Cuts Without Policy

WHATEVER the Government's decision to cut certain imports from the dollar areas, announced by Mr Dalton in the House of Commons on Monday, was intended to do, it cannot have been put forward as a solution to the crisis engendered by Britain's shortage of dollars. To suggest otherwise would be less than just to Mr Dalton. When a total is made of all the dollars involved in the import cuts proposed, the resulting saving cannot be more than some £25 million over a twelve months' period. This is a tiny sum beside the yawning and widening gap in Britain's balance of payments and the rapid exhaustion of the dollar credits. Since the fuel crisis, dollars have been drawn from the American credit at three-weekly intervals, generally at the rate of £50 million. The latest three-weekly drawing, however, was for £25 million. This welcome reduction, and certain other indications, suggest that the rate of drawing is not necessarily the rate of actual dollar expenditure. But when all allowances of this kind are made, the cuts announced on Monday will do no more than extend the life of the dollar loan for a week or two, and there is nothing at all, in any view of the situation, to justify a claim that another week or so, whether in June or January, 1948, will save Britain from the crisis that stares it in the face.

The Cabinet are in the position of the defenders of a beleaguered city. The supplies of food and munitions available to the garrison can be augmented, but never so rapidly as they are consumed. Somewhere at hand is a friendly force capable of raising the siege—when it is impossible to say. Shall the commander of the garrison decide that rations must be cut and, if so, by how much? Will a cut weaken the defenders so much that the city can be carried by a sudden assault? Will a cut enable them to hold out until relief comes? Or, grimmest possibility of all, must they after all try to survive on their own resources alone? These are decisions that have faced many men in the past. The analogy is not, however, complete, because the Cabinet suffer from an additional handicap. It is by no means certain that the friendly force in the vicinity has any intention of relieving this particular city at all. But the parallel is true to this extent: history teaches that delay in making a decision is never justified. Procrastination is in itself a decision, a decision to go on consuming at the old rate.

The basic facts of the dollar crisis have, by now, been so often set out in these pages that no excuse is offered for not repeating the details on this occasion. All that has been said is still true. The summer is reaching its climax with coal output still below the indispensable minimum, and so long as that danger signal is present, every other alarm bell must continue to ring. The new element in the crisis is Mr Marshall's speech and the events in Paris that have followed.

Clearly the Government have had two decisions to make: what cuts in imports to make and when to make them. In both cases they had to balance two considerations of prime importance: the effect of their decisions on public opinion in Britain and the effect on public opinion in the United States.

The second decision, the timing of the announcement, has proved to be the easier, largely because the decision has been made for the Government by events. The United States Administration cannot have disregarded the possibility that the Paris Conference would develop in the way it has, that the conflict between East and West would become more open, more intense and more localised in those countries, Italy, Austria and Germany, which are now the marches where East and West meet. As the situation developed that way, the claims for help to those three countries, and the results that follow such help, must of necessity have become more important in American eyes than aid to Britain. Mr Clayton must have passed on such views to the Cabinet last week. And whatever effect the counter-arguments may have had on Mr Clayton, it was natural that Mr Dalton should remind Washington, by specific action, of Britain's special needs and policies.

There remained the other decision, the size of the cuts made. It must be granted at once that there are strong arguments against any cuts in the import of raw materials and of machinery at any time before the twelfth hour itself. To cease the purchase of productive machinery now would be an act of despair, a denial that Britain can and will stand on her own feet eventually. Such supplies are as essential as the aircraft orders were in 1940. To cut the import of raw materials is, in effect, to apply for a receiving order in bankruptcy; to say that the days of an under-

 import program were food and supplies for agriculture (£750 million), petrol (£60 million), tobacco (£55 million), consumer goods (£35 million), and the "invisible" film remittances (£17 million).

The arguments for and against a cut in imports can easily be summarised—Mr Morrison himself dealt with some of them at the Foreign Office Conference on Wednesday. In favour of substantial cuts it can be said that, at least for a short time, they give a monetary shock—and the maximum shock would be achieved at a moment when Britain is, compared with Europe, relatively well-fed, fully employed and not distracted by internal political strife. The shock of the cuts would reach the miners at a moment when a stimulation in their output could still achieve a good deal. It would drive home to everyone the lessons, on staggering hours, on more production, on the improvidence of a further reduction in hours that the TUC Executive is endeavouring to teach to its constituent members with no marked success. It might well precipitate a beneficial fall in the world prices of primary products. The British people respond to disaster as to a tonic. The water never gets warmer while you wait. If eventually, why not now?

The arguments against substantial cuts are these: there is no inevitability about them; the Marshall offer is not meaningless, and the United States cannot afford to collect all the world's dollars back again inside its own boundaries and leave it at that; there may be wheat from Russia, more dairy produce from the Dominions, more petrol from the Middle East. But all these have their part in an expansionary world. As against this there is the point emphasised by Mr Morrison—that large cuts might inaugurate a policy of trade restriction that would spread throughout the world. Granted that public opinion in the United States and Britain needs a shock, it is not essential that the shock should extend to the main ingredients of the working-class diet. Indeed, it is a very strong argument that, over a long period, a big reduction in food would reduce output and, therefore, exports. And when all possible food imports save basic rations, are cut, what is saved? A hundred million pounds instead of three months' extension of the dollar loan instead of three weeks'?

No doubt these arguments, and many others, have tormented the Cabinet for the past month or so. It is apparent that

many threads of opinion have with difficulty been woven into a pattern of policy. It is possible, too, if the speculation is worth while, to identify the differing voices—there is, for example, a noticeable contrast between the caution of Mr Dalton, in expressly declaring that his announcement must be considered as an interim decision, and the confident ring in Mr Strachey's voice when he talked of the food prospects for Britain in Tuesday's debate. Then, too, there is the need to navigate between the Scylla of a pessimism that overwhelms and the Charybdis of an opportunism that stupifies, and American charts will not place those two traps in a position identical with that given by their British counterparts. But when due allowance is made for all the difficulties that face the Cabinet, can it yet be said that they have, in fact, decided anything? Who is to have less petrol and when? What American films are to be turned back? As for tobacco, has not Mr Dalton already cut consumption to the amount he requires? The Government may have intended to do no more than fire a warning shot across the bows of public opinion, but have they even loaded the gun?

It may be that the Cabinet have been swayed by the consideration that increasing exports to dollar countries will help to close the gap by increasing the dollars earned, in contradistinction to a policy of reducing the dollars spent. Mr Dalton's reference to increased exports of textiles bears this out. Obviously, all that can be done to increase exports should be done, even at the expense of the home market. But in the immediate future, exports cannot reduce the gap. The dollar market is not an easy one for British products to enter. The set-back to total production earlier in the year is still not made good, and the President of the Board of Trade believes that the sellers' market is nearing its end. The Cabinet cannot surely believe that exports can solve the problem.

In the end, it is impossible to escape the feeling that the Cabinet collectively are still in a woolly, sentimental state of mind. They seem to believe Britain in some way to be a most favoured nation in the eyes of Providence, as well as in certain trade treaties. Nothing could be more dangerous to the future of the country. Mr Marshall may have kindly feelings towards Britain. The average American Congressman has not. In the United States there is an Italian vote and a German vote, a Polish vote and an Irish vote. There is no British vote. The only safe assumption for Britain to make is that, for the average American, external affairs have a commercial significance and a strategic significance, and that the death of Unrra on Monday meant exactly what it seemed to mean. Is Britain a commercial risk? Are its people capable of enterprise and initiative, and of standing up to the hardships that are part of pioneering a new future? Is the economic system of which Britain is the centre in need of fresh loan capital or can it get by without, if it pulls the belt a little tighter? Those are hard thoughts, but they are very relevant ones. When the American Congressman reads Mr Dalton's statement, will his reaction be "Britain is again trying to get away with giving up as little as possible"?

Mr Marshall's proposals are a challenge to Britain to give up a great deal for a common end. So, in another field, are the facts that come from the dollar shortage. By what route, even supposing more dollar aid is forthcoming, is Britain to ensure that eventually it can manage without them? The incisive gesture on imports makes no contribution at all to the solution of that—the one crucial problem. Mr Morrison this week again promised a long-term economic plan. Will this, when it appears, support the Government's claim to economic statesmanship? At the moment it seems that they are still hoping for a favourable miracle. It was in that mood that they approached the fuel shortage last autumn. They gambled on their luck, and they lost. Blizzards may repeat themselves, but excuses never.

Knife Edge in Greece

THE arrival of the American Commission in Greece to administer American economic aid under the Truman proposals has coincided with a deterioration in the Greek situation. Guerilla warfare has become more widespread. At the same time, the United Nations Commission of Enquiry into the frontier troubles has reported, with Russia and Poland abstaining, that Albania, Yugoslavia and Bulgaria have armed and assisted the Greek guerillas. The Security Council must now decide whether or not to adopt the Commission's recommendations—the negotiation of new frontier conventions and their oversight by a standing body until August, 1949. But the American delegate to the Security Council, Mr Warren Austin, has already taken the crisis a stage further by suggesting that the Greek affair, so far considered under Article 6 of the Covenant dealing with the settlement of disputes, may have to be taken under Article 7 which is concerned with action to meet a breach of the peace. Such a proposal would clearly bring the Security Council face to face with an entirely new situation.

Whatever the immediate outcome of Mr Austin's strong stand, its deeper significance is clear. Bolstering up the Greek economy, arming and training the Greek Army, championing the Greek cause in the assemblies of the world, the United States is now the prime mover in Greek policy. This point may seem too obvious to stress, but it must be stressed because of a danger into which American statesmen have fallen before and may fall again—that of conducting their policy through intermediaries, through a Darlan, or a Roxas, or a Chiang-Kai-shek, and allowing local interest, and not decisions taken at the centre, to determine what American policy shall be. Such a course is tempting to a nation with no strong or continuous traditions in foreign policy. But, as American critics, chief among them Mr Walter Lippmann, have not ceased to point out, it is always extremely dangerous. In the case of Greece, it is vital that the United States Government should be clear about its purposes and about the methods it proposes to achieve them. First of all, there is present in Greece the possibility that a local conflict might—in Europe's present state of tension—become the lighted fuse of a great conflagration. Again many, all too many, people in Greece are not averse to lighting the fuse. The extreme Right Wing, which dominates the Government, greeted the announcement of the "Truman Doctrine" as a prelude to war with Russia, and politicians and newspapers announced complacently that "the atom bomb will look after Stalin." Finally, as the British discovered in their three years' connection with the Greeks, it is by no means easy to guide and influence Greek policy. Traditions of honest and responsible administration are scant. The occupation and the civil war have left their legacy of intense political passions and hatreds. In two years, however good the intentions of the British advisory missions may have been, the quality of each successive government has declined and today the Maximós Government is certainly no advertisement for Western democracy or "Anglo-Saxon" influence. The Americans may assume that this decline is simply due to the ineptitude of the British. They would be well advised to see what is in fact the real reason, that in spite of, not because of, British efforts, the Greek political situation has drifted out of control and that the drift will continue in the same sense: towards further repression, more violence, more economic misery for the masses, more exploitation and corruption and, above all, a deepening risk of war—unless Mr Marshall in Washington and Governor Griswold with his Mission in Athens take over genuine control.

But may it not be already too late? Inside Greece "ban-

ditry" is a euphemism for the real situation which is growing to the scale of civil war. The support the guerillas receive from Greece's northern neighbours has been proved and those northern neighbours would not take action unless the Russians permitted them to do so. What can the United States do if the Russians are determined to take over Greece by Communist attack and infiltration? A fully equipped and brutally determined German army of occupation could not suppress the partisans. American military advisers have infinitely less chance. This argument, however, assumes two factors which are by no means certain. The first is that the Russians are determined to push the frontier incidents to the point of war. The second is that the Communist guerillas have behind them the kind of popular support which the partisans enjoyed during the war. On the first point—Russian policy—there has been little in the last two years to suggest that the Russians seek more than nuisance value in the frontier incidents. The amount of aid given by Albania, Bulgaria and Yugoslavia has been strictly limited—enough to keep the guerillas active, not enough to organise them for a full-scale campaign. That their activities have greatly increased since the announcement of the Truman Doctrine can as easily be explained on defensive as on offensive grounds.

The second point—the amount of popular support enjoyed by the guerillas—is more difficult to assess. Correspondents tend to argue that it is growing. Immediately after the civil war in 1944, the excesses committed by the Communists reduced them to a small and hated minority. They hardly restored their popularity by falling in with Moscow's pan-Slavism and advocating the dismemberment of Northern Greece to the benefit of Greece's Slav neighbours. Unhappily, the Greek Government, by moving steadily to the Right and rallying behind itself more and more right-wing extremists, has gradually permitted the Communists to recapture some lost support. The kind of general radical association which EAM represented before it fell under Communist domination and which broke to pieces after the civil war is tending to reappear. Eighteen months ago, a year ago, the people of Greece were so solidly anti-Communist that they could even accept an unpopular Monarchy as a bulwark against Communism. The activities of the Government police and the gendarmerie, the passage in the summer of 1946 of an emergency law suppressing most civil liberties, above all the steady deterioration in the economic situation, are reversing the position. Once again, men and women with no Communist sympathies are beginning to look to the guerillas as their only hope against a corrupt and tyrannical government. If the trend is not reversed, the guerillas may come to have in time the kind of mass support which would make their suppression impossible. Nevertheless, the most important and most hopeful factor is that the Communists are still a small minority and can again become an intensely unpopular minority if the people of Greece are given some relief from their present discontents.

This then is the situation. Inside Greece the futility and savagery of the Government have re-created a measure of popular support for the guerillas, but it is negative support, the turning to a *pis aller*. Outside Greece, the Russians and the satellites are ready to exploit this internal situation but are almost certainly unwilling to push it to the point where general war might follow. What, then, should American policy be? Clearly, to check and play down the frontier incidents on the one hand and to work fast to reduce internal tension inside Greece on the other. In the international field the proposal to take action under Article 7 of the Covenant seems ill advised. It will

XL
Xmsb, 1143

164805

expose the United Nations' inability to act and leave the Americans with the need to take some strong action—but what? A more fruitful line would lie in strengthening and increasing the boundary commission and giving it authority to exercise a perpetual surveillance along the Greek frontier. Its establishment should precede, not follow, the negotiation of frontier conventions and it should be given all the prestige and, if necessary, the police functions necessary for its work. If the Russians refuse to accept such a body, there is no reason why the Greek Government should not invite an international Commission drawn from the nations willing to co-operate to exercise roughly the same functions. Meanwhile, it is in Greece itself that the major effort of pacification should be made.

It cannot be accomplished in a day. For two years, Greece has drifted towards anarchy. A long and patient effort is needed to reverse the trend but at least some of the steps on the long journey have already been mapped out. In the economic field, the first task of the US mission is to undo and reverse the policy introduced in February, 1946. The Porter Report, issued after the visit of an American Economic Mission in the spring, lays down the means—an end to gold sales, strict taxation, strict control of imports and exports, the diversion of capital to reconstruction, agricultural revival and industrialisation, a measure of rationing and price control, budgetary stability. Six months of such a programme could begin to restore the faith of the Greek masses in a more tolerable economic future and would begin to undermine the attraction of popular revolt. But it is also vital to

realise that the present Government, in spite of undertaking to observe precisely this programme in its Note to the United States of June 15th, is almost certainly incapable of doing so. A measure of political reorganisation is as essential as a new economic approach. The Americans should make their assistance conditional upon a broadening of the Government to include the Liberal opposition—with men such as Sophoulis and Sofianopoulos—and later if possible the moderate fringe of what was once EAM. A useful model might be the shortlived Sophoulis Government which in October, 1945, almost managed to secure all party support. If the predominantly Populist assembly refuses, they should be offered the alternative of an American withdrawal and no loan.

These policies are perhaps less sensational and emotionally satisfying than banging on the big drum, proclaiming that Greece is "the frontier of freedom" and drifting in a flurry of fine words and ill-considered actions into a conflict which the world must seek by every means to avoid. The Americans will find no responsibility in Greece. They must take what there is with them. They will find no policy in Greece save a mixture of sloth and violence. They must create the policy. They will get little support from either side, for both are extremists. They must create their own moderates. They must expect dislike, ingratitude and double-dealing. But surely they can find their own reward—in seeking the peace of the world and preventing one small inflamed and diseased corner of the body politic from spreading its contagion to all the rest.

Manpower for Public Office

(By a Correspondent)

IT is perhaps an exaggeration to say that Britain is becoming a nation of people who sit on committees to mind other people's affairs—living by taking in each other's dirty linen, to put it more shortly—but almost every other new Act of Parliament that reaches the Statute Book calls for the appointment of a fresh tribunal to adjudicate on this or that problem which the Act attempts, or neglects, to solve. So far, the only overt acts suggesting recognition by the Government that any problem connected with these lay tribunals exists is the appointment of a Royal Commission to report on the magistracy in general and the Report of an Inter-Departmental Committee on Expenses of Members of Local Authorities (Cmd. 7126). The problem is far more general than that. Manpower shortage is not confined to the basic requirements of industry. It extends into every aspect of social activity, and it is a question today whether the country has enough people available and competent to man these tribunals as they are set up.

Tribunals of this kind may be composed of professional or non-professional members. An example of the professional kind is the series of tribunals appointed under the Pensions Appeals Tribunals Act 1943. They too need manpower, but their difficulty is less complex, if equally serious. Either the experts exist or they do not, and, if they are in short supply, the deficiency can only be made good over a long period. Shortage of qualified men for a professional tribunal is only one aspect of a general shortage of experts in that particular profession. What is of more general interest, and concern, is the problem of staffing the non-professional tribunal, where one of the qualifications for appointment is the fact that the person appointed is not an expert.

To take one example. The Furnished Houses (Rent Control) Act 1946, as is well known, provides for the setting up of district tribunals to review rents of furnished houses in their area and gives these tribunals wide powers to reduce or increase rents, which are otherwise fixed by agreement. Each

tribunal is to consist of a chairman and two other members. No qualifications for office are laid down by the Act. It is left to the Minister of Health to find suitable people to fill these positions (incidentally this Act provides for payment to the members of the tribunals). There are many other cases of similar bodies set up for special purposes. Their numbers grew greatly during the war. They are not likely to diminish now. They range from hospital boards under the health service to juries for the law courts, from consumers' councils under the Coal Industry Act to tribunals under the Reinstatement in Civil Employment Act. When to that is added all the other activities in which a public-spirited man or woman can engage, from employers' associations to councils of social service, the claims on the time of the few with leisure become overwhelming. At some time or other, preferably soon, the community will need to find some way in which to augment their numbers.

Is there any common denominator for those who are best qualified to serve on these tribunals? There is, but it is one that is much easier to recognise than it is to define. The main attribute required is a certain balance of experience, prudence and sympathy which is generally called common sense. They exist independently of social status or business experience, and they give the person in possession of them that essential ability to stand outside himself on occasion and to judge facts, and the actions of other people, with a blend of the common standards of behaviour and of the actual mixture of standards and emotions that govern the behaviour of the individual who is before him.

These qualities are needed on every tribunal of this kind, from the jury to the magistracy. The quantity required may vary but a minimum must be present. It is not essential to be a practical psychologist to be a jurymen, but it is very desirable to have some common sense. A jury is concerned with truth. Each member should decide for himself which

evidence is the most accurate recollection of fact, and that is no simple task. But on some tribunals something more is needed—experience of the actual tribunal itself. To become a good magistrate it is necessary to learn from experience on the magistrate's bench. It is impossible to teach that experience before appointment, but it is necessary to appoint people who are capable of learning.

At the moment, the selection of people for these positions is haphazard. The methods of recruitment vary. There is the political field, directly and indirectly the principal source of supply for the magistracy. Political activity is not necessarily a bad test of a person's capability as a judge of others. To make his or her way in politics a man or woman must be capable of working with others and so of understanding something about them. But politicians have their defects. They tend to be exhibitionists, to be better talkers than listeners, and nothing is more likely to obscure truth in any court than a much-talking judge.

Another route to the magistracy is the social one, which has less to commend it; when they are good, men and women appointed for social eminence are very very good; the difficulty is to devise a scheme which will keep out the bad. To continue a scheme under which appointment to the Commission of the Peace follows automatically on ownership of a particular property, almost as a territorial title, is to introduce too high a proportion of dead wood into the bench. For other tribunals other methods of recruitment are used, equally unsystematically. For one, prominence in the trade union world is the qualification; for another dutiful attendance at Chamber of Commerce meetings, or Rotarian gatherings. All these may be good methods of selecting the best fish in the net, but is the mesh always the right size?

There are two problems. The first is to select the right people, regardless of whether they can afford to give up time to public affairs or not, a task no more difficult than the problem of finding officers for an army. The selection of the first list must be an arbitrary one. In an army the practical details are easy to arrange. There is always some one man to be found who knows the capabilities of any given collection of possible candidates. In a district or a town there is rarely any one person who could compile a comprehensive list, for the whole of his area, but there do exist people each of whom could compile a section of such a preliminary list. The actual selection must involve an individual test. To find a good member of a tribunal it would not be necessary to go to quite the same lengths as the personnel selection boards did in the army, but it is desirable that some estimate should be made of individual capabilities for the responsibility. These methods, if applied systematically, would result in the compilation of a rota of people

fitted for this work. The next problem is the financial considerations in the way of practical work in public affairs. The answer cannot be in professionalising public service. The majority report of the Inter-Departmental Committee on the position of members of local authorities is in favour of payment not only of expenses but also of payments, a maximum of £1 for a full day and 10s. for half a day, to meet loss of remunerative time. Yet even these proposals go some way towards professionalising public service. The minority member quoted an example from Scotland (where such payments are already permitted) of members who attended over 400 meetings a year, on 200 days. The real sufferer is the man who is paid by the hour or by piece rate. Few employers would cut down a monthly salary cheque by the amount represented by, say, one afternoon spent at a rent tribunal. If the compensation payment for public work were fixed on an hourly basis, and at a rate which equalled the higher industrial rates, the problem would be met. Employers might claim that a man's absence on this kind of work at irregular intervals dislocated the smooth running of their works, but a similar dislocation arises every time any such person is kept in bed for a day by a cold, and that is a problem most factories have solved.

Finally, there is the question of the housewife, where the problem is not so much one of payment as of providing a substitute pair of hands. It is practically the most difficult problem of all, and there is probably no one quick answer. But the problem must be solved, for on many tribunals the daily experience of life that the housewife acquires (whether she likes it or not) is very much the kind of experience that is of most use.

★

It is to be hoped that the Royal Commission will suggest a plan for the magistracy that will be equally applicable to all such tribunals, for this is not a question that can be dismissed as one of minor detail in public administration. It strikes at the root of public administration. The country is not at present utilising all the talent that is available, and required—required it is, for these tribunals will grow in number and importance, and it is right that they should. It is an essential part of democracy that local administration should be local. The country does not want everything to be decided by civil servants of the Central Government solely because the authorities, or the public, are too lazy to work out a scheme by which the work involved in making those decisions is spread out fairly between those citizens competent to do it. Democracy does not mean having a large supply of masterful civil servants. It is almost the reverse.

Bonus Distribution

TRIENNIAL VALUATION
1944-46

Reversionary bonuses on With-Profit policies have now been allotted at rates per annum ranging from £1. 10s. to over £2. 10s. per £100 of sum assured, and 10/-% on all existing bonus additions

This reasoning leads directly to the second conditioning factor—the economic one. Social and economic maladjustment constitutes a serious threat to British-Middle East relations to-day. It presents British Governments with a dilemma which, in spite of Mr Bevin's awareness, they have not yet found means to solve. Social change is necessary if Middle East states are to be viable and self-reliant. It is a British interest that they should be so. But equally Britain must refrain from anything which might look like intervention in any state's internal affairs. This is the disadvantage of paramountcy: Britain being responsible for peace and order must not take sides in Middle

In these conditions it seems certain that British and American economic assistance and advice must be given primarily country by country—and cautiously at that. There are great openings for both, although the Middle East as a whole is, in the words of one expert, “not an inherently rich area, agriculturally or industrially.” The cultivable area may amount to less than five per cent of the whole, while the agricultural productivity of the land is less than one-fifth to one-sixth of that in the United Kingdom or the United States. The density of the rural population

In Syria the Government is still studying the report of the British firm of consulting engineers which has carried out an economic survey of the country at its request. If contracts are subsequently awarded to this or other firms, they will be the best answer to opposition criticisms of neglect. In Persia the surveying has been done by an American firm, which may reasonably hope to get a share of any contracts that result. In Saudi-

Breakdown in Paris

August 15th.

A plan of this sort is so general that clearly its attractiveness must depend entirely upon the subjective standards applied to it by the various Ministers concerned. To Mr Bevin and M. Bidault it offers Europe the opportunity of agreeing—freely—on a reasonable measure of self-help, of securing in return substantial American aid, and incidentally of breaking the deadlock on reparations by ensuring at last that Germany will have some production out of which "mutual aid" (or reparations) can be drawn. But to Mr Molotov, riddled with the suspicions the atom bomb and the Truman Doctrine have created, hide-bound in ideology and disastrously ignorant of the real conditions prevailing in America and the Western World the Bevin plan was a plot—a plot to deliver the smaller countries of Europe to their powerful neighbours, to subordinate their national needs and plans to the greedy interests of the capitalist Leviathans, and, above all, to shelve reparations and to substitute the restoration of a powerful German economy.

The reasons for Russia's fears and suspicions (which are fully discussed in an article on page 21) would carry more weight were

It may be foreseen that the social strains which are already characteristic of the region will be aggravated by this increase of wealth. Oil will intensify the need, while it multiplies the means, of social reform. The problem of the Middle East is thus different from that of Europe ; it is not reconstruction but development, not recovery of lost values but the adjustment of an obsolete social framework to an economic process which is under way. Its people will need all the clear thinking and wisdom which they and their British and American advisers can muster if they are to come safely through.

it not for three points which stand out clearly as grim facts far outside the turgid circle of Russian suspicion, interpretation and ideology. The first is the fact that when one nation has more than any other to contribute to a common pool, and is apparently ready to make the contribution, the less favoured nations can only benefit by its co-operation. Such was the experience of Lend-Lease, and there is at least a chance of the experience being repeated under the Marshall Plan. The second point is that the danger of political and economic conditions imposed by "American imperialism" which Mr Molotov seems to fear can be tested only in the event. But Mr Molotov assumes in advance that the conditions will be imposed and refuses *a priori* the proffered help. The third point is, however, the most damning. The methods of which Mr Molotov complains—subordination of small Power interests to those of great neighbours, interference by more powerful economies in local production plans and the like—are precisely the methods by which large sections of East European industry and agriculture have been subordinated to the Soviet Five-Year Plan.

But no one should underestimate the difficulty of achieving this "example." The French are likely to be handicapped at every turn by the Communist Opposition and by their own intense fear of seeing Europe's division mirrored within their own community. A big stumbling block will be met early in the dis-

cussions in the problem of redeveloping the Ruhr's resources—a problem on which neither British, French nor Americans see eye to eye. But perhaps the greatest difficulty lies in the fact that Mr Bevin and M. Bidault are not, in the long run, masters of the situation. The attractiveness or otherwise of the plan they elaborate depends upon America's readiness to back it speedily and upon the methods of American support. The scale of economic help needs to be very great. The political and economic conditions should not be such as to produce an acute crisis of conscience in every Socialist breast. And the United States must be persuaded to modify its present mood in which ex-enemies—German, Italy and Japan—appear to enjoy more consideration than tried allies and friends. Mr Bevin and M. Bidault can only lay the stones of the altar of European reconstruction. The divine fire will descend from the American firmament or not at all.

* * *

Those Calories

Unlike last week's debate on consumers' goods, commented on in another Note, the debate on food supplies took place under the shadow of Mr Dalton's statement on imports on the preceding day. It might have been expected, therefore, that the debate would have largely turned on this statement. Instead, with one or two exceptions, members trod the usual ground and aired the usual grievances—the high price of vegetables, the shortage of potatoes, queues and, as usual, the amount of calories in the nation's diet.

Mr Strachey's speech was mainly taken up with a defence of bulk purchasing and with the present system of food distribution, which are discussed elsewhere in this week's paper. He also dealt at some length with what Dr Summerskill later called "the great calorie controversy." As usual, he gave a figure of 2,880 to 2,890 calories consumed on an average per head per day, a figure which is based on the amount of food going into civilian consumption and eaten at home and in canteens, restaurants and so on. Actually, as is well known, this is a very inadequate measure of the people's diet because individual needs of calories vary so considerably. One wants to know whether each member of representative families is actually obtaining—at home, at work and at school—the calories that are required at his particular age and in his particular occupation. Mr Strachey was also misleading when he compared figures of calories consumed in the home now with those consumed in 1941, 1942 and 1943. In the earlier years, particularly in 1943, the needs of calories were reduced by the absence from home of so many men whose needs are high. The return of ex-Servicemen from the armed forces, where they were fed amply and well, to their own homes is probably a large factor in the present discontent about the supply of food. If they do not draw more than their fair share from the family pool, they feel the contrast with the supply of food in the armed forces severely. If they do, someone else is the sufferer.

But it is unrealistic to discuss the amount of calories at the present time. Even if it were true that the national diet is inadequate—and, in spite of individual hardships, the commonsense opinion is that this is not so—it is certainly as adequate as the country's balance of payments can afford. The most damaging part of Mr Strachey's speech was his assurance that there is no food crisis and that the country will be able to "obtain an ample food supply in the coming year." For the time being he may have won the battle in the Cabinet over the purchase of food abroad. But, in view of Mr Dalton's statement, this was hardly the time to be so complacent and blatant about it.

* * *

Cost of Food Distribution

The debate a week ago on the adjournment in the Commons, on the methods and costs of food distribution, provided some interesting evidence on the gap between wishes and their fulfilment. The debate was opened by Mr Brammall, Labour MP for Bexley, Kent, and he quoted three examples of cases in which, he claimed, the cost of food to the consumer was unnecessarily raised by payments made by the Ministry of Food in excess of the value of the services rendered by the recipient of the payment. The cases he quoted were those of tomatoes, flour and meat. In the case of tomatoes, the payments to which he referred were the commissions of 1s. 6d. and 1s. 9d. per 26 lb. paid respectively to the first-hand salesman and to the wholesaler (who may in fact be the same person). In the case of flour it was a guaranteed profit, amounting over six years to an average of 13 per cent on their capital, paid to flour millers,

although the risk in their business had been eliminated by the financial arrangements made by the Ministry of Food with the trade as a whole. In the case of meat it was the commission paid to the Wholesale Supply Association based on the 1938 turnover of each member. But the substance of Mr Brammall's case was this: it is justifiable to guarantee a man's profit if you take over his business as a temporary measure in an emergency; it is not justifiable to build up a permanent system of food distribution which includes the continued payments of money indefinitely, for services no longer performed.

The debate was, in effect, continued on Tuesday in the Ministry of Food Supply vote, which was a good thing, since it cannot be said that Dr Summerskill gave any convincing reply, certainly no reply to the point of principle involved on the previous Friday. In effect her speech was an admission that payments of this kind were made, that they could only be eliminated by an overhaul of the whole of the distribution machinery and that her Ministry had not had the time to devise and promote any better system than that which exists at the moment. She concluded with the sad but true statement that it is very difficult to control, except by rationing, both the price and the distribution of an article that is in short supply.

On Tuesday, Mr Strachey had something to say on food distribution. He was candid and frank. The existing organisation, he said, in essence a partnership between the Ministry and the private trading concerns, does distribute food, and had carried out that task throughout the war without serious failure. But he did not regard the present organisation as ideal. Controls were no permanent solution, and a series of rings or cartels of traders more or less protected by the state from competition was a policy of de-control. But on the long-term solution he, too, fell back into generalisations.

It is impossible, in fact, to escape the conclusion that the Ministry may have regarded itself as indispensable but its duties as mainly temporary. The Minister has a duty to all housewives (without the capital letter) to give the trade an ultimatum. If it desires to remain in being as organised at present, it should be asked so to arrange the functions of those in it that a fair remuneration is paid for work that is essential in the collection, transport and marketing of food, and that nothing is paid to those who render no service in any of those fields. Then, perhaps, the gap between the rod that is paid for the pound of onions by the consumer and the half-penny per pound that is received by the producer will be appreciably less.

* * *

The Consumers' Grievances

In the light of Mr Dalton's statement on Monday on the import programme, last week's debate on the Board of Trade vote, giving as it did an opportunity to air the grievances of frustrated housewives and business men, now looks more like the performance of the proverbial ostrich, and a comparatively sleek, well-feathered one at that. No doubt the speakers felt the better for it directly afterwards, but the whole future of the consumer has been once more ringed by doubts as the result of the new cuts in imports and the proposed changes in exports. Not that Mr Dalton's immediate proposals, discussed in a leading article on page 1, are nearly as drastic as they might have been, but their implications shows only too clearly that to complain of present shortages is to concentrate mainly on surface difficulties rather than to probe the fundamental problems of increased production and the balance of payments.

But even if the perspective has changed since last week some of the points made in that debate deserve attention. Sir Stafford Cripps and Mr Belcher dealt easily enough with the parliamentary counterparts of the screechings of the Housewives' League. But they had no adequate answer to the much more sober complaints about the regional maldistribution of retail goods and industrial raw materials, and the shortages of such particular key materials as carbon black and sodium chloride, which are key factors in the production of tyres and textiles, and which the Opposition claim to be in short supply owing to lack of Government foresight. It is just in matters of this kind that a Socialist Government devoted to planning should be at its most careful in replying to criticism, for it is here, if anywhere, that they should be able to justify themselves. Mr Webb also commented very pertinently on the disgraceful quality of many consumer goods, which makes nonsense of any soothing statistics of quantity. To applaud an output increased by 50 per cent over pre-war is merely silly if the goods last only half as long as the pre-war product—as anyone who has lately bought children's shoes or perambulators can testify.

Mr Dalton's announcement allowed the housewife to expect no worsening of her food problems, but on clothing the future is black, in spite of the Chancellor's careful attempts at reassurance. If a larger proportion of textiles is to be exported, the home market will only not suffer if production is increased, and this is a very big if. Labour shortages in the textile industry are well known. Yet clothing is almost as essential as food, and distasteful as further controls must be there is here a case for again cutting out all the inessential luxuries and concentrating only on the essentials to keep the nation warm and weatherproof.

* * *

A Voice for Germans?

The Economic Council of Germans which is to direct the reconstruction of the British and American Zones does not really get down to business for another fortnight. But its first meetings have already shown its political possibilities—possibilities which the British had denounced in advance, lest the Russians should accuse them of rearing a western German government in Frankfurt, and which the Americans had also denounced because of their tender feelings for the independence and sovereignty of Bavaria, Hesse and Württemberg-Baden. And now the new Economic Commission of the Soviet Zone has met and is running the gauntlet of contradictory accusations—on the one hand that it is a future zonal government and on the other that it really has no powers at all. Divided Germany is taking shape.

There is no doubt about the scale on which power and authority are being concentrated in Frankfurt. Some 10,000 German and Allied personnel are to be found living accommodation in and around the city; a new bi-zonal executive group has been created to deal with them alone. Their task has been described by General Macready, joint head of the Allied control group which is the point of the Frankfurt pyramid, as the economic reconstruction of the two zones with "an overall German outlook." It will be very surprising indeed if they get on with that task without continuing and developing the political arguments and manoeuvres which were heard and seen last week. For the Right predominates in the Economic Council of 54 members and the Left has a clear majority in the Executive Committee of eight. It is quite possible that the eight will be able to prevent the Executive Directors under them, who run the bi-zonal economic agencies, from doing what the fifty-four want done. It will be some time before this machinery can pump new blood into the economic life of the two zones.

Now that such a body exists the British and Americans—particularly the Americans—must expect to hear from it a demand that the German representatives should take part in discussions of the answer to be made to the Marshall offer. Recent rumours that the Americans want to put fresh capital into the Ruhr and to make its revival the central point of a European recovery plan must have reached the Germans; and it is quite obvious that the part Germany is to play in such a plan cannot just be settled by an Anglo-French-American debate. The right to take part in the technical committees which will assess European needs should be accorded to German representatives; on their performances there and on the record of the Economic Council three or four months hence should depend the possibility of a German or Germans taking a more prominent and responsible role. Such a concession would be a tonic to all responsible politicians and administrators in western Germany, among whom the sense of futility and isolation is as demoralising as the low ration.

* * *

Challenge of the Ruhr

Meanwhile, the problem of getting coal out of the Ruhr is as baffling and exasperating as ever. Production has come nowhere near the 250,000 tons a day on which all industrial plans for June were based. There was a rise from 211,000 tons in the first week of the month to 222,000 tons in the last week, but no-one can explain why. Perhaps there were more hopes about rations, more pickings to be had from the countryside; but if the connection between production and rations is decisive, then there is another fall in production ahead, not only in the immediate future, but in the whole foreseeable future.

It needs to be frankly admitted, and said again and again, that unless extraordinary efforts are made now to build up food stocks in Western Germany, rations will be as bad and as low next winter as they were last. And if coal production does remain at between 200,000 and 220,000 tons a day, then the old bitter tug-of-war will

begin again: the French will ask for the increased deliveries they were led to hope for by the autumn, and the Germans will complain that their vital industries cannot recover unless coal exports are cut. The French may find the Americans pulling on the same end of the rope as the Germans, for shortage of coal has begun again to threaten the electricity supplies to the whole West German grid and the output of the chemical plants; and it is to those plants that the Allies in Frankfurt look for valuable export goods and essential materials for fertilisers. The Leverkusen works of I.G. Farben are still getting only a quarter of the coal they need, and a fortnight ago there was talk of their closing down for two months.

The need to increase production in the Ruhr mines is as urgent as any that now faces the British Government. They are being judged all over Western Europe by their efforts to get more coal, British as well as German. Their hard-won right to run this industrial area will be challenged from every side; and it will be asked whether every effort has been made to ensure that there is no avoidable inefficiency, no political sabotage, no passive resistance by German technicians. The paramount need for more food should not prevent Lord Pakenham and his advisers from preparing an answer to this question.

* * *

A Peace Treaty for Japan

General MacArthur, in his recent allocation to a group of American publishers and journalists visiting Tokyo, has disclosed a policy which, whether it is Washington's or only the General's own, must now be taken into account in the international field. The General said that a peace treaty must be concluded with Japan "within a year or 18 months at the most"; he would return to the United States as soon as it was signed, that is to say, in any case by the end of next year. The United States, he declared, must possess the Ryukyu and Bonin Islands as a "strategic frontier" and also to protect a disarmed Japan against possible aggression; the occupation army should be withdrawn after the signing of the treaty, but there should still be some supervision of Japan which might be entrusted to the United Nations. The Soviet Union was not expected to make "extensive opposition" in the negotiation of the treaty, as Soviet claims had already been met by the cession of the Kuriles.

General MacArthur may be over-optimistic if he thinks that Russia will consent to American possession of the Ryukyus without demanding a fresh *quid pro quo*; the Kuriles were given away long ago without any guarantee for American claims and the Americans cannot now use their cession for bargaining purposes. But there are some indications that, if they meet with obstruction in the drafting of the treaty, the Americans may go ahead on their own. The Foreign Editor of *Newsweek* on his return from a trip to Tokyo has urged his fellow-countrymen: "Call the conference, set a time limit, and sign the treaty whether or not other nations agree. That treaty should provide for the continuance of paramount American interest in the guidance and administration of Japan for a long period of time." Such a course, as the writer admits, "could mean leaving out not only the Russians, but the Australians, the Chinese, the Filipinos and the other six nations on the Far Eastern Commission."

The Australians, indeed, are at the moment feeling rather sore at the overruling of their two recent protests against unilateral American acts of favour to Japan outside the Japanese homeland—the one permitting Japan to send a second whaling expedition to the Antarctic and the other allowing a resumption of Japanese mining of phosphate rock in Angaur, one of the former Mandated Islands. The American attitude is that, as the deficiency in Japan's food supply is at present being made up by the American taxpayer, it is for the American Government to take unfettered decisions in such questions. A complete breakdown of Allied agreement on policy towards Japan would, however, be a serious matter, and it is much to be hoped that the forthcoming Canberra Conference will help to produce a better understanding and co-ordination between the United States and the other nations whose interests are liable to be affected by measures for the economic rehabilitation of Japan.

No Reply from Mr Paling

It is doubtful if a full dress inquiry into the efficiency of the Post Office, as was suggested by Mr Keeling in a debate on the Post Office vote on Wednesday, would be justified, for the questions he raised could be answered perfectly straightforwardly by

the Postmaster-General if he chose to do so. These questions were first whether the small savings in manpower, effected by the recent cuts, was worth while in view of the slowing down of business; secondly, whether improvements could not be effected by reorganisation; thirdly, how far the breakdown was due to unreasonable behaviour of the staff and fourthly, whether the staff had any just grievances.

The first of these questions goes to the heart of the matter. The Post Office administers services which are of supreme importance in a modern industrial community if its efficiency is to be maintained. A rapid letter and telephone service are now the prerequisites of ordinary business life, and delays are a waste of manpower just as much as the physical presence of an extra postman or telegraph boy—indeed, the waste is probably proportionately greater owing to the type of person whose time is being wasted. Has the Post Office made any serious efforts to relate the waste of productive efficiency owing to delays in essential services with the manpower savings in the staff reductions which have been made? If they have, Mr Paling said nothing about them. He was equally silent about the negotiations over the reduction of hours of Post Office workers. At the present time such reductions cannot be justified, and Mr Paling should certainly have given more information about the effects these cuts would have on the evening services of the Post Office, and what staff difficulties there have already been in increasing the numbers of collections and deliveries. It is possible that all these considerations have been considered and correctly weighed, but if so, the public is entitled to know. Instead, both Mr Paling and Mr Burke concentrated a great deal of unnecessary attention on helicopter services and other innovations of the future when what is wanted is an improvement in the main services now. The Post Office did so well during the war, under very abnormal conditions that it is doubly disappointing that the services are now deteriorating.

* * *

Representation of Interests

The case of Mr W. J. Brown, MP, brings out into the light of day a very ticklish problem of parliamentary representation. Although the Committee of Privileges decided that there had been no breach of privilege, and that no further action was necessary, the facts of the case and the Committee's observations upon them show how dangerous can be any arrangements which link the actions of a Member of Parliament with any sectional group or vested interest unconnected with his duties as the representative of a constituency. In the present case Mr Brown was elected to Parliament in 1942 as an Independent member for the constituency of Rugby. But he also undertook duties as Parliamentary Secretary of the Civil Service Clerical Association, a large Civil Service trade union, with which he had been connected for many years as General Secretary. In return for a salary of £1,000 a year and expenses allowances Mr Brown agreed to handle the parliamentary business of the association, which he has indeed done most energetically. The contract which set out these arrangements expressly states that he should "be entitled to engage in his political activities with complete freedom."

The trouble arose because Mr Brown's perfectly justifiable exercise of this freedom caused him to express views which were often strongly critical of the Labour Party and the Trades Union Congress, and which did not accord with the views of the executive committee of his association. As a result the executive committee sought to terminate the connection, but without any financial disadvantage whatever to Mr Brown, on the ground that his political views were not in line with theirs, and that it was not always realised that his appointment as Parliamentary General Secretary left him complete political freedom.

As events have turned out there has been no damage done to the public interest (nor incidentally to Mr Brown's private interests) as the result of the dispute, since Mr Brown very properly refused to temper his views to those of his association. But the Report (HMSO, 118, 3s.) shows the delicacy and danger which must surround any contractual arrangement between a Member of Parliament and a trade union, trade association or any other vested interest. Not all Members of Parliament are necessarily as independent of mind as Mr Brown, nor have all of them contracts which protect them so well if disagreements occur. It is well known that many Members have their income supplemented or their election expenses paid, or both, by organisations for whose interests they undertake to be spokesmen. Do they sometimes temper their tune to suit those who pay them as pipers?

A parliamentary salary of a thousand pounds a year is, of course, a considerable safeguard. But as the time-table of the

House of Commons becomes more and more congested there is less and less time for members to supplement this thousand pounds by part-time work elsewhere, and so a greater and greater temptation to combine representation of their constituencies with other conveniently arranged duties inside the House. Only in glaring cases can the corrective of the Committee of Privileges be brought to bear. For the rest, public opinion both inside and outside Parliament must do this work. It is of vital importance that political integrity should be maintained.

* * *

The Regional Hospital Boards

At the end of last week, the names of the chairmen and other members of the regional hospital boards, set up under the National Health Service Act, were announced. Mr Bevan always made it quite clear that although, as is laid down in the Act, the various interested bodies were to be consulted before any appointments were made, they would not consist of nominees of these bodies. The members of the boards were to be experts, not representatives, and a study of the names of the chairmen and other members shows that this aim has been fulfilled. The chairmen are, in some cases, chairmen of public health committees of local authorities, in others officials of voluntary hospitals, in others high officers of a university. The other members of the boards include many practising doctors—specialists and general practitioners—some Members of Parliament, members of local authority health committees, university officers, nurses and ex-nurses, and persons with no particular qualifications, but with wide experience and ability. The number of members, other than the chairmen, varies between 31, in the Welsh region, and 21, in the north-east metropolitan region.

The composition of the regional boards is in contrast to the usual equal representation with an independent chairman that is characteristic of many public boards and committees today. Whether the members will be able to act as independently as is intended remains to be seen. It is probable, however, in view of the manner of their appointment, directly by the Minister, and the fact that they will only give part-time service, that they will wish to get on with the job as quickly and efficiently as possible. That job is, in the next twelve months, the co-ordination and grouping of hospitals in their regions and the appointment of specialists and other staff to serve them. In exactly a year's time, on the appointed day, the organisation should be so complete that if a comprehensive hospital service is not available for everyone, it is because of physical shortages of building, equipment and staff, not because of a failure of planning.

If they have done their job of planning properly, the regional boards' work, after July 5, 1948, should consist mainly of keeping their services up to the mark. They will continue to make appointments, but the day-to-day running of the hospitals will be the concern of the hospital management committees which the boards will appoint when they have drawn up their plans. Here, too, a study of the composition of the boards bears out another of Mr Bevan's assurances—that the management committees will be given a real job to do. There are so many practising doctors and others with full-time employment on the boards that they will be physically unable to concern themselves with the detailed running of the hospitals. They will have to delegate a great deal to the people on the spot—which is all to the good.

* * *

Waiting in Indonesia

Negotiations between the Dutch and the Indonesian Republicans have dragged on with such endless procrastination and delay that the world finds it hard to remember what they are all about. In Washington, however, there has been a growing impatience at a deadlock which is preventing a resumption of production of commodities very important for world supplies at the present time. The United States is prepared to provide financial aid for the restoration of Indonesian economy, but only after a definite Dutch-Indonesian settlement has been reached and a stable administration set up. Not long ago the American Government was inclined to blame the Dutch for an intransigent colonialism and failure to face the realities of the new situation; more recently, however, Washington opinion has turned in favour of the Dutch, partly, perhaps, because of a growing disillusionment about Asiatic nationalisms, but mainly because the recent Republican Note to the Dutch Commission-General goes back in several respects on the Linggadjati agreement which was supposed to be the starting-

point of the discussions, and this has created the impression that the Republicans are not acting in good faith. The Dutch were so exasperated at the lack of progress that it was rumoured in the last days of June that they were about to renew military operations and make a serious effort to crush the Republic altogether. At this point an American Note was sent both to the Republican Government in Jogjakarta and to the Dutch Acting Governor-General, Dr Van Mook; it urged the Indonesian Republic to "co-operate without delay" in setting up an Interim Federal Government for Indonesia—to cover both the territory of the Republic, consisting of Java and Sumatra, and other parts of Indonesia—and emphasised that Dutch sovereignty would be recognised in accordance with the Linggadjati agreement until the end of 1948.

It seems probable that Dr Sjahrir would long ago have reached agreement with the Dutch but for the pressure of the extremists in Jogjakarta, who have accused him of betraying the national cause every time he has made a concession. As a consequence of this conflict Dr Sjahrir has now thrown in his hand and resigned, and up to the time of writing President Soekarno has not been able to form a new Government. The Republic certainly will not be able to put its relations with the Dutch on a firm basis until it has ministers who can make binding agreements without risk of being repudiated by up-country zealots.

* * *

"Unfinished Business"

On June 30th Unrra came to its official end and the Director-General marked its demise by publishing a statement on its four years' work. This is a modest little document pointing out one or two of the more obvious facts connected with Unrra's operations—the scale of assistance it provided (nearly 3 billion dollars worth of supplies, or three times the value of relief provided after the last war), the proof it offers that "an operating agency depending upon international organisation can function efficiently and effectively," the fact that an immense work of direct assistance and salvage was accomplished, starvation held at bay and disease warded off. As the Director put it: "Although serious need still exists . . . recovery from the devastation of war can proceed from the base created by Unrra."

