costs.

United Steel Companies Expansion

Details of the progress made by United Steel Companies with post-war capital projects were outlined at the company's annual meeting on October 31st by the chairman Sir W. Benton Jones. The group has two separate schemes in train. The first is part of the seven-year programme submitted to the Government by the Iron and Steel Federation and embraces the construction of two blast furnaces, coke ovens and other equipment to be completed within five years, at a cost according to current estimates of £5,500,000, a sum which will probably be exceeded. The expenditure of this amount has been officially approved, but nothing has been said about the start of the work. In view of the urgency of expanding steel exports and of current shortages of raw materials some delay in implementing this scheme, although it is of considerable long term importance, could not be regarded as immediately alarming.

The other capital plans of the group on which good progress has been made involved an expenditure of £3,136,000 during the year; there are capital commitments outstanding for a further £3,500,000 under this second scheme. The Distington works in Cumberland has already commenced operations though it is still short of certain capital equipment; it will be in full production by the end of the year, turning out high priority products such as ingot moulds, steel castings, coal cutters, coal loaders and conveyors. A new steel melting shop in Lincolnshire went into production this week and all extensions and re-equipment in the works there will be completed during the first quarter of 1948. But at Steel Peck and Tozer the modernisation of the railway wheel works which was to have been completed this year has been held up, and there has been a similar delay in finishing three large

gas holders at Workington, Orgreave and at the Samuel Fox works. Other coal saving plant has been installed during the year and when the full changeover has been completed a consumption of 90,000 tons of oil will replace 160,000 tons of coal, allowing for 10,000 tons to be saved by the new gas holders.

The issue of £1,713,546 4½ per cent preference capital in January this year to finance development and expansion has supplemented the strong internal financial resources of the group which have been built up over a period of years partly by a cautious ordinary dividend policy. The income of the group from its coal interests has been reduced by the vesting in the National Coal Board of the colliery assets, valued in the latest balance sheet at £4,268,698; its main-line wagons will be vested in the British Transport Commission as from January 1, 1948. However, the group's steel output for 1946-47 of 1,708,169 tons—apart from the 1,752,048 tons produced in 1939-40—was a record and 6.2 per cent higher than in 1945-46 although 130,000 tons were lost as a result of the fuel crisis. An increase in the earnings on the equity—11.5 per cent was earned in 1946-47—is anticipated in view of the progress being made in re-equipment and expansion and the high current rate of national steel output. But the directors, even as nationalisation approaches, seem determined to stick to their long-established dividend policy.

Bank and Fund Statements

The International Monetary Fund and the International Bank have this week issued their latest quarterly statements. In the three months to end August, Australia became a member of the Fund and the authorised subscriptions of members were, as a result increased from \$7,721.5 million to \$7,921.5 million. On August 31st members had paid up \$6,579.2 million, of which the amount paid in gold was \$1,345 million. It is disclosed that approximately \$100 million in US dollars was sold to members against their own currencies during the quarter. Since then the Fund has sold at least \$180 million to the United Kingdom, and it was

announced this week that it has approved Denmark's application to buy \$3,400,000, a figure which represents 5 per cent of the Danish quota.

The International Bank's statement, for the quarter ended September 30th, announces that loans aggregating \$455 million were made to France, the Netherlands and Denmark. Of this total \$222 million remained unused at the end of the quarter. The Bank's capital was increased by the admission of Australia to membership, and the latest figure has thus been increased to \$8,225.1 million. The US dollar resources available to the Bank increased by \$250 million as a result of the July issue of bonds in the US market. The expenses of this issue amounted to \$1,267,902.

Ashanti-Obuasi Verdict

The report of the independent engineer, Mr F. Clelland, appointed by the board of Ashanti-Obuasi Reefs to inquire into the contradictory reports of assay values in B shaft of the mine has now been made available. The crux of the matter is that the original sample which gave a value of 1 oz 10 dwts over 132 inches at a depth of 160 feet was "salted" before it reached the assay office and that the assaying of the check samples which showed no evidence of gold values was correct. However, both results were known to the mine manager before he sent the cable on July 30th, indicating only the gold values found in the original sample. The laconic comment of the board on this is that the manager was unable to give any satisfactory explanation why he ignored the negative results of the check sample when sending the confirmatory cable, or of the long delay in advising the board of the true position. Thus the worst fears of the market are confirmed. It is something that the manager has been dismissed, but no doubt the shareholders' committee, which was appointed after the stormy general meeting on October 1st will now press for sterner action. At any rate there has been no move on the part of the Stock Exchange to resume dealings in the shares. Certainly, no such step should be contemplated until fuller investigation into earlier share dealings has been carried out.

SECURITY PRICES AND YIELDS

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked out on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7.6 per cent) (i) To latest redemption date. † Free of tax.

THE UNITED STEEL COMPANIES, LIMITED

NEED FOR VIGOUR AND DETERMINATION

COAL SHORTAGE RESTRICTS OUTPUT

HOME AND EXPORT PROBLEMS

SIR WALTER BENTON JONES' SURVEY

The annual general meeting of The United Steel Companies, Limited, was held, on the 31st ultimo, at the Iron and Steel Institute, 4, Grosvenor Gardens, London, S.W., Sir Walter Benton Jones, Bt., chairman and managing director, presiding.

The secretary, Mr Ronald Peddie, C.A., having read the notice convening the meeting and the report of the auditors,

The chairman said: Ladies and gentlemen,—The year 1947 has been disappointing for everybody throughout the country. Instead of approaching nearer to a period of plenty we appear to have moved away. But repining will not help us, instead we have to attack our tasks with renewed vigour and determination.

REPORT AND ACCOUNTS

The directors' report and accounts, which I am assuming you will take as read—(agreed)—cover the twelve months from July 1, 1946, to June 30, 1947. In the report you will see a statement of our production of pig-iron and steel year by year from 1938-39, which I should explain was much below normal, to the twelve months just completed. In 1939-40 the production of both pig-iron and steel were records and the production for 1946-47 would have been not much below these records if the supplies of coal in the first six months of 1947 had not been drastically reduced.

Revenue suffered from this brake on production, but when all the circumstances are taken into consideration you may not complain of the results which the accounts disclose.

THE ACCOUNTS

The accounts are clear and I do not propose to review them in detail. The vesting of colliery assets in the National Coal Board on January 1, 1947, causes changes in a number of accounts in the balance-sheet, as well as in the nature of the assets. The assets vested include fixed assets, certain railway wagons, loose plant, stores and stocks. Instead of these assets we now have claims for compensation. The amount of compensation has yet to be determined and may not be determined for a year or two. In the meantime the figures at which the vested assets of all kinds stood in the books and the amount of depreciation provided in respect of them have been lumped together, and the accounts from which they have been transferred have been correspondingly reduced. Debts in respect of colliery trading prior to January 1, 1947, have been collected and creditors have been paid.

Apart from these changes, the only departure from the form in which the accounts have been presented for a number of years is the separation of the provision for depreciation from the balance of trading profit. This will be required in the future by the new Companies Act, but in other respects the requirements of that Act have not been antici-

pated. The uncertainties of the present time make it wise to provide for outgoings which cannot be foreseen now. The large allocation to general reserve has been made with this end in view, and, should the need arise, the directors will not hesitate to use this reserve for any appropriate purpose.

THE STAFF

We sometimes hear it said that in spite of our dire need Great Britain is not working. I do not believe this is true. The relief from the tension of war, followed by the coming into power of a Government to which many thousands of people had long looked forward as a means of bringing them a larger share of wealth and a greater degree of leisure, certainly raised great expectations of an easier time. But there is a hard core of stable and conscientious people in this country, young as well as old, and of all classes, who work hard and regularly. These have not changed their habits, they continue to work hard and regularly, and their endeavours are reflected in the large volume of national output. We can all do more, maybe, but it is wrong to say that as a country we are not working. There is, however, so much leeway to make up as the result of the terrible destruction caused by the war, and the great changes which have followed it, that far from having an easier time we are called upon to work as hard and make as many sacrifices as we did during the war, and this must continue for a period, the end of which we cannot see at present.

I believe the employees of our company are among those whom I have described as "the hard core of stable and conscientious people," and, as the directors say in their report, "all employed in the works and mines of the company, and its staff, have worked regularly and with great good will in spite of the many difficulties and restraints of the present day." If you will record your agreement with this tribute it will give all to whom it is paid great pleasure and encouragement.

You will be glad to know that the works councils, which were inaugurated at every branch more than 15 years ago, and production committees, which were established during the war period, continue to work smoothly and are much appreciated by both employees and the management.

WIDENING SCOPE

The figures of iron and steel production set out in the report are only a general measure of activity. The turnover is also influenced by the growth of finishing departments and the greater varieties of products into which the steel production is converted. In addition, the company is engaged in the chemical and engineering industries, in both of which it is increasing its operations.

The company is one of the largest carbonisers of coal in the United Kingdom, and consequently it makes large quantities of coal gas and tar, from which are extracted a number of chemical bases. It is intended to enlarge the range of products extracted, and this expansion is to be undertaken by the United Coke and Chemicals Company, Limited, a wholly owned subsidiary.

MODERNISATION AND EXTENSION

Our schemes of modernisation and extension reported a year ago have not proceeded quite as quickly as was expected. In this

they do not differ from similar schemes all over the country. All the basic steel melting furnaces at the Samuel Fox works, and 30 per cent. of those at the Templeborough works of Steel Peech and Tozer, are already fired with oil. Further furnaces at the latter plant are in course of conversion and the percentage will have been raised to 60 in the course of the next few months. The extent of this changeover—which is made only to relieve the short supply of coal—can be appreciated by the quantity of oil which it will require—namely, 90,000 tons a year—which displaces 150,000 tons of coal.

Three large gasholders, one at Working-ton, one at the Samuel Fox works and the other at Orgreave Coke works near Sheffield, which should have been completed by the end of 1947, will not now be ready for use until the middle of next year. Together they will save the equivalent of 10,000 tons of coal per year.

At Steel Peech and Tozer the modernisation of the railway wheel and tyre works, expected to be finished in the second half of 1947, will not be complete until early in 1948. At Orgreave the first of the two new batteries of coke-ovens was put into operation this week.

LINCOLNSHIRE AND CUMBERLAND

In Lincolnshire the new steel-melting shop will be in operation next week. The enlargement of the constructional engineering shop has been completed. The modernisation of the section mills, including a new cogging mill and the electrification of the remaining mills in a new building, expected to be completed by the end of 1947, has made good progress, but it will not be finished until three months later.

The works of the Distington Engineering Company in Cumberland are now in operation, but the machine shops are not yet fully equipped with machine tools. The equipment will be complete by the end of 1947. The demand for the products which are being made—that is, ingot moulds for the steel industry, steel castings for the company's own use, and coal cutters, coal conveyors and coal-loading machinery for the coal-mining industry—is very great, and there is every reason to expect that these works will be fully occupied.

The two new blast furnaces, coke ovens and other equipment to which I referred a year ago and which form part of the seven-year programme presented by the Iron and Steel Federation to the Government, have been approved and permission to proceed has been granted. The cost of this installation was estimated to be five and a half million pounds, and the time for completion five years. The estimate of the cost may be exceeded because of the continuous rise in costs; completion will be in stages, but it is hoped that the whole will be in operation in less than five years. The cost of the installation will be spread over a number of years and no part of it is included in the outstanding commitments referred to in the directors' report.

ANALYSIS OF EXPENDITURE

A large part of these schemes is correctly described as modernisation. It is therefore appropriate to refer once more to the misconception in the minds of many people of the term profit applied to the operation of a manufacturing undertaking. They appear to regard the surplus of current expenditure over income as a surplus which goes without more ado into the pockets of the stockholders or partners. This surplus has to meet many calls. Out of it has to come, as well as a return to stockholders, taxation and all the things which go to keep the undertaking alive and up to date.

There is a similar misconception about dividends. Dividends are regarded by some as the return on the amount of capital subscribed by the partners in the form of shares or stock. But if the partners choose to leave savings in an enterprise to pay for improve-

ment or enlargement, the dividends they receive thereafter are the return not only on subscribed capital, but also on the savings left in.

I mention these two subjects because one hears and reads so often of ideas about limiting profits and limiting dividends as if there was really a large fund in them which could be tapped for the community at large. They are not golden eggs, but only ordinary eggs, and if the geese which lay them are starved they will not lay at all. In this connection it will interest you to see in the short statement which has been handed to you how the gross revenue of the company in 1946-47 was expended.

DISPOSAL OF GROSS INCOME FOR YEAR ENDED 30 JUNE, 1947

	Total amounts £	Equivalent proportions %
Gross income received	38,961,594	100.00
Amounts expended on:		
Raw materials, fuel & services	20,766,459	53.3
Wages, salaries and National Insurance	11,501,641	30.9
Holidays with pay	369,700	
Pensions for staff and workmen	160,000	
Rents, rates, insurances, stationery & general trade expenses	721,156	7.0
Delivery charges	1,996,716	
Taxation	1,200,000	3.1
Dividends to stockholders	553,481	1.4
Retained in the business for depreciation of plant and machinery and for other purposes	1,692,441	4.3
	38,961,594	100.00
Number of employees		30,900
Number of stockholders		26,498

Raw materials, fuel and services absorb 53.3 per cent. Wages, salaries, workmen's insurance, including holidays with pay, pensions for staff and workmen absorb 30.9 per cent. Delivery charges, rates, insurances and general trading expenses absorb 7 per cent. Taxation requires 3.1 per cent. Depreciation of plant and machinery and unappropriated balance require 4.3 per cent., and dividends to stockholders require 1.4 per cent. It is interesting also to see that the number of stockholders, namely, 26,498, approximates closely to the number of employees, which now that the coal miners are employed by the National Coal Board are reduced to 30,900.

NEAR FUTURE PROSPECT

The prospect for all our works for the near future is one of full employment. Nearly everything we make is of high priority and although our direct exports relatively are not large we serve many exporting industries indirectly. We are now receiving larger supplies of coal and we understand every effort will be made to supply our full requirements. The smooth working and regularity of our operations will depend on the success of the export drive to which the nation's energies are now to be directed.

IMPORTANCE OF EXPORTS

It seems that since the war ended as a country we may have been trying to catch up too quickly in directions absorbing, for capital purposes at home, the use of labour and raw materials which might have been converted into goods for sale abroad. At speaking to you two years ago I said: "At this critical stage production for sale in the world's markets may be more important than producing for ourselves capital goods which may not become productive until the present

gaping markets, which we thereby neglect, have been partially filled by others, who will by then have captured the goodwill which at present belongs to us." And last year I expressed the same view in similar terms.

I do not suggest that the importance of export has not been widely recognised, but it is obvious that the jam for labour and materials which frustrates us has been made more severe by embarking on capital expenditure much in excess of what could be completed in a reasonable time. We now find ourselves with many things only partly done, and still progressing far too slowly, compelled to divert our energies in a disorderly manner to the production and sale of goods abroad which might have been made and sold in the last three years.

We cannot recover what we have lost, but how much better it would have been to have avoided the loss, and how much more vitality there would have been in our commerce and industry. However this may be, we have now to concentrate all our energies on export. Priority in the supply of raw materials and in the allocation of labour is to be given to those undertakings in every trade which can achieve high targets in export. Without wishing to be discouraging, it is not crystal clear that even in the export drive coal comes first?

COAL

If you will allow me, I will dwell for a few moments on the subject of coal, because everybody in these days is rightly concerned about it and it affects our company in many ways.

A large part of our property has been vested in the National Coal Board. When the coal mining royalties were acquired by the State the valuation and the payment of compensation was not completed for six years. It is certain that we shall have to wait for some time for compensation for our coal mines, but I hope not so long as that. The number of our employees has been reduced from 45,400 to 30,900, represented by the number of colliery workers who have passed over to the National Coal Board.

FUTURE SUPPLIES

We are very large users of coal, for the most part coking slack. We estimated that in order to give us the quantity of coking slack we required it would be necessary to mine not less than five million tons of coal a year. In recent years we had patiently acquired a number of colliery undertakings in addition to the collieries which formed part of our original amalgamation, which together secured for us a coalfield in Cumberland and another in the Midlands sufficiently large to supply all our requirements for the lifetime of our works. We have now lost control of this quantity of coal and in the future it will be a raw material which we have to buy.

In future we shall be dependent on the National Coal Board, which means that we not only want from them sufficient coal, but coal of the right quality. We have no reason to suppose we shall not be well served by the National Coal Board, but that is not the same thing as having the coal in our own hands. In this connection, however, I would like to say that in these difficult times the National Coal Board has served us well. The price of coal is already very high; it has recently been raised to cover rising costs and it may be raised again.

AN ESSENTIAL FOR SURVIVAL

If the export drive is to succeed, the output of coal in this country must be raised sufficiently high to provide a large quantity of coal for export. To call for export in the abstract assumes that buyers abroad will buy anything we care to offer. But why should we make this assumption? Buyers want some things more than others. Coal is wanted more than anything else in export markets, and at home it is wanted to feed industry before it can manufacture goods for export. If it is true to say that we cannot

survive without export it is probably true to say that without sufficient coal we cannot survive. Have we to wait until unemployment drives home this truth? But if we do not get enough coal unemployment may soon be here.

We seem resigned to insufficient output and are settling down to dole it out to industry and services according to some estimate of need, leaving the man in the street and his wife and children to shiver and make do with what is left.

RAPID INCREASE IN OUTPUT NEEDED

We need a rapid recovery in output. In 1946 it had fallen to 180 million tons, which was 60 millions less than in 1937 and more than 100 millions below the peak output of 1913. In the past the coal-mining industry has responded to rapid increases in demand. Output jumped between 1912 and 1913 by 27,000,000 tons; between 1922 and 1923 by 26,000,000 tons; between 1928 and 1929 by 20,000,000 tons, and between 1935 and 1937 by 18,000,000 tons.

These jumps were made possible in two ways; first, by an increase in the number of men employed, and, secondly, by a larger output per man-year. I need not trouble you with the figures in each case, it is sufficient to give them for the last jump. Between 1935 and 1937 the increase in men employed was 22,000 and the increase in output per man-year was 15 tons. In 1937 there were 776,000 men employed; they produced 240,000,000 tons of saleable coal notwithstanding that some classes of coal were not in full demand and the man-year output of 310 tons was higher than in any year since 1900.

If the number of men employed and the output per man-year could be restored to the 1937 figure, this would give the country 240,000,000 tons of coal a year. We are being taught to congratulate ourselves if output reaches 4,000,000 tons in a week, whereas nothing less than 5,000,000 tons in a week will meet our crying needs.

A SHORT-TERM PROBLEM

What is it that prevents sufficient men volunteering for work in the pits, and what is it that prevents them producing at the rate of 310 tons per man-year? It seems unbelievable that the answer is the lack of the latest American machinery and American methods, which will take four or five years to introduce and which cannot be applied universally. They are not the means to restore production to what it was, but to increase it after it has been restored.

Is it not abundantly clear that the production of sufficient coal is not a long-term problem but a short-term problem requiring more men and more production, not so much per man-shift as per man-year. But, however sufficient production is to be brought about it cannot wait for four or five years. The solution of this problem is not one of a number of our problems, but it is the one problem, and it may even bring with it the solution of nearly all other problems. It is the concern alike of Parliament, industry and the man in the street.

CONCLUSION

In conclusion, in our company we have the plant, the men and the will to make our due contribution to the target at which the steel industry aims; we shall be aided by the modernisation and extensions which we have already completed and others nearing completion, and provided the raw materials are available we expect to play our full part.

The report and accounts were unanimously adopted; the proposed final dividend of 5½ per cent., making 8 per cent. for the year, less tax, was approved; the retiring directors, Mr C. F. Ward Jones, Mr Gerald Steel, J.P., Mr R. F. Summers and Sir Herbert Walker, K.C.B., were re-elected and the auditors, Messrs Peat Marwick Mitchell and Co., having been reappointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

KAMUNING (PERAK) RUBBER AND TIN COMPANY, LIMITED

THE BATTLE FOR DOLLARS

"A GREAT CAMPAIGN"

SIR JOHN HAY'S VIEWS

The annual general meeting of the Kamuning (Perak) Rubber and Tin Company, Limited, will be held, on November 24th, at 19, Fenchurch Street, London, E.C.

The following is the statement of the chairman, Sir John Hay, circulated with the report and accounts:—

After a lapse of six years we present accounts showing such a profit as, in the opinion of your board, justifies the payment of a dividend although only a modest one. We have not followed the usual course of merely recommending a dividend, but have declared it in the form of an interim payment. By so doing, payment warrants can accompany this. Double postage and paper are thus saved, and by paying at a rate of so much per share, tax free, clerical work and time which would otherwise be spent on fine computations are spared. Such are the economies to which the hard pressed rubber producer must resort if his expenditure is to be related to the meagre revenue grudgingly allowed to him.

Although our capital is only £200,000, we have 4,000 stockholders, which gives an average holding of £50. This, then, is the company of "the small man." I should like to think that each of the 4,000 would have the patience to read this statement as a sequel to the one I issued last year, and in reading to appreciate that his interest in the fortunes of the industry, of which this company is but one of many units, extends far beyond the payment of dividends, however welcome they may be.

A COMPARISON IN COSTS AND REPLANTING

But before I deal, and then only very briefly, with these broader questions, it is proper that I should review our domestic activities. You will learn from our report that although we lost 900 acres of rubber, our crop was the highest in our history at well over two million pounds and represents an average yield over the area tapped of 987 lbs. per acre. I have made a comparison between our costs per pound for the period under review with those of the year immediately preceding the war. This comparison shows some remarkable results: for instance, the omnibus item "General Charges," which covers management, supervision, administration, office expenses, and all such fixed charges shows no increase over the year 1938-39, that is calculated in terms of cost per pound. Considering the high costs now prevailing for all such services, that is indeed remarkable.

On the other hand, the cost of works upon which labour is directly employed has increased very substantially: tapping, the main estate operation, is over three times more costly than it was in 1938-39. That the overall increase in estate cost is not greater than 74 per cent. is due to high output, a skilful

disposition of labour and a close observation throughout of strict economy. The rice situation has not improved since I made my statement last year, and therein lies the main cause for high labour rates. Against a pre-war consumption of 16 ozs., the official ration permitted to a labourer in Malaya is 2.3 ozs. To supplement this totally inadequate allowance he resorts to the black market where he can purchase his additional requirements at a greatly inflated price. Wages have perforce to be adjusted accordingly.

The secondary causes aggravating this condition still prevail, namely, a regrettable hesitation at times to enforce law and order, political and social unrest, and a loss of former skill. To complete my brief review of costs I should mention two items of external expenditure. Ocean freight has increased 100 per cent. as compared with 1938-39, while London administration reckoned again in terms of output has decreased by 41 per cent.

REPLANTING POLICY

Of the 900 acres lost through enemy action, we are replanting 448 acres this year, an operation which we could have carried out at lesser expense if it had been undertaken earlier. But for some reason, never yet explained, we were prohibited from doing so by a Government regulation. Replanting is for us no new development. It is but the continuance of a policy upon which we embarked 20 years ago: as a result, nearly 60 per cent. of our planted area consists of rubber, budded or planted with selected high yielding stock. There is a definite limit to the economic life of a rubber tree. Replanting is a continuing and ever-recurring operation, the cost of which must necessarily be met out of revenue, and the only sure basis for this regenerating and modernising process is a profitable industry. There is no financially prudent alternative. To resort to borrowing money for replanting is at the best a desperate expedient involving both the borrower and the lender in risks which are uncommercial.

I hope that this short recital of sober facts will help to some understanding of the economics of modern day rubber production and act as a corrective to the apocryphal accounts which largely originate in America, the underlying reason for which is, no doubt, a growing realisation of the need to justify a restrictive trade practice, the continuance of which in a great creditor country is without moral or economic sanction.

RUBBER EXPORTS AND PRICES

Rubber exports from British territories to the U.S.A. in 1947 may well reach the figure of 550,000 tons. At current prices that represents a considerable sum in dollars. It is only, of course, but a part of this country's

total dollar requirements necessary for the purchase of raw materials and of our present drab and meagre food rations. None the less, rubber is the outstanding item in our exports to the U.S.A., and if the figures that I have just given are realised, then in value they may be found to exceed the total of all the similarly directed exports of all the domestic industries of the U.K. If by such comparisons I again draw attention to the vital part played by rubber in our overseas trade, it is because it is so seldom done elsewhere and it is so very relevant to our present economic plight.

But the figures I have given can only be regarded with qualified satisfaction. Part of our present exports are being taken by America for stock piling and to that extent do not represent recurring demand. The price, although above the miserable level that was current a few months ago, shows only a slender profit on present-day costs, and is far remote from the high prices we still have to pay for our essential imports from the U.S.A. Moreover, we cannot expect that British territories can continue indefinitely to enjoy their present predominance in rubber production. Other territories at present disturbed will again become tranquil and resume production on something approaching their former scale. If restrictions on the use of natural rubber are continued in the U.S.A., then the value of our exports both relatively and actually will decline, to our serious economic detriment.

"A GREAT CAMPAIGN"

When we resumed production in Malaya we were solemnly and repeatedly warned that we must be prepared to meet the competition of synthetic substitutes developed in the U.S.A. during the war. When does this competition start? Or after all is there to be no competition because the U.S.A. team prefers the shelter of the high wall of an enforcement order?

In a recent speech dealing with what he termed "the Battle of the Gap," the Lord President of the Council is reported to have said: "The Government must conduct a great campaign of negotiation to remove import restrictions on British goods, open up the channels for our trade, and give our industry its chance." To one like myself, who started in his humble way on such a campaign soon after Malaya's liberation, that is a gratifying pronouncement. But is there really to be "a great campaign" or just "negotiation through the usual channels" in the course of which we play a diffident and appeasing part and emerge with much the worst of the bargain?

A great campaign against formidable although friendly opponents can only be carried through to a successful conclusion if it is conducted with courage, determination and skill. Although in this context seldom mentioned and seemingly lightly regarded, rubber is still the most important of our hard currency exports, and one of the first objectives in the "great campaign" should surely be the abolition of all restrictions on its use. If we do not capture that salient it will go ill with us in "the Battle of the Gap." And that connotes continuing and increasing privation at home as well as a lowering of the standards of living in our Eastern territories.

Our thanks are due to our manager and to his deputy, Mr I. Murray, who acted for him when he was on leave, and to their staff, for all their excellent work.

MUREX, LIMITED LARGER TRADING PROFIT

The twenty-eighth ordinary general meeting of Murex, Limited, was held, on the 30th ultimo, in London, Mr George P. Josepa (the chairman) presiding.

The following is an extract from his circulated statement for the year to June 30, 1947:—

The trading profit for the year, £294,313, before provision for depreciation and taxation, shows an increase of £142,725, as compared with the previous year, and reflects the improved trading conditions experienced, particularly in the latter part of the financial year; despite this improvement, the profits are again below the standard profits for the purpose of E.P.T., and a refund will arise on the six months' period to December 31, 1946, the date of termination of E.P.T. The dividend from Murex Welding Processes, Ltd., is the same as for the previous year.

The trading profit of that company for the year has increased also, as compared with the previous year, and reflects savings resulting from the introduction of further measures designed to improve efficiency and to eliminate waste.

PROGRESS ACHIEVED

Despite the difficulties which your company, in common with industry generally, has experienced during the past year, progress has been achieved. There has been an improvement in the demand for ferro alloys, special metals and alloys and chemical products; there has also been a satisfactory increase in the sales of tungsten carbide (hard metal) tips for cutting and turning tools, tungsten and molybdenum rod and sheet and wear-resisting dies; the latter products are distributed in the home market substantially by Protolite, Ltd., the company's specialised selling organisation for these secondary products. The demand for welding electrodes has continued at a high level, but owing to the shortage of steel supplies it has not been possible to meet the demand, and sales of welding electrodes have decreased; sales of welding plant have decreased also in comparison with the previous year.

Your company's export trade has shown a marked improvement and the values of orders received during the year for the products of the parent company are three times those of the previous year. This expansion of export business is directly attributable to the decision reached by your directors in the closing stages of the war, to build up a strong export organisation, a policy which has been energetically pursued over the intervening period. As a result, your company is now represented abroad by agents of the highest calibre.

The research departments at Rainham and Waltham Cross have been actively engaged during the past year on the modernisation and improvement of our manufacturing processes and the development of new products.

PERSONNEL

During the past year the company has adopted the 44-hour working week, and by agreement with the unions concerned has introduced a guaranteed week which ensures the maintenance of a minimum wage equal to 34 hours at the basic time rate to all manual workers. There exists among our employees a real appreciation of the need for increased production, and I am glad to have this opportunity to convey to the staff and employees, the thanks of the board and the stockholders for their continued loyal co-operation.

The improved demand for the products of the parent company in the closing months of the past year has been maintained in the opening months of the current financial year. Your directors are confident that a great expansion lies ahead in the arc welding industry.

The report was adopted.

GOODE DURRANT AND MURRAY, LIMITED

SUBSTANTIAL IMPROVEMENT

The forty-ninth ordinary general meeting of Goode Durrant and Murray, Limited, was held, on the 3rd instant, in London, MR GEORGE P. SCHOOLAR, the Chairman presiding.

The following is the Chairman's circulated statement:—

The directors have pleasure in being in a position to place before shareholders a balance-sheet for the year to July 20, 1947, which displays a sound financial and trading position. The demand for general merchandise has been well sustained and promises to continue on a satisfactory basis for goods of quality and sound construction. We have been hard put to it throughout the year to maintain stocks at a suitable level, and a substantial part of the stuff we have handled has been of a nature we would hesitate at stocking when goods are in normal supply.

The Australian turnover shows a substantial increase on that of 1946. Rates of gross profit are lower, and, were it not for the increase in turnover, would be cause for concern. Further reductions in profit margins issued in recent Prices Orders will adversely affect our future gross profits. Our only remedy is continuous increase in turnover. Our London activities on overseas business continue at a satisfactory level. Similar market features to those experienced in Australia have been reported from other countries. This business is valuable in helping us to maintain associations with suppliers in markets from which Australia is temporarily excluded, and also in bringing to our notice developments in other countries which may be turned to account in our Australian business.

The result of the year's trading is a substantial improvement on last year. Ample provision has been made for future taxation, doubtful debts and known contingencies. The directors recommend that the dividend on the ordinary shares be raised from 7½ per cent. to 10 per cent. In addition, the remission of taxation enables the recommendation of a bonus distribution of 2½ per cent. Properties, fixtures, fittings and plant are taken into our accounts at conservative values and are in good order and condition.

In other respects the balance-sheet reflects the increase in trade. Amounts due to the company are greater by £126,957 and stocks have increased by £441,101, which is largely accounted for by goods in course of shipment from this country to all parts of the world. It should be pointed out that the amount of bills receivable covers goods on the water and proceeds on the way back, and that the amount bears true relationship to the trade being done. Liabilities to creditors and bankers are increased by £330,058, which consists chiefly of the amount required to finance the increased shipments. Reserves and provisions for income-tax and contingencies show increases of £155,278, and in the opinion of the board this addition is adequate to protect the company against fluctuations in the market and any other unforeseen contingencies.

Prices of goods, whether of Australian manufacture or of British or foreign origin, are still rising, and we are wondering when the peak will be reached and the decline set in. Turnover and profit will soon reflect any downward trend, and as prices recede our ratio of expenses will increase. Some lines are already reported as fully sufficient to satisfy demand, and consumers are more exacting and discriminating. Certain traders incline to the opinion that trade will develop weakness, some going so far as to predict a slump. We are not prepared to go so far, but do say, very definitely, that conditions are developing which call for caution in buying and in treatment of stocks.

Goods of British origin continue in request from all quarters, but owing to limited export from the United Kingdom we have

been forced into other markets. Various controls still operating in Australia affect progress, but we are hoping for some relief in this direction, and a progressive return to normal trading. Definitions of normalcy vary, but for us it means a demand for sound goods at right prices. It means a return to competition and the servicing of trade by means of travelling salesmen; in short, rising expenses absent in a sellers' market but ever present in a buyer's market.

With less money to spend, the public will devote more time to a search for values, and our problem will be to adjust expenses to changing conditions and to expend greater effort where best results can be expected. The change in conditions was recently described by the Perth correspondent of a British trade journal—"Gone is that first careless rapture of the early demobilisation days when deferred pay was being spent with abandon." Income-tax reductions operating from July 1st will improve the position of the average wage-earner to some extent and help those who have to rely on the weekly pay envelope for their upkeep. The return of men from the Services was effected smoothly, and we are pleased to state that, with very few exceptions, they resumed duties in a satisfactory manner.

In South Australia expansion in secondary industry continues in an encouraging manner. Rains have been good, and agricultural and pastoral prospects are promising. The season opened well in Western Australia, but dry conditions during August caused some crop deterioration. Mining is employing a large number of men, and would show marked expansion if labour and machinery were available. In view of the demand for gold, every effort can be relied on to foster the industry. Interest in water supply is steadily growing, and we again emphasise the importance we attach to projects connected with providing adequate storage and distribution to town and country. The report was adopted.

ALLIED BAKERIES, LIMITED

GRATIFYING RESULTS

The twelfth annual general meeting of Allied Bakeries, Limited, was held on the 31st ultimo, in London.

Mr F. G. Russell, who presided, in the course of his speech said:—

In spite of the difficulties of rationing and scarcity of essential supplies, we have had a most gratifying trading year. The improved sales volume has resulted in a net profit of £595,754, which is some £218,000 greater than last year's figure of £377,015. The dividend on preference share capital at £42,000, together with the dividend of 20 per cent. on the ordinary share capital, absorbing £154,000, makes the total remuneration of capital £196,000.

One matter which continues to engage a great deal of the time of your board is planning for the future and a considerable amount of preparatory work has been done so that our development plans can be put into operation as soon as it is possible to obtain the necessary buildings and plant. We have acquired many strategically placed building sites for new factories up and down the country, and in many cases have the blue prints ready for use when it is possible to obtain licences to proceed, and have placed orders for the plant and equipment required.

Our current sales and profits are being well maintained as compared with last year. But I would hesitate to forecast the future trend of events in the present uncertain economic state of the country. A substantial proportion of future profits will have to be retained in the business to meet the cost of re-equipping our factories and for our expansion programme in order to strengthen the company's financial position for the future.

The report was adopted.

WILLIAM DOXFORD AND SONS, LIMITED

RESTRICTIONS AFFECT OUTPUT

The fifty-fifth annual general meeting of William Doxford and Sons, Limited, was held, on the 31st ultimo, in London.

Mr E. P. Andreae, Ph.D., the chairman, in the course of his speech, said: At our last annual general meeting I mentioned that orders in hand would keep our establishments fully occupied for a considerable time ahead unless, of course, circumstances entirely beyond our control should force us to modify our programme. Such circumstances did arise during the year under review, resulting in quite a serious setback in output, which is reflected in the figures.

The balance brought forward from the profit and loss account at £231,843 shows a drop from last year's figures of some £72,000. After providing for reserves and the dividends, paid and proposed, the carry forward stands at £74,710. I think it will be generally conceded that, in spite of the very strong financial position of your company, the reduced profit shown this year, coupled with the universal uncertainties and supply problems still facing the industry, fully justifies your directors' decision to reduce the bonus recommended to 5 per cent., as against the 10 per cent. last year.

The exceptionally severe winter weather, which seriously handicapped work in the open for several months, was followed by the removal of the shipbuilding and marine engineering industries from any priority previously accorded to them.

As a result of handicaps, we completed and delivered during the year only seven ships, totalling 44,892 gross registered tons, as against eight ships, in the previous year, and against the target of 12 per annum we had hoped to achieve when we laid our plans on the cessation of hostilities.

Our engine works, in addition to building the seven sets of oil engines of 25,500 B.H.P. for our own ships, supplied six sets totalling 19,800 B.H.P. to other shipbuilders, making in all 45,000 B.H.P., against more than 50,000 B.H.P. in the previous year. Here, again, a much higher target had been set, but scarcity and spasmodic deliveries of materials destroyed the rhythm of planned production, and at the same time both output and costs suffered by the reduction in working hours from 47 to 44 per week, which was introduced in January, 1947.

DEMAND FOR OIL ENGINES

I have always stressed the importance to this company of its marine engineering department. The demand for the Doxford oil engine continues to expand rapidly. There are now 11 marine engineering firms building the Doxford engine under licence in Great Britain and four firms abroad, with the result that we can record a total of over a million indicated horse power now building or on order. During the year our licensees alone have completed 29 Doxford engines, totalling nearly 131,000 B.H.P.

Whilst it is satisfactory to know that we have a large number of orders on our books, it is doubly unfortunate that the scarcity of materials is so seriously retarding their fulfilment, particularly as many of them are for foreign account. Export being of such vital importance to the economy of our country, it is rather surprising that more is not being done to assist the shipbuilding industry.

Not only the present building cost of ships, but probably even to a greater extent the impossibility of quoting fixed prices, or of giving reasonably firm dates of delivery, has made shipowners very chary of placing further orders, in spite of their need for tonnage. We can only hope that, as present contracts in hand near completion, circumstances will have so changed as to encourage new orders.

The report was adopted.

HARRISONS AND CROSFIELD, LIMITED

GRATIFYING PROGRESS

The thirty-ninth ordinary general meeting of Harrisons and Crosfield, Limited, was held, on the 4th instant, in London.

Mr H. Eric Miller, the chairman, in the course of his speech, said: The profit and loss account shows in the aggregate gratifying progress in the right direction. The greater part of the profits we earn are the direct result of our initiative and enterprise, as Merchants, at Head Office, at our branches and at the offices of our subsidiary and associated companies overseas. The business was founded over a century ago for the merchandising of tea and, although our later activities in the development of the plantation industries of the East have drawn the limelight, we have continued to fulfil our original mission on an expanding scale.

At the same time we have built up and developed an extensive general trading business all over the world. Merchant firms like ours, with a competent organisation and adequate financial strength, perform a valuable function for British manufacturers, who are thereby enabled to concentrate on their own problems of production, knowing their sales effort, particularly in overseas markets, to be in the hands of specialists who can correctly interpret the requirements of their clients. One of the most attractive features of our business is that so much of it is transacted abroad. In addition to our successful fostering of British exports on an expanding scale, we take a very substantial part in entrepot trade throughout the world.

In spite of a continuing shortage of rice—the staple food—the economic recovery of Malaya has been rapid beyond expectation, due to the commonsense, enterprise and adaptability shown by businessmen of all races in circumstances which have put those qualities to the test. Great credit is due to them; by contrast it is deplorable that the restoration of law and order has not made more progress.

NEED FOR FREEDOM

The strength of this country at any particular time lies not so much in the Government as in the people themselves. If a stranglehold is clamped on their initiative, and if the will to put the best foot foremost is persistently weakened by official or trade union agency, how can a country in our present straits hope to make a real recovery? Hence the need for us rapidly to recover a reasonable measure of individual freedom as urged with inimitable vigour by Mr Winston Churchill.

Mr Haydn O. Peake, the vice-chairman, referring to his recent visit to Canada, said: Canada is not a new field for the company's operations. As a convenience of organisation Harrisons and Crosfield (Canada) Limited, was registered in Canada in 1938 to consolidate the business other than tea and coffee. This company's activities consist mainly of import and distribution of raw materials for industry, including the paint, textile, rubber, paper and tanning trades, feeding oils for the farming industry, and a number of other lines. A considerable export trade has also been developed to various parts of the world.

Canada is a country with a great future. Wise leadership during the war and since has enabled her to avoid, or at any rate to mitigate, some of the economic difficulties with which other countries have been confronted since the war. Business prospects in Canada will appear to be good.

The report was adopted and a final dividend of 20 per cent. (making 25 per cent. for the year) on the Deferred Ordinary stock was approved.

INDUSTRIAL FINANCE AND INVESTMENT CORPORATION, LIMITED

ANOTHER SATISFACTORY YEAR

The annual meeting of this company will be held on the 12th instant.

The following is an extract from the statement of the chairman (Mr J. N. Buchanan, D.S.O., M.C.), circulated with the report and accounts:—

It will be seen from the accounts that your company has had another active and satisfactory year.

Compared with last year, net revenue, after taxation, is higher by approximately £19,000; after allowing for an ordinary dividend at the rate of 9 per cent., there remains £33,000 to be carried forward, bringing that item to £140,000.

Turning to the balance-sheet, it will be observed that the unquoted investments show a large increase; a fair proportion of these investments, will find their way into quoted securities in the normal course of business. The valuation has been made, as before, on a conservative basis.

Creditors and debtors have swollen substantially, but the position as shown is more apparent than real since, in the main, the increases represent a single large investment transaction, carried out on the instructions of one of our clients, which was completed shortly after the date of the balance-sheet.

In accordance with the procedure adopted last year, only the realised appreciation of investments has been brought into the profit and loss account, no credit being taken for any appreciation which was not realised during the year. Now that the economic crisis is having repercussions on market quotations, the wisdom of having provided reserves against this contingency is apparent. Although the tempo of finance business has eased, we continue to have before us a number of interesting projects, and our revenue to date has been well maintained.

PRICES, TAILORS, LIMITED

A YEAR OF PROGRESS

The nineteenth annual general meeting of Prices, Tailors, Limited, was held at the Queen's Hotel, Leeds on the 3rd instant. The chairman, Sir Henry Price, in his opening remarks announced that the company's fixed assets showed an increase of £384,143, due mainly to the purchase of properties. As a result, the chairman went on, net current assets are depleted, but only temporarily, as since June 30th, the company sold properties, amounting to £286,000 on advantageous terms which include long leases favourable to the company.

Referring to specific reserves, Sir Henry spoke of a balance of £42,388 which he said was reserved for factory development last year and was still available for this purpose. Sir Henry was sure that shareholders would consider the trading profit of £575,976 satisfactory.

Speaking of Prices, Tailors Properties Limited, Sir Henry remarked that the only item which needed comment was the redemption of old and the issue of new debentures and preference shares—which resulted in the prior charges for interest and preference dividends being considerably reduced.

Regarding consolidated accounts, Sir Henry said that after deducting dividends payable to preference and preferred ordinary shares in subsidiary companies, the net profits available for Prices Trust Company Limited amounted to £195,914 of which £15,125 was required to meet the preference dividend. The balance £180,789 had been appropriated as to 57 per cent. to dividend and 43 per cent. to reserve and addition to carry forward.

Net current assets of the Group were £734,560 and after taking account of £286,000 released from fixed assets—referred to above—amounted to over £1,000,000.

GOVERNMENT RETURNS

For the week ended November 1, 1947, total ordinary revenue was £84,344,598, against ordinary expenditure of £99,639,939 and issues to sinking funds nil. Thus, including sinking fund allocations of £9,149,891 the surplus accrued since April 1st is £214,522,549 against a deficit of £543,701,893 for the corresponding period a year ago.