There will no doubt be some disappointment that Unrra's last report does not include some appreciation of the wider issues raised by this first world-wide experiment in international co-operation, especially since one fact is plain beyond doubt. Unrra's work is "unfinished business." By implication, the Director-General's report admits it. Only if the nations continue to co-operate effectively can the recovery already made be sustained, and there is no sign at all of such a spirit—in Moscow or Washington. Worse, the gains made by Unrra may even be dissipated if instead of further co-operation a complete division both in Europe and the Far East takes its place. Unrra until its ending last week continued almost alone in the international field to straddle the chasm.

The heavy blame borne by the Russians for Europe's growing cleavage is known to all. But for the record, it may here be recalled that it was the United States, exercising its "economic veto," that decreed Unrra's end last December, although every nation voted against the decision, save only Britain. To-day, looking back over the six months that have elapsed since that momentous decision, can it be said that Europe or the world has gained by it? A Marshall Plan which might have found East and West still effectively co-operating within Unrra on the basis of some pooling of resources, an Economic Commission for Europe which might have taken over its international machinery ready made—these possibilities have gone out of the world through the dreamers' Gate of Ivory. The American veto was understandable. Its consequences are disastrous, none the less.

* * *

Greenland, Denmark and the USA

The Danish Government has asked the United States to open negotiations "as soon as possible" for a new agreement on the defence of Greenland. Mr Marshall has replied that he is ready actively to explore at any time the basis of such a new agreement in keeping with the letter and the spirit of the Charter of the United Nations, which would fully take into account Danish sovereignty over Greenland and legitimate United States and hemispheric defence requirements. And the Danish Ambassador in Washington has returned to Copenhagen. There is no need to emphasise the strategic importance of Greenland in the defence of the United States. By the agreement of April, 1941, America actually

extended the Monroe doctrine to the area. Since then the Truman doctrine has been expounded, and at the end of May General Spaatz, justifying defence appropriations, made a remarkable speech on the importance of the Arctic in the air defence of America. The Danes are beginning to ask what the local application to Greenland of some sort of Truman doctrine may entail for them. Under the 1941 agreement the United States may retain troops in Greenland "until it is agreed that the present dangers to the peace and security of the American continent have passed." At first sight this refers obviously to the war, but not necessarily so; and in any case the war has not officially ended in America. Juridically, therefore, the Americans have a sound case for staying in their Greenland bases, of which the main ones are near Julianhaab, near Godthaab, and the recently completed one at Thule. But this has aroused discontent and protest in Denmark.

The Danish Government has, it is true, attempted to re-assert its sovereignty. Early last year a small force of Marines was sent out and, soon afterwards, a separate Greenland naval command was created. But rather unwisely the Danish Government made no comment on public criticism of America,

thereby stimulating that criticism. In the late summer sensational reports from journalists, at last allowed to visit Greenland, confirmed the popular disquiet, which Russian reactions to American negotiations for rights at the largest airfield in Iceland had done nothing to allay. Norwegian concern was also aroused by the Danes' somewhat hesitant and obscure handling of the Greenland question. For, if "legitimate United States defence requirements" justified the establishment of American bases in Greenland, the needs of Russian security, it could similarly be argued, would justify the Russians sharing bases on unfortified Spitzbergen. Norway, however, has firmly refused to establish bases on Spitzbergen as a partner of any country, but only for the use of Uno's forces.

Some such formula could probably be applied by Denmark to America's case in the proposed negotiations on Greenland, but any new agreement concluded is more likely, as suggested by Mr Marshall, to be a compromise conceding all the American claims. Danish sovereignty over Greenland will be recognised. America will get the bases and other facilities, undertaking to make them available to Uno forces as and when necessary. But until then—in spite of an influential body of Danish opinion which considers the position should and will revert to what it was before the war—the bases are likely to remain American.

* * *

Freedom of Association

The main interest at the International Labour Conference now meeting in Geneva centres on a resolution on freedom of association, which the ILO has prepared at the request of the Economic and Social Council. The issue was originally referred to the Council by the World Federation of Trade Unions and was passed on to the ILO, under the terms of the agreement reached between the United Nations and the ILO last December. The scheme is to draw up an international convention on the basis of the resolution for adoption at a later session.

The resolution lays down certain broad principles of industrial organisation. It stipulates that employers and workers shall have the inviolable right to establish their own associations and to develop in complete freedom from outside interference. It provides for the establishment and strengthening of collective bargaining and the creation of voluntary conciliation and arbitration machinery. Much of the resolution will be generally accepted. Indeed it only represents rights and principles which have long been established in Britain and other industrially developed nations, even if in some less advanced countries the rights of association are not so firmly secured. But the approval given in the resolution to the "closed shop" principle, even though it takes a negative rather than a positive form, is certain to be contested. Indeed it is difficult to see why this highly contentious and dubious principle should have been included at all, for it is one on which not even all British trade unionists are agreed. Again, the provision urging the establishment of joint committees to promote welfare and the improvement of productive efficiency, either by agreement, or if necessary by legislation, may seem too specific, in view of the less advanced technical development of some countries. The clause stating that wages and conditions established by collective agreement must be observed by employers, even where they are outside a federated organisation, and not a party to that agreement, admittedly provides a safeguard against under-cutting and exploitation, but it contains certain obvious dangers, and if carried too far, might lead to the "closed shop" for employers as well as workers.

The difficulty, as always with the ILO, lies not so much in securing agreement on the form of a resolution or a convention as in securing its application. An international convention is, after all, a matter of honour, and there is no sanction that can be applied to ensure its observance. The ILO is well aware of this defect in its constitution, and progress with ratification of conventions by Governments, even under constant pressure from the workers' side, has often been disappointingly slow. For some time past it has been concerned with methods of improving its machinery, and in particular developing a system of labour inspection; but, like the conference itself, the speed is leisurely, and no revolutionary improvements can be hoped for. At the lowest, the ILO provides a valuable tripartite forum for the international discussion of labour problems—at the highest, if the principles and policies of the organisation are observed in practice as well as on paper, it can be—and is showing itself to be—an important instrument for the raising of standards and the protection of labour in every country.

Patent Medicines in the Health Service

The object of the Penicillin Bill, which is awaiting the Royal Assent, is sensible. Since self-medication with penicillin might induce resistance towards its therapeutic properties, the Bill provides that it can virtually only be supplied on a doctor's prescription. The same control can be extended by regulation to similar substances such as streptomycin. There was no serious opposition to the principle of the Bill when it passed through Parliament, but there was just enough ineffectual criticism to show what a difficult task a Minister of Health would have if he attempted to control self-medication in general.

Yet self-medication is surely incompatible with a national health service that will claim to provide the best possible treatment, free of charge, for everyone, and will use large sums of public money to do so. It is not surprising, therefore, that another attempt is being made to bring the sale and advertisement of medicines under control. The Pharmaceutical Society recently sent a report to the Minister of Health recommending, among other things, that the duty of securing proper standards for proprietary medicines and their advertisements should be placed by statute on the Minister of Health who should make strict regulations to enforce such standards; that a register of medicines and manufacturers should be kept; and that the sale of unregistered medicines should be prohibited. The Pharmaceutical Society can hardly claim to be entirely disinterested in the matter, for it is in close contact with the Pharmaceutical Union, which represents the commercial interests of pharmacists and resents the sale of patent and proprietary medicines through "other vendors" such as the multiple stores. But it has certainly produced an impressive indictment against the patent medicine advertisements. In spite of the legislation that has been passed since 1914, when a Select Committee reported, many advertisements still contain gross misrepresentation, extravagant claims and appeals to fear, to which should be added, in recent times, the exploitation of chemotherapy, as witness the "bio-chemical" and "oral vaccine" preparations.

Logically, a strong case can be made for the control of the patent medicine trade—Mr Bevan has, in fact, expressed his sympathy with it. In practice, however, it is not so simple. There is a prevalent tendency, in matters of health, for people to refuse to accept medical advice when it does not tell them what they want to know. They refuse to believe that there is no cure for their ailments. Under the present system such people may go to one doctor after another. Under the National Health Service appeals from the doctor of first instance may be difficult if not impossible, and the only recourse will be to the patent medicine trade. If that is abolished, will not some new quackery arise to serve the same purpose? But if it is impossible to stop the trade, it should be possible to place a tighter control on advertisements which only serve to encourage people's belief that they are ill, and that there is a man-made cure for every symptom and disease which flesh is heir to.

London's Juveniles

The report of the London Regional Advisory Council for Juvenile Employment for the years 1939-46 gives very convincing confirmation of the problems facing the employment of young workers which were discussed in an article in *The Economist* of June 21st. Between 1939 and 1946 the juvenile labour force in London declined by 30 per cent—

1939 408,000 1946 287,000.

Although the definition of what is a juvenile is not quite the same in the report as it was in the article, the drop in numbers is proportionately very much alike, and reflects the very serious fall in the birth-rate in the early nineteen thirties. The same problem is also shown up by the vacancy figures for the two years. Just before the war the total number of unfilled vacancies was 8,000, or approximately 2 per cent of the total juvenile labour force. At the end of 1946 the number of unfilled vacancies had risen to 42,000, or 15 per cent of the total of juvenile labour. Even the latter figure probably understates the position, since recognition of the shortage was by then so widespread that employers were not registering their vacancies or had scaled them down to fit better with the supply position.

Such large alterations in supply compared with demand are giving employers cause for very serious thought. Increases in wages can alter the competitive attractions of different types of work, but they cannot alter the fundamental problems of shortage, which must be solved by increased mechanisations of routine processes and the employment of part-time and over-age workers.

Shorter Notes

The Conservative Central Office have decided to replace their former publication *Onlooker* by a fresh and more attractive monthly magazine, entitled *Tory Challenge*, of which the July issue has now appeared. It is claimed that the magazine is not wholly a party publication, and the contributors for July, besides Lord Woolton and Colonel Water Elliott, include Miss Dorothy Sayers and Mr Collie Knox. Readers of the former publication will, however, be glad to see on reading the new that the essential spirit behind the enterprise has not appreciably changed.

*

The Agricultural Wages Board has decided to raise the weekly minimum wage of farm-workers from £4 to £4 10s. Women's wages will be raised from £3 to £3 8s., and there will be corresponding adjustments in juvenile wages. Thus, after vainly bringing pressure on the farmers for some time for a £4 10s. minimum, the farm-workers have won their case. The Board also decided to raise the standard rent of farm cottages from 3s. to 6s., so as to even out the anomalies of rent variation in different counties. The wage increase was conceded in spite of the opposition of the farmer members of the Board, on the ground that workers in other industries had been granted higher wages. It is true that a case can be made for higher wages in agriculture, in view of its man-power shortage and its importance to the national economy. But the cost is bound to be substantial, and will presumably be passed on to consumers in the shape of higher prices for home-grown food. It also seems inevitable that the granting of a £4 10s. minimum for farm-workers will be followed by demands for higher wages from other industrial workers.

Letters to the Editor

America's Synthetic Rubber Policy

SIR,—I should like to make a few comments on the Business Note on the above subject which you published on June 28th.

My own point of view is that it is incorrect to ascribe the present American attitude towards synthetic rubber as being based on the desire of the manufacturers. I do not think that any USA manufacturer (and I keep very close contact with America) has any doubts as to what he really wants, namely, freedom of usage as between natural and synthetic rubber. You state in *The Economist* that in these circumstances we might have expected that some of the manufacturers might have organised opposition to the present enforced usage of synthetic rubber. I think that this view of the position is too simple. As you are doubtless aware, the position is far more a political one than an economic one, and in present circumstances no manufacturer wishes to show his hand, which might be a moderate one, too quickly in case a more violent minded competitor may put the case more strongly and press it to a point where complete freedom of usage might be demanded immediately.

This, of course, would be impossible from the American point of view, as the demand for synthetic rubber would decrease to such an extent as to create a world shortage of natural rubber. Therefore, the only solution is to get Order R-1 modified discreetly and in general agreement.

Now, Order R-1 is not a simple document. It contains specifications for usage of natural and synthetic rubber in detail for almost every article manufactured by the industry. The method of restriction is by laying down a percentage of usage of natural rubber. Even if the Order were altered so as to increase the usage of natural rubber, which is at present well under 50 per cent, say, to 66 per cent, there would still be a danger that if the total of usage of rubber falls in the near future (and this is not impossible) the immediate results of the change in the Order might be nil, and with my knowledge of official methods in America I doubt whether the Civilian Production Administration would go so far as to state the total amount of natural rubber that might be consumed monthly. This, of course, would require a complete recasting of the Order, and it is possible that such a recast might not be possible by executive action but might have to be referred to Congress. That would raise the whole problem of synthetic rubber usage and regulation, perhaps at an inconvenient time.

You further suggest that manufacturers might object to further restriction of the uses of permitted rubber while the material (synthetic rubber) is still in its swaddling clothes. I think that this is definitely a misconception. One of the leaders of the industry—I believe it was Mr. Collyer—stated quite definitely that it is the desire of the industry to have synthetic rubber free from Government manufacturing control. Feeling in America is that if the synthetic rubber industry reverts to private hands progress will be much faster and much more convenient, and that it is in the interests of America, both from the security and commercial point of view, to let commercial developments start again at the earliest possible date. All the big manufacturers resent the fact that they have been compelled to pool their knowledge and patents of synthetic rubber, and each one of them in the usual American manner wishes to exploit his technical knowledge and brains to his own advantage and not to the advantage of others.

It is difficult out of these complex circumstances to evaluate the real reasons for present strict control of natural rubber in America, but one thing has been pointed out to me recently by a friend in America: that the recent fall in the price of natural rubber has hit the manufacturing companies' inventory accounts so severely that they are anxious to see the price rise again to a reasonable level. The extent of inventory write-offs has always been one of the difficult problems of American industry.—Yours faithfully, F. D. ASCOLI.

Mr Dalton's Statement

SIR,—Mr Dalton's statement in the Commons on Monday has provided final proof that the Government's economic policy is not directed towards raising the productivity of our labour by increased mechanisation and modernisation of our industry; nor is it their foreign trade policy to implement this objective by concentrating on the import of capital goods and the export of consumers goods. Instead, they allow the country to run into huge external debts in an endeavour to keep up our present

standards of nutrition to pre-war level and look on at the fast dwindling of our dollar resources waiting, Micawber-like, for something to turn up. They fail to appreciate—or have not the political courage to avow—the simple fact of our economic position: that to be able to regain our old standard of living in the face of the loss of much of our pre-war overseas income we must create new capital resources. That—as every first-year economic student will be able to tell them—"investment," the accumulation of capital resources, presupposes "saving," the foregoing of present consumption so as to expand future consumption. And that we cannot have our cake of a high standard of living in the future if we eat it now.

The Economic White Paper provided for the import in 1947 of 60 million dollars' worth of machinery and equipment, or less than 2½ per cent of the total value of imports. Set against this the planned expenditure of half the total value of the import programme on the purchase of food, and it becomes obvious that the Government's policy is one of living from hand to mouth and of letting the morrow look after itself. It must have been obvious to any thoughtful student that we could not raise our output substantially by exhortation and by a fatuous "work or want" campaign. The only effective policy was—and still is—to cut down our imports of consumers goods to the bare minimum (not the "politically feasible" minimum, but the smallest quantity necessary to keep body and soul together) to increase the import, as well as home production, of capital goods as much as possible and to bring home to the people the fact that if we do not want now, for a strictly limited period of time, we will want in future, and all the work in the world will not help us. Recent experience has demonstrated that the people of this country are capable of heroic sacrifice, but only if the emergency is great and clearly understood.

Let us prove that a deliberate temporary reduction in our standard of living is within the moral power not only of a people ruled by a police State, but can be the result of a free democratic decision of well-informed and determined citizens.—Yours faithfully, M. WALLACH

Turning Point in Hungary

SIR,—Your correspondent who wrote on Hungary last week was no doubt anxious to prove that Hungary is now completely in the hands of Communists. Many of his facts certainly appear to suggest that. But in matters of this kind it is well to look beyond the suggestion of appearance. He writes that the Communist Party "took almost complete control of the 'frontier guards' (based on the 'frontier troops' of the NKVD in the USSR) . . ." Perhaps it did. It would be much to expect that Communists should now be excluded from the Hungarian armed forces. But the "frontier guards" in question are none other than the old and respectable *Határvédség* battalions which formed part of Admiral Horthy's army. *Határvédség* does mean "frontier guard," or something very near it; but it may be doubted whether Admiral Horthy was moved to base their formation on the doings of the NKVD. This over-straining of evidence scarcely lends weight to your correspondent's views.—Yours faithfully, 16, Lanercost Road, London, S.W. 2 BASIL DAVIDSON

An Optimist on Democracy

"The Web of Government." By R. M. MacIver. The Macmillan Company. New York. 498 pages. 21s.

It is not easy to construct a political philosophy that is both stimulating and balanced, but Professor MacIver largely succeeds. He eschews the rather arid heights of traditional political theory, and he will have nothing to do with either the mis-called "idealists" who see in the state the focus and goal of human endeavour or the individualists who would put the state on the level of a joint-stock company. Instead he shows that government—he is rightly concerned with the nature of government as such rather than with that of the national state—is a necessary growth from the needs of family, tribe and community, but that the community is a deeper and different thing from the political entity that it supports.

Two of the most interesting chapters deal with democracy and dictatorship. The author rightly insists, over against those who at the present time think it necessary to assert the opposite, that democracy is not tied to any specific creed, to "any particular doctrine of man's rôle or his destiny." Democracy can endure through great changes of economic, social or religious belief. Its distinguishing mark is said to be that it alone gives constitutional effect and embodiment to the responsibility that the state owes to the community, of which it is no more than the political expression. In all other forms of government this responsibility is explicitly or implicitly denied—sometimes, the author might have added, by means of a false identification of community with state. It is no doubt because of the great difficulties, both human and technical, of establishing this relation of responsibility that democracy is such a tender plant that can grow only under favourable conditions and is "never completely achieved."

The author believes, however, that the increasing prosperity promoted by industrialisation favours democracy although it surely only does this if the rising standards are widely shared. However, economic advancement also brings great dangers to democracy. In the last chapter, it is pointed out how the levers of social control are being progressively removed from the reach of the common man, how a new institutionalisation which extends into every sphere of life—into sport and entertainment, no less than economics—"canalises and specialises functions and relationships formerly conducted as the personal responsibility of man to man." The effect is that the sources of power become more remote and more strong. But Professor MacIver is an optimist—perhaps too strong an optimist, although this is a refreshing contrast from overwrought treatises prophesying doom. Among the factors making for democracy he places first

the increasing assertion—if we look not at the moment but in the perspective of history—by the mass of the people of their right to control their own affairs and to make their leaders responsive to their will.

His analysis of dictatorship is penetrating. He maintains that it is where "the ground is to some extent being prepared for democracy"—where the class structure is challenged, traditions are weakened, yet economic and especially strategic circumstances

are unfavourable—that "the conditions most congenial to dictatorship develop." Yet dictatorship is not a uniform product. There is a world of difference between the Latin-American type of dictatorship, which is pointed out to be superficial and "peculiarly denuded of myth," and the Nazi type where the prefabrication and enforcement of a false emotional faith is essential to the construction of totalitarianism. Professor MacIver maintains that "the Soviet dictatorship is so novel, so distinctive, so revolutionary, that it constitutes a type by itself." Despite some genuine efforts to give it effect, for instance in the field of cultural liberty, the Marxist ideology has not been adequate to the requirement of dictatorship which can be neither "temporary" nor "proletarian." In particular Marxism failed to realise that "Wealth can indeed be socialised—but not power . . . Political power can be controlled only by being made responsible."

The Function of Law

"The Province and Function of Law : Law as Logic, Justice and Social Control." By Julius Stone. Stevens and Sons (1947.) 918 pages. £3 10s.

THE man in the street is apt to think of the law as a body of defined rules administered, rather than interpreted, by a small body of men originally trained in the arts of advocacy and therefore well fitted to sift the true from the false in the cases presented before them. In short, he tends to think of courts as fact-finding instruments only. Parliament makes the laws: the judges do the rest.

Such a view is misleading. In criminal cases, it leaves out of account the fact that only in one crime, that of murder, is the judge compelled to impose a particular sentence, death (even there he has some discretion over a recommendation for mercy). In all other cases, only the maximum penalty is fixed, and the variations in punishment for the crime of manslaughter are an excellent example of how much is left to the trial judge. In civil law, there are many fields in which an equally wide liberty of action is left to the judiciary. One example from a recent case: is a woman whose husband undergoes an operation to make him sterile entitled to a dissolution or annulment of the marriage? Does it make any difference whether the operation was performed before or after marriage? The legislature has not answered those questions. The judiciary must. And in doing so, what considerations must a judge allow into his mind, and what must he exclude? The situation and conduct of the parties? The guidance to be derived from legal principle and precedent? The element of current public morality and public interest?

All these questions can properly be called the province and function of law. All of them, and many others, are discussed by Dr Julius Stone in his book. Dr Stone has some peculiar advantages. He was originally, and still is, an English solicitor, a graduate of Leeds University. In addition he holds degrees from Oxford and Harvard. He has formed a part of the teaching staff of four universities, Leeds, Harvard, Auckland University

Under Vichy the syndicalist leader, Belin, was given the congenial task of dissolving the trade union movement, and proved with many of his colleagues that treachery is not the prerogative of a class. Then the trade union movement was re-born in the *Maquis*, and French labour provided one of the finest spectacles of courage and devotion in the war. But already they had started to theorise, and Mr Ehrmann leaves them planning the economic federation of Europe in the hills of Savoy. He wonders if French labour, salted with fire, has learned its lesson. Had the publication of this brilliant and carefully documented work, distinguished as much for its insight as for its scholarship, been delayed a few months he could have provided the answer.

An omission may be noted in the bibliography: the Allied Commission Bulletin, which circulated in Italy, and contains the official testimonies to Italian services, was not made available in this country.

July 5, 1847

The principle now avowed by the ministers, and always, we must admit, by the Protectionists, is, that the Government, disregarding the principles of science . . . is to undertake the task of directing the labour and distributing the property of the people. It no longer confines itself to levying taxes and protecting the community; it professes to make the nation prosperous by applying its capital. It undertakes to provide for the proper diffusion of wealth. The English and Scotch have too much, or the merchants and manufacturers have too much, therefore, the Government decides that a part of their wealth must be transferred to Ireland, and applied to making railroads. We know from experience that the Government . . . will not succeed even in its limited object of making Ireland prosperous, but its larger object of promoting the public happiness by the plan of distributing the property of the people, will end, we fear, not merely in disgraceful, but convulsive failure. Already there are persons in the community, neither few nor unimportant, backed by celebrated names, and widely circulated journals, who contend that the Government is bound to secure to the labourer an adequate reward, and who accordingly propose, as a part of the national policy, a law fixing a minimum below which wages are not to be allowed to sink. Already we have not a few persons in the country who describe individuals as particularly meritorious, and insist on the Government giving them pensions, or providing for their wants. . . . These are the two extremes of the principle to which the legislature has now given its solemn sanction; and we see no logical argument which can protect it against the demands of all workmen to be secured in good wages, and all kinds of meritorious individuals to have pensions, since it undertakes to distribute the property of the people.

From the first he was recognised as an astute and tenacious politician. His reputation for efficiency and sure control is so marked that he has been accused of running a "push-button" government. Citizens' organisations which aim to study proposed legislation complain that the Bills which he sponsored this year were not released for public discussion until he was sure that the legislature was ready to pass them, and that they passed almost without debate. So smoothly does his steam-roller run, they say, that even though one of these Bills pro-

Mr Dewey's record of achievement during the five years he has been in office displays a curious fogginess. His technique of being all things to all men, of refusing to alienate any single vote which might be cast for him when he makes his next try for the Presidency, has given his administration so indeterminate a character that normally well-informed citizens confess to difficulty in remembering what stand he has taken on controversial issues or pressing projects. His objectives as set forth in his inaugural address when he began his second term are typical. He aimed, he said, to "show that Government can have both a head and a heart ; that it can be both progressive and solvent ; that it can serve the people without becoming their master." Assorted bogies were thus knocked down. The Governor has not forgotten the Democratic wise-crack of the 1944 campaign: "Don't look now, Mr Dewey, but your record's showing." He has carefully abstained from taking a position on the Labour Bill, for example.

The Governor recently endorsed American assistance for Greece and Turkey, and called for resistance against "ideological aggression" everywhere. He also called for the admission of 100,000 Jews into Palestine at once; he has not recommended increasing their numbers in New York State.

both existing political parties. The argument is that the President's veto was a mere gesture; from labour's point of view the important and tragic fact was his inability to force his own party's Senators to vote to sustain his veto. (Twenty Democrats voted with the Republicans.) This exhibits a short memory. If Labour had gone to the polls last November, the Democrats in Congress would not be swamped by Southern reactionaries as they are today.

It is this unity which is in the balance. Co-operation to fight the Labour Law exists; will it be extended to political action? All the great labour groups are determined to fight the Labour Bill at the polls as well as in the courts, but if they go different ways about it, their efforts may cancel each other out. There are rumours that Mr Lewis is making approaches to Governor Dewey behind the scenes, offering to deliver the AFL vote. Other labour leaders, like Mr Murray of the CIO, are faced with the decision of supporting Mr Truman, or joining those who have with Wallace bled.

A deterring factor will be the patent party-line of many of Mr Wallace's supporters. Another should be the knowledge that a Wallace campaign which drew away votes from Mr Truman would not only ensure a Republican Congress and President, but a Congress, and perhaps a President, several degrees to the right of the present Republican leadership in Washington.

Labour's temptation to cry "A plague on both your houses" is understandable. But the difficulties in the way of getting a third party on to the state electoral rolls are almost insuperable. In some states it is flatly impossible; a party must have polled a certain percentage of the votes cast at the previous election in order to file. In others candidates would have to run colourlessly as unidentified "independents." In others, long and expensive lists of signatures and affidavits are necessary. These political facts of life are known to Mr Wallace, to Mr Green of the AFL, and to Mr Murray of the CIO. Their rumblings may thus be no more than a genteel form of political blackmail calculated to reopen the door which Mr Truman shut so firmly on Mr Wallace nearly a year ago.

Notes on "Bulwinkling"

In future years, the master philologists may foregather to trace the development of the verb "to bulwinkle" as a phrase beloved by journalists in their description of any political manoeuvres designed to frustrate the operations of the Sherman Act. This useful addition to the lusty and tolerant vocabulary of the North American continent could follow easily from the passage of the Reed-Bulwinkle Bill which seeks to exempt the railroads, and all common carriers, from the anti-trust laws. It is by no means the first time that such an attempt has been made, but a Democratic majority in the Senate last year refused to bow to the pressure of interested parties. The Eightieth Congress has shown no similar reluctance, and it looks as though both Houses can command the votes necessary to over-ride a Presidential veto.

The Bill (which has received some impressive support from Federal and state authorities, chambers of commerce, civic organisations, industrial customers, and farm marketing groups), seems to introduce some awkward points concerning the precise status of the Interstate Commerce Commission. The ICC was the first regulatory body established by Congress under the Interstate Commerce Act of 1887, and successive grants of authority governing not only maximum, but also minimum, rail rates have never met with a major judicial challenge. Indeed, when the State of Georgia first moved (in 1945) to challenge the discriminatory rail rates which favoured the East, against the South and the West, the Court majority held that it could not set aside rates approved by the ICC, while a dissenting minority held that no relief could be given without the breakdown of powers specifically delegated by Congress. Shortly afterwards, the ICC itself ordered reductions in rates ruling in the South and West, and increases for Eastern rates, and this decision was upheld by the Supreme Court only a few weeks ago.

Now that it has been prodded, the ICC is apparently determined to go very much further in the campaign against discriminatory rates, and this action may bring eventual abandonment of the suit which is still being pressed by the State of Georgia on the ground that recent adjustments by no means eliminate the discriminatory rate structure. Another problem arises, however, in connection with proceedings now being brought by the Federal government against a number of western railroads for alleged violations of the Sherman anti-Trust Law. Passage of the Reed-Bulwinkle Bill would seem to nullify this suit.

Probably, the dilatory movement of the ICC in the matter of discriminatory freight rates is one of the major charges which can be made by opponents of the Reed-Bulwinkle Bill. Certainly, there does not seem to be solid evidence for some of the extreme claims against the ICC as a rate-fixing authority. But it does seem as though a higher court of appeal might sometimes be necessary, and while the Supreme Court has explicitly denied any power of rate revision, it has sustained, at least in theory, the power "to eliminate collusive practices." Where opponents of the Reed-Bulwinkle Bill find their best debating ground is in the record of earlier exemptions from anti-trust laws. Farm and food marketing co-operatives, exporters' associations, bituminous coal producers, fire and marine insurance companies, have all now secured this exemption. For each body, strong claims can be made for special treatment. But the trend is not without its dangers, and a Republican Congress is sometimes fallible.

Floods in the Corn Belt

The weather, which throughout the war years produced bumper crop after bumper crop, has at last turned hostile. Floods throughout the Middle West are drowning out the corn-lands; on the Mississippi the peak of flood water is the highest in 103 years. Wheat is affected; but it is the maize crop which has been hardest hit. Farmers who have already planted twice this sullen spring feel it is too late to plant a third time; all the chances are that the crop would fall a victim to frost. Prophecies are for a corn crop 25 per cent to 40 per cent below that of last year, the lowest in twenty years. The determined optimism of the Department of Agriculture is belied by all local reports.

Maize makes up only a small part of the export programme. Wheat and flour account for over 13 million long tons, maize for only 1.4 million. But floods in Iowa may even so damp hopes abroad. Wheat is already being used as a substitute for maize in distilling, by government permission. The main effect, however, will be on meat and government food policy. The price of meat is already so high that desperate cities, like New York, are conducting investigations, and buyers are turning away. The stock answer of the trade is that it is the government's buying programme for export which is to blame.

These two consequences will grow in importance. Corn is consumed chiefly on the farm; 90 per cent of it leaves the county in which it was grown only in the form of hogs, poultry, cattle, dairy products, corn sugar and syrup. But with the price of corn hitting a new all-time high day after day, the temptation is for the farmer to sell rather than to turn his corn into meat or milk; and wherever the feed goes, it will produce less than last year at higher prices. Even the farmers' lobby groups are now confessing that price control may be necessary, to the amazement of Senator Taft, whose simple faith in the virtue of the price mechanism is never shaken by events.

Extending Rent Control

Mr Truman, faced with the alternative of letting rent control lapse altogether, has signed as "the lesser evil" the Bill presented by Congress. At the same time, he appealed for an investigation of the real estate lobby's activities in promoting the Bill, and for a programme to encourage home building, slum clearance and low-rent housing. The extension Bill which aroused the President's displeasure does four things: it permits a 15 per cent "voluntary" increase in rents under existing leases; it removes all ceilings on new construction completed since February; it weakens enforcement of rent control by turning it back to the states; and it ends all Federal building priority controls except those over recreational construction.

The first provision, which has received so much unfriendly publicity, seems, on examination, to be the least harmful or unjust. Since December, 1941, there has been a 41 per cent increase in the over-all consumer price index and a 66 per cent increase in the price of food, but rents have risen only by .7 per cent. To some extent landlords are compensated by the fact that to-day they can rent anything remotely habitable; but, even so, a 15 per cent rise, in view of the rise in incomes, does not seem excessive. As it affects 15 million families, half those in the country, it would be an unwise step, politically, for Mr Truman to support. It is this fact and the housing shortage which have kept rent control alive so long after other price controls. The weakening of enforcement seems much more dangerous.

THE WORLD OVERSEAS

Molotov on Marshall

(By a Correspondent)

"BEVIN'S 'No' to Molotov," "Bevin again says 'No,'" "Molotov's words have no effect on Bevin"—these would have been the headlines given to cables from Paris in the Russian press, if it were not that Russian sub-editors do not like headlining their pages in shorthand style. The readers of the Russian press are undoubtedly as puzzled by what happened in Paris as is the Western European public. Only that in the Russian picture Mr Bevin is the utterly incomprehensible *bête noire* whose stubborn malevolence threatens to frustrate the most fruitful conceptions and schemes for economic rehabilitation advanced by his infinitely patient Soviet colleague. In the west Mr Molotov is seen as wasting a unique and potentially epoch-making plan for international economic co-operation. In Russian eyes, Mr Bevin seems now to have pride of place among the saboteurs of Europe's recovery.

There is, however, this difference between the respective journalistic mythologies that have formed around the Marshall offer: that in the Russian version the nobility of Mr Marshall's intentions is far from being taken for granted. In the deliberations of the Politbureau, that must have preceded Mr Molotov's departure for Paris, the term "American gifts" undoubtedly acquired the unpleasant connotation of "Greek gifts." Soviet economists have devoted a lot of attention in recent months to analysing the changes in the economic structure of the United States brought about by the war. The analysis has led them to discover an intensification of most of those trends in American economy which, according to Lenin's classical formulas, make the economic springs of imperialism. The concentration of American capital is stated to have made a gigantic stride forward. The interdependence of banking and industry on the one hand, and of the state and "finance capital" on the other, is seen to have become much closer than ever before. An intensification of these trends is bound, in the Russian view, to weaken the liberal and progressive elements in American capitalism in favour of reaction and imperialism. This is regarded as the "natural law" of development, asserting itself either through or even against all the checks and balances of a constitutional system, in which Marxists have never seen more than a secondary or subordinate factor. American economic policy is believed to be firmly hitched to the chariot of monopolistic capital, now about to invade a war-ravaged and famished Europe.

Trumanism in Disguise?

It is in this context that the Marshall offer has been scrutinised in Moscow. As elsewhere, so in Russia, the question has been asked whether the Truman doctrine has been thrown overboard or whether the Marshall offer has merely been intended to provide the idealistic wrapping for that "doctrine," the undisguised anti-Communism of which did not commend it to a large body of neutral or vacillating European opinion. On purely doctrinal grounds, the Russians are inclined to put the least charitable interpretation on the offer. However, the Kremlin apparently did decide to give Mr Marshall some benefit of the doubt, because of Russia's own economic needs and because of her anxiety not to burden herself with the odium of a straight rejection of the Marshall offer. Mr Molotov's mission in Paris was therefore to test the implications of the offer in so far as that could be done at the present stage.

Mr Molotov has this time taken the bull by the horns. Contrary to his habit, he did not indulge in squabbles on procedure, but attacked directly the basic problem raised by the Marshall offer. He made it clear that he would willingly co-operate in the drafting of a European shopping list to be submitted to the United States; but he also made it clear that such a shopping list could be nothing but a sum of the national shopping lists of the various European countries. In the insistence of his Western colleagues

that the Marshall offer meant that the European countries must first show that they are helping themselves and making the most efficient use of their own resources, before there could be any hope for American credits, the Russians have inevitably found a confirmation of their worst fears. They are in their own way very sincere when they express indignation at such conditions. Does Wall Street—they ask—really expect Russia to show that she is "helping herself" and making the most efficient use of her resources before a billion or two of dollars are loaned to her? Those who doubt—they say—whether Russia is helping herself ought only to cast a glance at the statistics of her devastation and to compare them with the target figures of the current Five Year Plan! Russia is certainly anxious to obtain American credits; and Mr Stalin has swallowed his pride and said so publicly. But what she wants is a purely commercial, good old capitalist loan at such interest as may be required; Russia is not prepared to pay the US creditor what she regards as political usury—to give him the right to pass judgment on the way Russia is using her own resources.

Shortly Mr Stalin will preside over the celebrations of the thirtieth anniversary of the Russian Revolution; and he is not going to mar the occasion by the acceptance of any degree of foreign capitalist control over Russian economy. Even an appeal to the Russian people further to tighten their belts, in view of the refusal of their capitalist allies to help them on acceptable terms, would better harmonise with the spirit of the anniversary than any degree of surrender to foreign pressure. But there may not even be the need for any further tightening of Russian belts, if the very optimistic forecasts of this year's harvest come true, as they are very likely to.

Pretexts for Interference

The talk about a co-ordinated plan of European rehabilitation arouses equal suspicion, for the Russians see in it an attempt at forcing them to scrap their trade arrangements with foreign countries, arrangements which they believe to be essential for their own reconstruction and which they know to have incurred the wrath of the United States. American protests against the alleged exclusiveness of the Russo-Swedish trade agreement are still fresh in the Kremlin's mind. Should they give up the concrete advantages of that agreement in favour of some misty "all-embracing European plan"? Or should they perhaps give up Polish coal and Rumanian oil, on which their recovery in part depends as long as their own coal and oil industries have not been fully rehabilitated? Mr Bevin reproached Mr Molotov with wanting the European nations to ask the United States for a blank cheque. Mr Molotov might have answered, if he has not done so, that Mr Bevin was urging him to give up many concrete, existing advantages in exchange for a blank and still unsigned cheque.

In the Russian view, the United States seems to demand for itself the right to veto the national plans for reconstruction which the various European countries have worked out. Otherwise—so the Russians reason—the talk about a co-ordinated European plan would make no sense. They foresee that the United States would handle its loan policy as a powerful lever to upset the quasi-Socialist planned economies of Eastern Europe. To this Mr Molotov has objected, ostensibly because of his concern for the "national sovereignties" of the smaller states. The "national sovereignties" are, of course, a pretext—Mr Molotov's real concern is over the social structure of Eastern Europe. On the other hand, the Russians take it for granted that the American concern over the integration of European economy is no more than a pretext. They see the Americans defending European capitalism, under cover of internationalist pretexts, and themselves struggling for Socialism under the admittedly faded banners of national sovereignty.

In its desire for trusteeship, Australia also hopes to secure native support in its use of mandated areas like Manus Island as naval bases. So this year Australia is urging nations in the Pacific area to confer on these mutual problems. In August, when British Cabinet Ministers will be in Canberra, this desire will be placed alongside Australia's deep concern about the delay in making a peace settlement with Japan. The Prime Minister has declared that stability in the Pacific and the development of Australia as a strong post in British Commonwealth defence depend on the form of peace concluded with Japan. Mr Chifley also seeks the closest co-operation with USA, but he leads his Cabinet in the unanimous opinion that recent signs of influences within America wishing to dominate world economic and political policy make it essential that the lines of continuous British Commonwealth consultation, approved at the Prime Ministers' Conference in London in 1946, should be developed rapidly in the next five years.

THE BUSINESS WORLD

Cheap Money Now

THE terms of the new Southern Rhodesian loan—the first gilt-edged issue since the fuel crisis to acknowledge realistically the ruling market level—have naturally drawn public attention to the deterioration which had been proceeding steadily, though fairly unobtrusively, for some six weeks or so. Inevitably, the effect has been to accentuate the weakness—and, on top of that, has come the reaction this week to the failure of the Paris conference. Yet it is doubtful whether, even now, the extent of the transformation in the market has been generally recognised. But if the Stock Exchange has proverbially a short memory, on this matter the memory of the Chancellor seems to have been even shorter. His pronouncements on cheap money policy in recent months have moved in intriguing sequence from qualification to virtual contradiction of the tenets which he so noisily proclaimed last year. In the circumstances, it is hard to say which of the two sets of factors—the veerings and tackings of the official craft, or the strong under-currents in the waters themselves—has the larger responsibility for the altered course of the market.

In 1946 the Chancellor and his policy had assumed so dominant a role that it is important to understand the nature and manner of the change in the official attitude. Outside the relatively narrow circle of mainly professional investors who follow every detail in the invariably complex market evolution, there is still a widespread belief that Mr Dalton, though forced (through the allegedly fortuitous effects of the fuel crisis) to yield his most advanced position, is still as determined as ever to pursue his 1946 objectives. Such an assumption cannot be squared with the facts; yet it is certainly true that the authorities, and the Chancellor especially, remain firmly wedded to cheap money. For this confusion, Mr Dalton himself is largely responsible. He persistently represented last year's controversy as a debate about the relative merits of "dear" and "cheap" money. It was easier to attack hypothetical enemies—those "baleful Bourbons"—than to defend his own policy. But the critics, and especially the financial journalists whom he so belaboured, had never disputed the need for the maintenance of cheap money—in the sense in which the policy was understood in the years 1933 to 1945. The whole dispute was about the wisdom of deliberately engineering a further reduction in interest rates in a period of acute postwar scarcity of capital, when the physical controls which are the only substitute for financial controls were inevitably growing steadily weaker. The difference between the Chancellor and his critics (though he would never admit it) was on the question of forcing the yield basis down from 3 per cent to 2½ per cent, and especially from 2½ per cent towards 2¼ per cent. It was never a plea for "dear" money. It is important to get this matter straight at the outset. Otherwise, a realistic survey now may again be misrepresented; or the less sophisticated of investors, following the Chancellor's line of attack, may get the impression that a fall in Consols to, say, 50 or 60 is being forecast or even advocated.

On this plane of discussion—which concerns itself with the difference between 2½ and 3 per cent—there is no doubt about the change in official tactics. It is a much more significant change than the ostensibly modest difference in interest might seem to imply. Equally, there is no doubt about the objective which Mr Dalton originally set himself. The climax to his

audacity—the issue, at par, of the 2½ per cent "irredeemable" (1975 or after)—was widely regarded as the thrusting-out of a salient which he did not really expect to hold. But the ambition to seize and maintain the position eventually was plainly revealed in the parallel rashly but proudly drawn with the Goschen operation of sixty years before. This Government, declared the Chancellor, could do better than Goschen, who took two years to move by "siege technique" from 3 per cent to 2½ per cent. This time, the Government could "command" 2½ per cent for its irredeemable. The choice of words was as unfortunate as the parallel. This Canute's command was impotent to stop either February's freeze-up or investors' resistance. As for the Goschen parallel, the City pundits were quick to recall that 2½ per cent Consols once stood at under 44, and between the years 1907 to 1933 never topped 90. Now this inauspicious issue, the "Dalton" 2½ per cent irredeemable, stands at only a little over 90—involving for "tap" subscribers a capital loss which wipes out seven years or so of net income even at the standard rate of tax.

Obviously, the abandoned salient now lies far out of reach; but the Chancellor was slow to admit it. Even after the fuel crisis, he was reiterating, in identical terms, the autumn's challenging assertion that the policy would be "resolutely pressed home" by using to the full the accumulated resources of the "departments." But that was precisely what the departments were no longer doing. They left the market to its own devices in the dark days of February and March, and have scarcely bestirred themselves since. By Budget day the official apologia was shifting its ground. The promised defence of the cheaper money policy, by a reasoned reply to the real (as distinct from hypothetical) criticisms, never came. Instead, the Chancellor blamed the press for "organised gloom"—gloom which foresaw the impending loss of exports and dollars, the inevitability of import cuts and the drive for harder work—and "aunted the gilt-edged jobbers for "loss of nerve." But Mr Dalton should know better than anyone else that the gilt-edged jobbers have not for years been the real cushion in the market mechanism. Even before the Daltonian essays in market inflation, the effective cushion was provided by the authorities themselves. Was it they who lost nerve? Or did City prudence and realism at last triumph over political exuberance and ambition? In either case, it is small wonder that by mid-April the emphasis had already begun to shift from future possibilities towards past glories. The launching of the 2½ per cent Treasury Stock was then dubbed a "proud day for patriots"—an ironic truth, if patriotic pride be measured by the sacrifice it has demanded. All who would not lend at 2½ per cent and face these burdens were "too avaricious or too frightened"; but the Chancellor could not believe that any such reluctant Britons existed. He has learnt the sorry truth now.

So, step by step, has policy progressed to its latest recantation—the admission, in mid-May (quoted textually in *The Economist* at the time), that reduction of the floating debt now matters more than reduction in the rate of interest. In short, the critics' case has really been conceded in full. The implication of the new solicitude for the level of floating debt (in flat contrast to the open indifference shown to its rising volume twelve months or so ago) is that interest reductions pursued

since there are no significant trading or financial relations with the countries in question. If, however, they deign to reply to the letters which have been sent to their governments, even these countries may come within formal recognition of the new post-July 15th sterling arrangements.

The problem of payments with Soviet Russia is vastly simplified by the fact that there are no accumulated balances, and that only one account, the Russian Government's, comes into question. Some new financial agreement may ultimately emerge as a sequel to the trade discussions now proceeding in Moscow.

Switzerland, apparently, has no desire to enter into multi-lateral arrangements of any kind. That country is in the happy position of being able to turn away sterling, dollars and even gold. The present strictly bilateral agreement will continue to regulate payments between Switzerland and the sterling area, and Switzerland will no doubt ensure, by the appropriate control of exports and of tourist expenditure within the country, that the sterling it acquires as a result of that agreement is kept within the desired limits.

The agreements with South America are virtually complete, though not published. Details of the Brazilian agreement should be released before long. The arrangements to be made with Uruguay are still under discussion. They are the only ones which are likely to cause any difficulties, but these should not be formidable, given the small size of Uruguay's accumulated sterling balances. In view of the political and economic chaos which obtains in China, it is probably impossible to reach any agreement with that country. This is not to say that trade or payments with China are at a standstill, but the larger part of this flow is being canalised through Hong Kong, where it is handled by means which no stretch of elasticity would allow of inclusion in any negotiated or published agreement.

There remain the arrangements with the sterling area countries. The most important of these, namely those with Egypt and India, should be viewed separately—Egypt because that country is in fact moving out of the sterling area, and India

because there is as yet no political authority with which agreements can be negotiated. The arrangements with the Dominions will probably assume the minimum of formality and are likely to continue the pattern which has worked so successfully for the past eight years. Those arrangements are no more than a gentleman's agreement, by which the Dominions undertake to maintain their external reserves in the form of sterling and Britain undertakes to meet any current payments, whether in the sterling area or to other countries, out of these balances—whether current or accrued. So long as Britain can trust the Dominions to exercise their licensing of imports and to operate their control of exchange with the same reserve, conservatism and realism as have been shown in the past, these arrangements can safely be allowed to continue. If any further protection is needed, verbal agreements for the maintenance of minimum global balances should suffice.

These completely elastic and informal arrangements should avoid the necessity for any blocking or immobilisation of accumulated balances held by the Dominions and Colonies. They will make it possible to deal both with accumulated and currently earned sterling indiscriminately. They should also obviate the need for imposing restrictions upon movements of capital within the sterling area. This retention of the sterling area mechanism is a token of the mutual trust and confidence that exists between the remaining members of that area. So long as they are prepared to operate their import and exchange control policies on broadly parallel lines, the informality and elasticity of these sterling area arrangements can safely be preserved. This particular solution of the problem of convertibility of current sterling has necessarily involved the disappearance from the sterling area of one country, and may yet require the departure of others. It is a price worth paying for the achievement of a solution which is in keeping with the traditional character of British institutions and which follows the lines along which the sterling area has gradually evolved over the past century.

Business Notes

The City and the Cuts

So many warnings have been given of the need for cuts in imports (the statistical possibilities, it may be helpful to recall, were fully analysed in *The Economist* five weeks ago) that this week's announcement certainly did not take the City by surprise—not, at least, in the sense in which it has been registered in some quarters. Within the Square Mile, where many still believe in old-fashioned remedies for old-fashioned maladies, the only surprise was at the Government's timidity. It is well understood—as a later Note, on import prices, more precisely demonstrates—that the prospective economies will hardly suffice to make good that part of the widening external gap which has resulted simply from the worsening of the terms of trade in the past few months. But the news did deepen the gloom which has been settling over the Stock Exchange in the past fortnight or so, and the resultant fall in prices was not confined to the sections conceived to be immediately affected—oil, tobacco, cinema and newspaper shares. In these days, however, the Stock markets rarely seem to meet bad news half-way. Indeed, they have discounted hardly at all the effects of the underlying difficulties of industry, and still retain a surprising faith that other influences will prevent them from forcing their way through to profit and loss accounts and dividends.

It is true that there are influences which will tend to work in this fashion—principally the freedom this year from EPT, the possibility of further inflationary pressure, and the search for alternative "income" investments to replace the disappearing Argentine rails and home nationalisation stocks. This last factor is perhaps the most weighty of the three (the EPT factor is of course highly selective in its incidence), but lately there has been a tendency to exaggerate its effects. It ought to be remembered that these operations will bring no new money into the market unless the Chancellor is willing to create it. The extent

to which he may be prepared to do so is considered, in relation to gilt-edged, in a leading article this week. But if the money to finance the reinvestment purchases is not newly-created money, it must be provided first by selling securities. In the Argentine case, the seller on that assumption would be the Chancellor—to provide himself with funds with which to repay his borrowings from Argentina. In the home nationalisation cases, the sellers will of course be the recipients of the compensation stocks, and the only question is how much of these sales will be absorbed by the authorities. That is not to say that what is bad for gilt-edged may not be good for equities, but the importance of the cheap money factor last year, in lifting the market as a whole, demonstrates the connection between the two—and equities, which stand nearest to industry's difficulties, have troubles of their own. To see the matter in perspective, it ought to be borne in mind that industrial ordinary shares, though they have lost almost 4 per cent in the past fortnight (taking the index of the *Financial Times*), even now stand only 6 per cent below the peak reached on the eve of the fuel crisis.