One Shilling

Leading Articles

THE only reason for having a supplementary Budget was to put some check upon inflation. There is, consequently, no occasion for congratulating Mr Dalton on the fact that all the steps he proposed to the House of Commons on Wednesday were in the right, disinflationary direction—he would have made himself ridiculous if they had not been. The question is whether he took the right steps and whether they were firm enough. And the answer must be that he was more concerned, once again, to side-step the major issue that events have been forcing upon him. That major issue is that the fiscal and financial policies that he is pursuing are doing more to hinder than to help the economic recovery of this sorely pressed land. Nothing that he said or did on Wednesday substantially mitigates this heavy indictment. The Chancellor must, by now, be very well aware of this criticism that is directed at him. That he did not choose either to accept it or to answer it tells its own story.

Mr Dalton's position—implied rather than argued—appears to be that his Budget of last April did all that was necessary at that time. If there was then an “inflationary gap” he had closed it, and the need for further measures now arose simply from the steps that the Government had been compelled to take to bring the balance of payments into equilibrium. But if this is the argument, it is patently inadequate. Nobody but the Chancellor himself can believe any longer that goods and money were in balance with each other in April. The phenomena of inflation—a steady rise in all uncontrolled, and some controlled, prices, and a no less steady drift of resources from essential into unessential uses—have certainly been in evidence throughout the year. Perhaps the clearest proof is to be found in the extreme difficulty that the departments concerned with production are experiencing in making their controls work or their priorities effective. Certain forms of activity—notably mining, agriculture and exports—are vitally important to the country. But they are continually being elbowed out of the full priority they ought to enjoy by the pressure of competing demands. Until these demands are cut back enough to give the priority classes a clear run—until Mr Dalton takes his disinflationary duty seriously—Sir Stafford Cripps's policy cannot succeed. That was true in April and it is true in November.

Moreover, Mr Dalton has not even come up to the unduly restricted measure of the task he set himself. Even if everything were in balance last April, it would still be necessary to close the new inflationary gap created by the decision to cut down imports and expand exports. Though the inflationary gap as a whole cannot be statistically measured, this new gap can; it is equal to the reduction in the overseas borrowings on which the country has hitherto been living. Last spring, the country was borrowing at the rate of some £600 million a year. By the end of 1948 the plan is that it is not to be borrowing at all, on balance. Mr Dalton's task, even on his own definition, therefore, was to see that the flow of money trying to get itself spent will be, by the end of next year, at an annual rate of £600 million smaller than it would otherwise have been. This he has hardly achieved. His increases in the revenue are estimated to yield £208 million in a full year, and to this can be added the

reduction of £200 million in capital expenditure (provided that the money thus saved is not spent on something else). The rest of the sum is still to be found by reductions in the expenditure of the Government on other than capital purposes.

★

The reduction of expenditure, in fact, lies at the very centre of the whole problem and deserves a much more thorough analysis than Mr Dalton gave it. It is very doubtful whether the large surplus that the Budget ought to show can be built up by the method of tax increases alone. And even if the inflationary gap could, on paper, be closed in this way, it would be a very unsatisfactory way of doing it. The fact is that the level of taxation is very much higher than the economy can stand. The net national income (at market price) is in the neighbourhood of £9,000 million; the revenue from taxes (including local taxes and social insurance contributions) for the current year would, if this week's tax increases had been in force for the whole of it, amount to over £3,600 million. Whether or not there is any absolute validity in the rule propounded some time ago by Mr Colin Clark that 25 per cent of the national income is the highest proportion that can be collected in taxes without inflation, it is certainly true that the present proportion of 40 per cent is far and away too high. It is better that a Budget surplus should be created by increasing taxes than that there should be no Budget surplus at all. But it would be infinitely better if the surplus were created by a reduction of expenditure. The target for any Chancellor of the Exchequer to aim at should be to get his total of expenditure down to something of the order of £2,500 million at most—that is, some £700 million below the estimate for the current year. If this could be achieved, it would be possible to run a surplus of £500 million and still take several hundred millions off the mountainous burden of taxes.

It does not take any close analysis of the figures to establish that this could not possibly be done without cutting out the greater part, if not the whole, of the expenditure on food subsidies. What is the sense in raising £400 million more in taxes than is necessary, and suffering all the disincentives of so doing, simply in order to pay out £400 million in subsidies and suffer a further set of distortions and misdirections of popular purchasing power? Mr Dalton's argument in defence of the subsidies was, in substance, that it was very nice for the average family of four persons to have 12s. 6d. knocked off its weekly food bill. Of course it is. But what irresponsible demagoguery it is on the part of the Chancellor of the Exchequer to take this as sufficient reason, without the devotion of even so much as a single sentence to the economic effects, without asking whether the benefits of the food subsidies are worth the income tax of 3s. 3d. in the £ that they cost. Since all the foods on which the subsidies are paid are rationed, it is most unlikely that (with the exception of a few of the very poorest families) they achieve any increase in the actual consumption of food—even if that could, in present circumstances, be ascribed to them for merit. They simply mean that people have more money to send chasing after the restricted supplies of other things—the very phenomenon that Mr Dalton says he wants to stop. His attitude to these subsidies, in short, is as illogical as it is uncourageous. It is true that he has set a limit to them and that he uttered words that might be taken to mean that he would set about reducing them next year. But if rumour is to be believed, this is merely another instance of the Cabinet's favourite remedy for disagreement within its ranks: if we cannot agree now, we will postpone the matter until next year.

The general verdict on the Budget must, therefore, be that it is not so much an opportunity missed as a duty declined. What was needed was, on the economic plane, to make a prompt and large correction of the distortions now plaguing the national economy, and on the psychological plane, to provide a dramatic

symbol, whose meaning no member of the public could miss, of the gravity of the economic emergency. The purely economic effect of the Budget is deferred—the difference to this year's revenue is a mere £48 million—and inadequate. Psychologically, by his boast that he has imposed "no serious hardship on any citizen" and by his talk of further reductions in income tax next year, he has once again encouraged the ordinary man to believe that there is nothing seriously wrong that cannot be put right by a few more slaps at business profits and by a slight reduction in marginal expenditures.

★

Beside these considerations of major economic policy, anything that is said of the actual tax changes proposed, either in favour or in criticism, is necessarily of minor interest. Mr Dalton's batch of proposals included some that were good and some that were bad. The main additional revenue-producers are the increases in the Profits Tax, the Purchase Tax and the duties on alcohol. The Profits Tax is wrong in principle, and if the rates have been doubled, the tax is just twice as noxious as it was before. Mr Dalton himself, in an earlier and wiser manifestation, was quoted in these columns last April against the principle of levying heavy taxation on precisely that element of income from capital that is most valuable, the enterprising and risk-bearing portion. If Mr Dalton's class-consciousness made it necessary to raise a further £47 million from property incomes, he should have done it in the only fair way through the Income Tax. The only consolation to be found in the doubling of the Profits Tax is that it makes repeal of the whole tax at an early date the more certain. Increases in the Purchase Tax, on the other hand, are admirably adapted to the circumstances of suppressed inflation. At first sight, the comment might be made that it would have been better to spread the net of the tax more widely without an increase in the rates of tax, rather than to increase the rates without changing the incidence; but justification for what has been done may possibly be found in the administrative complication of any more diffused tax. There is a clear case for the increase in the alcohol duties; the mystery is why the Chancellor made no further increase in the tobacco duty also, after himself making a conclusive case for so doing.

The two novelties are the new duty on certain forms of betting and what amounts to a new tax on advertisements. In the minds of the great majority of people the only possible objection to a betting tax is the administrative difficulty of collecting it. The Chancellor has decided to cut this Gordian knot, which defeated Mr Churchill twenty years ago, by leaving the book-makers alone and confining himself to the football pools and the greyhound totalisators. There is a touch of inequity about this, which, perhaps, accounts for the very lenient rate of duty; most people would have been well content had it been doubled.

There has long been a strong case for a tax on advertising, and it is impossible not to admire the combined ingenuity and simplicity of the device by which the administrative complications of a tax levied directly on advertising are cut out; the advertiser will, in future, be allowed to reckon only half his expenditure on advertising as a business expense and will thus have to pay tax on the remainder. But approval in principle must be qualified by a serious question whether the rate of the new tax has not been set too high. The effect of disallowing half the expenditure is to subject the whole to a rate of tax equal to half the combined total of Profits Tax and Income Tax—that is, to a rate varying from just over 25 per cent to just less than 30 per cent, according to which of the two rates of Profits Tax is applicable. To tax betting 10 per cent and advertising between 25 per cent and 30 per cent suggests that something has gone wrong with the scale of values. Mr Dalton would make his case much stronger if he would disallow not half of advertisement expenditure, but one quarter or one fifth.

The Plan Takes Shape

THE Marshall offer has now begun to turn into a plan. With the Paris report to tell him what western Europe thinks it will need, and with the Harriman report to tell him what 19 leading American businessmen and economists think their country can afford, Mr Marshall has asked the committees of Congress for something between the two. He has declared that reliable estimates of needs as far ahead as 1950 and 1951 just cannot be made; he will therefore "not recommend to the President that Congress appropriate for the full four-year period." Nevertheless, he has staked his claim for between \$16 and \$20 billion (that is, between £4,000 and £5,000 million) which compares with the estimate of \$19,310 million made by Sir Oliver Franks and his fifteen colleagues and with the Harriman Committee's estimate of between \$12 and \$17 billion, varying according to the assumptions made about prices and available supplies.

What really matters, however, is the sum proposed for the vital year 1948, or rather for the fifteen-month period ending June 30, 1949. Until April 1, 1948, Western Europe will be struggling through with interim aid amounting to \$597 million, destined for France, Italy and Austria. When that expires the Marshall Plan proper should come into action; and its success will depend on its ability to provide quickly what the Harriman Report calls "the spark which can fire the engine." Western Europe will have passed through a winter of intense political and economic strain, exposed to persistent propaganda for and against the plan. Its expectations will have to be met quickly if Mr Marshall is to obtain the psychological effect which is one of his major objectives. It is therefore fortunate that the divergence between the Marshall and Harriman estimates for the full period—due rather to different views of price trends than to differences of principle—is not repeated in the estimates for this decisive first period. Mr Marshall wants between \$7,000 million and \$7,500 million for 15 months; the Harriman committee thinks America could afford \$5,750 million for twelve months. Congress cannot fail to be impressed by this near agreement between the Secretary of State and the men of business, which represents a reduction of some \$2,300 million on the Paris estimates of the dollar deficit for this decisive year.

The Marshall Plan raises so many issues, domestic and international, political and economic, that there is a real risk of the discussion straying off into a confusion of minor matters. The important questions to be asked at this stage are three in number. First, are the sums suggested large enough to meet the inescapable needs of Western Europe? Secondly, do the conditions of principle and detail attached to American aid amount to an infringement of the national sovereignty of the sixteen nations receiving it? Thirdly, will any of the conditions frustrate Europe's effort to become self-supporting?

To the first question the answer, on present evidence, is quite clearly Yes. Both for the long and the short period the Paris estimates have been found too optimistic but for reasons which must be accepted. There was always a good margin for trimming in the Paris estimates, as Mr Clayton proved by getting \$7 billion lopped off in a week-end. They were no doubt a correct interpretation of the assumptions on which they were based—but the assumptions themselves can be modified. It is no more in Europe's than in America's interest that more than the minimum of aid should be given, since nothing could well be more disastrous for European recovery than that illusions should be kept alive on a diet of dollars. There should be no complaints about the efforts so far made in Washington to make the whole scheme look tighter and thriftier and to transfer large portions of the work to the World Bank and the

Export-Import Bank. Changes were better made that way than by calling together a second Paris conference and telling it to think and calculate again, of which the political consequences might have been deplorable.

★

To the second question too, the answer is Yes. Some of the conditions foreshadowed in Mr Marshall's statement do represent some infringement of national independence. And so they should. It was from the first inevitable that the Americans should attach strings to an operation of this kind. The only question has been, and still is, whether the conditions are reasonable and wise. So far as can be judged from comments made in the Harriman report they amount at present—before Congress starts its work—to this: that participating countries should stabilise their currencies and balance their budgets as soon as possible, and that persistent failure to do so should disqualify them from aid; that they should make genuine efforts to attain their production targets—which means, among other things, that British coal production should increase by 25 per cent, to make possible the exports which would "change the face of Europe." They are asked to desist from excessive effort to create new capital, for example, by too radical a mechanisation of agriculture or too rapid a switch from coal to oil. National currency earned by European Governments by the sale of American goods provided to them without payment is to be set aside for constructive schemes and not be used for budgetary purposes. The independent federal agency set up in America to administer the plan is to maintain in individual countries, and through a permanent committee of the Paris committee, a close watch on the use and effects of its aid.

There is nothing in any of these conditions that unreasonably infringes the political sovereignty or injures the national self-respect of the receiving nations. It is true that their rigid enforcement might cause some clash of opinions and ruffling of dignities. But it is reasonable to ask that a borrower should start with his affairs in order; it is eminently reasonable to enforce Mr Marshall's basic principle that America only helps those who do everything possible to help themselves and one another; and, whatever Mr Horner may think, it is as reasonable that Americans should urge higher coal production on the British as it is that the British should urge the lending of dollars on the Americans. It is proper that France should be restrained from carrying out some of its more extravagant schemes of capital reconstruction at the expense of its neighbours in Europe, and should be asked to concede to western Germany a bigger role in the Marshall Plan than it has yet received. And it is both wise and welcome that the Americans should wish to prevent the proceeds from sales of their goods being used by thriftless Ministers of finance as a deceptively easy way to give their budgets an appearance of balance.

All this can be said with confidence once it is accepted that the American objective is to get western Europe eventually standing on its own feet, to make the sixteen nations partners in a common European enterprise and not mere mercenaries of State Department policy. On this point the Harriman Report is both candid and clear. It says that America's position in the world has been based for over a century "on the existence in Europe of a number of strong states committed by tradition and inclination to the democratic concept." Therefore it is in America's interest to see to it "that the democratic system provides the bare necessities of life now," so that it may "rekindle the hope that by hard work a higher standard of living

is attainable." In other words, the Moscow prophecy of inevitable collapse for the West must be proved wrong. The West, if it is wise, will not object to the demonstration.

As for Mr Molotov's other prophecy, that to accept Marshall aid will be to accept dollar slavery, the Harriman Report says that adherence to basic democratic principles is "an essential condition to continued aid" (a pregnant phrase for General de Gaulle), but that this condition "should not require adherence to any form of economic organisation or the abandonment of plans adopted in and carried out in a free and democratic way." And there is a further warning against "unwarranted interference with the internal affairs of friendly nations."

So far, then, so good; it remains to be seen whether Congress will follow this statesmanlike advice.

*

But there remains the third question. Will the Marshall Plan repeat the mistake of the British Loan and have economic conditions attached to it which in fact prevent the recipient nations from working their way out of dependence on dollar aid? In giving (or lending) dollars to Europe, will Congress make it more difficult for Europe to balance its trading accounts without gifts or loans? Will the Marshall dollars be turned into a compulsory habit-forming drug? There are hints of such conditions in the Harriman report and in unofficial comment on Mr Marshall's intentions. For instance, there is the suggestion that some of the proceeds, in local currency, of selling American goods delivered to the European governments free of charge could be used to finance local expenditure by the American Government, including the stockpiling of strategic materials, such as rubber and uranium. As a principle this is not unreasonable. But if the local expenditures of the American Government, including expenditure on stockpiling, are expenditures that would have to be carried out in the absence of a Marshall Plan, then this proposal would in fact reduce Europe's earnings of dollars below what they would otherwise have been and, to that extent, create a further need for more Marshall dollars in their place.

The same tendency seems to lie behind the criticism that the shipbuilding programme of the Paris Report makes excessive

demands for steel. Is this a genuine piece of businesslike criticism, or a desire to assist American shipping? Is Britain to be denied the right to build liners and cargo vessels which might regain some of its pre-war dollar-earning capacity? The answer is obvious, and it must be borne in mind that there may be similar threats to the dollar-earning capacities of other countries buried in the massive argument of the full Harriman report. The argument to be used against them—if they exist—is that they are inconsistent with the basic purposes of the Marshall Plan. It is very natural that Americans should hesitate to spend their dollars in order to build up competitors for their own trade. But if the nations of Western Europe are to become solvent they must be allowed to compete with American trade. Congress can have, in Europe, either solvent competitors or insolvent non-competitors; it cannot have solvent non-competitors.

These facts and possibilities should not be lost from sight. Yet they weigh lightly in the balance against the generosity and the grand sweep of the Marshall proposals. It has to be made clear to the 245 million people of western Europe affected by them that two-thirds of the aid for the first stage of the plan will be a straight gift—a gift of some \$3½ billion; and that execution of the plan will mean difficulties and sacrifices for the American producer and consumer, even controls and restrictions alien to their way of life. Nor can the generosity be argued away by saying that the American people are merely paying an insurance premium against a domestic slump; if that was the object of Mr Marshall's policy, cheaper and more effective methods could be found. On the other hand, there is no point in denying or glossing over the fact that the plan is to be one of the main weapons of American foreign policy. As such Mr Molotov and Mr Zhdanov are quite right to fear it and attack it. It sets out to prove wrong their publicly proclaimed hopes and estimates; and there can be no doubt that the majority of the people of western Europe want to see the proof succeed.

Mr Marshall has allowed exactly nine months for the gestation of his plan. Conceived last June, it is to be born next April. The prospects of a healthy and normal progress towards the happy event are better than ever seemed possible.

Trial and Terror

AFTER Petkov, Maniu; after Maniu, treason trials are promised in Czechoslovakia. Mikolajczyk has escaped from Poland, but substitute victims will no doubt be found for the cheated tribunal. In the end, when the time is ripe, we may expect that the political process of law on the Moscow model will be extended to the Russian zone of Germany. There it will engulf those leaders who still resist the power of the Socialist Unity Party and expose the malignant designs of Britain and the United States against the German people.

The diffusion of the technique of the Soviet political trial has been one of the consequences of Communist ascendancy in Eastern Europe. This technique has been developed and elaborated over a period of years, but it has been devised in accordance with a basic conception of law which the Russian Communists already held in the time of Lenin. Indeed, the view of the judicial function which underlies the procedure used in political cases was formerly expressed more frankly than it has been in recent years, when propagandists have been at some pains to convince Western liberal opinion of the purity of justice as administered by the Military Collegium of the Supreme Court of the Soviet Union. In 1924 Krylenko, the former Public Prosecutor, who was himself destined to perish by the system which he defended, declared in his book "The

Court Structure of the USSR" that "every court . . . has the task of defending the interests of a given governing class and is distinguished from other means of defence only by its specific form and nothing more." As the interests of the new governing class, the proletariat, were held to be fully and exclusively represented by the Communist Party, it followed that the advantage of the Party was the sole criterion of justice—in so far as politics were in any way involved, directly or indirectly—in cases brought before the courts. Krylenko had previously given a practical demonstration of his principles in the first of the great Moscow trials, that of the leaders of the Socialist-Revolutionary Party in 1922. Then he, as President of the Supreme Court, appeared as prosecutor before a judge who was his own subordinate, and the latter announced that the Court "does not intend to handle the case from a dispassionate objective point of view, but will be guided solely by the interests of the Soviet Government."

When once it has been theoretically established that *raison d'état* is the final principle of law and that the citizen has no legal rights which are valid against the interests of the ruling party, it becomes irrelevant whether an accused person has actually committed the offences of which he stands accused. A political trial of which the result is in doubt is obviously of

no use to the Party-State; when, as always happens in these trials, the ruling faction has proclaimed the guilt of the accused by officially sponsored propaganda, acquittal is unthinkable. The defendants should not be brought to trial unless it is intended to convict them; the trial must demonstrate the theses of official doctrine and there can be no thought, therefore, of admitting testimony which upsets the prosecution. It is not merely that the ruling faction, claiming absolute power, desires to destroy its political opponents physically and to discredit them morally. Even more, the political trial is a means by which the rulers justify themselves and impose themselves upon the people.

*

The Russian Communists, basing their power so largely on mass propaganda, and possessing an untrammelled insight into the possibilities of modern technical means of publicity, such as the radio and cinema, were the first to grasp the importance of the political trial as a medium for appeal to the masses. There is nothing more dramatic—or melodramatic—than the proceedings of a court of law when men are in peril of their lives, nothing which can give so sharp and intense a form to the presentation of political issues. If the proceedings can be so predetermined as to approximate to a planned, theatrical production; if they can be transmitted by camera, microphone and press reporting to the furthest corners of a vast territory, and if the Government's monopoly of the means of publicity excludes any note of doubt or criticism of the evidence, then the holders of the state power have an incomparable medium for persuasion of the people. "The psyche of the broad masses," says Hitler in "Mein Kampf," "is accessible only to what is strong and uncompromising. . . . the masses of the people prefer the ruler to the suppliant, and are filled with a stronger sense of mental security by a teaching that brooks no rival than by a teaching which offers them a liberal choice." But never is the voice of authority so strong and uncompromising as when it speaks with the majesty of the law.

The propaganda effect is greatest if the accused can be induced to co-operate with the prosecution. Self-inculping testimony is the most convincing of all. If the principal accused in a trial deny the charges in the indictment, it is desirable that the prosecution's chief witnesses should be men who also stand in the dock and denounce themselves in their evidence; it is the task of the Court to protect them from exposure to cross-examination or rebuttal by obstructing, eliminating or intimidating the defence counsel and defence witnesses—as it has done in the trials of Mihailovitch and Petkov. But the ideal is that all the accused without exception should confess their guilt and abase themselves with abject self-vilification, as in the trial of Professor Ramzin and his "Industrial Party" in Moscow in 1930, or in the later trials of the "Old Bolsheviks" in 1936-38. These well-conducted symphonies produced complete conviction in the minds of most Komsomoltsi, of many Bashkirs and

of Ambassador Joseph Davies. However, the "shadow trial" of Trotsky, held by the "commission of inquiry" under Professor Dewey of Columbia University, subjected the evidence given in the Zinoviev-Kamenev and Pyatakov-Radek trials to a devastating critical analysis, which showed parts of it to be, by any standard of human reason, certainly false. The report of this commission has never, of course, been permitted to circulate within the borders of the Soviet Union, nor has it ever been widely read in Western countries—for the Moscow trials had long since ceased to be news before it appeared—but it remains as a massive rational refutation of stories told with ingenious detail, but without the essential quality of truth. The report severely censures "the failure of the prosecutor and the court to call the attention of the accused and witnesses to contradictions in their own testimony, or between their testimony and the facts of general knowledge, or between their testimony and that of other accused or witnesses, on matters of great importance to the credibility of the alleged conspiracy."

That part of the evidence in these trials is demonstrably false does not mean that none of it is true. Imagination makes its most successful flights when some facts are included in its diet. Under an authoritarian regime, even an opposition which desires to be constitutional can scarcely avoid straying into illegality, or being in some way mixed up with groups disposed to attempt a violent *coup d'état*. There is evidence, apart from the Moscow trials, that a military conspiracy against Stalin was hatched among Red Army generals in 1936. But in this and other cases it is not enough for the ruling faction merely to establish the fact of conspiracy; for even though the Government might be legally justified in executing the accused men, popular sympathy might still be with them. It is necessary to discredit them by attributing to them the basest motives and most despicable behaviour, particularly by representing them as agents of foreign powers, ready to sell the interests of their country for power or money. This fits in well with another purpose which can be served by political trials—that of impressing on the consciousness of the people real or imaginary threats from abroad.

*

People may be induced to confess falsely—or to distort or add invented supplements to confessions of genuine guilt—for either personal or political reasons. In the former category come the motives which the normal man, who is not a political or religious fanatic, has for preserving his own life and the lives and liberties of his family. In a totalitarian state, where the political police have powers of execution or consignment to concentration camps without trial—a power which can be extended arbitrarily to the near relatives or friends of the victim—the situation of an arrested man is the opposite of what it is under a normal legal system. In this country a man charged

with a crime knows that his condemnation or acquittal depends on the effectiveness of his defence in court and that, if he is acquitted, nobody has any right to kill or imprison him. But in a totalitarian state he knows that he is at the mercy of the police—at least in political cases—that he can be killed or sent to a concentration camp without any public trial, proof of guilt, appeal or redress, and that the best hope of clemency is by pleading guilty when he is told to. Professor Tchernavin in his book *I Speak for the Silent* has recorded arguments which went on in his prison between those (known in prison slang as “novelists”) who signed false confessions and those who refused. One of the former thus justifies his kind:

Why, when the threat of an infamous death hangs over us and our families are threatened with poverty, hunger and even deportation, should we not do everything possible to alleviate our fate? The GPU demands that we confess to wrecking and espionage—all right, we are wreckers and spies. They demand denunciation of our friends—all right, we'll denounce them. If we don't, somebody else will.

Political fanatics, however, cannot be subdued by such methods, and when a man's opposition to the regime is uncompromising, he must be either destroyed without public trial or given a trial *à la Petkov*. But it may be that the opponents are men of divided purpose because, in spite of their desire

to remove the Government, they may support it in relation to something else; if they are men for whom the political consequences of their acts outweigh every other consideration, they may be persuaded by protracted argument to help the regime by their testimony. This is undoubtedly the main explanation of the extraordinary confessions of the old Bolshevik leaders. They hated Stalin, but they preferred Stalinism to Fascism, and they believed that the Revolution was in danger.

In Eastern Europe to-day, with the Nazis overthrown, it will indeed be hard to convince opposition leaders, not schooled in the special ethics of Communism, that there is a greater evil than that which already holds power. It follows that we are unlikely to get, except from minor political personalities, the perfect unanimity of self-immolation achieved in the great Moscow trials. The producers will have to fall back for the most part on the clumsier technique used in the Petkov trial; and it is right that these trials, in which Britain and the United States will be cast for roles of off-stage villains, should be fully reported by competent observers for the information of Western opinion. The aim of such trials is propaganda, and publicity about them is the best antidote for the influence they can have—an influence which should not be under-estimated. This is a phase of the “cold war” in which, perhaps more than in any other, there is a challenge to human reason which cannot be ignored.

Wages and Profits

It is not the purpose of this article to take sides in the argument whether wages or profits have been the more inflated and should therefore bear the heavier brunt of any corrective taxation that may now be imposed, but rather to set out such statistical material as is available on the subject.

The natural starting point is weekly wage rates. There are two index numbers of weekly wage rates, one compiled by Professor A. L. Bowley and published by the London and Cambridge Economic Service, the other calculated by the Ministry of Labour. They do not greatly diverge; for example, in July, 1947, Professor Bowley's index stood at 167.9 per cent of the level of September, 1939, and the Ministry of Labour's index at 166.5 per cent. In Table 1 the Ministry's index is used. Money wage rates, of course, need correcting by an index of prices. But here a difficulty presents itself. The old index of the cost of living was so inadequate that it has now been abandoned. On the other hand, the only alternative is to use the annual index, which can be calculated from the figures in the White Paper on the National Income, showing changes in the price-level of the consumption goods actually consumed by the public. To use this as a means of deflating an index of wage rates is to come perilously close to circular reasoning, for in so far as the prices of any consumption goods have been free to move, they should be regarded as consequences of the increase in money wages, not as an independent variable. The cost-of-living index does have the advantage of showing the effect of the subsidies paid on the necessities of life, even though it undoubtedly exaggerates it. In the table, both measures of the change in prices of consumption goods is given, with the index of wage rates as so adjusted. That rather elusive concept, the “level of real wage rates,” probably lies somewhere between the two italicised columns.

But the movement of wage rates is only an indirect guide to the movement of the incomes of wage-earners. They must be adjusted for the amount of short-time and overtime worked and for charges in direct taxation on wages (including, for this purpose, social insurance contributions). Table 2 starts from Professor Bowley's index of average earnings, which is then adjusted by the estimates in the White Paper of the direct

taxation paid on wages. The resulting index of net earnings is then shown as adjusted by the two price indices. The two final italicised columns of this table are about as close as it is possible to get by statistical means to a definition of what has happened to the real net income of the average wage-earner. He appears to be between 10 and 35 per cent better off.

It should be remarked that figures of earnings are not a measure of what has happened to the labour element in costs of production, which is affected by alterations in the length of the working week, by absenteeism, and by changes, due to whatever cause, in output per man-hour.

Before passing on to the subject of profits, a brief digression into salaries is in place. The only figures of salaries that are available are the annual series in the White Paper on the National Income. This is shown in Table 3, where it is also adjusted for direct taxation and by the index number of the market price of consumption (the cost-of-living index is hardly relevant here). These figures must, however, be interpreted with caution. It is probable that there has been an increase in the number of salary earners during the last eight years and the rise in average salary income has therefore probably been smaller than the 51 per cent rise in total salaries. If the number of salary earners was one-tenth larger (a pure guess), the increase in the average gross salary would be 37 per cent, with a loss of about 20 per cent in purchasing power. If the question is considered from a somewhat different angle, a representative—not average—salary earner (a married man with two children) whose income was £500 in 1938 and has since increased in the same proportion as average salaries, would find himself in 1946 with an income only 15 per cent larger after tax and about 27 per cent lower in purchasing power. There cannot therefore be much room for questioning the conclusion that there has been a sharp fall in the real value of the total amount received by salary-earners and still more in the net real value of the average salary. Since last year there has been a relief in income tax, but this is probably just about offset by increased prices.

The statistical basis for an assessment of what has happened to profits is even more uneven than in the other two instances. The official estimates of the national income include an item designed as “Interest and Profits,” which has moved as in Table 4.

This shows, for 1946, a larger reduction than salaries and a sharp contrast with the course of real net wage-earnings. It is reasonable to suppose, however, that some recovery will be shown for 1947, owing to the lapsing of Excess Profits Tax.

The “Interest and Profits” item in the White Paper is, however, virtually worthless for comparing what the ordinary man understands as “profits” with wages, for it includes not only farming profits but also the earnings of all those professions that are remunerated by fees and not by salaries. This gap can be filled, so far as public companies are concerned, by figures regularly computed from over 2,000 published company reports by *The Economist*. Two breaks in the continuity of this sample of companies are bridged by index numbers in Table 5; they in no way upset its representative character or its reflection of industrial profits as a whole.

The profits figures are shown after deducting EPT, NDC and

NOTES OF THE WEEK

Lords and Commons

With potatoes rationed on the first day of the debate, and the spiv round-up announced on the second, the Parliament Bill has had less than due attention from press and public. This Bill is important. The reduction in the Lords' delaying power from two years to one (effectively, as several Members pointed out, from 18 months to 6) could indeed be represented as a comparatively minor matter; and a great deal of irrelevance (much of it included in Mr Churchill's gloriously characteristic onslaught) was talked about the Lords in general, their antecedents, justifications, virtues and iniquities. Mr Attlee, in winding up, obviously found these not at all discomforting. But he ignored those more substantial objections which the debate had elicited; the fact that it introduced that retroactive principle which has always appealed so strongly to tyrants, and that it introduced a change in the fabric of the constitution on which no public discussion had taken place and no popular verdict had been solicited or passed.

Britain has no written constitution; Parliament is omnicompetent. There is no special constitutional procedure or corpus of special safeguards, laid down in writing and susceptible of legal interpretation, such as protects the continuity of institutions in, for instance, the United States. And a good thing too, perhaps; but there is all the more need for the most fastidious avoidance of anything which could be interpreted as irresponsible or merely partisan constitutional change, and particularly of snap legislation of this kind, originating from a rather shady intra-Cabinet deal. The precedent is remarkable and deplorable. Until last week there could be discerned, negatively at least, the growth of a convention that changes in the constitution should require a degree of prior publicity, a breadth of opportunity for public debate and judgment, greater than that necessary for other legislation. This embryo convention the Government have now knocked on the head, without worrying about how the precedent thus set might work against them, were some electoral fluke ever to give a majority to an extremist government with inadequate respect for democratic processes and liberties. They would have done better to let well—even passably well—alone.

Peersesq or Women Peers?

The peeresses in their own right who have renewed their assault on the closed doors of the House of Lords have a logically watertight case; but in the circumstances of today their motive is really a subject for some bewilderment. Mr Quintin Hogg, fretting under the very real disability imposed on the political aspirations of an heir to a peerage, cannot conceive why anyone else should seek a similar burden; others may wonder, now that the whole ponderous question of Lords reform has been set in motion by the Government's deceptively insignificant-looking Bill, why anyone should want to board a quite possibly sinking ship. Perhaps, in addition to feminist pertinacity, there is at work some such chivalrous desire to affirm solidarity as moved Henry James, at the critical period of the First World War, to renounce American citizenship and become a naturalised British subject. If so, it is a pretty gesture. *Noblesse oblige.*

The Hungry Forties

Although prior warning had been given of the intention to ration potatoes, the public was nevertheless profoundly shocked to hear last week end that the ration would be only 3 lb. per week. If supplies of such a basic foodstuff as potatoes are short, rationing is the only method of ensuring a fairly equitable distribution, in spite of the inconvenience to both the trade and the housewife. But granted that as a general principle, there are still many points which the Minister of Food should clarify. Surely Mr Strachey knew that the potato crop was short much earlier than last month; it was already known in agricultural circles during the summer. Moreover, Mr Strachey warned Parliament before the summer recess that Britain could not depend on imported supplies. It is apparent that the decision to ration has been delayed and in the intervening period there has been a rapid reduction in supplies.

This year's potato harvest was a little over 8,000,000 tons compared with 10 million tons in 1946, when only 60 per cent was reported as moving off the farms. If the proportion this season is the same—though with rationing it is likely to be reduced—then the available supply will only be 4,800,000 tons. But already from the beginning of July up to last week end nearly half this quantity, or about 2,200,000 tons, has been consumed. At the present ration, civilian consumption should be in the region of 80,000 tons a week, which over the 33 weeks to the end of June gives a total off-take of something over 2,600,000 tons. And no allowance has been made for the requirements of the Services and any small scale export which might be necessary. Therefore even at this present low level of rationing, supplies only just cover consumption, and the chances are that the ration will have to be further reduced. Nor is there much likelihood of purchasing potatoes abroad. The potato crop has also suffered from the drought in other European countries and the smaller grain supplies, discussed in a Business Note on p. 815, will make them expand their own potato consumption. Moreover, only very small quantities are available in Canada, the United States and other dollar countries.

The most serious effect of potato rationing, however, lies not in the small quantity—and that is serious enough, particularly if by next March two of three pounds of potatoes per head are bad—but rather in the ineffective control which the Ministry of Food has over the potato trade. The ration cannot be guaranteed and there is certain to be much inequitable distribution. The potato being a relatively cheap and bulky commodity does not easily lend itself to large-scale black market operations, but a loose rationing system may have an important psychological effect on the public and undermine their trust in the Government's whole food policy.

Rumania in the Bag

The latest events in Rumania may be regarded as the completion of that country's *Gleichschaltung*. On the road towards the "only true democracy" it has now reached approximately the same stage as the People's Republics of Yugoslavia, Albania, Mongolia and Bulgaria. The National Peasant Party was dissolved in June when some of its leaders were found trying to leave the country. This has always been a mixed party of peasants and urban middle class, and it is no doubt largely true, as the Communists assert, that all those who long for the old regime have rallied to its support as being the most right-wing party allowed to exist since 1944. It is even possible that adventurers have talked wildly in coffee houses, an old Balkan custom. But accusations that the party has been dominated by "Fascist elements," and that its leaders have engaged in subversive plots for the overthrow by force of the regime, with material help from the "western imperialists," have not been supported by any hard evidence at the trial of Dr Maniu. But truth is not an important consideration in a trial whose aims are to silence the last critical voice and to terrify Rumanian subjects from any further social contact with westerners. So on November 11th Maniu, at the age of 76, was sentenced to solitary confinement for life.

Parallel with the suppression of the formal opposition has come the liquidation of all slightly independent elements within the government coalition itself. Throughout the last year it has been well known that opinion within the Socialist Party was divided on the interpretation of "collaboration" with the Communists. Some were willing to subordinate their party completely to the Communists, on the model of the Neikov group of stooge Socialists in Bulgaria. Others wished to maintain independent organisation, and even sometimes to criticise Communist policy. The formation of the Cominform forced the issue. An appeal by "non-party" Premier Groza for "workers' unity" was followed by a congress of the party, which voted in favour of fusion.

Last week the other remnant, the "governmental Liberals," were expelled from the Government. Their leader, the opportunist Tatarescu, former Premier of King Carol, is a man whom for once the Communists are fully entitled to call a "reactionary." He has held for two years the Ministry of Foreign Affairs, and his party have been strongly entrenched in the Finance Ministry. Though subservient to the USSR, Tatarescu began to express discontent with the police terror and with the inefficiency of present economic policy. Now the Communists

have decided they can do without him. The present government of Rumania is now as completely Communist-controlled as the governments of Yugoslavia and Bulgaria. It will consist of a Communist "United Workers' Party" and a rural branch of the Communist Party known as the "Ploughman's Front," once a small independent radical peasant movement, now a bogus mass organisation whose organising staff are members or nominees of the Communist Party.

Turning Point in Prague

The present crisis in Slovakia is likely to have important results for the future of democracy in the whole Czechoslovak Republic. Ever since the election of the Constituent Assembly in May, 1946, the work of framing a constitution has been held up by uncertain relations between the Czech and the Slovak portions of the Republic. In 1945 a body called the Slovak National Council (SNR) was set up as a provisional legislature for Slovakia. Its members were from two parties, the Communists and the Democrats, the latter comprising peasants and urban middle-class people, whose views ranged from left centre to extreme right. The SNR has never been elected, but its composition was changed in May, 1946, so as to reflect the general election results, Democrats receiving 60 per cent of the seats and the Communists 30 per cent. The SNR formed from its number a provisional cabinet known as the "Board of Trustees." In the Board formed in 1946 the Communists, though a minority in the SNR, received the premiership and the locally very important "trusteeship" of education, while the control of the interior went to a so-called "non-party soldier."

Since the trial and execution of quisling ex-"President" Tiso in April, when the Democrat Party—well aware of the hostility to the sentence of Slovak opinion in general and their own supporters in particular—adopted an equivocal attitude, Communist attacks on the Democrats as reactionaries have greatly increased. In October the Ministry of the Interior in Prague and the "Trusteeship" of the Interior in Bratislava "unmasked" a conspiracy against the Republic. The evidence published so far seems to show that various prominent supporters of the Democrat Party have maintained contact with the ex-"Foreign Minister" under Tiso, Durcansky, now in exile in the West. But it is equally clear that the Communists are making use of these discoveries to disrupt the whole party, and to obtain control of Slovakia.

At the end of October the Democrat "trustee" for food supplies resigned, after being attacked by the trade unions for his failure to eradicate the black market. Then the Slovak Democrat vice-Premier in the Prague Government, Ursiny, resigned after some of his employees were implicated in the conspiracy. In Bratislava the Communist President of the Board of Trustees resigned, with his party colleagues and the "Trustee" of the Interior, and claimed that this constituted the resignation of the Board as a whole. The Democrat majority on the Board announced that they had not resigned and that they would continue to function in their posts. The Communists then suggested that a meeting should be held of the Slovak National Front (composed of Communists, Democrats and two lesser parties—Socialists and Freedom Party), and that it should be attended by representatives of the Communist-controlled trade unions and resistance organisations, in order to create an artificial Communist majority. This meeting failed to solve the crisis, and representatives of the Slovak parties therefore left for Prague to attend a meeting of the National Front of Czechoslovakia (i.e. of Czech as well as Slovak parties).

Threat to the Republic

The crisis went one stage further when the Prime Minister of the Republic, Dr Gottwald, announced that this meeting would be attended by representatives of the Czechoslovak Trades Union Council and the United Czech Farmers' Association, as well as of the Slovak trades unions, Slovak resistance organisations and the Slovak United Farmers' Associations. All these organisations are Slovak United Farmers' Associations. All these organisations are more or less Communist controlled; and it is noteworthy that the Czech resistance organisation and the Sokol, which are not Communist controlled, were not invited. Dr Gottwald's action caused the Czech People's Party and National Socialist Party, as well as the Slovak Democrats, to refuse to attend the meeting.

The situation is now serious. If the cleavage between Czech Communists and Czech "non-Marxists" is permanent, the whole political structure of Czechoslovakia will be threatened. Government by a genuine coalition and parliamentary methods will yield to government by a "workers' block," in which the Communists

use a bullied Socialist rump and groups outside parliament to create a dictatorship of their own. Czechoslovakia will be well on the way to "Eastern popular democracy."

Industrial Conscription

The new Registration for Employment Order under Defence Regulation 58A announced by Mr Isaacs in the House of Commons on Tuesday, which comes into force on December 8th, is important for its psychological effects, rather than for any practical contribution it will make to swell the industrial labour force. The introduction of industrial conscription is, at any rate, an unmistakable indication that the Government wish to bring home to their own supporters no less than to the country as a whole the seriousness of the present economic crisis. Of the two types of registration, that of employees in the scheduled inessential occupations is perhaps more likely to produce results than the individual registration of unoccupied persons, where the onus is on the individual to present himself or herself at an employment exchange under penalty of fine or imprisonment, a subject which evidently caused Mr Isaacs some embarrassment.

Psychologically perhaps the knowledge that there will be "conscription of the idle rich" may sometimes help to soften the blow of redirection. It must, however, be doubted whether the game of hunting spivs and other types of miscellaneous fauna is really worth the candle. Unless the Order is to remain largely a dead letter the amount of supervision involved will be enormous. There will obviously be a great deal of evasion which will be impossible to check without involving strict police measures—and all this in order to increase recruitment in essential industry by how many thousands?

The reintroduction of industrial conscription more than two years after the war must surely cause considerable searchings of heart, not only in labour circles but also among all those to whom the liberty of the subject is more than a text-book phrase. The powers of conscription conferred on the Minister of Labour were undoubtedly necessary in wartime, but in peacetime they are an anomaly, even though it is unlikely that in practice they will be used in an oppressive manner. And like so many other of these hardships, are they really necessary? If the Government had taken adequate steps to reduce inflationary pressure, and had confined its programme of capital expenditure within the limits of the country's resources, if it had determined to work out and enforce a courageous wages policy, the need for reimposing direction might have been avoided. And even now it is doubtful whether in terms of "bodies" the reimposition of registration can possibly yield a worthwhile harvest.

Mansion House Reflections

The Lord Mayor's dinner, now indeed no longer a banquet, is, perhaps, hardly an occasion, even in these days of austerity, for the exhibition of public penitence. It was, therefore, scarcely to be expected that the Prime Minister's speech, which was obviously designed for foreign consumption, should contain any doubts or misgivings as to the causes of our present discontents. Still, it is impossible not to detect a rather disturbing undertone of complacency. It is true that Mr Attlee was able to produce some hot news in the very welcome tidings from the coal mines that the week's output had attained the postwar record of over four million tons deep mined, an achievement on which the miners certainly deserve congratulations. All the same, coal production, even at the level just attained, is barely sufficient for domestic needs and quite insufficient to make even the smallest contribution to Europe's industrial recovery. Nor does it really convey a convincing picture to quote instances of increased production over 1938 in certain industries—even including agriculture and iron and steel—when the country is still so far from making both ends meet. For the fact remains that looked at whether from at home or from abroad Britain's industrial peace effort up to date is hardly a thing of which the nation can afford to be particularly proud.