Exports and Fuel

Meanwhile, it is very plain that the repercussions upon industry of measures to reduce the external deficit will not be confined to the direct impact of the import cuts themselves—even if policy is no more austere than that which emerges from this week's pronouncement. The import cuts are to be combined with new measures to expand exports where the chances of rapid expansion seem good. Hence textiles, of which there is still world-wide shortage, are at once singled out. Yet the Government apparently does not intend that increased reservations of textiles for export shall be provided simply by further sacrifices on the

part of the consumer. To minimise these sacrifices further efforts are to be made to expand production. In textiles, for which the need is so great, the case is perhaps good for giving the consumer the benefit of increased output. But this is not a policy which can be justified beyond the range of really essential goods. Obviously, any additional output which is saleable abroad should be exported unless the needs of the home market are very pressing indeed. It is true that estimates given by Mr Morrison this week suggest that the loss of exports resulting from the fuel crisis may be rather smaller than that implied by Sir Stafford Cripps's figure of £200 million given some weeks ago. But it now appears that the *Economic Survey* estimate of £1,200 million for 1947 was computed on the assumption that the fuel crisis would cost £100 million. Total exports for 1947 are now tentatively estimated at £1,100 million. This is approximately the rate per annum which the flow of exports had reached by the closing months of 1946, and falls £100 million short of the *Economic Survey's* revised estimate for the year as a whole. But if the effect upon the export total may after all be rather smaller than had at first been feared, the short-fall below the target estimates will still be very wide: an aggregate of £1,100 million for 1947 would represent only 110 to 115 per cent of the 1938 volume.

In any case, if the aim of speeding-up textile production to make room for, or replace, increased exports, is more than a pious hope—if, in short, the additional labour required were in sight—it still needs to be emphasised that expansion of one form of priority production may involve important losses elsewhere. To step up textile production further would presumably involve an increased allocation of coal. Does Mr Dalton's statement therefore mean that the additional coal will be made available, and, if so, does this mean that the summer coal budget is already out of date? Are textiles to rank immediately after steel in the scale of coal priorities, and, if so, what will happen to other "priority" consumers? It would be optimistic to suppose that the requisite releases of coal could be provided only at the expense of relatively inessential users.

Latest information does, indeed, make the coal prospect seem even more bleak than before. Recently the one relieving feature seemed to be the promising rate of new recruitment to the mines.

By the end of the first week in June there were 717,000 men on colliery books—an increase of 21,000 over the figure of January, 1946, or a net increase of about 1,000 a week. Now, however, the net increase of manpower is reported to be only running at about 300 a week. Yet to achieve the original manpower target—730,000 by the end of this year—would involve a recruitment of 100,000, allowing for normal wastage, for the year as a whole.

Bonus Tax Concession

So the mountain has laboured and brought forth a mouse. The fruit of that long confinement at Westminster on the night of June 11th is now to be seen in a Government amendment to the bonus issues tax. Where the value of the bonus does not exceed one-twentieth of the amount of value of the consideration received or receivable by the issuing company, it will be treated as if its value were nil—that is to say, it will be exempt from the 10 per cent duty. It is not quite clear whether, if the bonus is greater than one-twentieth, that portion of its value will be ignored. But it certainly is clear that the concession does not extend to "free" bonuses. Amid the major absurdities of this tax, the new concession affords a refreshing glimpse of sanity. But most competent observers question whether it will suffice to meet the practical point which was in view—namely, the justice of relieving companies which need to raise new money from of inevitably paying the tax, because in practice it is impossible to place new securities without affording at least a minor market turn purpose, the tax-free margin now to be allowed leaves little room for manoeuvre, and is likely to be inadequate in many cases, especially where the new issue is large in proportion to the existing capital—which is often true at present. Neither the City nor the Opposition, however, can reasonably complain on this score, for the Government amendment which was withdrawn when the Chancellor proposed to look at the matter again—and the proposer of that amendment was well versed in the ways of the Stock Exchange.

Among other amendments tabled by the Government to meet pledges given at the Committee stage, the most important are two relating to the distributed profits tax. The first will have effect on liquidation of a company; originally it was provided that any distribution then would rank as capital only to the extent of the nominal paid-up capital; now the limit is liberalised to include

premiums received from share issues. The second concession relates to the time after the end of a financial year within which a dividend is permitted to rank as a distribution for that year.

Mr Strachey on Bulk Purchase

The question of bulk purchase has always been highly controversial. A frank and dispassionate discussion has been seldom possible, partly because of political prejudices and partly through the lack of official information. Apparently official circles at long last realise that well-informed debates can do more good than harm, and within the last six weeks some welcome details on bulk purchase and long-term contracts have been given in Parliament. They were reproduced in the *Records and Statistics* Supplements of June 7th and June 28th. But the most enlightening *exposé* was undoubtedly Mr Strachey's speech last Tuesday. Bulk purchase is a legacy of the war, when it formed an integral part of the British procurement system. At the moment, according to the Minister of Food, it is the corner-stone of the general British food policy enabling Britain to secure available supplies in a world of shortages and to distribute them equitably to the public. It is true that food rationing and price stabilisation would at least be made extremely difficult if not impossible were procurement not in the hands of the Government, particularly at a time when currency restrictions enforce certain discrimination as to sources. The method adopted is flexible; it may be between Governments or by private firms acting as the Ministry of Food agents or as intermediate principals working within limits.

But the real burden of Mr Strachey's case rests less upon the advantages of bulk purchase in facilitating controlled distribution at home than upon its value, through the system of long-term contracts, in developing new sources of supply. This particular argument can easily be overdone, but it certainly has force, in present abnormal conditions of shortage, in relation to colonial development and in the rehabilitation of war-disrupted countries. For example, Britain has recently signed a contract with Poland for eggs, sugar, bacon and other foodstuffs; another is expected to be signed shortly with Hungary for eggs, bacon, poultry, lard and vegetable oils; and negotiations are continuing with Yugoslavia. As to new sources of supply, beef is now being obtained from Denmark; meat supplies may be made available for Britain in Mexico; and plans are afoot to re-direct westwards to the United Kingdom at least a part of the flow of foodstuffs from the Danube Basin, which in pre-war days went northwards to Germany.

But valuable though this information is on particular aspects of the problem, too little data are still available to permit of objective and fully considered judgment upon the Government's trading policy as a whole. It is true that many of the arguments both for and against bulk purchase cannot be quantitatively assessed. But even those details which could permit quantitative assessment of particular aspects are still withheld from the public. The greatest need, if a reliable judgment is to be formed, is for disclosure of comprehensive trading accounts—even though actual contract prices may still have to be kept secret—and, more important still, for a complete statement of the principles upon which prices are fixed.

Egyptian Sterling Accounts

The new financial arrangements arising from the agreement with Egypt discussed in a preceding article require considerable changes in the operation of Egyptian sterling accounts. The first move was the issue of a Treasury Order (SR. & O, 1947, No. 1,355) blocking Egyptian assets in Britain and preventing any disposal of them except with Treasury permission. This order was issued at the request of the Egyptian authorities in order to immobilise the sterling assets of their nationals—a move which the Egyptian Government could not make with the powers at present at its disposal. At the close of business on July 12th there will be a stock-taking of the sterling assets of each Egyptian bank and each office in Egypt of any other bank. Three types of Egyptian accounts will then be created. No. 1 accounts will hold sterling which is freely expendable. Some of these, to be specifically agreed between the British and Egyptian Governments, will be designated "Egyptian Transferable Accounts." The others will be known as Egyptian accounts. The former will have all the attributes of transferable accounts; the latter will represent freely available sterling for making payments to residents in the sterling area or for transfers to transferable Egyptian accounts. These

No. 1 accounts will be credited with the proceeds of current exports, with the £8,000,000 release of accumulated balances for the second half of 1947, with the £12 million special "working capital" release and with an amount, estimated at about £14 million, equal to the Egyptian confirmed credits in London. The remainder will be credited to No. 2 accounts, which will be immobilised save for transfers as between such accounts and agreed investment transactions. No stipulation has been made regarding the interest paid on No. 2 accounts, but a verbal agreement provides for the maintenance of approximately the rate now being paid on these immobilised assets. Detailed instructions about the operation of the various accounts have been issued to banks by the Bank of England.

Electricity Bill Recommitted

The Electricity Bill is now through the Commons. Following the report stage, discussed in last week's issue, the Bill was recommitted in the House to include several last-minute Government amendments. The issues were points of substance, but do not vitally affect the structure of the Bill. The main amendments are a proposal to pay an additional £5 million to local authorities as compensation for severance, and a recognition in the Bill of the special circumstances of "composite companies." The Government has not been moved, as was hardly to be expected at this late stage, to modify the harsh principles upon which compensation to local authorities for acquisition of their electricity undertakings has been fixed. But a new clause has been added to compensate them for the loss of the contribution which their undertakings made—in effect, in relief of local rates—towards central establishment charges, on the principle of a spreading of overheads. A global sum of £5 million has been fixed to be dispensed among local authorities concerned—preferably by an agreed formula. This sum represents severance costs of £1 million a year for five years, after which it is assumed that local authorities will have readjusted their administrations sufficiently to remove any necessity for further compensation. It would appear that the local authorities have agreed that the basic annual loss due to severance lies between half a million and one million pounds, but object to the Government's five-year limit to the compensation. Obviously, the duration of losses due to severance is bound to vary considerably from one local authority to another, and there are grounds for allowing an appeal against compensation assessment—if not, indeed, for adopting the principle of arbitration which is allowed in other forms of compensation under the Bill—but the Government was uncompromising in committee last week in sticking to the tidy, but blunt, device of a global sum. There are now specific provisions for compensation for "composite companies." Compensation will be paid to the company in British Electricity Stock in the same way as to holders of securities in electricity undertakings.

The Electricity Bill has enjoyed a careful scrutiny in the Commons, free from the time-limit of the guillotine. It goes to the Lords in more considered form than either the Transport or the Town and Country Planning Bills. To that extent its passage through the Upper House will be smoothed. But in any case the Government is unlikely to accept any modifications on questions of compensation which are the Bill's outstanding weaknesses.

Quarter's Revenue Surplus

The revenue returns for the first quarter of the financial year show a quite unseasonable surplus—with only one exception, it is the first quarterly surplus since pre-war days. It is also a substantial surplus—on paper. "Ordinary" revenue showed a much larger expansion than might have been expected from the Budget estimates: these contemplated an increase for the full year, compared with 1946-47, of £110 million, but in fact the quarter's increase is no less than £211 million. On the other hand, ordinary expenditure, which in the full year was expected to decline by £729 million, has dropped by £182 million. Hence an "ordinary" deficit of £273 million in the first quarter of 1946-47 now gives place to an ordinary surplus of £220.2 million.

The Chancellor, if he follows the line he took in the Finance Bill debates, will no doubt make great play with this achievement. But it does in fact give little ground for rejoicing. It is true that one of the normal big revenue producers has been particularly buoyant; Customs during the quarter have risen by £60 million, more than half the increase expected for the full year. But even this is a rather dreary reflection of the increase in imports (by comparison with last year) which Britain can no longer afford, and of the high prices which have had to be paid.

For the rest, the surplus is mainly attributable to wholly abnormal items of revenue. For the full year, the Chancellor counted upon credits totalling no less than £420 million from sales of surplus war stores, surpluses on trading services and miscellaneous receipts; yet of this total no less than £193 million has been brought into the first quarter of the year, in contrast with a mere £10 million from the comparable sources in the first quarter of 1946-47. The first two items—receipts from sales of surpluses and profits on governmental trading—may perhaps be regarded as "genuine" sources of finance (in the sense that they withdraw money from the pockets of the public) to the extent to which they arise in the current period; but the speed with which these totals have mounted suggests that, to date, the finance arises mainly from transfers to the Exchequer of balances accumulated during 1946-47. The third item (£143.6 million) consists almost entirely of purely nominal receipts from the "clawing back" of unspent votes by means of which the Chancellor expects to engineer his eventual Budget surplus.

If the first two items are regarded as "genuine" finance, the true ordinary surplus for the quarter amounts to £76.6 million. But this surplus has, of course, to be set against the outgoings "below the line." Including only EPT refunds, advances to local authorities, war damage payments, post-war credits and advances to the civil contingencies fund, the below-line items require £80.8 million and thus wholly absorb the current ordinary surplus. In addition, £18.7 million was required for repayment of small savings (3 per cent Defence Bonds) on maturity.

Import Prices Still Rising

The rise in import prices, which has played so large a part in the widening of the adverse visible balance, is accelerating. The Board of Trade index number for May showed an increase of 7 points, or 3 per cent on the month, compared with a five-point rise in April and one of 3 points in March. The main increase occurred in raw materials, the index for which rose by 5½ per cent. This large upward movement was general among the commodities, although particularly marked increases occurred in wool, hides and wood pulp. Manufactured articles rose by 4 per cent, mainly in consequence of the higher prices of non-ferrous metals, but the food, drink and tobacco category showed a much more modest rise amounting to 1 per cent. Since the beginning of the year, import prices have risen by 7½ per cent, whereas within the last 12 months the increase has amounted to 20 per cent. The Board of Trade monthly index numbers (1938 = 100) for both import and export prices are given in the following table:—

	February	March	April	May
Imports:—				
Food, drink, tobacco	225	226	229	232
Raw materials	242	246	254	268
Manufactures	210	216	223	232
Total	226	229	234	241
Exports:—				
Food, drink, tobacco	212	217	216	217
Raw materials	218	218	218	222
Manufactures	215	220	221	226
Metal goods	194	199	200	204
Textiles	287	294	297	301
Others	206	210	214	218
Total	215	220	221	225

Export prices in May increased by 2 per cent compared with April, which represents a slight acceleration of the average rate of advance (of 1½ per cent per month) of the previous four months. The main rise occurred in the manufactures group—metal goods and miscellaneous manufactures were 2 per cent higher than a month ago. Textile prices, which rose by a little more than 1 per cent, were about three times their 1938 level. Prices of food, drink, tobacco and raw materials, which had been more or less stable over the past three months, also participated in the general rise.

The terms of trade, therefore, are still moving against Britain. Not only have import prices risen further since 1938 than export prices, but their current rate of increase is faster. This disparity means that the import programme and the export target drawn up in the first months of this year no longer stand in any realistic relationship. The significance of this rise in import costs is graphically shown by reflecting that the price-rise of the past five months alone probably represents an annual burden equal to three and perhaps four times the savings which may result from the import cuts announced this week; of that additional burden, perhaps two-thirds may be offset by the higher prices from exports.

*Business is really more
agreeable than pleasure;
it interests the whole mind*

BAGEHOT

Every business man has his own ideas about the conduct of business. It makes a direct call on each man's native personal character and ability. Martins Bank combines up-to-date business service with personal courtesy and attention.

MARTINS BANK
LIMITED
LIVERPOOL · LONDON & BRANCHES

Is Australia your market?

Do the people of Australia buy your products? Or do you buy theirs? Whichever is the case, the Commonwealth Bank of Australia is able to give you considerable assistance. Guaranteed by the Commonwealth Government, the Bank has 330 branches throughout Australia and New Guinea; it has an unrivalled first-hand knowledge of Australian produce and Australian requirements; it is, therefore, unusually well equipped to facilitate trade between this country and the Commonwealth. The Managers of the London branches welcome enquiries from those whose interests lie in the Australian market.

COMMONWEALTH BANK OF AUSTRALIA
8 Old Jewry, London, E.C.2. Australia House, Strand, London, W.C.2.

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA · CEYLON · BURMA · SINGAPORE
MALAYAN UNION · BRITISH NORTH BORNEO
SARAWAK · CHINA · HONG KONG
THE PHILIPPINE REPUBLIC
FRENCH INDO-CHINA · SIAM · INDONESIA

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

New York Agency - 68, Broadway, New York
Associated Banking Institution in India - The Allahabad Bank Ltd.

**THE CHARTERED BANK OF
INDIA, AUSTRALIA AND CHINA**
(Incorporated by Royal Charter 1853)

SERVING COMMERCE

The combined assets of the Three Banks exceed £300,000,000. With their resources they are able to satisfy the requirements of the largest customer. Each member of this group of famous banks has had a long-established association with every aspect of home and international finance. Each has sound knowledge of conditions in world markets. Their combined experience is available to the business house.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches
GLYN, MILLS & CO. Founded 1753
WILLIAMS DEACON'S BANK LTD.
Founded 1771 Manchester, London & Branches

Unfortunately, there is little chance that the price disparity can be narrowed from the export side. If the sellers' export market is ending, export prices are unlikely to rise substantially, so that hopes must be pinned to a reduction in world prices of foodstuffs and raw materials, if the general standard of living in Britain is not to be reduced *pari passu* with an increase in import prices.

Free Gold Markets

The prices quoted for gold in the free markets of India and the Middle East have not yet shown the expected rise following the International Monetary Fund's initiative to stop the flow of metal to these markets through official sources. In Bombay the quotation for gold, which had risen to Rs. 116 per tola on June 21st, has since declined to Rs. 113½. This, however, may be due to a more immediate factor than the likelihood of an ultimate drying up of certain sources of supply. It is more likely to be the result of the surprising calm with which the preliminaries to Indian partition are being completed and to the consequently improved prospects for political stability—always a bear point for the precious metals in the East. There has as yet been little noticeable reaction to the IMF letter from the members to which that communication was addressed. It is, however, already apparent that Mexico's activities in this sphere are about to be seriously curtailed and shipments of gold coins from that country have ceased. Ethiopia's sales of domestic gold to Egypt and the Middle East are also likely to encounter greater obstacles, not so much as a result of compliance with the request of the IMF as because Egypt and the other countries that have hitherto provided the main market for this metal will henceforth operate much stricter control of exchanges than in the past. There has been some discussion of the effect which the IMF request may have on purely domestic gold operations. The New York market, where there are dealings in free gold at a premium of \$5 to \$6 over the official price of \$35 per ounce, has interpreted the IMF note as condemning all dealings in gold at prices higher than the official quotation and is reported to be considering a self-imposed rule banning such operations. In London, where there are still non-residents' holdings, the view which generally prevails is that these can be sold at a premium provided the transaction does not move across the exchanges and, therefore, does not establish a depreciated rate for sterling.

World Bank's Bond Issue

The International Bank for Reconstruction and Development is now planning its first issue in the American market. It has filed with the Securities Exchange Commission the documents required for an issue of bonds totalling \$250 million. The amount to be raised by this first operation will, therefore, exactly reimburse the bank for its initial loan operation, that to France. The bond issue will comprise two securities: ten-year bonds, maturing on July 15, 1957, which will bear interest at 2½ per cent, and 25-year bonds, maturing on July 15, 1972, which will bear interest at 3 per cent. The bonds will be offered through security dealers throughout the United States. The marketing organisation will be handled by the bank's New York office, which will thus make its first bow to the public. The terms on which the bonds are being issued confirm the most optimistic anticipations. The indications are that the bonds will in the first instance appeal primarily to institutional investors, though the persistent publicity campaign which has been conducted by the Bank to introduce itself and its securities to the American public should bring in some private subscriptions. The recent response to the Dutch and Norwegian issues, however, indicates that the appetite for foreign issues—and the bank's bonds must in some respects be regarded as such—has still to be revived in the United States. The average American investor still thinks with Mr Randolph Burgess that "he took an awful shellacking on foreign loans after World War I" and that he is not going to get caught in that way again.

US Wool Policy and the Empire

The interest that the southern Dominions have been taking in the progress of the Wool Bill through the United States' House of Representatives is understandable when it is realised what an important part wool plays in the export trade of Australia, South Africa and New Zealand—but particularly Australia. The proposed new tariff on foreign wool entering America even

threatened to wreck the international trade talks at Geneva. Mr Truman's veto of the Bill, although expected, has therefore brought some relief to the rather tense atmosphere which has existed. And the Senate has now passed a revised price bill, which provides support for domestic wool prices through Government purchases while omitting any reference to an increase in the tariff. The American problem is one of record wool consumption comprising mainly foreign wools, while the domestic clip is purchased by the Government and stored for lack of buyers. If, therefore, 1947 repeats 1946's history, America will become an important operator in the world wool market.

An interesting paradox, however, has arisen in the case of Australia. While it desires a firm wool market and therefore on that ground alone naturally welcomed the vetoing of the Robertson Wool Bill, some consternation has been caused about the possible repercussions of the recent precipitous rise in wool prices upon Australia's policy of internal stabilisation. It is apparently becoming more and more difficult to isolate the internal economy from rising export prices. Where the techniques of monetary and fiscal controls are not highly developed, or are already pursued to the limits of what is politically or administratively practicable, overseas balances which are too large may seem almost as embarrassing as those which are too small. To what extent South Africa and New Zealand would agree to a restraint upon wool prices is not known, but at least they have not the same anxiety about stabilisation schemes as Australia. It is probable therefore that they would be more agreeable to the continuance of a rising wool market. If this difference of outlook within the Empire is more real than apparent, it will no doubt be reflected in the outcome of the present discussions, and the next season's policy, of the Joint Organisation—the Commonwealth body entrusted with the disposal of the Empire's surplus wool stock.

Bank Advances Analysed

The latest of the quarterly analyses of distribution of bank advances had been awaited with particular interest for the indication it might afford of the sources of the record demands for bank accommodation in recent months. Clearing bank advances rose during the three months to last May by £85.7 million, to the new high level of £1090.5 million. During the same period the total of the classified figures, which embrace all members of the British Bankers' Association, but exclude advances made outside Great Britain, rose by only £67.1 million—an increase which was in fact only a little greater than that for the preceding quarter (during which, it now appears, the more comprehensive figure was abnormally swollen either by clearing bank advances outside Great Britain or by some large transactions by "outside" banks). As a guide to future trends, the classified figures are not in fact very revealing. The large movements shown by the clearing banks in recent months were largely due to the operations of two banks only: it now appears that there was also a concentration upon particular categories of business. Of the quarter's aggregate rise, one half was attributable to retail trade (with an increase of £10 million) and food, drink and tobacco (an increase of £22.7 million). Advances to the retail trade, indeed, have expanded in the past 12 months by 45 per cent and now account for no less than 9 per cent (compared with 7.3 per cent) of the aggregate—they are the largest single group apart from the omnibus "personal and professional" category. In the expansion over the year the improvement in overall supplies and the reopening of businesses are evidently the principal influences, but the growth during the past quarter is presumably mainly a reflection of the rising price level. The expansion in food, drink and tobacco has been even more spectacular, the increase in 12 months being no less than 60 per cent, raising the proportion of the total from 6.3 per cent (it was no more than 5.8 per cent in August last) to 8 per cent. There seems little doubt that an important factor here has been the changes in the scale and method of tobacco financing. As usual, the personal and professional group absorbed a substantial volume of finance, rising by nearly £19 million, and thus maintaining its proportion to the whole at 28.7 per cent.

Of the quarter's increase, therefore, only £15 million represents advances to the twenty-two other categories. Hence there is little sign in the figures of the effects of the fuel crisis. Advances for coal mining have again declined—but only fractionally—and now account for a mere 0.8 per cent of the total. Rather more noteworthy, in view of nationalisation uncertainties, is the decline in the iron and steel group by £1.8 million to £12.9 million; it now represents only 1.2 per cent of the total compared with 1.8 per cent last year. On the other hand, agricultural, engineering,

cotton, wool, other textiles, leather, rubber and chemicals, all show modest increases. An interesting indication of the potential effects upon the banks of a return from governmental to private methods of finance is afforded by the movements in the wool group. Changes here have been relatively slight in recent months, but the total now, at £10.2 million, is a good deal more than double what it was in February, 1946.

Spinning Machinery Register

Just a year ago the Cotton Industry Working Party submitted its report. Its first recommendation was that a survey should be undertaken of the industry's plant and its suitability for modernisation. At the request of the President of the Board of Trade, the Cotton Board examined, as a first step, the spinning sections of the industry, and the results are published this week. The report is in three sections: a survey of cotton spinning machinery in operation as at October, 1945; a study of the comparative effects of different forms of re-equipment as set out by the British Cotton Industry Research Association; and, finally, a statement by Textile Machinery Makers, Ltd., of their capacity under present conditions to undertake the manufacture of new machinery and to carry out renovations to old equipment.

The first part of the survey is a register of existing machinery. Much of the statistical material is of a highly technical nature, but the table reproduced below gives an overall picture of the present state of re-equipment.

CONDITION OF MACHINERY IN THE SPINNING INDUSTRY

Type of Machine	Total No. of Machines	% of total machines acquired in:		% of total machines reconditioned in:	
		1940-46	1935-39	1940-46	1935-39
Lap endst	2,277	...	...	45.3	15.3
Carding engines	56,407	...	...	34.6	18.5
Combers	9,537	1.8	3.8	75.9	14.5
Draw frames	12,059	2	2	41.8	16.3
Shubbing frames	3,966	5	3	45.6	19.1
Intermediate frames	1,763	5	4	41.9	17.2
Roving frames	14,367	1	1	38.3	16.3
Jack frames	5,279	...	...	41.2	20.1
Single passage speed frames	225	15.4	3.8	65.9	5.1
Wet mule pairs	4,077	...	...	44.9	19.7
Twist mule pairs	5,508½	...	...	37.6	22.3
Ring frames	25,966	3.8	4.4	37.2	15.4

N.B.—There are a number of footnotes in the original table modifying slightly some of these figures, but they have been omitted owing to shortage of space. Their inclusion would not significantly alter the general picture.

† New machinery included among re-conditioned.

The analysis shows—as indeed was to be expected—that in hardly any instance has there been any extensive investment in new plant in the last twelve years, and that much of the reconditioning was done before 1935. But the table does make plain that considerable renovations were made in the period 1940-46—a fact not widely appreciated outside the spinning industry. Unfortunately, it is not possible to discover from the published information just how important, from the point of view of productive efficiency, these reconditioning programmes may have been. Reconditioning might mean virtually building a new machine, or it might mean only minor changes.

Section two of the survey analyses the effects of different kinds of re-equipment in terms of yarn quality, labour-saving effects of machinery changes and machine cost. The general conclusions to be drawn from the tables is that the most valuable savings in labour costs at current prices of machinery are to be found in short processing (especially in the coarser counts of cotton) which involves introducing a high-draft spinning system. These broad principles were already widely recognised in the industry. The value of the report lies in the detailed analysis of potential economies for each type of machine in the spinning process.

The last section endorses the conclusion drawn in the second section, that the issues of reconditioning versus installing new machines must be judged on the merit of each case, with the proviso that reconditioning worn-out machines should be discouraged. Attention is also drawn to the adverse effects on textile machinery production of cluttering up the workshops with too many machines awaiting renovation.

This survey is factual. General questions of policy are outside its purview. It fits into place as a companion volume to the Evershed report on the textile machinery industry. (An interim report from this source was discussed in these columns four weeks ago.) The main value of the Cotton Board's report lies in the

background it provides for the preparation of re-grouping schemes under the Government's offer to advance 25 per cent of the cost of re-equipment to units of not less than about 500,000 spindles.

Stanhope Steamship Case

The mere fact of the refusal of a quotation by the Stock Exchange—i.e., of permission to deal—is not in itself a matter which would call for comment, even though such action is happily rare. But a case in which there appears to be an acute conflict of opinion between the Council and one of the most reputable and experienced firms of brokers in the house deserves to be put on record. The trouble arises over an offer by the Stanhope Steamship Company, a concern, incorporated in 1934, which in the decade to September 30th last earned £572,246, before income tax, and distributed £67,592. Of these sums, £250,167 was earned and £12,000 paid in the last of the ten years. At the end of the period the company had a capital of £60,000 and net assets of £916,736. Fixed assets alone were taken in at £1,783,007 but were valued independently at over £3,000,000. Since the date of the accounts there has been a series of operations, including the sale of one ship to the chairman, Mr J. A. Billmeir, and a cash distribution to the old shareholders of £100,000 out of capital profits. The net result is a slight increase in fixed assets and a minor addition to the bank overdraft, raising it to £692,857. For the purpose of raising fresh capital, the old £1 ordinary have been split into 1,200,000 1s. ordinary and an additional 400,000 of such shares were offered to the public at 22s. 6d. per share as well as an equal number of ½ per cent cumulative redeemable preference shares of £1 each at 21s. 6d.

Two points are worth making: a larger part of the excess of net assets over issued capital appears to be due to capital appreciation, and of the gross yield of the new issue (£880,000), almost 4 per cent is absorbed by expenses of the issue and a further 78.7 per cent in repaying the bank overdraft, leaving only £152,000 odd to be added to working capital. Contracts have been concluded under which Mr Billmeir is engaged for 15 years as managing director at a salary of £5,000, exclusive of fees as chairman and expenses, and by which J. A. Billmeir & Co., of which the chairman owns the issued share capital, are appointed as managers of the company for an equal period on terms the money value of which is not specified but which are related to the tonnages and gross earnings of the ships.

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

On the basis of this prospectus, the issuing broker succeeded in securing support for the issue from only one of the four or five jobbers in the shipping market. The Stock Exchange regulations call for the support of two jobbers, but the Council can waive this requirement if it thinks fit. In the event, the issuing broker was asked to state a case and did so, but without satisfying the authorities, and the quotation was refused on the eve of the opening of the lists. The brokers deferred proceeding to allotment for three working days, thus giving applicants an opportunity to withdraw, which was the proper action to take in the circumstances. (Under the new Companies Bill no allotment may be made if a quotation is refused.) The sub-underwriters are, however, called upon to bear the burden, for their contract did not contain the "escape clause" which commonly acquits them of responsibility if no quotation is granted. The allotment has been made, but there is no information as to its details. The issuing broker has until Monday next to appeal, but at the time of writing no appeal has been officially lodged.

The issue is of great importance for this firm's reputation, and every effort will be made to secure a compromise arrangement; but it is not easy to see on what grounds the Council can reverse its decision, unless indeed the issuing broker can produce important evidence which was not available before. It is rather surprising that a firm of this experience did not see the possibility of a refusal; had that been foreseen, it would presumably have withdrawn earlier. The Council has gone to great lengths in pursuance of its self-assumed duty of protecting the investor, and, while this is not a matter on which the vote of the market should be the deciding factor, it is clear that it has the support of the majority of the jobbers in its present decision. Whether, however, it is desirable that the Council should go to such lengths and in effect pronounce upon the intrinsic merits of a particular project—this, presumably, is what its decision in this case amounts to—is a difficult and very debatable question.

* * *

Fuel Savings and Working Hours

It is satisfactory, and a tribute to the patient efforts at conciliation of the Ministry of Labour, that, after long months of negotiation, full agreement has been reached between the engin-

earing employers and trade unions on the terms and conditions for staggered hours to reduce the electricity load this winter. Both sides have had to make concessions. The unions have agreed to give up their five-day week and work on Saturday mornings at normal rates, where this is necessary to make up a full working week of 44 hours. The employers on their side have agreed to pay night rates for night shifts, in spite of the increase in costs which any considerable transfer to night working must entail. Both sides have agreed to compromise on the question of overtime rates for abnormal daytime hours.

A memorandum accompanying the agreement emphasises the need for local flexibility and points out that detailed arrangements for shedding the load must be determined in each region in the light of the local availability of power. It also stresses that the arrangements should be regarded as of a temporary emergency character and should not represent a permanent system of working. The suggestion, originally put forward in the Ministry of Labour's sub-committee on electricity, that, wherever possible, factories should be grouped on an area basis, so as to spread the load more evenly, is approved.

This agreement, which affects some 2½ million workers in a key industry, should be a stimulus to other industries to speed up their negotiations and overcome any obstacles which may have hitherto retarded agreement. The urgent call of the TUC's General Council to the Government to secure the adoption of measures to spread the load should have the same effect—incidentally, it is interesting to note that, having originally opposed night-shift working, the TUC has now come round to the view that some transfer of the load of heavy power using plant will be necessary if a breakdown is to be avoided. The national target, as indicated in the Electricity Sub-committee report, is to ensure that the peak load carried during the corresponding period last winter. The effects of the crisis of last February and March would have been very much less severe had industry been able to adjust its working arrangements sufficiently rapidly to meet the situation. If a new crisis is to be avoided next winter, it is essential that schemes should be agreed during the summer months, in such a form that they could be put into operation at very short notice.

Meanwhile the wider aspects of fuel saving in industry have been surveyed by the Parliamentary and Scientific Committee in a report issued last week. The committee estimates that if the present utilisation efficiency of fuel—the efficiency factor now is 30 per cent—could be increased by one-tenth, the saving would be sufficient to provide an annual coal output this year of 220 million tons. It points out that during the crisis the total saving of coal as a result of the cuts was only 2 million tons; yet the consequential dislocation may have cost an export loss of some £200 million. The committee's estimate that output in 1947 is unlikely to exceed 195 million tons is pessimistic—although on current trends pessimism would seem to be justified—leaving a gap of 15 million tons between output and the estimated annual consumption of 210 million tons.

Few of the points raised in the report are new, although the authoritative character of the sub-committee which prepared it must carry weight. It recommends, for instance, that coal allocations to industry should be on a system of priorities and on a basis which provides an incentive to fuel saving. It makes certain recommendations for domestic saving and urges some restrictions or rationing scheme for the sale of new electric fires and electric appliances. Oil conversion schemes should be speeded up, as should research into methods of combating the effects of frost, ice and snow on the transport system. The report is an interim one, and is mainly concerned to set out the urgent needs and difficulties. The fuller and more technical report now being prepared on the scientific aspects of coal utilisation will be awaited with interest.

* * *

Hudson's Bay Outlook

There are signs that the Hudson's Bay Company, in common with other trading concerns operating in relatively prosperous countries, is facing the possibility of a new turning point in its affairs. The report for the year to January 31st last shows a fall in all the main sources of revenue separately stated in the accounts. In the general trading account the decline is more than offset by a halving of the tax provision (now £670,000), and the net profit is slightly higher on the year at £161,539. This covers the dividend, increased from 7 per cent to 8 per cent—a new high level for many years—with a margin of some £50,000. In the Land Account, revenue is down from £308,849 to £257,731, but the statutory provision for capital reserve is reduced from £94,740 to £70,926, leaving the net figure a little lower. The dividend is maintained at 5 per cent tax free and the carry forward reserved for a contingent liability which will not materialise. As a source of large-scale revenue, the Land Account cannot have many more years of life. Although sales last year dropped by one-third in amount they nonetheless absorbed one-fifth of the company's unsold land. Further, there was a drop in price which is likely to be accentuated should farming prosperity decline or alternative means of spending income increase.

It appears that virtually all sources of general trading revenue enjoyed a record year—except for the fur trade. This suffered so heavy a fall in values towards the close of the period that the resultant writing down of stock-in-trade caused a loss, after many years of good results. Some further fall in prices is likely, but it is expected that trading results will be satisfactory and the experience of the current year to date supports this view. As to the other sections of the business the Governor, Sir Patrick Ashley Cooper, states:

While customers' high spending continues, the pace of return to normal buying and selling is quickening, and we may expect that free competition will again prove effective.

Already, on a larger turnover, the retail stores suffered a fall both in profit margins and in net earnings. It remains to be seen whether the company has been able to consolidate the improved position it was attempting to build up before the war, but it is at least probable that Canada will suffer to some degree if there is a substantial recession in the United States.

The accounts still lack consolidated figures, although there is a half-promise of a consolidated balance sheet for the current year. The statutory statement for last year shows an increase of some £237,500 in interests in subsidiaries and a rather larger decline in net current assets, but a much larger proportion of the total of some £4,733,000 is represented by merchandise and debtors. Dollar assets are converted at the old rate of 4.866 dollars to the pound, thus understating the sterling value, and there is in addition, the right to a refund of Canadian EPT, estimated at £577,000, of which the first payment is not due until next year and for which no credit has been taken in the accounts. The outlook is evidently uncertain and this is reflected in a sharp fall in the value of the 20s. ordinary shares from a recent peak of 106s. 3d. to 87s. At that price the yield on last year's dividend is the comparatively handsome one of £2 14s. per cent tax free, but the 5 per cent tax free from land is bound to decline and the power of the trading account to make the loss good has yet to be proved.

* * *

World Tea Supplies

The output of tea in India reached a record level in 1946, when some 585 million lb. were produced compared with 452 million lb. in 1938, although the acreage planted was similar. In Ceylon, tea production was also well above the pre-war level, and reached 280 million lb. last year. But the development has not been steady; the acreage planted declined continuously from 559,000 acres in 1936 to 549,800 acres in 1942 and thereafter remained approximately at that figure. This reduction occurred in both estates and smallholdings, but the latter acreage has on the whole been more stable since 1938. There is, unfortunately, no official information about production in the Netherlands East Indies, but no sizeable exports of tea are expected until next year. In 1938 estates and native production in that country

Abridged Particulars.

SILVER LINE LIMITED

(Incorporated under the Companies Acts, 1908 to 1917.)

SHARE CAPITAL

Authorised:	Issued or to be issued:
£1,000,000 in 4½ per cent. Cumulative Preference Shares of £1 each	£1,000,000
£2,000,000 in 4,000,000 Ordinary Shares of 10s. each	£1,250,000
£3,000,000	£2,250,000

LOAN CAPITAL (Authorised and Issued)

£800,000 4½ per cent. Guaranteed Second Debenture Stock. Repayment at par on 1st October, 1949, has already been provided for by the deposit of £609,262 2½ per cent. National War Bonds, 1949-51.

The Subscription Lists will open on Thursday, 10th July, for an

ISSUE OF

1,000,000 4½ per cent. Cumulative Preference Shares of £1 each at 21s. per Share
and
500,000 Ordinary Shares of 10s. each at 17s. per Share.

The prospectus shows (inter alia) that:—

- The Company and its wholly owned subsidiary, Kerr-Silver Lines (Canada), Limited, are engaged in world-wide deep-sea liner trades. The Company's ships carry dry cargo, bulk oils and refrigerated cargoes and have limited passenger accommodation. Alone or jointly with Dutch and Norwegian shipping companies, the Company operates regular high-speed schedules on round-the-world and other services, both eastbound and westbound, linking the United States and Canada with China, the Philippine Islands, Netherlands East Indies, Singapore, Malaya, Ceylon, Burma, India, the Persian Gulf, the Red Sea, the Mediterranean, and South and East Africa.
- The Company's business is of national importance in that it earns substantial freights payable in dollars.
- At the present date the Companies own ten ships. After allowing for new ships to be built under a long-term tonnage replacement programme and for the sale of one vessel, the combined fleet will, by 1950, number 17 diesel engine or oil fired ships with a total deadweight tonnage of 173,282.
- For the year ended 31st December, 1946, profits were £223,684, after charging all operating, maintenance and management costs and depreciation. The Directors calculate that profits for the current year on the same basis should be not less than £250,000 (excluding any profits of the subsidiary company) and that in future years this figure should be exceeded.
- A profit of £250,000 covers the Preference dividend, requiring £45,000 per annum, 5½ times and leaves a balance available for reserves and dividends equal to 16.4 per cent. on the nominal amount of issued Ordinary Capital. In respect of 1946 an Ordinary dividend of 8 per cent. was paid.
- The Company's taxation position is such that no liability for Income or Profits Tax on trading profits should arise for several years. Losses for Income Tax purposes available for carry forward (unrestricted as to time) are estimated to amount to approximately £900,000.

Full prospectuses, on the terms of which alone applications will be considered, and application forms will be obtainable after 3 p.m. on Monday, from:—
BANKERS: NATIONAL PROVINCIAL BANK LIMITED, 15, Bishopsgate, London, E.C.2, and Branches.
BROKERS: J. & A. SCRIMGEOUR, 3, Lothbury, London, E.C.2; and The Stock Exchange, London.
REGISTERED OFFICE OF THE COMPANY:
Palmerston House, 51, Bishopsgate, London, E.C.2, and from

THE CHARTERHOUSE FINANCE CORPORATION LIMITED, 6, Old Jewry, London, E.C.2.

* To earliest redemption, except for flat yield and assumed average life 17 years 6 months.
Net yields after allowing for tax at 30%.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) Also a capital bonus of 2½ per cent. free of income tax; yield worked on 15 per cent. basis. (f) Fifteen months to March 31, 1947 (yield basis 7.6 per cent). † Free of Tax.

amounted to 178 million lb., and this quantity has been almost made good by the expansion of output in India and Ceylon. Moreover, production in East Africa has increased from a pre-war total of 23 million lb. to approximately 30 million lb. in 1946—a significant expansion, no doubt, to the producing countries, but its contribution to the total world import consumption of about 900 million lb. is negligible. There are no details available for Japanese production, which before the war had increased to 127 million lb. in 1939, while estimates for China indicate an annual output of about 600 million lb.

An assessment of world consumption trends is difficult owing to the absence of data. The United Kingdom, which before the war accounted for about half of the world's total, absorbed only 380 million lb. in 1946, according to the calculations of the International Tea Committee, compared with 432,000 million lb. in 1938—a reduction of about 12 per cent. Actual consumption declined by only 10 per cent, the difference being made up by an off-take from stocks. It would seem likely that if the tea output of both India and Ceylon is maintained at present levels, world requirements will be amply filled once the Netherlands East Indies' supply again becomes available. Nevertheless, if the present policies of full employment are pursued in consuming countries, the total level of consumption will probably be above the pre-war figures.

Dock Labour Decasualisation

A delegate meeting of dockers last Friday agreed unanimously to accept the Ministry of Labour's scheme for the permanent decasualisation of dock labour. The final scheme has been slightly modified, to the advantage of the men, and under it the dock worker will receive a guaranteed weekly wage of £4 8s., instead of the £4 7s. 6d. proposed by the Hetherington Committee. Thus, for the first time in history, the docker will enjoy security of income. As Mr Arthur Deakin, secretary of the Transport and General Workers' Union, commented at the end of the meeting: "This agreement marks the end of casual employment in dockland and the end of a fifty-year fight." Now that the dockers have gained this important objective, it is to be hoped that the rank and file, as well as their leaders and delegates, will make real efforts to preserve industrial peace in this difficult industry. Perhaps a test case will be provided in the Clydeside dockers' reaction to the report of the Ministry of Labour's committee of enquiry into the size of the labour force at the Port of Glasgow. This committee was set up after the seven weeks' strike of Glasgow dockers over the dismissal of 500 redundant workers, which had brought spasmodic sympathetic action from London dockers. The committee rejects the union's thesis that a labour force of 3,600 men is needed on the basis of a 44-hour week, and considers that a total of 2,900 is sufficient. The employers had suggested 2,850, in view of the extension of mechanical handling and the decline in traffic at the port. The present number on the register is 3,400.

There can be no doubt that the committee's figure is adequate—possibly more than adequate—to man the port. The tonnage of 3.5 million tons handled in the eleven months ended May 31st is about half that for the year ending June 30, 1941, when the registration scheme was first introduced. It would be entirely uneconomic, and might endanger the whole national scheme, if the port were allowed to carry a large surplus. Yet, if 500 dockers are declared redundant, in view of the recent trouble and the existence of unemployment on Clydeside, there may well be a fresh outbreak of unrest among the men.

Shorter Notes

Maximum prices for newsprint, paper and paper-board are to be increased from July 7th owing to higher costs of woodpulp and other paper-making materials. Maximum prices of home-produced newsprint will be raised by £7 2s. 6d. a ton.

*

Immediate cuts in cigarette allocations to retailers are being made by the Imperial Tobacco Company. Two of the largest branches, making Players and Wills, have had to make precautionary reductions in quotas to customers owing to the uncertainty of future supplies of leaf tobacco arising from the dollar shortage.

*

Netherlands Indies prospective total tin output for 1947 has been estimated at 21,000 tons, and is expected to increase to 37,000 tons in 1948 and 43,000 tons in 1949.

What do YOU know about the 'other' films?

A survey on British films was recently carried out by Research Services Ltd. among top-ranking professional and business people. (Some idea of the type of person approached will be gained from the fact that the principal papers read by them are: *The Times*, *The Observer*, *The Economist*, *The New Statesman and Nation*, *The Spectator* and *Tribune*.) The answers given suggest that many people are lacking accurate information. For instance, 75% of informants were unaware that the Rank Organisation makes NON-FEATURE films.

Among the classes of non-feature films regularly produced by the Rank Organisation are:

EDUCATIONAL More and more teachers are using these films to supplement traditional methods.

* * *

INSTRUCTIONAL Films to aid recruitment to industry. Films to train factory workers and to demonstrate industrial sales technique. Training films for the Services, and films specially commissioned by Government Departments.

* * *

CHILDREN'S Fifty-two entertainment films are being specially made this year for showing in the Children's Cinema Clubs.

* * *

DOCUMENTARY Including 'This Modern Age,' a forthright monthly commentary, a picture of our times seen through British eyes. Subjects already covered include 'Homes for All,' 'Palestine' and 'The Coal Crisis'.

J. ARTHUR RANK ORGANISATION LIMITED

COMPANY MEETINGS

SOUTH-EASTERN GAS CORPORATION, LIMITED

A YEAR OF CONTINUED PROGRESS

The fifteenth ordinary general meeting of the South-Eastern Gas Corporation, Limited, was held, on the 3rd instant, at Gas Industry House, 1, Grosvenor Place, S.W.

Mr A. E. Sylvester, F.C.A., the chairman, who presided, said:—

Since the accounts were printed, the directors have learned with very great regret of the death of Major Julian Day, who had been ill for a long time. He played a leading part in the formation of this corporation, and in the movement to co-ordinate gas undertakings by means of holding companies, and the board will greatly miss his wide knowledge and sound judgment.

The following is the statement by the chairman, circulated with the report and accounts:—

I must first of all refer to the great loss we have sustained by the death in April of our colleague and friend Mr Thomas Hardie. He had spent his life in the service of the gas industry, and had been a director of this corporation for ten years.

Mr Henry Woodall, who became a director of the corporation in 1933, resigned from the board at the end of last year. Mr Woodall has an exceptionally wide knowledge and experience of the gas industry, and I wish to pay a tribute to the valuable contribution he made to the development of the corporation.

During the year the board invited Major the Hon. Gwilym Lloyd George, P.C., M.P., to become a director, and this appointment will be submitted for your confirmation.

The year 1946 was one of continued progress, and the total output of gas for our operating companies was 13 per cent. more than in 1945 and 43 per cent. above the pre-war figure.

INCREASED REVENUE

The revenue account shows an increase of £15,000 in the dividends and interest received on investments. During the war the income of the corporation was substantially reduced because most of the companies were supplying areas on the south-east coast were unable to pay dividends. All but one of those companies were able to resume dividends in 1946, the one exception being the Broadstairs Company. This company incurred exceptionally heavy losses during the war, and the profits earned since have not yet been sufficient to write off the deficit so accumulated.

Even if the profits are available, it is not always possible for our operating companies to return to the rates of dividend they were paying before the war. Dividends are limited by reference to the price charged to consumers for gas in comparison with a standard price. In order that stockholders should not be prejudiced by or benefit from increases or decreases in cost beyond the company's control, provision was made under this system for the standard price to be varied, but, in spite of greatly increased costs, it has not been possible in recent years to obtain the necessary Government sanction for any variation. During last year we decided to take advantage of the Gas (Maximum and Standard Prices) Order and General Direction, 1942, which permits certain of the increases in costs to be taken into account in calculating the dividend payable, but even where this order is applicable the

rate of dividend must still be limited to 1 per cent. below the average rate paid for the three years before the war.

ASCOT COMPANY'S DIVIDEND

The present accounts include a dividend on the ordinary stock of the Ascot District Gas and Electricity Company only for the first half-year. The whole of this joint undertaking appears to be subject to acquisition under the terms of the Electricity Bill, and it has been decided to defer the declaration of a dividend for the December half-year until the position is clarified.

Other income is up by £24,000. The increase in the quantity of goods obtained through the central purchasing organisation resulted in a greater revenue from commissions, and more was received in interest on the increased amount of loans outstanding.

On the debit side, general expenses are up by £9,000, and there are increased charges for interest and income-tax. As the result of the year's working, there is a profit of £141,285 to be carried to the appropriation account, compared with £121,216 in the previous year.

DIVIDEND RESTORED TO 6 PER CENT.

Taking in the balance of profit brought forward, there is a sum of £234,228 available for distribution. The directors have paid the usual dividends on the preference stock and an interim dividend of 1½ per cent. on the ordinary stock. We are now recommending a final ordinary dividend of 4½ per cent., less tax, thus restoring the dividend to the rate of 6 per cent. which was regularly paid from 1933 to 1939. After payment of this the sum of £102,515 will remain to be carried forward, compared with £92,943 brought in.

The corporation has continued to advance money to subsidiary companies to finance development, and the loans to subsidiaries at March 31, 1947, amounted to £768,478, an increase of £500,000 on the figure for the previous year. At March 31, 1947, the temporary borrowings of the corporation amounted to £801,356, in addition to which there was the sum of £474,293 on deposit from subsidiary companies.

Since the close of the year British Government securities, shown as an asset at their cost of £271,000 have been sold, and the sum of £280,000 realised by their sale has been applied to reduce these borrowings. I have dealt thus briefly with the accounts, since they are so largely self-explanatory, and would now like to offer a few observations on the general circumstances in which we are operating.

GROUP ORGANISATION

As you are well aware, the intention of the Government is to nationalise the gas industry within the lifetime of the present Parliament. The policy of the directors remains the same as I outlined to you last year and we are continuing, within the limits of our powers, to maintain the orderly development of the business. But for the restrictions imposed by war time, which have in the main continued and seem likely still to continue, our aim would have been to effect an integration of our various interests by actual amalgamations of companies, which because of geographical position and character of business would benefit from such a procedure. For various

reasons, however, such a course seems hardly practical at this time. The need for action, however, remains, and we are thus forced on to a second-best method—namely, to operate the companies in groups so as to obtain the maximum benefit of co-ordination short of actual amalgamation.

We have formed four groups, namely: Uxbridge group, consisting of Ascot, Chertsey, Slough, Uxbridge, Windsor.

North London group, consisting of Hornsey, Lea Bridge, North Middlesex,

Maidstone group, consisting of Gravesend, Lewes, Maidstone, Mid-Kent, Rochester, Sheppy, Sittingbourne, Tunbridge Wells.

Coastal group, consisting of Broadstairs, Deal, Dover, East Kent, Folkestone, Hastings, Herne Bay, Whitstable.

Periodical meetings of each group are held, at which the directors meet the managers of the companies. In order to simplify the planning of meetings and to regularise the proceedings, it has been arranged that all directors of the corporation should be directors also of each operating company. Thus the group meetings can fulfil their twofold function of a board meeting and what might be called a district departmental meeting. To avoid any misunderstanding, however, I should explain that directors of the corporation draw fees only from the corporation and are not entitled to any separate fees from the operating companies. These, as you can see from the published accounts, are all paid to the corporation.

IMPORTANCE OF CAREFUL PLANNING

The general pattern of nationalisation (as seen in coal and electricity) is not one which I, personally, find reassuring. The danger of very large organisations is that, unless they are carefully planned, remote control takes place of the personal touch. Assuming the need for a large organisation, the problem is how to ensure that the operational units may function with the greatest efficiency, using the word broadly and including the maintenance and improvement of human relationships. This, in my opinion, is only possible when the distinction between the laying down of policy and the business of carrying it out is clearly understood and effected in the scheme of organisation. Full operational authority should be given at as low a stage in the plan as practicable and only policy matters (with, necessarily, some power over major appointments) put into the hands of regional and national authorities. Neither of these bodies should intervene in details of operation, but should confine themselves to such matters as can only be effectively judged on a regional or national level, as the case may be.

It follows from this that, to my mind, the appointments to boards at these levels of experts with executive functions is unsound; each board should act collectively and should obtain its data and local opinions from the working units. Their staffs should be comparatively small and engaged principally in the collection of necessary facts and figures.

I fear you may think this all very elementary and obvious. It is indeed, but can we really feel that these simple principles are being considered in the vast schemes that are being so hastily thrown together?

However soundly a scheme of organisation is planned, it cannot work successfully unless the right people are put into the right jobs. We are fortunate in the corporation and its subsidiaries in having a splendid team, and a good spirit runs through the entire organisation. The qualities of courage and endurance which were shown over and over again in the war are still there, and I am sure the shareholders would wish to join with the board in expressing our thanks and good wishes to all our employees.

The report and accounts were adopted.

GOODLASS WALL AND LEAD INDUSTRIES, LIMITED

IMPROVED TRADING RESULTS

MR CLIVE COOKSON'S REVIEW

The sixteenth annual general meeting of Goodlass Wall and Lead Industries, Limited, was held in London on the 2nd instant, Mr Clive Cookson, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1946:—

In spite of the statement which I made last year as to the nature of our business, I notice that some sections of the press appear still to be under the impression that we are solely a paint-making company. This is far from the case. Although paint manufacture is a prosperous and important section of our undertaking, it has for a long time been our policy to spread our activities over a wide field of industry. The fact is that paint making, as such, constitutes less than a third of our whole business whatever criterion is used.

The improved trading results are derived from all departments of our business and they reflect the favourable conditions brought about by the eager demand for all our products and the willing efforts of our management and workers. Without doubt also the effect of rising prices has operated for many products other than our main raw materials, producing a general buoyancy of income. The results of this favourable background are not the less welcome, but it is wise, when circumstances have conspired to help us, to give due weight to the fact.

We have also certainly derived increasing benefit from the improvements in plant and processes which we have carried out over a long period and which are producing a cumulative effect in economy of working. This policy and the depreciation which has been applied to our fixed assets have resulted in balance-sheet valuations much below real values even when present inflated costs are ignored.

DEMAND EXCEEDS PRODUCTION

This time last year I indicated that our activities would be determined by the amount of raw materials available, and this has proved to be correct. On all sides of our business, in common with most other manufacturing businesses, the demand has far exceeded our production with available raw materials, and the problem has been the allocation of our output in accordance with the requirements of Government Departments on the lines most advantageous to the national interest.

There is an acute world shortage of lead, no new deposits of any magnitude having been discovered in recent years, and this may continue for some time. The present high price will possibly bring forward supplies which otherwise would not emerge, but it may well be that on the longer view, lead, compared with the other non-ferrous metals, will be relatively higher in price than in the past. The shortage of lead in primary form was, to some extent, made good for the time being by an increase in the volume of secondary materials available, partly as a result of the aftermath of war. Having had the foresight during past years to build up an up-to-date and flexible smelting and refining organisation, we are able to play an important part in bringing these secondary materials forward for general use in metallic form. The benefit of this capacity has been felt not only by us but by other lead consumers and by the nation as a whole.

INCREASE IN PAINT TURNOVER

The turnover on the paint side of our business showed a gratifying increase; great

efforts by our Liverpool staff to expand production, which was so severely cut down by the loss of our main factory, have contributed powerfully, but all our paint companies have done well and this has brought about a very satisfactory improvement in the trading results. It is a pleasure to report that most of our well-known specialities are again obtainable though in quantities much smaller than our customers would wish. Most raw materials were in short supply, particularly linseed oil and, unfortunately, this position still continues. Good progress has been made with the erection of the new paint factory at Speke, to which I referred last year. All of the foreign paint subsidiaries showed excellent results.

FACTORY RECONDITIONING

During the year we have pressed on against increasing delays and difficulties with our programme of factory reconditioning and extension. Our programme is a large one and it is already evident that it will unavoidably take longer than we hoped. Further improvements have been devised and the cost of existing plans has been constantly rising. Our E.P.T. post-war refund will be available for these purposes but we have not taken credit for this in the 1946 accounts. We are also very much increasing our investment in the Titanium Industry. For these reasons and also because of the exceptional nature of part of this year's profit we are again devoting only a very moderate share of the amount available for distribution in the form of dividends. Our ratio of the amount distributed in dividends to the net profit has been as follows in recent years: 1943, 64 per cent.; 1944, 54 per cent.; 1945, 57 per cent. and 1946, if the proposals of the Board are approved, 47 per cent. As will be seen from the accounts, if the Board's recommendations are accepted all classes of shareholders will receive a total of £168,603 net after deduction of taxation, whereas it has been necessary to reserve against total taxation on the year's accounts a sum of no less than £1,129,203.

Although we are making every effort to economise, particularly in the use of labour, our costs continue to rise, and, with the advent of a 44-hour week this summer, the tendency will continue. I am strongly in favour of the best possible conditions for all employees in industry, but, unless improvement in conditions is accompanied by increased output, the result will very soon be shown to be disastrous for the country. It must also be realised that in many processes rate of output is determined by plant capacity as well as by the nature of the process, and in these cases a loss of total output or an increase of cost is unavoidable if operating hours are reduced. This fact is not sufficiently recognised.

The year's results must be looked upon as being more favourable than they would have been had the prices of our raw materials not risen. We would prefer to see steady prices at lower levels and normal conditions of trading. Unfortunately this time has not yet arrived. It is therefore difficult to make any reliable forecast of our normal trading prospects in 1947. The shortage of lead and other vital raw materials is more acute than ever; the volume of our trade has shown reduction so far this year as compared with last year. We are, however, in a very strong financial position and, given a reasonable supply of metal and other materials, we hope to give a good account of ourselves.

The report was adopted.

THE TRUST COMPANY OF LONDON AND SCOTLAND, LIMITED

LARGER REVENUE AND DIVIDEND

The eighteenth annual general meeting of The Trust Company of London and Scotland, Limited, was held in London on the 30th ultimo.

Mr B. W. Bloomer, the chairman, in the course of his speech, said:

Net revenue, after payment of all expenses and debenture interest and allowing for income tax, amounts to £33,666, an increase of £7,122 compared with the previous year. Your directors recommend that the dividend for the year on the ordinary stock be increased from 4 per cent. to 5½ per cent., less tax.

Our holdings are spread over 554 securities, and are distributed as follows:—Bonds, debentures and debenture stocks 8.80 per cent.; preference stocks and shares 23.50 per cent.; ordinary and deferred stocks and shares 67.70 per cent. Eighty-seven per cent. of the book cost, or 91 per cent. on the valuation of these investments is represented by securities within the British Empire. A valuation of the investments shows a further improvement, the appreciation being 26.21 per cent. on the balance-sheet figure. On this basis the break up value of your ordinary stock at the date of the balance-sheet was over twice the nominal amount of the stock.

The re-investment of funds becomes increasingly difficult with the various nationalisation proposals and the prevailing low interest rates, but an estimate of our earnings for the current year indicates that, in the absence of any unforeseen factors, our revenue will probably be at least maintained.

The report was adopted.

ODHAMS PRESS, LIMITED

SUCCESS OF PUBLICATIONS

The twenty-seventh annual general meeting of Odhams Press, Limited, was held in London on the 26th ultimo.

Mr Arthur G. Cousins, C.B.E., the chairman, said that the trading profit of £1,098,226 was practically the same as that of the previous year. The net profit was £963,495 and the directors recommended an Ordinary dividend of 15 per cent. plus a bonus of 2½ per cent. The final results of the subsidiary companies was a net profit of £465,399 compared with £414,567 for the previous year.

He was sure that all stockholders were proud of the success of the newspapers, periodicals and other publications for which they were responsible, including *The Daily Herald*, with a net circulation of over 2,000,000 copies for every day of publication, *The People*, with a circulation of over 4,500,000 copies each week, *John Bull*, over a million, *Illustrated*, over a million, *Woman*, over a million, and many other periodicals with large and influential circulations.

The net result of all the figures was a trading profit of £1,737,370, which was 15½ per cent. of their gross revenue. Of the net profit of the group, provision for taxation took 75.5 per cent., dividends 20.8 per cent., and reserves and carry-forward 3.7 per cent.

They were rationed as to the number of pages they could print. Every newspaper got its fair share. When the war started some newspapers were in an advantageous position as regarded competition. During the early stages of the war Lord Kemsley had approached Lord Beaverbrook with the idea that all newspapers in the country should pool their resources of newsprint. Lord Beaverbrook had readily agreed and so the Newsprint Supply Company had come into existence.

The report was adopted.

RICHARD CRITTALL AND COMPANY, LIMITED

NEW CAPITAL PROPOSALS

MR J. L. MUSGRAVE'S STATEMENT

The thirty-sixth annual general meeting of Richard Crittall and Company, Limited, was held at the company's factory, Great West Road, Brentford, on the 30th ultimo, Mr J. L. Musgrave (chairman) presiding.

The following is an extract from his statement circulated with the report and accounts:—

Before dealing with more formal matters I must refer to the resignation from the chairmanship of Mr Richard Godfrey Crittall, which took place in July last year. Mr Crittall has been a director of the company since 1911 and chairman since 1923. I am happy to state that he has agreed to retain his seat on the board, and he has accepted the vice-chairmanship of your company.

Turning now to the year under review, I believe our shareholders will feel that the result is satisfactory. It has been a year during which we have undertaken and carried through successfully a considerable scheme of reorganisation, which has led to the creation of six new subsidiary companies.

One of them has this year doubled its turnover and another has quadrupled its turnover; all have operated at a profit, and in each case the order books reflect growth and expansion.

CURRENT ORDERS AND SALES

The current order book of the group at December 31, 1946, stood at the satisfactory figure of £1,600,000 and it should be noted by our shareholders that this figure is arrived at after eliminating from the order book all those orders where licences and permits had not been received; the total volume of orders received at the date mentioned was considerably in excess of that figure.

I would mention that during the four months ending April 30th this year, current orders have been received to the value of £598,000, including £157,000 for export, while sales in the same four-monthly period exceed those for the same period last year by 23 per cent.

RAILWAY, MARINE AND AERIAL CONTRACTS

During the year we have been favoured by one of the main-line railway companies with the order for the construction of the equipment for their first series of post-war kitchen cars. Another contract is from a shipping company for the heating and ventilation for, I believe, the first ship extensively embodying electric radiant heating panels ever to be built in this country.

A further notable contract to which I would like to refer is for a large number of our special aircraft galley ovens which we developed in collaboration with B.O.A.C. for use in airliners.

INDUSTRIAL PLANT AND EQUIPMENT

The expansion of the business in the field of industrial plant and equipment has been in every way satisfactory and we are carrying out a variety of important contracts for the manufacture and supply and in many cases the design, of equipment for important companies in the food, chemical, photographic and industrial processing industries.

GOVERNMENT CONTRACTS

We have a considerable volume of work for various Departments of His Majesty's Government, and a tribute has recently been paid to the very high standard of workman-

ship put into a special and important Government contract by one of your subsidiary companies.

NEW FACTORIES AND PROGRESS

The growing volume of business has necessitated the expansion of our production facilities. In consultation with Government officials, we decided to accept the offer made to us by the Board of Trade and establish a factory on the Hillington Estate at Glasgow. The negotiations for this factory were only completed in December last year, but production was commenced at the end of February.

Our activities in the Midlands have also demanded increased production facilities, and we have acquired a site in the new Stoke-on-Trent Development Area upon which we intend building a new factory to cater for the manufacture of industrial plant and equipment of various types and particularly for the refractory industries. This factory will not, however, be ready before the end of 1948 so far as we can determine at the present time, and we have, therefore, taken a lease of a factory in Stoke-on-Trent.

I must pay tribute to the helpful co-operation and consideration we received from the Government and Local Government officials during these negotiations, and would state that without their help our acquisition and planting of the new factories could not have been carried out so speedily and efficiently.

Our three London factories continue to work at full pressure, and I am happy to say that our workpeople have agreed to work three nights a week overtime for a period of three months, to enable us to make up the time lost in the London factories during the fuel crisis, and steady progress is being made towards this end. Electrical generating plant has been acquired and installed at our Great West Road Factory, to balance any curtailment of power which may be imposed on us.

I may sum up the manufacturing side of our organisation by saying that our factories are very fully occupied and have order books that will ensure full productivity for a considerable time, given only a continuity of raw material and labour, and an absence of difficulties such as those experienced earlier this year.

THE CONTRACTING ACTIVITIES OF THE GROUP

On the contracting side of our undertaking we have a full order-book, although our specialised work in the field of big public buildings must remain more or less dormant until building restrictions are removed. We have been advised by many of our architects that they wish us to undertake certain important building schemes when permission is available, and I am confident that your company will make a substantial contribution to the reconstruction of the great cities of this country.

Our main contracting effort at the present time is concerned with the rehabilitation of industries, and we are carrying out a wide range of work in connection with the modernisation of factories and industrial premises and of industrial processes in many parts of the country. Our services cover a wide field, and we can broadly take the shell of a factory and leave it equipped ready for production.

EXPORT EFFORT

At the end of the year we had on our books export orders amounting to approxi-

mately £100,000 (excluding orders in the hands of our American subsidiary), but we also had export inquiries under negotiation amounting to one and a half million sterling, and we estimate that not less than half this sum will accrue to us as firm orders during the course of the coming year.

BRITISH OVERSEAS ENGINEERING AND CONSTRUCTION CORPORATION

I cannot close this brief review of our export work and potentialities without referring to the newly formed British Overseas Engineering and Construction Corporation, Limited, which came into existence towards the end of last year. This corporation, in which your company holds at the present time a substantial interest, was formed to canalise the supply to certain foreign countries of a wide range of engineering equipment and constructional work, to eliminate unnecessary and wasteful competition, and to avoid duplication of overhead expenditure, thus improving the competitive quality of British firms in overseas markets.

THE ACCOUNTS

The profit on the parent company's trading for the year is £44,365 (a figure reached after full reserves have been made), against £10,983 in the preceding year. To this sum must be added £19,550, representing interest received from loans made to subsidiary companies, and dividends received from subsidiary companies, thus giving us a total of £63,915, as against £53,569 last year. From this gross income of £63,915, must be deducted directors' fees, £6,450, depreciation of fixed assets, £1,137, and full provision for taxation (including subsidiary companies' excess profits tax), amounting to £27,000. After making these deductions, in all amounting to £34,587, we have an available balance of £29,328, which compares with £15,630 in 1945.

To this available balance of £29,328 must be added £26,886, brought forward from the previous year, giving an available total of £56,214. We have already paid the year's preference dividend, absorbing £1,070, after deduction of tax, and we have paid an interim dividend on the ordinary share capital at the rate of 50 per cent., less tax, absorbing a further £13,750; and I shall ask you at the annual general meeting to approve a final dividend of 50 per cent. on the ordinary shares, less tax, which will absorb a further £13,750, leaving the carry-forward increased to £27,644.

It should be noted that the total dividend payable to the ordinary shareholders for the year represents 13.2 per cent. on their capital and reserves employed in the business at December 31, 1946. It should also be noted that the ordinary dividend represents approximately 6 per cent. on the current market valuation of the shares.

NEED FOR NEW CAPITAL

It is quite clear that the expansion of the business demands the creation of new permanent capital, and your directors decided to approach the Capital Issues Committee for permission to increase the share capital of the company. It has been decided, subject to your approval, to increase this capital by the creation of 450,000 £1 5 per cent. cumulative preference shares, to be issued at 21s. 6d. each, and to rank *pari passu* with the 50,000 preference shares now issued.

It is my great pleasure to thank my colleagues, our executive officers, and employees in our companies at home and overseas for their help and co-operation during the past year.

The future expansion of the business is firmly based on the needs and requirements of our many customers at home and overseas who come back time and time again for the services and products of your company.

The report and accounts were adopted.

ULTRAMAR COMPANY, LIMITED

OPERATIONS DURING PAST YEAR

PRODUCTION PLANS

INCREASE OF BORROWING PLANS

The eleventh annual general meeting of the Ultramar Company Limited was held at Winchester House, Old Broad Street, London, E.C., on the 25th ultimo.

The directors' report embodying the statement of the chairman (Sir Edwin Herbert), together with the balance sheet of the company at June 30, 1946, and consolidated statement showing the position of the subsidiary companies as at that date have now been issued to stockholders. A report of Caracas Petroleum S.A., the company's wholly owned subsidiary company, regarding its operations to May 10, 1947, is included, of which the following is a summary:—

PARTICULARS OF CONCESSIONS

The total area of oil concessions in which Caracas Petroleum S.A. is interested comprises 1,941,000 acres of which 1,145,000 are exploitation parcels and 796,000 acres exploration concessions situated mainly in Eastern Venezuela.

(a) *Mercedes Oilfield and Adjoining Territory*: During the period under review 21 wells have been drilled on the Mercedes field or in adjoining territory. Some of these wells were considerable outcrops to test the possibilities of outlying areas, thereby extending the limits of the proven producing area to the west and north. The remainder were drilled for development purposes, partly to provide potential oil for the pipeline and also gas for fuel and pressure maintenance. Six wells have been completed in the gas sand and 10 as oil producers. One well has been suspended and four wells, which were drilled in the outlying areas, have been abandoned as dry holes.

A NEW PRODUCING AREA

(a) *Palacio Oilfield*: This is a new producing area in the Chain Lots about eight miles south of the Mercedes field, on which four wells have been drilled. One of the wells was a dry hole, but the other three have been completed as oil wells. These discoveries have opened up an area of considerable promise and a development programme is in progress. The latest drilling results have extended the proven area an additional two miles to the west. The productive horizons are considerably shallower than those of the Mercedes field.

(a) *Other Areas*: On Infante Lot 13 an exploration well is preparing about 15 miles north of the Mercedes field.

(a) *Punzon-Grico*: (b) *Camaz-Placer*: Two rigs have been kept in continuous operation on the Grico area and two on Camaz-Placer. Seven exploration wells have been completed on Grico, Punzon and Camaz since June, 1946. Five of these have been abandoned, and two on Grico have been cased as gas wells. The areas where this gas has been discovered are respectively 26 miles west and 17 miles west-north-west of the Mercedes field.

DRILLING PROGRAMME

Exploration wells are now being drilled on Placer (the Camaz-Placer area is jointly held with Atlantic Refining Co.)

The geophysical and geological programme on the Grico and Camaz-Placer exploration concessions is now well advanced, and preparations for the conversion into exploitation parcels of these properties will begin towards the end of 1947. The programme of drilling on these exploratory concessions is well under way and will furnish valuable information to guide the selection of acreage to be retained.

(c) *Barbula and Grico Concessions*: The drilling of an exploration well, Barbula 1, some 50 miles west of the Mercedes field, is now in progress.

The geophysical and geological programmes are well advanced and preparations for parcelling into exploitation concessions will begin towards the end of the current year.

(c) *Cagigal Concessions*: Caracas Petroleum S.A. has made its selection from the exploration concessions, retaining 58,000 acres of exploitation parcels.

(a)—In which Caracas Petroleum S.A. has a 50 per cent. interest.)

(b)—In which Caracas Petroleum S.A. has a 35.53 per cent. interest.)

(c)—In which Caracas Petroleum S.A. has a 100 per cent. interest.)

PLANS FOR PRODUCTION

S.A.P. Las Mercedes, in which Caracas Petroleum S.A. has a 50 per cent. interest, has now in continuous operation nine drilling rigs with three additional rigs expected to be delivered shortly. This drilling equipment is chiefly devoted to the development of production for the pipeline which it is anticipated will be ready for operation in the second quarter of 1948 and to the completion of the heavy programme of exploratory drilling.

At this date there are 29 wells on the Mercedes and Palacio fields capable of producing oil and sufficient oil reserves have been established to justify the expectation of an initial production of at least 25,000 barrels per day by the time the pipeline is ready.

Pipeline: Contracts have been entered into for S.A.P. Las Mercedes to construct a pipeline from the Mercedes field to the terminal at Pamatacal near the Venezuelan port of Guanta, a distance of about 157 miles and the line is expected to be in operation in the second quarter of 1948. The line will be of 16-in. diameter with a capacity of 64,000 barrels per day, which can be readily increased to 100,000 barrels.

FIELD INSTALLATIONS

In the Mercedes field, a permanent camp has been built. Warehouses, garages, machine shop, power plant, and the necessary offices have been provided. Quarters for technical and labour personnel have been constructed and more housing is projected as soon as the necessary materials can be secured and shipped. The camp must be further enlarged in order to accommodate the personnel which will service the terminal station of the pipeline in the Mercedes field. Schools and limited hospital and recreational facilities are already available and extensions of these facilities are planned. In all such matters S.A.P. Las Mercedes is doing its best to conform with the high standards which have been set by the oil industry in Venezuela in order to maintain competent

THE ECONOMIST, July 5, 1947

personnel and conform to labour regulations. S.A.P. Mercedes now employs about 1,250 staff and other workers, of which the greater part are centred on the Mercedes field.

ACCOUNTS AT JUNE 30, 1946

Advances to subsidiary companies at £2,941,474 show an increase during the year of £1,526,688 due to remittances abroad for exploration and development work. The statement of combined net assets of the subsidiary companies shows shareholdings in the Mercedes and Manapire Companies, concessions, royalty rights, interests and equipment in Venezuela, including advances to the Mercedes and Manapire Companies, at £4,626,520, an increase during the year of £1,683,328, represented by costs of exploration and development.

Since June 30, 1946, the company has issued 531,773 shares at a price of 72s. 6d. for each 10s. share. The shares were offered to stockholders in proportion to their holdings; in accordance with the Articles of Association the new shares stand converted into stock which is transferable in amounts and multiples of 10s. each. The issued capital of the company now amounts to £1,716,179 and premiums on shares £3,718,461. Remittances abroad since June 30, 1946, have amounted to £2,326,000, with the result that the proceeds of the last issue of shares have been expended and the company has obtained temporary loans totalling £1,005,000 from Morgan Grenfell and Company Limited (the company's bankers), and from the principal stockholders, viz. The Central Mining and Investment Corporation Limited, New Consolidated Gold Fields Limited, Selection Trust Limited and Unions Corporation Limited. These loans are unsecured and carry interest at 3 per cent. per annum.

FINANCIAL REQUIREMENTS

Present estimates of expenditure for the year 1947, including repayments of temporary loans and administrative and other expenses, amount to a total sum of £3,289,000. In order to provide for these requirements and allow for a reasonable reserve for contingencies and minimum bank balances, your directors have entered into negotiations which, subject to their borrowing powers being increased as hereinafter mentioned, they hope to complete shortly, for borrowing sums totalling £3,750,000 on short term. In addition, your directors consider they should have power reserved to borrow up to a further sum of £1,750,000 if and when required.

The above arrangements will call for a total borrowing power of £5,500,000 and the notice calling the Eleventh Annual General Meeting refers to a proposed resolution authorising the directors to borrow up to that amount.

VIROL, LIMITED

GOOD RESULTS DESPITE DIFFICULTIES

Presiding at the forty-seventh annual general meeting of Virol, Limited, held in London, Lord Luke, the chairman, said:—

A recent visit to the Argentine confirms my opinion that State bulk purchase should be replaced by a more up-to-date technique of buying through joint action by the Government and market experts in order to counter State cornering of markets.

At the present moment we are having to pay nearly eight times the pre-war price for certain edible fats and I can hardly believe fats are as much as eight times as scarce, whilst most of our other raw materials, of

THE ECONOMIST, July 5, 1947

which there are many—mostly foodstuffs—have risen to prices considered unthinkable in the past. Consequently our manufacturing costs have recently substantially advanced.

Our sales during the past year again showed an increase, and in an endeavour to regain some of our valuable overseas markets we released a small part of our stocks for this purpose. There are excellent indications that our export trade will make a rapid recovery once we are again in a position to manufacture on a larger scale.

The profit on the year's trading shows over £8,000 increase before taxation at £46,553. The directors recommend, after paying the preference dividend and transferring £10,000 to reserve against £5,000 last year, that the ordinary shares receive a dividend of 15 per cent. and a bonus of 2½ per cent. less income tax. This will leave the balance carried forward at £45,587 against £45,065.

The report and accounts were adopted.

COLTHROP BOARD AND PAPER MILLS, LIMITED

INCREASED PROFIT AND DISTRIBUTION

MR FRANK SMITH'S SPEECH

The twenty-ninth annual general meeting of Colthrop Board and Paper Mills, Limited, was held at the registered office of the company, Thatcham, Berkshire, on the 30th ultimo. Mr Frank W. J. Smith (chairman and joint managing director), presiding.

The following is the Chairman's speech, which had been circulated with the report and accounts for the year ended May 31, 1947, and was taken as read.

This is the twenty-ninth annual general meeting and in the first place I have to report two sad incidents which have occurred during the past year. I refer to the passing of Mr Shirley Cropper, who was the original chairman of the company, and Sir John Pakeman. Both these gentlemen were directors for many years and they will be greatly missed.

Last year I told you we were being hampered in our business by the continued restrictions and controls, and I expressed the hope that they would soon be relaxed. Unfortunately, this hope has not materialised, and we are still working under great difficulties notwithstanding that hostilities in Europe ceased over two years ago.

CONTINUED DEMAND

The demand for our goods continues, but the shortage of coal, raw materials, and labour has seriously affected us. Nevertheless, it is gratifying to be able to show an increase both in the trading profit and the net profit, and although part of the increase is due to the necessary provision for excess profits tax and profits tax being less than was required for excess profits tax last year, the result may be considered satisfactory, and could not have been attained but for the continued efforts of my colleagues on the Board and the loyalty and good work of the employees.

In view of this result, the directors feel that they are justified in recommending to the shareholders an increase in the bonus distribution from 2½ per cent. to 5 per cent., making a total distribution of 15 per cent. upon the Ordinary shares for the year.

The report and accounts were unanimously adopted.

The retiring director, Mr Harry F. Smith, was re-elected, and the auditors, Messrs Deloitte Plender Griffiths and Company, having been reappointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

CABLE AND WIRELESS (HOLDING), LIMITED

WIDER SPREAD OF INVESTMENTS

The eighteenth ordinary general meeting of Cable and Wireless (Holding), Limited, was held on the 25th ultimo, in London.

Sir Edward Wilshaw, K.C.M.G. (the Governor), in the course of his speech, said: This is the first occasion upon which I address you since the Government's expressed intention to nationalise Cable and Wireless Limited (the operating company) was implemented on January 1st last. The shares owned by your company in Cable and Wireless Limited have now become the property of His Majesty's Government, and the control of the cable and wireless telecommunications system has passed from our hands.

We took every legitimate step to oppose the scheme by petitioning against the Bill before Select Committees both in the House of Commons and the House of Lords. We did not oppose it on any political ground. We should have opposed it as our bounden duty whatever Government had been in power.

In the proceedings before both these committees directors and officials and I gave evidence, and during the passage of the Bill through both Houses we endeavoured to obtain certain safeguards affecting your interests, and those of the staff of the operating company who had served your company so devotedly for so many years. We were successful in obtaining some protection for your interests, but it was disappointing to us not to have secured some more definite safeguards for the officials and staff than the vague assurances that were given.

It was gratifying to note during the passage of the Bill that not only were there no criticisms of the efficiency of the undertaking, but universal tributes were paid to the operating company on both sides of the House for the services rendered by it and by its staff, in war and in peace.

The other matter of outstanding interest during the year was the sale of our shareholding in Marconi's Wireless Telegraph Company, Limited, to the English Electric Company, Limited. I feel sure that under the able direction of Sir George Nelson there will be further prosperous days for the world-famous Marconi Company.

RESULT OF YEAR'S OPERATIONS

The revenue account for the year 1946 shows a profit of £1,259,641. Investments in securities, stocks and shares quoted on the London Stock Exchange stand at £2,185,000, the market value of which stood at £2,463,000, an appreciation of £278,000. Furthermore, there has during the course of the year been a notable increase in the company's investments from £921,000 at the end of 1945, to £2,185,000 at the end of 1946. The increase, of course, is due mainly to the instalment which was received for the sale of the shares in the Marconi Company.

If you will turn to the consolidated balance-sheet you will see that the securities held at December 31, 1946, had a book value of £9,974,125 and a market value at that time of £11,274,700, showing an appreciation of £1,300,575, equal to about 13 per cent. The comparable figure of appreciation shown at the end of 1945, eliminating the securities held by the operating company, was £357,974, equal to about 4½ per cent. The profits realised during the year amounted to £322,458. The comparable figure in this case for 1945 was £208,280, so there is an increase of £114,178.

INVESTMENT POLICY

As a consequence of the Government's cheap money policy the choice of invest-

ments is becoming largely one of low-yielding fixed charges on the one hand or of Ordinary shares on the other. After careful consideration of the position, the policy of your directors has been to spread the companies' investments over a still wider field and in making each choice to endeavour to hold a reasonable balance between caution and enterprise. As you will observe from the figures before you, the results shown are very satisfactory, but it will be generally agreed, I feel sure, that with the present uncertainties prevailing and with all the hindrances to productive work and enterprise it is difficult to be confident about the economic outlook.

One of the chief requirements for recovery, in my view, is that the nation should be encouraged by wise and statesmanlike leadership to a revival of its war-time unity, and be freed from the constant attacks on one or other section of the community which are for the most part quite unjust and more often than not made for party ends and without a due sense of responsibility.

ARBITRATION ON PURCHASE PRICE

If you will turn to the report of the directors you will see that in paragraph 4 it is stated that it is not possible to make any statement at this annual general meeting regarding the effect of the acquisition by the Government of the shares in the operating company upon the holding company's affairs.

Under the Cable and Wireless Act it is provided that failing agreement on the price to be paid for the shares in Cable and Wireless, Limited, a tribunal should be established to fix the compensation. Attempts to reach agreement with His Majesty's Treasury regarding this purchase price were unsatisfactory and the matter will therefore be referred to an arbitration tribunal. We have done everything in our power to hasten the hearing, but I do not expect the tribunal to sit before the autumn. You will appreciate, of course, that interest on the sum awarded to your company by the tribunal will be retrospective to January 1st last.

As soon as we know the amount we are to receive for the shares of the operating company, which is to be in negotiable Government stock, we shall be able to consider the best course to adopt in your interests and to lay before you for your consideration any recommendations.

STOCKHOLDERS TO BE CONSULTED

In closing my review of last year's operations I feel that the stockholders can congratulate themselves upon the results which have been achieved, and that I may well claim that the confidence which they have so generously given to their directors has been fully justified.

In reply to a question as to what the Board proposed to do when they received from the Government the stock to be paid for the stock of the operating company, he said that it would appear to him that at some stage a scheme of arrangement would have to be made between the Preference and Ordinary stockholders for a re-adjustment of the present position. It would be impossible to do that before they knew the amount and the terms and conditions of the stock to be issued by the Government. Stockholders would be consulted before any decisive step was taken.

The report was adopted.

SPEAR AND JACKSON, LIMITED

GREAT DEMAND FOR PRODUCTS

The forty-second ordinary general meeting of Spear and Jackson, Limited, was held, on the 26th ultimo, at the Staff Dining-Room, Aetna Works, Savile Street East, Sheffield.

Mr A. K. Wilson (the chairman and managing director) presided. The following statement was circulated with the report and accounts.

It is naturally impossible for many of our shareholders—who number close on 850—to attend our annual meeting and I therefore feel it will be appreciated by them if I continue my practice of issuing a statement with the directors' report and accounts as I have done for several years.

PROFIT AND DIVIDEND

As regards the accounts: their presentation is similar in form to that of last year. The net profit is £37,350, which shows an increase of £3,543 compared with the year 1945, and the Directors feel justified in recommending that the dividend for the year shall again be 15 per cent. and that a further £5,000 be added to general reserve which will then stand at £50,000. The directors' report shows a balance to be carried forward to next year of £12,330 against £8,730 for the year 1945.

Our small subsidiary works in Vancouver and Eugene (U.S.A.) have both had a successful year and earned good profits.

Reference was made in my statement of last year to the post-war refund of E.P.T. due to this company, which was then estimated at about £120,000 after deduction of Income Tax. Against this we have received a provisional payment of £113,823 in respect of the period to December 31, 1944, and it is estimated that there will be a further sum of £5,000 receivable for 1945.

A DIFFICULT YEAR

The year 1946 has been a very difficult one, fuel and power supplies have been uncertain and at times the management has been faced with day to day problems which have made it no easy task to carry out their production plans. From the Autumn onwards, supplies of raw materials became uncertain, which added to their difficulties. The labour shortage, particularly of skilled operatives, shows no signs of improvement. Every effort is being made to encourage new entrants into the trades carried on at Aetna Works and with the co-operation of our employees we trust that eventually this shortage will become less acute.

The demand for our products, both at home and in overseas markets, remains very great and notwithstanding the fact that we have to tell our customers that new orders must, of necessity, take many months to execute, with very rare exceptions, all are prepared to wait. There must come a time when this state of affairs will alter, but before then we hope to have greatly improved the delivery position.

VISITS FROM OVERSEAS

During the year we have not received as many visits from our overseas customers as we might have expected—no doubt due to their difficulties of obtaining passages to England, and particularly the return journey. We have continued to build up our world-

wide sales organisation and have now 60 agents and representatives in overseas markets.

Since our last meeting, Mr G. F. Howard and Mr G. W. Parsons, who have been connected with the firm for many years, and who were special directors, have been appointed to the board. Mr D. F. Gordon, who has been connected with the company for some years on the steel side and who is the son of our works managing director, Mr F. F. Gordon, has been appointed a special director. Mr F. W. Clayton retired from the position of a special director on December 31, 1946. He joined the firm in June 1877 and has assisted very considerably in the growth and success of the Company. We wish him continued good health in his well-earned retirement.

Mr G. W. Parsons has just returned from a further visit to the United States of America and Canada and at the present time Mr G. F. Howard is visiting South Africa and Mr R. J. Coombe and Mr S. M. de Bartolomé are in Canada and the U.S.A. From August, 1946 to January, 1947, Mr S. M. de Bartolomé was in South America, making an intensive study of that market.

RELATIONS WITH LABOUR

Labour.—The relations between the management and the workers continue good. I believe it is true to say that a real effort will be made so that output shall not suffer through the introduction of the five day week. Unfortunately, through the shortages to which I have already referred, output is down in many sections of our business, but I trust, as the year advances, this will be remedied.

I once again, in all sincerity, express the board's appreciation to the company's management, staff and employees for their efforts to overcome the many difficulties which have arisen during the year and congratulate them on the results achieved.

The report and accounts were unanimously adopted and the dividend of 15 per cent. on the ordinary shares was approved.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

RECORD PEACE-TIME OUTPUT

The annual general meeting of the Automatic Telephone and Electric Company, Limited, will be held in Liverpool on the 16th instant.

The following is an extract from the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts:—

Profits including adjustments total £440,335. The balance available is £238,869, from which your directors recommend a final dividend of 7 per cent. on the ordinary stock, making 10 per cent. for the year, plus a cash bonus of 2½ per cent., and a dividend of 10 per cent. on the deferred stock and shares plus a cash bonus of 2½ per cent., all subject to tax. In spite of difficulties and delays we have succeeded partially in our policy of providing new machinery and equipment.

We have spent much money and great effort in expanding our activities and we have substantial business on our books from some sixty countries, of which not a small proportion comes from hard-currency countries. The year 1946 was a most difficult one. We achieved a large output—the largest we have ever had in peace-time—but it was in spite of immense difficulties.

The one thing industry is being urged to do is to produce, and industry wants to produce, but the doctrinaire plans of our Government seem to do little but distract

and retard. In this perilous period in the history of the country, industry, commerce and business want an end to the disturbance and frustration inherent in schemes of nationalisation and the spate of legislation, a gradual cancellation of controls and every use made of skill, experience and willingness on the lines which have been proved so successful.

PURNELL AND SONS, LIMITED

INCREASED PROFIT

Mr. W. HARVEY'S SPEECH

The thirteenth ordinary general meeting of Purnell and Sons, Limited, was held, on the 26th ultimo, at the Chartered Insurance Institute, 20, Aldermanbury, London, E.C., Mr W. Harvey (chairman and managing director) presiding.

The following is the chairman's speech, which had been circulated with the report and accounts for the year ended September 30, 1946, and was taken as read:—

It will be observed from the profit and loss account that the profit, before providing for taxation for the year under review, is £988,005, compared with £815,133 in the preceding year, and that after providing £800,000 for taxation the balance remaining is £188,005. The dividends already declared have absorbed £30,302, leaving £157,703, which, together with the amount brought forward from the last account of £14,326, gives a balance available of £172,029. Your directors recommend a final dividend of 60 per cent., making a total for the year of 80 per cent., and this, less tax, will absorb £68,401, leaving a balance to be carried forward of £103,628.

A perusal of the balance sheet would indicate that your company has spent over £44,000 on fixed assets, and have made further advances to the subsidiary company to enable the subsidiary company to acquire a business which provides material for the main business of the company.

RECENT NEW ISSUE

Owing to the complicated nature of the business with all its ramifications, it has not yet been possible to compute the final taxation, but your directors have, during the year, made substantial payments on account and have provided a reserve of £1,538,887, which they consider is adequate to meet the full liability of the group, no provision having been made for the substantial repayment which your company should receive in due course.

It will be remembered that in my speech last year I indicated that your directors proposed to endeavour to obtain the permission of His Majesty's Treasury to issue the unissued capital of the company. It will be known to all of you that early this year the consent of His Majesty's Treasury was obtained and the unissued capital was offered to existing shareholders and was fully subscribed. The premium at which the shares were issued will provide a substantial reserve which will appear in the current year's accounts.

Although it is becoming increasingly difficult to obtain adequate supplies of material for our business, I am pleased to be able to state that there is every indication that the profit of last year will be maintained in the current year.

Your directors are making arrangements to enable you to be furnished next year with a consolidated balance sheet and profit and loss account.

In conclusion, I wish to pay tribute to the work of my colleagues on the board, the staff and the workpeople, without whose wholehearted co-operation the excellent results shown on the accounts could not have been attained.

The report and accounts were unanimously adopted.

GROSVENOR HOUSE (PARK LANE), LIMITED

IMPROVED RESULTS

The nineteenth general meeting of Grosvenor House (Park Lane), Limited, was held on the 30th ultimo, in London, Colonel H. W. Burton, O.B.E. (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts:—

The net profit amounted to £238,486 and there remains available £149,244. The board has pleasure in recommending a final dividend of 3½ per cent. (less tax) on the Ordinary Stock, making 6 per cent. for the year. In view of the exceptionally good trading results and the profit, the board also recommends a bonus of 4 per cent. (less tax).

The reserve for maintenance now stands at the imposing figure of £250,000. There is little doubt, however, that all this and more will be required to re-equip, redecorate, and generally refurbish the premises and contents so as to bring them up to the standard which is properly expected of Grosvenor House.

THE TOURIST BOARD

The Government has set up the "British Tourist and Holiday Board," which has four Committees, one of which is the "Hotels Committee." This is a new departure and constitutes a welcome recognition by the Government of the importance of Tourism and Hotel-keeping in the nation's life.

The short-term policy of this Board will no doubt be to stimulate the vitally important tourist trade, to extend the facilities for holidays for Britain's workers, and therefore to make available and to equip the maximum possible amount of hotel accommodation. Judged by the wording of the Catering Wages Act and of various relevant reports, the long-term policy of the Tourist Board and its committees will be to set new and better standards of travel, accommodation, and service. These are obviously highly desirable objectives, and should be of benefit not only to our industry, but also to the general well-being of the nation.

These are historic years for the hotel industry and there is no doubt that we have entered upon a period of developments which are likely to profoundly affect its future.

If we face the future boldly the new developments—the introduction of Trade Unionism, Government recognition through the Tourist Board and the setting up of a statutory Wages Board—might well lead to a better understanding of the nature of the hotel business and a more general recognition of its status among the nation's major industries.

In contrast with some of the opinions that have been publicised, I hold the view that the majority of visitors to London are favourably impressed with the extent of our recovery from the war. Visitors to this hotel have again and again expressed their pleasure and surprise at the high standard of personal service they get from our staff. Many, indeed, have assured us that they find it distinctly superior to the service offered today in many American hotels with a high reputation.

SHORTAGE OF ACCOMMODATION

Our greatest shortage is, indeed, accommodation. We are at Grosvenor House preparing to have 129 additional rooms available for the 1948 season.

During recent months the apartments, flats, restaurant, grill room, banqueting department and American bars have all broken previous records of turnover.

The large ballroom has been derequisitioned for over a year, but agreement on replacements and repairs has not been completed. I fear that it may not be ready for use as a ballroom for another two years.

The report and accounts were adopted.

GENERAL MINING AND FINANCE CORPORATION, LIMITED

(Incorporated in the Union of South Africa)

INCREASED PROFIT

SIR GEORGE ALBU'S SPEECH

The forty-seventh ordinary general meeting of shareholders of the General Mining and Finance Corporation, Limited, was held on the 17th ultimo in Johannesburg.

Sir George W. Albu, Bt., the chairman, in the course of his speech, said:—

The profit for the year at £44,289 is £67,604 in excess of that earned in the previous year. This profit, when added to the unappropriated balance at the beginning of the year, made £586,527 total available profit. Dividends equivalent to 5s. per share in respect of the year have been maintained, absorbing £316,145. General reserve and investment reserve now aggregate £1,400,000.

In December last shareholders by special resolution authorised an increase of 500,000 shares of £1 each in the Corporation's registered capital. The registered capital now stands at 2,000,000 shares of £1 each of which 1,264,579 fully paid shares are issued.

GOLD MINING INDUSTRY

In my address to shareholders at the last annual meeting I expressed the hope that the industry would return to more normal operations by the gradual removal of the restrictions under which it laboured during the war years. The position, unfortunately, has not improved during the past year, as you will note from the statistical figures of the producing gold-mining companies of the Witwatersrand. These show that the working profit decreased by about £5,500,000 to £26,402,389, while working costs per ton milled increased by a further 1s. 10d. to 25s. 7d., or 30 per cent. higher than the pre-war figure.

The past year has undoubtedly been one of great difficulty for the industry, and since the close of the year production has suffered a further setback by the sectional strike of underground European miners, to which I shall refer later.

OPERATIONS RESTRICTED

Operations during 1946 were restricted, due to a large extent to the continued shortage of both European and native labour, want of essential mining materials, delays in plant and machinery delivery and to the adverse effects of European and native strikes. In the main, however, increasing working costs limited production and development operations. The disquieting features of the upward trend in working costs and diminishing ore reserves are problems of grave concern to mine managements. This upward trend in costs during the year has brought about a further decline, estimated at 3½ million tons, in the ore reserves by raising the marginal pay limit. The reserves have now fallen to a dangerously low level with a consequent shortening of the lives of existing mines.

During the year the industry had to shoulder additional burdens, the principal being payments and benefits granted to mine employees by way of increased increments and by contributions to the Mine Officials Pension Fund established during the year; increase in the railway administration's charges on freight carried for account of the mines; additional contributions to provide increased benefits under the new Silicosis Act (1946) and expenditure in meeting the heavy upward cost of stores and foodstuffs, etc. In the general inflation of wages, commodity prices and other items of expenditure, gold mining is being crushed between the fixed selling price of gold and the pressure of ever-growing production costs.

Earlier in my address, I mentioned the damaging effects on the industry of the prolonged intra-union strike by a section of European miners which began last February and lasted nearly seven weeks. A particularly serious aspect of these strikes is that they have nothing whatever to do with the terms and conditions of employment.

It is apparent that the revenues of the industry and the Government suffered heavy loss and the men and their families too had had to bear the hardship of lost wages and other benefits. If the unions are unable to settle their differences by discussion and conciliation through the methods built up over many years by the Chamber of Mines and the European trade unions, then I maintain some form of legislation is necessary whereby such strikes will be illegal. The use of the strike weapon is totally uncalled for to settle intra-union disputes. The disturbed conditions in the industry affected native labour and the influx from within and outside the Union fell considerably, making the already acute shortage experienced in recent years more pronounced.

TAXATION AMENDMENTS

The immediate effect on dividends of high costs and lower profits was somewhat mitigated by the amendments in gold mining taxation. Since the close of the year the Minister of Finance, in his Budget speech, announced a reduction in the formula tax of 10 per cent. as from January 1, 1947. In addition the Budget proposals will allow a more rapid amortisation of post production capital expenditure. These concessions are welcome; nevertheless the rate of taxation of many gold mining companies remains inordinately high compared with the general level throughout industry.

The percentage receivable by the Government in taxation and share of profits from the gold mining industry's taxable income in respect of the past year is more than double the level referred to and it is hoped that in the near future the Minister will by further reductions in the formula tax remove the whole of the war-time levy. In making this plea we ask that he should also consider the abolition of the non-resident shareholders' tax, an imposition which has been a constant source of irritation to overseas shareholders. The Union largely depends on overseas capital to finance its undertakings and the industry is opposed to this tax on the ground that it tends to discourage the flow of such capital and to the fact that overseas investors in gold mining companies are already subject to excessive taxation before profit is available to them.

ORANGE FREE STATE

The opening up of the new gold fields in the Orange Free State by the granting by the Mining Leases Board of lease areas for seven mines and the work that is proceeding has fully confirmed the faith which I expressed in this new field when I last addressed you. Two lease areas, each of approximately 5,100 claims, to be known as Freddie's Northern Lease Area and Freddie's Southern Lease Area have been granted to the Free State Development and Investment Corporation, Limited. Your corporation is indirectly interested in the two companies which will be floated to take cession of the lease areas by reason of its controlling interest in General Exploration Orange Free State, Limited.

A report of the proceedings at this meeting will not be circulated to shareholders. Copies may be obtained on application to the HEAD OFFICE in Johannesburg and to the LONDON OFFICE.

SILVER LINE, LIMITED

PROPOSED CAPITAL INCREASE

The twenty-first ordinary general meeting of Silver Line, Limited, was held at Palmerston House, Bishopsgate, London, E.C., on the 3rd instant.

The following is an extract from the statement of the chairman, Mr Stanley M. Thompson, circulated with the report and accounts for the year to December 31, 1946:—

As you can well imagine, we have had constantly before us the problem of replacement of the tonnage lost during the war. This problem has short-term as well as long-term aspects. The short-term problem has been met in large measure by more extensive chartering than would normally have been necessary, which has at least enabled us to cover the berths and maintain some sort of continuity of service. Also, as part of this short-term policy, the company's Canadian subsidiary is this year taking delivery of its remaining Canadian-built Victory vessels, which are being time-chartered to this company as a stop-gap arrangement pending delivery of our own specialised tonnage now under contract. We have also been able to purchase an American Liberty vessel which will be re-named the "Silvercedar," and we are hopeful of being able to obtain an American-built Victory vessel.