The present distorted state of industrial production cannot be entirely attributed, to quote the Prime Minister's phrases, "to the all-out effort that we made in the war," "the exhaustion of Western Europe and parts of Asia, and the consequent disequilibrium between the western hemisphere and the rest of the world." It is at least as much due to factors which might have been avoided, such as misguided Government policy in the form of excessive capital expenditure and inadequate anti-inflationary measures (of which

the new budget forms the conspicuous example) and the failure of trade union leaders to understand or to teach their followers the elementary truths about the economic situation. Even if the five-day week has now voluntarily been abandoned in the coal industry, the pressure for "less work for more pay," still remains far too strong for a nation caught in the grip of economic crisis. As the table reproduced in the *Records and Statistics* of last week showed, the average weekly hours worked by all workers during April amounted only to 45 compared with 46.5 in October, 1938—hardly a very impressive indication to foreigners (or Americans) of the magnitude of the efforts which the British people are making to overcome their difficulties.

* * *

Overseas Resources—Second Reading

Little new came out of the second reading of the Overseas Resources Development Bill last week, except for the first detailed official accounts of the progress and difficulties of the groundnuts scheme in East Africa which formed a large part of Mr Strachey's speech. Most of the rest of it was devoted to explaining why he was concerned in the matter at all, why responsibility for all development in colonial territories is not concentrated in the Secretary of State for the Colonies. In this he was singularly unconvincing. There may well be a case for a special corporation to undertake projects in independent countries—it is apparently proposed, for instance, that the Overseas Food Corporation, which is responsible to the Minister of Food, should undertake the production of beef in Australia. It would hardly be apt for the Colonial Office to be concerned in the development of a fully sovereign Dominion.

But is it any more apt that the Ministry of Food should be concerned in the development of the colonial empire? As Mr Stanley said, the division of responsibility and function proposed by the Bill produces a most "cockeyed set-up." The development of some foodstuffs in the colonies will be the responsibility of the Ministry of Food, of others, that of the Colonial Secretary. Industrial development in the colonies will solely be undertaken by the Colonial Development Corporation and will therefore be the responsibility of the Colonial Secretary. Industrial development—in fact, any non-agricultural development—outside the colonies can be undertaken by neither corporation. The Ministry of Food will be answerable to Parliament for the direct activities of the Overseas Food Corporation in the colonies. But for their secondary effects—their effects on the health and welfare of the colonial peoples and so on—questions will have to be directed to the Secretary of State.

These anomalies, this familiar departmental compromise that has been reached, might be dismissed as another typically British arrangement, were it not for the susceptibilities of the people living in the colonies. Mr Strachey appeared to assume that because the development envisaged under the new Bill will be undertaken by public corporations instead of by private enterprise, the colonies will have no fear that they are being exploited. Mr Stanley warned him that this is far from being the truth. Suspicion is engendered in the colonies as easily by official British policy as by the activities of private British firms, and it has already arisen over the proposed new corporations. That suspicion will be intensified by the appearance of the Ministry of Food, which is mainly interested in obtaining food for the British consumer at the lowest possible price.

* * *

Illusions on Palestine

The agreement between the United States and the Soviet delegations on a joint approach to the United Kingdom in the Palestine Committee of Uno does not—as an American delegate is reported as hoping—put the British in a corner. At least, the British Government does not seem to think so. It is a naïve view, from which the world since Yalta has already suffered much, that unity among the great powers is so good in itself, that any policy, however unjust, becomes just if only the Powers agree to carry it out. It will be a nice point for a future historian to decide whether more harm has resulted to the peoples in this postwar period when the Powers agreed or when they disagreed.

The British Government in its present position on Palestine feels for once that it has the support of a vast majority of the British people, and there is no reason to expect it to move from it just because America, Russia, and Guatemala have reached agreement at Britain's expense. This position is that Britain declines to enforce the partition of Palestine except as the outcome of a measure of agreement between the Arabs and the Jews. By withdrawing from Palestine, Britain is about to offer its inhabitants a last chance to face facts, and it is to be hoped that the report

that Mr Creech Jones will now be instructed to announce a date is correct. The most effective contribution which America could make to the fact-facing process would be to restrain the ambitions of its Zionists within the bounds set by America's own unwillingness to contribute a single man to enforce a Zionist policy in Palestine.

Instead, while official America is counting on the Palestine Jew to hold his own unaided against the Arabs, all the Palestine Jews—except a tiny minority of the well informed—are at this moment convinced that America is coming over with a large force of troops, tanks and guns to establish their Jewish state for them. The reverse side of this radical and tragic misunderstanding is that the majority partition scheme must appear to the Arabs as nothing but a disguised device for establishing a Jewish state in the whole of Palestine, while British withdrawal looks to them like a chance to settle accounts with Zionism once and for all.

From what has been published hitherto, it is not clear whether America and Russia have agreed on the details of a partition scheme or merely that Britain must carry it out. Previously, even the Americans had publicly questioned some of the boundary provisions of the Special Committee's scheme, particularly that for including Jaffa in the Jewish state. The Soviet delegates on the other hand had made sweeping criticisms of the whole scheme, including the "division of Palestine into a number of regions connected by narrow corridors" which to some might seem the essence of it. It might be that a partition scheme to which both Russia and America had agreed would bear very little resemblance to that of the Special Committee.

The British Government apparently still hopes that a compromise form of partition might be accepted by the Arabs, under protest, provided they could be made to feel they were not the only ones to whom pressure was being applied, and provided there was some hope of finality. In that case there would be no inconsistency in Britain's joining with other powers in the enforcement of such a policy.

* * *

Deputies Start on Germany

With less than a fortnight to go before the Foreign Ministers begin their talks on Germany in London, their deputies have made next to no progress out of the deadlock in which the Moscow conference ended last March. One of the main purposes of the deputies' meeting was that they should clear away differences of view over procedure and agenda before their masters got down to work. There is so far no sign that any of them has received from his government instructions that will make this easy.

There are already curious contrasts between the orders of agenda suggested by the deputies. The Russians want procedure for the wider peace conference and the provisional political regime for Germany taken as the first items, with economic principles and the Austrian treaty last. Perhaps they should be given credit for leaving to a late stage the question of reparations, which killed the Moscow conference; but they should certainly have no credit for putting Austria at the bottom of the list. Agreement on Austria should be possible if the four Foreign Ministers can agree on anything at all, and there is everything to be said for taking it first. As for Germany, there is no point in discussing forms of government for a united Germany if its economic basis cannot be agreed on.

The French, of course, want to discuss the integration of the Saar with their economy, for which everything is ripe since the elections in October, but which does not appear on the Russian agenda. The Americans may want to discuss the frontier in the east. They are in any case determined to have their offer of a four-Power and forty-year pact against German aggression brought up again. If headway could be made with that proposal the moderates in France would be immensely strengthened in their policy of co-operation with America; and if the Russians wanted to give a conciliatory sign they could take a less evasive attitude towards the proposal than they did in Moscow.

Much advance comment on the conference still confuses two questions: the first is, whether the four governments can get on better terms than before; the second is, whether they can agree on a workable settlement for Germany. The fact has to be faced that the price to be paid for getting better relations might be such as to make Anglo-American plans for the recovery of western Germany unworkable; which in turn would mean a blow at the foundations of the Marshall Plan. It behoves British critics to scrutinise very carefully their list of priorities: which comes first, some slight relaxation of tension with Russia, or the recovery of western Europe? If the latter, then the failure of the conference would not be the catastrophe it is sometimes made out to be.

No Compromise from de Gaulle

General de Gaulle is probably unwise to compare France's party politicians to Kipling's monkey people—it dates him. He is certainly unwise to call his Rally of the French People "an elemental force which corresponds exactly to the promptings of the French people's instinct and reason"; elemental forces are generally too strong for human control, and the confidence that might be felt abroad in General de Gaulle's capacity to lead France will depend on the extent to which he can behave in a constitutional manner and dispense with a mystical vocabulary.

His press conference on Wednesday showed fresh confidence with no fresh ideas, although it was held on the eve of Parliament's re-assembly for a session which has somehow to find a strong coalition government of moderate or centre parties. He emphasised as usual the need for a stronger executive and told the Assembly that it was its duty to get new elections held as soon as possible. Clearly, the General does not feel sure that he could get from the present deputies the 310 out of 618 votes necessary for a new Prime Minister. He derided the prospects of a "third force" keeping power and leading France out of its difficulties. He also did his best to drive a wedge between the parties of the Republican Centre and the Ramadier Socialists by describing the former as a "co-operative for self-preservation"—a taunt not so far off the mark. On economic matters he was as vague as usual: budget expenditure to be cut by a third, salaries and wages to be related by law to output, trade unions to cease acting as rivals to the government. On the other hand, unless the French Communists change the tactics of direct action foreshadowed by their Central Committee a fortnight ago, General de Gaulle is quite right to regard France as "the most menaced country"—the battlefield on which the main effort will be made to cripple the Marshall Plan. But it is up to him to say and do nothing which will turn moderate French opinion against American aid.

Meanwhile, the obvious and decisive value to France of the Marshall Plan is being more and more understood by moderate men in the trade union movement. From two quarters the Communist domination of the General Federation of Labour (CGT) for political purposes is being challenged: by a Socialist group under M. Jouhaux, its general secretary, and by the "Social Action" group of M. Morgues, who successfully organised 20,000 workers in public communications into an autonomous and anti-Communist union. M. Jouhaux is demanding the use of the secret ballot in all trade union councils, and it is still uncertain whether he will press his case by threatening a split in the CGT or by adding a fifth and non-political organisation to the four which already exist.

* * *

New Parliamentary Procedure

The debates on this week's supplementary Budget will be curtailed. This is one of the chief changes resulting from the twelve-hour debate on parliamentary procedure in the House of Commons last week. The subject was not a party matter. Nor ought it to have been discussed in a party spirit. But the Whips were on, and the debate turned into a ding-dong struggle between the Opposition, on the one hand, and the Home Secretary and Mr Morrison on the other. The Labour backbenchers, who are as much affected by changes in parliamentary procedure as is the Opposition, were strangely silent.

Only a small proportion of the electorate can have grasped what the struggle was about. Yet they too are involved in it, for, as Sir Gilbert Campion, Clerk of the House, has pointed out in his distilled version of Erskine May, and as indeed was emphasised during the debate, the borderline between what is procedural and what is constitutional is very indistinct. Changes in procedure may lead to changes in the constitution. Why, therefore, was the Government not content to introduce the changes as sessional orders instead of as new standing orders, so that they could have a fair trial before they become permanent? That they could have been, at the very least, more polite to the Select Committee on Procedure, which reported over a year ago and which had differed from the Government on the four main changes that the Government's majority has now enabled it to pass. These are: a theoretical increase but an actual reduction in the number of supply days from an average of 28.6 in a session to 26; a shortening of the Budget debates by making the Report stage of the Budget resolutions purely formal; the establishment of a central business committee to allocate a timetable for the consideration of bills in Committee of the whole House and for the Report stage of all bills; and the enabling

of chairmen of standing committees to disallow debate on the question, "That the clause stand part." In addition, the Government rejected the Select Committee's proposal that there should be an inquiry by both Houses into delegated legislation.

The arguments for and against the Government's decision cannot be stated here. But the difference in its attitude and that of the Opposition—and that of the Select Committee—was very apparent during the debate. Mr Morrison wanted parliamentary procedure to be speeded up and made more efficient, so that more and more legislation could be passed through the Commons. The Select Committee was mainly concerned with the rights of the private member. It, and its spokesmen last week, were less interested in the House of Commons as a legislative machine than in its duty to criticise the Executive on behalf of the people. It is an old, old issue that is of the very essence of Parliament. Hence the constitutional importance of last week's debate.

* * *

Silkin and Welwyn

Mr Silkin is planning to set up a development corporation under the New Towns Act, for Hatfield and Welwyn combined, and to buy all the land now held by the Welwyn Garden City Development Company. The private company might continue certain activities, such as its departmental store, but its work of planning and developing the garden city would be terminated. Mr Silkin does not deny—nobody could—that the private companies at Welwyn and Letchworth, inspired by the ideas of Ebenezer Howard, have shown the way in the proper creation of new towns. They have made mistakes—but they started with nothing like the finance and powers possessed by the new development corporations, which ought to do proportionately better. Now, it seems, pioneering days are over. Mr Silkin argues that the new job is too big, difficult, and important for any but a public body, which alone can satisfactorily co-ordinate the development of the Welwyn-Hatfield area with the decentralisation of London's population and industry.

The Minister has gained a surprising amount of local support. The local authorities welcome being relieved of the high cost of new drainage and sewerage schemes, and of the problem of Welwyn's water supply. Other interested bodies like the prospect of dealing with one agency for the area—instead of several—although Mr Silkin was emphatic that the fusion of Welwyn and Hatfield would be purely administrative, and not physical. They are to remain distinct communities, separated by a few miles of open country. But the projected expansion of population—Welwyn with 36,500 and Hatfield with 25,000 will both be from two to three times as big as in 1938—makes co-ordination necessary. Whether this expansion of two towns so close to each other, to London, and to Stevenage constitutes good planning, is, perhaps, doubtful. The Abercrombie plan does, indeed, sanction it—but with the stipulation that new industry should be concentrated at Welwyn and rigidly excluded from Hatfield. This provision will be broken if, as is rumoured, a large new chemical factory sponsored by the Ministry of Supply has now got Mr Silkin's permission to settle at Hatfield.

The projected plan itself is, therefore, seriously open to question. But if it is to be adopted, there is already in Welwyn sufficient land, finance, and planning still to implement it satisfactorily. Admittedly, Governmental assistance over water and some other services may be necessary—but is this not equally true of many other existing towns near London which are earmarked for a moderate expansion? Why not, then, set up a small development corporation for Hatfield (if this is necessary) and let Welwyn continue to grow under its present, competent direction? There seems to be no real reason beyond the zealous wish of doctrinaire and bureaucrat for a tidy uniformity. But good planning requires local roots and fresh ideas. There are going to be many centrally designed, cut-to-a-pattern, development corporations; let there be one tree in the forest which has grown on its own.

The Pressure for Higher Education

Last week the Minister of Education made some interesting statements in the House of Commons about application for and awards to the seven hundred and fifty State Scholarships which were offered by the Ministry for the present university year. More than 11,000 boys and girls entered for these scholarships. (This is the first year in which the scheme to increase the number of state scholarships from 350 to 750 a year has been in operation.) The proportion of applicants to successful candidates was, therefore, fourteen to one, and shows a very keen competition.

The new scheme to ration the number of state scholars going to each university, so as to prevent a still further "creaming off" for the benefit of Oxford and Cambridge is now coming in for a number of kicks. When it was announced in the spring most people applauded this attempt to equalise the distribution of brains among the universities. Now that Mary Smith and Tom Jones are being "allocated" to Sheffield or Exeter instead of Oxbridge there is a howl of human but illogical rage.

Application for state scholarships does not debar those who fail to obtain them from applying for a major award from a local authority, of which probably something approaching 3,000 have been made for the current year. This gives a wide scope for those who fail to obtain a state scholarship. At the present time there are many in the universities who believe that some candidates admitted with public awards do not justify this expenditure of public money upon them. This may be true enough, taking the education system as it is. But it would be well to recognise the increasing pressure for higher education and the more hopeful prospects it gives for the future, which can be illustrated from statistics of public examinations taken at school.

Last year—the latest for which statistics are available—23,000 pupils took the Higher School Certificate examination and 16,000 passed. This was an increase of 74 per cent in the number who entered and 70 per cent in the number who passed over 1939. Since the number taking and passing School Certificate increased over the same period by only 24 and 27 per cent respectively it is clear that the fashion for taking Higher School Certificate is increasing the more rapidly. However defective this examination may be and whatever changes in the examination system are made next year, these figures are further evidence that the nation is paying increasing attention to its higher education.

Industrial Research

Research is all the rage. Great Britain's survival and future prosperity, it is frequently claimed, depend on the technological advances it can make. The Government have given their blessing to the increased flow of scientists from universities, who will either add to fundamental knowledge or assist in the application of that knowledge to industry. Technical schools are to be increased, and public money on a modest, yet much more generous scale than before the war, has been provided for medical, agricultural and other research.

Industry is urged to fall in with this new spirit, but hitherto the facts about the extent to which it was doing so have been unknown. The Federation of British Industries is, therefore, to be congratulated on their attempt to assess statistically the quantity of scientific and technical research being carried out by British industry in its own laboratories and works at the present time. The report is not complete, for it was a private and not a public inquiry, and was backed by no sanctions. Nevertheless the replies received from 471 firms are estimated to cover 50 per cent of British firms carrying out research and some 75 per cent of Britain's privately financed research effort. The results are therefore important.

The figures obtained by this survey and one carried out before the war may be summarised as follows:—

1930	422 firms spending	£1,736,000
1935	484 " "	£2,696,000
1938	566 " "	£5,442,000
1945/6	420 " "	£21,815,000

On the assumption that in 1945/6 the 420 firms were carrying out three-quarters of the industrial research in private establishments, some £30 million a year is being spent by industry on its own research. Although this sum is a great improvement on prewar years it still compares very unfavourably with the amount spent in America. Perhaps the tax concessions made in 1944 for expenditure on research will bear more visible fruit in years to come.

Compared with these sums government expenditure on research for the year 1947/48 is estimated at £67 million, of which £60 million is for the defence services, and the rest for civil purposes. The sum of £11 million is also to be distributed to the universities for all purposes.

Coup d'Etat in Bangkok

How to grow and export more rice, and how to check and uproot corruption, are the two central issues of Siamese politics. Dissatisfaction with Luang Dhamrong's government, which has been brewing for some time, was based on its failure to deal with

them adequately. It remains to be seen whether the *coup d'état* which brought Marshal Pibul Songgram back into power last Sunday will solve the problem.

Pibul Songgram led the constitutional revolt in 1932 against the absolute monarchy. He was premier of Siam before and during the Japanese occupation, and declared war on the Allies in 1942. He was ousted from power in 1944, but he re-entered the political field in April this year, uniting with his old Liberal opponent Aphaiwong to throw out Dhamrong's Popular Party, which they claimed was inefficient and too far to the Left.

Far more important than the serpentine coils of Siamese politics is the export of rice. Before the war it amounted to about 1½ million tons per year. It has fallen now to little more than 500,000 tons, although an aerial survey of the padi fields at the beginning of this year showed that 99 per cent were under cultivation. In 1946 the Allies were demanding 1,200,000 tons of rice as an indemnity for Siam's alliance with Japan, but since then the resistance to its collection has been exasperatingly effective. In an effort to improve the position the Allies set up a year ago a Combined Rice Commission. They offered a price of £12 14s. per long ton, thereby hoping both to encourage hoarders to release the rice and to put Siam on its feet. The price was raised at the beginning of this year to £24, and again at the end of August to £31, when the Siamese Government agreed to ship the rice under the instructions of the International Emergency Food Council. But full supplies of rice will not come into the regular markets as long as there is the lure of the Malayan and domestic black markets and corrupt Siamese officials to feed it. The experiment of Luang Dhamrong, the displaced Prime Minister, in state trading led to a big expansion of bureaucracy, giving ever wider opportunities for officials to line their pockets. If Marshal Pibul Songgram can check the corruption and increase the export of rice, his *coup d'état* will have results as useful to the outside world as they may be salutary to Siam.

Shorter Notes

The Minister of Town and Country Planning announced on Tuesday in the Commons the composition of the Central Land Board set up by the Planning Act of this year. In effect, with two exceptions, the membership of the Board will be identical with that of the War Damage Commission. Sir Malcolm Eve will continue as chairman. The present staff of the Commission is about 3,000, and no doubt the majority of them will be absorbed in the organisation of the Board, which should accordingly start with benefit of a considerable body of accumulated experience.

*

A note on page 751 of last week's issue attributed the whole of the output of over four million tons of coal in the week ending November 1st to the miners. It has been pointed out that over a quarter of a million tons of this total was obtained not by mining but by civil engineering.

*

Three interesting and significant sets of figures have come from the British Zone in Germany during the last ten days. Ruhr coal production, which during the week ending November 1st maintained an average of more than 250,000 tons per day, increased last week to a daily average of 272,881 tons, with a peak day of 274,277 tons. The other figures were revealed by Mr Bevin, who said that in the past nine months 89,000 authorised and about 100,000 unauthorised refugees from the Russian zone have crossed into the British Zone. He also revealed that there have been 1,598 resignations from the British Control Commission within the last six months.

*

The success of the Liberal Party in the Victoria state elections is proof of the fears and resentments aroused by the Labour Federal Government's plan to nationalise the banks. Both the Liberal and the Country parties made the nationalisation Bill the main issue in their election campaigns and the results have reflected a widespread public opposition to it. The Federal Government is rushing the Bill through at great speed and has steadily resisted all efforts by the Opposition to make it the subject of a referendum. With the present Labour majority at Canberra there is no likelihood that the Bill will be thrown out, though it will still have to stand the test of the High Court when it becomes an Act.

Letters to the Editor

Crisis of Leadership

SIR,—Your article in your issue of October 11th substitutes generalities for precision and should be blamed for a general lack of understanding of the American scene and mentality. You say that "... in the matter of availabilities in one sense there are no American availabilities. The consuming power in the United States is such that it could devour everything its farmers and factories pour out." Nothing could be further off the mark. American wheat exports of 350 or 450 million bushels could definitely be regarded as a surplus "fully available." Nor is this amount significant, either in relation to the crop of 1,400 million bushels or the prewar exports which amounted to 93 million bushels in 1939. Similarly, exports of trucks and buses, which were 21 per cent of total production in the first quarter of 1947 can be spared without domestic hardship. Other items like coal can be shipped without causing excessive dislocations, while the number of items of less essential nature, such as cotton, textile materials and tobacco, are too long to enumerate. It seems difficult to understand *The Economist's* contention that domestic availabilities are unimportant and that foreign need should be the sole consideration in the American discussion about the Marshall Plan.

Except for controls which start with price ceilings, wage regulation, excess profits taxes and end with consumer rationing, no system of control will assure a reduction in domestic consumption to a level indicated as necessary to raise the European economy to the desired level. If exports are undertaken in excess of available supplies without such controls the result will be to raise prices. As the European requirements are highly concentrated in commodities with an extremely inelastic demand like wheat, the inflationary effects of even a 10 per cent excess of exports over supply will cause a general price spiral in the United States which would hurt Europe as much as the U.S. Rightly or wrongly, the mood of this country is not ripe for full wartime controls. Barring such measures it will be necessary to limit exports to surpluses, which have to be carefully calculated, or go head-on into inflation.

This is deplorable, but should be understood by the Europeans just as the Americans have to recognise British inability to date to impose adequate controls and incentives to raise coal production to the prewar level (physically certainly feasible but politically impossible) or the inability of the French Government to induce or force the farmer to sell his output. We all live in glass houses, and an attempt to understand the different problems of all nations is better than throwing stones at each other.—Yours faithfully,

A. SALTON

400 East 57th Street, New York

Cripps, Controls and Consumption

SIR,—It has often been emphasised that the main cause of the present inflationary situation is that the amount of provision for the future, that we, as forward-looking people, feel we ought to do, is greater than the supply of savings that we, as consumers, are willing to provide. In your leading article of November 1st you advocate again the policy of eliminating this gap by forcing savings (through budget surpluses) and pruning investment plans.

May I make some comments on the latter operation? (1) The object of provision for the future should be to make sure that our cost ratios equate with world price ratios in a normal postwar year and at a bearable standard of life. This equation does not hold at the moment because of the turn of the terms of trade against us and the extent of our capital disinvestment in war and slump.

(2) The amount of provision for the future that we do this year should be determined by the relation between the marginal pain of consuming less now and the marginal pleasure of having a larger cake later. This ideal rate of investment is secured neither under a *laissez faire* system nor under the present practice of planning authorities (who seem merely to think up the amount of construction it would be nice to do and then compress it into a four or five year plan).

(3) The sort of investment that we do this year will affect the marginal utility of income—and thus the amount of saving we will be willing to do—next year.

(4) During the period of the Investment Plan our cost ratios will still not be aligned with world price ratios. Therefore the real value of £1 worth of goods exported will be greater to the country (though not to the producer) than £1 worth of goods sold on the home market. Some sort of export controls or subsidies would therefore have to be maintained in the interim period even if deflation was completely successful. A similar, though opposite, reasoning applies to imports, which would still have to be subject to consumption control.—Yours faithfully,

N. A. D. MACRAE

Corpus Christi College, Cambridge

Bank Nationalisation in Australia

SIR,—May I suggest that, in your attacks on the Australian Government's bank nationalisation proposals, you are being misled by a false comparison with Britain?

Personally, I agree that something like the British system, combining Government control of general credit policy with individual flexibility, has advantages in theory over the vast state banking monopoly Mr Chifley proposes to establish. But in Britain the leadership of the Bank of England has long been almost undisputed. Australia has no agency for Government control of comparable authority and prestige. Far from traditionally following the lead of the Government Commonwealth Bank, the commercial banks have always been bitterly hostile to it, since it was originally set up to compete with them in ordinary banking business. It was not until the war that the Commonwealth Bank was given any central banking powers, consolidated by the Bank Act of 1945. The commercial banks strenuously opposed the 1945 Act, made it plain that they only accepted the central banking control by "special accounts" under protest, and reserved the right to challenge it under the Federal Constitution. In fact, an important section of the 1945 Act has already been declared invalid by the courts, casting doubts on the validity of the whole.

Moreover, in view of the hostility of the commercial banks towards Government control, it is doubtful whether the 1945 Act, even if its validity were upheld, gives the Government adequate powers. The 1945 Act can be used successfully, as at present, to stop an expansion of credit: in fact, the "special accounts" technique was devised as a weapon against wartime inflation. But it is hard to see how any legislative coercion can make a bank expand credit if it is determined not to. I presume the contingency Mr Chifley has in mind is a depression hitting Australia when a Labour Government is in power. The commercial banks might be given all the necessary means for implementing an easy-money policy. It might be profitable for them to do so. But they might

From *The Economist* of 1847

November 13, 1847

ALL hope of avoiding civil war in Switzerland is at an end. The Diet has finally resolved to carry into execution, by force of arms, its decrees for the abolition of the Sonderbund. On the 4th inst. this resolution was taken, and notified to all Switzerland and the world, by an elaborate manifesto. The 8th was the day appointed for the troops of the Diet to begin their operations on a grand scale; but already there are reports of trifling conflicts having taken place, and at least two officers have been killed. The die is cast, and whether it turn up ruin or consolidation and aggrandisement for Switzerland, we must wait to see. Not supposing, however, that strife and bloodshed can ever lead to good, we deplore the beginning of a contest which, on the showing of the parties, can only be prosecuted with a view of establishing and strengthening the authority of a body of priests or a body of civil magistrates. If the increase of either authority were likely to be conducive to the security and happiness of the Swiss, the result of the war might possibly be beneficial, but it is an ill augury that the welfare of the people is wholly lost sight of in this contest for supremacy. They are, in the first instance, the victims of the struggle for power; though it is possible that the successful authority, whichever it be, may, when the interrupted peace is restored, by an enlightened administration and extension of freedom, add to the happiness of the next generation.

deliberately choose to keep credit restricted, defying the Government's wishes by every possible legal loophole and legal delay, hoping that a temporary intensification of unemployment would lead to a change of Government. The possibility of the banks behaving in this way can hardly be denied, considering the virulence of the anti-Government propaganda they are now inspiring.

The slightest personal knowledge of Mr Chifley discounts any idea that he is a "doctrinaire Socialist": witness, for instance, his action in handing back to private enterprise the wartime factories built by the Government. Still less is he the Bolshevik bogeyman depicted by the Australian newspaper—a would-be dictator who, while cunningly posing as a moderate pipe-smoking politician, is cleverly taking the first step towards a totalitarian Communist regime complete with concentration camps. Mr Chifley is first and foremost an acknowledged financial expert, whose monetary policy to date has been shrewd and successful. He has explained that he is nationalising the banks because the 1945 Act does not give him the power necessary to prevent a repetition of the miseries of the 1930 depression: and he has denied any "hidden purposes." His record of complete political honesty (somewhat unusual in Australian politics) leaves no doubt that he is speaking the truth.—Yours faithfully, ALAN WOOD

Blackheath, NSW, Australia, 5 November, 1947

Local Financial Reform

SIR,—Your comments on the Government's proposals for the valuation of dwelling houses do not, it seems to me, show a proper appreciation of the situation. These proposals do not arise from a desire to prevent "hardship to individuals" or even "to assist poor householders in general," but to prevent a shifting of the incidence of local taxation. If the law is not altered, houses will have to be assessed on the rent "that can reasonably be expected," however high that rent may be. Owing to the shortage of houses after the first world war, the rise in the costs of building and the higher standard of working-class houses demanded by public opinion, rents of these and similar private enterprise houses, unless controlled or subsidised, were very high. On the other hand the rents of the larger pre-1914 houses had hardly risen at all, and rents of other properties very much less than the small post-1919 houses. The same postwar conditions are now repeated. If assessments are based on rents, therefore, a part of the burden of rates now borne by large houses, shops, offices and other properties will be shifted on to the occupiers of the smaller houses.

The reason why this did not happen in the inter-war years was not mainly, as you suggest, because local authorities wished to stimulate house building—although by their action they certainly assisted private enterprise to increase its output—but because they realised that a grave injustice to a section of rate-payers would be the result of valuing "correctly."

I do not suggest that the Government's solution is perfect—the subject is too complicated for that—and Parliament might still improve it, but it will prevent grave injustice which would inevitably have resulted from the application of the law as it stands.—Yours faithfully,

Didsbury, Manchester, 20

Light Clothing Industry

SIR,—Having read with considerable interest your commentary on the Report of the Working Party on the Light Clothing Industry, I feel impelled to stress the importance of "the problem of price control" to which you give prominence. There would seem to be little hope of increased exports except at the expense of home trade supplies, under the cost-plus system, and I submit that this is an intolerable state of affairs which requires the widest publicity.

The total labour employed by that part of the clothing industry covered by the Heavy and Light Clothing Working Party Reports is given in Cmd. 7018 as 462,000 in November, 1946. The corresponding figures provided by the Bureau of Labour Statistics in Washington is 724,900. United Kingdom exports in the industry ran at approximately 3 per cent, which closely paralleled the export percentage figure for the United States. The population in this country was 48,016,000, whilst in the United States it was 140,386,509. Your readers will be in a position to judge whether the ordinary person in this country is more lavishly clothed than his or her opposite number in the United States, but the ordinary person here on the basis of the above figures requires rather more than double the manpower to meet his or her clothing ration than the ordinary person in unrationed America.

Whilst our Minister for Economic Affairs wants more wives and mothers in the textile factories to make up his deficit of 75,000 workers there, assuming that the average American is no more lavishly dressed than the average Briton, there must be something like 200,000 surplus workers on the payroll of the clothing industry in this country at the present time. The industry has highly paid workers and high trading profits, but never was the mockery of a policy of full employment unaccompanied by a rising standard of productivity more clearly exposed.—Yours faithfully,

G. T. MACEWAN,

Chairman—Institute of Export 1943-1946

The End of Plural Voting

SIR,—As one of the people with two votes, I agree that I ought only to have one, but I shall object strongly if this change is brought about by abolishing the only four constituencies where one can be reasonably certain that this one vote will count—that is, the four University constituencies that vote by proportional representation.

As you say, the University MPs are generally of high calibre and often of genuinely independent views—but that was not true of Oxford and Cambridge before 1918; it is only since the introduction of PR that people like Eleanor Rathbone have been able to secure in the Universities the seats which they could not win elsewhere.

I like your suggestion for one large University constituency, and it would certainly give PR a chance to work even better than it does in the present two- and three-member constituencies, but I doubt whether the Government will be persuaded to let the Universities keep the twelve (not thirteen) Members which they have at present.—Yours faithfully,
ENID LAKEMAN

AMERICAN SURVEY

The Position of Labour—I

(From Our US Editorial Staff)

THE conclusion of the annual conventions of the American Federation of Labour and of the Congress of Industrial Organisations, and the passing of the administrative deadline set by the National Labour Relations Board for the filing of affidavits and reports under the Taft-Hartley Act, make pertinent a review of the current position of American labour. The basic fact affecting its position is that American production is currently employing some 60,000,000 people. Only yesterday the war-time post-war planners were yearning toward this figure as a goal on the upper fringes of the possible, attainable, they said, only if American business were prodded out of its attachment to an unimaginative normalcy with scarcity just around the corner. But these prophets have been denied even the consolations of Cassandra. The honour is going to management. In a dark world, the American output takes on the contrasting glitter of a cornucopia.

American labour is now reorganising its methods and purposes to suit this situation. Its campaign against the Taft-Hartley Act, the law which at once reflects and fortifies the new mood of the country, is on its own behalf. More of what it is doing concerns matters of direct interest to labour, but of equally direct interest to other segments of the population. The emphasis at both the AFL and the CIO convention supports the guess hazarded when the Taft-Hartley Act was passed, that it might stimulate American labour to political activity as the Taff Vale decision stimulated an earlier generation of British workers. The CIO's claim that labour will influence 60,000,000 voters in 1948—the similarity with the employment figure is doubtless coincidental—calls for a large-scale extension of the doorbell-ringing, precinct-by-precinct technique practised by the CIO and its Political Action Committee with varying degrees of success over the last few years. The AFL decision to organise "Labour's Educational and Political League" is new. The traditional AFL doctrine of rewarding friends and punishing enemies individually is to be maintained, at least to the extent that prevents the endorsement of a whole political party, but it is not impossible that the new League may decide to endorse a Presidential candidate. And the rousing ovation the convention gave to Mayor Hubert Humphrey of Minneapolis, potential Democratic candidate against Senator Ball, head of the joint Congressional Committee on Labour-Management Relations established under the Taft-Hartley Act, left no doubt about AFL intentions of political activity on the state level.

The purpose of the League, however, is to be educational as well as political in the narrow sense of winning elections. In other words, the AFL sees that it is necessary to make friends before influencing people. Budgeting a sum that will run somewhere between one and three million dollars to acquaint the public with labour's cause is precise recognition of the fact that labour alone does not have enough strength to put its programme through.

During the New Deal the liberals courted labour, and made a coalition that produced majorities for over a decade. Today, labour is courting liberals. To win support from the citizens who are not unionists but just people—and many of them who were alienated by last year's strikes—emphasis must be on issues broader than those of wages, hours, and conditions which are labour's primary concern as a producer. Consumers' issues provide the basis for a community-wide bid.

Demand for another round of wage increases would be widely unpopular. Demand for action to halt inflation and bring prices down is likely to be very popular indeed—and at the same time to serve the immediate purposes of labour. The CIO resolution on the subject urged the President—eight days before he acted—to "call for an immediate session of Congress for the purpose of re-establishing price control on all commodities and rationing for food, clothing and other necessities of life."

General resolutions of this sort have been paralleled by some local action. Not long ago the United Auto Workers, CIO, took measures to bring down the cost of living for its Detroit locals by using union money to buy groceries wholesale and resell to members at a saving of 10-12 per cent. From this beginning has grown a move to co-operate with churches, veterans and consumer organisations, postal employees and some AFL units in Detroit to raise funds for a co-operative warehouse and a large retail outlet. Supply would be arranged through relations with the wholesale co-operatives and farm organisations. And in the process, people from various segments of life would work with unionists.

★

Further co-operation with other groups is likely to be a by-product of the UAW's convention held this week at Atlantic City. The background of this convention is perhaps worth outlining in detail, as an example of technique in the application of trade union democracy. More than any other union, the UAW has demonstrated the left-right cleavage which is a reality—to an extent frequently unrecognised in Britain—in a considerable number of strategically located CIO unions, all the way up to national headquarters. Its relations with the public, and those of the CIO, have been prejudiced by suspicions of Communist influence. The Reuther brothers have been the leaders of the UAW's right wing. Mr R. J. Thomas, the former president, and the secretary-treasurer, Mr George Ades, have been followers of the Communist party line. Last year, Mr Walter Reuther was elected president with a very delicately balanced board. A short time ago, his group seemed likely to lose control to the left, through the recommendation, first by the jurisdictional disputes committee and then by the executive board, that the Farm Equipment Workers be taken into the UAW. The Farm Equipment officers are highly disciplined left-wingers; the union is some 70,000 strong.

The proposal required ratification by the membership of both unions. Acting on the assumption that left-wing successes are apt to be compounded of intense and well-maintained energy on the part of small numbers of party-liners plus lethargy on the part of a majority that would oppose them if the issues were

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

known and clear, Mr Reuther engaged Mr Addes in debate, stumping the local meetings prior to the vote. The merger failed. The effect of this rank-and-file campaign took Mr Reuther to the convention with a strength sufficient to defeat moves for the re-election of Mr Addes as secretary-treasurer, and Mr Thomas as vice-president. The full election for a new Executive Board of UAW has not taken place, but these first defeats, along with a clean sweep for the Reuther forces on other votes, are of immense importance. They leave the way clear for the UAW to register with the National Labour Board, and to obtain full recognition under the Taft-Hartley Act. Formerly, Mr. Reuther's insistence upon registration had been blocked by Mr Thomas who, as a union officer refusing to sign the necessary anti-communist affidavits, could disqualify the entire body of UAW workers. The defeat of Mr Addes is equally significant.

Up from Colonialism

(From a Correspondent in Denver)

WALK down a business street anywhere in the American West between the Missouri river and the Sierra Nevada mountains—and you will find that more than 90 per cent of the fabricated and manufactured products for sale in shop windows have been brought 1,000 to 2,000 miles, largely from the quadrangle bounded by Chicago, Boston, Washington and St. Louis. In normal times, three-fourths of the manufacturing in the United States is done in this north-eastern quadrangle. Here also is the nation's centre of finance and politics. People living outside that area are getting tired of their colonial or semi-colonial status. They are largely limited now in the economic pattern of the nation to the supply of raw materials, which imposes on them a lower *per capita* income, and therefore a lower real standard of living than the industrial sector. Even during this greatest crop year of all time, even with farm income leading the upward price spiral, *Business Week's* study of what it calls the Farm West—the 10 states including the Missouri River Basin and bordering it on the East—have shown that they barely brought their *per capita* income up to the national average, and that only by a combination of loss of population during the boom years 1940-47 with the higher prices for their products. Further, their present prosperity rests on an uneasy crust, for a drought would send their production plummeting downward, and every one is aware that a dry year, or a succession of them, is overdue.

How little even war manufacturing has changed the fundamental agricultural pattern is shown by the fact that Missouri, the easternmost state in this group, has 40 per cent of the group's entire factory employment. Yet a recent study made for the Army engineers asserts that the tri-state area of Colorado, Wyoming and Utah contains the greatest energy potential in the world in a similar area, counting coal, oil, oil-shale, water-power and uranium. The South, of course, has an older and deeper complaint, and an even lower *per capita* income. Its economy is even less diversified than that of the mountain-and-plain West. The leader in the political and economic drive for industrial diversification, its aggressiveness has brought such victories as this policy has so far achieved, such as the freight-rate changes granted by the Interstate Commerce Commission in 1945 and confirmed by the Supreme Court early this year.

In the West as in the South, local counsels are divided, since many of the more influential citizens and institutions are in effect agents for the industrial and financial companies of

He has held office since 1938, and each convention since then has provided a fresh demonstration of his personal hold on delegates. Now, his failure is the signal for re-election of a completely new Board on which Mr Reuther hopes to place eighteen of his supporters. There are twenty-two members, and the Reuther forces last year held only eight votes, to fourteen of the Left-wingers. With the party-liners driven from office, the UAW is likely to develop its community activities, particularly group-insurance plans with other right-wing unions, and possibly with farm organisations. The balance of power throughout the CIO will change appreciably, and in the longer term this may change the entire prospect for organised labour.

(A second article will review the status of the unions under the Taft-Hartley Act, in connection with their organising activities and procedure before the National Labour Relations Board.)

the North-East. But the West is waking up. One awakener was the Republican national victory in 1946 which installed a Congress dominated by North-Eastern politicians with no fondness for devices like the Tennessee Valley Authority which might be a drain upon the East. Westerners are aware that progress toward diversification has been greatest in those regions where large government works have provided low-cost electric power, not only in the Tennessee Valley but in Southern California and the Pacific North-West. Industry is attracted almost against its own will. Water falling from the high spine of the Rockies, trapped in reservoirs, can provide several additional millions of kilowatts of power if the huge Western irrigation projects proceed, and these projects promise to be largely self-supporting. The reaction against the cuts in the Federal Government's programme of public works in Western States during the last Congressional session, are raising Democratic hopes for those states in 1948.

The situation regarding wool illustrates the current trend. About three-fourths of the nation's wool is produced in the 12 Western states, including Texas. Still "in the grease," almost all of it is loaded into freight cars and shipped bodily across the country to the Boston region—up to 60 per cent of the weight thus transported is grease and dirt. Cloth and garments made from the wool are then shipped back 1,000 to 2,000 miles. Public bodies and private individuals are working on a programme to carry the western wool industry beyond the raw material stage. Until this year, wool to be purchased by the government under its buying programme could not even be "core-tested" for quality in the West—it had to be shipped to laboratories in Washington, D.C. Now there is a laboratory in Denver. The agricultural extension experts of 11 Western States also are jointly studying the whole question of wool marketing. A pilot plant is to be built in Denver for the scouring of Western wools and to be followed by the erection of similar plants for preparing "tops" of the finished wool ready for the textile manufacturer. Once these facilities were available, cloth and garments could be made on the spot. Initially, such industries would supply the local market; later, they might perhaps sell in competition with the Eastern wool and wool-fabricating industries.

What is true of wool processing is comparably true of tanning—there are no tanneries or leather-using industries of any magnitude in this whole region, despite its millions of cattle—and manufacturing based on leather is being studied with great care. Westerners, too, insist that since the country's industry is now largely concentrated in the North-East, in an area little larger than some Western states, national safety in modern war lies in the encouragement of secondary industrial centres so widely scattered that they cannot be obliterated. In other words, they feel that their programme is no longer merely self-seeking, but is tied up with national policy.

American Notes

Administering the Plan

As the committee reports come home to roost and the Marshall plan gets under way, the most striking fact to emerge is the broad area of agreement on principle between such bodies as the Herter and Harriman committees, the Administration, and such outside political figures as Governor Dewey. This meeting of minds is reflected in the receding of partisanship over the special session's immediate task of passing judgment on stop-gap aid. Mr Marshall has supplied the full picture of the long-term programme which Congress wished to possess before it determined whether the gap could and should be met. Mr Truman has given precedence to the interim foreign aid bill over the anti-inflation programme which is so much more controversial, and the speaker's *quid pro quo* in deferring Mr Knutson's \$4 billion tax reduction bill to the regular session has done much to clear the way for prompt and unpartisan action. Senator Taft alone has isolated himself in stubborn opposition to the orders of magnitude suggested by the Harriman Report and Mr Marshall's testimony on the Congressional Committees.