The long-term programme involves not only the eventual possession of specialised tonnage adequate to our needs, but also the modernisation of the existing fleet. We have to keep in mind that the complete restoration of our post-war services will require an adequate number of vessels, and also that they must be sufficiently modern and efficient to meet all competition. The two oldest units have been sold, one being delivered to her new owners in 1946, and the other will remain in the company's service until later on this year. We now have four new vessels on order, for building in this country, but this is not the end of the present long-term programme. I need scarcely remind you that vessels of the type permanently required by this company cost twice to three times as much under present conditions as they would have cost just before the outbreak of the war; furthermore, the rate of delivery has been seriously retarded due to the present shortage of steel. As a continuing liner company, however, it is imperative for us to plan ahead and to maintain the fleet at a high state of efficiency.

POST-WAR REORGANISATION

As part of the post-war reorganisation, negotiations have now been concluded to make the company self-managed, the cost of which operation has been provided out of the 1946 profits, and which will take the form of an allotment to the management company of 100,000 shares of 10s. each, fully paid. Whereas in the earlier days of the company's history the share capital of the company was held in the main by only two groups, namely the leading brokers and the managers, there have since been introduced further groups which have somewhat broadened the base of the shareholding interest in the company. The directors believe that it is desirable to face the future with an organisation which, whilst retaining the value of the experience gained in past years, is capable of normal expansion, and it is considered that to make the company self-managed will be a valuable contribution to that end. It was reported last year that arrangements were completed to acquire from the leading brokers the outright ownership of berth rights covering the trades on which the vessels had operated hitherto, which ownership substitutes the more limited "loading rights," which item now disappears from the balance sheet. There-

fore as from the end of 1946, the company will become a self-managed concern, with its berth rights (so important for a liner company) standing in its own name.

NEED FOR FURTHER CAPITAL

You will note that the balance sheet shows a highly liquid position, but we still lack resources to a substantial amount to complete the first part of our long-term development programme. Following the formation of the company in 1925 we financed our development by way of loan capital guaranteed by H.M. Treasury and the Government of Northern Ireland, and by other forms of loans, and this proved to be an unsatisfactory arrangement from the company's point of view, for it put us in a relatively weak position to withstand the impact of trade depressions. Whilst I do not anticipate that trade depressions in future will be as severe as they have been hitherto, your directors have none the less decided as a matter of policy to avoid large issues of loan capital in future.

In order to be in a position to raise capital for purposes to which I have referred, notices have been sent to shareholders inviting them to pass resolutions, the effect of which will be to increase the authorised capital from £950,000 to £3,000,000 by the creation of £1,000,000 4½ per cent. Cumulative Preference shares and 2,100,000 further Ordinary shares of 10s. each, and at the same time to adopt new and up-to-date articles of association. If these resolutions are passed, a public issue will be made shortly thereafter of part of the new capital on terms which the directors believe will be fair to both the company and investors alike.

You will note that the directors recommend a dividend in respect of 1946 at the rate of 8 per cent., which is a modest increase over the distribution for the previous year. Shareholders have been denied a reasonable return on their shares during recent years because it was considered prudent to plough back as much of the profits as possible, pending clarification of the post-war situation. Now that this is beginning to clear shareholders are entitled to some indication of what they may reasonably expect until such time as the proposed further tonnage is in commission.

MOTAPA GOLD MINING COMPANY, LIMITED

(Registered in the Colony of Southern Rhodesia)

GOOD PROGRESS

The first ordinary general meeting of this company was held, on the 30th ultimo, in Bulawayo, Major E. Tulloch, D.S.O., M.C., presiding, and the following is an extract from his address.

The chairman, in the course of his speech, said:—

Operations on the company's property have advanced considerably. A reduction plant of a capacity of 25,000 tons per month is in course of erection and it is expected that milling operations will be commenced early in 1948, provided that there will be no undue delay in the remaining deliveries of machinery, plant and equipment.

Good progress has been made with the sinking of the two new vertical shafts which had been commenced prior to the formation of the company. The No. 1 Shaft in the Eastern Section has been stopped at a depth of 511 feet, having been completed in its initial stage. The No. 2 Shaft in the Western Section has been stopped at its final depth of 858 feet.

The partially proved ore and the probable ore available as the result of development work which had been done up to June 30, 1946, was calculated to amount to 1,387,000 tons of an average value of 3.6 dwts per ton

over a width of 17.1 ft. The development footage accomplished since that date has been mainly confined to the preparation of the mine for stopping. The small amount of exploratory development, while exposing some new payable ore, has not brought about sufficient material change to justify, at this stage, a revision of the estimate of partially proved and payable ore as originally computed.

The report and accounts were adopted.

PHILIP HILL INVESTMENT TRUST, LIMITED

SIR EDWARD MOUNTAIN ON SATISFACTORY RESULTS

The fifteenth ordinary general meeting of Philip Hill Investment Trust, Limited, was held on the 21st ultimo, at the May Fair Hotel, Berkeley Street, London, W. Sir Edward M. Mountain, Bt. (chairman of the company), who presided said:—

Conveniently, the accounts for the year show our profits, before providing for taxation, amount to £10,469—which compares with £74,399 for the previous year. Income from investments and interest on advances to a subsidiary company amounted to £223,569, compared with £190,888 for the previous year.

Dividends from subsidiary companies amounted to £350,000, compared with £180,500 last year. This latter increase is attributable to the larger dividends received from your company's wholly owned subsidiary, Philip Hill and Partners, Limited, and is a reflection of the activity during the past year in the new issue market and other financial business generally.

During the year under review Philip Hill and Partners, Limited, has been responsible for issues, conversions and placings totalling over £25,000,000. Your directors have maintained their policy of sponsoring only issues which, in their opinion, are not merely fundamentally sound, but whose long-term prospects are such that they can be recommended to the permanent investor.

CONSERVATIVE DIVIDEND POLICY

While the results for this year are very satisfactory, it should be remembered that, owing to the practical cessation of industrial issues during the war years, there were considerable arrears of this class of business to be dealt with. The period under review may thus prove to have been an exceptional one. For this reason the directors have deemed it advisable to adopt a conservative dividend policy and only to recommend the payment of a dividend which, so far as can be seen, should be at least maintainable in future years. The outlook for Philip Hill and Partners, Limited, for the current year is promising.

You will note that, as explained in the directors' report, the accounts of the company are presented in a new form this year, and that we have included a consolidated balance sheet, from which it will be seen that the capital reserves total £2,178,527, and the profit and loss account balance carried forward amounts to £634,987. The total quoted investments held by Philip Hill Investment Trust, Limited, had a market value at March 31, 1947, of £5,661,823 and those held by the subsidiary companies of £1,320,684, giving a total market value of £6,982,507 as compared with a total book value of £4,626,667. The unquoted securities held by your company's subsidiaries stand in the balance sheets of these companies at £1,011,663, which in the opinion of your directors is a conservative valuation. I hope that you will agree with your board, in view of these figures, that they are justified in having every confidence in your company's future.

The report and accounts were unanimously adopted and a final dividend of 15 per cent. on the ordinary shares, making 25 per cent. for the year, was approved.

ORION INSURANCE COMPANY, LIMITED

CONTINUED DEVELOPMENT

SIR STRATI RALLI'S STATEMENT

The seventeenth ordinary general meeting of The Orion Insurance Company, Limited, was held, on the 26th ultimo, at 70-72, King William Street, London, E.C., Sir Strati Ralli, Bt., M.C., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year ended December 31, 1946:—

The more favourable conditions prevailing throughout the year 1946 made it possible for your directors to set in motion certain long deferred projects which form the long ground plan of our policy of gradual expansion of the company's business, both territorially and in the classes of business transacted. The underwriting results realised and brought into account in 1946 are again satisfactory and the balance-sheet affords further evidence of continued development.

MARINE DEPARTMENT

The marine premium income for 1946 at £432,654 compares with £384,549 for the previous year. The total claims paid amount to 56 per cent. of net premiums, compared with 64 per cent. for 1945. The increase in expenses of management from 3.9 per cent. to 5.3 per cent. is due to the higher level of costs and salaries now prevailing.

The 1944 underwriting account has closed with a satisfactory surplus. This involves a correspondingly heavy liability for excess profits tax and has necessitated transferring the sum of £125,000 to profit and loss account. The marine fund now stands at £627,335 (or 145 per cent.), as compared with £585,421 (or 152 per cent.) last year.

Our 1945 and 1946 underwriting accounts are progressing favourably, but the heavy losses incurred by the market generally in the early months of 1947, in conjunction with the high cost of hull repairs and the continuing drain of theft and pilferage claims, act as salutary reminders that underwriting margins in the marine department cannot be expected to remain at the level generally attained in recent years.

NON-MARINE DEPARTMENT

The aggregate premium income from all classes of business in the non-marine department amounts to £242,761, compared with £248,578 for 1945. Claims incurred work out at 70 per cent. of earned premiums, compared with 71 per cent. for 1945, and commission and expenses together absorb 18.5 per cent. compared with 20 per cent. for 1945.

After setting up our customary reserve of 50 per cent. for unexpired risks and making adequate provision for all known outstanding losses, this account has provided the satisfactory profit of £29,073, or 11.8 per cent. of earned premiums, compared with £22,320, or 9.6 per cent. last year.

PROFIT AND LOSS ACCOUNT

To the balance of £28,302 brought forward from 1945 has been added net investment income of £22,449, which shows an increase of £4,901 over last year, and the underwriting profit of £154,073, which compares with £127,319 for 1945. After charging £2,000 in respect of directors' fees, transferring a further £1,000 to staff contingency fund, and providing the sum of £155,000 for taxation, there remains a balance of £46,824 available for distribution.

In view of the satisfactory results disclosed, your directors feel justified in recommending the payment of a dividend of 10 per cent. less income-tax, for the year 1946 which compares with 8 per cent., less income-

BRITISH ELECTRIC TRACTION COMPANY, LIMITED

EFFICIENT TRANSPORT SERVICE

The fifty-first ordinary general meeting of this company was held in London on the 20th ultimo.

Mr H. C. Drayton, the chairman, said that the gross revenue for the year to March 31, 1947, was £823,000 and constituted a record in the history of the company. The net profit was £366,000 against £337,000 and the directors recommended a dividend on the deferred ordinary stock of 50 per cent. Reserves and undivided profits totalled almost £3,000,000. That was the amount which they had ploughed back into the company.

When their electricity supply and road passenger transport businesses were started it had meant a lot of hard work and much money had been lost. To-day they were in a prosperous condition brought about by the company's work over a great number of years in building up and giving an efficient service to the public. He did not think anyone, even the Government, could deny that their road passenger transport organisation was among the most efficient and economical in the country. With the exception of two companies, they had not increased their fares since 1934, although they had had a considerable rise in the cost of labour and operation.

It might be argued that as road passenger transport as a whole was profitable and there was no guarantee that it would remain so indefinitely, now would be a good time in the interests of the stockholders for them to be nationalised, but a business such as that of this company had not been built up on expediency. He could not accept the argument that because they were prosperous now was the time they should cash in.

The report was adopted.

LISBON ELECTRIC TRAMWAYS, LIMITED

ALL-ROUND INCREASES

The forty-ninth ordinary general meeting of the Lisbon Electric Tramways, Limited, was held, on the 25th ultimo, in London.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, K.C.I.E.:—

The number of passengers carried on the tramcars and elevator increased by nearly 23 millions compared with 1945, to the record number of 250,765,722, while the company's motor buses, seven more of which were put into service during 1946, carried 3,332,247 passengers, an increase of nearly 2,000,000 over 1945. The total passengers carried on all the company's vehicles amounted to 254,097,969, approximately 25 millions more than in 1945, the mileage run increased by nearly 700,000 miles. The average number of tramcars per day increased from 347 in 1945 to 370 in 1946. Every expedient has been adopted to relieve the over-crowding which still exists. Five more motorbuses including two double-deck vehicles have been received in 1947 and a further 92 single-deck vehicles are on order; delivery of a substantial number of these is promised before the end of 1947.

Operating revenue has increased by £154,847, due to the larger number of passengers carried, but the greater mileage run, together with further wages increases, a necessary increased allocation to depreciation, etc., have resulted in expenses rising by £149,297.

The accounts show that, after providing for all charges, including general and depreciation reserve, there remains a balance of £59,790. The Preference dividend for the year and a dividend of 5 per cent. net on the Ordinary shares amount together to £61,595, leaving £33,565 to be carried forward.

tax, distributed for the year 1945. This requires a net provision of £13,832, leaving an increased balance of £32,992 to be carried forward.

BALANCE SHEET

The total of invested funds is shown in the balance-sheet at £1,327,779 and, of this figure, approximately 90 per cent. consists of British Government securities. The aggregate market value of the investments is in excess of their aggregate book value. The total assets of the company stand at £1,621,204, compared with £1,444,608 last year.

Regarding the account as a whole, I feel there is reason for us to be satisfied with the progress achieved during the year under review. In closing, I would again record our thanks to the company's friends in the London market and to our representatives at home and abroad for their valued support of the company throughout the past year.

The report and accounts were unanimously adopted.

VENEZUELAN OIL CONCESSIONS, LIMITED

LARGER PRODUCTION AND PROFIT

The thirty-first annual general meeting of The Venezuelan Oil Concessions, Limited, was held, on the 1st instant, in London, Sir Andrew Agnew, C.B.E., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:—

The profit and loss account for 1946 shows a profit of £1,012,942, an increase of £244,620 over 1945. Although we have had to meet rising costs of production during 1946, we produced a much larger volume of crude oil and, in consequence of the upward tendency of the oil market, we received higher prices for our production. The increased profit arising from these factors has brought us within scope of the U.K. Excess Profits Tax and no less than £7,492,101 has been reserved against our liabilities to the Venezuelan and U.K. Treasuries for income taxes and other taxes on profits.

In consequence of this retention of profits in the business, the nominal value of the share capital by no means represents the total amount which we have invested in our undertaking in Venezuela. The balance-sheet generally shows a position of strength and we have ample funds on hand for further expansion. Your board considers the financial position to be thoroughly sound. Under the circumstances, they feel justified in recommending a final dividend of 2s. 4d. per share, making a total distribution for the year of 3s. 3d. per share.

Venezuelan production averaged about 886,000 barrels daily in 1945, and about 1,065,000 barrels daily in 1946; during the first five months of this year the rate has been approximately 1,160,000 barrels daily. Our own production has been increasing at a proportionately somewhat higher rate and our output for this year to date has averaged 238,000 barrels daily, representing an annual total of some 87,000,000 barrels.

As in my statement last year, I must couple my reports of rising output and higher prices with references to the still increasing producing costs in Venezuela. The advance in labour costs, which became effective on June 1, 1946, represents in direct wage increases and indirect benefits, a rise of at least 40 per cent. This wage agreement is operative only until the end of this year. Another extra item of cost is involved in the obligation undertaken in the labour contract to submit to the Government a draft pensions plan covering both daily workers and monthly employees on the Bolivar payroll.

The report was adopted.

HARLAND AND WOLFF, LIMITED

RECORD OUTPUT OF NEW TONNAGE

SIR FREDERICK REBBECK'S SPEECH

The sixty-second annual general meeting of Harland and Wolff, Limited, was held on the 26th ultimo, at the registered offices of the company, Queen's Island, Belfast. Sir Frederick E. Rebeck, D.Sc., D.L., chairman and managing director of the company, presided.

The Secretary, Mr A. T. Marshall, O.B.E., read the notice convening the meeting and the report of the auditors.

The Chairman referred to the report of the directors, which it was agreed could be taken as read. He felt sure the stockholders would regard the report and accounts as satisfactory. He went on to say: The company's output of new merchant tonnage has again achieved the record for the year in the shipbuilding and marine engineering industry. The total tonnage of ships launched was over 180,000 gross tons, and the output of machinery totalled over 310,000 I.H.P. The tonnage launched from the company's yards at Belfast and Glasgow consisted of passenger ships, cargo liners and tankers, and H.M. Aircraft Carrier Eagle. The Aircraft Carrier H.M.C.S. Warrior was completed and commissioned during the year.

RECONDITIONING AND REPAIR WORK

Our establishments at Belfast and on the Clyde, as well as the repair works at London, Liverpool and Southampton, have also played an important part in the reconditioning and repair of a large volume of merchant tonnage, including many well-known passenger liners, which are so urgently required for the immediate relief of sea transport. The return to service of these vessels, fully restored to their peace-time conditions, has received much favourable comment.

Until towards the end of the year under review there was no serious interruption in the supply of materials required in the industry. The output which we were thus able to attain at all our establishments required the services of approximately 40,000 workpeople.

The shipbuilding industry is making an important contribution to the national export drive, and our present programme of work

includes orders for French, Dutch, Norwegian and Argentine owners. We also have orders in hand for diesel engines for pipeline service in the Middle East.

We have entered into an agreement for a term of years with the English Electric Company, under which we will undertake, at our ordnance works on the Clyde, high priority work for national power schemes and for the export market.

PRICES AND SUPPLY UNCERTAINTIES

We have a considerable volume of work in hand at all our establishments, but the uncertainty regarding prices and supplies of materials may have a serious effect on our future prospects. Some owners are deferring the placing of orders in the hope that prices may fall, but the outlook in this connection is very obscure. It is the concern of the shipbuilding industry to prevent further increases in cost, and to do all in their power to reduce current prices in spite of the difficulties.

In recent months the position in regard to supplies of materials and equipment has been difficult and, so far as the most important items of steel and timber are concerned, the situation is acute and work is being delayed in all directions. The drastic rationing of steel to the shipbuilding industry is naturally having a serious effect on our entire production programme. Ships, by carrying exports and earning foreign currency, are important export factors, and the decision to exclude steel for shipbuilding from the priority list is a very serious one. We hope that this will be reconsidered at an early date. Shipbuilding is so much an assembling industry that success depends on the availability of materials at the time they are required.

PROPERTIES FULLY MAINTAINED

The company's properties and plant have been fully maintained during the year. The reconstruction work necessary at our Belfast works as a result of enemy action has been practically completed, but considerable air raid damage has still to be made good at our branch establishments. This work will be put in hand as soon as material and manpower are available, and the necessary licences forthcoming.

Once again we were honoured by a Royal visit, when in April of this year Her Royal Highness The Duchess of Kent visited our Belfast works to name the Light Fleet Carrier Centaur for His Majesty's Navy.

The chairman took the opportunity of

expressing the Board's appreciation of the loyal support and high standard of service rendered to the company by its employees.

The chairman then formally moved the adoption of the report and accounts, which was seconded by Sir John Craig and unanimously approved.

Thereafter Mr Wm. Strachan, jr., Mr Atholl Blair and Mr L. V. Dunlop, the directors retiring by rotation, were re-elected and the auditors, Messrs Price Waterhouse and Company, were reappointed.

The meeting terminated with a unanimous vote of thanks to the chair.

RIO DE JANEIRO CITY IMPROVEMENTS COMPANY, LIMITED

TERMINATION OF CONCESSION

The eighty-fifth ordinary general meeting of The Rio de Janeiro City Improvements Company, Limited, was held on the 25th ultimo in London.

Mr Francis M. G. Glyn (the chairman) said that in his statement he had said that the board was considering the question of the continuation of the company as an investment trust. The board had, however, decided that it would not proceed with the original suggestion of changing the company as a whole into an investment trust.

There were many complicated matters to be settled as between the company and the Brazilian Authorities. It was difficult to say when the negotiations would be concluded. There was no reason, however, why a substantial part of the liquid assets should not be returned to shareholders. The board proposed, therefore, as soon as practicable, to make a return of capital of 15s. per share. When the negotiations were concluded it would be possible to ascertain what available balance was on hand and the board would then consider whether the company should be put into liquidation or, in its modified form, be continued as an investment trust.

The report was adopted.

The following is an extract from the chairman's circulated statement:—

It is a matter of great disappointment that we should no longer be entrusted with the drainage of the City of Rio. Our concession was expressed to be terminable on April 25, 1947, and the Government of the United States of Brazil decided to hand over on that date to the Municipality of Rio all installations, vessels, plant, machinery and so on which were included under the heading of Drainage Works.

APPOINTMENT OF FIRE AND ACCIDENT MANAGER. Progressive Home and Foreign Fire and Accident Business, invites applications from Senior Executives having wide underwriting experience in both Departmental Assistant-Managers and supporting technical staff will be made at appropriate times and in consultation with present Appointee. The Company already transacts a sound nucleus of business in both age between 35 and 48, with highest technical qualifications, proved initiative, energy and personality required to develop the many contacts the entire organisation and long-term development of these two Departments. Remuneration would consist of high-level Salary plus Profit Commission. Excellent opportunity for the right man. Application of age, experience, qualifications, present position and salary, to Solicitors C 675, c/o Streets, 110, Old Broad Street, E.C.2.

APPLICATIONS ARE INVITED FROM CHARTERED OR INCORPORATED ACCOUNTANTS for service with Control Commission for Germany. Candidates must have wide industrial experience, preferably in coal, oil, power and chemical industries; good knowledge of German language essential. Salary £600 to £1,320 according to qualifications and experience, plus single men, also tax-free foreign service allowance £90 p.a. married men, £25 p.a. single men. Free board and accommodation in Germany. Contracts may run to September 30, 1950. Applications should be made in writing, giving full name, date of birth, qualifications, experience, to Ministry of Labour and National Service, 1-6, Tavistock Square, London, W.C.1, quoting reference number F.B. 35/6. Original testimonials should not be forwarded. No acknowledgments except to candidates summoned for interview.

INTERNATIONAL firm requires Accountant in twenties, willing, after approximately six months' training, reside and travel Far East, view supervising accounts and administration of local branches. Write, stating qualifications and experience, to Box 516.

Statistical Summary

GOVERNMENT RETURNS

For the 9 days ended June 30, 1947, total ordinary revenue was £88,740,000, against ordinary expenditure of £53,385,000 and issues to sinking funds £10,000. Thus, including sinking fund allocations of £2,349,015, the surplus accrued since April 1st is £217,892,455, against a deficit of £275,206,004 for the corresponding period a year ago.

DOMINION OF CANADA
FOUR PER CENT. REGISTERED STOCK 1953-58

For the purpose of preparing the Interest Warrants due September 1, 1947, the Balances will be struck on the evening of August 1, 1947, after which date the stock will be transferred ex-dividend. For the Bank of Montreal, Financial Agents of the Government of the Dominion of Canada in London.

A. D. HARPER, Manager,
47, Threadneedle Street, E.C.2. July 1, 1947.

URWICK ORR & PARTNERS, LTD., have not yet been successful in finding candidates they require for their consulting staff in the Control Division. Further applications are invited from qualified accountants or secretaries who have had industrial or commercial experience, in addition to some years of professional career and who have an understanding of the use of accounting procedures as a tool of management. A good basic education is essential and the desirable age range is 32-40 years. Successful candidates must be prepared to spend several months continuously resident in different parts of the country (apart from week-ends). High level of remuneration commensurate with responsibility entailed. Applications, giving details of qualifications and career to date, should be submitted in writing to the Company's offices at 7, Park Lane, London, W.1.

BRITISH Zone of Germany. English-speaking German business man, resident Bielefeld district, offers service and advice to British trade visitors. Representation undertaken. Wide experience in England and Germany; first-class references either country. Write Meyer, 18a, Highbury New Park, London, N.5, or telephone London, Clissold 1004.

ABLE, youngish man required for London Cosmetic Firm. Must have knowledge of Office Organisation, Advertising, Sales Management and be accustomed to responsibility and authority. Starting salary £1,200 to £2,000 according to qualifications and experience. One or more languages an advantage. Full details of past experience to Box 512.

CHARTERED Accountant. Young man required for administrative position in Cosmetic Manufacturing Company near London. Starting salary £1,200 to £2,000 according to qualifications and experience. Full details of past experience to Box 511.

UNIVERSITY OF LONDON.—The Senate invite applications for the Readership in Economics (Banking and Currency) tenable at the London School of Economics (salary £800-£1,000-£1,200). Applications must be received not later than September 4, 1947, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY OF LONDON.—The Senate invite applications for the Readership in Colonial Administration tenable at the London School of Economics (salary £800-£1,000-£1,200). Applications must be received not later than September 4, 1947, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

WANTED: All copies of *Economist*, 1946, and issues February 22nd and March 1, 1947. Replies to Hulton Press Ltd., 43/44, Shoe Lane, E.C.4.

NATAL UNIVERSITY COLLEGE, DURBAN
Applications are invited for a LECTURER IN POLITICS AND PUBLIC ADMINISTRATION, at a salary on the scale:
Men: £550 x 25—£725 per annum; Women: £425 x 25—£500 per annum to this will be added a cost of living allowance of £46 16s. per annum. A suitable applicant may be appointed at any point of the scale, in accordance with his qualifications.
The successful applicant will be required to lecture in Politics and in Public Administration to B.A., B.Econ., and B.Com. students, at all stages. He will be expected to inaugurate and develop courses in Public Administration. Applicants should be qualified both in Public Administration and in Political Philosophy.
Membership of the University Teachers' Pension and Provident Fund is compulsory.
The appointment will be in the first instance for a probationary period of one year. The successful candidate will be expected to take up duties not later than January 1, 1948.
Further particulars may be obtained from The Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. Closing date for the receipt of applications is July 18, 1947.

HALIFAX EDUCATION COMMITTEE
MUNICIPAL TECHNICAL COLLEGE
Required in September a full-time TEACHER of COMMERCE, Commercial Mathematics, Company Law and Secretarial Practice, Accounting and Business Administration, in the Commerce Department of the College. Applicants should hold a Degree in Commerce or Economics, or equivalent qualification, and have had suitable teaching and business experience. Salary in accordance with the Burnham Technical Report.
Full particulars of the post may be obtained from the Principal, Technical College, Hopwood Lane, Halifax, and applications should be returned to the undersigned within a fortnight of the appearance of this advertisement.

C. E. GENT, Chief Education Officer
West House, Halifax

COUNTY TECHNICAL COLLEGE, GUILDFORD
Principal: J. R. I. Hepburn, D.Sc., Ph.D., F.R.I.C., F.I.M.

TUESDAY'S debate on import policy was unquestionably the most important economic occasion since the inquest on the state of the nation last March. It proved to be a drab, dispiriting and directionless affair. The nation is heading at breakneck speed towards a crisis of dollar insolvency; its prospective deficit on external account during the next twelve months is of the order of £450 million; it is living, quite plainly and obviously, beyond its income. And what is the policy of the Government to meet a situation which could, within a matter of months, jeopardise the British economy and the people's standard of life? Let Mr. Morrison answer:

The Government did not feel it right to impose, shortly after the war, any greater degree of austerity than actually had to be imposed on this country. . . . The Government are quite clear, having given deep and prolonged thought to this matter, that they should not impose cuts of a scale which would require a drastic adjustment of our standard of living until it is perfectly clear and certain that this is the only course open to us.

So Mr Micawber is still waiting, even at the twelfth hour. A series of trifling cuts is the only decision of policy, though Mr Morrison was forced to admit that, measured by the arithmetic of dollars, the cuts would be too little and too late. It may be interesting history to dilate on the contribution which Britain has made to winning the war and constructing the peace. But history is not policy. Nor is the analogy of wartime mutual aid, which Mr Morrison pressed into service as a possible remedy for the world's present ills, a dependable or even a respectable solution of Britain's problem.

The Government's painful hesitation is understandable, but even politically the point is surely that it is the job of government to lead, and that good leadership, however unpleasant its tasks, pays good dividends. The first duty of the Government, as the Lord President truly stated, is to keep Britain in full production, in full employment, in good health and in good heart. It is not to give hostages to fortune when time is running so desperately short. Britain has no right or reason to expect a current deficit of this order to be covered wholly or even mainly out of the proceeds of a new version of mutual aid or any other outcome of the Marshall offer. Mr Morrison might well reflect on the attractiveness of lend-lease in enabling its beneficiaries to spend beyond their income. But propping up the bastion of democracy is one thing; propping up an elderly and impecunious European aunt is another. The refusal of Poland, Yugoslavia, Rumania and Bulgaria to defile themselves with the root of all evil may relieve Britain from some embarrassing competition from countries whose needs are infinitely greater than its own. But, even so, what exactly is the common bond of mutuality which would impel a Middle Western Senator to guarantee to Britain a standard of living still well above the European average? Would America accept this as a rational system of international finance? And are Americans so despairing of the resilience of their own economy that they are ready to accept the principle, as enunciated by Mr Morrison, that gifts to other countries are a positive advantage because they promote stability of employment and a high national income? The American electorate is hardly likely to be moved by such a degree of economic

sophistication. It will show an old-fashioned desire to see its dollars back with interest. It will demand to know whether it is American or British incapacity that accounts for the lower productivity of British industry, and why America should pay for what are, in large part, its consequences.

Mr Morrison was plainly right when he claimed that the gap cannot be filled by cutting imports; equally certainly increased production and exports cannot provide the entire short-term solution. But the debate revealed no intention on the Government's part of making a real effort to reduce the gap by these means. The import programme, large though it is, could easily be larger. Food, if dull, is adequate, and imports of manufactures can be temporarily postponed. But imports of raw materials cannot be deferred without doing further damage to British industry, and they are running well below the level which is needed to give industry a chance to show what it can do. The worst shortages, in coal and steel, are largely for Britain to rectify. But their acuteness merely masks—and sometimes fails to mask—the equally hand-to-mouth supply of many imported raw materials. Yet it is a dangerous and supine doctrine to assert that Britain cannot increase production enough to make some difference in the short run. Production has already recovered impressively from the February slump in many industries—motor vehicle output, for instance, reached a new high level in May. The crucial question is whether the proper proportion of the current output of British industry is being devoted to paying for essential imports—whether, in addition to a standard of living which is being partly paid for on credit, the British consumer is not getting too many motor cars, too many houses, and too many clothes.

It is surely debatable, to take up another of Mr Morrison's points, to say that Britain cannot quickly increase exports or reduce imports by direct measures without imposing an unreasonable cut in the basic standard of living—the standard, that is, which is needed to maintain working efficiency. The Chancellor of the Exchequer, with perhaps unconscious wisdom, pointed to one main line of approach—to cut down inflation and to reduce the pressure of demand in the home market; though, in characteristic fashion, he distorted the plain common sense of a call to arrest the rise in British prices and production costs into an attack on full employment and the national standard of living. A debating point is no answer to plain facts. A reduction of inflationary pressures would correct many of the distortions in the British economy, and by taking some of the easy profits out of the home market, would stimulate manufacturers to seek more business abroad. A return to wartime levels of taxation, a reduction of Government expenditure, and tighter controls over all but the most vital expenditure on physical capital are unpleasant measures for both the politician and the general public to contemplate. But until they have been faced, can the Government honestly claim to have made the best effort to correct the balance of payments deficit and the inflationary situation at home? And is it necessary, at this time of day, to make, once again, the case for an effective wages policy? Is it beyond the capacity of the Government (with or without Mr Deakin's blessing) to convince the nation of the simple fact that more money wages cannot mean a higher standard of living, that they merely increase the level of British costs of production and prevent the undermanned industries from obtaining an adequate share of labour? The faded injunctions of last January's White Paper on labour and wage policy have been buried beneath an avalanche of wage increases and shorter working hours. How does the Government regard the morality of working less and eating more?

The Government are undoubtedly right in claiming that the present levels of food and raw material imports cannot be cut to any large extent without affecting production. Nor are their costs likely to become cheaper—at any rate appreciably cheaper—if America again comes to the rescue; for the whole

sales value of the Marshall offer within the dollar countries lies in its promise that it will ensure that commodity prices will not break. But the fact that British imports are almost trimmed to the bone does not mean that no other savings are possible. Is it quite beyond the bounds of possibility to save £50 or £75 million in the overseas expenditure of the Government? The stock arguments about national prestige and giving a free hand to trouble-makers are wearing a little thin already, and they will vanish into thin air if the Government, having gambled on something turning up, has to announce one Friday afternoon that the dollars have run out, and that rations must be cut from the following Monday by a third.

Good government, good economics and good sense clearly dictate, at this stage of crisis, that increased production, reduced pressure of home demand, and increased exports are the only worthy policy. The sellers' market may be dying, but it is not by any means dead. The pace of world recovery would be brought to a standstill if Britain imposed a series of panic cuts on imports and failed to increase the exports, particularly of capital goods, for which the world will remain hungry for a long time to come. A bigger slice of durable goods production—everything, that is, not urgently needed for current consumption—could still be guided into the export markets. The export quota for cars has been increased; could it not be raised even higher? Why choose this, of all moments, to announce an increase in the clothing ration when 14½ million dollars have recently been spent on Japanese cotton cloth so that Lancashire can supply the Colonies? How great a contribution, in labour, scarce imports, and domestic output would be provided by a temporary reduction of, say, 100,000 houses in the current programme?

These measures would be severe and would doubtless not wholly close the gap. A new drive for British exports would have to face the fact that, in many areas of the world, sterling is now a scarce currency—a miniature rival of the dollar—and even in countries where it is not scarce, the doctrines of non-discrimination mean that a cut in dollar purchases must be automatically accompanied by a cut in sterling purchases. The slowness of world recovery, the succession of natural disasters since the war, the enormous rise in commodity prices during the past year—all these are factors for which no Government is to blame and which no Government unaided can remedy. But they are not going to be solved by a system of European mendicancy and American patronage. Britain is capable of helping itself—to some extent. It would surely be preferable to transpose Mr Morrison's words and say that the Government should impose cuts which entail some adjustment of our standard of living unless it is perfectly clear and certain that this course can be avoided. To base policy—or the negation of policy—on the assumption that the United States will willingly and inevitably solve Britain's problems is a bad example both to the British people and also to European countries whose plight is at least as serious as our own.

A solution has to be found, and found quickly, whether or not it is to the taste of the public, the Government, and the keepers of their conscience behind the scenes. And some attempt at a considered and sincere policy must be on the table in a matter of days, not months. The country is tired of solemn warnings followed by yet another recourse to the banker. It may be that even the best attempt to meet our obligations and to maintain a fair standard of living might fail. But, if so, Britain would at least have the satisfaction of feeling that it failed, not because it asked for charity and was refused, but because it exhausted every resource of effort and skilled leadership and still found it not enough. Only the purblind would say that the economic signals shining out over Britain to-day are still yellow; yet the Government seem quite prepared to act in a haze of forever amber. The colour is red—for danger

The Shadow of the Ruhr

THE attendance at the Paris Conference may not, after all, precisely reflect the division of Europe into Soviet and Western spheres of influence. The Czechs have accepted the Anglo-French invitation and, at the moment of writing, the Finns have not refused; the absence of the Poles, Rumanians, Jugoslavs, and Bulgarians seems certain. Whatever their number, the presence of delegates from Eastern Europe is not likely to alter Russia's fundamental hostility to the whole idea of a Marshall plan. The bitter accusations of treachery and imperialism thrown at Mr McNeil and M. Philip by the Soviet representative at the meeting of the Economic Commission for Europe in Geneva are a foretaste of the campaign which will be waged against the plan by every means in Russia's power. The conferring States, together with their American sponsor, must expect to work under conditions which will be as unfavourable as the Russians, by their influence on local parties and trade unions and by their use of propaganda, can possibly make them.

This campaign of propaganda is only just beginning, but some of its main lines are already clear—that the plan involves the economic enslavement of Europe by American capitalism, which is acting in a desperate attempt to stave off a slump, that Britain and France have "sold out" to Wall Street, that the idea of pooling European resources will wreck the national plans and infringe the economic sovereignty of the European states. One line, in particular, is likely to be given prominence—that the Marshall offer is really a cover for America's determination to restore the Ruhr to full working efficiency and that for the Americans the revival of Germany is the first European priority. On the day the French Communist leader, Thorez, made this allegation in the French Assembly, the *Daily Worker* appeared with a report of the Foreign Affairs Committee of the House of Representatives, which appeared to give German reconstruction top priority. The coincidence is obviously not accidental and it may well develop into the Communists' chief line of attack. Certainly, it is a fruitful one. Uncontrolled German industrial revival appears to the French, to the Czechs and to the Poles, and, for that matter, to the Dutch and the Belgians, to contain a double threat—a threat to their military security, and a threat to their hopes of replacing German industry by their own. It is also a challenge to their strongly held view that allies—not ex-enemies—should receive first consideration under any plan of reconstruction. The Communist attack will also be made more effective by the fact that west German industry is a subject upon which the Western allies are largely in disagreement.

This fundamental difficulty may not appear in the first days of the conference. The delegates will be occupied with

questions of procedure and the underlying points of principle may not emerge at once. But the discussions cannot develop far without the question of the Ruhr moving to the centre of the stage. The Ruhr presents the allies with three problems. The first is the level of production to be permitted; the second is the type of authority which should supervise the area; the third is the disposal of the Ruhr's products in a divided Europe. This third point has not yet received much attention and cannot, therefore, be said to cause major disagreement among the allies at present. But once the period of acute shortage and steel famine is overcome, it is possible that the Ruhr will be competing with France, the Benelux Union, Britain and the United States for markets very considerably reduced by the separate development of Eastern Europe. Any long-term plan which finds itself restricted to Western Europe will be compelled to face this problem. For the moment, however, it is on the level of industry and the type of control in the Ruhr that the controversy turns.

The French attitude to these two points is clear cut. The French do not wish to see a revival of the Ruhr iron and steel industry beyond the point permitted in the Allied Plan for the level of industry—in other words, an annual output of 5.8 million tons of steel. To replace the loss of production represented by this figure—the Ruhr is estimated to have produced some 14 million tons in a "normal" year—the French demand that their industry should be expanded to produce 15 million tons of steel a year, an expansion which is possible only if the Ruhr produces very large quantities of coal and exports them to Lorraine. On the question of controlling and managing this development, the French published a memorandum last February outlining proposals for an international authority in which ownership of the Ruhr's coal and steel would be vested and whose responsibility would extend down to the management. This, then, is the essence of the French approach to the Ruhr—more coal and less steel and direct management by the Allies.

The British have consistently supported a figure of some 11 million tons of steel for the Ruhr's annual production and accepted the lower figure with great misgiving. They argue that in an industrial area as inextricably interwoven as the Ruhr a reasonable output of steel is a condition of securing a high output of coal. They blame the present failure of coal production to rise not only on inadequate rations but upon the decision taken two years ago under the Potter-Hyndley Report to concentrate on the export of coal and to allot an altogether insufficient quota of coal to local reconstruction. They have, therefore, been very ready to consider any reason-

able plan for raising the level of German industry and it is likely that an Anglo-American decision to do so may be announced very shortly. The British do not welcome the idea of an international authority, first because they wish to continue to run their own Zone themselves, and secondly because they believe the experience of the French in the Ruhr in 1923 and 1924 suggests that direct Allied management will hamper production, not increase it. In fact, the British intend to hand over almost complete responsibility for production and distribution to the Germans on July 15th, and consider that the socialisation of mining and heavy industry, with possibly some sort of international commission for broad surveillance, will be a sufficient method of control.

★

The British and the French thus disagree at every point on policy for the Ruhr and two years have not overcome the divergence. Unfortunately, the beginning of a much more active American interest, both governmental and private, in the Ruhr has not resolved the differences, but has introduced new variations on the troubled theme. The Americans appear to share France's distrust of the British administration of the Ruhr. The criticism is often heard that neither in Britain nor Germany are the British getting the coal out of the ground. It is therefore likely that the Americans will insist before the year is out that the Ruhr should be managed either under Anglo-American control or under tripartite administration with the French. The American case will be all the stronger since it is clear that Britain cannot much longer meet half the costs of occupation in dollars.

So far there need be no conflict between the Americans and the French. Nor would the French necessarily reject the tentative project suggested by the International Bank—that its loans should finance the Ruhr's revival under an authority possibly representing the chief users of Ruhr coal. The French might even accept a feature of the plan which is disturbing to British opinion and would be instantly exploited by the Communists (whose hold on the Ruhr miners is not negligible)—that is, the possibility that private as well as government capital might form part of the total American aid, and that the body administering the credits would resemble a private cartel rather than an international authority. The Americans are known to oppose the idea of socialising Ruhr industry. They would almost certainly oppose it equally if the plan for socialisation were transferred to the international field. But the French (not to speak of the Czechs and the Poles) will certainly find it almost impossible to accept the chief feature of the new American approach—the desire to expand industry in the Ruhr as rapidly as possible (some observers have spoken of 18 million tons as the target for steel) and to give that expansion the first place on Europe's list of priorities. From an economic point of view, the American attitude is understandable. The gap between Europe's present scale of production and Europe's needed scale of production is almost precisely equivalent to the tremendous cut in German output.

The American concentration on the Ruhr has unfortunately been reinforced by a marked change of mood that has come over official and unofficial opinion in the United States in the last six months. It is still a mood rather than a policy, but it may be strong enough to affect policy vitally now that a plan for Europe is coming under concrete discussion. In essence, the mood is one of disillusion with America's wartime allies—Britain and France (and incidentally China). The British and the French have received loans and assistance, it is argued, and what has been the result? France faces a severe economic crisis and is riddled with strikes. The British have failed to increase coal output and are running a deficit of £450 million a year in their trading accounts. Is there any point, the argument runs, in giving further substantial aid to countries which

so obviously do not keep themselves? And may not the alternative be to concentrate attention on such hardworking peoples as the Germans and the Italians (and the Japanese)? No doubt, American thinking does not follow quite these over-simplified lines, but the speech made by Mr Dean Acheson at Jackson, Mississippi some two months ago in which he called for revived German and Japanese production, Mr Stassen's address in which first priority for reconstruction went to the Ruhr, Mr Hoover's appeal for the revival of German industry and finally Mr Clayton's warning to the British Government during his recent visit, that the British claims could be considered only as part of a Western Europe plan and would not necessarily receive a high priority, all point in the same direction—towards an American policy based upon the revival of ex-enemies and a certain depreciation of the efforts of wartime friends.

It is impossible not to be very seriously disturbed at the possibilities of deadlock, hostility and recrimination latent in this very complex situation. Yet if the Marshall offer is not to result in fundamental disagreement on principle, there must be some coming together of Allied opinion, some pooling of differences and some willingness for a compromise solution. The position today is that while the French and the Americans agree on inter-allied control and the British do not, the British and the Americans believe in a higher level of industry and the French do not. And this deadlock is reinforced by the lessening value the United States appears to attach to Anglo-French co-operation. Can any compromise be coaxed or screwed from this unpromising situation? Clearly it will demand some sacrifice of opinion from each of the Powers but it is at least possible to sketch out some potential lines of advance. The British record in the Ruhr coalfields and in Ruhr industry generally is not so brilliant that the suggestions the Americans and the French make for technical improvement should be automatically dismissed. Nor can the British afford much longer to run a separate zone on borrowed dollars. It seems clear therefore that the British should accept a more complete fusing of the Zones (with the French Zone included) and should agree to the setting up of a joint interallied authority or board of trustees or similar body to oversee the Ruhr. On the French side, the concession should be readiness—perhaps without prejudice to a long-term scheme for a new level of industry—to co-operate in getting German output up to say 5 or 6 million tons of steel in the next eighteen months, even if this policy meant abandoning for a time the hope of larger deliveries of Ruhr coal. The greatest change in attitude would, however, need to be made by the Americans and the difference should lie as much in the psychological approach as in any concrete economic measures. The first point would be to give the rehabilitation of British and French (if they come in, the Polish) mines and of the French and Czech industry at least as high a priority as the industries of the Ruhr. The second would be to conceive of the new joint authority for the Ruhr on the lines not of American domination but of cordial Allied co-operation such as was achieved during the war in Shaeft. The third point in a new American approach would be to realise that economic plans are inseparable from politics and that, to put it bluntly, an American plan to base European revival upon a German heavy industry built up as a cartel by private capital might well bring the Communist Party to power in France and in the Ruhr, and complete the absorption of the Czechs and the Poles in the Russian system. The memory of the Nazis is not so dim in Europe—within walking distance of the concentration camps—as it may (understandably) be on the far side of the Atlantic. It will in any case take all the wisdom and statesmanship there is in the world to coax Europe together. But if, lurking behind the reunion, there is a possibility of a future domination of Europe by a revived Germany, the plan is doomed to fail before it is even born.

Peace with Japan

“THAT is causing us to think very hard and very deep,” said Mr Bevin, speaking in London on July 8th, about the problem of making a peace treaty with Japan. It is now generally agreed that a peace conference for Japan will precede any which may ever be held for Germany. General MacArthur has called for a treaty within a year from now, Australia is also pressing for an early settlement, and Commonwealth discussions on the subject are to be held in Canberra next month. Japan is in the same category as the European satellite nations with which peace has already been made, in so far as it has a single recognised Government—and is unlike Germany, which has no central Government and no prospect of having one in the near future. Japan is free, moreover, from the special complications arising from the zonal division of Germany; for the authority of General MacArthur as Allied Supreme Commander extends over the whole country. This does not mean that the making of peace with Japan is going to be an easy matter or that the fate of Japan does not confront the victors of the Pacific war with an acutely difficult problem. If Japan has escaped the political disintegration of Germany, its economic plight is quite as serious and its position as an object of rivalry between Russia and the United States is very similar. From the British point of view the international situation with regard to Japan can give rise in some respects to even greater anxiety, for whereas in Germany Anglo-American co-operation has been obtained to a high degree and is a great factor of stability, in the Pacific the friction between the United States and Australia renders it much more difficult to reach a good understanding between London and Washington.

It is the economic situation in Japan which, more than anything else, is making a settlement in the Pacific a matter of urgency. This situation is becoming more and more acute as Japanese industry uses up the last of the fairly large stocks of raw materials which were left in Japan on VJ day and, being no longer required for war purposes, could be turned over for civilian production. It is these stocks which, by rendering possible a limited, temporary industrial recovery, concealed for a while the economic ruin which had overtaken the country. When the stocks were exhausted, Japan had no means to replenish them and the extreme poverty of its own natural resources was starkly revealed. There should, of course, have been nothing surprising in this, for the basic facts of Japan's industrial development were well known to experts on the subject. But in the hour of victory those who made the decisions on the Allied side saw only the war potential which had made it possible for Japan to strike so dangerously in December, 1941, and which must therefore be abolished by every possible means. Those were the days when eminent public personages talked of the “pastoralisation” of Germany and Japan, and an Allied general announced that the defeated enemy would get just enough relief from famine “so that their rotting corpses don't infect our troops.” Apart from the resolve to obtain future security by “de-industrialising” the enemy, there were powerful economic motives in operation: on the Russian, French and Chinese side mainly to obtain capital re-equipment and supplies by means of reparations, on the British and American side to eliminate German and Japanese commercial competition for the future. So all the emphasis was negative and destructive, on completing the havoc which the bombers had already carried so far.

A change of mind was bound to come. Once military administration was instituted and Allied Governments became responsible for the territories under their control, it gradually became clear that a certain minimum of economic life must be

maintained. It was not seriously proposed to exterminate the conquered peoples; therefore they must have enough food to sustain life. Moreover, the occupation forces themselves largely depended on local supplies and public utilities; they had an interest, therefore, in preventing a complete economic breakdown. But soon it was found that the minimum required to keep things going involved imports which the defeated countries were no longer able to pay for by export trade and which the victors had to provide out of their own revenues. Thus the deficit economies of Western Germany and Japan became charges on the British and American taxpayer—a state of affairs which aroused a lively discontent, especially in the less long-suffering beast of burden on the western side of the Atlantic. By a force of logic which even ex-pastoralists had to admit, it came to be accepted that the enemy economies, if they were to pay their way, must no longer be demolished, but on the contrary rebuilt.

This conclusion has been reinforced by considerations of another order. The danger of infection from rotting corpses is no longer the only cause of apprehension to the victors from misery and starvation in defeated countries; there is concern also about the minds of the former enemy nations. As long as it appeared that the victors were united, it was plain that the defeated and disarmed peoples were powerless to resist the force which controlled and it did not seem to matter what they thought or felt. But, as the great rift between Russia and the Western Allies became daily more visible to all, the political sentiments of the conquered were also seen to have some importance. It also began dimly to be appreciated in London and Washington that in a competition for political influence the advantage under existing conditions lay with Russia. Breakdown of the economic order was liable to turn the masses towards Communism, and if and when Communist rule was established, its dictatorial methods of government would enable it to defy unpopularity. But to give stability to a multi-party parliamentary democracy and avoid violent revolutionary upheaval a certain vitality of the body economic, if not a condition of definite prosperity, must be maintained. It is now a commonplace of argument in America in support of aid to war-wrecked countries, whether Allied or ex-enemy, that economic revival in each case is a prophylactic against Communism. Japan is no exception to this principle; economic aid is seen as a means of giving it internal political stability and at the same time keeping it within the American rather than the Russian orbit after the withdrawal of American occupation forces.

★

If American aid to Japan is not to be a continuing subsidy, as it is now, and is to make Japan solvent within a term of years, it must be on a very large scale. Japan's modern industry has been highly artificial in the sense that it has been built up on a very slender base of homeland fuel and raw materials. Japan has evolved an economy exceptionally dependent on imports both of foodstuffs and raw materials. The population has more than doubled in three quarters of a century and, even though the birth-rate is gradually falling, there will be a considerable natural increase over the next twenty years. No great expansion of food production in the homeland is possible, and now that Korea and Formosa have been lost their food supplies are not available to supplement Japan's own production except through foreign trade. Moreover, in Japan as elsewhere, figures of total food production capacity cannot be taken as actual because the farmer himself is not an automatic machine; he depends on incentives. The altruistic farmer (*agricola philan-*

thropus) is as rare a species in Japan as in Germany, France, Britain or America. If the towns can give him nothing in exchange for his produce except a fixed price in paper money which will not buy any goods, he does not see why he should work to feed the towns, or if he does sell, it will be by barter in the black market where something of value can be obtained in return. In Japan there has long been a marked animosity between the countryside and the towns and to-day the Japanese farmer tends to regard the unproductive town-dweller as a parasite. Feeding the poorer classes in the towns has become a major problem for the Government and not until there is an adequate supply of industrial consumers' goods can it be fully solved even as regards home-grown foodstuffs; any coercion of the farmers not only requires a large police force but is politically dangerous for the party which attempts it.

If Japanese industry is unable to produce enough goods to induce the farmer to part with his harvest at controlled prices, still less can it now compete in foreign trade to provide Japan with essential imports. Japanese export trade was built up first on raw silk, and secondly on a wide range of light industries in which cotton and rayon textiles were most conspicuous; over the decade before 1941, and of course especially during the war, there was a development of heavy industry, which was mainly used for armaments and the capital equipment of Korea and Manchuria, but could theoretically provide civilian goods for export now that Japan has been disarmed. To-day Japanese raw silk has only very limited prospects because of the competition of nylon; industrial plant, both heavy and light, has been greatly reduced by bombing and what remains is mostly worn out or obsolete; raw material stocks have been used up; and, as nobody knows what will be the future permitted level of industry or how much plant will in the end be taken for

reparations, there is little inducement to invest in such capital improvement as is possible.

Japan's principal assets at present in seeking economic aid from America are first that the country has a unified and orderly state administration, and secondly that the Japanese have had a good reputation in the past for payment of debts and for efficiency of business administration. Japan has gained greatly by contrast with the chaotic condition of post-war China, and there is a strong disposition in America to regard it as altogether a safer proposition for American money. Meanwhile a peace treaty is desirable at an early date in order that the level of industry may be definitely fixed, that the American army of occupation (now a major charge on the Japanese budget) may be withdrawn and that the question of the American "strategic frontier" may be settled without further delay. There is indeed attraction for Americans in the idea of a disarmed Japan, rescued from feudalism and converted to democracy and Christianity by General MacArthur, protected against perils from the mainland by the loving care of American air power from bases not too remote, and paying its way as the American-financed workshop of Asia in ways which would not threaten conflict with American interests. The trouble is that some other nations, for various reasons, find less pleasure in this picture. Russia does not relish the thought of Japan as a permanent American satellite adjacent to the coast of Siberia, and many a spanner may yet be thrown into the works from Moscow. Nor do the countries which suffered most from Japan's pre-war trade expansion like the idea of its renewal as a subsidiary concern of the United States. There will indeed be plenty to talk about when it comes to peace-making with Japan and it is good that the Foreign Secretary has recognised the need for "very hard and very deep" thinking on the subject.

The Virtuous Monopolist

ECONOMIC institutions, like dogs, may be given bad names and hanged. Far as public opinion has travelled since the golden age of the classical economists, "monopoly" is still definitely a bad name. It conveys to the hearer the notions of sinister greed, of fantastic and immoral profits, of the hard-faced exploitation of public need. The dealings of Jacob with Esau are morally more repugnant, because more cold-blooded, than those of Cain with Abel. On the other hand "rationalisation" and "self-government in industry" are not bad names. They suggest order and seamliness, gardens in the economic jungle, the rule of law among the cut-throats. Economic theory, cautiously seeking a terminology both accurate in content and unemotional in association, prefers to speak of imperfect competition—and does so in a manner discouragingly incomprehensible to the lay mind. This is unfortunate, for if there is one subject on which, more than another, a keen and well-informed public opinion is needed, it is precisely this question; a question wider than, though akin to, that of the proper boundaries of public and private enterprise; the question of how to deal on the one hand with competition which promises to become self-destructive, and on the other with the situations which arise when it has been destroyed.

The nineteenth-century impulse to pulverise back into its constituent atoms any organisation which had grown large enough to control, by deliberate restriction of output, the market price of its wares, long ago proved itself futile. There is no need, in order to demonstrate that futility, to invoke the limiting case of an industry in which the technically most efficient size for a firm is one big enough to supply the whole market, nor the textbook example of unique natural resources, nor yet the unbridled lust for power of the wicked and megalomaniac

capitalist. Under the stress of a slump any heavily capitalised business with overheads to cover will sell at a loss rather than incur a heavier loss by not selling at all; any of its competitors will go one better rather than see the last of their markets overrun; and at a certain point the survivors will conclude an armistice, draw up a self-denying ordinance against further warfare, and establish, in one form or another, a governing body to see that this ordinance is observed.

When this sequence has played itself out, a monopoly has been born, whatever the organisation may call itself. It need not by any means be a bold, bad buccaneering monopoly of the kind lambasted by the classical economists. It is far likelier in this day and age to be cautious and even reasonably public-spirited, and to refrain from such flagrant abuse of its newly acquired power as might tempt authority to intervention. That power may not indeed be very great, if passable substitutes for its products are actually or potentially available, or the field is not too forbiddingly difficult for the entry of newcomers not bound by the original treaty. Indeed, the exquisite peace and quiet reigning in a newly cartelised industry has, since the first world war, been so impressive that Governments have not waited for battle and negotiations to run their course, but have often intervened with compulsory powers to "rationalise" the competing units—as witness the forerunners of nationalisation, such as the London Passenger Transport Act. Where Governments have not hurried on the process of monopoly-forming, they have allowed nature to take its course; war-time "concentration" and other exigencies of control have played their part, and the result is that the fields of economic activity in which competition is wholly free—in which any newcomer can try his hand, selling as much as he can profitably

produce and charging such prices as his judgment of the market freely indicates—are now, even leaving war and post-war restrictions out of account, the rare exception rather than the rule.

A good deal of this process is, of course, a by-product of the trade cycle. Depression notoriously breeds restriction; and a policy of full employment should in time remove much of the incentive to limit competition. But a full employment policy demands, if it is not to be hampered from the start and hamstrung in the end, not merely a halt to new restrictive practices but a prompt abandonment of the restrictionist mentality. This is less easy. A quota allocated some time back in the thirties is a wonderfully comfortable feather bed for the tired business man; a base price which all other concerns can be trusted to observe because of the penalties attached to undercutting tends delightfully to peace of mind. And, indeed, what cause has the general public to grumble? The modern British monopolist does not drive Esau's bargain, he does not reap inordinate profits, he does not rampage like his American opposite number in the lobbies of the legislature, he is not perceptibly corrupt, he may not even be grossly and obviously inefficient. Why not let well alone? After all, in a semi-planned society, it is much easier for the state to deal with a few big well-organised units speaking with one voice than with a mass of quarrelsome individualists; and how beautiful is peace!

Traces of this frame of mind are perceptible in the recently published reports of the Committees appointed respectively by the Ministries of Works and of Supply to inquire into the organisations dominating the manufacture of cement and of textile machinery.* Though both, particularly the latter, are open to criticism on specific points, neither is a conspicuously badly behaved or aggressively-motivated monopoly. On the contrary. Both were formed in mutual self-defence at the trough of the depression; neither has made exorbitant profits. The internal structure of the Cement Makers' Federation is democratic, and though that of Textile Machinery Makers, Limited, is less so, the shares of its dominant company are too widely distributed for any question to arise of a stranglehold exerted by a few "malefactors of great wealth." TMM is the result of a merger, a form of combine giving ample scope for rationalisation; the CMF, a cartel organisation, has quotas revisable at five-yearly intervals, so that any firm too willing to rest on its laurels is liable to find a share of its business transferred to more energetic members of the Federation. Finally, there is no suggestion that the skeletons of murdered inventions are to be found in the closets of either. With a sheet so clean of the traditional crimes of monopoly, why should anyone worry about them?

The loudly expressed discontent of the textile industry over TMM might well be taken as an adequate answer. But even were that discontent (largely directed against TMM's export policy) assuaged by some particular changes, there would still be plenty to worry about. Within both organisations there are wide differences between the operating costs of different units—TMM, indeed, is only just beginning, after sixteen years of existence, to set up a proper costing system. In both, research is a Cinderella. Neither in TMM, with its closely-knit central control, nor in the CMF, with its nominally variable quotas, has there been any attempt to concentrate production at the more efficient units. Possibly the more efficient have their hands so full, both administratively and technically, that they could not, even if they were allowed to, take away any business from the weaker vessels; possibly the cement quotas of 1934 or the machinery output of 1931 still correspond to just that division of resources, in manpower, capital and raw material, which would preserve just so many high-cost units in being as are needed to satisfy total demand. Possibly. But is it probable? The Committee on Textile Machinery do not think so, and even the

*Cement Costs: Report by the Committee appointed by the Minister of Works. Interim Report of the Committee of Investigation into the Cotton Textile Machinery Industry.

milder-spoken Report on Cement Costs expresses misgiving.

In a world of plenty and a self-sufficient Britain one might indeed say, "Well, what of it?" Efficiency may have too high a price. The driving force of competition is hard on the human element in industry. Let the convoy travel at the pace of the slowest, and no one's boilers will burst. What the public lose materially on the swings as consumers they will more than gain on the roundabouts as producers. The trouble is that this attitude, particularly attractive to a community most of whose members are dog-tired and longing for an ingredient of lotus in their diet, is disastrously inappropriate to the Britain of to-day. It is distastefully true that we work or want; and mere work is not enough, it must be work where work is most telling, work under conditions of the utmost technical and managerial efficiency. And that means that no one has a moral right, merely because he is doing a job passably well, to prevent someone else from trying to do it better; still less so, of course, if his performance is obviously inefficient.

That is the right claimed by even the most virtuous monopolists; and that is why the two Reports are so inadequate on the policy to be followed in dealing with monopolies in general. The Committee on Cement Costs found no evidence that new potential producers had, in fact, been deterred from entering the industry. Of course not. Confronted as they are by that impregnable barrier, buttressed by deferred rebates and armed with disguised transport subsidies, which guard the Federation's position, few potential competitors would be likely even to envisage themselves as such. A passing bright thought, quickly abandoned, that something could be done in cement if it were not for the ring is not likely to be subsequently offered as evidence to a committee of inquiry. Yet every economic advance, large or small, must have begun with a bright thought—and must also have made some established interest uncomfortable. One might as well deduce the innocuousness of a upas tree from the absence—since passers-by know enough to avoid it—of any actual corpses in its shade.

Needless to say, it is not only in private industry that a solution of the problem of monopoly is needed. It is still more needed where the rôle of the private combine is filled by a national body whose economic powers are backed by legal sanction. Theoretically, a perfectly integrated, publicly owned and publicly administered industry, whose constituent parts have no profit-making axe to grind, should be able to "play at competition," to "compete within glass walls," and to achieve the social justification of competition—the rapid spread of the best methods, the shifting of human and material resources to their point of highest productivity, the constant approximation of every part of the highest pitch of efficiency known—more swiftly, smoothly and painlessly and with less incidental waste and duplication than any group of independent and blindly battling units. Actually, the effect seems at least as likely to be the replacement of the profit motive by the trouble-saving motive; the gain from the absence of secretiveness and duplication being balanced by a cautious reciprocal willingness to let sleeping dogs lie, even when they are dogs in the manger. It is probably impracticable to devise any administrative machinery or to make any legislative provision which will prevent this all too natural development; its possibility is the price to be paid for the advantages of integration, whether under private or public control. The Russian method of keeping suspended over each executive's head a sword of Damocles in the shape of a possible trial for sabotage is hardly likely to commend itself here; the best that can be done is to encourage in those who, for the public's benefit, are to "play at competition," something of the man-eating ferocity and zest for victory which inspired the real thing in the bad old days. It is not enough for monopolists to protest, and for committees of enquiry to verify, that they are not King Storks. It is equally important for the national welfare that they should not be King Logs.

NOTES OF THE WEEK

The Royal Betrothal

Princess Elizabeth's betrothal to Lieutenant Philip Mountbatten will cause general pleasure. The Princess has earned the respect and affection of the people by her wholehearted acceptance of the trying royal round of public and official activity and by the simplicity with which she performs her multifarious duties. And from the affection has risen the natural hope that when the time came for her to marry, she would be able in her peculiarly difficult and special circumstances to choose a husband whom she really loved and not one to whom she would become betrothed for dynastic reasons. But to hope both for a love match and for a suitable consort is to hope for much, and in the past not all queens have had the good fortune of Queen Victoria.

Princess Elizabeth, however, is following the happy precedent of her great-great-grandmother. Not only is the match one of obvious affection; Lieutenant Mountbatten fulfils all the qualifications of eligibility. He is young, he is good looking, he is a commoner but of royal blood, he is related to one of the most popular and distinguished public servants in the country—the Viceroy—and he has served with conspicuous success in Britain's most popular service—the Royal Navy. Under these conditions, it is reasonable to hope that he will in the arduous public career that lies ahead of him play his part in cementing the links of affection, respect and friendliness between the Royal Family and the people upon which the British Monarchy is fundamentally built.

* * *

The Planning Board

The establishment of an Economic Planning Board, whose membership was announced by Mr Morrison on Monday, was first decided upon last March. In the three-day economic debate which followed the appearance of the Economic Survey for 1947, Sir Stafford Cripps told the House of Commons that the Government had decided to set up, first, a Chief Planner with a small staff and also a small board, representative of the planning staff and both sides of industry, which would enable the Government to consult industry as a whole on economic planning.

It has taken some time for the members of the board to be chosen, but now they are known they provoke little surprise, for as is usual in such appointments the representation of interests is carefully balanced. With arithmetic precision, the Board consists of three nominees of the Federation of British Industries and the British Employers' Confederation; three nominees of the Trades Union Congress; the Permanent Secretaries of three Government Departments—the Board of Trade, the Ministry of Labour and the Ministry of Supply; and three members of the Central Economic Planning Staff. In addition to these trinities, there is the Director of the Economic Section of the Cabinet Office and the Chief Planner himself, Sir Edwin Plowden, who will be in the chair.

Whether the Board will play any real part in planning seems very doubtful. Mr Morrison described its functions as being

to advise His Majesty's Government on the best use of our economic resources; both for the realisation of a long-term plan and for remedial measures against our immediate difficulties.

But how can a Board on which there is such equal representation of, in some respects, conflicting interests come to any big decisions? Such general economic planning as the Government, and Government Departments, allow is surely the task of Sir Edwin Plowden and his staff. Presumably the main object of the new Board is to enable the Government to put across more easily any policy that it may decide upon. It would, for instance, be easier to introduce a system of payment by results if the Government had secured the prior agreement of the TUC. But it is as well to realise that this method of putting plans into force has grave drawbacks. The Board is likely to be as obstructive as constructive, and will tend to whittle down plans to the lowest common measure of agreement. Its establishment is a further step in allowing big business—the smaller manufacturers, it may be noted, are not represented on the Board—and the TUC a veto on matters of high policy. It marks more progress towards the corporate state, but hardly towards the planned Socialist state the Government claims to have set in motion.

Discipline in the Coalfields

If evidence were needed of how little aware the people of this country are of their economic plight, it exists in the coalfields. Barely two months after the introduction of the five-day week the irresponsibility of the individual miner is revealed in Mr Shinwell's warning last week-end that the coal industry cannot afford to have passengers, that miners must work the full five shifts or go. The action of some of them, he said, was "deplorable." They had formed a habit of working one, two or three shifts a week and absenting themselves for the remainder.

That Mr Shinwell, whose position as Minister is commonly thought to rest on the miners' support, should feel moved to use such strong language is revealing enough. But his words are given even more force by Lord Hyndley's grave warning to the annual conference of the National Union of Mineworkers. In a letter to Mr Horner and in person he referred to the Coal Board's concern about the continued occurrence of unofficial stoppages, and gave a warning that if the Board and the union between them could not find a way of checking unofficial strikes, the Board would have to consider whether to resume the practice of prosecuting the striker for breach of contract. In an industry where relations between labour and management have such a bad tradition, the Coal Board has hitherto wisely avoided prosecution in the interests of building up good relations. But it is quite clear that some miners are utterly uninterested in good relations or anything else except how to obtain as much money as possible for as little work as possible. In the interests of the majority of miners, let alone the interests of the country, these wreckers should be prosecuted.

Yet it is a damaging commentary on the position of the trade unions today that the Mineworkers' Union has to leave the disciplining of its own members to somebody else. At the conference, both Mr Lawther and Mr Horner strongly condemned unofficial strikes. But this is nothing new; every time an unofficial strike occurs, in any industry, it is condemned by the union officials—with no effect. In the coal mines, voluntary absenteeism and unofficial strikes can be tolerated no longer, and the threat of action at last given by Lord Hyndley is in welcome contrast to the appeals and exhortations that are all that members of the Government rely on. More pay, more consumer goods, extra rations, a shorter week—all these incentives have been given to the miners to induce them to work harder and produce more. And the Mineworkers' Union has this week passed a resolution to press for an increase of £1 a week in the minimum wage. But none of these incentives has resulted in the output of coal that is wanted. They have only added to the cost of what coal is produced. The miners have only themselves to blame if the Coal Board now decides that the time has come for less rewards and more punishments.

* * *

Coal Culprits

If some British voice does not say soon that many of Europe's political and economic difficulties are due to Britain's failure to export coal an American voice will. Mr Lawther missed an opportunity when he brought international politics into his speech on Monday to the conference of the National Union of Mineworkers. He was all for "standing alongside" the Soviet Union and for refusing to "sit at the foot of a new financial oligarchy": in other words, he did not like the prospect of further European dependence on American policy and aid. He might have gone further and explained to his audience how it had lain—and still does lie—in their power to make western Europe less dependent on dollars and credits by restoring that surplus of 35 million tons of British coal which was available for export in 1938. The argument is complicated but not beyond Mr Lawther's powers of exposition.

It is briefly this: that if British coal exports were at their 1938 level instead of being virtually non-existent the demands of France would have been met in full and her recovery would be far more advanced than it is. She would then have been able to reduce her demands on the Ruhr for coal which could have gone into the reconstruction of German transport, into producing consumption goods for the miners, and into the delivery of new mining equipment. Quicker German recovery would have saved Britain dollars, by providing goods with which German food imports

could have been paid for. In fact the vicious circle in which the west German economy moves would have been broken earlier. Britain has not escaped. The current wheat harvest is estimated at less than 10 per cent below the 1946 crop of 1,350 million bushels (excluding Russia), compared with a pre-war average of 1,670 million bushels. The Soviet harvest is reported to be good and above recent levels, and there will no doubt be an exportable surplus for necessitous countries politically worth helping. The European grain deficiency for the next twelve months has been put at between 30 and 33 million tons, of which 25-28 million tons are in bread grains alone. And this deficit will be larger than the exportable world surplus.

It is little use crying over lost coal, but foreigners—particularly Americans—are puzzled by our unblushing complacency over this failure of a major industry to provide exports. And the British, controlling as they do the Ruhr, look like chief culprits to anyone planning European reconstruction; for Germany's contribution to Europe's coal has fallen from 40 per cent to 15 per cent, while Britain's contribution has fallen from 32 per cent to a negligible figure. If the United States were not now contributing 27 per cent of Europe's coal needs, at the cost of 400 million dollars a year in 500 ships, the European coal deficit would be catastrophic. Of all the dollar extravagances caused by the war this is one of the worst. And there is no sign that Mr Lawther, or any other man charged with leadership in the coal industry, is preparing to cut it down. If the British could export coal and the Russians could export wheat to Europe, then there would indeed be a basis of common achievement from which to reduce dependence on the generosity and commercial sense of the Americans.

* * *

Turning the Corner in France?

M. Ramadier, encouraged by successive votes of confidence in the Chamber of Deputies and in the National Council of his own party, is more determined than ever to continue the arduous task of governing France in defiance of hardening Communist opposition. The split on foreign policy, now that France and Russia are following separate paths on the Marshall offer, has made the Communists more intransigent, and they have dropped the pose of being a "parti de gouvernement"—an attitude they maintained since they left the Government.

The Socialists are certainly divided on internal policy; in particular the Party is concerned at the extent of the concessions to *laissez-faire* which may have to be made in order to keep the Radicals inside the coalition. It was on this issue that the final vote of the Socialist Council showed the Party divided into two almost equal halves: 2,576 for M. Ramadier and 2,056 against him. But on foreign policy the Socialists voted to a man for a resolution fully approving the Anglo-French initiative.

It can safely be assumed that the immediate result of the breach with the Communists will be a deterioration in the strikes situation, with the Communist trade union leaders exploiting the social discontent to impress and embarrass the Government. The nerve centre of unrest will again be the mines, where the workers only gradually returned to work after the last strike, which cost the nation between 3 and 4 million tons of coal. Not very much "orchestration" will be needed in the present conditions of disorder and distress, in which the one thing that has clearly emerged is that "strikes pay," particularly in the publicly owned sectors of industry.

M. Ramadier and his friends are counting on a gradual improvement of the situation as a result, in the first place, of the new harvest and, secondly, of the outcome of the international agricultural conference now meeting in Paris, which they hope will enable the French to improve the quality as well as the quantity of bread for the coming year. They also hope that external aid under a Marshall Plan will raise French productivity and enable the national economy to absorb higher wages. Finally, the Government may reasonably hope for some relief as a result of the public reaction against the strikes, which has been increasingly apparent within the last two weeks. Meanwhile, M. Ramadier believes it is a question of turning the corner. Whether he succeeds or not will depend partly on the scale of external aid, but also on the ability of the parties inside the coalition to sink their differences and evolve a coherent economic policy which, since the end of the Blum experiment, has been sadly lacking.

* * *

Why Europe Goes Hungry

It is less than eight weeks since Mr Clinton Anderson, the United States Secretary for Agriculture, issued the warning that the food prospects next year are likely to be worse than now. The conference he then suggested began in Paris on Wednesday with nineteen countries taking part. It was convened by the Food and Agriculture Organisation to discuss the international supply and distribution of cereals over the next twelve months.

Statistically, the world grain position has deteriorated. The severe winter has wrought havoc with the European crops, which Britain has not escaped. The current wheat harvest is estimated at less than 10 per cent below the 1946 crop of 1,350 million bushels (excluding Russia), compared with a pre-war average of 1,670 million bushels. The Soviet harvest is reported to be good and above recent levels, and there will no doubt be an exportable surplus for necessitous countries politically worth helping. The European grain deficiency for the next twelve months has been put at between 30 and 33 million tons, of which 25-28 million tons are in bread grains alone. And this deficit will be larger than the exportable world surplus.

The current American wheat crop is expected to produce 1,400 million bushels, which will surpass the record figure of 1,156 bushels for last year, while Canadian prospects are also favourable. Even if the South American countries have a harvest of similar size to that of the past season, there would still be a gap between world consumers' requirements and world producers' exportable surpluses. But the problem goes deeper than one of supplies. Most European countries are faced with a dollar shortage, yet bread from abroad they must have; the maintenance of the present high grain prices means that imports of other goods have to be reduced. Were Europe able to withhold from purchasing cereals in the Western hemisphere, the effect on world prices would be drastic. But it is more likely that dollars will be made available under a Marshall Plan or some other scheme to sustain European demand.

The United States has already rendered great services in alleviating the world food shortage, and the American citizen at the moment is making a sacrifice for Europe by paying high food prices, bolstered up by relief exports. But the suspicions of Europe are aroused by other things. It seems strange that the United States, disinterestedly concerned for the welfare of the world, should again last month, at the Washington meeting of the International Wheat Council, refuse to meet the demands of other grain producers for larger export quotas, and of the consumers for lower prices. Such tactics suggest self-interest—selfish interest in the maintenance of high world grain prices.

It is difficult to see what value the present Paris Conference will have. What is required is either considerably increased supplies delivered quickly, or the provision of an adequate international scheme for allocating food. The present arrangement under the International Emergency Food Council cannot work satisfactorily so long as there is no restriction on consumption in the main producing areas. Australia and New Zealand have given a clear lead to the world in this respect, in rationing their own consumption of meat and dairy produce. It is not suggested that all countries should have the same quantitative rations, but provision for the vital needs of some countries should not depend on the unplanned "exportable surplus" of others.

* * *

Farm Wages and the Consumer

Judged by the criterion of doing justice to a relatively poor section of the community, who have not yet gone on strike to get a forty-hour week, the recommended increase of a further 10s. in the farm workers' minimum wage (bringing it to 90s.) must be welcomed; but its probable adverse effect on the food consumer cannot be denied. The machinery for agricultural price-fixing is now such that an increase in wages is likely to mean a more than equivalent increase in guaranteed farm prices, for not only will the extra wage packet—estimated at £25 million—be passed on in prices, but it is accepted by the Government that the labour of the farmer himself and of his family should be valued at a level that takes account of increases in wage-rates. Under their informal agreement with the Government the farmers can ask for an immediate special review adjusting prices upwards and have in fact already done so; and no doubt Mr Williams's desire to maintain harmonious relations with the National Farmers' Union will ensure that any awards given now will be fully consolidated at the next annual price review. Who is to pay the extra cost? It cannot easily be the taxpayer. The Treasury is anxious, and rightly so, to prevent food subsidies from costing more than their current enormous rate of £400 million a year—indeed, it should have drawn the line much sooner, and Mr Dalton will make a big mistake if he permits any further increase. Therefore it can apparently only be the food consumer who will pay.

There is one other possibility. The price of imported food may fall even while that of home-produced food rises—thus disclosing the wide gap between the two price levels which *The Economist* has always believed will eventually appear. But the

signs are not yet very propitious. The moral for the Government is thus clear. It is essential to prune, not to raise the food subsidies; and it is even more essential to prevent the price of food to the consumer from rising rapidly or far. This can only be done if the cost of home-produced food is stopped from following wages in an upward spiral. A firm and intelligent price-fixing policy, which steers British agriculture into its most suitable branches of production, and a real policy for the elimination of the grave wastages of food distribution—these are the two things which can leave the farm worker with his modest new wage without bringing further hardship to taxpayer or consumer. But they require a degree of statesmanship on the part of Mr Williams and Mr Strachey which those two Ministers have still to make manifest.

Civil Service Pay Claim

The officer cadre of the Civil Service, comprising some 4,000 men and women out of a total of over 700,000 civil servants, have just staked their claim to an increase in pay. Their case is very strong. For thirty years the salaries of this class of civil servant have been falling in relation to the rise in the cost of living, while at the same time their responsibilities have grown heavier, their hours longer, and the advantages of security and pension slighter. This process was greatly accelerated by the war, and the growing sphere of centralised control makes it very improbable that it will be reversed. It may be that in another five years some of the grueling pressure may have relaxed, but the leisured days of Trollope are gone for ever. In addition, their work calls for imagination and enterprise, qualities which are far rarer than those demanded for the negative and regulatory forms of administration expected formerly. The demand for such men is, therefore, the greater.

In 1913 the head of a large department received £2,000, in 1920 £3,000, in 1947 £3,500; on an average the salaries of the top ranks of the Administrative grade rose by 70 per cent over this period, while the two lower ranks—of Principal and Assistant Principal—rose by 50 per cent. Over the same period the cost-of-living index, which is officially admitted to under-estimate the rise in prices, rose by 104 per cent. Thus at a time when their responsibilities were growing their financial position was worsening. Civil servants are not alone in suffering a fall in their standard of living since 1939, but in few cases can the relation between burdens and rewards have moved so far apart. The present claim does not cover the heads and deputy heads of departments, but it is here that the discrepancies are most glaring. The chairmen of the Coal and Steel Boards receive £8,500 per annum, of the Central Electricity Board £7,000, of the Port of London Authority £7,500. These are bids in the open market. It may well be that these salaries are too high, but those of their civil servant opposites are too low.

It would be embarrassing to the Government to grant the present pay claims now, but there is a case for at least promising a review in two years' time, and meanwhile for granting such reasonable expense allowances as would enable civil servants to meet business men on fairer terms.

A Disproportionate Sacrifice

To save some \$3,000,000 the Chancellor has dealt a heavy blow at the Press. The gain to the balance of payments is insignificant, but the loss to the public and to the daily newspapers is serious. Few industries have already made such large sacrifices

over the past eight years as the newspaper industry in order to save first shipping space and subsequently dollars.

British newspapers are already among the smallest in the world, and the proposed cuts now look like reducing them to their smallest wartime size. The modest increases which were permitted last year—for example, the extra page for the four-page dailies—will now disappear and with them much of the most

NEWSPRINT SUPPLIES
000 tons

Year	Imports	Production	Consumption
1939	35.3	15.38	23.1
1944	11.3	2.85	5.4
1945	15.5	3.11	5.9
1946	8.7	5.67	7.2

valuable sections of the papers. Those daily newspapers which have taken their responsibilities seriously have devoted much of this extra space to parliamentary reports and serious comment, and a reduction in these will do the Labour Government a far greater disservice than Mr Dalton and his colleagues appear to realise. Even now the public as a whole appear oblivious to the economic crisis that is upon it. Smaller newspapers is not the best way to bring it home.

One further aspect of the reduction deserves comment. In 1945 the newsprint contract with the Canadians, which was negotiated with the Government's full agreement, was rudely broken at a time of the ending of lend-lease. Only the most painstaking and delicate negotiations, again with Government agreement, persuaded the Canadians to renew the contract on terms which were far less advantageous than they could have secured by selling newsprint to the United States. Now without prior consultations or any apparent thought for the political consequences of the relations between this country and Canada, this long-term contract is to be broken again—and all for the sake of \$3,000,000.

Franco's Referendum

The referendum on the future organisation of the Spanish State has come at a time when the fortunes of Franco may undergo some modification. No one will under-estimate the Caudillo's capacity, like a child's toy with lead in its feet, for bobbing upright after pressures or crises that would have toppled a less shrewd and tenacious man. But the regime cannot isolate itself entirely from the outside world, and the events of the next months may be exceedingly testing.

So long as America and Britain were Russia's more or less active allies, fear of Communism was sufficient to counter the attractions of Western democracy. But now the rift is growing in Europe, and there are strong forces in Spain anxious for close rapprochement with the West. To this Franco is an insuperable obstacle. The British and American Governments will no doubt swallow a great deal, but not a Caudillo. Franco may attempt to counter this mood by arguing—as does Perón—that the world may again be divided by war, and that it is the job of Spaniards to keep out of such a struggle. And indeed it must be admitted that if the danger of war increased, and the presence of Franco offered the Spaniards any chance of neutrality, the overwhelming majority would opt for peace.

But suppose the development is on quite other lines. Suppose the Marshall Plan begins to bring prosperity to a Europe from which Russia has, for the time being, excluded itself. The Spaniards would then see the food, the fuel and the capital which they need desperately to end inflation and restore production flowing into Western Europe under impeccably non-Communist auspices, and they would be excluded simply because of the Franco regime. It is not unreasonable to suppose that under such conditions the potential alliance of moderate Socialists, Monarchists and dissident generals which has given Franco considerable uneasiness in the last year might become a formidable fact.

To this development the referendum of July 6th is purely irrelevant. As a piece of free voting it was a farce. As a proposal it alienated all Socialists and Republicans by confirming Franco in power and all Monarchists by making the "royal prerogative"

depend upon Franco's choice. Under these conditions one is left wondering why the regime troubled to hold the referendum at all.

Perón Offers Moral Leadership

When the ruler of a country broadcasts to the world with every possible solemnity and then devotes his time to the condemnation of extreme ideologies, general offers of material and moral assistance and assurances, that the spirit and action of our country will always be at the service of the forces of good, to overcome the forces dominated by evil...

he must not be surprised if people ask in a rather puzzled way what it is all about. Equally, he must not resent their speculations about his real meaning. President Perón clearly felt that he had something very important to say last Sunday, but his broadcast rarely departed from the plane of principle and platitude. His offers of assistance may, of course, be an attempt to map out a place for Argentina in a Marshall plan. Europe is potentially Argentina's best trading partner, and President Perón may argue that too exclusively American sources of aid might choke future trade channels. But the more likely explanation is that the Perón broadcast is one more incident in the President's effort to combine two more or less contradictory policies—on the one hand, to attest, underline and generally demonstrate Argentina's independence, strength and claims to Latin American leadership, and, on the other, to play a part in pan-American co-operation which, whatever Argentina may think about it, the other nations clearly support. Moreover, now that American plans for joint hemispheric defence have taken precise shape, and are to be discussed in the course of the summer, Argentina would be in danger of being outstripped in armaments by its neighbours if it were to abstain. But President Perón chafes at the dominance of the United States in pan-American councils, and loses no occasion of asserting a separate policy. Special diplomatic links are being sought with Brazil and Chile, and the heads of state have exchanged visits. And, by those who suspect the perfect correctness of every aspect of Argentine diplomacy, the President is also accused of forging unofficial military links with Paraguay and Ecuador, to the detriment, Brazilian Deputies complain, of Brazilian security.

In this context of Argentina's ceaseless striving for influence, the President's broadcast may be read as a bid for leadership in Latin American affairs on the basis not of Left-wing extremism or Right-wing capitalism, but of a genuine indigenous, middle of-the-road moderate ideology. The response of Latin America is more doubtful. The various nations may be very anxious to steer clear of a Russo-American conflict, and Argentina may have demonstrated in the late war its capacity for neutrality. But the United States has the dollars and the arms, and they speak louder than noble sentiments.

Unfinished Houses

Stimulated by a sharp increase in the number of houses completed in the month of May, Mr Bevan made a cock-a-whoop speech last week-end about the Government's success in the housing programme. Judged by the criteria which Mr Bevan chose to select the record is good; under a Conservative Government something like 1,500 houses were built in the first two years after the 1914-18 war; after nearly two years of a Labour Government between 1945 and 1947 some 200,000 new homes have been built, including 110,000 temporary houses, 48,000 permanent built, including 110,000 temporary houses, 48,000 permanent houses built by local authorities and 42,000 permanent houses built by private enterprise. On this basis the difference is spectacular. Then, again, Mr Bevan used the much-quoted figure of 750,000 new homes required to provide every family with separate accommodation, and claimed that 613,000 homes were built or in the process of being built, and that already, with 226,000 in families rehoused in converted accommodation and 200,000 in new accommodation the Government were more than halfway home on their housing target.

By such standards the record might be considered good. But Mr Bevan's claims only tell half the story. The concentration of thought, planning and resources put into the housing drive for of thought, planning and resources put into the housing drive for the Government conceived of planning a house-building programme such as was put into action in 1945. The Labour Party made housing its foremost election issue on the home front, and

ever since coming to power priorities in administrative action, in labour and in materials, have been heaped upon it, so that it would be a scandal if the results had not been very much greater than they were last time. In 1920, for example, there were 750,000 men in the building industry, while at the present time there are more than a million. No one could accuse the present Government of lack of drive, or of underestimating the importance of

building more houses. What has been at fault is the lack of a sufficient sense of direction, which has resulted in an ever-rising volume of houses under construction and only a halting, dragging rise in the numbers of houses completed. This lack of balance is likely to continue to have serious repercussions, for the decision to concentrate now on completing houses will almost certainly result in acute shortages in the finishing trades, while leaving labour used in the early stages, such as bricklaying, under-employed.

The New Dominions

The Indian Independence Bill was formally introduced in the House of Commons by the Prime Minister on July 4th. It provides for the establishment of the two Dominions in what is now British India on August 15th, for the lapse of paramountcy over the Indian States on the same date, and for certain transitional powers for the Viceroy extending to March 31, 1948, "or such earlier date as may be determined by the legislature of either Dominion." Each Dominion will have a Governor-General, but it is apparently intended that Lord Mountbatten should act as Governor-General for both during the period of the exercise of his transitional powers for putting the Act into effect; it will be open to Pakistan, however, to insist on having its own Governor-General at once, and it is reported to be likely to do so, if only for reasons of prestige. A Governor-General, after all, cannot be in two places at once; and if he is in Delhi, he is not in Pakistan. Pakistan will be the more concerned about its formal equality with the sister Dominion because the latter is to inherit without qualification the name of "India," which geography and common usage will no doubt continue also to apply to the whole subcontinent.

Meanwhile the outlook is stormy both in the Punjab and on the North-west Frontier. The Sikhs have demanded that Pakistan shall not extend east of the Chenab and have made vague threats of "struggle" in which "no sacrifice would be too great" if the Boundary Commission's decision is given against them. In the North-west Frontier Province the Congress Ministry has called on its followers to boycott the referendum on adhesion to Pakistan and is credited with the intention of demanding a general election if the votes cast in the referendum are less than half the total electorate—the point being that the referendum is being carried out under the supervision of British officers, whereas elections to the legislature would by law be held by the Government in power, which would have no idea of not winning them. Both parties are reported to be busy arming themselves and a further complication has now been added by a demand from Kabul that Frontier tribes shall be free to join Afghanistan. Neither Con-

SIR,—It might be profitable to link discussions of the "hard currency" problem to the fuel shortage at home. On the whole, the probability appears to be that the "hard currency" areas want our high-class consumer goods rather than large quantities of the type of capital equipment which we produce. Broadly speaking, the fuel content of consumer goods is much less than the fuel content of capital equipment. The moral is surely obvious. It is to decrease the export of those capital goods which, if kept at home, would accelerate our production of consumer goods, and, having done this, to increase our export of consumer goods to the "hard currency" areas. The United States and Canada show

very little effective demand for our capital equipment, but a heavy demand for some of our consumer goods like textiles.

So long as fuel is so short here, it would appear desirable to keep our exports of it to the minimum, and this includes keeping down our export of goods which have a high fuel content. The rehabilitation of the "soft currency" areas may be a noble political objective, but it is hardly sound business in face of the twin problems of fuel and the balance of trade. The essence of the matter is that the policy which will produce dollars will also keep fuel where we need it most—at home.—Yours faithfully,

ARTHUR CROOK

Knife Edge in Greece

SIR,—May I on my return from a fairly long visit to Greece comment on your article in your last issue?

With the implications of its title I fully agree. I agree too that the paramount requisite in American policy should be the playing down of border incidents. Unfortunately, there are grounds for believing that the American and Greek governments may do precisely the opposite—that is, increase the Greek army, thus leading to an increase in rebel forces by the recruitment of international brigades, thus leading to a form of international civil war on the Spanish model.

But with some parts of your diagnosis and with one important part of your solution I disagree.

First, the extreme Right does not dominate the Greek Government. It is in fact excluded from it. The shortcomings of the Populists are the negative ones of inadequacy and mediocrity rather than the positive ones of evil designs and sinister methods.

Secondly, the Greek Government has not moved to the Right. The inclusion in the Cabinet this spring of Messrs. Papandreos,

Venizelos and Kanellopoulos was a move towards the Left, and Papandreos, for instance, has introduced salutary measures dealing with local administration.

Thirdly, it is misleading to exaggerate the unpopularity of the monarchy, which—though successful in 1946 largely for anti-Communist reasons—has never forfeited the goodwill of substantial parts of the population, particularly the peasants. Moreover, distrust of George II does not extend to his successor.

Fourthly, although there is war in the air in Greece, I did not get the impression that "all too many people are not averse to lighting the fuse." All too many are convinced that the fuse will soon be lighted, but that is not quite the same thing. Very, very few want it to happen.

To your suggestion that men like Sophoulis and Sophianopoulos should be brought into the Government I would say two things.

First, the Liberal Party (the best led and most clear thinking unit in Greek politics) is still suffering from being put into power by the British in 1945 when public opinion had swung violently to the Right. If the Americans try the same sort of tinkering with the Greek cabinet they will do the Liberals more harm than good. Their experiences in Argentina before the last election there should be a warning.

Secondly, Western and Greek judgments on Sophianopoulos differ markedly. The West noted and approved his stand against Argentina at San Francisco; the Greeks, having just received large gifts of food from Argentina, thought that their representative should have taken a less prominent part against their benefactor. It is in any case quite wrong to describe Sophianopoulos as part of "the Liberal opposition."

Finally, a word of protest against the idea that Greece displays only "sloth and violence." In many parts of the country I got an impression of energy and initiative and a good working spirit—a better impression than one can get in many countries of Western Europe.—Yours faithfully,

PETER CALVOCORESSI

Cartels Examined

"National Interest and International Cartels." By Charles R. Whittlesey. Macmillan. 164 pages. 10s. 6d.

A BRITISH reader encountering, in a news item, an article or a book on economic topics, the word "cartel" receives a more or less accurate and emotionally quite colourless picture of a complex of independently managed firms pursuing, under an agreement backed by more or less stringent voluntary sanctions or possibly having legal force, a common price and output policy. He may approve or disapprove either of cartels in general or of the policy of some cartel in particular; but he certainly will not find the word a trigger to touch off an explosion of righteous fury. In America, as Professor Whittlesey points out, the word is not a descriptive term, but an abusive epithet. To call an organisation a cartel is like calling a political group a cabal or a local government official a Gauleiter; and much that seems incomprehensible in American public opinion concerning British economic policy—particularly in the domain of foreign trade—derives from the lurid emotional penumbra surrounding this convenient label.

National Interest and International Cartels is very far indeed from an apologia. The author concludes that cartels are almost invariably undesirable because they are almost invariably, on balance, an influence restricting the volume and distorting the course of economic activity. But he has no difficulty in absolving them, in the interests of justice and clarity, from the charges of special iniquity levelled against them. The sins of monopoly can be equally ascribed to any economic institution exploiting a dominating market position. The suppression of patents, or their use to clinch the monopolist's grip, is not their vice alone, and depends in any case more on faulty patent law than on laxity towards monopolies. The pre-war leaks of strategically important secret scientific knowledge, through cartel connections, from America to Germany was matched by an equal though less publicised return flow. The use of cartels as an instrument of Nazi aggression is a black mark against the Nazis, not against cartels as such. It is a pleasure to watch Professor Whittlesey sorting our invective from argument, bringing logic and common sense out

of disorder, and displaying the residual case against the international cartel in the cold light of day.

As a contribution to future policy he suggests the establishment of an international body "somewhat similar to the International Labour Office" and perhaps forming part of an organisation dealing with international business problems in general, but is surprisingly vague as to its objectives and methods; and a similar criticism applies to his discussion of the internal mechanism of control in the United States. The clarifying of opinion, rather than the formulation of policy, is evidently his first concern.

A Study in Inaccuracies

"Iran: An Economic Study." By Raj Narain Gupta. Indian Institute of International Affairs. 169 pages. Rs. 5/8.

INACCURACIES and misprints make this book of little use. It starts out with the assumption that Persia is "one of the richest countries in the world in matters of natural resources," which, true in so far as oil is concerned, is for the rest not borne out by the facts as known to us. To take at random a few of the misleading statements of the book: the *ayani* rights mentioned as giving security of tenure to the peasant are not, in fact, found all over Iran; the law of July, 1946, "to improve the lot of the peasants" has not yet been put into operation; the division of crops between the landlord and the peasant is subject to far greater variation than the text would suggest; in the description of efforts made to improve agricultural technique no mention is made of the Government Agricultural Institute at Hesarak or the Agricultural College of Tehran University; the experimental farm in Khuzistan is described on page 51 as "the Forestry School at Shadejan in Khuzistan" and on page 64 as "the farm in the marshes at Shadejan." The statement that there are 150 major factories in Persia owned entirely by the state (page 81) is an exaggeration. Similarly, the statement that there are 68 trades unions is, without qualification, misleading. No clear account is given of the effect of the war years on Persian economy, nor are such questions as wage rates, the cost-of-living index, and retail

and wholesale prices discussed. The Loan Bank and the Mortgage Bank mentioned on page 156 are, of course, one and the same institution. When Dr Millsbaugh resigned as Administrator General of the Finances, the American Financial Mission ceased to exist and did not stay on as stated on page 165, and by September, 1945, nearly all those who had been members of this mission had left Persia.

A Misnomer

"Failure of the Left." By Norman Mansfield. Staples Press. 192 pages. 10s. 6d.

It is always difficult to find a title which is at once striking, curt and accurate, and nowadays it is generally accuracy which goes to the wall. Mr Mansfield is likely to lose many potential readers, who will be led by his title and dust-jacket to think that this is a counter-revolutionary tract, heralding the revival of a capitalist or catholic or otherwise reactionary Right. It is not. It is a sturdy liberal essay; a realistic sermon on the Middle Way; a keen analysis of the many errors into which well-meaning democrats have been betrayed during the last thirty years. Mr Mansfield has dug patiently and profitably into the great burial mound which devoted hands have heaped above the Prophet Marx, and he comes out bearing many revealing shards. He selects four Apostles for special examination—Bernard Shaw, G. D. H. Cole, Harold Laski and John Strachey—and in all four gospels he finds the marks of totalitarianism, though he is charitable enough to show that all four possess liberal intentions.

In H. G. Wells, on the other hand, Mr Mansfield finds the pattern of the true liberal. Wells is quoted as saying, in *The Brothers*, that fascism and communism are "defensive hate systems." . . . "Both are obdurately dogmatic. Both pretend to be scientific and both suppress reason. Neither will face novelty. . . ." Let in the light of truth, says Mr Mansfield, and the world's problems will be solved by simple, common-sense methods. There is no one correct solution, as in school examinations. "Civilisation without planning is impossible, but civilisation subjected to the one plan ceases to be civilised." So Mr Mansfield wisely offers no plan of his own. When one leaves him, one is no further along the road, but one has a clearer head and a feeling of new vigour.

Australian Self-Defence

"Australia: Its Resources and Development." Edited by G. L. Wood. Macmillan, New York, 1947. ix+ 319 pages, with index. Price in U.K. \$20 net.

IN this book Australia again attempts to explain her background and aspirations to a world suspected by implication of indifference; this time the task falls to an imposing panel of Australian experts, who have produced a most readable and at times even an exciting book—exciting to those who can visualise the adventures and disappointments in the opening up of a continent of which so much is inhospitable. Excellent use is made of illustrative maps, and of statistics. The Australians are proud of their country, and are, on the whole, confident of their future. The reservation is necessary only because of the unknown factor of world influence upon the Commonwealth; if that influence was certain to be favourable, they would be quite confident. The book is thus in a sense a plea for understanding. As one of the authors puts it:

Australia has need of sympathetic understanding on the part of other countries in its attempt to construct a civilisation. For this it is necessary, as thinking Australians realise, for Australia to demonstrate to the world energy and practical achievement in the development of its resources.

One fallacy the book endeavours firmly to squash is that of Australia's supposedly vast empty spaces; the reader is conducted through the deserts by text, map, and photograph and introduced to formulae relating rainfall and evaporation to crop growing periods. The spaces are vast, but not empty, in the sense that anything much can be put into them. The Australians have tried and failed.

The Australians remain unrepentant protectionists, convinced that the stimulus to local industrialisation has been and is an

indispensable factor in maintenance of their standards of living. Now notice is served that:

Should the industrially powerful nations try to maintain an excess of exports over imports, should they refuse to lower their own tariff barriers, should they disregard the reality that Australia has come of age industrially, then Australia will be left with no alternative but to maintain her present protectionist policy.

There are other aspirations from which, the authors say, Australians will not lightly be diverted. Avoiding "tedious definition," the adjacent islands to the north and north east and west are down to become an Australian northern bastion.

Not to put too delicate an edge upon statement, the whole area not backed by military power to defend and financial resources to develop it. Whatever the protective system which finally emerges from international agreements, Australia's interests in shaping and sharing its defence are clear, and it is imperative that her position should be understood by the United Nations.

The book is addressed, it seems, primarily to the American reader; one wonders therefore whether a single paragraph on Dominion status and the relation of the Parliament at Westminster to the Commonwealth is sufficient to clarify Australia's position in the British Commonwealth. Nevertheless, the book as a whole is a successful attempt at that difficult exercise, a coherent symposium which covers much ground. It should whet the appetite of the interested for more, and it is therefore a pity that the authors did not close each chapter with a brief bibliography to guide further interest, particularly specialist interest.

Shorter Notice

"Citizens All." By Maurice W. Thomas. Nelson. 156 pages. 15s.

THIS book gives a straightforward description of how a local authority works, how rates and taxes are spent, and how parliament and the civil service and the judiciary carry out their functions. There have been dozens of books written on these subjects: this one combines in an unusual degree clarity of exposition, a lavish distribution of diagrams which are both helpful and attractive, and a deceptively simple style. The knowledge which Mr Thomas conceals behind his almost childlike descriptions must be considerable, for his simplifications are rarely distorted: the book is designed for the teacher or the uninstructed reader, but it is also a useful book of reference for those whose knowledge is more extensive, but not necessarily always at their finger tips.