On this he sharply parts company with Governor Dewey, whose decision to abandon fence-sitting for a place on the Marshall band-wagon is one of the most favourable of present omens. Mr Dewey has not only declared that there is no alternative to the Marshall plan; he has aligned himself with those who oppose attaching political conditions to foreign aid, and who consider that it would be fatal to demand dollar repayment for the bulk of the programme. He made, however, no commitments on the amount of aid he would support; that nettle has been left to other hands. What his speech does suggest is that much of the Republican fire will be concentrated on the administration of the plan. He made a most bitter partisan attack upon the incompetence with which the aid programme had been handled in the past by the State Department, and demanded that control should be taken from "social planners who do not know a loom from a corn husker."

A Bipartisan Board?

American opinion is virtually unanimous on the need for creating a new agency or corporation to administer foreign aid, to ensure flexibility of operation, and efficient centralised control over purchasing, allocations, and control over European progress. The Harriman Committee specifically recommended a government corporation, which would be free from bureaucratic procedures, to be headed by a Presidential appointee approved by the Senate, and with a Board of Directors which would include representatives of the government departments chiefly concerned. It would also have an Advisory Board on general policy made up of representatives of business, labour and agriculture, rather, in fact, like the Harriman Committee itself. Mr Marshall, while not committing himself on the question of whether the new body should take shape as an executive agency or enjoy the greater freedom of the corporate form, underlined the need for flexibility and the desirability of making full use of the experience and resources of existing agencies like the Departments of Commerce, Agriculture, the Interior, and the Treasury. The control of an organisation which, Congress willing, may enjoy wide powers to qualify foreign nations for further aid, to scrutinise demands, to allocate goods and funds, and to decide how much assistance is to be tied or free, is as important as the total amount of aid which Congress may grant. It is understandable that the State Department, which has fathered and nursed the Marshall plan, should want to ensure that its operation which is so central to American foreign policy, should be in accord with the main aims of State Department policy, rather than in an independent compartment.

At this point Republican views diverge sharply. Governor Dewey has demanded businessmen for a businesslike job. The Republican party also suffers from a suspicion that in the past it has had the short end of bipartisanship; its members feel that it has forgone the making of party capital out of foreign issues without enjoying either a fair hand in the origination of policy or a fair share of the credit. The Herter Committee at first favoured a scheme which would have placed the control of the new European Recovery Corporation in Republican hands. It has since come to sponsor a bipartisan board as urged by Governor Dewey, the appointments to be made by the President after consultation with Republican leaders. A party struggle over control of the administration of the plan could be very damaging;

and the Administration will no doubt appreciate the necessity indeed the inevitability of making concessions. The names of former Senator LaFollette, a protégé of Senator Vandenberg, and that of Mr Lewis Douglas have already been suggested for leading appointments. These skirmishes over control of the programme are the most convincing evidence, however, that the great question of to be or not to be for the Marshall plan has already been decided in the affirmative.

Wheat and Hogs

In striking contrast to the view taken by the Council of Economic Advisers, the Harriman Committee's report on aid for Europe declares that exports, rather than domestic demands, have been the primary cause of inflationary pressure. It agrees, however, that the grain stock position is extremely serious, and asserts that minimum export commitments rest upon the presumption that the United States will experience "average weather conditions" over the next three crop years. In itself, this would seem to be an entirely reasonable presumption. Unfortunately, one bad year could spoil the entire pattern, and this year's bumper wheat harvest has been followed by drought throughout the wheat belt. So far, plantings cover less than one-half of planned acreage for the 1948 crop, and heavy rains are needed to avoid the certainty of a much lower yield next year.

The immediate prospect for exports looks rather more hopeful. While precise figures are not available, it is understood that the Federal government has completed a very substantial proportion of the emergency wheat purchases, and that deliveries are assured. Moreover, there are suggestions that early estimates by the Department of Agriculture were rather generous in their assessments of wheat consumption by livestock. Some time ago, the Department suggested that, with a reduced corn (maize) crop, livestock would consume no less than 350 million bushels of wheat, against 500 millions for domestic food. Much of this livestock feeding represents a quite unjustifiable drain on resources at this stage. Some relief may follow from the fact that the rise in the price of corn in recent months has brought about a sharp decline in the "corn-hog ratio." This yardstick measures the number of bushels equivalent in value to 100 lb. of live hog-meat, and the higher the ratio (or the relative cheapness of corn) the more profitable does livestock feeding become. The ratio is now 12, against 19 last spring. Even this development, however, cannot be relied upon to provide sustained relief. With consumers' income at peak levels, meat prices will remain relatively high, and the amount of wheat fed to livestock depends not only upon the relationship between corn and hogs, but also between corn and wheat. This year, with corn scarce, and badly distributed over the United States, wheat feed for hogs and cattle will remain at levels that spell waste, except in terms of abundance.

The more zealous advocates of control continue to assert that the only practicable measure would be for the government to impose price ceilings on all livestock, and to penalise fat stock by price schedules which discriminate against overweight hogs and cattle. On earlier experience of price control, however, such a programme would demand the establishment of a tremendous machine for enforcement, and the farm community and the meat packers can no doubt be counted upon to provide a very stubborn resistance through their Congressional spokesmen. The President, it is thought, may be willing to propose fixed prices for grains at levels that would discourage livestock feeding of wheat, and to provide farmers with tax incentives, so long as they co-operate in the government buying programme. But the response of the farmer, in turn, hinges upon the prospect for the 1948 crop. The Bureau of Agricultural Economics, in an initial survey of that prospect, declares that a wheat crop of one billion bushels might leave only 200 million bushels of wheat for export, or only forty per cent of the projected total for 1947-48. And a billion bushels (against 1.4 billion in 1947) would be decidedly better than an average crop.

The Political Tide

The returns in last week's scattered municipal and state elections have been received with a certain quiet gratification by the Democrats, while the Republicans have insisted, with a new vigour, that they are too isolated to have any real political significance. This is something of a change of tune; before the election the Republicans were prepared to draw a comfortable moral than the hoped-for results. In Kentucky alone was there a campaign waged on any national issues; there the Democratic

candidate for Governor, on a platform of support for the Administration and opposition to the Taft-Hartley Act, soundly beat his Republican opponent. Kentucky is a border state and something of a weather-vane; in 1946 it joined the Republican tide by sending a Republican Senator and two Congressmen to Washington, and the sitting Governor was a Republican. Normally, however it is Democratic; and a return to the fold can hardly be counted as more than a sign that the flood-tide of Republicanism evident in 1946 has receded from one Democratic peak. In other states the Democrats registered a number of mayoral victories, and in three by-elections to the House of Representatives, the Republican percentage of the vote declined somewhat in each case. The Gallup poll, on the strength of these returns, the result in Kentucky, and the Republican victory in Pennsylvania in September, estimates Democratic gains at 5 per cent, but the sample is too small to be reliable.

More general interest will be felt in a purely Democratic contest in Mississippi to fill the seat of the late Senator Bilbo. An open race between five candidates resulted in the election of Judge Stennis, whose campaign was as dignified as Bilbo's used to be disgraceful. Representative Rankin, of the Un-American Affairs Committee, whose proud boast has always been that he could out-Bilbo Bilbo, came in last. It will be remembered that Bilbo used to twit his Northern critics by insisting that it was their interference in purely Southern affairs that put him in. The lesson was not lost on any of the contestants for his toga, who vied with each other in efforts to make enemies and influence people. There is no reason to imagine that Judge Stennis, in Washington, will fail to adopt the traditional Southern attitudes toward a Fair Employment Act, anti-poll tax, anti-lynching or anti-discrimination legislation. But it is to his credit and the credit of the Mississippians who voted for him that not once did he raise the issue of "white supremacy."

Defeat for PR

The system of proportional representation was on trial in New York and Cincinnati last week for the third time. In the Ohio city, PR held its own by a substantially wider margin than in earlier elections, but in New York, its largest laboratory, there was an almost two-to-one majority against retention. In both cases the results seem final; in Cincinnati the Republican leading the opposition promised that there would be no more attempts to oust PR. Democrats and independent Republicans had rallied to its support.

In New York the Republicans, who under Mayor La Guardia had repulsed two attempts to repeal PR, joined with the Democrats against the minority parties and civic groups. Their chief argument was that PR had discharged all too effectively its function of guaranteeing minority representation: that a City Council of 23 containing two Communists, two American Labour Party men, two Liberals (right-wing Labour) and only three Republicans and 14 Democrats grossly over-estimated the strength of these independent and splinter groups in the city. The fact that two Communists were elected to the Council in 1945 gave the major parties an opportunity to denounce PR as "a handy tool of Communists and Fascists" and to paint its elimination as a return to traditional Americanism. When PR was adopted in 1936, the new City Council replaced a Board of Aldermen consisting of 64 Democrats and one lone Republican—a one-party system under the control of Tammany. Under PR, the pendulum swung to the other extreme.

In addition to the question of fair representation, it was claimed that voting in large constituencies meant that few voters knew their candidates; that the system was so complicated that a fifth of the ballots were invalid; and that PR has not appreciably raised the average ability of Council members. New York, because of its bigness, its vast minorities, and its energetic and ingenious Communists, has proved a less favourable testing ground than Cincinnati. The immediate political effect in New York is to dissolve the coalition between the Democrats and the American Labour Party built up by Mr Roosevelt.

The new system will replace the boroughs (of which there are five in the city) as a voting unit by 25 State Senate Districts. The next election will be held under it in 1949. Under majority rule it seems likely that not only the Communists, but other independent parties will lose their representatives, including several able independent Republicans. The burden of proof is now on the victors to show that the repeal of PR will lead, not back to the bad old times, but to a better version of the two-party system embracing a vigorous minority.

Wall Street and Profits

Over the first half of the current year, company profits continued to provide a generous—though by no means unduly generous—reflection of the post-war boom. Estimates made by the Department of Commerce show that, at seasonally adjusted annual rates, profits before taxes increased from a level of \$27 billion at the end of 1946, to \$29 billion in the first quarter of 1947, and declined again to about \$27.5 billion in the second quarter.

These comprehensive figures conceal a considerable disparity in the experience of the various groups. Railroad earnings, for example, are relatively good, but are now far below war levels, while the domestic air transport companies are going through a very awkward patch. In such groups as oil, coal, automobiles, and machinery, however, profits are now running at very high levels, more particularly when comparison with 1946 is with a period when reconversion problems and material shortages were especially acute. Detailed figures are not available for the third quarter, but individual reports have been entirely satisfactory, and dividend rates are now decidedly higher than for any previous period.

The figures to June 30th, however, throw considerable light on Wall Street's sustained refusal to discount present profits on any generous scale—the Dow Jones average of industrial stocks is still considerably below the prewar peak. Inventory profits, for example, have been exceptionally high in relation to total profits, although they show a considerable decline from the fourth quarter of 1946 which brought the end of price control. By excluding these non-recurring profits, total earnings for the last quarter of 1946 would be reduced from an annual rate of \$27 to below \$19 billion, and for the first six months of 1947 from a rate of \$27.5 to nearly \$23 billion.

Similarly, although dividend payments are now relatively high, they represent a lower than normal share of distributable profits. Of profits totalling \$8.5 billion after taxes in the first half of 1947, less than \$3 billion was paid out in dividends, and \$5.5 billion retained. And the wisdom of this conservative policy is shown by the fact that retained profits and depreciation funds totalling \$7.5 billion were only just sufficient to meet expenditures on new plant and equipment, while industry was called upon to finance additions to its inventories to the tune of \$4 billion, provided by temporary bank finance, or by new issues.

These figures go quite a long way towards providing an explanation of the fact that, over a wide range of industrial companies, dividend yields are as high as 5 per cent in marked contrast to the exiguous returns available from Treasury and first-grade company bonds. The immediate outlook is good enough, and Wall Street may well move higher before the turn of the year, if only to keep pace with the still-advancing rate of dividends. But the professional and institutional type of investor is scarcely likely to let optimism outrun caution at this belated stage of a trade cycle, more especially when all responsible authorities are beginning to display concern, and when mounting consumer protests may even force a reluctant Congress to support the President's demand for more effective inflationary controls.

Shorter Notes

President Truman will probably avoid a major clash on the issue of tax reduction during the Special Session of Congress. A threat to reintroduce the Bill, defeated last summer, for reductions totalling \$4 billion had been made by Mr Harold Knutson, chairman of the House Ways and Means Committee, who was supported by Senator Taft. Last week, however, Mr Joseph Martin, speaker of the House of Representatives, said that the programme for stop-gap aid and for price legislation would not leave time for tax debates, and it is believed that his party will support the President, at least to this extent.

*

Voters continue to support liberal plans for bonus payments to ex-service men. Apart from the very large sums already voted by the Federal Congress, State legislatures have approved substantial payments, and municipal elections in New York and Ohio have now brought authority for further grants totalling \$700 million. "Bond elections" in other States will raise the sums authorised to beyond \$1 billion. While this sum is not very large in relation to national income, its cumulative effect may be much more powerful, following immediately upon the disbursement of cash for Terminal Leave Bonds, and the general relaxation of controls formerly covering consumer (hire-purchase) credits.

TI in to-morrow's world

As soon as the war in Europe ended, special missions were started by TI to every country where they saw a possible market for British light engineering products—during the past year no fewer than seventeen such visits were paid.

These were much more than trading missions in the immediate sense of the term. They were composed, not of salesmen, but of technicians. Their task was not to exploit the abnormal shortages which obtain to-day, but to ascertain the long-term needs, the special problems, in each market and to decide how those needs and problems could be met. They were to found a technical service which would endure.

The mass of information gained by these experts will be put to increasing use as production expands. Theirs were embassies to the world of to-morrow... for TI believe that to-morrow only value and service will tell, and that to-morrow is coming fast.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paints—the whole is TI

Mr Molotov's Christmas Box

(By a Correspondent)

IT was with a singular lack of *élan* that the thirtieth anniversary of the Bolshevik Revolution was celebrated in Moscow last week. Wind and rain swept the Red Square and compelled the organisers of the celebration to shorten the traditional march past of soldiers and civilians, and to cancel the parade of the Red Air Force. Marshal Stalin was not to be seen at his usual stand on the Lenin Mausoleum, from which, six years ago, he reviewed the parade of hurriedly improvised divisions, which marched straight from that parade to the front, then on the outskirts of Moscow.

In Mr Stalin's absence, Mr Molotov addressed the Moscow Soviet in a long, dull, repetitive speech which would have lulled to sleep any audience less hardened for such occasions than are the people of Moscow. There was a strange contrast between the lifeless and colourless character of the peroration and the great and full-blooded drama of thirty years ago which it was supposed to commemorate. Rarely has a nation undergone more profound and violent changes within a single generation than have the Russians; and rarely have the leaders of any nation been more incapable than are the present Russian leaders of uttering a single inspiring phrase or a single new generalisation about the great events of which, in part, they have been the makers.

The interest of the Russian public as well as of the world outside has been concentrated, not on the commemorative aspects of the occasion, but on the statements and hints of a topical character that have been thrown out in Moscow. In Russia the political Father Christmas makes his appearance in the first week of November; and he could not fail to bring some gifts this year, too. Thus, the Russian people have learned about the general improvement of their economic situation. The plan for this year is being fulfilled, although the earlier promptings that this year's plan be carried out seven weeks ahead of schedule and finished in time for the anniversary had proved ineffective and were dropped some time ago. It is none the less a fact that the worst of the initial difficulties which hampered postwar recovery have been overcome. Coal output has reached prewar level, even though some of the coal pits in the Donetz basin are still under water. But the rehabilitation of the Donetz Basin has gone ahead with remarkable speed; and this, together with the opening up of many new coalfields in other parts of Russia, accounts for the recovery of the coal industry as a whole. This has been no mere anniversary boast.

So the basis has been laid for a quicker expansion of other industries, although the output of iron, steel and timber is still falling short of expectations. The rebuilding of the destroyed cities of the Ukraine and Byelorussia has hardly made any real progress; but, in contrast to this, the re-housing of millions of homeless peasants, which has been left to the local initiative of the kolkhozes and has been carried out with local resources, has gone ahead very rapidly.

Secret of the Grain Crop

The rehabilitation of agriculture has been another anniversary theme. This year's crop is stated to have been 58 per cent more than last year's. The amount of the crop has not been published—this is apparently considered to be "an important state secret." Grain is, as it were, Mr Molotov's diplomatic ammunition; and he apparently does not want the world to know just how much of it he may be able to fire against the big guns of the Marshall Plan. On a hypothetical calculation one may venture the guess that this year's grain crop has been 70 or 75 million tons, roughly three-quarters of an average prewar harvest. In view of the enormous devastation which Soviet farming had suffered in the war and afterwards, this would be an impressive achievement, obtained thanks to favourable weather as well as to effective use of agricultural machinery and high administrative pressure.

According to official reports, about 75 million acres of land more than last year have been serviced this year by tractors.

The best crops and grain deliveries have been reported from the Ukraine, while Siberian farming has had to contend with unexpected difficulties. The administrative pressure has been stronger in the Ukraine—where Mr Kaganovich has been in charge of the agricultural campaign—than elsewhere. But the better crop in the Ukraine may also have been due to the fact that so much of the land there has been lying fallow for several years. On balance, the improvement in farming has been sufficient to relieve the food situation in Russia and to yield some surplus which can be disposed of abroad. But in order to secure that surplus the Government has so far had to maintain the rationing of bread at home. Abolition of rationing which was forecast, has not been among the anniversary gifts.

War Wounds Healing

Against this background of economic improvement Mr Molotov could rightly claim that Russia was beginning to heal its wounds. He would still have been on not very shaky ground if he had merely stressed the long-term advantages of a planned economy over the vagaries of uncontrolled trade cycles. But he went farther and, in accordance with a time-honoured custom, he portrayed a crude picture, all in black and white, of contrasts between Soviet "prosperity" and the economic miseries of the capitalist world. This part of his peroration could hardly have sounded convincing to those millions of Russian ex-servicemen who, during their advance into Europe, were dazzled by the standards of living in foreign lands. But it is precisely Russian society's incipient awareness of just how low its own standard of living has been that impels Russian propaganda to dwell, with such ridiculous over-emphasis, on all the real and imaginary shadows in the capitalist economy.

Mr Molotov analysed the international situation in terms of a world-wide competition between Socialism and Capitalism. This was once the accepted angle, from which all Bolshevik spokesmen viewed the world situation. There would be no novelty in Mr Molotov doing it again, if it were not for the fact that, in the course of the last few years, international relations were treated in Moscow in terms of a conflict between democratic and anti-democratic forces, rather than directly between Socialism and Capitalism. The pristine Bolshevik formula was revived by Mr Zhdanov in his speech at the foundation meeting of the Cominform in July; in a somewhat softened form it was adopted by Mr Molotov.

As a result of the second world war, Mr Molotov argued, Capitalism has been weakened and Socialism strengthened—"all roads lead to Communism." As a profession of faith or an enunciation of a broad historical view, these words were quite natural in what was after all a eulogy of the first victorious proletarian revolution. But Mr Molotov failed to relate his abstract evaluation of the historical trend to the concrete and current facts, especially to that truly international swing to the Right which has been revealed in almost every recent election outside the Russian zone of influence. In the very long run, maybe, all roads lead to Communism. In the short run, most roads seem to lead away from it. It is not clear to what an extent the makers of Soviet policy are aware of these realities of the international situation.

It is most likely that they have resorted to the old formulas of class struggle, not so much because of any genuine interest in the social outlook of other countries, as because of their uneasiness over what they consider to be the sure symptoms of a warlike attitude in the capitalist world. It is not inherent in the Stalinist doctrine that the competition of the two systems must lead to their armed conflict. But, in the event of armed conflict, the Soviet leaders must in the last resort appeal to the working classes of other countries and try to utilise the social conflicts of the capitalist world. In the war against Nazi Germany they could still afford to refrain from purely Communist revolu-

tionary propaganda and to confine themselves to much vaguer "anti-fascist" appeals. They counted on the assistance of their capitalist allies; and that assistance was, in their eyes, a factor of greater and more real importance than any hypothetical response of the German working class to revolutionary Communist appeals. The position in the case of a war between the USSR and the USA would be very different. In such a conflict Russia could hardly count on any capitalist allies. The alignment of forces would then, in the Soviet view, correspond much more closely to a straight and fundamental division of classes and class-interests, in which the Soviets would be compelled to try to arouse the working classes of foreign lands for their "last and decisive battle."

The weapons of purely Communist ideological warfare have been left rusting in the Comintern storehouses ever since the days when Russia joined the League of Nations, and when the Communist parties formed Popular Fronts with Social Democrats and bourgeois liberals. Now some of those weapons are being brought out of the storehouses, cleaned and prepared for use, just as the somewhat rusty weapons of anti-Communism have been taken out of the arsenals of the west. However, ideological warfare is by its nature slow, far too slow for the

The Karens and the Future

(By a Correspondent lately in Burma)

WILL the beginning of Burmese independence lead to civil war? The question can best be answered by the Karens, the largest racial minority in Burma, whose earlier demands for complete autonomy have not been met. They have been given partial self-government within the Union of Burma in a Karen state containing a small proportion of the Karen race, but important groups of Karens refused to take any part in framing Burma's new constitution.

To understand the present position of the Karens one must know something of their past. Claiming to have entered Burma with the Tai-Chinese migration wave about A.D. 600, they were later driven by the Burmese into the mountainous country to the east of Burma and south of the Shan States. Here they lived for centuries in isolation, nursing a sullen hatred of their despoilers, who in turn treated them with scorn, labelling them the wild cattle of the hills. In the almost trackless mountain wastes that became their home the Karen tribes developed the intense reserve and suspicion typical of any self-centred community living by a subsistence economy. Like all other hill races in Burma their customs, dress, and even their language developed in different directions, so that now some groups cannot understand each other. Each little village community became ever more self-contained; reciprocal obligations between neighbours and relatives developed great importance; mutual support in adversity became a commonplace; honesty a natural virtue; and theft and similar forms of trickery were almost unknown. Isolation enforced marriage within the community, leading to a still greater sense of exclusiveness.

When the British annexed Lower Burma and set free large areas for peaceful cultivation, many thousands of Karens moved down to the plains and settled amid Burmese immigrants from Upper Burma, in the Delta of the Irrawaddy, in the Insein, Pegu, and Tharrawaddy districts north of Rangoon, and in the plains of Tenasserim. Though they established themselves firmly and prosperously, they did not mix with their neighbours. Like blobs of oil on water one finds Karen hamlets dotted among Burmese hamlets, and Karen quarters set apart in larger villages and towns.

Beginnings of Separatism

The extraordinary enthusiasm with which they embraced Christianity set them further apart from the Burmans. Always believers in a Supreme Being, Y'wa, and told in prophecy that he would return the Sacred Book by the hand of a white brother beyond the seas, they hailed the first American Baptist Missionary, Adoniram Judson, as the promised messenger. Thousands adopted Christianity in the stern puritan form dispensed by the early Baptists, enshrining their natural honesty, chastity and goodness in a casket of Victorian propriety which added fuel to the scorn of the easy-going, pleasure-loving Burmese.

As time went on the Karens, slower thinking and less "examined" than the Burmese, fell behind in the race for the government posts which both unwisely worshipped as the supreme goal

atomic age. The forging of atomic weapons takes precedence over the sharpening of the ideological ones. Mr Molotov's anniversary audience therefore accepted with thunderous applause his enigmatic hint, which vaguely suggested that Russia may have actually broken the American monopoly of atomic weapons.

The hint has been followed by foreign comment to the effect that Mr Molotov was merely bluffing, as well as by reports about the first demonstration of a Russian atomic bomb, which allegedly took place in the vicinity of an Atomgrad, somewhere in Asia. Speculation on this point is highly unprofitable. The Soviet leaders are certainly masters at putting on poker faces; and it may be as erroneous to believe that they already have the atomic ace as to assume that they cannot possibly have it—yet. Amid all this rattling of ideological and atomic weapons, Mr Molotov was at pains to assure the outside world that its meaning was purely defensive, and that Russia's desire for peaceful co-operation with her wartime allies was as strong as ever. In the present state of war fever there is a tendency in the west to dismiss these assurances wholesale as insincere talk. Will not history say one day that this was the most tragic fault of inattention ever committed by statesmen?

of the intelligent. Feeling that their own officials, with their rigid honesty and conscientiousness, gave better value than their Burmese rivals, the Karens made serious efforts to secure special treatment in the allocation of posts. Through the writings of Sir San C. Po, they first voiced their conviction that their only hope of real advance lay in territorial separation from the Burmese. Thus, in 1928, the idea of "Karenistan" was born. Perhaps unwisely, our administration ignored it as too controversial.

Then came the war. With the advancing Japanese was a ruffianly horde of Burmese hangers-on, looting, burning, murdering Indians, British, Karens and their fellow Burmans with equal impartiality. They were responsible for savage massacres of Karen men, women and children, undoing in a few weeks the work of half a century. Though the Japanese-sponsored Burmese government sent out a "Karen Peace Mission," it was unable to still the wave of bitterness and despair that filled all Karen hearts.

Meanwhile some 15,000 Karens were armed by the British to fight the Japanese. In 1945 they launched an attack which rivals the deeds of any guerillas in any theatre of the Second World War, and established at long last a sense of national manhood, a feeling that they were able to master their enemies and fight their own way to their national goal. For the first time Karen requests became Karen demands. Backed by this new-found confidence, the "Karenistan" issue became serious.

Cold Welcome in London

Karen agitation was intensified by the first suggestions that Britain would not object if Burma opted to leave the Commonwealth, a prospect wholly repugnant to most Karens. Their earliest claims, published in July, 1945, were very ambitious, and included Karen settlements in Siam. They argued that victorious Siam had annexed large slices of the Shan States as its reward for helping Japan, and therefore it was logical to exact a *quid pro quo* by carving out of defeated Siam any areas populated by Karens.

To all suggestions that the division of so small and weak a country as Burma was dangerous, the Karens replied that in a separate state peopled by peace-loving Karens, with an outlet to the world through the port of Moulmein, there would be far greater security than could ever be found in co-existence with the Burmese, whose history was one long tale of strife, anarchy and unrest. To protests that they could not expect the large Talaing, Burmese and Indian groups in Tenasserim to accept Karen domination, they replied that since the Burmese expected Karens in the Delta and elsewhere (there was never any talk of mass migrations) to accept Burmese domination even where Karens were in the majority, they should concede a similar privilege to the Karens in Tenasserim. To doubts about the economic viability of such a state, they pointed to the assets of Tenasserim and the Karen hills—wolfram, tin, salt, timber, rubber, hydro-electricity, and spoke of developing the Ataran and similar valleys for rice export.

In their anxiety to secure the gift of territorial freedom from

a still-grateful Britain, the Karens completely ignored the need to associate other dwellers in the proposed Karen State with their plans, and thus ruined their hopes of securing official attention from the start.

Their goodwill mission to England returned discomfited by its reception, and in due course the Karen National Union, formed by the fusion of the Karen National Association and the Karen Central Organisation, repudiated the Attlee-Aung San agreement. The elections for the new Constituent Assembly were boycotted by all except a group of young men who had thrown in their lot with the Burmese leaders. All the Karen representatives eventually "elected" were Burmese nominees. The Burmese cannot be blamed for this manoeuvre, for they feared that any obvious breakdown in the election machinery might jeopardise their own chances of freedom. No one now knows where the Karens stand, or what is the strength of the opposition to the new regime to which the nominated delegates have given their assent.

The present proposals are that the Salween district and certain other contiguous Karen areas, together with the Karenni States (which have now agreed to join) should be formed into a Karen State with limited autonomy, and that the interests of other Karens living among the Burmese (e.g., in the Delta) should be given special protection. This is substantially the 1945 official proposal, then turned down by the Karens as not going far enough, and by the Burmese as going too far. It is not perfect, but it does give the Karens a homeland to call their own, and on which they can lavish their keenly felt desire to build up an

administration and a way of life conforming to their own ideals. If its boundaries are not restricted to the unproductive hill country it may achieve material progress, and so take the heat from Karen-Burmese relations elsewhere.

Freedom to go to "a better 'ole" would do much to still the panic in isolated Karen communities in Burma during the periodic Burmese outbursts of xenophobia. With goodwill on both sides the proposals can work; without it there is no hope for peaceful relations.

The initiative rests with the Burmese and must be sustained. British success with Burma's hillmen was not fortuitous. It came because we were determined to get to know and to love them. In spite of setbacks, of treacherous attacks, even of prolonged warfare, we never lost the will to be friends. The Burmese must seek mutual understanding with equal patience and forbearance. The Karens, on the other hand, must relax their over-suspicious isolationism and show greater willingness to mix on tolerant terms. In accusing the whole Burmese race of being in effect a "nation of spivs," they forget that sanctimoniousness can be as exasperating as any other human frailty.

Britain, too, must play her part. The Karens gave the British unswerving loyalty; they must never lose their affection. Since Britain is committed to setting Burma free and can no longer give the Karens her protection, she must look to their material progress. She must establish trade contacts with their newly formed co-operatives, and offer them a share in British interests in Burma and in training facilities in England. Only by improving their worldly wisdom and by standing on their own feet can the Karens ever hope to achieve their just ends.

Soviet Stakes in Hungary—II

The Three Year Plan

BY A CORRESPONDENT

THE Hungarian Three Year Plan contains certain indications as to the percentage share of the joint companies in Hungary's total economy. The Three Year Plan provides that altogether 6½ billion forint will be employed for investments. According to this plan the Soviet Union will contribute 150 million forint for investments in the joint companies. This is about 2½ per cent of the total capital investment foreseen by the plan. As the Soviet Union owns 50 per cent of the joint companies' shares, the same amount for investment will have to be produced by Hungarian capital. Thus, the total investments of the joint companies represent not quite five per cent of the sum which the Three Year Plan provides for the Hungarian economy. This figure more or less confirms the assessments based on the participation of prewar German capital. Soviet control through the joint companies affects 5 per cent of Hungary's economy of which, however, only 2½ per cent are actual Russian holdings. One can assume that another 2½ per cent of capital invested in other Hungarian companies, banks and trading corporations, represents the balance of Russian capital interest in Hungarian economy.

Even if one assumes that Russia's present share does not exceed the former German share, her influence is more intensive. German influence was scattered among a number of financial groups and investors; the Soviet Union exercises her influence as a single shareholder.

Hold on the Credit Bank

Russia's economic hold on Hungary has been also strengthened by her participation in the Hungarian Credit Bank, by taking over shares formerly held by the Dresdener Bank, representing altogether 18 per cent of the capital. Again, in the past, foreign capital, first French and later German, which had this same share in the Credit Bank was satisfied by representation on the Board; now Russian capital also demands full representation in the Bank's actual management, by the appointment of a Russian deputy governing-director.

The Hungarian coalition government is now preparing a bill for nationalisation of the National Bank as well as the two largest banks, the Credit Bank and the Commercial Bank, which together have a controlling interest in about 60 per cent of Hungarian industry. The nationalisation will not affect, however, the participation of foreign capital. The banks will remain independent limited companies. Only the shares owned by Hungarian investors will be taken over by the state, whereas the foreign holdings remain unaffected. The majority of the share capital will of course be held by the Hungarian state; nevertheless foreign capital will continue to exercise a certain influence. In the case of the Credit Bank there will be an interesting combination of three partners: the majority of the shares, about 70 per cent, will be held by the Hungarian state, the second largest shareholder will be the Soviet Union with a holding of about 18 per cent, and the third partner with about 12 per cent will be the British Rothschild group.

New Reparation Claims

At the beginning of this year a new Russian claim based on the Potsdam agreement was made for about \$230 million, exceeding the nominal Russian reparation claim.

During the war Hungary had a clearing agreement with Germany. At the time of her collapse Germany owed over \$600 million to Hungary, whereas Hungary's liabilities to Germany amounted to about \$200 million. Thus there was a credit balance of about \$400 million in favour of Hungary. According to the provisions of the peace treaty Hungary had to renounce all her claims from Germany. It was naturally understood that this referred to the Hungarian credit balance on the clearing account. The Russians, however, had a different interpretation. They tried to revive this so called German asset of over \$200 million, notwithstanding the fact that it was wiped out by German liabilities. The recognition of the Russian claim would have meant the perpetuation of reparation payments to the Soviet Union. As a result of negotiations in Moscow in July and August the Soviet Union reduced its original claim to less than a quarter. The matter has not been settled yet, and a new Hungarian delegation, which is at present in Moscow, is trying to obtain further concessions. The object of these negotiations is to settle if possible all aspects of transfer of former German property in order to end the present state of uncertainty.

IN THE WORLD

A magnificent present for men

A YEAR'S SUPPLY OF THE FINEST
RAZOR BLADES IN THE WORLD

Here is a brilliant gift suggestion—a year's supply of Personna Blades, the most superb shaving instruments ever devised. Made by master cutlers from selected steel. Rendered rust-resistant by the Krauman process. Their extra keen edge is hollow ground. Each blade is leather-stropped and passes 17 rigid inspections before

it leaves the factory. Each blade is specially wrapped to keep it in perfect condition. The Personna Gift Box contains 50 double-edged blades, sufficient for at least 365 magnificent shaves. The special outer carton carries address space—no paper or packing necessary. Available at the best barbers, chemists, and stores, for 25/- a box.

THE BUSINESS WORLD

The Tax Changes

IN the detail as well as in the broad shape of his Budget, Mr Dalton has fulfilled all too faithfully the pessimistic forecasts advanced in these columns last week. He has wholly ignored the inflationary "gap" which already exists, and has focused exclusively upon the "new situation"—the additional inflationary pressure—which will result from the declining volume of consumption goods available to the home market. He has therefore wholly escaped the thorny problem of presenting a *pro forma* national balance sheet; there is no attempt to estimate the prospective balance between savings and investment, nor even the extent to which, on Sir Stafford Cripps's programme, the gap between them will be widened. The task which the Chancellor set himself was simply to produce a "considerable" additional revenue, without attempting either to justify or explain the particular sum at which he aims.

The result is a prospective additional revenue of only £33 million in the current financial year and £208 million in a full year. To the first figure, however, there must be added a possible £15 million from accelerated collection of existing tax arrears in consequence of the imposition of an interest charge of 3 per cent. The £208 million expected in a full year comes from five main groups of taxes. A doubling of the rates of Profits Tax is to produce £47 million after allowing for the resultant loss in income tax; a penny on beer and moderate increases on wines and spirits provide £56 million; purchase tax provides £80 million; a new tax on tote dog-racing and pool betting, £15 million; and an indirect tax on advertising, £10 million.

Purchase Tax

Most surprising, perhaps, of Mr Dalton's detailed proposals are those relating to Purchase Tax. It had been generally assumed that it would be impossible to secure any really large additional revenue from this source without a wide extension of the range of the tax, principally because the existing tax did not affect significantly goods normally regarded as necessities, and because the supply of many categories of taxable goods will in any case be drastically reduced by the new export quotas. But in fact the range of tax is not changed at all. The Chancellor expects to secure a substantial sum by indiscriminating increases in the existing rates, as follows:—

Existing Rates (% of Wholesale Value)	New Rates (% of Wholesale Value)
16½	33½
33½	50
66½	75
100	125

From these additions £10 million is expected in the current year, and £80 million in a full year; the large disparity between the two figures naturally arises from the fact that the increases, although taking effect last Thursday, will not operate fully until stocks already delivered by registered manufacturers and wholesalers have been exhausted. The increase assumed in a full year, it is interesting to note, is the same as that for which Mr Dalton budgeted last April (on the basis of unchanged tax rates), because of the increase in available supplies of goods by comparison with 1946/47. Presumably at least the equivalent of that expected increase in supplies will now be lost as a result of diversions to export, and one is left in doubt whether the additional revenue for which the Chancellor now budgets is gross or net gain.

It will be noted, however, that the biggest proportionate increase in duty occurs in the lowest tax bracket, so that the burden of the changes falls upon categories of articles which may be presumed to have the minimum elasticities of demand.

Evidently, the changes are designed in the hope of producing revenue rather than of checking consumption, for though the scope of the tax has not been extended, its centre of gravity is shifted perceptibly nearer to the "necessary" groups. But, even granted this objective, it is surprising that an attempt has not been made to use the tax, in selected cases, as a specific instrument to divert particular goods to export. Not only are the changes quite unselective, but in the luxury categories—which, presumably, include some important potential earners of dollars—there is the minimum additional impost. If people were already prepared to pay the price dictated by 125 per cent. In the detail of its tax proposals, as well as in the timidity which they show in general, the Government is plainly seen to be counting still upon the efficacy of its physical controls and quota systems to deprive the consumer of the goods which must now be exported. Yet, given the failure to use this Budget as a means of mopping up any really large volume of purchasing power, there was the greater need to pay close attention to the problem of mere diversions of spending power. To the extent to which these purchase tax increases do succeed in restraining demand for the taxed articles, there will simply be a greater pressure on the huge range which remains tax-free.

Profits Tax

The market's estimate that the Chancellor might double the existing rates of Profits Tax proves to have been accurate. The rates are to be raised, with effect from January 1, 1947, to 10 per cent on undistributed profits, and to 25 per cent on distributed profits. This decision had already been fairly well discounted in share prices.

TABLE I—LOW GEARING

Profits :—£100,000 gross all distributed, less tax at 9s. (£45,000) = £55,000 after tax.
Capital :—£1,000,000 5% Pref. and £1,000,000 Ordinary.

(i) Pre-April Budget :—			
Pref. div. (net).....	27,500		
Ord. div. (net).....	27,500 = 5% gross		
	55,000		
(ii) April Budget :—			
Profits tax (12½%)....	12,500		
Income tax on balance....	39,400		
Total.....	51,900	Pf. div. (net) 27,500	%
Balance.....	48,100	Ord. div. (net) 20,600	3½ gross
(iii) November Budget :—			
Profits tax (25%).....	25,000		
Income tax on balance....	33,750		
Total.....	58,750	Pf. div. (net) 27,500	%
Balance.....	41,250	Ord. div. (net) 13,750 = 2½ gross	

The incidence of the increased rate of profits tax on ordinary shares will vary according to dividend policy and also according to the relation between the issued preference capital and ordinary capital. The higher rate of tax is levied on all distributed profits, irrespective of the class of capital. It follows,

therefore, that for companies which have to meet comparatively large preference dividend payments, the incidence of the increased rate on ordinary share earnings and dividends will be proportionately greater. Table I. shows the effect of the new rate on a set of simple assumptions. The effect of the increased rate of Profits Tax on these assumptions is to reduce the earnings on ordinary share capital from 3½ per cent to 2½ per cent gross—a proportionate reduction of 33 per cent—leaving the position of the preference capital quite unchanged.

The next example shows the effects of high capital gearing:—

TABLE II—HIGHER GEARING

Profits :—£100,000 gross all distributed, less tax at 9s. (£45,000) = £55,000 after tax.
Capital :—£1,500,000 5% Pref. and £500,000 Ordinary.

(i) Pre-April Budget :—			
Pref. div. (net).....	41,250		
Ord. div. (net).....	13,750 = 5% gross		
	55,000		
(ii) April Budget :—			
Profits tax (12½%)....	12,500		
Income tax on balance....	39,400		
Total.....	51,900	Pf. div. (net) 41,250	%
Balance.....	48,100	Ord. div. (net) 6,850 = 2½ gross	
(iii) November Budget :—			
Profits tax (25%).....	25,000		
Income tax on balance....	33,750		
Total.....	58,750	Pf. div. 41,250	%
Balance.....	41,250	Ord. earnings Nil	

In this case, the increased rate of Profits Tax absorbs the whole of the surplus of profits after meeting the preference dividend requirements, and earnings on the ordinary shares fall to zero.

A company with a straight equity capital which distributed the whole of its profits would have paid out 9.62 shillings out of every pound of gross earnings, after meeting 12½ per cent Profits Tax and income tax. The same company will in future pay out 8.25 shillings in every pound, after paying 25 per cent Profits Tax and income tax.

These guiding principles can be given some contact with reality with the assistance of the following table of industrial profits, for 2,004 companies whose reports appeared in the year to June 30th last.

	PRECEDING YEAR		LATEST YEAR	
	£'000s	%	£'000s	%
Interest.....	20,185	6.1	18,849	4.8
Preference dividends....	56,147	16.9	58,239	15.0
Ordinary dividends.....	176,684	53.2	207,456	53.4
Reserves.....	65,658	19.7	86,435	22.2
Other savings.....	13,441	4.1	17,734	4.6
	332,115	100.0	388,713	100.0

These figures are expressed before deduction of standard income tax, but after EPT and NDC. They are not, therefore,

a wholly reliable indication of what profits may look like in 1947, though they should be tolerably representative of the calendar year 1946. If the latest figures are used as a datum, however, the application of the old and new rates of Profits Tax and the deduction of income tax gives the following illustrative results:—

	(£ Mn.) No Profits Tax	12½% Profits Tax	25% Profits Tax
Profits tax.....	Nil	38.3	76.8
Income tax.....	175.0	157.6	140.4
Interest.....	10.4	10.4	10.4
Preference dividends....	32.0	32.0	32.0
Ordinary dividends.....	114.1	93.2	71.9
Reserves.....	47.5	47.5	47.5
Other savings.....	9.7	9.7	9.7
	388.7	388.7	388.7

In sum, the lower the gearing, the lower will be the incidence of the increased rate. The general principle, therefore, would be to favour shares of relatively low gearing (like Courtaulds or Imperial Chemicals) and to look more critically at shares with a higher gearing, like the unfortunate Debenhams. It is indeed this very factor that makes the distributed profits tax so inequitable as a fiscal weapon. It falls exclusively on risk-bearing capital, and with proportionately sharper effect on highly geared ordinary capital. But this is only a very broad rule. It is subject to every conceivable qualification in respect of relief from EPT and of general earning capacity.

Beer

The Chancellor having brought himself to the very edge of increasing the tobacco duty, finally left it unchanged. This very fact will make the penny a pint increase in the beer duty quite a tolerable burden—indeed, burden is too strong a word for it, since it will hardly be noticeable in the budget of the average drinker. The prices which are now being freely paid for non-proprietary and "black market" whisky suggest that the Chancellor has missed an opportunity for strengthening the revenue and of circumventing some of the more dubious channels of trade in spirits.

Betting Tax

On betting, a much-advocated avenue for tax experiment, the Chancellor has had second thoughts. Last April he felt that a tax on bookmakers was impracticable, and still feels that it would be uneconomic to "go after them"—that would mean "too few tax collectors chasing too many bookmakers." But the huge expenditure of manpower and paper in the football pools has dictated a discriminatory approach. As from January 4th next, there will be a tax of 10 per cent on the stake money on all pool betting except totalisator betting on horse-race courses, including a tax on the football pools. In both cases the

Gilt-edged speculators were quick to observe that undue leniency in financial policy as a whole by no means implies a return to the aggressive techniques of promoting cheaper money. The Chancellor, so far from promising or threatening a renewed fall in interest rates, merely "hopes" that the recent improvement in prices will continue. By past precedent, he should now have stated definitely that the £300 million of 3 per cent Conversion stock will be called for redemption on March 1st, the earliest optional date. But Mr Dalton merely said that by the beginning of next month he would "make an announcement as to how this stock will be dealt with"—phrasing which strongly suggests that he is not, even now, quite certain whether the operation ought to be undertaken at this stage. In the circumstances, the resultant reaction in gilt-edged prices—the irredeemables dropped by three-quarters of a point on Thursday morning—seems more moderate than the situation deserves. But perhaps the market is counting on further support as the war damage monies, disbursed last Monday, filter through.

* * *

Silver Lining?

Mr Dalton, ignoring by the timidity of his budget the lesson of the savings figures, none the less admits them to be "very disappointing indeed." And the latest figures are particularly so. Hopes that the autumn season—normally a good period for savings, because people are then trying to recover from the financial strain of holidays—would go far to redress the dismal performance of the first six months of the year have not materialised. The figure of gross weekly savings is actually lower than for any week at the height of the holiday season, and although the amount of withdrawals and encashments was a little smaller, the week's net saving was only £1,573,000, easily the worst since mid-August. So far, the only result of the ending of the holiday period has been a reversal of the trend of net dis-saving. Whereas in June and July the year's cumulative net total was reduced from £58.8 to £51.6 million, in the past three months it has been laboriously raised to £79.9 million. But this total is not much more than one-third of the target figure for the period: although thirty-one weeks have passed, only £80 million has been found towards the year's target of £366 million.

Obviously, this figure is now a forlorn hope. To achieve it would require weekly net saving at the rate of £13.6 million for the rest of the year. In fact, the weekly average to date has been only £2.6 million, and—most depressing feature of all—this has also been the average rate of the past ten weeks, since the summer dis-saving ceased. At the corresponding date last year—when, however, Mr Dalton had made great play with his spurious "last-chance" tactics and his increases in the limits upon individual holdings—the cumulative total stood at £186 million, well over twice this year's achievement. Even if the rate of saving for the remainder of this year were to be as large as in the similar period of 1946-47, the final total would still be 40 per cent below target.

The depressing performance of recent weeks naturally reflects the wave of spending in anticipation of the Budget, and to this extent may not fairly represent the prospect for the coming months. But it is noteworthy that the latest savings, though "reported" last week, in fact relate to the week to November 1st—to a period before the Budget date was announced. This autumn has indeed brought a silver lining drive—but it is the public's pockets and purses that have been lined.

* * *

Coal Output Spurt

A quick and gratifying increase in coal production has followed the introduction from the beginning of this month of longer working hours in most of the pits. Provisional figures for the week ended November 8th show an output of 4,243,400 tons (deepmined and opencast) compared with 4,092,900 tons for the previous week. Production from opencast sites continues to decline—this is a seasonal matter—but deep-mined coal output more than made up the loss by rising from 3,867,200 tons to 4,025,700 tons.

The largest increase in production was in the North Midland and Wales regions where the longer week is working most effectively. In Wales, for instance, 209 pits opted to work a Saturday shift. But there are still areas where the men have to make a decision. In the North West region, for example, 65 pits are still undecided on the question of the longer working week. And there are, of course, the few inevitable pits scattered up and down the country which have elected to do no overtime at all.

The longer week has made an auspicious start, but two factors

still have to work themselves out. It is clear in the first place that a further expansion in production ought to be achieved, when the scheme has been working longer and more pits are supporting it. But this is a short-term view, and it has yet to be shown whether Saturday working, which is more favoured so far than an extra half hour a day (the main exception being in the Northern region) will begin to encourage mid-week absenteeism when the first flush of enthusiasm has worn off.

On balance, even if absenteeism does increase, production ought to remain distinctly above 4,000,000 tons a week. The Minister of Fuel and Power based the winter coal allocation programme for industry and the domestic consumer on an estimated production of 3,900,000 tons each week, apart from statutory holidays. There ought to be a margin of at least 300,000 tons a week above the output on which industrial and domestic requirements have been fixed. A margin of this order would leave no answer whatever to the already powerful arguments for resuming coal exports to Europe possibly by the end of the year, and for maintaining the stocks at Atlantic bunker depots, where 24,000 tons are now to be shipped to save dollars. It happens that one of the main coal exporting areas, South Wales, has made a particularly promising start with overtime working.

* * *

Sterling Payments Agreements

A number of monetary and payments agreements are now being renegotiated between Great Britain and non-sterling countries. In no case, however, has official announcement of results been published this week. In two of these negotiations it is evident that success is near and that publication of the results may be expected in a matter of days. The first of these is an agreement between the National Bank of Persia and the Bank of England, by which certain current sterling receipts by Persia will become convertible again, while any sterling accumulated by Persia is to carry a guarantee which will probably be expressed in terms of gold. The most important item of sterling revenue flowing to Persia is the oil royalty income which runs at the rate of about £20 million per annum. Oil payments also figure largely in the negotiations which have begun with the Dutch West Indies. The delegation from Curaçao which is now in London is demanding dollar payments for future sales of oil, a request which is not altogether unreasonable given the proximity, both geographical and economic, of the territories concerned to the dollar area. Discussions with the Netherlands are expected to begin before the end of the year. The Swedish agreement is almost ready and is now being drafted. The main problem involved in this agreement is the extent of the sterling balances Sweden is prepared to hold and the terms of the guarantee that will attach to this sterling. As this issue goes to press, the terms of the trade and financial agreement with Eire are announced. They provide for increased supplies of food (at higher prices) in exchange for coal and machinery exports to Eire, which will have the right to draw £14 million in dollars up to June next year.

News of the talks with Argentina comes almost exclusively from Buenos Aires. It is unlikely that any official announcement will be made until after the arrival of the supply mission which will be discussing the volume and prices of future shipments of commodities from Argentina to Britain. Argentina appears, however, to have been conceded a very generous exchange guarantee in respect of any current accumulations of sterling. This guarantee will not be merely of strict bilateral character but will carry protection against the possibility of depreciation of sterling in terms of gold. Among the more difficult negotiations that will have to be tackled before the end of the year are those with India and Egypt. In each case the provisional arrangements made in the summer were of short-term character and a more formal agreement will have to be negotiated to take effect from the beginning of 1948.

* * *

New Union Disclosures

The New Union Goldfields debacle is complete. A report from the judicial managers as well as an auditors' statement and balance sheet as at June 30, 1947, have appeared this week; they leave no doubt of the magnitude of the collapse of the Erleigh group or of the painful repercussions which are likely to ensue for the South African mining industry. The salvage work of the judicial managers is likely to be prolonged, possibly for some years, owing to the complicated nature of the inter-company shareholdings and the unmarketability of the group's assets. Certainly, shareholders will have to be patient, for even an assessment of the true position of the group will take a long

time, quite apart from saving something from the wreckage.

The judicial managers' revelations of the activities of Mr N. S. Erleigh and Mr J. Milne unmask a sorry tale of men in a position of trust playing with other people's money. It is somewhat surprising to find that Mr Milne is implicated equally with his co-managing director who had until now generally been assumed to be primarily responsible—an impression which was engendered at the time of the first public disclosure of trouble by his secession from New Union to form the Union New Free State group and by the persistent reports of his disagreements with Mr Erleigh. These two men, up to June 30, 1947, borrowed £470,000 from New Union without the consent of the board, for financing purchases on their private account of shares in associated companies. Admittedly they lodged the shares so purchased with the company and these still remain deposited with it, and it is impossible at this stage to read into the facts the full measure of their intentions. But there is no room for doubt about their designs in respect of some £270,000 profit made by them from share dealings financed out of the resources of the company but credited to their personal accounts. The auditors made it quite clear that, in their opinion, these profits belong to the company.

Even these acts are not the most insidious in the judicial managers' recital of irregularities unless they are linked with the practice, which runs through the whole record, of issuing shares to directors at prices only a fraction of the current market prices. Thus Messrs Erleigh and Milne bought 80,000 shares in Coronation Syndicate at 5s. a share compared with the market price of around 25s., and 40,000 shares in Natal Portland Cement at 5s. a share, about 4s. below the price of a parcel of the shares sold to an outsider. As the auditors point out, no proper consideration appears to have been received by the company for these options. In the case of British New Union Investment Corporation, the two men received an improper advantage by acquiring shares in the concern at cost, after arranging a deal for the payment of coal royalties which raised the value of the shares; concurrently with this, another profitable and equally reprehensible deal was successfully carried through in the shares of Free State Development Corporation. It is obvious that the ramifications of the share dealings carried through during the

year will provide the judicial managers with many other ingenious tangles to unravel. Nor have Mr Erleigh and Mr Milne forgotten to spread their cynical patronage to relatives and staff by letting them purchase shares "on the cheap" at a "saving" of £12,000 in 1946-47.

* * *

What are the Assets Worth?

The balance sheet of the company at June 30, 1947, is of only limited assistance in assessing the true financial position of New Union. In the first place, the balance sheet figure of £3,537,590 for cash has been arrived at by the spurious method of calling in aid money belonging to associated companies. This procedure has inflated the figure of amounts due to associated companies to a total of £7,378,414 but this has subsequently been reduced to around £5,000,000 and cash has since fallen to no more than £400,000 partly as a result of the repayment of cash after the date of the balance-sheet. The liabilities of the company, excluding capital and reserves, amount to £8,445,107 against which the largest asset held is £4,535,801 for shareholdings and mining properties. But the value of this asset, as the auditors point out, has been considerably reduced since June 30th. Quoted securities, which had a balance-sheet value of £2,651,389, have also been reduced by the sharp fall in security values since June, and the auditors further state that the value of £1,884,412 given for unquoted securities could not now be realised.

It is difficult to make an estimate of the value of the other assets held. These include £470,453 owing by Mr Erleigh and Mr Milne and about £5,000,000 due by associated companies on loan and current account. It is hardly likely that the first amount will be readily repaid, and the value of debts owed by associated companies can only be a matter of conjecture, which must await the full unravelling of the position by the judicial managers. In any case, it would be unwise to place more than a nominal value on the shares of the company, although the market has apparently withstood the shock of this week's news fairly well. On Wednesday jobbers were prepared for dealings on a nominal basis around 2s. 6d., but support was forthcoming, and the net fall of the day was merely from 7s. 6d. to 6s. 3d. with a further decline to 6s.

Record Steel Output

Steel production reached an annual rate of 14,316,000 tons in October—a higher rate than for any previous monthly period. Pig-iron production has leaped ahead to reach an annual rate of 8,352,000 tons, compared with 7,805,000 tons for September. Comparative figures with the previous month and with October, 1946, are given below:—

PIG-IRON AND STEEL PRODUCTION

(In Tons)

	Pig-Iron		Steel Ingots & Castings	
	Weekly Average	Annual Rate	Weekly Average	Annual Rate
Oct., 1946....	155,800	8,102,000	254,300	13,226,000
Sept., 1947....	150,100	7,805,000	266,200	13,841,000
Oct., 1947....	160,600	8,352,000	275,300	14,316,000

If current levels of steel production could be maintained for the rest of this year, the output target of 12½ million tons set out in the *Economic Survey* would be met with ease. But pig-iron supplies are below current requirements, and coke, to quote the words of the British Iron and Steel Federation, "is substantially below the allocation figure." Low stocks of pig-iron and other materials are causing justifiable anxiety, for steel works have increased their production over the last few months largely by using up their stocks of raw materials quite freely. These are now dangerously low—pig-iron stocks, for example, are in some cases below one week's consumption, which if not dangerous is certainly too low for comfort. The blowing-in of the new blast furnace at Colvilles has been held up for want of coke—at the very moment when the industry is seeking desperately to increase its pig-iron output to about 9½ million tons a year.

Nothing, it would seem, promises to upset the achievement of next year's target of 14 million tons save shortages of raw materials. The coming winter may be affected by interruptions to transport and lack of wagons. The scrap position, too, is causing much anxiety. An increase of 1½ million tons of scrap, compared with the supplies available in the first half of this year, will be required to meet the 14 million ton target. Supplies are running down—there is less government scrap available, and labour for the scrap-yards is difficult. Negotiations are afoot to get a million tons of scrap from Germany (the only present source of imports) and to obtain increased supplies of shipbuilding scrap. But, as the recently introduced campaign for more rapid clearing of scrap emphasises, the position can only be eased by the turning out of every ton of scrap to the scrap merchants. These are days when the price mechanism is at a discount, and doubtless a higher scrap price would have consequential effects on steel prices. But is the supply so completely independent of price considerations as the industry seems inclined to suppose, or so inelastic that even a large increase in scrap prices would evoke only a small addition to supplies?

* * *

Labour Relations in Iron and Steel

The main factors which are contributing to the high rate of steel output are the length of the working week and the long tradition of good industrial relations in the industry. The 48-hour week now being worked in steel is above the average for industry as a whole, and while there is some feeling, particularly among day wage workers, that they should share in the general reduction of hours, there is no immediate prospect of a move in this direction. For blast furnace workers the 48-hour week represents a reduction from the 56-hour week worked until January of this year, and any further shortening at this stage would upset the rhythm of production and the continuous shift system which is now working so satisfactorily. Under their agreement, the blast furnace men work in teams of six, with a seventh man "resting" for two or three shifts, in a cycle of seven weeks. The penalty for absence without good reason is the deduction of a quarter shift's pay, but any man who has to work during his rest period beyond the 48 hours is paid an extra quarter shift.

Incentive schemes operate and apply to about 85 per cent of

the men in the industry. In addition to the daily basic rate, there is a shift bonus and a cost-of-living sliding scale. Average earnings in a typical furnace on the north-east coast are about £6 18s. 6d. a week. In some furnaces there is a healthy spirit of competition between shifts, which contributes to higher output. Productivity would no doubt be higher than it is today if the men had more to eat. Although there is some demand for extra meat, on the lines of the miners' scheme, the blast furnace union leaders are not pressing for it. They would prefer to see more use made of canteen facilities, which at present are used by only about one in three of the employees. The tradition of the "piece" dies hard.

The steel industry has been remarkably free from industrial discord, and there has been no major strike within living memory. This is attributed by union leaders to the excellence of the long-established negotiating machinery, under which every man has direct access to the management through his elected representative. Local grievances are thus settled rapidly. Blast furnace union leaders are opposed to the introduction of joint production committees, which, they fear, would upset the traditional negotiating machinery, but the Iron and Steel Confederation is more favourably disposed to the idea. It is clear that in output performance and in respect for their own negotiating machinery, there is much that the miners and other industrial workers can learn from the steel workers.

IMF and European Convertibility

One of the few disappointing features of the Harriman report was the curt refusal of the committee to consider and recommend a grant of free dollars to Europe to be used for the twin purposes of aiding monetary reconstruction and restoring the mechanism of multilateral trade and payments within Europe. The committee of European Economic Co-operation had suggested that a sum of \$3,000 million might be appropriated for this purpose. The Harriman Committee comment is that these tasks should not fall within the scope of American assistance but should be tackled by the International Monetary Fund in whose province they obviously lie. The committee further states that if the articles of agreement of the Fund do not allow this particular task to be tackled they should be accordingly amended. There is, of course, much to be said for the view that in the international organisation set up and to be set up, as little overlapping as possible should be allowed to occur. Such overlapping would unquestionably take place if a separate organisation were to be set up to put into effect a new clearing machinery for inter-European payments.

The difficulty is that the regional approach to the problems of convertibility is not one which the International Monetary Fund is at present well equipped to undertake. Under the terms of agreement of the IMF, convertibility is unconditional except where the scarce currency clauses are invoked. This exception apart, the duty laid upon members of the Fund is to make their own currencies available for current purposes in any currency area in the world. The exception from this commitment which is provided for the transitional period of 3 to 5 years is an exception expressed in general and not in discriminatory terms. It remains to be seen whether the articles of agreement can be amended sufficiently to allow the IMF to sponsor a strictly inter-European convertibility scheme which could later be dovetailed into wider multilateral convertibility—the only kind of convertibility which the articles of agreement now recognise. This problem may lose much of its urgency and present intractability if American assistance for Europe is forthcoming on the suggested scale. This assistance, however "tied" the loans may be, must lubricate the whole machinery of multilateral payments and may ultimately make the setting up of special inter-European clearing mechanism unnecessary. It is, however, a problem to which the IMF authorities in Washington should give immediate consideration.

Dollar Arithmetic

The confusion surrounding the exact arithmetic of the expenditure of dollars in the US line of credit has been heightened by the apparent conflict between the figures given by the Chancellor in his speech on October 24th (quoted on page 729 in *The Economist* of November 1st) and the information given last week in answer to a Parliamentary question and reproduced on page 772 of *The Economist* of November 8th. In the earlier of the statements the Chancellor had announced that the whole of the sterling area dollar purchases outside the

Western Hemisphere (mainly in Europe) amounted to only \$150 million between July 15, 1946, and August 23, 1947. In the answer to last week's Parliamentary question the Chancellor gave details of conversions of sterling into US dollars by a number of countries which included some in the Western Hemisphere and others in Europe. Excluding the former, namely Argentina and Brazil, these conversions amounted to nearly £70 million for the period January 1 to August 20, 1947. Since the European countries were not selling dollars to Britain in the second half of 1946 these figures could not be reconciled with the \$150 million figure in the earlier statement. The discrepancy is, in fact, explained by errors on the part of the Chancellor of the Exchequer in defining certain items of dollar expenditure in his October 24th speech. Two items are involved. The first is the \$620 million which he said represented sterling area purchases, other than those of Britain, in the Western Hemisphere. The figure in fact refers to dollar expenditure by the sterling area other than Great Britain throughout the world and not only in the Western Hemisphere. It therefore includes dollar payments to European countries and helps the reconciliation of this item with the figures of sterling dollar conversions by European countries divulged in the Chancellor's later answer in Parliament.

The second item which is in need of correction is the \$150 million defined in the October 24th speech as being the dollar expenditure of the whole sterling area outside the Western Hemisphere, mainly in Europe. This should in fact be attributed to the dollar expenditure of the United Kingdom outside the Western Hemisphere, mainly in Europe. The revised account of the \$3,115 million expended from the US line of credit between July 15, 1946, and August 23, 1947, should, thus, read as follows:—

	(In \$ Mn.)
Direct UK purchases from US (net).....	1,350
Direct UK purchases in rest of Western Hemisphere	960
Direct UK dollar expenditure outside Western Hemisphere (mainly Europe).....	150
UK subscription to international bank.....	35
Total direct UK dollar expenditure.....	2,495
Rest of sterling area's dollar expenditure in and outside Western Hemisphere.....	620
	3,115

Banking with Inconvertible Sterling

The effect of the suspension of convertibility of sterling on international banking business transacted through London has already begun to make itself felt. The symptoms, which are discussed in some detail in an article in the *Annual Banking Survey* published with the current issue of the *Records and Statistics Supplement*, include the decline in Clearing Banks' acceptances. It is, however, the merchant and foreign bankers in London that have felt the impact most immediately. There is no question that there has already been a considerable reduction in the demand for credit facilities provided by London for the finance of trade with or between non-sterling countries. Since the suspension of convertibility a considerable volume of trade between non-sterling countries, which until August 20th was invoiced, paid for and financed in sterling, has been conducted on a dollar basis. It is interesting to note, however, that even where this

has taken place the facilities of the London market are in some cases still being used. London banking houses are in effect extending dollar credits, working in some cases with their own dollar resources, in others with dollars provided by the Exchange Control. So long as there is assurance that the dollars paid out will be reimbursed, there can be no quibbling about the interposition of a London house in the transaction—a compliment to the mechanism of the London market, though at the same time an unwelcome, but inevitable, reflection on sterling.

The August 20th developments have had no effect on credits used to finance sterling area trade. These are still handled largely through London houses, whether the transactions are inter-sterling trade operations or those in which one of the parties is in a sterling area and the other in a non-sterling country. The greater part of the international credit facilities provided by London now takes the form of sight credits, payments being made against delivery of shipping documents. The acceptance credit has suffered some decline in international trade. The volume of commercial paper circulating in the London market has been steadily increasing recently but largely as a result of increasing use of acceptance credits for financing domestic trade. The future of the London credit as an instrument for financing international trade clearly depends on the return of sterling to effective convertibility and automatic transferability over a large part of the world.

* * *

Europe's Breadgrain Deficiency

The severe winter and a rainless summer were expected to cause a serious decline in the European breadgrain harvest—wheat and rye. But a number of countries have reported that their crops are even smaller than was originally anticipated when the Marshall Report was drawn up. According to the Paris Conference, the breadgrain requirements of the fifteen participating countries (excluding the United Kingdom) were estimated at 38 million tons for 1947-48. Home production was put at 21 million tons, leaving an import balance—which was not assured—of 17 million tons. These requirements permitted the existing level of consumption to be maintained, but no allowance was made for an increase in stocks. The difficulty facing Europe is that whereas domestic production has been reduced by at least 500,000 tons, there is little likelihood of even the original import balance of 17 million tons being met.

It is, of course, difficult to give an accurate assessment of the exportable surpluses of the chief grain producing areas, as much depends on the quantity consumed internally, which has lately been rising. Also, in the United States wheat is being used as a livestock feed owing to the shortage of maize. But an idea of the quantity available to Europe can be obtained from the following estimates. It is generally thought that American wheat and rye exports to Europe this season will total 10 million tons, while Canada, after meeting her obligations to Britain under the long-term wheat contract, will only have about 1,000,000 tons of breadgrains available for export to other countries. No official estimate of the Argentine harvest has yet been published, but in view of the reduced acreage, it is improbable that exports will exceed 2,000,000 tons, and even this figure is optimistic. From Australia it may be possible to export 1,500,000 tons if shipments to the Pacific area are drastically reduced and on the assumption that a similar quantity is being purchased by the

NATIONAL PROVIDENT INSTITUTION

FOR MUTUAL LIFE ASSURANCE

— ESTABLISHED 1835 —

48 Gracechurch Street, London, E.C.3.

United Kingdom. These estimates give a total exportable surplus available to Europe of 14½ million tons compared with an import requirement of 17½ million tons. This deficiency of 3,000,000 tons represents four weeks' supply. On this basis, Europe will have sufficient breadgrains to feed itself until the end of May, 1948.

The prospects, however, for 1948-49 are not very encouraging. Poor germination of winter sown wheat in the United States and the disappointment of the Canadian farmers over the new wheat contract price suggest that wheat production may be less than this year's total. And Europe will be unable to accumulate stocks to meet it. If the supply of breadgrains next season is shorter than this season's, Europe can only be saved from severe privation by the introduction of an effective international rationing scheme, which would reduce domestic consumption in the major grain producing countries.

* * *

Rayon for Export

In rayon manufacture, as in other textile industries, emphasis has changed from supplying the home market to searching for export markets, especially in hard currency areas. Two weeks ago, the minimum allocation of rayon production for export was raised to 50 per cent for the period January to April next year. But the prize gymnastic exercise for earning hard currency has been kept for this week. It requires a little preliminary explanation.

Although all three sections of the rayon industry—filament yarn, staple fibre and piece-goods—are expected to make a contribution towards achieving the export target of £3,630,000 a month by the end of next year, special interest attaches at present to the position of staple fibre. Production of staple fibre can be increased more rapidly than filament yarn and it also has better prospects of earning dollars. The American textile industry's requirements for staple fibre are well in excess of the American rayon industry's capacity to supply them at present. In its October issue, *Rayon Organon*, the American rayon trade journal, estimated that in the first eight months of this year the United States imported 17½ per cent of its staple fibre needs. This gap in the American market is likely to persist for some time or until the United States industry can complete its expansion programme which is now under way.

The Board of Trade have decided to divert British staple fibre from the Lancashire textile industry to the American market, since raw staple fibre will earn dollars while its capacity to earn hard currency in the form of piece-goods is more problematical. But the weaving industry must not be starved, so the argument goes, for it too has a valuable if less certain contribution to make to the export drive. So staple fibre is being imported experimentally from Holland to feed Lancashire's looms with rayon, at a price rather higher than the British product.

This is one instance—there will probably soon be others—of the contortions to which industry must now be subjected in an effort to pay for essential dollar imports. It will have the more salutary effect of bringing home to consumers in this country the increased prices which now have to be paid for ever-dwindling supplies—a blunt truth from which they were shielded when the textile allocations for export were cut last March in order to maintain supplies at home. It will involve some nice calculations of gain and loss. In particular, at what point is a gain in dollar earnings counterbalanced by an increase in sterling costs for imported substitute supplies? A few schemes of this sort will show the measure of the real depreciation of sterling against the dollar as it is measured at Millbank.

* * *

Flash-back to Gilt-edged Rigging

Twelve months ago, when pressed to disclose the amount of the national debt held internally by Governmental agencies, in order to clear up the controversy about official operations in the gilt-edged market, the Chancellor replied that the information regularly made available was adequate, and he did not propose to add to it. In fact, the only information is that extracted by the persistence of certain Parliamentary questioners, who each year since 1939 have obtained from the Chancellor two figures—the amount of floating debt and of "other" debt so held at the preceding March 31st. Such information is not only grossly inadequate; it is also, as *The Economist* pointed out some months ago, hopelessly and perhaps deliberately misleading. The nature of these totals is not usually defined, but from a supplementary

statement by Mr Dalton two years ago, listing the "principal" departments concerned, it is evident that the Bank of England Issue Department was not included—although it certainly ranks with the National Debt Commissioners as the biggest holder. Hence the figures raise more problems than they solve.

This is particularly true of the latest release, showing that at March 31st last the departments held £695 million of floating debt and £3,152 million of other debt. Although the Bank of England Issue Department is even more clearly a Governmental agency than it was in 1945, it is still excluded. Yet the total holding shows a huge increase over the year—by no less than £649 million, easily the biggest annual movement in the series. The expansion in 1945-46 was only £290 million.

* * *

Departments "Go Long"

The annual changes in the two categories of debt are shown in the first two columns below. In addition, an adjustment has been made for known issues of "other" debt to the National Debt Commissioners (column 3), since these issues generally comprise special securities such as terminable annuities, representing investments held on behalf of the Post Office Savings Banks. It is reasonably safe to presume that the bulk of the residual "other" debt (column 4) comprises marketable securities; this, therefore, is the item which has most relevance to the gilt-edged market.

DEPARTMENTAL HOLDINGS OF SECURITIES
(£ Mns.)

Change in Years Ended Mar. 31	Floating Debt	Other Debt			Total
		Total	Issues (net) to Nat. Debt Commissioners	"Marketable" Securities	
1940.....	+ 91	+ 49	Nil	+ 49	+ 140
1941.....	+ 193	+ 173	+ 76	+ 97	+ 366
1942.....	+ 43	+ 256	+ 167	+ 89	+ 299
1943.....	+ 187	+ 311	+ 240	+ 71	+ 498
1944.....	+ 137	+ 330	+ 357	- 27	+ 467
1945.....	+ 196	+ 429	+ 468	- 39	+ 625
1946.....	- 265	+ 555	+ 296	+ 259	+ 290
1947.....	+ 77	+ 572	+ 218	+ 354	+ 649

Apart from the known issue of £50 million to the National Land Fund (which apparently was still intact at end-March last), the sources of the £360 million additional absorption in 1946-47 (compared with the previous year) can be only surmised. Conceivably, the bulk represents accumulations of trading and miscellaneous surpluses and of receipts from sales of surplus stores which at the date of the statement had still to be directly absorbed into the central Exchequer. The speed with which the "clawing-back" process proceeded and the "revenue" from sales of surpluses accrued immediately after the April Budget strongly suggests that large sums were awaiting transfer at the end of the last financial year. Pending such transfer, and their consequent appearance in the Revenue Return, they would have been "lent" to the Treasury against various forms of internally-held debt. There is also a possibility that any holdings of the now redeemed Local Loans stock were not included in the 1946 figures on the ground that it was not technically an obligation of the Government; whereas the successor stock, the ill-fated "Daltons," was certainly largely held in March last, and naturally figures in the total.

From the gilt-edged market standpoint, the figures, so far as they go, strikingly support the assumption that the cheaper money drive necessitated a major offensive by the "departments." In the two years to end-March last, a period which covers the whole of Mr Dalton's drive, the floating debt holdings actually declined by £188 million, whereas the longer-term portfolio expanded by no less than £1,127 million. In this second category, £514 million represented known net issues of non-marketable securities to the Debt Commissioners; but, even after allowing for this, the "marketable" longer-term securities rose by £613 million. If the Bank of England's portfolio had shown changes which substantially counteracted this huge switch—in other words, if the Issue Department had on balance been taking in floating debt while releasing other securities—Mr Dalton would surely have thought the time ripe to bring the Bank figures into the reckoning. Unless and until he sees fit to give more information, the presumption must be that the departments were obliged to "go long" on a very large scale indeed, because the public in face of enforced interest cuts was determined to "go short"—so short, indeed, that it demanded cash.

THE SPIRIT OF ENQUIRY

"The Devil's in it", they growled...

Nickel, cursed by Saxony miners two centuries ago as impossible to refine, has to-day become a blessing. The isolation of pure nickel and the wide application of its specialized alloys have influenced industry in a thousand ways. Without this background of research and enquiry we would not now enjoy many commonplace comforts and advantages.

'Eyes to See'...

Sam Weller said that he might be able to see through a flight of stairs and a deal door—if his eyes were "a pair o' patent double million magnifying gas microscopes of hextra power". The modern microscope does better. It can reveal secrets whose existence was hidden from naked eyes for thousands of years. This metal-lurgical microscope, for example, shows details of the structure of what to the naked eye is but a lump of metal. Since metals are opaque they are examined by reflected light. The surface of the metal under examination is given a high polish so that a beam of light directed on to it is reflected back into the microscope. The power of the instrument is such that, while an ordinary hand glass may magnify up to two diameters, the microscope shown here has a magnifying range extending up to three thousand diameters! For the past 80 years the microscope has played an important part in the study of metals. Modern instruments like that shown above have enabled it to retain its position as one of the most important pieces of equipment in the laboratory of the metal-lurgical chemist. The metal-lurgical microscope is a sign of the readiness of the British chemical industry to employ the most modern equipment to serve the community efficiently.

Sweet Sixteen—and sweet dreams, too, as the giant Short boat flies through the air with the greatest of ease. What will her relatives in England think of her—"our cousin from New Zealand"—and what will she think of them? How easy and pleasant it is, how clean and comfortable, how *romantic*, to fly by flying boat!

Tea was fun, too, watching the clouds go by. Of course, it was rather unkind of daddy to spend so long upstairs in the lounge last night, talking economics to that Professor, but it did leave her the whole of the evening to herself in that lovely cabin. If only this pleasure cruise could go on for ever! But then, there's England, too....

This year, next year—some time it will be your turn to travel. Enquire from your travel agent, then, the routes served by Short flying boats. At present they include U.K. to Africa, India, China, Australia, and New Zealand, as well as services in South America.

It's fun to fly by flying boat!

Discrimination in Tin

America's dislike of discriminatory practices, as adopted by other countries, has once more taken the form of a proposed international agreement. This time, the proposal—which was recently discussed at Geneva—covers the abolition of discriminatory export duties; the result of these discussions will be made known next week when the full tariff agreement is published. Until then, it will not be known how far the proposals have been translated into specific undertakings which might have a serious effect, in particular, on the Malayan tin industry. For many years past, an export duty has been levied on Malayan ores and concentrates shipped for smelting in countries outside the Empire. This duty is admittedly discriminatory; its intention has been to foster local tin smelting. The same objective of assisting local smelting has been pursued in the United States by the provision of a government subsidy for the recently-built tin smelter at Longhorn in Texas.

Here is scope indeed for argument about discrimination. The duty on exports of Malayan ore is an admitted case, but would its abolition be fair if direct subsidies for tin smelting continued elsewhere? The output of the Longhorn smelter in the first nine months of this year was only 24,500 tons compared with 36,000 tons in the corresponding period of 1946, but the reduction was due more to a lack of supplies of ore rather than to American Government policy. The fact is that the low-grade Bolivian ores which feed the smelter require an admixture of high grade ores from Malaya and Indonesia for sweetening and to make operations at Longhorn economical. Thus, even if the Texas smelter were operating close to its rated capacity of 70-90,000 tons (compared with current American tin consumption of about 60,000 tons a year), the United States would be even more dependent on supplies of richer tin ores from Eastern sources. Such a demand, if it were projected on to a free Singapore market, might be sufficiently large to force local Malayan smelters to close down through a lack of supplies. If, therefore, the abolition of the tin export duty is contemplated, it should be coupled with the abolition of the subsidy to the Longhorn smelter, so that Malayan smelters could then compete on an equal footing.

Malaya obviously would not wish to lose the American market for tin ore, and an intransigent stand about the export duty which was intended to force the United States to purchase tin-metal might well lose both the tin-metal and the tin-ore market—with the consequent loss of important dollar earnings. The American Government has already purchased fairly large quantities of concentrates from the Netherlands East Indies and reports suggest that a long-term agreement is being arranged with the Dutch authorities. If, therefore, American policy intends to keep the Longhorn smelter in operation, Malaya might have to make a one-sided concession—merely to assist the uneconomic process of shipping tin ore and concentrates half-way across the world when it could be smelted at the source.

Employment in September

The Ministry of Labour's manpower figures for September are more than usually interesting, because they begin to show the effects of the emphasis on production for exports. If the figures are to be believed, the number of persons directly working on exports increased by 131,000 during the month and is now 74 per cent above the mid-1939 figure. In previous months, the increase had been at the rate of 10-15,000 a month only. The September figure, however, is difficult to accept at its face value. There is no doubt that more workers are now employed on exports, but the difficulty of determining the boundaries between home and export production is often considerable, particularly in industries manufacturing components. Equally there can be little doubt that many firms, on whose voluntary returns the Ministry has to rely, tend to push up their export manpower figures—at least to give a good impression of how well they are doing and perhaps to support their claims for fuel and materials.

With this qualification, however, the manpower trend seems broadly satisfactory. The total working population of 20,363,000 has increased over the middle of the year, as a result of the addition of 20,000 women, although it will drop again before the end of the year. The number employed in industry is now 18,676,000, more than 750,000 above that of 1939. The increase of 17,000 in the number of women in industry last month is particularly encouraging, for it suggests that the response to the Government's recruitment campaign has exceeded expectations. The bulk of the increase is accounted for by part-time workers, the number of whom increased by 30,000 during the month. This is clearly the solution to the problem of employing married women. The slight increase in employment in building and civil engineering, which is now above its prewar strength, and in the distributive trades is not so auspicious, though it cannot be called serious. There should be a downward trend in building during the winter months, while distribution is still at only 81 per cent of its prewar level.

The Government is now trying hard to recruit agricultural workers, and aims at an increase of 85,000 by the middle of next summer. Just over half of this total, it is expected, will be made up of European volunteer workers, Poles and German prisoners of war who elect to stay in Britain as civilians, leaving the balance to be found from British sources. Unless the schemes to give priority for house building in rural areas are expedited, it is doubtful whether any campaign to recruit farm workers or any use of the powers of direction will succeed very far. The effect of the switch over to exports is not yet reflected in the unemployment figures, which increased by 19,073 between mid-September and mid-October. This still represents only 1½ per cent of the insured population, although the proportion is considerably higher in the development areas of Wales and Scotland.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: British Sugar Corporation; Wm. Doxford and Sons; Singer Motors; Imperial Smelting.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (e) Net yields are calculated after allowing for tax at 5s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

Standard Motor Prospects

When the Standard Motor Company issued its preliminary statement several weeks ago, shareholders were astonished to learn, without a word of explanation, that net profit for the year ending August 31, 1947, had been reduced by some 30 per cent from £283,499 to £198,915. Despite much conjecture about the real earnings position of the company, the actual reason for the fall in net profit remained hidden until the full accounts revealed that trading profit had in fact increased by 31 per cent, and that the reduction in net profit was brought about by the increased provisions for taxation and depreciation. The next instalment in this serial was provided at the meeting last week with its indications that shareholders should await the final chapter with fair confidence—the marketing of the new “Vanguard” car and of the Ferguson tractor, in which £3,000,000 has been invested on capital account during the last two years. *

The “Vanguard” will go into production early in 1948 and at the same time double shift working on the Ferguson tractor will begin. The company's total output of vehicles, including the Standard and Triumph cars and the tractor is at present in the region of 8,000 vehicles a month. The originally planned output of Ferguson tractors has already been reached, and the company is confident that it will be able to make a substantial contribution to the Government's planned increase in exports of agricultural machinery from £1,500,000 a month at the end of 1947 to £4,500,000 a month at the end of 1948.

As yet no figure has been given for the contemplated output of the Vanguard to replace the present Standard and Triumph models, although the chairman stated at the meeting that orders for the new car ran into hundreds of thousands. There can be no doubt of the ambitious intentions of the Standard Motor Company and it is to be greatly hoped that shortages of power, steel and other raw materials in the coming months will not interrupt their plans. But it will not be forgotten that, about this time last year, equally optimistic forecasts of prospects were being made by the motor industry, which did not foresee that it was on the brink of the calamities of the ensuing February and March or of the later diversion of an increasing proportion of its output to foreign markets. No signs of apprehension were heard at the Standard Motor meeting. The company has taken the plunge, scrapped its old models, and is launching what is virtually a new product. For that willingness to take so high a degree of risk it

deserves success, but the market, overseas and at home, will be the final arbiter.

* * *

Payment by Results

The Ministry of Labour Gazette has filled a gap in industrial statistics with a timely survey of the proportions of time and pieceworkers in manufacturing industry. Both sides of industry have declared their readiness to co-operate with the Government in extending systems of payment by result, in order to secure increased output, and more factual information about the adoption in practice of piecework systems is, for this reason alone, particularly valuable, especially if it can be published at regular intervals.

The proportion of workers on piece rates varies widely from industry to industry. Of the 5,750,000 workers covered by the survey last April, pieceworkers accounted for only 26 per cent—only 1 per cent more than in October, 1938. The proportion of women employed on piece rates is considerably higher than for men—38 per cent compared with 23 per cent, though there was a drop of 8 per cent compared with October, 1938, in the proportion of women working on piece rates. Nearly two-thirds of the individual industries covered by the survey had relatively fewer women pieceworkers in 1947 than in 1938. In the range of engineering and general manufacturing industries, the proportion of pieceworkers is fairly high. In the metal, engineering and ship-building group as a whole, no less than 46 per cent of the men were working on piece rates, and in a few individual industries, including iron and steel manufacture, electrical engineering and motor vehicle production, the proportion was over 50 per cent. Such industries as transport (2 per cent) and public utilities (1 per cent) do not lend themselves easily to systems of payment by results, but the recent agreement reached in the building industry should lead immediately to a large increase in its present negligible proportion of 2 per cent. In the textile group, 43 per cent were pieceworkers, and the proportion of women pieceworkers was as high as 58 per cent.

The fact that only one quarter of the workers covered by the survey are working on piece rates cannot be regarded as satisfactory, at a time when the most rapid and effective incentives to increased output are needed. It would certainly be an advantage if the representatives of each industry could examine their methods of wage payment, to see how far in practice systems of payment by result can be extended.

Suppliers of Aga Cookers to H.M. The King

The Aga Cooker for Farmers

NEW PRIORITIES SCHEME

IN VIEW OF the great demand for Aga Cookers and Water Heaters, both in this country and abroad, and in accordance with “National policy”, Aga Heat Limited have decided to inaugurate a system of priority deliveries.

(1) Exports (2) Farmers (3) Doctors

In this time of National crisis, when the country bitterly needs all the foreign exchange it can get, it is obvious that exports must take first place. The reasons why the next priority has been allocated to farmers are also simple.

Freedom from worry: When the

nation is making a special effort to make itself more nearly self-sufficient in food, it is important that farmers should be given every facility by way of modern equipment.

Just as tractors are replacing horses, so should the farmer's kitchen be equally up to date. The Aga cooks more food and heats more water to each cwt. of fuel than any other appliance of any description. It is not, as some people seem to think, a luxury toy for the well-to-do, but a fuel-saving invention of national importance. Besides directly saving solid fuel, the

Aga also relieves the load on gas and electricity undertakings: this is particularly important in rural areas.

Freedom from unnecessary work: The Aga requires only a couple of minutes' attention a day. By saving labour, and also by improving general domestic working conditions, the Aga enables the farmer and his wife to give more time and energy to their work as producers.

Aga Heat Limited believe that, by giving first priority at home to Farmers, they are benefiting the country as a whole.

AGA HEAT LTD. (Proprietors: Allied Ironfounders Ltd.)
20 NORTH AUDLEY STREET, LONDON, W.1. MAYfair 6131
The word AGA is the registered trade mark of Aga Heat Ltd.

COMPANY MEETINGS

IMPERIAL SMELTING CORPORATION, LIMITED

A MARKED IMPROVEMENT

The annual general meeting of this company was held, on the 12th instant, in London, Mr John R. Govett, the chairman, presiding.

The following is an extract from his statement circulated with the report:—

The net profits for the year ended June 30th last showed a substantial increase. Two factors are in the main responsible for the marked improvement, viz., a wider margin between costs of raw materials and operation charges on the one hand and realised prices on the other, and the effects of the rigidly conservative policy followed by the board during the past few years. It would be unwise to anticipate a continuance of the former. After payment of the dividend on the 6½ per cent. Preference shares the directors recommend a dividend of 5 per cent., plus a bonus of 1 per cent., less income-tax, on the Ordinary shares of the Corporation. The carry forward to the current year has been increased by £42,252 to a total of £103,354.

The revenue received in the way of dividends from our wholly and partly owned subsidiaries and investments in associated enterprises continues to be satisfactory. Orr's Zinc White Limited, Fricker's Metal and Chemical Company, Limited, National Alloys Limited, Cuprinol Limited, British Titan Products Company, Limited, Fisons Limited, Capper Pass and Son, Limited, The Wolverhampton Metal Company, Limited, etc., all show good trading results.

PRODUCTION MAINTAINED

Fuel and power shortages and dislocation of services last winter interrupted production at each of our principal works, the most serious being at Widnes, where production of lithopon: stopped entirely for three weeks and could only be resumed at about 75 per cent. capacity for several months. Notwithstanding this setback, average production over the whole period was well maintained. Zinc production exceeded that of the previous year, largely due to a record output from, and improved efficiency in, the operation of the vertical retort plant. The production of sulphuric acid was the highest in the history of the Corporation. These achievements in the face of unfavourable conditions resulted from the efficiency and high morale of our works management and operatives. The difficulties caused by shortages of fuel and other supplies were minimised by the helpful co-operation of regional officials of the various Ministries. Shortages of constructional materials and delays in delivery have slowed up our programme of modernisation and expansion.

Throughout the year the products of our works—all of national importance—continued to meet a heavy demand from essential industries. Under the officially controlled distribution of our lithopone, the home paint trade has absorbed 75 per cent. of our production, leaving only 25 per cent. for other trades and export. The high performance of our latest type of vanadium catalyst (N.P.7) in Government acid plants during the war has confirmed the excellence of this I.S.C. product. It is now being adopted by leading sulphuric acid manufacturers in this country and abroad. While business continues at a high level and absorbs practically all our supplies, the obvious uncertainties now developing prevent any reasonable prediction of results for the current twelve months.

The report and accounts were unanimously adopted and a special resolution was passed approving an alteration to the Corporation's Articles of Association, amending Article 99 to enable the board to appoint a person who might, or might not, be a member of the directorate, as president of the Corporation.

GENERAL CEYLON RUBBER AND TEA ESTATES, LIMITED

MR. J. GILROY ANNAN'S STATEMENT

The fiftieth annual general meeting of this company was held, on the 11th instant, in London, Mr J. Gilroy Annan, the chairman, presiding.