From *The Economist* of 1847

July 10, 1847

There is, especially towards the end of every session, a general complaint that Ministers have not done enough, and that much of what they have done is not well done. The reason is apparent; they are required to do a great deal more than men can well do. They are the executive officers of the Government, obliged to attend at levees and drawing rooms, accompany the Queen on excursions, and administer the law in the last resort in all cases . . . in their keeping is placed the honour of the nation, and they have to attend to all our relations, commercial and political, with other countries. In a very complicated state of society, they have duties to perform as the executive government of this great empire. . . . In addition to these, they may be almost called our sole legislators. The least acquaintance with the manner of carrying on the national business is sufficient to show that theory and practice are now essentially at variance. According to the former, the executive carries into effect the laws made by the legislature; actually the executive dictates and, by the help of the Parliament as a council, makes the laws. Instead of acting on a rule laid down by another body, it lays down the rule it wishes to follow. Practically, it ceases to be the executive when it has ceased to be the legislative power. . . .

Engaged as Ministers are with such a multifarious quantity of business, it is impossible that they should be able to attend to a half, or even a tithe, of the measures they propose to Parliament. They are obliged to receive assistance from others. In fact, those others—obscurer and nameless barristers, or enterprising and industrious schemers—are generally the authors of the measures which the Ministers . . . recommend to Parliament. . . . It would be an approximation to improvement, if those nameless persons stood before the public, clothed with all the responsibility of their acts.

AMERICAN SURVEY

Reactions to Marshall

(From Our US Editorial Staff)

THE educational campaign to prepare this country for whatever the Marshall offer may be specified to require is gaining momentum. But it has still failed to answer two of the most important questions. Whether the silence in these matters is part of the plan or is indicative of planning yet to be done is not yet clear.

The first major step in the campaign has been a translation. The Secretary had simply said that reconstruction in Europe was a problem for which Europe should devise some solution, and that this country would listen to any proposals attentively. This has now been translated: at least an important part of the solution will entail provision of dollars in large amounts. This was strongly indicated by Mr Thorp, Assistant Secretary of State, and has been stated, with no amount given, in the latest report of the National Advisory Council. It was specified by Mr Cohen, the State Department's Counsellor, in Los Angeles as \$5 to \$6 billion annually for some years. It has been "guessed" by a House Foreign Affairs Subcommittee to be \$10 billion for the three years 1947-49 for 18 countries: the need for this period is put at \$17 billion, from which is deducted \$2,285 million of gold and dollars now held and \$4,783 million of credits now available. It is being elaborated daily by stories regarding the developing dollar shortage in Britain, France, Canada, Mexico, Brazil and Argentina. It is being underlined by the growing spread between this country's exports and imports, now perhaps at an annual rate of some \$12 billion.

The second step was the formation of the committees to study this country's ability to maintain its present high rate of exports. A group headed by the Secretary of the Interior, Mr Krug, will consider the drain on natural resources. The President's Council of Economic Advisers will study the economic impact. And a National Committee, headed by Mr Harriman, Secretary of Commerce, and consisting of public men from various walks of life will consider the reports and evaluate them. These committees are in accord with Senator Vandenberg's proposal, and presumably will establish limits and perhaps suggest methods. The Harriman Committee expects to report in September, so that its findings will become available about the same time as those of the European conference.

These two steps are of course necessary. And from them more specific information will become available. The first of the unanswered questions is that of appropriations and technique. What is the device that is being considered? Three techniques are possible: loans, the revival of Lend-Lease and the Hyde Park agreement covering Canada during the war, and outright grants such as those made by Canada, Australia and New Zealand. There are also the international organisations, the Bank and the Fund, which could be used, perhaps after reconstitution. Which of these methods is being considered now, or whether some new one has been devised, has not been hinted. It is not even known whether technique is being considered. Yet this will surely be one of the most vital aspects of the whole programme.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

A part of the same question is that of appropriations and the budget. Will what is to be done be a budgetary item requiring appropriations? It is hard to see how this can be avoided. But the Republicans are still riding hard on budget and tax reduction, and "\$5 or \$6 billion" a year for several years in addition to what they have come to regard as necessary government costs will require extensive orientation. Mr Taber, chairman of the House Appropriations Committee, is severely criticising some current requests for expenditures abroad. Perhaps the solution of method will have to await the preparation of the data. But the recollection of the long controversy about the mere drop in the bucket called for by the Greece and Turkey programme suggests that the Congressional job is not a small one.

Some of the lines of questioning concerning the amounts needed are already clearly emerging. The July letter of the National City Bank is especially significant: the letter appeared just after the bank's vice-chairman, Mr W. Randolph Burgess, who is a leading spokesman for American banking and a member of the Harriman Committee, had returned from Europe. The United States, it says:—

have not wished to be, and have not been, ungenerous; but we have been apprehensive lest our resources be squandered and our aid unproductive. Only the Europeans can make it productive. . . . The will to work and the incentives to trade and enterprise must be strengthened, threats of confiscation removed, and printing press inflation brought to a halt. . . . To consider that giving away vast amounts of goods is essential to our "prosperity" is to see only one side of the picture. Money collected through taxes and used to pay for the exports could have supported just as many jobs if the taxpayer, instead of having to pay the tax, had his own free choice in disposing of his income. . . . Enough dollars are already in the hands of foreign nations, or will become available under existing programmes, to tax out export capacity for some time to come. . . . Gold holdings outside the United States stock, and outside the Monetary Fund and the World Bank, are estimated at \$15 billion at the end of May, even after the heavy transfers in February to get the Fund going. This compares with \$10 billion in 1940. Dollar holdings of foreigners evidently amounted to more than \$5 billion at the end of May. The total of gold and dollars is estimated at \$20 to \$21 billion. New gold production outside Russia may run to \$700 million annually. . . . (This) provides an answer to the more extreme statements about a world-wide "dollar crisis." Aside from the gold and dollars in foreign hands that can be used to buy American products, dollars are constantly being supplied under existing programmes. . . . The full potential of money so far unused under existing programmes runs to at least \$12 billion. . . . Their apparent needs may be greatly affected by their internal policies. . . . If the world produced more to sell us at attractive prices, we would buy more. . . . A whole group of other questions come up—the attitude of workers, the hours worked and individual productivity, incentive, the distribution of labour and resources among the industries. The inflation that prevails in so many countries itself induces a shortage of dollars.

Other students and observers, including some recently returned from Europe, are voicing similar views: the United States is willing and eager to import, but many countries are not willing to work and produce; the so-called dollar crisis is in fact in large part a crisis of production due to economic mismanagement abroad; the United States is criticised for elimination of controls and lack of planning, but the results of devotion to controls, planning and nationalisation abroad do not invite emulation. These views, it should be emphasised, are not those of western isolationists or chronic anti-foreigners, but of students, many of whom have jobs abroad.

THE CHASE NATIONAL BANK

OF THE CITY OF NEW YORK

STATEMENT OF CONDITION, JUNE 30, 1947

RESOURCES		LIABILITIES	
Cash and Due from Banks	\$1,113,745,115.62	Capital Funds:

Figures of Foreign Branches are included as of June 25, 1947, except those of the Dairen Branch which are prior to the outbreak of the War, but less reserves. \$266,372,976 of United States Government Obligations and \$1,588,219 of other assets are deposited to secure \$218,225,035 of Public and Trust Deposits and for other purposes required or permitted by Law. (Member Federal Deposit Insurance Corporation)

The second major aspect regarding which silence has been complete is that of monetary policy. Throughout the war, finance was a camp follower and funds were raised at 2½ per cent. But the consequences were that tremendous inflation of money supply occurred. This has been one of the basic problems in the American economy ever since. And ever since the war, cheap money generated through monetisation of debt has continued to pile up inflationary fuel and certainly has been a factor in the intransigent upward trend of prices. This was a consideration in the veto of the tax reduction bill and is clearly a political issue of first importance for 1948.

Is the financing of the "\$5 or \$6 billion" to follow the same plan, leading to more debt monetisation and inflationary tendencies? The only alternative would seem to be to find some way to increase savings, but neither of the two known methods can be used with ease: higher interest rates are anathema to the Treasury and many followers of "modern" theory of course doubt their effect on the rate of savings, while the imposition of any kind of rationing as the 1948 election approaches seems unthinkable.

Both of these unrevealed aspects may be within the realm of the assignment to the Council of Economic Advisers. But if so, this is curious. So far, the evidence is that the Council has made little impression on Congress, and it would be a strange vehicle to choose to "make a sale" regarding appropriations. And, so far as monetary policy goes, the Council virtually disavowed interest in that subject in its first report.

Europe may have some way to go in devising its plans. Certainly some distance has yet to be traversed in the United States. The only source of major accomplishment in demolishing barriers, preparing Congress for large-scale action, and sweeping aside all questions, is Mr Molotov. If his desire is to cause all groups of Americans to forget all doubts about aid to Europe in almost any amount, he is proceeding with brilliant success, and he may well be able by September to see his every wish fulfilled.

American Notes

The Peerless Leader

With one stroke of his pen on Monday, Mr John L. Lewis won for the miners the most triumphant contract in their history, by-passed important sections of the new Labour Law, and re-established his own position as the "peerless leader" of American labour. The new contract, signed by operators of Northern "captive," and some Western mines, provides for an eight-hour day (in place of the nine hours, including two hours overtime, previously worked), a net wage increase of \$1.20 a day; continued portal-to-portal pay; and an increase in the royalty payments to the union welfare fund from 5 to 10 cents a ton. Mr Lewis is to be chairman of the three-man board which will administer the fund. Most of the Southern mineowners later announced their grudging acceptance of the new contract terms.

The eagerness with which the negotiators for the industry met the miners' terms has three explanations, which interlock. The demand for coal is so unprecedentedly high that this was no time for haggling over cost or mere legal points, however dear to Senator Taft; this was a particularly potent argument with the representatives of the steel industry, who played, through their ownership of the "captive" mines, a dominant part in the negotiations. The oil shortage postpones the day when the miners may find they have priced their product out of its market. Nor does it appear that the coal owners put any faith in the ability of the new Labour Law to avert a strike, if John L. Lewis willed it. It is particularly significant that the operators finally agreed, after some soul-searching, to embody in the contract the provision—already part of the anthracite agreement—that it applied only so long as the miners were "willing and able to work." This is Mr

Lewis's *chef d'œuvre*; the operators become co-conspirators in evading the law. It means that the union is no longer liable for damage suits in case of unofficial strikes, and places in jeopardy all the elaborate provisions for mediation, injunctions and cooling-off periods of the Taft-Hartley Act. To say that the coal contract makes the Labour Law a dead letter is an exaggeration. Only the strongest unions will be able to follow the Lewis lead. But Senator Taft, examining his catch, may well say ruefully, "You should have seen the one that got away!"

Mr Lewis has demonstrated once more that for a combination of courage and cunning, and a sense of which card to play, he has no peer in the labour movement. If the long-heralded but never consummated marriage between the American Federation of Labour and the Congress of Industrial Organisations is ever to take place, Mr Lewis's throne is now secure. His victory has its wider political implications. In the past he was gallingly unable to persuade the miners to vote the Republican ticket, when Mr Roosevelt was the Democrat candidate. Next year he may be more successful, now that he has shown so plainly that in good times, at least, the miners need neither bow to Senator Taft nor seek favours from the Democrats.

Business Now

Industrial reports continue to assail all recent suggestions of a more or less immediate downward trend in activity. The volume of production is still at a high level, with commodity prices not very far from peak levels, and while the terms necessary to avert a coal strike are scarcely too high for industry to pay at this very critical period, they are hardly calculated to reinforce earlier moves for a downward adjustment of prices. It is perhaps fortunate that Mr John Lewis has secured his terms long after the negotiation of full settlements in most of the main industries. This will lessen pressure in the near future for another twist to the wage spiral, though the railroads operatives are now demanding wage concessions, and rail rates will probably move up again.

Altogether, Wall Street seems to have become convinced that it is now safe to postpone the deadline for a substantial break in business activity. And observers in that centre are at least inclined to minimise the present stress on the impending "dollar famine" with the comforting assurance that withdrawal of the Soviet Union from European reconstruction plans will bolster Mr Marshall's case in Congress, and thus assure the continuance of exports at a high level. Moreover, the so-called "defrosting" of Treasury bill rates (dealt with on a later page) is not a forerunner of any major adjustment in the structure of interest rates, while Treasury officials deny that the debt retirement programme over the rest of 1947 will result in deflationary pressure on the scale suggested by recent analyses.

Export Controls

The Congressional position on the Export Control Act seems still to be confused, with existing authority remaining in force by agreement of both Houses while committees are working to adjust outstanding points between bills approved separately by Representatives and Senators. Mr Truman's authority over the next year or so is thus still in doubt at the time of writing. Approval for the full wartime control of exports, and for import controls over such key materials as edible fats and oils, and scarce metals (particularly tin) seems to have been won in the Senate, which also deserves credit for a broad clarification of government authority defined only very loosely by Congress earlier this year, when a Decontrol Act put a sharp limit on continuing emergency provisions. The House has been far less responsive and has sought constantly to exempt foodstuffs from export control.

Washington, however, has already begun to discuss the much broader authority for priority and allocation which will almost certainly be needed for full implementation of the Marshall plan. The continuance of wartime export controls over such basic products as foodstuffs, coal and petroleum products, lumber and steel will by no means ensure adequate shipments of the machinery, machine tools and other specialised equipment necessary for a broad plan of European reconstruction. Moreover, development of these plans will almost certainly overlap with needs in other areas; the supply of mining machinery for the Far East, for example, is an essential factor in American, no less than European industry. To judge by recent debates in

Congress, such moves would meet with almost insuperable political barriers, and although the problem could be eased substantially by a slow-down in domestic activity, it seems clear that for many items, demand must outpace capacity.

Ultimately, this political battle will no doubt be resolved to a very large degree by the nature of the report made to President Truman by the recently established National Committee, headed by Mr Averell Harriman as Secretary of Commerce. In the longer run, the Marshall project must secure full bipartisan support for any type of necessary control. All that can be said at the moment is that (as with the very different debate on Lend-Lease) there is an increasingly influential section in Congress and industry which realises quite plainly that the future political and economic structure of the United States is worth a considerable measure of restraint in terms of consumer goods. Under emergency conditions, the Administration probably would not hesitate to move well in advance of Congress for priority and allocation. Such powers are always well within the limits of the service departments at times of crisis. These moves, however, would also be quite futile—unless designed purely as short-term commitments, supported by an overwhelming public demand for action in the face of delay or obstruction by a Congressional minority.

Congressional Log-Jam

A recent American cartoon shows Congress, a slovenly housewife, displaying with pride two plates labelled "Labour Bill" and "Foreign Aid" and saying airily of the stacks marked Housing, Health, Education, Armed Forces Merger, and Universal Military Training: "Oh, I'll do those next year." The seasonal log-jam is at hand. Congress hopes to adjourn on July 26th, yet by June 30th it had sent to the President only one of the twelve appropriation bills. Government departments are operating on hope and the promise of Congressional authorisation of interim spending. The new legislative budget, the flower of the Reorganisation Act, still reposes, as one acid Democrat remarked, on the bosom of the Republican Party.

Inevitably many admirable projects, like the Stratton Bill for admitting 400,000 DPs, will fall by the wayside. Legislation regarded as in the "must" class appears to include, beside the

appropriation Bills, the merger of the armed forces, the Mundt Bill to continue the broadcasts of the State Department, and perhaps the Bill raising the minimum wage from 40 to 60 cents an hour. Left-wing Democrats who have constantly pressed for the raising of the minimum wage are gratified, but hardly surprised, that the Republican leadership should consider the month in which the Taft-Hartley Bill was passed an opportune moment to go on the record as favouring at least one of labour's aims.

In the closing weeks of the session Congress will be much concerned with measures involving the national security. Before it are three measures backed by the Services: merger, standardisation of hemispheric arms, and universal military training. The last two appeared doomed by the hostility of Senator Taft, who has the power to decide whether they ever reach the floor. Universal Military Training, which was supported not only by the Compton Commission but by a new unofficial group headed by retired Justice Roberts, Senator Taft denounces as "un-American, wasteful and obsolete." The interest of the Services in these measures is, however, probably no greater than that in the fate of their appropriations, which were reduced by the House, and will, it is hoped, be restored in the Senate.

Sugar Plum

The vote of the House Agriculture Committee on the new Sugar Bill takes policy back to normalcy—defined as something a bit worse than pre-war. While Mr Clayton fights the battle of quotas at Geneva, the American sugar industry has written a Bill, with the approval of the Departments of State and the Interior, which would not only revive the quota system for sugar, but would increase the share of the market reserved for domestic producers and for Cuba. Under the Bill, which would replace the Sugar Act when it expires on December 31st, US producing areas would have a minimum tonnage of 4.2 million short tons, divided as follows: domestic beet, 1.8 million; mainland cane, 500,000; Hawaii, 1,052,000; Puerto Rico, 910,000; Virgin Islands, 6,000. The Philippines would have a fixed quota of 952,000 tons. Cuba would supply 98.64 per cent of the remainder of the American market, and fall heir to any domestic or Philippine deficits. The

OVER A MILLION CLIPPER PASSENGERS WERE CARRIED IN 1946

A Clipper's Eyes are never closed

In a box no bigger than a card-index drawer the Navigator can see his exact position

There are devices aboard a Flying Clipper that reveal things no mortal eyes could see. They enable the Navigator to observe his exact position marked clearly on a screen, and to determine his exact height above land or sea.

These and other aids to air navigation enable the giant 4-engined Flying Clippers to carry you, in luxurious comfort, above the weather. No wonder experienced air travellers say, "Go by Flying Clipper when you go."

Consult your travel agent, or our general agents, U.S. Lines, Arlington House, Arlington Street, Piccadilly, S.W.1 (REG-ent 3101). Clipper Express (Air Freight), 50 Pall Mall, S.W.1 (WHitchall 3311).

German officials could not persuade the peasants to pick the famous Kaisersstuhl cherry crop.

So far then as the peasant is concerned, the French cannot claim to have found any method of bribery or coercion more effective than British or American methods. Consequently heavy imports of food from overseas are necessary even to maintain the lowest ration scale of the three Western Zones. In the period August 1, 1945, to December 31, 1946, over 48 million dollars were spent on foodstuffs out of a total of 69 million dollars paid for imports from outside Germany. In the first quarter of this year, 24½ million dollars have already been spent on imported foodstuffs. To pay for these out of German production, or by joint Franco-German production, has been a main object of French policy from the first; and to achieve it every side of foreign trade has been kept practically out of German hands.

In the final article of this series the methods with which the French have made their zone pay its way by foreign trade will be examined, together with some of the problems which will arise when the economy of the French Zone (minus the Saar) is joined to that of the fused Anglo-American Zones. Reluctant though the French Government are to take any such step until the November conference of Foreign Ministers has made a last effort to attain German economic unity, they realise that the programme needed to qualify western Europe for the Marshall offer may make such fusion inevitable before many months have passed.

Two Years of Dutch Recovery

[FROM OUR CORRESPONDENT AT THE HAGUE]

A WELL-KNOWN Dutch writer and journalist who visited his own country recently after having lived in South Africa, the Netherlands East Indies and the USA since 1939, expressed concern at the large number of people in this country who wished to emigrate. "Do you realise," he asked, "that Holland is a comparative paradise on earth, in the economic as well as the political sense?" He was right, and it is a regrettable fact that the Dutch are not sufficiently aware of their relative good fortune. Recovery here has been extensive and the immediate consequences of the war have already been overcome. The inner core of poverty, the difficulties of "muddling-through" at a time when "going ahead" would have been a better catchword, become clear only on closer investigation.

In reviewing the general position it must be borne in mind that Holland, situated at a point where the Rhine, Meuse and Scheldt reach the sea, in the densely populated north-western corner of continental Europe, neighbour to some of the most important countries of the world, has always been largely dependent on foreign trade. During the 17th century the Dutch were the carriers of Europe; their industry began as a series of finishing processes for colonial products (sugar refineries and rice mills), and both the trade with the Netherlands East Indies and Rhine transport to and from Germany have been pillars of Dutch prosperity. The textile industry was started mainly to supply the native population of the Indies with low-priced textiles, and the *Nederlandsche Handelmaatschappij* with sufficient freight for its shipping service to the East.

The fact that before the war only 7 per cent of Dutch imports came from the NEI and only 10 per cent of Dutch exports went there, is not decisive. The economic interests in the overseas territories provided an outlet for many young Dutchmen and supplied Holland with a substantial income from abroad; interest and dividends valued at almost 200 million guilders were received from foreign sources, as against profits amounting to approximately 100 million guilders made by Dutch firms in the NEI. A further source of Dutch income from abroad was shipping, which in 1938 provided some 150 million guilders on the balance of payments. Half the Dutch mercantile navy was destroyed during the war, however, and income from this source has, to a large extent, dried up.

In May, 1945, the general situation in the Netherlands was as critical as that of any other newly liberated country, with the possible exception of Yugoslavia and Poland. Some 230,000 men had lost their lives in the war, amongst whom were included some 105,000 Jews, 31,000 PoWs, political internees and men forced to work in Germany. The total national wealth, estimated at 28,000 million guilders in 1938, suffered a loss of 8,000 million guilders (calculated at 1938 index values). Of the cultivated areas

12.5 per cent had been made unfit for use by fortification, evacuation and inundations (9.7 per cent). In a comparatively short time, however, nearly all this land has been made available again; but meanwhile the yield of a number of products was far below pre-war level, e.g., the sugar beet crop in 1945 was only 6.5 per cent of the pre-war crops.

Industrial output, too, was very low in the summer of 1945. The output of the Limburg coal mines, already liberated during the autumn of 1944, was down to 29 per cent of the figure for 1938, while comparative figures for electricity were 18 per cent, gas 16 per cent and textiles even far below 10 per cent. Exports were practically negligible at some two or three per cent of the pre-war figure, while transport could be said to be at a standstill. To illustrate how badly the transport system was damaged in this country of rivers and canals, it is sufficient to say that of the 21 major railway bridges, a mere five had been left in a condition fit for use. At the moment of writing sixteen are in use.

Slump in Rhine Traffic

Now for the record of recovery. One of the best examples of Dutch post-war reconstruction is that of the railways. Total length of tracks in Holland was 3,300 kilometres in 1939. In 1945 this figure had fallen to a mere 1,200 kilometres, as a consequence of the big strike of 1944 and subsequent German looting. At present tracks once again total 3,090 kilometres. Much railway material has been brought back from Germany, while it was possible to repair damaged material found in the country. Locomotives, trucks and other rolling stock have been borrowed from the Allies, and at present rail transport is fairly satisfactory.

Canal and river transport has been restored as far as material is concerned, but the current difficulties in conducting a normal trade with Germany make the prospects for Dutch navigation on the Rhine far from bright. A large number of ships are again lying in the port of Rotterdam; but their freight is now calculated in thousands, whereas before the war it amounted to millions of tons. Although the lack of motor-cars and trucks is still felt, road transport is more or less back to pre-war levels. Doctors and other priority classes have nearly all the cars they need, and the complaint is generally heard that too many businessmen possess new and expensive American cars—a heavy drag on the Dutch foreign exchange budget.

Dutch industry—as is the case with industry all over Europe—is handicapped by the low productivity of labour (60-70 per cent during 1946). For the current year it is calculated at approximately 78 per cent, while the pre-war level is expected to be reached during 1950. It is very doubtful, however, whether this target will be reached. The food situation is satisfactory at a level of 2,200 calories per day, with extra rations for heavy labour; but then again, as everywhere else, fats are sorely lacking.

Output in Industry

The social atmosphere has been reasonably calm, with some occasional minor outbursts of dissatisfaction. Some American firms are even starting to put up branch plants in Holland, on account of the lower wages and the greater stability of the country. But the general wave of European strikes, which began in the spring of this year, did not leave Holland unscathed; although general strikes, such as those in France, have not yet been attempted. But trouble may well be expected if general fighting should break out in Indonesia. It is insufficiently realised, however, that some of the pre-war time practices will never return as long as the workers have the power to resist inhuman working methods and that the general productivity of labour depends—among other factors—on a sufficient supply of up-to-date tools and machines, which is not available because of the scarcity of foreign exchange. Nevertheless there is no reason for dissatisfaction with present industrial output, although exports are far below the original target.

In textiles production of some items is rather below, while of others somewhat above, pre-war level. The appalling lack of clothes and other textiles is more the result of five years' wear and tear without replacements than of allegedly insufficient production. The Government is seriously to be blamed for not taking rigorous measures to end the black market in textiles, which, even two years after liberation, still flourishes. The more plentiful supply of household products and textiles is reflected in larger sales and lower prices, which compare with lower sales figures for luxury

articles. In a few months the prices of some indispensable commodities fell on an average 10 per cent.

The black market in other commodities has shrunk considerably. Important in this connection is the increased manufacture of tobacco products and cigars (approximately two-thirds of the 1938 output), and of cigarettes (117 per cent), which reduces the exchange value of the black market cigarettes, mainly imported brands. But pessimistic estimates of the number of persons still engaged in "black marketeering" range up to several hundred thousand. This activity is not only due to shortages, for most of the young men who have already been committed once on black market charges return to this line of business, simply because they are unfit for any other kind of work.

For and Against Controls

The situation of scarcity still prevails, but a large number of people do not sufficiently realise that their standard of living is less restricted, so far as necessities are concerned, than during the reputedly golden pre-war days. The pressure of wage and price "pincers," most apparent in 1946, has not increased since. A slight increase in prices over a period of a year has been accompanied by an equivalent wage increase; the level of real wages compared with pre-war levels is now estimated at 91 for industry and 127 for agriculture. The general picture of the present control-ridden Dutch economy is that restrictions are somewhat less stringent than at the end of the war, but not fundamentally so. Some controls are simply unavoidable, for example, those on the distribution of raw materials; but for the continuation of other controls the reasons are not apparent. Nevertheless, it is—rightly or wrongly—felt that the raising of the price-ceiling involved in their relaxation would cause a general increase in prices, resulting in a socially undesirable distribution of goods.

There is a third group of articles, the controls on which can be explained in only one way—by the tendency of every system of red-tape to be self-perpetuating. But it is an established fact that the release of an article from controls still tends to drive it off the market altogether; so that, although an overall revision of controls would be welcomed, and is even necessary, care must be taken not to lift them too rapidly. A number of businessmen realise that a certain amount of control by the Government is unavoidable. Others, however, look back on the legendary freedom and wealth of the years before 1940—for example, members of the Amsterdam Stock Exchange—and refuse to recognise that the end of controls on exchange operations would mean at the very least the loss of an important part of Dutch overseas investments and foreign balances. The great majority of people judge Government control as it affects their own line of business and reason—not always wrongly—that it is an annoying affair.

[A second article next week will examine the main problems of Dutch foreign trade and relations with Germany.]

Oligarchy in Bermuda

[BY A CORRESPONDENT]

THE facts about Bermuda have at last been published in this country. During 1940-45, ordinary British people, brought by war service to that luxury tourist resort, were amazed at the irresponsibility of the local legislators: they thought that if only people at home knew, "Front Street" (the white merchants and landowners) would surely never be allowed to run the place so shamelessly in their own interests.

And now the full text of a petition from the Bermuda Workers' Association, praying for a Royal Commission of Enquiry, has been published by the Secretary of State for the Colonies in a White Paper (Cmd. 7093) discussed in *The Economist* of April 19th, page 579. The major grievances are detailed in it: the restricted franchise; labour legislation which prohibits organised labour from political activity*; a repressive tax system; lack of social security measures; an educational system which is compulsory but not free, and which segregates coloured from white; coloured people barred from responsible appointments alike by Government, public and private undertakings. Finally, it puts into words "Front Street's" private conviction that Britain will

* Until 1946 there was no labour legislation at all and trades unions were technically illegal.

not interfere so long as the local budget is balanced. The White Paper also includes the Governor's memorandum on the Petition, which combines a disarming admission that some reforms are overdue with meticulous criticism of certain minor inaccuracies in the Petition, and an evasive vagueness on the subject of colour discrimination with a critical hostility towards Petition and Petitioners. His conclusion is that "neither the Petition itself nor the true state of affairs in the Colony warrants the appointment of a Royal Commission."

Mr Creech Jones, Secretary of State for the Colonies, in the acknowledgment which concludes the White Paper, thinks otherwise. He makes it clear that he must be able to satisfy Parliament that all the various grounds of complaint are being dealt with. Since, however, the Colony has enjoyed representative government for over three hundred years, its Legislature gets a last chance to put its own house in order. "It is clearly desirable and necessary that, in the first place at any rate, examination should be undertaken by, or at the instance of, the Colonial Legislature." "Front Street" is thus "in a spot": shall it destroy its privilege or wait to be liquidated by the Imperial Power?

Three Centuries of Prosperity

To understand conditions in Bermuda today, it must be realised that almost unbroken economic good fortune has enabled an anachronistic oligarchy to defend its privileges and powers for over three centuries, producing at the same time a coloured population more capable of responsibility and more prosperous than most. Like all colonies settled by Englishmen in the seventeenth century, Bermuda received a constitution more or less on the contemporary English model, representative government with the franchise restricted to landowners. But efforts to grow a remunerative staple crop (tobacco) there failed, and, since the end of the seventeenth century, the inhabitants have used their unique situation at a strategic point on Atlantic trade routes to make a living from some form of maritime activity. At first it was shipbuilding, the carrying and *entrepôt* trades, salt raking, privateering and piracy. Bermuda has for long been a contraband station in wartime, and since 1810 it has had a naval dockyard. Today it is also a port of call for cruise ships, a balmy island Mecca for the American luxury tourist and site of two United States bases.

Thus Bermuda has been spared the problems of a single-crop economy—collapsing markets, absentee landlordism, social tension bred from plantation slave labour—which in the West Indies led to the replacing of old oligarchic Governments by Crown Colony administration. Slavery in Bermuda was therefore of a different character. Without the need for a large labour force to work plantations, importation of negroes almost ceased after the seventeenth century. Maintenance, even of the existing slave population, became a liability rather than an asset, since the owner had to feed them, in sickness and old age as well as in health, on imported foodstuffs. Emancipation was as much a relief to the owners as to the slaves, and was conceded right away in 1834. It produced neither dislocation of labour nor excessive racial tension. The coloured people were already a community, with traditions and local roots extending back almost as far as those of the whites. The women were accustomed to easy-going domestic service and treatment as child members of the family. The men, many of them mechanics or sailors, were used to working alongside white men. Many were used to finding jobs for themselves, for they were encouraged to hire themselves out so as to help pay for their keep. A Governor of the early nineteenth century described them as a bold and hardy race of seamen. Another wrote:

The Negroes of these Islands are a very intelligent, docile race, far superior in every point of view, to the Africans. . . . The Bermudian Black considers himself an Englishman, and would feel happy to be placed in a situation that gave him his freedom and entitled him to the privileges of a British subject.

When emancipation came the coloured people of Bermuda were ripe, it seemed, to take their place as citizens. But the owners had no intention of sharing their oligarchic powers. At the same time that the Colonial Legislature enfranchised the slaves it reduced their opportunities of political power by doubling the voters' property qualification—this in an island of 18½ square miles. Now, when the coloured population is roughly double the white, plural voting (another seventeenth century survival) gives only 1,352 coloured votes against 1,634 white votes. The conflict which has developed since emancipation appears at first to be racial. Although most of the coloured people have some white ancestry, intermarriage is practically unknown and there are therefore two distinct communities. The oligarchy are well aware of Imperial disapproval of colour discrimination, and they do not wish to stir up trouble. The subject is, therefore, rarely if ever

referred to officially; discrimination is left to customary administrative practices. For example, the dual system of education is maintained in Government-financed, Government-directed schools by the face-saving expedient of describing them as private schools, leaving head teachers to discriminate between intending pupils. But it is a commonplace for white Bermudians privately to express alarm at the coloured population's rate of increase. An English observer who criticises racial discrimination is told, first, that since the present economy depends on American tourists who are even more anti-negro than Bermudians, the coloured people must be kept out if the tourist trade is not to suffer. A second reply is simply this: "It's all very well for you to come here and criticise. You can go home to England where you haven't any coloured population. We have to live here. Naturally we don't want the coloured people competing with us and taking jobs away from our children."

Fundamentally, however, the problem is one of property distribution, complicated by the fact that the dominant landowners and merchants are white and the workers coloured. In Bermuda a fortunate history has given the property owners greater powers and a more highly developed technique for their defence than perhaps exist in any other British colony—with the exception of the similar colony of Bahamas. Deducting from experience that Britain does not interfere in the internal affairs of a colony which makes no demands on the Imperial Treasury (and making doubly sure during the war by using revenue surpluses for interest-free loans to Britain, at the expense of local educational improvements) the oligarchy have perfected the arts of procrastination. Popular causes are referred to one committee after another; legislators express approval of the principle of reform but disagree about the method; so time passes and nothing is done.

The Colour Bar

The raising of revenue by import duties falls heavily on the poor, who pay taxes on virtually everything they buy, and the failure to introduce the usual social security legislation, adequate teachers' salaries or better schools makes it possible to get along without direct taxation. Racial segregation begins with education and goes on to bar coloured people from all categories of the local civil service except those of postman, policeman and messenger; it bars them from training at or being on the staff of the Government-financed and only fully equipped hospital, from any but menial positions under the city corporations or other large establishments.

The coloured people have been slow to resent their position. The same economic factors which have preserved the oligarchy have given the workers, skilled and unskilled, full employment and a comparatively high standard of living. The Governor is not exaggerating when he writes:

I have never before seen a coloured population—and I am fairly conversant with them—so well dressed, well fed or well housed as it is in Bermuda.

This, of course, ignores the fact that, with so much wealth in the island, there is no excuse for the poor social services and the bad cases of overcrowding and insanitary housing, malnutrition, child neglect and hardship in sickness and old age to be found there. But it was inequality of opportunity, not poverty, which three years ago drove some of the workers into the Bermuda Workers' Association, under the leadership of Dr Gordon, a more politically conscious coloured immigrant from Trinidad. Some individual members may have hoped for short-term advantages; but they

have been led to petition for something much more fundamental—an impartial investigation into the problems of the "voiceless, voteless and under-privileged masses of Bermuda."

"Front Street's" Opportunity

Naturally the Governor, Admiral Sir Ralph Leatham, K.C.B., is sympathetic to the oligarchy. The historical reasons which made it unnecessary for Britain to interfere in the Colony's internal affairs have, for the last hundred years, prompted the appointment of Governors likely to get on with the ruling Bermudians. Moreover, as in Gibraltar and Malta, the Governor of this "Gibraltar of the West" has normally been found, not among experienced Colonial Service personnel, but from "the Services." Anthony Trollope described the Bermuda Governorship as a convenient provision for a military gentleman in the decline of years. So the Governor's memorandum picks holes in the petition and counsels its rejection. He admits that the existing franchise should be reformed, but speaks of it as "a system which has withstood the test of time"; he points out that a committee of the Assembly has been appointed to consider extension of the franchise, but does not mention that this committee, set up in June, 1946, had not once met at the time he wrote, five months later. He ignores as much as he can of colour discrimination; he expresses himself as "sympathetic towards the employment of coloured men and women of sufficient competency in some (sic) more Civil Service posts..." but adds, "there are well-known practical difficulties involved which have their origin in the historical development of this Colony." He freely pleads for "time for cogitation and adjustment of ideas" after the war, and reveals his own prejudice by saying,

It would be so much more helpful and profitable to the Colony if Dr Gordon and his Executive Committee... could be persuaded to direct their energies and cleverness in the coming years to teaching their followers good citizenship and preparing them for greater responsibilities, instead of apparently instilling into them the wrong belief that these things are to be had for the asking, whether or not they have shown themselves to be competent.

No one could fairly claim that the average coloured Bermudian, as he is today, would make a first-rate leader of society. Generally speaking, he shows a characteristic indifference to family responsibilities, to work and to the good of the community. The white people, who have their own share of irresponsibilities, take this as evidence of innate inferiority, ignoring the effects of two centuries of slavery, the influence of white example, the demoralising play-boy atmosphere of a tourist resort, and, most fundamental of all, the disadvantages summed up in the explanation given by a coloured Member of the Colonial Parliament for parents' apathy towards education: "No outlet for the children, so the parents figure what's the use."

The white community are not devoid of generosity. The old patriarchal relationship between master and slave has lingered on: the coloured man still looks to the white for help, and there are Bermudian employers today who do to their coloured employees and other "deserving cases" many acts of kindness. But the time for mere charity is past. The serious protest that has come from the coloured community suggests that they will not rest content with their inferior status. If Bermuda is to keep what remains of the racial harmony it enjoyed at the time of emancipation, procrastination must end. The principle of equal opportunity must be established. If "Front Street" will not do it, then it becomes the responsibility of Great Britain.

THE BUSINESS WORLD

How Big is the Gap?

THIS week's debate on the import cuts, the wider aspects of which are discussed in an earlier article in this issue, has cleared away some of the obscurities in which Government policy was shrouded. But many remain. Why did the Chancellor deliberately abstain from putting his original statement in a statistical setting, thereby avoiding an evaluation both of the cuts themselves and of the size of the gap that needs to be closed? He himself, when taken to task on this point, lamely explained that he was afraid of "overburdening" his statement by "interlarding a lot of statistics into it." But in this statistical age, especially this dismal phase of successive revisions of nearly all the economic targets, the House and the public are scarcely strangers to figures. The balance of payments presents the crucial problem of Britain's whole economy, and the Chancellor was making his most important pronouncement since the issue assumed its present frightening dimensions. Would he dream of proposing tax increases without first defining his revenue and expenditure and the size of the deficit? Is the explanation, alternatively, that the statement resulted from a snap decision to reveal action while the Paris conference on the Marshall offer was still proceeding? Even that is unconvincing. The import programme has been under detailed scrutiny for many weeks, and the figures could obviously have been produced at a minute's notice. Yet Mr Dalton, responding to Opposition pressure, thought he could furnish them in about three days. It is hard to avoid the conclusion that, at the outset, obscurantism was a deliberate objective, designed to hide the vagueness and timidity of the policy itself.

The promised figures appeared just after the last issue of *The Economist* went to press. Despite the delay, they dealt with only one aspect of the problem, and this week's debate has shed very little light upon other aspects. Nothing further is revealed about the size of the gold and hard currency reserves, the rate of actual expenditure of dollars drawn from the credits, or the period for which the residual dollars might be expected to last. No further estimates are given of the overall balance of payments or the state of the "invisible" account, and nothing specific has been said about the dollar costs of completing the arrangements for full convertibility of sterling. All that has been furnished in any coherent form is a revised import programme—classified under the same very broad headings as those given in the now out-dated *Economic Survey* for 1947—and a minor interpretation of the information already given by Mr Morrison about the export prospect. But although much has been withheld that is indispensable to a proper appraisal of the problem, the published figures easily suffice to show the utter insignificance of the Government's contribution to its solution. They are set out in the accompanying table, which compares the new import programme (for the year beginning on July 1st) with that given in the "Economic Survey" for the calendar year 1947.

The original 1947 programme for imports of £1,450 million at f.o.b. values (excluding £18 million of invisible imports of films) was £350 million more than was actually spent in 1946, but it was understood to represent little improvement in the effective flow of imported supplies. Most of the increase reflected, first, the need to make good the 1946 inroads into domestic stocks and, secondly, the rise in prices in overseas markets, notably in the United States. Now the total, for a period ending six months later (and therefore overlapping by

six months with the original period), is increased by a further £232 million (nearly 16 per cent), to £1,700 million including films—or to more than 50 per cent above the 1946 level. Yet we are told that it represents "no significant change" in the bulk of imports embraced in the original programme: the "major change" results from the increase in prices. Although the rise in dollar prices affects Britain's import bills after an appreciable time-lag (only in recent months have the effects of last summer's decontrol of American prices been strongly felt), the significance of this factor was seriously underestimated in the budgeting of last February. The Board of Trade's index of import prices (which admittedly tends to understate the effects of the dollar changes) has risen by 20 per cent in the past twelve months and by 7½ per cent since the turn of the year; yet the official programme, for the same bulk of imports, has had to be stepped up by 16 per cent in four months.

It is unprofitable to consider whether this deterioration could have been foreseen sooner, but if the Government has been slow to drive the point home, it is now more than ever important to emphasise that this huge rate of importation affords no greater support for the standard of living or the export potential than did the much less costly imports of 1946. In bulk, it is equivalent to some four-fifths of what Britain imported before the war. But even an increase to the—at present unthinkable—level of 100 per cent would not suffice to restore pre-war

THE IMPORT PROGRAMME
(£ Million, f.o.b.)

	Economic Survey Estimates Year 1947	Revised Estimates Mid-1947 to Mid-1948
Food and supplies for agriculture.....	725	840
Raw materials and supplies for industry...	525	640
Machinery and equipment (including ships)	60	55*
Petroleum products.....	55	80†
Tobacco.....	50	40
Consumer goods.....	35	30
Film remittances.....	18	15‡
	1,468	1,700

* This represents some increase for machinery over the *Economic Survey* figures for 1947.

† Excluding possible effect of film import duty.

‡ Including requirements of coal/oil conversion.

standards of life (so far as they depend, as they vitally do, upon imports) because of the much larger slice which must be reserved for incorporation in exports. Yet this huge programme already takes credit for the latest cuts—all except the expected cuts in film imports. Incidentally, therefore, it gives no clue to their precise amount.

By contrast with the figures given in the *Economic Survey*, the prospective deficit on the balance of payments is even more depressing—though here, too, the Government has refrained from disclosing what the latest official estimates really are. The trend of exports has improved a little upon the worst expectations of a few months ago. Not only was the recovery from the shock-effects of the fuel crisis rather less protracted than many people had feared, but it now appears that the *Survey*'s estimate of the total for 1947 had already allowed for half the loss of £200 million which the crisis and its aftermath were expected to cause. But for that crisis, 1947 exports would have been put at £1,300 million; as it is, they are now estimated at £1,100

million. No comparable revised estimate has been given for imports, but if the *Survey* estimate of £1,450 million was realistic at the time it was made, it might be reasonable to assume that the revised figure for the calendar year would lie nearly midway between that estimate and the £1,700 million now foreshadowed for the period from mid-1947 to mid-1948. On this basis, the 1947 import total (including films) would be, say, £1,550-£1,575 million, and the adverse balance would be no less than £450-£475 million, in contrast with less than £270 million estimated last February. If other net invisible outgoings are estimated on the basis suggested in the *Survey* (£175 million of net Governmental expenditure overseas, offset to the extent of £82 million by net receipts from other sources), the overall deficit for 1947 would be in the vicinity of £530-£560 million, compared with the original estimate of £350 million and with the £450 million actually experienced in 1946. By comparison with a gap of this magnitude, the cuts now contemplated are of so little account that it is hardly of consequence whether the figures are computed before or after allowing for them.

Nor is it reasonable to argue that the years 1946 and 1947 should be considered together, and that, from the point of view of the drain upon the dollar credits, the disappointments of 1947 might be regarded as being balanced by the unexpectedly good achievements of 1946. The overall deficit for the two years combined may be a little less than was contemplated at the time of the American Loan agreement. But the negotiators of that agreement assumed that British external borrowings of this magnitude would, by the end of 1947, have provided both much larger quantities of imported supplies for Britain, and a much higher proportion of capital and re-equipment goods, than will actually have been secured. The steep rise in prices and the concentration of Britain's deficits upon the hard currency areas have imposed a much greater effective strain upon the dollar credits than any such calculations might superficially imply.

As for the extent of Britain's remaining dollar resources, it is impossible, even now, to frame a precise estimate. The information regularly made available, like the figure given by Mr Dalton on Tuesday, relates only to the drawings upon the dollar credits (i.e., to the amounts transferred from the US Treasury to the British Treasury's account in New York); it gives no reliable clue to the rate at which the dollars are being actually spent or earmarked; and the latest figure for the dollars and gold in Britain's till is already more than six months out of date. Since the winter's crisis, dollars have been drawn from the credits at an accelerating rate. By the end of June, drawings on the US credit—excluding the £37½ million draft announced this week—had totalled £512½ million, and those on the Canadian credit roughly £165 million. The amount drawn on both credits in the first half of this year was about £400 million, and of this no less than £250 million was drawn in the second quarter. The acceleration suggests that Britain has been living from hand-to-mouth; but, in the absence of further data, it would be unwise to take this for granted. In the latest period for which ostensibly comparable figures are available—the six months to end-December last—the gross holding of gold and dollar reserves was increased by nearly £100 million. It is at least conceivable, therefore, that the true dollar position is a little more favourable than the Exchequer Returns suggest. But, if the dollars which have been drawn are assumed to have been spent almost immediately, the amount which remains at Britain's command in unutilised lines of credit is about £570 million (or £532½ million after this week's draft), to which must be added the £642 million of gross gold and dollar holdings which Britain had in the till six months ago. At the recent rate of drawings, the residue of the dollar credits would last until the early weeks of 1948, while the gold and dollar reserves would provide perhaps for a further six months of expenditure before the situation reached the direst

extremity—after allowing about £150 million for a minimum working balance and inescapable gold liabilities.

Obviously, the position is extremely grave. Yet there is, even now, a breathing space during which policy could be brought to bear. Moreover, the prospect on a twelve months view may be rather more favourable than it is for the calendar year 1947. In the first place, it is very questionable whether the recently completed arrangements for restoring convertibility to sterling will in the coming year add appreciably to the effective strain which convertibility arrangements have already imposed in the first half of this year. Although the arrangements generally are not reciprocal, it would be wrong to suppose that they work only one way. By conceding the right of convertibility to sterling accruing from current earnings after July 15th, Britain achieves two notable gains. First, a limit is set to the diversion of British exports from their urgent task of paying for imports to the role of simply repaying past indebtedness. These unrequited exports in the past have imposed a very severe strain upon the balance of payments, and probably would have been checked much sooner if Britain had not known quite definitely, long in advance of July 15th, that by that date at latest it would be necessary in any case to set a limit to them. In future, exports of this character will be limited to the amount of agreed releases from accumulated balances. Measured by the experience of the past, this is perhaps the most striking of the two advantages which Britain reaps from the July 15th arrangements. But, looking to the future, the second advantage may well be the more important: it has been made a condition of the granting of convertibility of sterling that each country agrees to accept sterling without limit when offered by any other country in settlement of current debts. Sterling, as many countries will quickly discover, is achieving a real multilateralism based on the confidence that it can be converted into the ultimate scarce currency. For that reason it will not only itself become a scarce currency, but will move with increasing freedom around Britain's series of trade connections, enabling deficits to be offset against surpluses and enabling Britain to pay sterling for supplies which in the past have cost her dollars.

There is probably no need, therefore, to assume that the pure technicalities of the exchange situation will at this stage seriously aggravate Britain's own problem. But the repercussions of the world dollar shortage upon British exports will become increasingly burdensome. The 1947 export target has now officially joined the list of abandoned objectives; the rate of 140 per cent of the 1938 volume of exports, which in the *Economic Survey* was planned for the end of 1947, is now projected as the goal for the middle of 1948. In relation to 1947 the 140 per cent was geared to an export value total for the year of £1,200 million; now it is geared to a value total (for the year—mid-1947 to mid-1948) of £1,300-£1,350 million, an increase which is apparently not wholly attributable to the rise in export prices. It will be an extremely difficult target to achieve, and the effort to achieve it will certainly involve further sacrifices for home consumers. But if it can be regarded as attainable, the prospective overall deficit for the year 1947-48 is about £400-£450 million (after allowing for £50 million of re-exports), or between £100 million and £200 million less than the prospective deficit for this calendar year. If, as is perhaps reasonable to expect, governmental overseas expenditure can be reduced below the £175 million estimated for the calendar year, and if income from tourism and shipping expands, the final result might be £50 million or so better than these figures suggest, leaving an overall deficit, on the most favourable assumptions about exports, of possibly less than £400 million.

The prospect is clearly alarming; but the gap on these assumptions is not so vast as to suggest to the fainthearted that it is hopeless to try to narrow it significantly without gravely impairing Britain's short-run capacity to produce.

Wages and Industrial Unrest

THE sense of restlessness among organised labour is clearly reflected in the recent outcrop of unofficial strikes. This week, shop assistants in the Royal Arsenal Co-operative Society's stores, provincial bus workers in the northern and midland regions and London Transport Board's busmen have all withdrawn their labour, and have brought great hardship to the public. The growing unrest and indiscipline in certain coal-fields is even more serious, for if it develops, it may result in an irretrievable setback to production. Fortunately, the findings of the Court of Inquiry on Railway Wages (which gives the men an increase of 7s. 6d., instead of the £1 for which they had asked) have been accepted by both the National Union of Railwaymen and the Associated Society of Locomotive Engineers and Firemen. The latest Ministry of Labour Gazette shows that only slightly more working hours were lost through trade disputes in the first five months of 1947 than in the first five months of 1946 (1,105,000 compared with 992,000), but the possibility of fresh waves of industrial unrest is ever present.