The following is an extract from his circulated address for the year 1946: The net profits, as compared with 1945, are less by some £19,300. Revenue from tea was more by about £21,900, partly on account of increase in crop secured during the season, and also to a small increase in selling price. Revenue from rubber shows a decrease of about £21,000, almost entirely offsetting the increased tea revenue. The crop of cardamoms was considerably reduced, and despite an increase in selling price of about 11½d. per pound, the revenue from this product was less by approximately £1,150.

Costs of production have continued to rise during the year, tea by 1.83d. per pound, rubber by 3.06d. per pound, and cardamoms by 28.74d. per pound, as compared with the 1945 average costs. The excess of current assets over commitments, including provision for taxation, shows an improvement of £5,496 over the corresponding figures for 1945. Your directors recommend the restriction of the distribution in dividend to 5 per cent., less income tax.

The estimates for 1947 are framed to deal with a crop of 2,608,000 lb. of tea and 1,464,000 lb. of rubber, the crop harvested to September 30th being 1,928,932 lb. of tea and 826,831 lb. of rubber, compared with 1,829,234 lb. of tea and 970,674 lb. of rubber at the corresponding date in 1946.

The visiting agents continue to report favourably on the company's properties and the agricultural condition of the estates. The report was adopted.

MALAYALAM PLANTATIONS, LIMITED

RECORD FIGURES

The twenty-sixth ordinary general meeting of Malayalam Plantations, Limited was held in London, on the 13th instant, Mr H. J. Welch, the chairman, presiding.

The following is an extract from his circulated statement for the year to 31st March, 1947:—

The figures in the accounts show high records for net profits, for net liquid assets, for surplus and reserves, and for cash investments and funds. The year proved to be a more satisfactory one for tea which showed a profit of £13 19s. per bearing acre as against £11 2s. 3d. in the previous year. Rubber production, however, was disappointing as its profit per mature acre fell from £7 8s. 9d. to £3 10s. 7d. Consequently, the trading profit showed only a slight advance and the much increased net balance available for dividend was made possible by reductions compared with last year of £16,000 in the sum provided out of revenue for expenditure on buildings, machinery, etc., and of £58,000 required for Excess Profits Tax and Profits Tax.

The dividend paid by this company last year was 12½ per cent. and it was 10 per cent. for each of the previous nine years. The net profit available was the highest for nineteen years and, in view of this, and the apparently satisfactory prospects for the company, the board decided to recommend an increase to 15 per cent. of the total dividend for this year.

If adequate labour forces are maintainable and climatic conditions are not too unfavourable, we estimate to produce during the current year 14,691,000 lb. of tea and 5,493,000 lb. of rubber. The current year again promises to be a satisfactory one for stockholders and the company's financial position is one of great strength.

The report was adopted.

RAPHAEL TUCK AND SONS LIMITED

HOME EXPORT PROBLEMS

The forty-sixth annual ordinary general meeting of Raphael Tuck and Sons, Limited, was held in London on the 14th instant.

Mr Desmond Tuck (chairman and joint managing director) in the course of his speech, said: The satisfactory results before you have been achieved in spite of a continuation of many of those obstacles to which I referred last year, and which can be summed up under that unpleasant word controls. One important factor which has helped to offset our difficulties is that we are fortunate in possessing a world-renowned name as a background to our activities. It is an Open Sesame wherever we operate. It conjures up an immediate thought of Christmas, birthday and other greeting cards, of picture postcards, calendars, and of picture and other illustrated books which are of such delight to the younger generation.

Those of us who are so closely in touch with the Christmas card, and realise how deep-rooted it is in the hearts of every section of the public, can only join issue with unimaginative people who care to regard it as an article of luxury. Nothing could be further from fact. We claim it to be a necessity in so far as any intention still remains of preserving the fabric of human society and of maintaining traditions which are the fundamentals of civilised people. Failure, by restricting necessary supplies of paper, to recognise and accept this proven truth, can only be classed as an instance of ill-advised policy which should be rectified at the earliest possible moment.

Whilst the demand for our publications at home continues to show a liveliness which, due to the shortage of the supply of material we are unable to satisfy, we have, in response to the general call made upon industry, been devoting our especial attention to the extension of our export markets. This entails the employment and maintenance of a chain of highly trained and skilled personnel to carry the work through from its initial to its final stages. Export orders, the moment they are received, have an immediate call upon their services.

PRICE HANDICAP

We face an immediate price handicap, because our hands are manacled. If you are dealing with a monopoly article, or with one whose entire output export can absorb, you might perhaps, in your calculations, be justified in divorcing export from home trade. But when it is a case of a manufactured commodity, the like of which is produced abroad even though not as good but nevertheless passable, and, at a pinch, still acceptable there, a wholly different consideration should be given to such cases, instead of inflicting on manufacturers the suicidal policy of having their home supplies of material cut down or cut out simply because the order has gone forth to “clear the decks” for export.

Our recent experience has shown us that although our friends overseas are more than ready and willing to buy from us, in some cases they find themselves confronted with barriers which greatly restrict, and sometimes prevent, importation. I hope that our legislators have taken these conditions into due consideration when planning the high export targets which they have set.

The more distant future will depend upon how long and to what extent industry as a whole is doomed to remain shackled and with the Sword of Damocles hanging over its head. Let wiser counsels prevail than are at the moment apparent. Let the essential partnership of home and export trade be officially recognised, and then British Industry, ourselves included, will render a good account of itself.

The report was adopted.

STANDARD MOTOR COMPANY, LIMITED

LARGE CAPITAL EXPENDITURE

MR C. J. BAND ON THE OUTLOOK

SIR JOHN BLACK ON NEW PRODUCTION POLICY

The forty-fourth ordinary general meeting of this company was held, on the 7th instant, in Coventry, Mr C. J. Band (chairman of the company) presiding.

The Chairman, in the course of his speech, said:

It will be seen that the general lay-out of the accounts is on entirely new lines and the directors anticipate that the figures will provide stockholders with a clearer picture of the financial position of the company.

The interest of stockholders together with reserves appear in the top section of the balance sheet, and the lower portion shows how this interest is made up between fixed assets and net current assets.

The general reserve has been increased by the sum of £200,000 transferred from contingencies reserve, the directors being satisfied that the contingencies for which the reserve was created are not now likely to mature.

During the year additions to the fixed assets less sales have amounted to no less a sum than £1,867,527.

£3,000,000 IN CAPITAL ASSETS

During the two years ending August 31st last, over £3,000,000 has been invested in capital assets to provide for "Vanguard" and tractor production.

Expenditure on the adaptation of factories leased from the Government is being written off over the terms of the leases.

The value of stock and work in progress has increased by nearly £2,000,000, and this accounts for the large rise in trade liabilities. I can assure stockholders that this is quite in keeping with the large increase in the company's turnover.

In consequence of the policy adopted by the directors there has been a substantial reduction in the bank balance due to the capital expenditure I have already referred to.

The 10-year bond shown in the accounts will mature early next year and the sum payable to the company will be approximately £130,000.

The tax reserve certificates are adequate to cover the company's liability for current and future taxation.

PROFIT FIGURES

If you refer to the profit and loss account you will see that the actual trading profit is substantially in excess of that in the previous year, but the net profit is less due to the incidence of taxation and the large sum required for depreciation of fixed assets, the sum being £346,860, compared with £152,670 last year.

It may be of interest when I tell you that all prewar plant has now been completely written off the company's books. Having regard to certain comments made in the press, I must emphasise that the charge of £346,860 for Depreciation represents pure depreciation for the year and that this figure has not in any way been increased by the Taxation Equalisation (Initial Allowances) Reserve referred to in the Directors' Report. The substantial purchases of new plant in the two years ended August 31, 1947, have given rise to exceptionally high initial tax allowances for the purposes of income tax, the effect of these being that a greater allowance for wear and tear has been given for income tax than the amount written off in the accounts as depreciation.

If full credit were taken for these allowances in arriving at the provision for income tax, a false position would result. To correct this the directors have created a Taxation Equalisation (Initial Allowances) Reserve, shown on the balance sheet as £200,000, and

it is their intention to draw upon this reserve in future years to take care of the position when wear and tear allowances are less than the depreciation charged against profits.

I feel bound to warn stockholders that if the depreciation policy adopted by your directors, as I think wisely, is continued in the future, the depreciation charge next year may be in excess of the amount which we have had to provide in the accounts now under review. Long-term stockholders will, of course, appreciate that this policy is for their ultimate benefit.

DIVIDEND PROPOSAL

I now turn to the directors' report, which I am asking you to confirm. It is proposed to pay a dividend of 25 per cent., less tax, and to transfer the sum of £50,000 to the employees' special fund.

Very frequently speeches are made by more or less irresponsible people about excessive dividends being paid by various companies, and, therefore, I wish to emphasise the point that, although the issued capital of this company is a little less than £1,000,000, the actual net capital of the company after making provision for all liabilities is nearly £4,000,000. It is this latter sum that must be considered in relation to profits made or distributed. I had some comments to make in my speech to stockholders at the annual meeting held last year about the employees' special fund. In the light of present conditions your directors are still of the opinion that it is essential to continue the building up of this fund, and thus ensure that our employees are, as far as possible safeguarded should unforeseen circumstances arise. As I have stated on previous occasions, the fund is administered by a committee, who give careful consideration to all cases brought before them. You are well aware that Sir John Black takes a keen interest in the welfare of all employees of the company, and I can assure you that the proposed allocation to the fund has his wholehearted support.

THE OUTLOOK

With regard to the future, I can state with confidence that our equipment is such that the company is in a position to expand its activities far beyond anything that has been achieved in the past. I have purposely said nothing about the company's production because I am going to ask Sir John to second my proposition and, I have no doubt, he will give you information that will be of the greatest possible interest.

Once again I ask you to join with me in expressing our appreciation and thanks to Sir John Black, his executive staff and all employees for their services during the past year. I have on numerous occasions expressed my appreciation of their good work—on this occasion I will only add that so long as Sir John remains the skipper, with his uncanny foresight, outstanding genius for administration and production, and with his loyal and efficient crew, stockholders of the company can rest secure in their berths with the knowledge that the course taken will bring them through any storm into calm and safe waters.

I have great pleasure in proposing the adoption of the balance sheet and accounts for the year ending August 31, 1947, and of the directors' report for that year.

SIR JOHN BLACK'S VIEWS

Sir John Black (deputy-chairman and managing director) said: Mr Chairman, ladies and gentlemen,—Before I second the adoption of the balance sheet and accounts, and the directors' report, I want to thank the chairman for all his advice and help

during the past year. I would also like to congratulate him upon his analysis and appreciation of the company's progress as displayed in the balance sheet.

The chairman has suggested that I should tell you something of the company's production, and I propose to deal with this under two main headings.

Firstly, the present output from our factories. The combined production of Standard and Triumph cars and Ferguson tractors is now approaching 8,000 units a month. The tractor output fulfils the original planned programme.

Secondly, the programme in hand for the immediate future.

ALTERATION OF POLICY

The company has recently made an important announcement in connection with the production of Standard cars for the future. It is a major alteration of policy, because it means the eventual termination of the existing range and the concentration of all production facilities on one model—the Standard "Vanguard." This car, designed in 1945 for the world's markets, regardless of domestic legislation then in existence, has had a remarkable reception from all countries.

Production will start early in 1948 and the "Vanguard" will contribute materially to the country's exports. Some hundreds of thousands of orders have already been received.

Concurrently with the production of the new car, the tractor programme will be stepped up by the introduction of a double shift. This will enable the Banner Lane works to increase its output substantially. Agricultural implements are an essential contribution to the company's tractor activities, and the manufacture of implements is increasing weekly. Arrangements are being completed to ensure that they will match the tractor figures.

The Ferguson system of farming is of major importance to the country's agricultural policy. In addition, the Board of Trade have recently announced a substantial increase in the export target for agricultural machinery, which is to be raised from one and a-half million pounds' worth a month at the of 1947 to four and a-half million pounds' worth a month at the end of 1948. You may be assured that the company will make its full contribution towards achieving this vitally important export objective.

REVISION OF PRODUCTION METHODS

Stockholders will appreciate that the change to one type of Standard car and the Ferguson tractor, both on a tremendous scale, has involved a radical revision of production methods, and great capital expenditure. As a result of these changes substantial economies will be effected in the future.

The benefit of all the hard work of planning the rearrangement of manufacturing facilities is only just beginning to be felt—in fact, the overall unit production is increasing month by month, and with the continued co-operation of all the splendid employees of the company, output will rise steeply during the coming year.

I trust that the directors' recommendation to allocate £50,000 to the employees' special fund will receive the unanimous approval of stockholders.

I take this opportunity of thanking all employees, as well as suppliers, and distributors and dealers both at home and overseas, for their enthusiastic co-operation during the past year, and I trust that they will share with us any success we may achieve in the future. I have great pleasure in seconding the chairman's proposition.

The resolution was carried unanimously. The retiring directors, Mr C. J. Band and Mr A. S. Dick, were re-elected, and the auditors, Messrs Thomson, McLintock and Co., having been reappointed, the proceedings terminated with a vote of thanks to the chairman for presiding.

GOVERNMENT RETURNS

For the week ended November 8, 1947, total ordinary revenue was £29,247,850, against ordinary expenditure of £40,655,851 and issues to sinking funds £440,000. Thus, including sinking fund allocations of £9,589,891 the surplus accrued since April 1st is £243,474,548 against a deficit of £498,558,830 for the corresponding period a year ago.

UNIVERSITY OF LONDON

THE CREIGHTON LECTURE, entitled "The Unification of the World and the Change in Historical Perspective," will be given by Professor A. J. Toynbee, D.Litt., B.A., F.B.A. (Stevenson Research Professor of International History in the University of London) at the UNIVERSITY OF LONDON: SENATE HOUSE (entrance from Russell Square or Malet Street, W.C.1) on Monday, November 17th, at 5.30 p.m. ADMISSION FREE, WITHOUT TICKET.

JAMES HENDERSON, Academic Registrar.

BRITISH ELECTRICITY AUTHORITY

PUBLIC RELATIONS OFFICER.

Applications are invited for the post of Public Relations Officer in the Secretariat of the Authority with headquarters in London.

A starting salary commensurate with qualifications, will be paid within a salary scale of £1,500, rising by annual increments of £50 to £2,000 per annum, subject to deductions for superannuation.

Candidates should have the ability to conduct a public information service, including press relations work, advertising, posters, films and pamphlets.

Applications, which will be acknowledged and treated as confidential, should be sent within 14 days to the Director of Establishments, British Electricity Authority, Portland Court, 170a, Great Portland Street, London, W.1.

GENERAL SALES MANAGER required by well-known London Pharmaceutical House. First-class experience of modern selling, advertising and marketing methods (not necessarily in the Pharmaceutical field) is essential. Applicants, preferably 35-45, must combine leadership, tact and drive with the ability to plan clearly and act decisively, and must possess the qualities associated with a position carrying a commencing salary of not less than £2,000 per annum. Write in confidence, giving full particulars as to age, training, experience, positions held and salaries earned, to Box 601.

BRITISH RAYON FEDERATION requires an Information Officer (male) with the necessary experience to control information services and press publicity. Proved literary ability, a sound knowledge of the textile industries and distributive trades are most essential, and practical press experience extremely advisable. The successful applicant will work mainly in London. Initial salary £1,200 with Pension Scheme in operation. Applicants should forward details of qualifications and experience to the Director, British Rayon Federation, Bridgewater House, 58, Whitworth Street, Manchester, 1 (marking envelopes R.I.O.).

CHARTERED ACCOUNTANT, not over 35, required by leading Mining Finance House as Assistant Accountant. Write, giving full particulars of education, experience and salary required, to Box 1978, c/o Charles Barker & Sons, Ltd., 31, Budge Row, London, E.C.4.

HERTFORDSHIRE COUNTY COUNCIL

DEPUTY COUNTY ACCOUNTANT.

Accountants who are qualified by professional examinations and experience, are invited to apply for the post of Deputy Accountant. The salary scale is £1,250, by annual increments of £50 to £1,450 (no cost-of-living bonus).

Applications and the names of three references should be sent to the County Accountant, County Hall, Hertford, not later than November 29th.

CAMBRIDGE B.A. (Honours), considerable experience Trade Association work, seeks alternative Secretarial/Administrative post, offering brighter prospects than present position.—Write Box 603.

YOUNG EXECUTIVE, Canadian, resident London, seeks U.K. appointment, proved ability in personnel, administrative and organizing fields. Able to accept responsibility, has initiative, tact, confidence, good appearance. Excellent Service record, decorated.—Box 604.

BETWEEN EPSOM AND GUILDFORD (5 min. Southern Electric): A well-equipped and conveniently planned building, suitable for Hotel, Hostel or Office use, with 33 bed, and dressing, 10 bathrooms, 3 reception rooms, ample offices, all modern conveniences. To let unfurnished 2 to 7 years from the New Year. Certain furniture available.—Rent and particulars from Box 602.

TRANSLATIONS: Efficient and prompt service undertaken by specialists in technical literary and commercial work. Moderate terms.—Apply to P.W.E.A. (E) Translation Service, 11, Gillingham Street S.W.1. Tel: Victoria 9557.

GIVE VOGUE'S CONTEMPORARY COOKERY for-Christmas—to your friends and to yourself. It is full of recipes for interesting food. Price 5s. from bookshops or newsagents, or 5s. 7d. post paid, from Vogue, 37, Golden Square, London, W.1.

INDUSTRIAL Designer (Artist) University man, experienced, inventive, progressive, would welcome 1 or 2 consultancies for assisting development and design of new products in any industrial field of research for popularising new materials.—Box PP 13345, Samson Clarke 57/61, Mortimer Street, W.1.

SECRETARY REQUIRED by the Technical Managing Director of a well-known firm of clothing manufacturers. Shorthand and typing essential. This post has wide possibilities for suitable applicant. All applications must be in writing.—Box 588.

THE Next Best Thing to a private secretary and a telephone is Finders Special (V.I.P.) telephone-secretarial service. And Finders are on duty 24 hours a day, and weekends. Ring GERard 9050 for details, or write to Finders, 77, Dean Street, W.1.

MONOMARKS.—Permanent London Address. Letters redirected 5s. p.a.—Write, Monomark PCM/MONO4N, W.C.1.

UNIVERSITY DEGREES, QUIETLY, in your own home, by studying our carefully prepared and tested courses, you can secure an external Degree of London University (B.Com., B.A., B.Sc., B.Sc.(Econ.), LL.B.). Expert and intensive tuition also given for Accountancy and Secretarial Diplomas, Matriculation, Civil Service posts, etc. Write now, specifying interest for the new 100-page FREE book "YOUR CAREER" to The Principal, The Rapid Results College (Estd. 1928), F.175, Tuition House, London, S.W.19 (or call at 235, Grand Buildings, Trafalgar Square).

Peace in our Time

IF the events of the last nine months have proved anything about international politics, it is that neither the Soviet nor the American government wants war. The opportunities to start war, or to issue the kind of challenges that lead to war, have been lavishly presented. There have been manoeuvrings for strategic position, interventions in the business of neighbours, exchanges of threats and discourtesies, appeals to passion and prejudice sufficient to provide fuel for a conflagration. The pile of fuel has grown higher and higher, until Americans and Russians can hardly see one another over the top. But still there has been no one willing to strike a match. Why, then, is there still so much talk of war in Europe? Why can Budapest be seized with panic for forty-eight hours at the rumour that war has started?

Disappointment has played a large part in the creation of this mood, disappointment that Great Power unity has been proved an illusion and that power politics have been with us all the time. Hope, too, has played its part, the hope of the discredited quislings and reactionaries of Europe that America's decision to stay in Europe means for them a new lease of life. Fear has played an even greater part, fear lest a Power with so mighty a weapon as the atom bomb might take the short cut to world domination, becoming suddenly arrogant in its youth and inexperience. Publicity, too, has made its contribution, bringing the applause of mass audiences to the ears of statesmen who should have been negotiating instead of cheer-leading. And Soviet diplomatic methods have added their quota of exasperating stubbornness, puzzling tactlessness and one-track realism. Yet to say all this is to make more inexplicable than ever the fact that tension has never been dangerous, and that there has not been an incident that had even the appearance of danger since Marshal Tito's men shot down an American aircraft in August, 1946.

Why—to use Mr Lippmann's phrase—has the war stayed cold? The answer can be found by asking another question: why, nowadays, do wars—large-scale wars between Great Powers—get started? In the old days, and even, perhaps, as late as 1914, wars could start almost by accident, because somebody's trigger-finger slipped, or because somebody was careless about smoking in a powder magazine. But it is hardly so today. The existence of the United Nations and the repeated demonstrations of the appalling risks of war, not least of its risk to the individuals who are in power when it begins, will be sufficient in future to prevent the purely accidental wars. War will break out only because some Great Power wants it. And a Great Power can want war for one of two reasons: either because, like Hitler in 1939, it believes not only that it can get its way by war, but also that it can do so easily and quickly; or because it is so badly frightened by the warlike preparations of others that it decides to strike while it still has time.

The reason why there is no risk of war now is because no Great Power is either confident enough of the results of war or frightened enough of the consequences of peace. This is not to say that the Americans and the Russians are not pursuing diametrically opposite ends. But they are pursuing them, and will, at least in the short run, continue to pursue them, by

non-warlike means. For two years—a short time by normal diplomatic standards—each has been marking out its sphere of influence in the no-man's-land left by the defeat of Germany and Japan, and by the weakness of Britain, France and China. Now the process is reaching its culmination, since the Foreign Ministers cannot any longer postpone the taking of decisions about Germany. The prospects of agreement are small; but there is no good reason why disagreement on this occasion should be any more catastrophic than on previous occasions.

It is true that there are noisy warmongers in the United States and aggressively nervous persons in the Soviet Union. Each group plays on the fears and ambitions of the other. But there is no sign that their governments, the handful of men in both countries who really decide policy, want war. They clearly prefer the "other means"—nowadays not formal diplomacy, but the use of money, goods, parties and ideas. The struggle between these other means is now joined: the Zhdanov directive to Communist parties and the Marshall Plan for the western democracies will be in sharp conflict throughout the winter. Each is admirably calculated to test the other. But there is no evidence that the rulers of Soviet Russia intend to back their stake with war. They are neither sufficiently scornful nor sufficiently frightened of American military strength to run the risk. They know that if they started a war now, they might in the end win it or lose it, but it would certainly be a long, hard war—and that they dare not face. On the contrary, Russian policy, though offensive in tactics, is defensive in purpose and tone. In the two chief scenes of struggle, France and Italy, it is evident that the new tactics of the Communist parties reflect an acceptance of the fact that they will not gain power. As for American policy, those who think that it could ever lead to an unprovoked declaration of war are simply exhibiting their ignorance of America.

There is then no present risk of war. But what of the longer run? Unfortunately it is not sufficient to demonstrate the foolishness of the prophecies of imminent war. The pessimists will come back with the assertion that in the long run war between two aspirants to world power is inevitable. The case for this is twofold. First, it is argued that the Russian way of life and work and the American cannot live side by side; secondly, that Soviet expansion—as inevitable, for historical reasons, as Romanov ambitions—must come into direct conflict with American and British interests either in Europe, or in the Middle East, or, indeed, in the Far East. It would be foolish to be very optimistic about the long-term prospects of peace. Mankind has never succeeded in keeping the peace for very long and the available evidence does not suggest that the present generation is so much more intelligent or fortunate in its circumstances that it will be able to succeed where all its forefathers failed. But this at least can be said, that no war ever has been inevitable, and that this particular one seems to be less inevitable than most. Nowhere in Europe—nowhere probably in the world—is there a likelihood of straight Americanism and straight Communism growing up side by side. They will be separated by any number of strange and various compromises. Moreover, it is highly probable that re-equipment and technological progress in the west will go faster than in the east, so that what is by all odds the less aggressive system will have the material attraction and advantage.

It is true enough that there will continue to be a severe conflict of interests, ideological, economic, political and territorial. If the prophets of woe would limit themselves to predicting that there will be no real peace, their case would be proven up to the hilt. But armed war will not break out unless the rulers of Russia—for the contingency of American aggression can really be ruled out—want it to break out; and that means, until they either think they can win quickly

or they really become as badly frightened as their propagandists try to make them out to be. It follows that the right long-term policy for the Anglo-Americans is to aim to produce a psychology in Moscow that is neither over-confident nor over-fearful. To do that they must stand quite firm against encroachments, while rejecting no opportunity of proclaiming and demonstrating that their ultimate aim is agreement with the Russians and not their destruction.

Both halves of this policy are equally necessary. But at the moment it is, perhaps, the second that most needs re-emphasis. At the moment there is no doubt whatever about the strength and firmness of American determination or of the impressive backing that Mr Marshall enjoys among his own people. So impressive is it that there may be some risk that the Russians, shut up in the Kremlin with their ideologies, their suspicions and their unfailing misunderstanding of all other countries, will begin to have some real fear of being overwhelmed by triumphant American policies. It is not yet time to soften the American policy of firmness, or to talk about softening it. It has already produced results, and to produce the final result at which it is aiming, it will have to be kept up for many years to come. But there is nothing more dangerous, in diplomacy as in warfare, than the temptation to follow up a retreating enemy too fast and too far—particularly when he is a Russian.

It is unlikely that there will be much opportunity for showing the other side of American policy round the conference table next week, even though Mr Marshall and Mr Molotov will be meeting again in the one European capital where there is little serious talk of war. The discussions of the Foreign Ministers' Deputies have shown no sign that their masters will meet half-way. Indeed, the situation is now worse than it was in Moscow last March: it is very doubtful whether any agreement on the economic unification of Germany could now be executed without striking at the roots of the Marshall Plan, which is the major interest of three out of the four Ministers.

But if the Foreign Ministers Conference itself provides no opportunity for anything other than acrimonious disagreement, Mr Marshall's visit to England may possibly do so. The great enterprise of the Marshall Plan was launched by a speech at Harvard—and Mr Marshall is to receive an honorary degree at Oxford. He can ignore the wilder Communist attacks upon his motives and his good faith—he knows that he is under no necessity of answering them before British public opinion. But he cannot afford to disregard the almost universal wish to know with more precision where the limits of American interest lie, and whether he really believes that security can be organised by the collective effort of the United Nations. Mr Marshall would much strengthen his following in this country if he would use his visit to give a glimpse of his vision of the future.

There is then a special task for Mr Marshall to perform in Britain, particularly in a Britain that has a Socialist Government. There has been an enormous slump in the Russian stock in this country since the end of the war. But certain illusions die hard, and among them are the wishful thoughts that agreement with Russia will come quickly, that trade will establish links that diplomacy cannot forge, that the rulers of Russia feel an affinity to Social Democrats. These illusions cannot safely be left merely to wither away in the unfriendly atmosphere of events. Nor can the Left Wing's ideological suspicion of capitalist America be left to disappear under the impact of the Marshall Plan. There is a much greater disposition in Britain today than there has ever been before to face all the implications of the view that the best way to be friends with Russia is to be firm, and to accept partnership with America in such an enterprise. But to transmute a disposition into a settled policy requires the chemistry of statesmanship.

Tariffs and Trade

WHATEVER the mountainous labours of the Geneva Conference on Trade and Employment have brought forth, it does not have the appearance of a mouse. The Report of the Conference, with its annexes and schedules, must be one of the longest and most complicated public documents ever issued—and one of the hardest to comprehend. A later article in this issue attempts to summarise what has been done and some more extensive extracts are printed in this week's issue of the *Records and Statistics Supplement to The Economist*. But even those who have studied the document in some detail would be hard put to it to pronounce upon its significance. It is possible to say what was, in 1938, the volume of trade affected by the rates of duty that are comprehended within the agreement. But nobody can say by how much that volume of trade would have been different with the different rates of duty now prescribed, and still less what it will actually be in the next few years. Altering tariff schedules must always be a matter of guesswork, and never more so than in the conditions of today.

For what they are worth, the figures of 1938 trade can be easily summarised. The United Kingdom has reduced its tariff duties on goods of which £30.4 million was imported in 1938, and has undertaken not to increase the existing rates on a further £63.1 million. Further, the United Kingdom has agreed to the reduction—and in some cases to the elimination—of the preferential margin it has previously enjoyed in Commonwealth and Empire markets for £36 million of its sales. It can, therefore, be said that the British concessions affect £100 million of 1938 trade, about three-fifths of them taking the form of facilitating the sale of foreign goods in the British market and the remaining two-fifths that of surrendering a competitive advantage for British goods in Empire markets. In return for these concessions, the other 22 parties to the agreement have made concessions in their turn. The amount of British trade in 1938 that would have been affected was £92 million, of which £44 million would have been affected by actual reductions and £48 million by undertakings not to increase the existing rates. Of these foreign concessions, of course, by far the most important are those made by the United States; some £23 million of British exports to the United States in 1938 are affected, about £13 million of them substantially. The United States has also made concessions to the Colonies, from which the United Kingdom will benefit indirectly.

Different people will interpret these figures according to their different preconceptions. The *Daily Express*, for example, headlines its report "Britain Forks Out 6d. For 4d." and goes on to declare "The Big Bad Bargain is sealed! The Big Black Pact is made! The citadel of Imperial Preference is breached." One suspects that the *Daily Express* would have

said this about the agreement whatever its content. For whether or not the Bargain is a Bad one, it is certainly not a Big one, as the above figures show. And though some reductions have been made in imperial preference, the "citadel" is still substantially intact; 70 per cent of the imperial preferential rates are completely untouched and only 5 per cent of them eliminated. Lord Beaverbrook's lieutenants were presumably caricaturing their absent master. Other people, who have had a hand in tariff negotiations in the past, will be full of admiration for the immense labours that must have gone into the negotiation of agreements between each pair of no less than 20 separate customs units. They will remember how completely such attempts have always failed in the past and in their applause for the quality of the achievement at Geneva they are already tending to exaggerate its magnitude.

Where between these two extremes would the unbiased observer settle his judgment? He would take due note, in the first place, that for many of the countries involved—and not least for the United Kingdom—customs tariffs are at present without any influence on the volume of trade. The British customs tariff is a mere fiscal formality and if it were abolished in its entirety, the effect on the volume of British imports, which is determined by quantitative licensing, would be imperceptible. In the future this may not be so; the Agreement contains an article providing for the removal of quantitative restrictions, followed immediately, however, by another granting exemption so long as balance-of-payments difficulties remain. But for the present reductions in the British tariff, and in many other tariffs, are no more than symbolic gestures. The observer might permit himself the cynical reflection that this may partly explain why success was possible in 1947 where it was impossible in 1927.

To this generalisation, however, there is one important exception. Imports into the United States are still limited by tariff duties only—apart, that is, from the importer's ability to sell the goods in the American market. If this agreement makes it possible to sell more British goods in America, that is of very real and immediate importance. On categories of British exports to the United States valued at £2,500,000 in 1939, the American duty is to be halved; on a further £10 million or so, it is reduced by between one-third and one-half. Some of the goods affected are linen piece-goods, woollen goods, knit goods, whisky, some machinery items and metal manufactures, including bicycles. Some examples are given on page 850. But it is very difficult to know what the effect of the reductions

Span the Gap

between inadequate capital and the provision of essential income for dependants by the adaptable capital and income benefits secured through the Family Provision Scheme

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844
20, LINCOLN'S INN FIELDS, LONDON, W.C.2

will be. If the 1938 rate was prohibitive, the halving of it may permit a great increase in trade—or it may still be prohibitive. Most of the items mentioned seem to be those that did not sell in the United States before the war, mainly on the score of cheapness, so that the increase in trade to be expected from reductions of duty will be small. Much depends on whether the British manufacturer is able and willing to exploit his opportunities or whether he will continue, as he has done so often in the past, to ignore divergences in taste. Bicycles are a case in point. To a British eye the American product is a monstrosity, an imitation motor-cycle, with huge tyres, unwieldy frame and even a sham petrol tank. But in a land of cheap cars, a bicycle is generally a child's toy and the utilitarian British bicycle is not popular, at any price. Unless there is a real willingness to fit the product to the market, the tariff reductions will have little effect; though that will hardly be the fault of the American Government.

It is a matter of the greatest difficulty, therefore, to assess the increase in dollar earnings that the Agreement will make possible. But it must inevitably be small. Indeed, this is a comment that must be made about the whole agreement. The £63 million of British imports on which concessions have been made were only about 7 per cent of the total of British imports. The £44 million of British exports on which tariff reductions have been secured were less than 10 per cent of British exports. And as for the dollar-earning concessions, even if it be assumed that the £23 million of British goods affected have doubled by now in price and are about to double again in volume as a result of these concessions, the total gain is still not much more than a fortnight's dollar deficit at the present rate. It would be a great pity to decry the devoted work put into this Agreement by those who have spent many months upon it. But it would be naïve to suppose that it makes more than a very small dent in the towering structure of restrictions on trade or that it contributes very much to the solution of Britain's export problem, by which the nation lives or dies. There is, after all, something mouse-like about the offspring—a welcome mouse,

a white mouse, one well worth putting on show, but definitely *mousey*, not even big enough to be the black rat that the *Daily Express* would have the public believe.

The solution of the problem of world trade—and in particular the solution of the problem of British exports—must therefore clearly be sought elsewhere than at Geneva (or Havana) and by methods other than the negotiation of multilateral pacts for the reduction of tariffs. It is most unlikely that the circumstances will ever again be as favourable as they have been this year, with the United States using all the leverage that Articles Five and Nine put in its hand and with import licensing deferring until a comfortably remote future the impact of most of the concessions offered. Other methods must now be sought. Some of these can be purely national. The British Government, for example, might well begin to take with all the alarming seriousness it deserves the great and rapid rise in the costs of production and in the selling prices of British exports. The index of these prices has been carried from 199 to 234 in a single twelve-month and it is still rising rapidly under the pressure of rising wages and shorter working weeks. It is true that the prices of imports have risen even more rapidly; but they will also come down more easily when the time comes. Costs will have to be cut if the export drive is not to fail.

Purely national action, however, cannot get very far in anything as mutual as trade must necessarily be. Over and over again, in these columns and elsewhere, the point has been made that something much more deliberate and purposive is needed to get the necessary increase in world trade than merely to remove the barriers, especially the symbolic barriers. Hitherto all such attempts have been impossible because of the theological straitness of American doctrine. There have been some signs of a loosening of ideas in that direction recently, and perhaps now that a demonstration has been given of the limited possibilities of achievement along the road that the State Department has hitherto been pursuing, it will be possible, both there and in the Board of Trade, to divert some energies into the exploration of alternative avenues.

India: Is it Working?

IN the recent debate on the Address in reply to the King's Speech Mr Churchill made the quitting of India one of the main counts of his indictment of the Government. After declaring that Burma had been "cast away" and that India had been plunged into the first of the long series of sanguinary battles which he had repeatedly predicted would follow the departure of the British, he quoted words used in the House of Commons nearly forty years ago by John Morley: "When across the dark distances you hear the sullen roar and scream of carnage and confusion, your hearts will reproach you with what you have done."

Should they indeed reproach us? That question cannot now be answered; perhaps it never will be; the alternative "might-have-beens" are too hard to calculate. But there is a more practical and immediate question to which some answer can already be given. Is it working?

There is no doubt that a very widespread impression prevails in this country that the sequel to India's Independence Day has been an almost unmitigated disaster. Yet this impression is very largely an effect of the selective character of news presentation in the daily press, especially under conditions of newsprint shortage. Unfortunately murders and massacres are always news, whereas most kinds of constructive political achievement are not. It is not that the horrors of communal warfare have been exaggerated, but that so many things

have been omitted from the other side of the account. In a sense, indeed, the values involved are incommensurable; for anyone who believes in the ultimate value of the individual human life, there can never be a merely mathematical calculation of gain and loss which counts individuals simply as units in an aggregate—that way lies the totalitarian ideology. Nevertheless, in all social and political affairs it is well to keep a sense of proportion; the fact that there are now and then terrible train accidents involving death or irreparable injury for a number of people does not prevent us from appreciating the general efficiency and security of railway transport.

The communal explosion in the Punjab has certainly been an appalling catastrophe. Though exact figures of the dead will probably never be known, a well-informed estimate puts them at 100,000, made up of 70,000 Moslems and 30,000 Sikhs and Hindus. Some 7,000,000 people have been uprooted and have migrated from India into Pakistan or from Pakistan into India, whether by forcible expulsion or in fear of further outbreaks of violence. The economic dislocation has inevitably been very great; even when immigrant families can be resettled on lands vacated by refugees of the other community, there has been a serious interruption of agriculture and in the towns the destruction of buildings and property through arson and the disruption of established business undertakings have produced a confusion which it must take years to remedy.

But when all this is recognised, it should also be appreciated that the very scale and intensity of the catastrophe imposed on the two new Governments in their first days of full power and responsibility a strain which would certainly have been too much for any men of straw. If Indian political leaders had been indeed as unfit for power as they have often been represented to be, the situation would at once have passed entirely beyond control; either the army units on both sides would have been involved in the fighting and the two Dominions would have been at war with each other, or else at least the outbreak would have been the signal for all disruptive forces everywhere in both territories to have defied the central authorities, bringing about a general disintegration.

But nothing of this kind happened. Not only did the Governments of India and Pakistan, in spite of bitter words and acute tension, aggravated by the dispute over Kashmir, avoid any resort to direct military action against each other and maintain discipline over their troops on the newly created frontier; they also co-operated with each other to a degree remarkable in the circumstances in grappling with the emergency of the vast movements of refugees. It must be remembered that provincial Governments of West and East Punjab did not exist before August 15; there had previously been only a single Government for the whole Punjab, and the new administrative authorities, in the midst of their reorganisation, were faced with a situation of sudden and overwhelming confusion. It is no wonder that there was an administrative breakdown; the wonder is that it was not worse and that the trouble was successfully kept localised—with certain minor exceptions—in the Punjab. Such an outbreak as took place in the Punjab in August and September tends to produce a vicious circle of reprisals without limit; refugees percolate everywhere with their stories of atrocity, which are never minimised in the telling. The danger was that the killing would spread to every part of India where the communities were territorially intermingled—that is to say, to practically the whole of the sub-continent, for there are Hindus in East Bengal and Moslems in Madras. But the authorities outside the Punjab showed generally both the will and the capacity to keep the peace.

★

Nor was it a question only of preventing a disintegration of that state authority which, subject to the India-Pakistan partition, had been handed over intact by the British Raj. The new Dominions also had to grapple with the task of somehow integrating in their territories for federal purposes the 564 princely states which by the abolition of British "paramountcy" had been left legally free to do as they pleased. Although it had been clear that the smaller principalities could not aspire to an independent existence, there were several of the larger states which, with their millions of subjects and armies of their own, might hope to exercise sovereignty and form combinations of the lesser states. On paper they had the right to do so, and here was a fertile field for intrigue and ambition. This situation was fraught with great danger for the stability of the new Dominions, especially of India—for few of the states were within or contiguous with Pakistan territory; had Hyderabad, Mysore and the principal Central Indian and Rajput States all refused to link their destinies with the new regime in Delhi, the territorial unity of India would have been so disrupted that effective central control would have become virtually impossible and the country would soon have drifted into a condition as chaotic as that which prevailed in the eighteenth century after the break-up of the Mogul empire.

In fact, however, all the states, with the single exception of Hyderabad, have acceded to one or other of the two Dominions. This result has not come about without statesmanship of a high order, for several of the Princes or their ministers had other

plans and it required much political skill in Delhi to prevail over the centrifugal movement; had the Indian Government shown itself weak or if, on the contrary, it had recklessly attempted coercion, the outcome might have been very different. But a policy at once firm and conciliatory, which attracted the more far-seeing political minds in the states, has brought about in a peaceful and orderly manner a great political unification which did not at all follow automatically from the transfer of power in what used to be British India. The new Indian leadership has not only averted a disintegration which would have been far more serious than the secession of Pakistan; it has achieved a unity with the states more organic than existed under British paramountcy, for representatives of the states now participate in a national parliament instead of having merely external relations with the Central Government. Within the states, democratic reforms have been introduced with great rapidity during the last few months, so that the former political contrast between the states and the British Indian Provinces has been very greatly reduced. Hyderabad still remains outside, but by itself it has now little prospect of permanent independence in its land-locked isolation. Kashmir's accession to India has indeed brought acute tension between India and Pakistan and its ultimate attachment is still undecided; nevertheless, its geographical position is such that it belongs to the fringe and not to the centre of Indian affairs.

In another way the situation in India has developed so as to justify a reasonable hope for the future, not merely for a diminution of the Hindu-Moslem strife, but even for the entry of India and Pakistan into some form of joint unity at no distant date. Despite the large-scale exchange of populations in the Punjab and the flight of many individuals elsewhere to their respective "homelands," there remain large minorities of each community on the wrong side of the border, especially of Moslems in India. What is to be the policy of each Dominion towards these minorities? Pakistan has been set up frankly as an Islamic State to save Moslems from Hindu Raj. But Congress has always claimed to be super-communal and to aim at an Indian national citizenship in a secular state without discrimination between Moslem and Hindu. Unfortunately Congress, particularly in the lower levels of the party organisation, has not always practised what it preached, and it was the anti-Moslem bias widely demonstrated after the Congress victories in the Provincial elections of 1937 which gave the main impetus to the Moslem desire for Pakistan. With the crescendo of communal riots and massacres in recent months, it was inevitable that the anti-Moslem sentiment among Congress Hindus should be intensified, and that the influence of the Mahasabha—the Hindu counterpart of the Moslem League—should increase.

But the higher Congress leadership—and particularly Mr Nehru and Mr Gandhi—has set itself firmly against the attempt to turn India into an officially Hindu State. The new Indian constitution strictly rules out religious discrimination, and it appears that Moslem minority rights are not being asserted on paper only, but are being actively sustained by Government policy in spite of bitter communal feeling. If this policy can be continued and strengthened over a period of years, if it can be demonstrated practically that Congress really is devoted to an ideal of Indian nationality transcending communal loyalties, then the effect will certainly be felt in Pakistan, and the reconstitution of an All-Indian unity by free negotiation will no longer be outside the sphere of practical politics. "There is only one way wherein India can save herself," said Mr Nehru recently, "and that is by keeping the religious and the political ways apart." That is easier said than done in the conditions of India's heritage, but the degree of success with which Mr Nehru has already grappled with the task indicates that Indian nationalism has a greater capacity to prevail over division than the sombre news of the last three months might suggest.

Agriculture and Food

THE report of the Lucas Committee on the working of the Agricultural Marketing Acts (HMSO, 2s.) has a much wider importance than its title suggests. Its recommendations could have a profound effect on both food and agricultural policy. There are four distinct stages in the supply of home-grown food. First, food is produced on the farms; secondly, it is transported from the farms to collecting centres or grading and packing stations; thirdly, it is processed in slaughter-houses, flour mills, bacon factories, and canning factories (this stage is missed out for some commodities); and fourthly, it passes through the hands of wholesale and retail distributors. Narrowly conceived, agricultural marketing is concerned only with the second of these stages, with a contingent interest in the third stage; the first stage belongs to agriculture, the fourth to food distribution. But from the viewpoint of the consumer, who purchases the finished article, and of the taxpayer, who at present subsidises the whole transaction to the tune of £400 million annually, the four stages are only parts of one gigantic supply operation. The pivotal point of this operation is marketing control, and it is with agricultural marketing in this wider sense that the committee has concerned itself.

The system of marketing control introduced by the Agricultural Marketing Acts in the early 1930s was explicitly designed to give farmers monopoly powers over the sale and disposal of their produce. The producers of each main commodity were permitted, on the decision of a two-thirds majority, to set up a Board which could obtain powers to reorganise distributive channels, limit production and dispose of surpluses, and regulate prices right down the line to the consumer himself. These enormous powers were rarely sought or used in full. Each Board's main aim was to increase and stabilise the price received by its producers, either by restricting production (as in the case of potatoes and hops) or else by controlling wholesale and retail prices (as was done with milk).

The Acts were passed at a time of considerable agricultural distress. Even so, their conferment of monopoly powers of restriction and sale on a single interested section of the community is impossible to justify. The only important safeguard which they left to the consumer was the existence of overseas competition, which was neither uniform (for it did not extend to all commodities) nor unlimited (for it was subject to increasingly severe import controls). At the outbreak of war, the English Marketing Boards were absorbed into the Ministry of Food—except for the Milk Marketing Board which acts largely as the Ministry's agent—and their more important powers are at present in abeyance.

The position of British agriculture has now changed so radically—for the better—that there can be no case whatever for reviving the Boards' powers. The chronic prewar excess of the supply of foodstuffs over the effective demand for them has been reversed with a vengeance—and, in this country, will stay reversed for a considerable time. But over and above this change in farming fortune is the fact that the Government, by guaranteeing prices and assuring permanent markets to farmers, has become the sole purchaser of three-quarters of farm output. As the Lucas committee points out, the taxpayer is "in effect" the purchaser of these commodities and he has to bear any loss arising from their sale and disposal. The National Farmers' Union argues that, having got their guarantee, the farmers' only interest in the matter is to reduce distributive margins and thus to establish their prosperity the more firmly; but this, if true, is beside the point. It would be, in the words of the committee, "utterly wrong," that any

sectional interest—however well intentioned—should exercise monopoly rights in the disposal of public property. The farmers would count themselves fortunate to have such an unprejudiced guarantee, instead of reaching for the moon.

But, more than this, the nation, having bought the farmers' produce has an imperative and inescapable interest in seeing that it is efficiently utilised. The scope for improving the efficiency of distributive channels, all the way down the long line from the farm gate to the consumers' larder, is as enormous as it is disturbing. The producer-controlled Marketing Boards did very little (considering their powers) to rationalise distributive channels—a fact which hardly helps their claim to do the job now. Since assuming control, the Ministry of Food has taken a few steps in the right direction—for instance, by concentrating the slaughtering of livestock in 800 in place of 16,000 establishments—but it has gone no further than the imperatives of wartime required. The picture of prewar conditions which Mr Thomas Shaw gave to the Lucas committee, under which the movement of cattle to the slaughter-house cost from 25s. to 30s. per head and a further 15s. per head was wasted in unused by-products, is by no means outdated. The marketing and slaughtering of livestock is a particularly black spot; but further down the line, in the wholesale and retail trades, there is equal waste and redundancy. The truth is that only the fringe of the whole marketing and distributive problem has so far been tackled.

*

It is, however, of vital interest to taxpayer and consumer—who between them must foot the bill for this inefficiency—that it should be tackled speedily and effectively. The only question is who should act for them in this matter, and the obvious answer at first sight is the Minister of Food, who already supervises the entire chain of marketing and distribution. But the Lucas committee, very rightly, says not—for two potent reasons which have already been pointed out in these columns. In the first place, the Ministry of Food has been recruited largely from the distributive trades, and "inevitably it has become distributive minded." This is a fatal defect for the job in hand, which is already reflected in Ministerial policy. True, the composition of the Ministry might and should be changed—but it would be a difficult political operation. In any event, the second objection is decisive.

The marketing of the crops, meat and milk of Britain is a huge commercial undertaking, and the very nature of a Civil Service makes it unsuitable for the executive functions of commerce. . . . Enterprise and initiative entail willingness to risk mistakes. Civil Servants cannot afford to take these risks."

The solution propounded by the Lucas committee is to set up an appropriate number of Commodity Commissions, conceived along the lines of public utility corporations, which will act as the "business executives of the taxpayer." Each Commission's purpose will be to dispose of the produce which the nation has bought in the most profitable and efficient manner. To this end it will have complete powers of control. While it will be able to hold stocks and to operate transport and processing units, its aim may very well be best realised in most cases by the regulation, rather than by the actual ownership, of distributive channels. For instance, it might be best to specify the location and standards of equipment of abattoirs, while leaving their operation to private enterprise. These are matters which the Commission ought to be left free to decide for itself. It can be safely predicted, however, that a thorough

rationalisation of processing units and distributive channels will be found necessary; and some Commissions would probably find it advisable to test the efficiency of private enterprise by competing with it on equal terms.

These Commissions cannot, however, be exclusively concerned with saving the taxpayers' money. Their relations with the producer, on one side, and with the consumer, on the other, will be of prime importance. As regards the former, it is suggested that producer-elected Marketing Boards should not be wholly disbanded but should be allowed to control marketing channels down to the point of delivery at which the guaranteed price is payable. This is eminently sensible, for up to whatever delivery point is chosen, producers will have every incentive to keep down marketing costs which will have to be paid by them out of the guaranteed price. The global sum received by the producers of each commodity must continue to be settled annually by the Minister of Agriculture, but it clearly ought to be decided in consultation with the Commodity Commission concerned. Moreover the detailed split-up of this total sum, according to different grades of quality and to seasonal factors, is the legitimate responsibility of the Commission, who in this way could bring home to producers the preferences of consumers.

As regards the consumer, the Lucas committee assume that the Commodity Commissions will be selling their produce in an open, uncontrolled market in competition with overseas supplies. The trading deficit of the Commissions, which will be paid to them by the taxpayer, will therefore represent the total cost of subsidising British agriculture and will contain no element of consumer subsidy. If, however, it is desired to reduce the cost to the consumer of certain foods such as milk—as it almost certainly will be—then these subsidies should be paid and shown separately. This separation of producer and consumer subsidies is essential for measuring the economic

efficiency of British agriculture, and making appropriate adjustments in the aid given for each commodity.

The report of the Lucas committee does not give a complete blueprint of the future relations that should prevail between producer and distributor on one hand and consumer and taxpayer on the other. It suffers from large omissions in the field of policy—for instance, on co-ordination between home and imported supplies; and it speaks only in the barest outline of the technical problems of the reorganisation of distribution which must be faced. But its importance is that it does offer concrete remedies for a half-baked and economically vicious policy—or rather lack of policy—into which Britain has drifted as the result of war. At present, farmers are paid on a cost-plus basis for the food which they produce; and a long chain of distributors are paid on a cost-plus basis for the services which they (sometimes) render. The consumer, it is true, gets rationed foods cheap. But there is hardly a shred of competition left in the whole system, there is no market mechanism for translating the consumer's likes and aversions back to the producer or for limiting the taxpayer's liability in terms of his capacity to pay. The consumer is spoonfed and disregarded, the taxpayer is mulcted and ignored. The wheels turn primarily in the interests of producer and distributor.

It will not be easy to displace these beneficiaries of the system from their feather-bed. The probability is that the Lucas report will be ignored—whereas a satisfactory policy needs to be more, not less, radical than the report. For instance, instead of letting the members of the proposed Commodity Commissions be appointed jointly by the Ministry of Agriculture—the producers' Ministry—and the Ministry of Food—the distributors' Ministry—it would be best to give the Treasury some say in the matter. If the Treasury under Sir Stafford Cripps develops as is hoped, it might prove the right hammer for driving some economic sense into agricultural and food policies.

NOTES OF THE WEEK

The Royal Wedding

The ceremony of marriage at Westminster Abbey between Princess Elizabeth and Philip Mountbatten, now HRH the Duke of Edinburgh, has stood out, in its magnificence, in sharp contrast to the drab days of a November in which the cold winds have not all been of meteorological origin. The Royal Wedding has been an occasion.

The relation between the British Royal Family and the British peoples defies analysis. It is so much a compound of the real and the artificial and yet it is impossible to define accurately what is real and what is artificial. A King may see all and yet experience nothing of the things that are essentials in the lives of his subjects. He may understand much and yet know that in so many things he is condemned to be always a spectator. A ceremonial is built around him, in form one of obedience, in substance one of imprisonment. The tyranny of princes has been replaced by a tyranny of their peoples. And yet, in the case of Britain, these captive Kings have given their captors many gifts. They have, by their own initiative, helped and fostered activities that need encouragement from above if they are to achieve success. The foundation stones laid by the Kings of Britain are not only cold slabs entombed in public buildings. They have also become warm impulses that have energised many corners of public life.

A wedding is a very human experience, whatever the status of the man and woman concerned. It is that fact which underlay the response of British people to Thursday's ceremony, for in a sense marriage is the highest common denominator in the lives of King and Commoner. There both can talk the same language and meet over the same experiences. In the very real delight which this marriage has assured there is the emotion of loyalty to all that the Crown symbolises, of very natural concern over the personality of the future ruler of the Commonwealth, of gratitude for all that the Crown has done and, certainly not least, the emotion of good will that all men and women of sensibility feel towards two young people starting together on a relationship which can make

or mar their own private lives. When the bells have stopped ringing and the celebrations are over and the crowds are gone, one may hope that to the loyalty and affection which London and the whole Empire have been demonstrating there will be added an element of delicate consideration for that private life to which even Princesses and their consorts are entitled.

* * *

Mr Dalton's Resignation

Mr Dalton's indiscretion on Budget Day last week, and his resignation from the Exchequer next day, form one of the most extraordinary episodes in the history of Parliament. Never before has anyone imagined that a Chancellor would give away his own Budget secrets. And rarely, if ever, before has a Minister been tumbled so suddenly from so high to so low. To wake up on Wednesday morning Chancellor of the Exchequer, secure in office, and to go to bed on Thursday evening a private citizen, is a remarkable performance. It is no wonder that many rumours were in circulation at the end of last week and that the ordinary man suspected something deeper behind a published story which seemed to be too egregious to be believed.

Actually, the simple explanation appears to be the whole explanation. Mr Dalton, keyed up for a great occasion, said too much to a friendly correspondent—a momentary example of badly suppressed inflation. The correspondent, trained to seize a "scoop" and knowing that the unwritten rules of the lobby permitted him to use anything that had not been specifically given him in confidence, telephoned it at once to his paper without stopping to reflect on what the consequences for the Chancellor would certainly be. And the newspaper, presumably not knowing where the report came from and treating it as one more intelligent anticipation, printed the report in an edition which was just ready to go out—with the result that the news was on sale half an hour before the Chancellor told the House of Commons.

No harm was done. But the indiscretion was nevertheless a

startling one, and Mr Dalton had no alternative but to tender his resignation. Nor had the Prime Minister any option but to accept it, so recently and emphatically has the House of Commons reaffirmed its condemnation of breaches of confidence. There is an authentic Greek touch about the inevitability with which, step by step, the initial fault leads to the final catastrophe. And Mr Dalton, by his Roman bearing in adversity, has earned a great deal of public sympathy. Nothing in his conduct of his office became him like the leaving of it. *The Economist* has never attempted to conceal its view that Mr Dalton has been the worst Chancellor of the Exchequer of modern times—that is, in respect of his major policies, for in some of the minor matters, such as university finance or the preservation of natural beauties, he has, as Mr G. M. Trevelyan has pointed out, set a high standard. His financial policies, however, in our view, have been disastrous and we would not have supposed, ten days ago, that there could be any circumstances in which his departure from office would not be an occasion for rejoicing. But in the face of so great a personal tragedy, we cannot cheer. On the contrary, we are sorry that Mr Dalton has had to resign and we trust that he will soon be restored to office—though not at the Treasury.

*

Sir Stafford Cripps was the only possible choice to fill the vacancy. An article on a later page attempts to assess the likely consequences of the change on financial policy, and reaches the conclusion that, at least for the time being, they will be few. Sir Stafford is as much by temperament a deflationist as Mr Dalton is an inflationist, and in the long run this will have some effect. But it is very difficult for any sincere Socialist to go any further than an ineffective toying with the doctrine of disinflation, and still more difficult for him to convert his colleagues even if he could convince himself. Moreover, Sir Stafford will be aware of the mutterings against him in a party that likes neither austerity nor intellect, and will be anxious to go as slow as his temperament permits, at least until he has consolidated the position of great power at which he has arrived.

One great gain from his appointment to the Exchequer is that it has put an end to the pretence that financial policy can contract out of general economic policy. The central position of the Treasury in the British machinery of government has long been a stumbling block to those who want to achieve a properly coherent policy in economic affairs. The Treasury, as the senior department—senior not only in status, but also as having powers over the others—could not be subordinated to any save its own chiefs; but to put it in control of economic policy has hitherto seemed to mean running the risk of too narrowly budgetary an outlook on economic policy. The arrival at the Exchequer of Sir Stafford Cripps, with his economic, non-financial outlook, is from one point of view a satisfactory solution of the dilemma. But it has other disadvantages, since the Chancellor of the Exchequer carries a very heavy burden of duties both in the House of Commons and in his department.

There is really only one fully satisfactory solution, which has been proposed in these columns on more than one occasion in the past. This is that the office of First Lord of the Treasury should be detached from that of Prime Minister and occupied by Sir Stafford Cripps and by his successors in the role of chief economic minister. The Chancellor of the Exchequer could remain in the Cabinet, as does the President of the Board of Trade, but, like the President, he would be the lieutenant of the First Lord. This would achieve the three requirements—that financial and economic policy should be co-ordinated, that the Parliamentary and departmental duties of the Chancellor of the Exchequer should be adequately performed, and that the fullest use should be made, for the purposes of economic policy, of that primacy of the Treasury that has long been recognised to be vital for sound finance.

* * *

The Budget Debate

If there were any who expected the new Chancellor of the Exchequer to foreshadow any divergence of policy from his predecessor, they must have been disappointed. Sir Stafford Cripps expressly made it clear to the House of Commons that he was in full agreement with Mr Dalton's proposals and almost went out of his way to defend the policy of cheap money from the charge of extending the inflationary gap. On the main issue raised by the debate, the reduction of Government expenditure by the cutting or abolition of the food subsidies, he was adamant, and he was content to confine the significance of the Budget to the wholly inadequate aim of making some immediate contribution to

the problem of decreasing inflationary tendencies. Indeed, his view of the nature of inflation was a trifle peculiar; he appeared to conceive it as being due, not to the existence of too much money, but rather to the incontinence of the holder, who spends on capital and consumer goods what he might be investing in national savings certificates. Nor can it be regarded as a very valuable contribution to the understanding of the present problem to declare that the inflationary tendency is largely in that area where the money is available for capital goods.

It is perhaps a little ungracious to criticise too meticulously a new Chancellor on his accession in such peculiar circumstances to a heritage not of his own making. But on both sides of the House there was an undercurrent of dissatisfaction, a feeling that the measures proposed were quite inadequate to counteract the existing inflationary pressure. This was expressed most strongly from the Labour benches by Mr Benson, who called for something far more drastic in the way of taxation, though not, of course, for any reduction in food subsidies. While there was thus general agreement that the inflationary gap needed closing there was no acceptance from the Labour side of the possibility that Labour could make any contribution to this vital object. Yet when account is taken of the redistribution of the national income involved by the present line of taxation, it is indeed hard to see where any Chancellor of the Exchequer is going to find the necessary means except by reducing substantially this item of public expenditure.

The White Paper on national income and expenditure 1938-46 (Cmd. 7099) shows that of the total of private incomes in 1945, at the disposal of individuals after deducting income and surtax at 1945-46 rates, over £5,000 million was accounted for by incomes below £500 a year and only £1,400 million by incomes above that level. There is little room for doubt whence a substantial proportion of the present excess of money chasing after the restricted supplies of goods is derived, or where the cut should be applied. The elimination of the food subsidies would, of course, entail, as Mr Thorneycroft recognised, an increase in the provision made at the bottom end of the income scale for old age pensions, sickness benefit and family allowances. But the amount involved would be comparatively small and it would render possible a sorely needed reduction in expenditure of close on £400 million, thus greatly reducing the manifold distortions exerted by the existing inflationary pressure on the whole economic system. Politically this might appear to be asking too much of a Government inevitably subjected to the paralysing influence of trade union dogmas, but the fact remains that unless something really drastic is done quickly to curb inflationary tendencies there is real danger that the whole mechanism of the measures elaborated during the war to protect the under-privileged may in the end break down.

Marshall on Germany

The Harriman Committee having reported emphatically in favour of giving Germany a bigger role in the working of the European Recovery Plan, it was tactful of Mr Marshall on Tuesday to produce reassurances for France and other worried neighbours of Germany. He said he would work for an arrangement which would ensure the resources of the Ruhr being used for the benefit of Europe as a whole, and which would not leave them under the "exclusive control of any future German government." What exactly the Americans may have in mind is not clear; but they are aware that the French will not take very seriously the proffered forty-year pact against German aggression until its drafters suggest specific methods of supervising the processes and products of German industry. There are plenty of expert memoranda on the matter in the pigeon-holes of the British and French ministries, and it should be possible to get experts working on them without delay. So long as control is not seriously discussed on a practical basis, so long will some governments suspect that the main object of the Marshall Plan is to build western Germany into a political "third force" in the middle of Europe.

In this same Chicago speech Mr Marshall made far more direct replies to Russian attacks than he has ever done before, rebutting vigorously the charge that the United States has "an imperialist design, aggressive purposes and . . . a desire to provoke a third world war." And his brief analysis of the quarrel with Russia went straight to the roots: the British and the Americans, he said, were working for the recovery of western Europe—the Russians were not. Once, therefore, Europe had become "a solvent and vigorous community," one of the main bones of contention with Russia would have been removed. That is the sane way to look at the European Recovery Plan. But there remains one important thing to be done in the presentation of

the plan to the British public: that is to reveal with what reluctance and lack of expansive zeal American business men regard any suggestion that they will need to expand their productive capacity in order to feed the European markets. If big business imperialism lurks behind the plan it is a very timid monster.

* * *

Ardennes Offensive?

That disorder and industrial strife would develop simultaneously and on parallel lines in France and Italy was to be expected, once the Zhdanov instructions had been read, digested and reproduced by the Communists of both countries. The battle is really to be fought over the Marshall Plan, but there is more than enough inequality, distress and bad feeding among Frenchmen and Italians to give it here and there the character of a genuine workers' revolt against the politicians. The winter of discontent has started and the battle may sway backward and forward for months. The prospects in Italy are examined by our Rome Correspondent in an article on page 844; in France the situation is just as complex and explosive.

The tragedy is that France had already a firm foothold on the slope towards recovery. It is that foothold which the Communists are now trying to cut away. When the French workers stay at work their productive effort is remarkable. In the Department of the Nord, for example, production in all the principal industries had come close to prewar levels, in spite of shortages of fuel, power, raw materials, labour and food. When strikes occur they seem to be due more to the effective discipline of the trade union leaders than to the will of the majority. The Socialists in the trade unions have failed in their first challenge to the Communists in the CGT, and in the past week Paris workers have been receiving copies of the resolutions passed by that body in favour of united action against all the Government policies—economic, social and foreign.

Faced with the threat of insurrection and discouraged by the intrigues of his own party's secretary, M. Ramadier has given up the attempt to strengthen his government and has resigned after ten months' gallant struggle. The men who might have helped him have shown just that factious spirit which General de Gaulle condemns, and M. Blum is left to create an interim government which may at least be able to instruct M. Bidault at the conference on Germany. A strong hand will be needed if the initiative in French politics is not to slip steadily towards General de Gaulle. It is to be hoped the Paris politicians understand that the Communists have begun their Ardennes offensive, that if it fails they will be far weaker than at any time since the war. It is more than doubtful whether the extremists could mobilise solid support from the workers; and if a general strike fails it cannot be tried again. Western Europe is passing into a most critical period. Sooner or later a test of strength had to come, in France as well as Italy; and the odds are that the Communists, in their nervous impatience, have chosen the wrong time and the wrong issue for the struggle.

* * *

The Next Dominion

The Ceylon Independence Bill, before the House on Friday, is the climax of one of Britain's happier experiments in liberal imperialism. The needs of defence and safeguards for minorities have been nicely blended with the natural desire for independence of a hitherto subject people. From 1865, when Britain first encouraged the Ceylonese to develop their own local government, until 1946, when the Soulbury Commission laid down the basis for an autonomous constitution, there has been gradual progress towards complete independence. That Ceylon should now freely choose to remain within the Commonwealth is as much to the credit of Britain's careful guidance as it is to Ceylon's good sense.

The Soulbury constitution, embodied in an Order in Council of 1946, reserved the right for Britain to make laws for defence, external affairs and minorities. This right, unacceptable to Mr Senanayake, the Prime Minister, as incompatible with the offer of fully responsible self-government, will be abolished by the Bill. Instead Agreements have been made between Ceylon and the United Kingdom which provide for mutual defence and for co-operation in foreign affairs. There have been some difficulties over defence. The naval base at Trincomalee, and the air stations which were built on the islands during the war, form a unique strategic asset in the Indian Ocean. To leave the control of these bases to nothing more than a fairly loose Agreement would appear

to be irresponsible; but Ceylon's desire for protection, particularly from its nearest neighbour, is as strong as Britain's desire for strategic bases. So tighter control by Britain is thought unnecessary, and it will gain much prestige in Ceylonese eyes by leaving so much to mutual trust. For the same reason it is unlikely that the Ceylonese will amend the section of the Order in Council which prohibits discriminatory legislation against minorities. By far the largest minority in Ceylon are the Tamil Indians, who form about one-sixth of the island's population. The close bond between the Tamils and the south of India should be a sufficient guarantee that they will not be penalised.

The larger question—whether Ceylon is ripe for self-government, with one-third of its population still illiterate and liable to be swayed by irresponsible demagogues—is now academic. National pride has been aroused, and it was inevitable that the examples of India and Burma would affect Ceylon. All the Ceylonese are not politically conscious, but the virus of nationalism is potent and Britain could not have long withstood their demand for independence. The new Dominion will start off properly. The first Governor-General will come from Britain, and with the civil servants who have chosen—or been chosen—to stay on in office, it should be possible to guide Ceylon safely through the first difficult stages of self-government.

* * *

Coal Miners' Wage Increase

In any consideration of wage increases for miners there are only two questions which really matter. The first is will the increases help to raise output, either by encouraging the individual miners to work harder or by encouraging more men to enter the pits? The second is—how will the increase affect the price of coal, and through that the whole price structure of British industry? If the National Union of Mineworkers accept the Coal Board's offer of £5 15s. (instead of the present £5) for underground workers and £5 (instead of £4 10s.) for surface workers as the basic minimum wages, what answers can be expected to these two questions?

There is no doubt that the Coal Board's offer makes the best of a difficult situation. To refuse an increase might have resulted in disastrous stoppages, which, after the Grimethorpe losses, the nation can less than ever afford. And if the miners are to be treated as the elite of the industrial population there is nothing exaggeratedly unreasonable about a £5 10s. minimum. But it must be remembered that these wages are minima, and that the coal hewers at the face may be earning twice as much or more on piece-rates. It is on these men that the burden of increasing output falls, and they are mostly unaffected by the new offer. The increase will serve, therefore, to improve the wage position generally rather than to provide an incentive to output.

So far as recruitment is concerned, the higher minimum will do something to improve the attractiveness of the industry. At the present time this is extremely important, for the numbers in the mines, which rose steadily from 692,000 in January to 719,000 on August 2nd, have been falling ominously since. It is this situation which has forced the union to agree to admit 30,000 adult and 10,000 juvenile foreign workers during the next twelve months. With these, and a vigorous campaign for recruitment at home, it is hoped to make up the deficit, and higher minimum wages will play their part in this campaign.

On costs the position is more serious. No exact calculation of the costs of the increased minimum wages is available, but it is estimated that something between £12 million and £13 million will be required, costing about 1s. 4d. a ton. This is very unwelcome, coming as it does on top of the increases in coal prices announced by the Board last August. And even these did not take account of the overtime payments involved in the extra half-hour a day or Saturday working. Together these are likely to add a considerable extra burden on industry—not least on exports.

* * *

Will Output be Maintained?

That the miners can deliver the goods, if they set their hearts on it, is proved by the coal output figures for last week, and this improvement will be greeted with a sigh of relief by Cabinet Ministers, Coal Board and the country alike. It now looks as if the target of 200 million tons may, at least very nearly, be achieved. Last week when 4,258,200 tons were produced, not all the miners were yet working the longer week: the target will be achieved if 4,300,000 tons are produced each week until the end of the year. There is no doubt that the miners could achieve

the target very largely by a further drop in voluntary absenteeism which now stands at 5.96 per cent for face workers compared with 6.29 per cent a month ago. Output per man shift at the face is now at last back to—indeed, very slightly above—what it was at the outbreak of war, though still below the figures for 1935-37. This has enabled an increase to be made in the amount available for bunkering, with a small but appreciable saving in dollars, and it is understood that no more American coal will be imported by South Wales, which this year imported to the tune of over one and a half million dollars.

These are very properly matters for congratulation. But they are still very far from what is needed. As Mr Gaitskell pointed out, the target for next year must be 211 million tons if the very modest promises of coal exports under the Marshall plan are to be honoured, and this figure allows for very little improvement in the allocations for industrial and domestic users. There can be no relaxation of effort until output rises well over the 220 million ton mark.

While improvements in organisation and mechanisation can achieve these results in the long run, the immediate burden lies heavily on the miners' shoulders. It is interesting to observe that last week's output of 4,049,500 tons of deep mined coal is only 205,000 tons more than was achieved last May in the first flush of victory over the five-day week. Unless the extended week results in a sustained output well above the present level, it can be argued that the nation is paying heavily in overtime for very little more than the miners could produce in five days if the agreement were fully honoured. As it is, the extra hours may only result in greater absenteeism. It is for the miners to prove during the winter months that they can beat the five-day week agreement on its own conditions.

From Colliery to Como

It is understandable that British miners should hear with some suspicion reports that the real objective of their longer hours is to send coal out of Britain. The evidence that there is not yet enough coal in Britain is still more obvious than the political and economic benefit of exporting it to Europe. But it will be interesting to see what comes of the Italian suggestion that the reward for higher production should be a trip abroad. Three Italian Ministries have accepted in principle the idea that, for every 500,000 tons of coal allotted to Italy, 11,000 British miners and their wives would enjoy twelve days' free holiday on the Italian Riviera or by the lakes. They would be invited from areas and pits achieving high output, and would have their board, lodging, entertainment and travel inside Italy paid for by the *Compagnia Italiana di Turismo*. The scheme would be paid for out of the saving of roughly \$3 a ton which would result from Italy's buying British instead of American coal.

Before the war Italy imported 12 million tons of coal, the greater part (until Sanctions) from Britain. Mr Bevin, who might have held his cards for use in trade negotiations, gave Count Sforza during his recent visit to London a cautious undertaking that there would be some coal to spare next year. Count Sforza played back not only his travel invitation, but the suggestion that 5,000 miners from Sardinia and Sicily should work in British mines. It is known that the Mineworkers' Union would accept them, but it is not known whether Whitehall is yet giving serious thought to the friendly and imaginative invitation from Rome.

Anglo-Soviet Negotiations

The rather caustic comment made by *Pravda* last week-end on Mr Harold Wilson's statement that last summer's trade negotiations with Russia broke down because of Russia's insistence on payment in dollars was not very surprising. Admittedly the words Mr Wilson chose were apt to be misleading—to those who wanted to be misled. But neither was the *Pravda* version the complete story, although it is undoubtedly true that had Britain been able to guarantee export deliveries the negotiations would have had a greater chance of succeeding.

In the initial stages of the talks Russia, not wishing to hold sterling balances for any length of time, wanted a straightforward barter agreement. This was not possible, as Britain had no export control organisation. But when the possibility of converting currently earned sterling into dollars arose (after July 15th), the Russian authorities agreed to accept sterling in payment for their grain and timber. To the British Treasury, however, such purchases from Russia had to be considered as equivalent to dollar purchases, particularly as the type of goods Russia wanted from Britain, such as heavy electrical equipment, would not have been available for

export for three or four years. These payments in convertible sterling, when added to the financial concessions made to the Russians on their outstanding debt, made the cost of the Russian goods too high for Britain to pay. The Russian delegation, of course, objected to the inclusion of the financial concessions as part of the cost, and as neither side was prepared to give way, the talks were brought to an end.

The bitterness of *Pravda* may be due to the realisation that had the Russian Government reached an agreement last June, it would have been able to convert at least some of its currently earned sterling into dollars. In any future trade discussions between the two countries, sterling will have to be considered on its own value. Britain can hardly expect all countries to hold sterling indefinitely, in the hope that, at some future date, goods which these other countries want may be available for export. Bilateralism clearly aggravates Britain's trade problem, but if there is no alternative to it for the next two or three years, every effort should be made to make bilateralism work, including the guarantee of export delivery dates—a difficult but not impossible task.

The price which Britain would now have to pay for Russian wheat in any new agreement would be about \$3 a bushel, rather than the \$2.50 suggested last June. If both governments realise that they have lost rather than gained by not settling their differences last summer, conditions may be more propitious for another attempt—in spite of acid recrimination on both sides. But there will be little chance of success unless both Britain and Russia are willing to make substantial sacrifices. Britain must obviously be prepared to guarantee delivery of exports; Russia must be equally prepared not to exact the highest possible price for its goods.

Purse Strings of Uno

With the British opposing and the Americans agreeing, the General Assembly of Uno voted last week in favour of holding its next session in Europe. Whether the delegates will in fact be removed from the atmosphere of the Presidential elections is still not certain, because the increased budget appropriation has to be voted by a two-thirds majority. A session in Geneva would cost over \$1,860,000, in any other European capital nearly \$2,100,000; New York costs less than \$1,000,000. But the delegates have had in mind the more austere setting that Europe would provide and the savings to their pockets in dollars.

There is a lot to be said in favour of a move, but it is alarming to see Uno expenses liable to rise again. There is no doubt that Uno could be run with less money and more efficiency. The difference between its budget estimates for 1948 and those of the League for 1937 is startling even when the enormous rise in world prices is taken into account. The Secretary-General, Mr Trygve Lie, originally asked for a grand total of \$39,403,792, including the cost of the International Court of Justice, but excluding that of the specialised agencies. He has since agreed to reduce this by just over 20 per cent, and the Budget Committee have got it down to \$32½ million. The League estimates for 1937 amounted to about \$6,000,000, including the ILO.

The budgetary requirements of Uno are a reflection of its commitments and organisation. It has shown a rather frivolous tendency to undertake too many diverse commitments, to establish too many committees and commissions, and to translate all new work into requirements for extra staff, too often more distinguished by their number than by their quality. The staff of the League grew to about 700 after 20 years. After only two years the staff employed by Uno has risen to nearly 3,400, and next year a rise to over 4,000 is proposed. The total staff employed by the Department for Trusteeship and the Division of Information from Non-Self-Governing Territories reached 100 in 1947, and a rise to 143 is contemplated next year. The Mandates Division of the League, with more territories to look after, although admittedly fewer obligations, employed a total staff of nine, including secretarial staff. It spent about \$53,000 in 1937 as compared with a proposed budget for the present Trusteeship Department of nearly \$927,000.

One department of Uno upon which criticism has been concentrated is the Information Department, whose needs in 1948 amount to nearly \$4½ million. This department, with the aid of the press, films, the radio and exhibitions, carries on worldwide publicity in the best American style. Its printing costs in 1948 are estimated at \$538,000, while the League's information department was content to spend less than \$90,000 on printing publications and periodicals. Yet it is almost impossible for students of foreign affairs to get detailed summaries of what is said and done in Uno meetings.

No Nearer to Partition

The working group of the American, Russian, Canadian and Guatemalan delegates has submitted to the Assembly an agreed plan to execute the majority plan of the Special Committee on Palestine. This plan is meaningless unless the Assembly can devise a way of carrying it out. The direction in which that body is heading is not the fault of the British delegation, which has been ready with advice and information. There has been contact between British and American experts all through, and the Americans have been reminded persistently that partition has not yet been accepted by the Arabs. Our special correspondent in Palestine in fact reports that the Mufti is preparing to step over the borders from Syria as soon as possible, in order to declare non-recognition of, and armed resistance to, a United Nations regime of partition. He has been raising a good deal of money for arms purchase by voluntary taxation; in Palestine alone £22,000 had been raised by July, and more keeps coming in.

The attention paid by American statesmen to the Jewish vote is leading directly to a situation like that in Greece. It is easy to see the American, or United Nations, commission becoming an advisory mission to a Jewish government waging ineffective war against Arab guerillas maintained and directed from neighbouring countries. The Americans will find themselves once more in the position of directing the operations of non-American soldiers—with the additional inconvenience that the governments supporting the "rebels" will themselves be under American influence. The staffing of such a mission by Guatemalans or Brazilians might free the United States from embarrassment, but not from ultimate responsibility. An immediate victim of this refusal to face facts will be the United Nations partition scheme itself. The boundaries of the Jewish "state" will be not those the United Nations thinks just but those the Zionists can defend. These will be very much smaller than those so extravagantly drawn by the pro-Zionist majority of the Committee, and they will have to be continuous—or at any rate the areas they enclose will have to be connected by sea. So many Jews will be busy policing these zones, which are bound to contain many hostile Arabs, as well as manning their frontiers that, as was pointed out to Mr Ben Gurion at a recent Jewish meeting in Jerusalem, it is difficult to see who will be left over to maintain the economic life of the country.

Abdulla versus The Mufti

Meanwhile the Arabs are still comforting themselves with the delusion that the British are just playing a deep game and have no real intention of leaving them in the lurch. The big start already made with withdrawal has no results that are visible to the ordinary Arab. The Army's relinquishment of 200 buildings and camp sites, the reduction of forces in the same proportion as at home, the stoppage of recruiting to the British element of the Palestine Police, the failure of the Administration to issue a new budget—having been simply instructed to repeat last year's figures—and the cessation of work on all permanent military camps, such as Gaza—all this is less noticeable to Arabs than the return to Palestine of a few evacuated British wives.

Of crucial importance for the future of Arab resistance are the relations between King Abdulla of Transjordan and the Mufti. One half of the Arab Legion forms part of the British security forces in Palestine. If it is left behind when the British withdraw, even if it were ultimately to be deprived of its British officers and its British finance, it would not only involve King Abdulla in some responsibility for security in Palestine, but it would be a powerful instrument in support of his Greater Syria policy. Yet any attempt by King Abdulla to annex the purely Arab parts of Palestine to Transjordan would bring him into direct conflict with the Mufti. These are old enemies, and such an attempt would also be resisted by the great majority of Palestine Arabs, who do not like Abdulla, and would regard such a move as an appeasement of Zionism and a recognition of partition. King Abdulla is not noted for prudence; but he knows that his only hope of winning support among the Palestine Arabs is by helping them against Zionism. A successful action by the Arab Legion against the Zionists could make Abdulla a hero overnight.

It is by no means impossible that some working agreement on common action in Palestine might be reached between King Abdulla and the Mufti. The report that Suleiman Bey Tuqan, the Mayor of Nablus, leader of the only faction in Palestine which supports Abdulla, has visited the Mufti in Beirut, is therefore of some interest. There is still in Palestine a large block of Arabs who support neither the Mufti nor King Abdulla and who would much prefer a quiet life, and it is these whom America and the United Nations have done nothing to conciliate or encourage.

The NEED for SPEED

in present-day accounting routine

The Underwood Sundstrand Class 'D' Accounting Machine illustrated is an all-purpose, fully automatic Machine, equipped with two cross-computing Registers, eight accumulating Registers and Front Feed Carriage, designed for comprehensive Accounting requirements demanding the simultaneous posting of a number of related records with the cross-computation of any series of New Balances and the automatic accumulation of a large number of inter-related totals.

Ideally suited to Comprehensive Pay Roll, Costing, Sales, Purchase, and Stores Ledger Accounting, these machines are the effective answer to the vital need for speed and accuracy to-day. Demonstration arranged without obligation.

The Exchequer and the Rates

Mr Aneurin Bevan outlined the three virtues of his Local Government Bill to the Commons at its second reading on Tuesday. It centralises valuation machinery, thus making it possible to estimate the true resources and needs of the different local authorities; it reduces the average level of rates throughout the country by the substantial sum of 2s. 8d. (on last year's figures); and, by substituting an Exchequer Equalisation Grant for the discarded Block Grant, it concentrates Government assistance where it is needed most—on the poorer authorities. This last point is convincingly illustrated by a statistical White Paper on the effects of the Bill (Cmd. 7253, HMSO, 3d.), which shows that 12 counties and 21 county boroughs get a net relief to the rates of over 5s., and that this gain rises to 13s. 6d. for the county of Cardigan and 15s. 8d. for the county borough of Merthyr Tydfil. Mr Bevan was able to tell Wales that it will be a major beneficiary.

Despite these admitted advantages contained in the Bill, the Opposition moved its rejection, mainly on the grounds that it did not provide local authorities with a sufficiently flexible source of income, and that its valuation proposals discriminate unfairly between different classes of householder. The first point is very pertinent. The White Paper's figures allow for the re-organisation of the health services, the transfer of out relief, and the recalculation of the education grant. But they ignore the rising expenditure which will fall on local authorities during the next decade under the Education Act, the Fire Services Act, and the National Assistance Bill. Experience suggests that the transfer of some services will lead local authorities to spend all the more lavishly on those developing social services which are left in their care. Therefore the national gain to the rates will probably be fairly quickly wiped out by new expenditure; and, when this point is reached, local authorities as a whole will suffer from the fact that the Exchequer aid which is freely at their disposal for general purposes (namely, the total sum payable in Equalisation Grants) will be a great deal less than in the old Block Grant days. Moreover it is interesting to note that, despite the general gain, five counties and eight county boroughs would suffer an actual loss, were this not made good by the payment of transitional grants which will last for five years only.

The Opposition's second criticism also has some weight—although precisely how much it is impossible to tell, until the practical differences in the new bases of valuation are made plain. The Bill has many good points and should certainly not be rejected; but it does not look sufficiently far ahead, and it needs careful examination at the committee stage.

* * *

Breakdown of Rationing?

Potato rationing has now been in force for a fortnight, and already there are all the familiar complaints that show that a rationing scheme is not working as it should. But this time the complaints are also symptoms of something far more fundamentally wrong with the rationing system in this country than has been the case hitherto. Until the last year or so, people on the whole approved of rationing. It ensured them a certain supply of the commodities they wanted. Rationing was trusted, and it worked. The continental black markets were held up to scorn.

With every new cut that has been made in British rations, however, since the war, the rationing regulations have become less and less respected. Quite simply, the rule is that rationing works only when there is enough to ration. When the guaranteed amount falls below a certain minimum, and people feel the pinch, then they will try to augment their supplies illegally, whether in the black market proper or not. The British people are no more moral in this respect than their continental neighbours. They have only been more fortunate because so far they have not been hungry.

This does not mean that the growth of the black market in this country can be regarded with equanimity. But what can be done to stop it? The Ministry of Food, which is the Department most concerned, unfortunately always gives the impression in public that it is quite complacent, whatever its private alarm. In a recent debate on the adjournment Dr Summerskill gave a quite inadequate and unconvincing answer to a member's charges about the illicit slaughtering of pigs. The trouble is that the present Government is so wedded to a policy of equal rations for all, even when, as is the case with bacon, there is virtually nothing to ration, that it cannot take the logical step of freeing such commodities from price control and rationing. Mr Bevan said last week-end, in one of his many excursions into food policy, that the one fundamental principle of the Labour Government was

share and share alike whatever was in the national larder. If that involves irksome rationing and things of that kind, I would rather

have irksome rationing than go through what . . . I witnessed at the end of World War I.

But this high-falutin' principle becomes ridiculous if, as a result of a too rigid adherence to it, more and more food is diverted to the black market so that the amount officially distributed gradually dwindles away. It is quite impossible to defeat the black market administratively. The only way to deal with it is to take away its *raison d'être*. If the Government would confine its rationing system to commodities which, though in short supply, nevertheless can provide an adequate basic ration—bread and sugar are examples—and free others from all control, it would find its task made easier. Which does it prefer? That the weekly bacon rasher should remain as a symbol of equality, or that the law should once more be brought into respect?

* * *

World Court Without Work

The United Nations Assembly on November 14th passed by 46 votes to 6 a recommendation that all organs of Uno should make much more use of the International Court of Justice, and in particular that it should be asked to interpret disputed clauses of the Charter. This movement towards providing Uno's constitution with a means of interpretation other than the arbitrary political decision by the organ concerned has arisen from a succession of disagreements over the extent of jurisdiction of the Security Council, Trusteeship Council and Assembly, and most recently from the Russian denunciation of the newly created "Little Assembly" as a body illegal under the Charter. While challenging the action of the Assembly on constitutional grounds, the Russian delegation nevertheless rejected the proposal to refer the question to the International Court for a judicial ruling. The Russian contention is that, although the Court is authorised by its own statutes and by the Uno Charter to interpret treaties, it is not specifically authorised to interpret the Charter itself, and reference to it would therefore be a "revision" of the Charter.

At present the question of reference to the Court is still yet another cause of dispute between the Uno majority and the Russian bloc, and if the latter refuse to accept judicial decision, it can hardly be an effective method of settling other disputes about jurisdiction. There is much to be said in principle for such reference, and it is a great pity that it was not clearly provided for in the Charter. It is naturally a principle that appeals more strongly to nations accustomed to the theory and practice of an independent judiciary than to nations which regard courts of law merely as branches of the executive power. But even with such profound differences of attitude, there might be a general willingness to give more scope to the International Court if it had acquired a high prestige as a judicial body. Unfortunately its dilatory and ineffective procedure, as shown by its failure even to fix a date for the hearing of the Corfu Channel case, brought before it early in May, holds out little hope that, as at present constituted, it can give much help in unravelling the tangles of Uno's own law.

* * *

Freedom of the Press

It is over a hundred years, according to counsel for the defence in the Caunt case, since an editor was prosecuted for seditious libel, and the long period of immunity in itself perhaps explains why the editor of the *Morecambe and Heysham Visitor* was acquitted within fifteen minutes. During this time the principle of the freedom of the press has become firmly established as one of the essential freedoms of a democratic state. "Nothing," said Mr Justice Birkett, "should be done in this court to destroy or to weaken the liberty of the press." What the jury had to decide was whether it was proved beyond all reasonable doubt that Mr Caunt published his article on the Jews

with the intention of promoting violence by stirring up hostility and ill-will between different classes of His Majesty's subjects.

In the light of this summing-up, the jury's verdict was a foregone conclusion. But right though the verdict was, and pleasant though it was to read of the principle of the freedom of the press being so firmly upheld in the courts, there is no doubt that the prosecution was equally right to bring the action. Mr Caunt was not guilty of that anachronism called seditious libel. But out of his own mouth he was convicted of being grossly offensive, primarily towards the Jews, but also to everyone who thinks that the anti-Semitism which is spreading in this country is a blot on its reputation and who holds that the freedom of the press is a privilege which entails responsibilities, not a cloak to conceal all manner of abuse. It is well that the people of this country should have heard of Mr Caunt. But neither the case, nor his gloating, in the name of freedom, over his acquittal is likely to enhance his editorial reputation.

Letters to the Editor

Austria Between Two Plans

SIR,—I consider the article in your issue of October 18th to contain several grave misrepresentations of the facts which I should like to attempt to correct.

The first concerns foreign trade. Your correspondent implies throughout, and states explicitly once, that the present Austrian Government has made no effort to establish trading relations with the countries of Eastern Europe, but on the contrary has, for political reasons, deliberately opposed such trade, and has attempted to divert Austria's foreign trade exclusively to the West. This statement is quite untrue. The Federal Government has made continuous efforts to expand Austria's trade in every direction; but until recently its main successes have been in the West. The reasons are fairly clear. Austria's needs are primarily for fuel, food and industrial raw materials. Eastern Europe, which before 1938 accounted for about half Austria's imports, supplied chiefly coal, food, live animals and fodder, against Austrian exports of mainly manufactured goods. At present the East European countries have food problems of their own, and little agricultural produce is available for export. Until a few months ago there was also insufficient coal because of the reduced output of the Czech mines and the increased European demand for coal, but Austria now has a trade agreement with Poland by which approximately 85,000 tons of coal a month are being imported, and largely paid for in dollars out of an American loan made for this purpose. Trade with Hungary is restricted by the fact that Hungary is not able to offer the commodities which Austria needs, and also that Austrian railway wagons engaged in this trade seldom return from Hungary.

A universal limiting factor is Austria's shortage of goods to export in exchange, but whereas a number of the "Western" countries have allowed credits, the Eastern countries have on the whole been unable or unwilling to do so. It should also not be forgotten that trade agreements in Eastern Europe often have long, very long, political strings attached to them, and this makes negotiations more difficult and protracted than they might otherwise be. When all these obstacles to normal trade are taken into account it is encouraging to observe that in July, 1947, Austria's trade with the East European countries (Poland, Czechoslovakia, Hungary, Bulgaria, Yugoslavia, Rumania) amounted to 24 per cent of total exports and 37 per cent of total imports.

The second point from which misunderstanding may arise is that concerning the effectiveness of controls in Austria. The impression is given that the economic controls are failing to work largely because unscrupulous business men either sell their products on the black market, or sell them abroad and fail to surrender the foreign exchange proceeds. But that is only part of the truth. One of the chief factors in preventing effective control and distribution by the Federal Government is that more than 200 concerns claimed by the Soviet authorities as German assets are working under Soviet control with complete disregard for Austrian law. The products of these firms are placed at the disposal of the Government either not at all, or in totally inadequate quantities. A considerable part of the output is exported without the knowledge of the Austrian authorities, and Austria receives neither goods nor foreign exchange in return, and another part finds its way on to the black market. If the Federal Government's powers extended over the whole of Austria's economic life, it could be more legitimately blamed for the deficiencies which undoubtedly exist.—Yours faithfully,

T. B. BOTTOMORE

Vienna

Crisis of Leadership

SIR,—A leading article in your issue of October 11th conveys an impression of the American constitutional system which I have previously noticed on a number of occasions in your columns. Your article says:

Yet the most tragic element in the whole tragic picture is the fact that it is perhaps inevitable. The American people, to meet this crisis, are being asked to behave in peace, in an abundant, an incredibly abundant peace, as nations have hitherto only behaved in war. Moreover, their political system, based upon a Constitution whose professed purpose is to prevent action, is designed at every point to favour the laggards, and the "do-nothings" and to frustrate the responsible few.

It seems an over-simplification, to say the least, to assert that

the American constitution's professed purpose is to prevent action—to favour the "do-nothings." After all, much has been accomplished under our Constitution in its 170 years. It is true that the basic philosophy of our Constitution is quite different from that of Great Britain's. Yours makes the immediate will of the people practically supreme—ours is designed to protect the individual from tyranny on the part of his government, to protect the minority from the arbitrary exercise of authority by the majority. In other words, a system of checks and balances.

In setting up these checks for the protection of the individual the Constitutional Convention undoubtedly sacrificed some mobility of action, but history has shown that the price paid was worth while. Our founders recognised that a pure democracy easily becomes a government by the mob, and they were determined to prevent this. The fact that the political and personal liberties of Englishmen were so well preserved for centuries is a tribute to the political intelligence of the British—not to the protection of the British Constitution. The curtailment of personal liberty which exists presently in England could not be brought about in peace time under our Constitution.

Let us not forget that in framing the American Constitution our founders were familiar with British constitutional practice, and when they deliberately departed from it, they had sound reasons to believe that the United States would best be served by a somewhat different system. Who can say in the light of history that they were wrong? The fundamental difference in our constitutional concepts seems to be misunderstood in Great Britain with such frequency that I trust these words of explanation may not be considered too elementary.—Yours faithfully,

JAMES H. SHEPPARD

Federal Square Buildings, Grand Rapids, USA

Should Electricity be Taxed?

SIR,—I very much doubt whether the writer of your article of November 1st would agree that his argument regarding a suitable provision for depreciation could be pushed to the point suggested by Mr Moon.

Your writer's contention was, reasonably enough, that prevailing load factors indicate that generating plant is being put to such intensive use that its effective lifetime is shortened, and that there-

From The Economist of 1847

November 20, 1847

The death of the venerable Archbishop of York has led to the translation of Dr Musgrave, Bishop of Hereford, to the archiepiscopal see, and to the promotion of Dr Hampden to be Bishop of Hereford. As usual, in all such cases, the number of disappointed aspirants for preferment far exceeds the number gratified . . . in the Church, a complete mutiny we are told is likely to ensue amongst the followers of the aspiring dignitaries who have not been made either bishop or archbishop. *The Times*—that monster of a journal—the organ of every interest—which speaks now for the ministers and now against them—which speaks for the army and navy—speaks for the monied interest—for the Irish Protestant Church and the Catholic people—for the whole body of paupers and their medical attendants, all over the world—*The Times* has spoken on this occasion for the disappointed bishops, deans, and heads of houses and their followers, for all the Puseyites, and all the strict theologians, and informs the community what it is to expect should Lord John Russell persevere in making Dr Hampden Bishop of Hereford.

. . . the English Church exists only by the law. It departed too far from the traditions of the Old Church not to break its hold of antiquity, and it did not go far enough with modern knowledge to grapple itself fast and firm on the minds of these generations . . . Let it enter fairly and manfully into a contest with the reason of the community for that supremacy it claims; let it stand forth, not as an auxiliary to the State, in which character it is now supported . . . but as a great spiritual power destined to put down other powers, as of darkness and evil, and to rule over the world. Then it will be right that the clergy should choose their own chiefs, and that they should elevate to the highest posts the most able and most ambitious of their great men . . .

fore existing rates of depreciation, which are based on a longer lifetime, should be correspondingly increased. Failure to do this, as he correctly points out, is sheer capital consumption.

Mr Moon goes much further, however, when he suggests that the depreciation provided should be based on the enhanced replacement cost. While it is a fact that the industry has to face enhanced replacement costs, it must not be overlooked that this same price trend has substantially increased the value of the industry's existing plant.

I submit that both aspects must be considered when determining depreciation policy; by all means provide for deferred repairs and abnormal depreciation (on installed value basis) which arise from the exceptionally high load factor. Regarding enhanced depreciation on plant installed at postwar costs, let this be met when it is actually incurred—i.e., when the plant is installed.

When it is considered that an undertaking's plant (including transmission/distribution) has lifetimes up to 50 years it will be seen that no violent fluctuations will be involved. The transition to the enhanced depreciation charges will take place gradually over an extended period, as and when the replacement items of plant at the higher prices gradually accumulate on the capital account.—Yours faithfully,

E. J. CARROLL

Grove Avenue, Blackrock, Dublin

Local Financial Reform

SIR,—In a pamphlet written two years ago I suggested cutting the Gordian knot of housing valuation by fixing a single, arbitrary value for all houses of working or lower middle class type—roughly, say, those with a true gross annual value in 1938 of

£40 or less, discounting the effects of under-valuation. To secure approximately the same results as the proposals in the Local Government Bill, the single standard gross value would, I suppose, have to be approximately £20-25, giving a true net value of £14-18. But I have not attempted to work out a precise figure. It would be necessary to revise the statutory deductions from gross value in the case of bigger houses so as to avoid an awkward gap in assessments and ensure a smooth transition.

The effect of this suggestion would be to secure more complete national uniformity of valuation, and a fairer basis for the new grant system, than is possible under the Local Government Bill's proposals; to recognise, as these proposals do, the fact that house rents had largely ceased even before the war to be correlated with tenants' incomes; to eliminate the discrimination of the rating system against new and better housing, which the Bill to some extent preserves; to prevent, unlike the Bill, any further increase, through the demolition of old and substitution of new and better houses, in the proportion of rateable value contributed by small householders; and, like the Bill, to meet Lady Simon's point that rising house rents should not be allowed to reflect themselves in a rapid rise of the rateable value of small houses relative to other property. In many of these respects the fixing of a single standard value would clearly be preferable to the Bill's proposals. And in addition—particularly important in the immediate future—it would reduce the valuation of small houses to an almost mechanical routine, and so help to bypass the shortage of valuers. And would it be more arbitrary, or a greater breach with the past, than what is proposed in the Bill?—Yours faithfully,

M. P. FOGARTY

Nuffield College, Oxford

The Hot Air Arm

"Comes the Reckoning." By Sir Robert Bruce Lockhart, K.C.M.G. Putnam. 18s.

A BOOK called "Secrets of Bush House" has yet to be written and the balance-sheet of British propaganda during the war has still to be drawn up. Sir Robert Bruce Lockhart's book lays the foundations for both, and it is to be hoped that those who come after him will build up their stories with the discretion and skill that he has shown. Few of them will have his journalistic skill, and none of them his direct insight into the struggle between propaganda and policy which went on between Whitehall and the Political Warfare Executive at Bush House.

Many new and important discoveries were made between 1943 and 1945 about the part that wireless and press propaganda can play in support of military operations. There had to be much prising and pushing by the propagandists—the Americans called them psychological warriors—before the Services would give access to the information and plans without which major blunders might be made and great opportunities missed. In fact, it was not until SHAEF was formed that the right relationship between operations and political warfare was found. In establishing this

relationship Sir Robert played a wise and mediatory role as Director-General of the Political Warfare Executive, grooming his civilian experts for their encounters with permanent officials, separating the ideal from the possible and gradually leading his department away from the reputation for irresponsibility and ineffectiveness which it had in the first two years of the war. "The hot air arm" he called it, in a lecture to a critical Service audience in the early days; it had become far more than this by 1944, and had seized and held the initiative in leaflet dropping, broadcasting and deception of the enemy.

Political warfare had to comment on and present the news of the war hour by hour. So the author was constantly in touch with the men in charge: with Mr Eden and Mr Bracken, with the chiefs of staff and such personalities as Air Marshal Harris and General Eisenhower. With skill he covers the whole development of the war, from 1941 onwards, recapturing the mood of the times and passing on at least a score of first-rate stories. With his special knowledge of Russia and the Czechs, he was constantly occupied with the problem of Anglo-Russian relations after the war, and worried by the refusal of the Foreign Office to face early and frankly what the presence of victorious Russia in Eastern Europe would mean.

This book has most of the ingredients which make the author's earlier work last so well; but it is a pity that he has not delivered a fuller and firmer judgment on the part that political warfare, in its open and secret forms, can play alongside the Services. If war should come again, it looks as if his battle with Whitehall will have to be fought over again, with less time to spare.

Elementary Economics

"Explaining Economics." By Gertrude Williams. B.C.A. 56 pages. 2s.

"Elements of Economics." By Edmund Whittaker. Longmans. 392 pages. 18s. 6d.

No strict comparison is, of course, possible between a fifty-six page pamphlet and a substantial textbook of nearly eight times that length; but the methods followed by Mr Whittaker and Mrs Williams are both sufficiently alike and sufficiently divergent to make juxtaposition interesting. Both are the fruit of practical experience in the teaching of beginners. Both are designed for use by the independent student, though Mr Whittaker's *Elements* is also unmistakably a teacher's standby, while Mrs Williams serves the tutorial discussion class; both keep much closer to brass tacks, to the contemporary workaday world, than do the general run of their rivals: each is, in its kind, extremely good,

displaying a really remarkable knack for reducing complexity to its basic essentials.

It is hard to imagine any English teacher or student taking the American Mr Whittaker as a standard textbook. Unfamiliarity of examples and of practical terminology is a disadvantage not easily outweighed, and there are no charms of style to set in the balance. But both—particularly the latter—could gain from it useful ideas concerning processes of thought and methods of presentation. All through, Mr Whittaker asks himself, and encourages his readers to ask themselves, "On what problems of business or of government policy does this bit of theory have a bearing?" and his suggested "exercises" for students consist, as often as not, in such activities as calling at the local bank and asking for a copy of its balance sheet, or at the nearest trade union "local" (i.e., Lodge) for permission to see a list of its rules, and then comparing the information thus gained with the textbook account of banking practice and the influences affecting wages. This is typically American, and could hardly be bettered as a means to the attainment of that working minimum of economic understanding required by the informed citizen.

Mrs Williams has no space for this sort of thing, any more than she has for the traditional textbook apparatus of demand and supply curves. She devotes four lively pages to the "placing" of economics in the sphere of human activities; seven to the comparison of price economy and planned economy; six to the structure of industry; five to competition and monopoly; eight to fluctuations (significantly, this is in proportion six times the space allotted by Mr Whittaker and introduces, as the *Elements* does not, the rudiments of Keynes); seven to money; five to foreign trade; five to the distribution of income; and these, with a little introductory matter and some light-hearted illustrations, make her book a *tour de force*, all the more astonishing because it passes so triumphantly that test appropriate to all elementary statements—How much will the reader have to unlearn? It is a pity that *Explaining Economics* is even less likely than Mr Whittaker's *Elements* to get a transatlantic circulation.

The Far East

"The Expansion of Europe in the Far East." By Sir John Pratt. Sylvan Press. 218 pages. 10s. 6d.

SIR JOHN PRATT'S latest book is based upon lectures given at Cambridge, and bears some trace of having been written to a plan not altogether of the author's own making. The first four chapters deal with the impact of the West upon Chinese society in general, and in particular with the history of China's relations with the European powers until about the year 1860. This is by far the more interesting half of the work, since Sir John Pratt's long personal experience of Chinese conditions and his deep sympathy for so many sides of Chinese culture make it much more than the conventional narrative of fairly familiar events. The last five chapters deal on more conventional lines, with the international relations of the Powers concerned with China, from the time when Russia and Japan became actively concerned with its affairs to the Yalta conference.

In these later chapters, Sir John has more than one axe to grind, and he hardly allows himself the elbow room for the job. He is particularly concerned to deplore Great Britain's share in assisting the rise of Japan—he dislikes Japan as much as he likes China which is saying a good deal—and traces many subsequent misfortunes to our abandonment of "splendid isola-

tion" in favour of the Anglo-Japanese alliance and the Ententes with France and Russia. It would appear that the reader is intended to draw a contemporary moral from this, but apart from references to the views of Mr E. H. Carr, the exact prescription is hardly made clear. It is obvious that no clear view of British foreign policy as a whole can be derived from an exclusive concentration upon its Far Eastern aspects, and the attempt to deal with the problem makes necessary a telescoping of the narrative which leads to occasional distortion.

A great deal of the weight in the second half of the book falls upon the question of Soviet and Communist influence in China, and Sir John has certainly managed to give an unusually balanced picture without concealing his own sympathies. So much thinking about Chinese affairs has been coloured by American writings with their often naïve enthusiasms for Chiang Kai-shek, or for the Chinese Communists, that it is useful to have an account of the latter which stresses the irrelevance of their strictly local experiments in government to the wider problems of governing China as a whole. But it is to be regretted that throughout the later chapters Sir John abandons the analytical tone of the early part of the book in favour of straight diplomatic history.

The Red Archer

Let Cowards Flinch, The Turnstile Press proclaimed; Who reads may see his country's fate in verse. All bourgeois hopes by Jacobins defamed And Dalton's fingers fumbling at the purse; By Attlee's frown, both Press and Peers entamed And War and Power bartered for the tinker's curse. Brushed by Vicky, penned by Sagittarius, Price shillings six, at bookshops various.

Such was the fear, in summer forty-five; The answer's changed by autumn forty-seven. Grim was it in that dawn to be alive; To live today is still some way from Heaven. But now we see that Labour leaders strive To inflate their cake and yet use no red leaven. Economists are free to watch their own confections; For those in power, the municipal elections.

Shorter Notice

"Commonwealth Bank of Australia in the Second World War." John Sands Pty., Limited, Sydney. 330 pages. 10s. 6d.

THE policy of secrecy pursued by the Bank of England contrasts sharply with the policy which led to the production of this volume by another sterling area central bank. The Commonwealth Bank has, not, indeed, revealed any substantial amount of information, hitherto undisclosed, which can be regarded as of first-rate economic importance; but it has, at least, produced a clear and readable account of its wartime activities which is well worthy of imitation elsewhere. It is understood, moreover, that a (presumably more technical) account of the development of the bank's functions and policy over a longer period is in course of preparation.

The four main wartime activities dealt with in this book are the exchange control, the mobilisation of gold, loan-raising and commodity finance. The treatment of all these subjects (as well as of the others, of less general interest outside Australia, which come under review) is straightforward, with a minimum of statistical analysis; and the whole book might well be recommended as introductory reading to anyone anxious to form an idea of the financial tasks which fall upon a Central Bank in war.

AMERICAN SURVEY

Flesh on the Bones

(From Our US Editorial Staff)

THE publication of the Harriman Committee's Report, Mr Marshall's statement to the Committees of Congress and the questioning of officials during the Committee hearings give the first clear indication of the Administration's plans for the European Recovery Programme and the directions from which criticism and possible amendment will come. There is almost unanimous "agreement in principle." It is as easy to find a Congressman opposed to virtue as one opposed to the Marshall Plan. But there are, to use the fashionable jargon of official Washington, differing "orders of magnitude" within the approval. There are also many disagreements about how the programme should be carried out.

There is little point in arguing about the estimates of cost of the full four-year plan. The Harriman Committee's guess of \$12 to \$17 billion and the State Department's of \$16 to \$20 billion were made reluctantly and with no certainty that the margin of error was wide enough. They will be forgotten long before the third year's appropriation comes up for discussion. The biggest criticism of the Paris report made by the Herter Committee is that, when instructed to plan for self-sufficiency within four years, the Paris Conference was given an impossible task and was forced to produce unrealistic figures. If Western Europe can be shown to be recovering under the impetus of American help the necessary funds will be found to carry on. Ceilings, either on time or money, set in 1947, will not be allowed to interfere.

It is the first year's appropriations that will be carefully scrutinised. The reduction (on comparable assumptions) in the Harriman Committee's estimate of \$1.98 billion from the Paris figure was made up of two elements. The first—and larger—was a saving on materials which would certainly not be available. The most important shortages will be in grains, in scrap and semi-finished steel and in fertilisers. The second element was the purchases that the European nations proposed to make from outside the United States. The report made it quite clear that a considerable part of the European deficit would have to be financed by the United States but it carefully refrained from suggesting how much, not wanting to tie the hands of the Administration's bargainers. To the extent that other Western Hemisphere countries can be persuaded to carry some of the load themselves, the gap between Paris requirements and American appropriations will be narrowed.

Over the problem of the first year's appropriations there hang, at present, two shadows. One—and the more dangerous—is the drought in the winter wheat belt. This, more than any other factor, has been responsible for Mr Herter's doubts about the feasibility of meeting the State Department's estimates. After seeing Europe and sensing its crisis, he is terrified of raising hopes which a bad harvest may destroy. On November 14th, after he had given evidence, rain came to the drought area and more is expected in the next few days. If enough comes within two weeks, the crop will be saved from disaster but after December 1st, no amount of moisture can help.

The second shadow is thrown by the Presidential election, but takes the shape, on the ground, of Senator Taft, who, after

skilfully lulling the State Department, by his earlier pronouncements, into the belief that he would be no obstacle, suddenly turned and announced that he would vote against providing the sum they asked. His opposition is probably genuine, as he has consistently proved himself able to swallow gnats while straining at camels. The Senator has had a very bad press, even in papers from which he expects political support. It appears, at the moment, that he is, as so often before, a political salmon, swimming against the current. But this is also a habit of the Republican National Committee, on which he must depend for nomination next year.

At present there is no tendency to consider his opposition dangerous. His economic ideas, it is pointed out, have always been "Too little and too late," while his political support is "Too little and too early." But, with Governor Stassen backing the Administration's dollar estimates and Governor Dewey at last giving his blessing to the Marshall Plan, Senator Taft is well placed to win the support of the isolationists—now hiding in the undergrowth of generalities, but ready to jump out and shout "Boo" to a billion. Their tactics will be to try to trade time for money and allow the Bill to pass quickly in return for reduced appropriations. With one, or possibly two, exceptions, the Senate Foreign Relations Committee shows no signs of being prepared to make this kind of compromise.

The Interim Aid Bill will certainly pass quickly and with little opposition. None of the controversial policy decisions have to be debated in considering it. But there will be long discussion, when the full European Recovery Programme comes to the floor, of the methods of administering it and the form of agreement to be signed with the participating countries. The State Department is fighting desperately to keep control and even relinquished to the War Department its claims to the government of Germany in order to husband its manpower resources for the larger task. Mr Marshall reminded the Committees, when talking of managing the programme, of "several important principles which should determine the nature" of the organisation set up to administer it. The operation of the programme will, in many ways, he said, "define and express the foreign policy of the United States." The inference was obvious but it is not at all certain that he will win his point. Many of the Congressmen who visited Europe this summer were unimpressed by the staffs of their Embassies and would prefer to see separate missions in the sixteen countries reporting direct to the new organisation in Washington, which they hope will be business-like rather than bureaucratic. The Herter Committee has recommended a corporation with a board of directors drawn from both parties, but this idea is generally thought too cumbersome. It is likely that a single individual will hold complete responsibility, but there is considerable doubt whether he will be the Secretary of State.

The problem of whether to sign sixteen bilateral agreements or one multilateral one will also be argued at length. Mr John Foster Dulles, when giving evidence, said "that the basic idea should not be the rebuilding of prewar Europe, but the building of a new Europe, which, more unified, will be a better Europe." This is the hope of many in Congress, who, torn between the desire to encourage the integration of the economies of the sixteen countries and the fear of charges of imperialist interference, see the signing of one agreement as a means of keeping Western Europe together. It is unfortunate that, at this moment, the vanity and isolationism of British policy should be

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

fighting against the idea of a multilateral agreement and in favour of bilateral ones. If the Foreign Office's hope is that, being not as other men are, they will get easier terms than countries with unbalanced budgets and flagrant black markets, they are wrong. Controls are likely to be in direct relation to the amount of aid, in which case Britain will be more supervised than nations in better financial circumstances.

After their experience with the Committees, the weary and devoted men in the Administration who have worked on the preparation of the programme must feel heartened. Many of the objections they expected have not been raised; many of the difficulties they foresaw have disappeared. Realising the seriousness and sympathy with which their case is being accepted by Senator Vandenberg, Mr Eaton and the other Republicans on the Committees, they have changed their decision to keep the long-term Bill until the regular session in January. The legislation for the European Recovery Programme will be presented to the Special Session as soon as it can be made ready.

American Notes

Truman Proposes

It is a measure of American changes over the past year that Mr Truman, who last November hastily liquidated price controls as the election returns came in, should have made the revival of controls the central feature of his message to the special session of Congress. The country, the crisis and the President himself have changed beyond all recognition when Mr Truman feels it may serve a useful purpose to ask a Republican Congress to approve all that it was elected to oppose. The programme he proposes includes not only such measures as credit controls, regulation of commodity trading, export controls and allocation of transport and of scarce commodities, all of which have been made familiar in recent months by the reports from the President's advisers, but a demand for authority, when it is necessary, to impose consumer rationing and price control on selected products, to strengthen and extend rent control and to re-impose wage ceilings. Among those most surprised must be Mr Truman himself, who recently, in dilating upon the advantages of voluntary food conservation, incautiously called rationing and price-control "police-state methods." To the anti-inflationary programme must be added the President's insistence that the Marshall Plan should be financed out of current revenues, thus leaving little scope for tax reduction.

The President has chosen to grasp the nettle firmly and to do battle on the very ground selected by Senator Taft, the only vocal opponent of the Marshall Plan. Last week in New York the Senator reiterated:

If we want the Marshall Plan we cannot have lower prices. If we want lower prices, we have to give up the Marshall Plan. . . . I would regard the return of price control in peace time as a major calamity to the United States which no probable Marshall Plan benefit can justify. Consumer rationing is only one degree less objectionable.

It is, however, something of a stage battle. Mr Truman may simply calculate that proposals for rationing and price-control will deflect the lightning from the less controversial parts of his programme. He knows that a Republican Congress is unlikely to accept, in the cause of foreign aid, the domestic remedies it repudiated last autumn.

It is the President's good fortune, which the Republicans will not overlook, that in this case the measures to meet the emergency are also good party doctrine. Runaway prices were second only to the Taft-Hartley Act as a cause of concern at the two Labour Conventions, and the CIO, though not the AFL, demanded a return to rationing and price-control. White-collar groups feel the pinch even more keenly. Wage-controls, which the President was careful to say would not be invoked frequently and which would not exclude gains based on increased productivity, will not alarm the unions unduly.

More than that, both parties appreciate that the cost of living may be the decisive issue in the Presidential campaign next year. If the Republicans refuse the President the powers he asks, the Democrats will be certain to pin the responsibility squarely on Congress. The Republicans resent both what they will regard as the shot-gun marriage between foreign aid and domestic price-control and the sensation of being outmanoeuvred. There is no reason to expect delay in the interim aid programme. But when

the Marshall Plan is debated, this may prove to be a case where the perfect is the enemy of the good.

★ ★ ★

Against Inflation

The inflationary price pattern, detailed at some length by President Truman in his speech to Congress, has now reached a point where quite stringent control measures secure the verbal support of a widespread public—right through from Federal advisers, banking officials, and industrialists, down to the lowest income groups. There is considerable evidence, therefore, for the view that Congress would have accepted, without undue opposition, those proposals covering export controls, allocation and inventory controls for scarce commodities, and transport regulation. Much of this, indeed, represents no more than a simple extension of existing authority—by no means fully utilised. On the demand for an extension of controls covering bank and consumer credit, there is more room for doubt. The Republican Party leaders scarcely rank as economic experts, and most of their reactions are a little vague. But on the whole, they have been frightened enough by inflationary price trends to admit that there may be room in this direction for increased Federal powers.

The more that the prospect is examined from this side of the Atlantic, the more reasonable does it seem to presume that any successful attack on present inflationary trends must accrue through fiscal policy and monetary controls. The tax debate has been ruled out for the Special Session—though it will revive in exacerbated form in January when the Congress majority bidding for tax relief is likely to have some success. A Republican Congress is not in the least likely to walk with the President on consumer controls and will, no doubt, put sharp limits on budgetary deflation. On consumer controls, in fact, weather reports from the wheat belt can, and one day may, speak with far more authority than Mr Truman.

The one sure way left to break the threatening spiral is through the reimposition of consumer credit controls, and, more importantly, through a general reinforcement of the banking controls held by the Federal Reserve Board. But, although Mr Marriner Eccles, the Chairman of the Reserve Board, quite recently diagnosed the position with brutal clarity, the Board has so far failed to take full advantage even of those limited powers which remain, in terms of an adjustment of the discount rate, the modest permissible reinforcement of bank reserve requirements. Presumably, this timid policy is still dictated by the Treasury, directed by its acknowledged vulnerability in respect of the vast bulk of securities, redeemable either on demand, or within a year. But the present need is far more for a close check to the expansion of bank loans, attainable by higher and more flexible reserve requirements, than for a drastic process of contraction. The longer the boom continues, the more drastic must restrictive measures become, at some later stage.

The conclusion must be that Congressional action, or inaction, over credit controls, will be far more eloquent for the industrial outlook, than all the probable storms over rationing and price control. The latter discussion, indeed, may immediately give a new hoist to inflationary trends as industrialists and consumers seek to protect their position against possible new controls.

★ ★ ★

Loyalties

A Loyalty Review Board, under Mr Seth Richardson, Assistant Attorney-General in Mr Hoover's Administration, has been created by the Civil Service Commission to hear appeals from federal employees accused of disloyalty to the United States. Such a guarantee against arbitrary dismissals was included in the President's order, issued last March, charging the Commission and the Federal Bureau of Investigation to purge 2,000,000 federal employees of their disloyal members.

The case which many Americans would like to see submitted to authoritative review is that of seven State Department employees who have been dismissed by Mr Marshall without being told why they were regarded as security risks. Four others were allowed to resign without prejudice. Two of the seven who refused this concession recently appeared anonymously on a radio programme as Mr Blank and Mr Y, with their counsel, Mr Thurman Arnold, Mr Paul Porter and Mr Abe Fortas. Their story is that they were subjected to irrelevant grilling on the part of the FBI and were discharged without a trial or without even being told what the accusations against them were. This charge is borne out by Mr Marshall's statement that a full bill of particulars cannot be made available because it consists of "highly classified," that

is highly secret, material of several government departments. For the first time Mr Marshall has had a bad press, on the grounds that the arbitrary workings of the military mind, hypersensitive to security, are not suited to civilian agencies in peacetime.

The Loyalty Board has no power to reinstate employees in the State Department, which is empowered, under the McCarran rider, to discharge any employee without stating the cause; the most the Board can do is to certify their loyalty, thus qualifying them for employment in some government agency less "security-sensitive." The indignation which has been aroused is welcome proof that the public, knowing how wide an interpretation of what is "subversive" appeals to the military mind and to the FBI, will insist on some further assurance that even in the State Department, dismissals shall not be capricious. But it is surely right that any foreign office must have the unrestricted right to hire and fire, even though it may be legitimately suggested that more care in hiring would make firing less frequently necessary. The Loyalty Board will restrain the application of a much more dangerous principle: that political affiliations or interests should be cause for dismissal in the case of federal workers who never see anything more highly secret than the outside of a registered letter.

Business and Exports

Export prospects attract increasing discussion as industry attempts to measure the duration of the boom. The September figures, only recently published, show that the decline of exports from the May peak of \$1.4 billion is still continuing; and Mr Averell Harriman, testifying before the Senate Foreign Relations Committee last week, indicated that recent evidence points to a still lower rate. Over the last quarter of this year, he declared, however, there would be no material setback while "with the help of new funds they would go up again in the first quarter of 1948."

The European prospect, along with the Marshall Plan itself, is now in the hands of Congress. But the recent appeal by the Secretary of State, Mr George Marshall, has certainly put something like a floor to exports for this area, if Congress accepts the estimates made by his Department. The estimate made by the Harriman Committee of \$5.75 billion for the year 1948, and Mr Marshall's own plea for about \$7.5 billion over fifteen months, were almost precisely the same as the figure submitted by the Paris Conference in assessing the 1948 deficit with the United States. Where they fall below the estimate of the Paris Conference is in their denial of the further claim made for about \$2.4 billion, representing the estimated 1948 dollar deficit with other Western Hemisphere countries. And on this issue, the Harriman Committee declared that the United States would not be called upon to meet the "external dollar deficit" in full, and that some help might be looked for from the World Bank and from private financing. Although help from these sources is likely to be relatively modest, it may quite well provide a useful addition to US agency funds.

The importance of markets beyond "Marshall Europe" is indicated by the following table of exports over recent months, so far as they are available in detailed form:—

EXPORTS AND RE-EXPORTS, WITH CIVILIAN SUPPLIES				
(Annual Rates: billion \$)				
Area	Jan.-June 1947	May 1947	July 1947	
"Marshall Europe"	5.6	6.0	5.2	
Other Europe	0.6	0.9	0.5	
Asia and Oceania.....	2.6	2.9	2.8	
N. America	3.8	4.2	3.5	
South America	2.4	2.9	2.2	
Africa	0.9	1.1	0.8	
Total	15.9	18.0	15.0	

In other areas of the world the US exporter is still facing the sharp contraction of markets for other than essential goods. Clearly, the peak annual rate of \$18 billion is not likely to be regained, and September's annual rate of about \$13.5 billion may

not be very far from a ceiling for the short-term, at least. Moreover, in the longer run, the maintenance of this rate will clearly hinge upon the willingness of the United States to expand import levels, and thus reduce the net stimulation of exports to her own economy. For the time being, however, the pressure of internal demand continues to outweigh possible repercussions from a lower export level.

Stockpiling Policy

Congressional debates over the longer-term Marshall plan may quite easily bring new moves for a reinforcement of the policy of "stockpiling" raw materials in a manner which may well have unfortunate repercussions on the debtor countries. In its report to the President, the Harriman Committee suggested that certain proceeds arising from raw material shipments to Europe might be earmarked by those governments concerned, for the local expenditure of the US government, and more particularly for the establishment of strategic material stockpiles.

So far, the full reaction of the State Department is not known. But it is reasonable to presume that many Congressmen would jump to an immediate approval if any such move were sanctioned by Mr Marshall, and it is significant that on this issue, Senator Vandenberg has already declared that "exploration of the *quid pro quo* is just as important as exploration of the *quo pro quid*." The Harriman Committee's suggestion coincides with a renewal of interest in the stockpiling programme on the part of most Federal agencies, and more especially the service advisers, who are reputedly alarmed by the growing lag between promise and performance in respect of the Strategic and Critical Materials Stockpiling Act of 1946.

Originally, this Act was designed to establish stocks of essential raw materials to a dollar value of \$2 billion over five years. Part of the delay has been due to pressure of domestic demand, and the consequent high prices for most of the products concerned. But in a large measure, the fault is due to Congress, which over the fiscal year to June 30th last appropriated no more than \$150 million. Actual expenditures in 1946-47 were no more than \$10 million, inaction being due partly to the drive for lower Federal expenditures, and partly to annoyance because the Administration has remained unsympathetic to the claims of marginal producers of metals at home.

These facts give an added attraction to the proposals of the Harriman Committee, since Congress could, in that event, dispense with further large-scale appropriations under the Stockpile Act. And the list of materials needed is extremely wide, totalling more than sixty items, and covering bauxite, chrome, copper, diamonds, lead, manganese, tin, and tungsten. While the stockpiling programme has already given a certain psychological prop to some commodities, and while large-scale buying would, in fact, assist the debtor countries to some extent through price support, it is quite clear that the Marshall countries, and particularly Great Britain, could be badly handicapped in their recovery by a programme which brought such a heavy subtraction from their potential dollar earnings. Fortunately, there is some ground for the belief that the US government itself, aware of the fuller implications of these proposals, is preparing the ground for an extension of stockpiling, under which earmarked funds could be used to assist development in return for the pledge of freely available materials, and thus form part of a much wider policy for contra-cyclical action. But Congress must first be persuaded that the strict application of Marshall funds for stockpiling can only serve to widen the "dollar deficit" of Europe at some later stage.

The Hughes Investigation

The system of inquiry by Congressional committee has suffered a serious loss of prestige this year in the antics attending the Hollywood trials and the first instalment of the Hughes investigation. It is remarkable with what discretion, amounting almost to secrecy, the inquiry has been resumed into the \$40 million of war contracts awarded to Mr Hughes for aircraft which were never delivered. The character of the testimony has brought it into the headlines again for the sordid light it throws on the relations between war contractors and the procurement officers of the government. It is impossible to tell precisely where the truth lies between Mr Hughes, who has accused Major-General Bennett Myers of seeking a loan from him of \$200,000 to speculate in government bonds, and General Myers, who has testified that the airplane builder offered him a loan of \$250,000 which he refused, as well as \$100,000 to use his influence to get the ban

The Crucial Biography of
1947

Published by
Hollis & Carter

raised on "The Outlaw," Hughes's motion picture. General Myers has also been shown to have owned a firm awarded war contracts, and admits that he made \$90,000 on paper, at least, by speculating on government bonds on margin during the war. Mr Hughes, as formidable and agile a witness as Washington has ever seen, seems to have succeeded once more in diverting the Committee to a new trail.

Wherever the trail leads, it points to highly improper relations between contractors and the men who allotted the big money. In following it, the subcommittee is performing an historic function of Congress. Given the wide gap between executive and legislature provided by the American Constitution, committees of inquiry are the only means by which Congress can maintain a check upon the operations of the Administration. They also dig out the information on which most of the great legislative reforms have been based. In American life, they combine the functions of the British Royal Commission and the Parliamentary question.

The need for fairer rules of procedure and more regard for the rights of witnesses has been underlined by the events of the past six months. It should not be forgotten how often legitimate inquiry has been frustrated by recalcitrant and insolent witnesses. It would be unfortunate if Mr Thomas's follies overshadowed the achievements of such bodies as the Pujo Commission, the Industrial Commission, the Senate investigation into Wall Street, and the Walsh inquiry into the Teapot Dome scandal. The committee inquiry is capable of abuse and open to reform, but it is an essential part of the American governing system.

THE WORLD OVERSEAS

Italians Turn to Violence

(From Our Rome Correspondent)

THIS week's outbreak of more or less organised violence, involving the centres of the most widely separated regions in the country—Milan, Verona, Florence, Naples, Bari and Palermo—may be regarded as a tentative and scrappy dress rehearsal for the campaign in the piazza by which Palmiro Togliatti will this winter try to keep his country outside the system known to Communists as "the American Protectorate." The campaign in the piazza (a convenient term covering every sort of minor direct action, from intimidatory open-air meetings to clubbings and bonfires of one's adversary's furniture) is the continuation of Parliamentary activity by other means. In the year before Mussolini marched on Rome his rows in the piazza and his deals with Parliamentary leaders (which ultimately resulted in the vote of confidence which made him a constitutionally legitimate Premier) were closely interwoven.

Signor Togliatti's rows in the piazza this week were punctuated by inquiries to the minor groups in the Constituent Assemblies how they felt about joining him in a Popular Front to oust De Gasperi. Apparently the Communist leader would have no more objection to 87-year-old Orlando as Premier of a National Government than he had to Field Marshal Badoglio and King Victor Emmanuel in 1944. Nor, it seems, would he refuse help from the "Uomo Qualunque" Party, once regarded as the quintessence of resurgent Fascism, now that the jingo wing of this party has flaked away from it into nationalist groups; while a group of more frankly Fascist character, the *Movimento Sociale Italiano* (MSI), has won seats in the Rome municipality and drawn the lightning of Communist and ex-Partisan hatred on to itself.

The intentions of the Italian Communist Party for carrying out its part in the Zhdanov campaign have not been concealed, save as regards contingency and timing. First among them comes a campaign in the piazzas, projected also into Parliament and local councils, and backed by the maximum available syndical pressure, to render life impossible for the Christian Democrat Government. "Christian Democracy," said Signor Togliatti in the programme speech which preceded the present violent outbreaks, "has in its governmental conduct betrayed the cause of democracy . . . to

Shorter Notes

A third Republican, Governor Warren of California, has now conceded that he would accept the Presidential nomination. Unlike Senator Taft and Mr Harold Stassen, who have already put in some hard campaigning, Governor Warren is a candidate only to the extent that he is willing; he himself will not campaign actively. This year he has made it quite clear in advance that his attachment to the governorship of California is too great for him to consider the Vice-Presidential nomination. This was a source of some hard feelings in 1944 when he refused at the last minute to run as Mr Dewey's Vice-President. Governor Warren, who ran on both Democratic and Republican tickets in California, is a strong dark-horse candidate in the event of a deadlock in the convention.

The railroad wage settlement announced last week is at least an encouraging pointer to near-term union claims. Two of the operating unions—or Brotherhoods—have accepted a wage advance of 15½ cents an hour, in contrast with an earlier demand for 30 cents. On this basis, the full claims could be settled for less than \$200 million yearly. More important, the unions seem to have abandoned many claims for new "feather-bedding" rules, which, added to straight wage advances, might have sent operating costs up by \$1.4 billion yearly. Managements claim that the financial position of the industry will remain precarious until the Interstate Commerce Commission grants the new freight rate claims. This is not likely for many weeks.

If so, it is not yet clear whether the Christian Democratic Government enjoys the unconditional support of the police services, and how adequate this force will be in face of a nationwide emergency. Signor de Gasperi has appealed for the collaboration of competent and loyal men. In his spirited defence of Democratic methods he has been widely acclaimed, and his new and combative attitude may have averted the move of Left Centre supporters to the Marxist side.

Another possibility is a modification of policy by the existing Government in order to maintain civil peace, or to gain time. As to this last possibility, Signor de Gasperi has never withdrawn the emphatic declarations of "neutrality" between East and West which he made at the outset of his Ministry. His governments have dutifully followed all openings for the enlargement of trading relations with the East, and a trade treaty with the most important of the "trans-curtain" neighbours, Yugoslavia, negotiated by Dr Raffaele Mattioli, head of the Banco Commerciale Italiano, has now received Cabinet approval. The eastward approach could not easily be pursued with more solicitude in the purely economic field.

Suppression of Fascists

The statements of Signor Scelba, de Gasperi's "brazenfaced" Minister of the Interior (as his opponents term him and as apparently he likes to be regarded), appear to leave room for Government action to suppress some of the bodies or organs whose existence has infuriated and alarmed others besides Communists. It is now easy to walk into a bookshop and to buy half a dozen newly published books, giving a barely veiled Fascist version of Italian history from 1943 to 1947: and the term Fascist can be quite judiciously applied to several of Rome's daily papers. The exponents of the *Movimento Sociale Italiano*, with their 27,000 votes gained effortlessly in the Rome municipal elections, make not the slightest bones about basing their programme upon Mussolini's last phase—the "Social Republic." And recent trials of Fascist Republican leaders, like Prince Valerio Borghese, have often appeared to put the prosecution in the dock. Hence Graziani's trial, a fortnight hence, will be exceptionally interesting.

In the background of the entire Italian situation lies a basic truth, which none of the political contestants knows how to handle for his own uses: it is that without American coal and food, idleness and starvation would—at least temporarily—descend upon the country. It is as difficult for a party in power to boast about this as for an opposition to ignore it.

Venezuela's Social Revolution

[BY A SPECIAL CORRESPONDENT]

THE prospect of stable government in a country which is the second largest producer of petroleum in the world is of obvious importance. For more than a hundred years Venezuela has been ruled by military dictatorships, but next month, as a result of the revolution of October, 1945, which brought into power the *Accion Democratica* party, elections will be held to establish a democratic government for the first time. The revolutionary party routed the old military cliques, and, at the end of 1946, sponsored a convention, which was freely elected by universal adult suffrage, to draw up a new democratic constitution. It is to elect a government under this constitution that the people will vote next month.