Trade union leaders have been loud in their condemnations of unofficial strikes. Mr Deakin described the Sunday strike of the London Transport workers—in defiance of a majority decision of a delegate conference—as “a violation of trade union principles.” Sir Mark Hodgson denounced unofficial strikes as “a body blow to collective bargaining.” Mr Will Lawther was even more outspoken in his presidential address to the miners, and described them as “a crime against our own people.” The trade union movement is understandably worried by independent strike action, for its own authority, as well as the public interest, is being challenged. Strictures and appeals for loyalty and discipline, so far, have not proved an effective curb.

There is general agreement on the need to speed up the working of industrial negotiating and arbitration machinery—or at least of avoiding unnecessary delay—but it is not easy to define the limits within which this could be done. This problem is under consideration by the Ministry of Labour's Joint Consultative Committee. The proceedings of the Road Haulage Board have shown that it is possible for months to elapse between the presentation of a claim and the announcement of an award; the delays create a restive atmosphere and make an unfavourable award even less acceptable to the men. Yet to impose a time limit on the deliberations of wage-fixing bodies would be an arguable step; clearly it would be undesirable for those claims which involved important points of principle, and had far-reaching repercussions on other sections of industry, to be considered, as it were, under duress.

The problem of overhauling and improving industrial negotiating machinery is not new. At the end of the first world war, as at the end of the second, the fact, or the fear, of industrial unrest prompted wide interest in the methods of settling industrial disputes. The schemes of the Whitley committee for setting up adequate safeguards for industrial peace were only partially successful, but they did result in the establishment of the Industrial Court. Recent bodies set up under the Industrial Courts Act, such as the Terrington committee on the road haulage disputes, the Forster Committee on ship-building hours and the Guillebaud committee on railway wages, have been instrumental in breaking deadlocks and preserving industrial peace. The war saw the extension of voluntary machinery and the gradually diminishing importance of the statutory bodies, and the Wages Councils Act of 1945 inherited the mantle of the Trade Boards Acts of 1909 and 1918. Voluntary machinery is more flexible and sensitive than statutory bodies

which tend to be hamstrung by their legal provisions. In general, therefore, the development of voluntary negotiating machinery should diminish the risk of industrial unrest.

It will be interesting to see whether the recently-established negotiating machinery for the mines will have the desired effect of reducing disputes in this traditionally troubled industry. It provides for an elaborate system of pit conciliation, with the object of establishing “a regular, speedy and efficient method” of dealing with grievances at the collieries. If no settlement can be reached directly between the workmen and the management, the matter is referred to a pit committee, with a time limit of 14 days. Then, if no settlement is effected, it will be referred to a disputes committee, with another 14 days' time limit, and finally, to an umpire selected from a panel appointed by a District Conciliation Board. At whatever stage a settlement is reached, it becomes binding on members of the union and upon managements.

The British system of industrial negotiating machinery, in spite of its haphazard and somewhat uneven development, is probably unrivalled, but in the last resort only a sense of responsibility determines whether industrial peace is to be maintained. The Government is in a dilemma on this question. It naturally wishes to minimise industrial unrest and to avoid loss to production. On the other hand, it must surely be concerned at the inflationary movement which is now developing from the concession of the claims of particular sections of workers whose demands are based on bargaining strength rather than a fair economic assessment of their wages and those of other workers in a weaker position. It has been suggested that an extension of the national arbitration machinery, to give the Government the opportunity, as a third party, to state its case for or against particular claims, might provide a solution, but, in practice, it would alter the two-party character of the present system, and might diminish the confidence of the workers in the independence of the arbitrators, if they felt that undue weight was attached to the Government spokesmen—even, probably, if they were Socialist Government spokesmen. Suppose that a court of inquiry rigidly followed the principles laid down in the White Paper on wages and hours, and refused applications for shorter hours or higher wages on those grounds. Would the unions be content to accept this because the Government have said so?

The dilemma was clearly recognised by the Court of Inquiry on Railway Wages. On the one hand, it admitted that the unions had a case for wage increases—especially in view of the drift of manpower from the railways—and that, with the general trend towards a reduction of working hours, it seemed illogical to withhold similar benefits from railway workers—a perfect example of the repercussive effect of labour awards granted to one industry being used as a lever for improvement in another. On the other hand, the Court had to take into account the effect on railway costs, which could only be passed on to the public in the form of higher fares and freight charges, and the effects on other industries:

We are aware of the tendency for wage increases in one important industry to have repercussions on the wage structure throughout the country, and we wish to make it clear that our recommendations have had regard to the special circumstances of the railway industry at the present time, and are not intended to serve as a basis for general upward movement of wages as a whole.

For this reason, their recommendation specifically states that the increase of 7s. 6d. should be regarded as a short-term measure, pending the very necessary examination of a system of

* Including East India wool, noils, shoddy, etc. † Including hair. ‡ Average of Sept.-Dec. only. § Ministry of Labour figures of numbers employed in the woollen and worsted industries. All other figures in the table are returns submitted to the Board of Trade.

policies and high rates they caused depression: the violent criticism they received after 1920, after 1929 and after 1937 is still exceedingly impressive. They have therefore been, and still are, seeking the best of two possible worlds.

Insurance and Nationalisation

In view of recent murmurings from unofficial Labour circles, the insurance companies will obviously have welcomed Sir Stafford Cripps's reaffirmation recently that the Government has no intention of extending nationalisation into the field of insurance. The Minister's reassurance was, indeed, quite comprehensive in its implications. Speaking at the anniversary dinner of the Norwich Union Insurance Societies, he reiterated the statement made when the new Assurance Companies Act was introduced in Parliament last year:—

The Government have no intention of interfering with the transaction of insurance business by private enterprise save to the limited extent to which insurance at home may be affected by the existing proposals relating to personal social insurance and industrial injuries. It is the desire of the Government that insurance should be in the future as in the past dealt with on an international basis and as business of an international character.

This re-statement of faith in the virtues of a free insurance business is the more significant in view of the recent discussions about the effects which industrial nationalisation may have upon the demand for insurance facilities. There have been complaints, for example, that the Coal Board is abstaining from insuring in the market its risks for fire, accident and similar contingencies, preferring to absorb them within its own organisation. Sir Stafford promised a considered reply to the representations which have been made on this issue but, in the meantime, categorically affirmed that it certainly does not follow automatically from nationalisation that the nationalised industry or service should not insure in the ordinary market. Given this assurance that there is no purely political factor in the equation, it is difficult to quarrel with the policy which is being followed: The nationalisation boards, as Sir Stafford pointed out, are designed to be virtually autonomous boards which should have sole responsibility for deciding matters such as these. It is true that the peace-time policy of Government departments is, very properly, to absorb their own insurance risks; but if national boards adopt the same procedure, it would be wrong to assume that they are merely assimilating their practice to that of Whitehall.

When an organisation reaches a given size, it is plainly more economic for it to rely upon the spread of risks within its own organisation than to pay a premium to the market for the service of providing a still larger spread. The policy adopted by the Governmental trading controls during the war—of insuring stocks and goods in transit—represented, not an admission that the normal policy was unsound, but simply a means of ensuring that no permanent damage was done to London's insurance market by the abnormalities of war-time trading. The nationalisation boards, if they decide that their business is sufficiently large to absorb particular risks without insurance, will simply be following a policy which has been considered appropriate by such organisations as the railway companies and London Transport. In the circumstances, it is hardly fair to regard the Government's attitude in this matter as inconsistent with its recognition of the important part which British insurance plays in invisible exports. Obviously the extension of nationalisation will tend to restrict the domestic demand for insurance facilities. But this is hardly a case in which the capacity of the insurance companies to perform services abroad is dependent upon the volume of the demand for their services at home.

* * *

Bigger Dis-savings

The recent trend of National Savings is hardly calculated to put fresh heart into the gilt-edged market. The latest figures, which relate to the last week of June, show a further increase in the rate of withdrawals and a negligible increase in the flow of new subscriptions. In consequence, the week's encashments (including the interest portion of savings certificates repayments) exceeded new savings by £3½ million, which is easily the largest amount of weekly dis-saving for the current financial year. Five weeks ago, when attention was drawn in these pages to the unsatisfactory trend, the cumulative total of net cash receipts (for the first eight weeks of the year) stood at £59.4 million, and thus was approximately equal to the target rate of £1 million per day.

Since then, although at the target rate the total should have risen by a further £35 million, it has actually fallen by £6 million to only £53.6 million—before allowing for roughly £7½ million for interest disbursed on the Savings Certificates encashments. Thus, whereas the "departments" could normally count upon at least a modest inflow of savings moneys which they automatically re-employ in the gilt-edged market, now they are having to find funds for the purpose of meeting small savers' claims. The following table summarises the trend for the financial year to date, and continues the series given in *The Economist* of June 7th:—

SMALL SAVINGS TREND (£'000s)			
Week Ended	Receipts	Repayments*	Net Cash Raised
April 5.....	31,988	17,917	14,071
" 12.....	20,735	12,055	8,702
" 19.....	18,071	14,688	3,383
May 3.....	26,546	15,976	10,570
" 10.....	30,384	19,504	10,880
" 17.....	20,740	14,992	5,748
" 24.....	17,441	15,630	1,811
" 31.....	17,717	13,450	4,267
June 7.....	14,711	16,326	-1,615
" 14.....	15,851	15,265	586
" 21.....	16,565	16,362	203
" 28.....	15,456	17,235	-1,779
" 28.....	15,596	18,824	-3,228

* Excluding interest portion of Savings Certificates encashments.

The year's target of £366 million for net savings is some £36 million above the comparable figure for 1946-47, yet already the total for 1947-48 is far below last year's level and over 40 per cent below the target rate. Sir Harold Mackintosh, explaining some of the underlying influences recently, attributed this contrast with 1946-47 mainly to the fact that the figures in the early weeks of that year were unnaturally swollen by the bumper demand for the last of the 3 per cent Defence Bonds. But, had it not been for the successive "last chance" drives, the 1946-47 savings figures would have been far below the level actually achieved; and, in raising their sights for this year by some 10 per cent, the National Savings Committee must be presumed to have taken account of this factor and to have assumed that the planned increase could be achieved without such adventitious aids as those of last year. If this savings target is not to join the long list of abandoned objectives, the Savings Committee will have to make even greater efforts to bring home to the public the need for maximum economy. Its task would be easier, perhaps, if the Government itself showed more realism in approaching the problem of the balance of payments, for the psychological and human issues which arise in both cases are closely parallel.

Exchange for Business Travel

The British exchange control authorities have this week taken necessary and belated steps to prevent the abuse of the regulations covering the issue of foreign exchange for business purposes. Hitherto such exchange has been made available to a business man and two members of his staff at the rate of £10 a day each, and authorised banks have had the right to grant exchange on these terms for periods up to three months without reference to the Bank of England. The only exception from this rule was that exchange allocations for Switzerland were restricted to seven days, any extension beyond this period requiring Bank of England authority. These highly elastic arrangements lent themselves to considerable abuse. Too often did the "other members of the staff" include the business man's wife masquerading as a secretary in order to qualify for the £10 a day with which wardrobes were restocked and scarce hard currency frittered away. Too often were "business trips" up to three months spent in the mountains. The main changes now made are to restrict to 15 days the period for which business travel currency can be allocated without reference to the Bank of England, and to make each application cover one person only. If secretarial or other services call for companions on the business trip, special application will have to be made for them.

Raw Cotton Prices Increased

The increase in raw cotton prices announced by the Board of Trade at the end of last week can hardly have surprised Lancashire. The home issue price had been for some months below

Abridged Particulars

JENSON & NICHOLSON LIMITED

(Incorporated under the Companies Acts, 1908-1917.)

MANUFACTURERS OF "ROBBIALAC" PAINTS.

SHARE CAPITAL

Authorised	Issued or to be Issued.
£200,000 in 6 per cent. Cumulative Pre-Preference Shares of £1 each.....	£153,231
£100,000 in 6½ per cent. Cumulative Preference Shares of £1 each.....	£100,000
£200,000 in 7 per cent. "A" Cumulative Preference Shares of £1 each.....	£200,000
£200,000 in Ordinary Shares of 5s. each.....	£125,000
£700,000	£578,231

The Company has no Debentures or Mortgages or Loan Capital (except a Charge in favour of Midland Bank Limited, to secure a loan which it is proposed to repay out of the proceeds of the present issue of Shares).

THE SUBSCRIPTION LIST WILL OPEN ON TUESDAY, 15th JULY FOR AN ISSUE OF

296,924 Ordinary Shares of 5s. each at 25s. per Share.

The Prospectus shows (inter alia) that:—

- The Company, with its subsidiaries, manufactures all classes of paints, varnishes, enamels, cellulose lacquers and distemper, including the well known "ROBBIALAC" and other proprietary brands.
- Net trading profits for the twelve years ended 31st December, 1946, before charging taxation or War Damage Act payments, but after providing for Directors' remuneration, depreciation and amortisation, interest (other than on the Bank Loan, which it is proposed to repay out of the proceeds of this issue), and deferred repairs, together with the parent Company's share of the profits of subsidiary Companies to the extent only to which such share has been received by way of dividend were:—

1935.....	£42,542	1941.....	£49,080
1936.....	47,571	1942.....	98,341
1937.....	57,642	1943.....	127,816
1938.....	44,205	1944.....	145,229
1939.....	59,745	1945.....	109,599
1940.....	68,470	1946.....	234,352

- The arrears of repairs, maintenance and re-building throughout the world, together with the everyday demand for all the Company's products, should keep the Works fully employed for many years. The Directors are confident that, unless unforeseen circumstances arise, the dividend of 25 per cent. per annum, which has been paid on the Ordinary Share capital for the last four years, should be at least maintained on the enlarged capital. Such a dividend represents a yield of 5 per cent. at the price of 25s. at which the Shares are being issued.

Copies of the full Prospectus, on the terms of which alone applications will be considered, and forms of application are obtainable from:—

OFFER FOR SALE

BY ROBERT BENSON & COMPANY, LIMITED,
of 292,500 ORDINARY STOCK UNITS OF £1 EACH AT 45s.,
payable as follows:—

On Application		20s. 0d. per Stock Unit
On Acceptance		25s. 0d. per Stock Unit
Total		45s. 0d. per Stock Unit

The List of Applications will open and close on Friday, 18th July, 1947

The Offer for Sale shows (inter alia) that:—

- The Company has been formed to acquire substantially the whole of the undertaking and assets of Lonsdale Investment Trust Limited (which was the undertaking and assets of Lonsdale Investment Trust Limited) and the whole of the issued and paid up share capital of Lonsdale Investment Trust Limited, T. L. Lonsdale & Company, Limited, previously a Subsidiary of Lonsdale Investment Trust Share Capital of Robert Benson & Company, Limited, whose name is in the course of being changed to Robert Benson, Lonsdale & Co., Limited.
- The Company will continue to operate as an investment trust, and through Robert Benson & Company Limited, will conduct an investment and merchant banking business, which includes the issue, offer for sale, underwriting and placing of securities, both publicly and privately, the financing and development of commercial and industrial undertakings, and the management and supervision of investment trusts and private investment funds.

ROBERT BENSON & COMPANY, LIMITED,
24, Old Broad Street, London, E.C.2.

- The Directors consider that, subject to unforeseen circumstances, the profits of the group should be sufficient to permit the payment of a dividend on the Ordinary Stock, in respect of the year ending 28th February, 1948, of not less than 10 per cent, which would represent a yield of £4/8/10 per cent on the price at which the Ordinary Stock is being offered for Sale.

- Robert Benson & Company, Limited are aware of applications for 70,000 Units from underwriters and clients, which will be accepted in full on the terms of this Offer for Sale.

Copies of the full Offer for Sale (on the terms of which alone applications will be received) and Forms of Application will be available on Wednesday, 16th July, from the Offices of:—

Hoare & Co., 4, Crosby Square, London, E.C.3, and The Stock Exchange, London, E.C.2. and

the New York spot rate, and the only uncertainty was the exact time when the Government's price would be brought more into conformity. The present increase, averaging 1½d. a lb. for American type and 1d. a lb. for Egyptian type cotton, is in fact quite moderate when compared with the previous rise of last October, which averaged 5½d. a lb. for American and 4½d. a lb. for Egyptian varieties. Since that date the spot price in New York has risen from 33.45 cents to 37.30 cents a lb.—an increase equivalent to 2½d., which compares with the present increase of 2d. for American growth. To what extent the differential price increases as between countries of origin will induce spinners to use raw cotton from sources other than the United States will depend largely on the quantities available. That these other prices were not raised as much as US cotton—for instance, Brazilian was increased only 1½d. a lb.—suggests that the Government certainly desires to encourage the consumption of these extra-American growths.

The following table, which shows the development of British cotton stocks by growth, reveals certain interesting trends in consumption:

STOCKS OF RAW COTTON BY GROWTHS IN UNITED KINGDOM
('000 Tons)

End of Period	Total	American	Indian	Brazilian	E. & W. African	Egyptian	Sudan	Peruvian
Dec. 1939...	275.0	122.4	23.0	9.9	0.9	55.8	25.0	28.0
June 1945...	376.4	113.3	40.3	42.9	16.3	87.4	47.4	9.6
Dec. 1945...	411.1	101.9	44.0	75.3	16.0	89.6	51.5	13.1
June 1946...	416.2	85.2	43.2	98.1	22.6	79.0	45.3	18.2

Stocks of American cotton have declined proportionally since the end of 1939, and also quantitatively, so that by June, 1946, Brazilian cotton became the largest item of the British stockpile. During the last twelve months this trend has continued. There has also been a greater emphasis on cottons from British East and West Africa. This changing pattern reflects the saving in dollars that has already been made.

The most important question raised by the Board of Trade announcement, however, is that of price policy. It is an established principle that the Cotton Control have to cover their costs, but the methods adopted for determining the home issue prices remain a mystery. Under such a system of governmental trading, price changes will be less frequent than in the days of the Cotton Exchange, but the magnitudes greater. If the industry is to plan forward, it must have an idea of the future trend of prices. It was never easy to assess accurately a market's reaction; that, was acquired by experience. But to foresee what a Government body will do, and when, is an impossibility. If Government trading is to work harmoniously with private enterprise some mechanism seems to be required to replace the price barometer which guided the industry in the past.

Courtaulds' Expansion

After twenty-five fruitful years as Chairman of Courtaulds, Mr Samuel Courtauld, who is the father of rayon development both in this country and overseas, has been succeeded by Mr J. C. Hanbury-Williams. The new chairman gave a comprehensive outline of the company's expansion programme in his address at the meeting this week, saying that contemplated capital expenditure exceeds even the huge total of £27 million available for reinvestment resulting from what is pointedly described as the "confiscation" of the company's interest in the American Viscose Corporation. Even the £37.4 million of net liquid assets available at March 31st is regarded as possibly inadequate measured against current construction costs, and though there will be no immediate recourse to the capital market, this might be necessary in due course. The extension of the company's activities in the United Kingdom has had to be keyed in with the Government's plans to direct as many new factories as possible to the development areas. The chairman was not able to add much information on the progress of the company's development schemes, but progress in the initial stages is bound to be slow when labour and equipment are both difficult to mobilise. A year may elapse, for instance, before the company goes ahead with its plans for the new factory to be erected at Dundee for the production of staple fibre. In the main, attention is being directed to augmenting production in existing mills which are now working in most cases at full capacity. Overseas, a rayon factory is projected in Australia, and extensions to the existing plant at Cornwall, Ontario; a badly damaged factory at Calais is working again, while at Cologne the Glanzstoff-Courtaulds buildings are little damaged and connections in Italy with Snia Viscosa are being resumed.

An interesting break down of trading receipts shows that out of £1 received, raw materials took 6s. 2½d., wages and salaries 5s. 10½d., running costs, depreciation and selling expenses 5s. 7½d., leaving 2s. 3½d. to be split between taxation, 1s. 0½d., and a mere 1s. 3d. for other contingencies and dividends. This analysis shows that the equity holder is on the thin edge of a very broad wedge. In fact it was pointed out by the chairman that actual ordinary capital employed in the business amounts to around £46 million, including profits ploughed back. The latest dividend was equivalent to 7.6 per cent for a twelve month period, or taken as a percentage of the capital actually invested, around 4 per cent. The present emphasis on long-term expenditure suggests that Courtaulds' ordinary shares cannot yet count on a more than moderate chance of higher dividends, though the eventual return on the new investment should certainly exceed that obtained on the gilt-edged securities now held by the company.

Cash for Damaged Chattels

It is perhaps anomalous that the long delayed payments of compensation for bomb damaged private chattels, which the

(Continued on page 83)

COMPANY MEETINGS

NATIONAL BANK OF NEW ZEALAND, LIMITED

RECORD DEPOSITS

The seventy-fifth ordinary general meeting of the National Bank of New Zealand, Limited, will be held in London on the 24th instant.

Sir Sydney Parkes, the chairman, in his circulated statement, refers to the strong ties binding the Dominion to the Mother Country, as evidenced by the gift of £10,000,000 sterling to the British Treasury and the generous subscriptions for the relief of flood distress in England.

Dealing with the balance sheet he states that deposits had increased by £5,342,000 to the record figure of £26,840,000, and advances have expanded by £2,731,000. The demand for loans has come from most classes of borrowers, but the increase is due mainly to the requirements of the Dominion's expanding industrial structure, to the cost of rehabilitation and restocking of business generally. Higher price levels have also contributed to the increase.

The net profit at £110,798 shows a satisfactory increase owing to increased lending and some slight relief from taxation. The proposed final dividend is 3 per cent. (less tax at 9s. in the £), which with the interim dividend of 2 per cent. makes 5 per cent. for the year.

Referring to general business conditions, he states that trading has been good in spite of many shortages. Expansion of secondary industries continues to be a market feature of Dominion economy. Coal and electricity, especially in the North Island, have been in very short supply. Building construction has been confined, through lack of an adequate supply of materials, to housing and essential works.

Overseas assets of the Dominion in March last stood at £NZ99,508,000. The con-

tinued high level of these funds is partly the outcome of increased prices for exports and partly the result of the difficulty of obtaining imports.

Dairy production has been better than last season, butter graded for export for the eight months ended March 31st being 18.5 per cent. higher than for the same period last year.

Two years ago the joint organisation (U.K. Dominion Wool Disposals, Ltd.) took over the responsibility of disposing of the accumulated war-time stocks of wool. Since then world demand for wool has exceeded all expectations, and it is gratifying to learn that more than half of the surplus has already been sold. There was almost a complete clearance of the current New Zealand clip, and in addition surplus stocks of New Zealand wools are now down to about 1,000,000 bales, or roughly a year's production.

BANCA COMMERCIALE ITALIANA, MILAN

ANNUAL GENERAL MEETING

The ordinary general meeting of this Bank was held on April 29, 1947, in Milan, the chairman of the board, Signor Camillo Giussani, being in the chair.

Mr Raffaele Martioli (managing director) submitted the directors' report for the year 1946.

It illustrates the more salient changes in the balance sheet. They reflect the economic and financial developments in Italy during the past year and the policy pursued by the bank in its endeavour to give the fullest support to the country's post-war reconstruction.

Without departing from its habitual caution in undertaking fresh liabilities, the bank has unhesitatingly brought to this task the full weight of its efficient organisation and of the spirit of enterprise which animates it.

There has been a fresh and substantial increase in the bank's resources consequent upon its ever-growing participation in national economic life. This has made it possible to meet in full the requirements of customers. The recognised canons of banking orthodoxy have been strictly adhered to. The bank has carefully refrained from granting accommodation for business of a speculative nature and has also declined certain propositions which would have involved a lock-up of funds intended instead for the purpose of promoting production.

A survey of the means by which Italian economy is endeavouring to find a new structural equilibrium and to get through the transitional period of reconversion shows that the Banca Commerciale Italiana, in addition to facilitating the placing of a number of new issues through its nationwide network of branches, has, in conjunction with the other two Italian Banks of National Interest, lent its assistance to the "Mediobanca" for the realisation of its particular programme.

As is known, the said institution receives monies on time deposit for periods varying from one to five years for the purpose of financing industrial undertakings. Its activities have already commenced and transactions of some importance have been concluded.

The directors' report of Banca Commerciale Italiana states that, in view of the fact that the former London branch had, unfortunately, to be wound up, it has been decided to open a Representative Office in order to preserve direct and close contact with that great financial centre.

(Continued from page 82)

Government had said must await a substantial flow of consumer goods, should fall to be made, after all, at a time when consumers face increasing rather than diminishing austerity. Most of the amounts now outstanding will be discharged on Monday next, when roughly a quarter of a million claimants will receive approximately £45 million. This sum includes interest on the agreed amount from the date of the damage and the supplementary payments which the Government last year agreed to make for certain losses which arose before the end of 1941. Obviously it is too late now to reopen the question of the basis of this supplementary compensation, but the sense of grievance felt by those who suffered damage after 1941 has certainly not diminished since last year's announcement was made, for every successive rise in prices makes the distinction the more inequitable. It is heightened, moreover, by the fact that many people secured substantial advance payments on grounds of hardship—and the authorities were certainly much less austere when judging what constituted hardship than in evaluating the amount of compensation due. The supplementary payments to those who have already received the full amount of their claims will not be made this week, but it is hoped that the payments will be completed in their entirety before the end of the year.

The £45 million now to be disbursed does not, therefore, represent even the greater part of the total disbursements for bomb damaged private chattels. The advance payments have already absorbed £65 million, and the supplementary payments to be made later this year will require roughly £10 million, to be made a total of about £120 million. Towards this sum the Government received during the war £16 million from those who voluntarily took out insurance policies for cover beyond the amount provided free under the Government scheme. The authorities now point out that "for the most part" the payments represent compensation under the free scheme for which no premiums were payable. This circumstance underlines the injustice of the other arbitrary feature of the arrangements for supplementary payments—that they are based on a percentage scale which descends as the amount of the claim rises; so that at the level of £1,200 no supplementary payments are made at all.

Shorter Notes

Deliveries of coal cutters to British coal mines during May totalled 73, compared with 75 in April and a monthly average of 70 in the second quarter of 1946. Deliveries of conveyors were slightly higher on the month, totalling 201 in May against 195 in April and 769 in the second quarter of 1946. Colliery tubs and mining car deliveries numbered 6,600 in May, compared with 5,370 in April. These, and other coal-mining machinery statistics, are given in a new table in the June issue of the *Monthly Digest of Statistics*.

A price-fixing agreement is being canvassed among the 1,400 owners of weaving sheds in Lancashire. Proposals follow the lines of the price-fixing contracts entered into already by members of the Yarn Spinners' Association, which covers 100 per cent of Lancashire spinners. It seems possible, however, that in the case of the weavers, rather less than 100 per cent agreement might satisfy the sponsors of the scheme.

Of the 6,330 European voluntary workers placed in employment between January 1st and June 30th, 564 were placed in textiles, 2,268 in agriculture and 1,836 in hospital work.

Addressing the annual conference of the National Union of Tailors and Garment Workers on Wednesday, Sir Stafford Cripps referred to the present lack of balance between supplies of clothing for men and women. The Wool Controller has requested manufacturers to make more cloth for men's clothes and less for women's. From July 17th the worsted flannels 214 and 214A are to be withdrawn from the schedules for women's garments.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Richard Thomas and Baldwins; Rolls Royce; Timothy Whites and Taylors; Beecham Group.

IMPERIAL BANK OF IRAN

RECORD FIGURE OF DEPOSITS

57½ YEARS' DIVIDEND AVERAGE

LORD KENNET'S SURVEY

The fifty-eighth ordinary general meeting of the Imperial Bank of Iran will be held, on the 17th instant, at the Charing Cross Hotel, London, W.C.

The following is the statement of the Chairman, the Rt. Hon. Lord Kennet, P.C., G.B.E., D.S.O., D.S.C., circulated with the report and accounts for the year to March 20, 1947:—

Our accounts this year show a further but more moderate increase in deposits, to the record figure of £24,663,000. Bills payable show a reduction of £684,000 in sterling drafts on London and items in transit. Credits and guarantees are increased by nearly £3,000,000. Much the greater part of the total of £7,000,000 in this item represents documentary credits opened by us in Britain and the U.S.A. and Europe to finance orders for goods of all kinds to be exported to Iran and Iraq. This is prime banking business for which we are reasonably secured, firstly by the control of the goods and secondly by the deposit, for a percentage of the value, which the importer in the Middle East leaves with us until he pays the bills and receives from us the documents enabling him to take delivery of his merchandise. As both the import of goods and the supply of foreign exchange are under Government supervision and control, the importer has to conform to varying limitations, restrictions and regulations, the object of which is broadly to establish an orderly supply of useful imports without drawing excessively on reserves of foreign exchange or flooding the market with excessive imports in particular classes of goods.

BALANCE SHEET CHANGES

On the assets side of the balance sheet there are two items which appear for the first time. Below the cash item we have a statutory deposit with the Bank Melli Iran. Under a decree issued by the Iranian Government on November 23, 1946, we have in future to maintain in a special account at the Bank Melli 15 per cent. of our public current deposits in Iran and 6 per cent. of our fixed deposits in Iran, all in Iranian currency. These redeposits do not earn interest. For the purpose of comparing this year's figures with those for March 20, 1946, the amount of £1,741,000 shown as deposited with the Bank Melli may be added to the first item, namely, cash in hand, at bankers, etc. The combined figures are very slightly below the cash figures for the previous year.

The second item of novelty in our balance sheet appears below investments. While conforming to the decree regarding redeposit with the National Bank of percentages of current and fixed deposits lodged with us by the public in Iran, we undertook simultaneously to hold Iranian Government Treasury Bonds to the extent of the same percentages of the same deposits with us by the public in Iran. We held accordingly at March 20, 1947, the equivalent of £1,914,000 in rial bonds. These bonds are repayable at three

months or six months after the date of issue. Since December 29, 1946, the rates of interest have been reduced to 1 per cent. and 1½ per cent. respectively per annum, and we understand that only three months bonds will be issued in future. It has been our practice for some years to hold these bonds, and in fact we held the slightly larger total of £1,953,000 at March 20, 1946. That was entirely of our own volition and the amount was comprised in our balance sheet in the figures for bills discounted, loans and advances, as I explained a year ago. The rate of interest on these bonds up to the end of July, 1946, was 4 per cent. per annum at three months, and 4½ per cent. per annum at six months.

EFFECT OF NEW OBLIGATIONS

The effect of these two obligations accepted by us last November is that 30 per cent. of our demand deposits and 12 per cent. of our time deposits in Iran will in future be immobilised and earning one-half per cent. per annum only. Discounts, loans and advances show very little change after deducting the Treasury bonds from the previous year's figures. In bills receivable we have an increase of £640,000 mainly in bills drawn under documentary credits. Notwithstanding the segregation of the obligatory redeposit referred to above, our cash and money at short call now amounts to 43 per cent. of our deposit liabilities, which we regard as quite adequate.

Our profit of £138,305 is a little more than the previous year. In placing £20,000 to reserve and so bringing that account into equality with our capital we mark another milestone in the march of our affairs. Our satisfaction at this stage is, however, tempered by a sense of the growth in our commitments and the uncertainty of the future. We are the better pleased to have been able to increase the carry-forward by £28,000. Maintenance of the final dividend at 6 per cent. brings the average gross return on the price of issue of our shares to 5 per cent. per annum over the 57½ years of our existence. You will remember that our shares were issued at a premium of £2. The average gross return on our nominal capital of £1,000,000 is 6 per cent. per annum over the same period.

GOVERNMENT'S DEVELOPMENT PROGRAMME

In reviewing the situation in Iran a year ago I referred to the unsettled state of the north-western province. The announcement in June, 1946, of a settlement of the Azerbaijan question did not inspire confidence, and it was not till six months later that the opposition to the central Government ceased, on the withdrawal of the Russian forces and the resumption of control from Teheran. The change was made in an uneventful manner, and the resultant improvement of the political atmosphere was very noticeable throughout Iran. Trade between the north-west and the rest of Iran has since been slow to recover, as the once-prosperous province of Azerbaijan had been impoverished by disorganisation and unrest.

With internal peace and confidence restored and good order re-established throughout the country, and with the parliamentary elections over, the Iranian Government is now free to pursue its policy of national development on constructive lines. The programme includes extension of the railway system, more factories, and a

pipled water supply for Teheran, also labour reforms and the extension of compulsory education and hygiene. The cultivation of opium, which has been discouraged for a generation, is now prohibited.

FOREIGN TRADE ACTIVE

Foreign trade in Iran has been active throughout the past year in spite of the Azerbaijan troubles, some tribal unrest in Fars and Bushire in the late autumn, and a period of congestion at the port of Khorramshahr. There is still considerable delay in the supply of imports, notably material required for capital construction or replacement. Substantial supplies of textiles and miscellaneous goods are being imported from the Continent of Europe. The cost of living has again fallen slightly. Some shipments of barley have been made to the Mediterranean. America is still the principal market for Iranian exports. The supply of sterling exchange at the official rate of 130 rials to the pound is limited, and sterling normally commands a premium in the unofficial market. The regulations controlling exchange vary from time to time to meet changing conditions.

As you know, our bank was established in Iran under a concession for 60 years from January 30, 1889, and we have always taken for granted that it would accordingly expire on January 30, 1949. Some months ago, however, we were told that in some quarters it was held that the period of our concession should be read as lunar years, not solar years, and that our concession therefore ended in April, 1947. The question of the expiry date is at present under discussion. After the concession expires we are liable to taxation on such profits as we may earn in Iran; but the expiry need not otherwise materially affect the conduct of our business.

PROGRESS IN IRAQ

Business in Iraq has continued to make satisfactory progress. The good harvests of last year resulted in substantial shipments of barley to Europe, the United Kingdom and North Africa, at prices well above those of the preceding year. Higher prices were also obtained for wool and hides and skins during the 1946 season, but these commodities were a bad market in early 1947, owing to lower prices in the U.S.A. The date crop was a good one and large shipments were made to India. The rise in the price of gold in India resulted in a reversal of the westward flow of gold as the Mediterranean price declined. This reversed movement has continued, notwithstanding the prohibition of bullion imports to India. Imports of all classes of manufactured goods have increased, including rayon and silk textiles from Italy via Beirut. Active development is promised for irrigation and flood control in Iraq.

Our branches at Kuwait and Bahrain and Dubai in the Persian Gulf are performing a useful function in trade with Iraq, Iran, India and Saudi Arabia. The oil developments at Kuwait give assurance of increasing activity at that prosperous port. Since my last review we have expanded our sphere of interest westward by opening branches at Beirut in the Lebanon and at Damascus in Syria. These towns have trade relations with Iraq and Iran which should improve with the quickening of transport facilities.

CHAIRMAN'S VISIT

In October last, accompanied by Mr Hale, I had the pleasure of revisiting Iraq via Beirut, and of going over our establishments at a number of our offices in Iran. On this tour I particularly valued the opportunity of making the acquaintance of our local staff. In the course of a short stay in Teheran I had many interesting talks about our affairs and I was glad to note the good feeling shown towards us. British banking has traditionally a good name throughout the world, and I feel that we uphold it in the Middle East.

THE UNION-CASTLE MAIL STEAMSHIP COMPANY, LIMITED

INCREASED TRADING PROFIT

PROBLEM OF RISING COSTS

SIR VERNON THOMSON'S SURVEY

The annual general meeting of The Union-Castle Mail Steamship Company, Limited, was held at 3, Fenchurch Street, London, E.C.3, on the 10th instant.

Sir F. Vernon Thomson, Bt., G.B.E., the chairman, in the course of his speech said:—

The outstanding event in South African affairs during the year since our last meeting has been the visit of the King and Queen with the two Princesses to the Union of South Africa and Rhodesia. The royal tour gave immense pleasure and satisfaction to the peoples of those lands and will promote and strengthen mutual goodwill. It has also focused attention upon the natural beauties and the fine, health-promoting climate of Southern Africa, stimulating a desire on the part of many of the inhabitants of these Islands to visit that great part of the Commonwealth.

ACCOUNTS

The profit on trading for 1946, after providing £600,000 towards Deferred Repairs and renewals, shows an increase of about £500,000 on the corresponding figure for 1945. This is in part accounted for by the additional tonnage which we had available during the greater part of the year. With the additions to our fleet, the charge for depreciation (which has been calculated at the same rate as for the preceding year) is accordingly higher at £713,747. In pursuance of the policy started in 1943, the normal annual depreciation written off the book value of the fleet for 1946 has been supplemented by the transfer of £690,114 from Fleet Replacement Account towards writing down the cost of new tonnage acquired or delivered in 1946 and built at prices increased by war-time inflation.

DISTRIBUTION OF 8 PER CENT.

After providing for depreciation the directors have again allocated £250,000 to general reserve account, it being prudent ship management to make provision now for less good times which, from previous history of shipping, are bound to be experienced. The directors are pleased to be able to recommend a dividend upon the ordinary stock of 6 per cent. plus a bonus of 2 per cent. less income tax, carrying forward the slightly increased balance of £467,000.

The accounts show that of the earnings for 1946, after providing for interest on debentures, £190,664 has been provided for taxation, £1,598,012 is being retained in the business, and £209,000 represents the net distribution to the holders of £5,480,000 share capital. The dividend and bonus recommended on the ordinary stock absorb £219,200 gross, and this figure represents 2.38 per cent. on the ordinary share capital plus reserves.

The Union-Castle is a continuing company with a record of service to Britain and South Africa now nearing a century. Its substantial liquid resources should not be regarded from the angle of the break up value of the assets, but as the wherewithal to renew the fleet as ships become due for replacement, thus enabling the company to maintain its high traditions of efficient service and to contribute of the best in our time.

FLEET AND SERVICES

The company's fleet consists of 24 vessels of 315,059 tons gross register, as compared

with 30 vessels of 383,000 tons gross register in September, 1939. It has been well maintained throughout the year and operated without any serious accident. Work has continued satisfactorily on the two new vessels under construction at Belfast for the Mail Service, although unfortunately, owing to adverse weather conditions and other factors, some delay has occurred and it is not now expected that they will be delivered until February and April, 1948, respectively. I should like to express cordial appreciation of the splendid work done by Messrs. Harland & Wolff, Limited—work-people as well as management—in the re-conditioning of our vessels and in the building of our new tonnage in times of exceptional difficulty.

Since the beginning of this year our weekly Mail Service has been resumed, and, pending the return of all our passenger vessels, our fast cargo vessels will continue to be used as supplementary tonnage in order to maintain the weekly sailing between Southampton and Capetown in each direction.

We have continued to operate cargo vessels in our old established trades between the United Kingdom and Continent and South and East Africa and Mauritius. We have in addition maintained frequent sailings from the U.S.A. to South and South-East Africa, and acquired primarily for this important dollar-earning service the fast cargo vessels "Drakensberg Castle," "Good Hope Castle" and "Kenilworth Castle." We also retain our interest in the trade from East and South Africa to the U.S.A., and intend to devote particular attention to its development.

Southampton Dock Facilities.—After consultation with the Southern Railway, we have decided to take advantage of the opportunity to utilise berths at the New Docks at Southampton, which afford more scope for the provision of modern facilities for the expeditious handling of passengers and cargo. Considerable work is required to be done before our vessels can regularly use these new berths, which are expected to be fully available to us before the end of 1948.

OPERATING EXPENSES

Unfortunately there is no sign of any reduction in the expense of operating vessels—on the contrary, costs have continued to rise during the past year. This is a matter of grave concern to Shipowners. Thus ship-building costs are more than twice pre-war costs, ordinary upkeep repairs are more than three times pre-war cost and oil fuel is about twice pre-war cost. Agreements made by the National Maritime Board on behalf of Shipowners and the various Seafarers' Unions came into operation on 1st April, 1947, and effect important improvements in the pay and conditions of employment of ships' personnel in addition to offering greater security of employment. These we welcome in the belief that they will encourage the right type of seafarer. They will, however, entail a very substantial additional expenditure to this Company—more than £120,000 per annum over the Wartime rates. These are factors which affect freight and passage rates.

Another important item affecting operating costs is the slower turn-round obtainable in certain United Kingdom and overseas ports. In this country, serious delay has been experienced in some ports. The economical utilisation of high class and expensive tonnage requires the quickest

possible turn-round consistent with efficient cargo handling and satisfactory overhaul of the vessels' machinery. With the introduction of the new Decasualization Scheme for dockers, it is hoped that recent difficulties will now be overcome. If we all "go to it" that would be the best practical contribution we as individuals can make to the solution of our present economic problems as a nation.

CARGO AND PASSENGER TRAFFIC

Last year the volume of cargo shipped from the United Kingdom to South Africa fell short of pre-war quantity and, notwithstanding the drive for exports, outward traffic so far this year has, on the whole, been disappointing, partly in consequence of fuel and power cuts. Recently there has been a further falling off in cargo. In the trade from the United States of America, shipping competition is keen. Homeward from South Africa, the amount of cargo has fluctuated. Substantial consignments of citrus and deciduous fruit have been carried by this company's vessels, which have been specially built and fitted for the conveyance of perishable products under refrigeration. To and from East Africa, cargo has been steady.

The greater proportion of passenger space in our vessels is still allocated to various Government Authorities for outward use and the allotment at this company's disposal is therefore limited, whilst there is still a long list of persons waiting for passages to South Africa. It is a matter of regret to us that the hopes of intending passengers to South Africa are still being deferred owing to our present inability to cope with the demand for accommodation, but every effort is being made to meet requirements. We are hopeful that it will be practicable before long to increase substantially the passenger allocation in our vessels so that, with more frequent sailings as vessels return after reconditioning, greater progress can be made in meeting ordinary passage demands.

PROSPECTS

The immediate prospects in regard to passenger traffic, especially to the Union of South Africa (although there is also a pent-up demand on the part of South Africans for opportunities to visit this country), are good and the competition from increased facilities for travel by air is consequently not felt so acutely as it would otherwise be. South Africa offers good opportunities to British manufacturers but present indications suggest some recession (temporary it is hoped) in the sellers' market, and strenuous efforts are needed to improve or even maintain our position in the export trade to the Union. Homewards, the outlook is uncertain until the import programme as a whole is settled. South Africa being Britain's best customer, it is important not to curtail U.K. imports from South Africa lest South Africa may find itself unable to take as many of our exports, resulting in the loss not only of some of our imports but exports as well. Our fleet of cargo vessels is larger, with a higher average speed and greater carrying capacity, than before the War; it should prove adequate for the needs of our various trades, an objective constantly in mind.

The people of this country have had impressed upon them constantly in recent months the facts of the economic situation. Apart from the basic necessity for maximum possible output and the urgent need for considerable expansion of export trade, there is no more important factor in this country's economy than the overseas earnings of British shipping, which constitute our principal although "invisible" export. This fact is apt to be overlooked but in my opinion its importance cannot be over-emphasised.

The chairman concluded by expressing warm appreciation of the loyal and diligent service of the staff ashore and afloat.

The report and accounts were adopted.

EDMUNDSONS ELECTRICITY CORPORATION, LIMITED

LORD ROYDEN ATTACKS NATIONALISATION

"RUTHLESS EXTINCTION"

"In this, the fiftieth year of the life of this great company, Edmundsons is facing an arbitrary and nationally harmful destruction under the Electricity Nationalisation Bill, to satisfy academic party doctrines."

Lord Royden, chairman of Edmundsons Electricity Corporation, Limited, began his speech with these words at the fiftieth ordinary general meeting of the company, held at Gillingham Street, London, on the 3rd instant.

He went on: "The Corporation has six main subsidiaries and owns twelve other companies, covering a total area of more than 15,000 square miles. A great measure of uniformity of tariffs has been brought about within this vast area, which represents nearly a quarter of England and Wales. To-day we serve 565,000 consumers, more than three times as many as in 1932. And they are consuming nearly ten times as much electricity:—387 million units in 1932, 3,536 million units in 1947.

"Since 1932 our capital expenditure has increased from £17 million to £41½ million; mains constructed, from over 5,200 to over 15,500 miles; receipts from sales of electricity rose from over £2 million to over £12 million; the average domestic price was reduced by 62 per cent. to 1.7d a unit. On the other hand there was a decrease of nearly 40 per cent. in return on capital expenditure from 4.5 per cent. (1935) to 2.8 per cent., while the average cost of coal per ton for generation more than trebled—from 13s 8d to 44s.

RIISING COSTS

"Coal costs were not the only ones to rise. There has been an enormous increase in the capital costs of erecting and equipping power stations."

Lord Royden compared two of Edmundsons stations, Little Barford and Llynfi, showing that the cost of a 120,000 kw. station in 1938 was much less than half its counterpart to-day. He also showed that the cost of heavy equipment had in some instances increased three-fold since 1938.

"Could anyone say that destructive inflation is not already with us, or suggest how we are to meet foreign competition if the cost of a prime necessity of manufacture is to be so profoundly affected by increased prices?"

CRIPPLING SCARCITIES

"I am continually surprised by Government spokesmen's references to co-ordinated research as though this were something which only nationalisation could bring about. Our research is most up to date, and has a direct impact on our extensive areas. Many varied benefits are accessible to consumers and I have heard of such amenities, and research, being named by Socialist speakers as the prospective fruits of nationalisation. Such men are hopelessly out of date.

"The crucial test of any public utility company or industry is to answer fairly and squarely these questions:—Does it serve the public? Does it succeed? Does it progress year by year? If the answer in each case is 'Yes,' then the future is secure. There can be no doubt that 'Yes' is the answer in the case of Edmundsons."

After detailing facts proving that the industry as a whole has a record of success comparable to any country in the world, Lord Royden enumerated the crippling scarcities extending over the whole field of electricity supply. "The new organisation proposed by the Electricity Bill," he said, "will have to operate under the same con-

ditions of world-wide material shortages. If on these grounds the industry is hard pressed today, the proposed Electricity Boards will be just as hard pressed.

"It has been said by protagonists of nationalisation that the industry has no alternative to offer. Far from having no alternative to offer, the industry is perfectly aware of the rearrangements required in its structure, but insists that they can be carried out without the wholesale disruption of nationalisation."

RURAL DELAYS

He ventured to say, too, that there was no possible chance of the Government dealing with rural electrification more quickly than the companies under the £72,000,000 scheme which they and the National Farmers' Union put forward in September, 1946.

"Nationalisation of electricity, added to the present burden of material shortages within the industry, may well lead to another disastrous industrial breakdown."

Dealing with the supposed benefits of nationalisation, he contrasted the wording of the Electricity Bill—the development and cheapening of supplies so far as practicable—with the Minister of Fuel and Power's own words, during the Committee Stage of the Bill, on this point:—

"There can be no guarantee that every potential consumer in the country will be supplied with either a cheap or an abundant supply until the physical resources to enable that to be done are available."

And (referring to cheapness in rural areas):—

"It does not matter whether it is nationalisation or private ownership, physical factors cannot be ignored."

REPORT AND ACCOUNTS

The corporation's balance sheet showed an increase in "investments in and advances to subsidiary companies" which now stands at a figure £700,000 higher than a year previously. This increase indicated the development of a capital nature which was taking place in the subsidiary companies.

On the liability side of the balance sheet the most noteworthy feature was the increase in the corporation's reserve. The reserve had received the usual appropriation from profits and had benefited as usual from the operation of the debenture sinking funds, but, in addition, the tax position had been carefully reviewed, after the termination of excess profits tax, and a further £145,000 had been taken to reserve. The increase in the reserve in the year was no less than £238,000.

The profit and loss account showed a considerable improvement, the net profit for the year being £647,362 compared with the previous year's figure of £572,397.

It will be remembered that the interim dividend had been increased from the usual rate of 2½ per cent. to 3 per cent. in the expectation that the final dividend would make a total distribution for the year of 6½ per cent. or even 7 per cent. From the figures submitted it would be apparent that the Board could have distributed the higher of these figures: because of the Electricity Bill, however, the dividend would have to be restricted to the previous year's total distribution of 6 per cent. thus adding over £100,000 to the amount to be carried forward.

The consolidated profits statement showed increased gross revenues, but smaller appropriations for depreciation, for contingencies and for deferred maintenance. The con-

solidated net profit was £909,851 compared with £620,499 in the previous year. Because of the Electricity Bill the increased profits could not be paid out in increased ordinary dividends and had, therefore, to be added to the subsidiaries' carry forwards. The net profit of Edmundsons Electricity Corporation for the twelve months to December 31, 1946, was £630,164 compared with £531,295 for 1945.

On the statement of consolidated assets and liabilities the most noteworthy feature was the increase in the consolidated surplus, which had advanced by nearly 2½ million pounds during the twelve months. This increase was due to the release, mainly by subsidiaries, of tax and other reserves. Due to the termination of excess profits tax, £750,000 of tax reserves had been released. The figures of war damage sustained by the electricity industry had been published during the year and from these figures it was apparent that the Edmundsons group had over-provided for war damage contributions and no less than £500,000 of the reserves created for this purpose had also been released. Contingencies and deferred maintenance reserves had also been carefully reviewed and a further £750,000 had been added to general reserve or surplus. The parent company and the subsidiaries had added substantially to their carry forwards and all these and some other minor items made up the total increase of 2½ million pounds.

INADEQUATE COMPENSATION

Anyone examining these figures might well ask whether the take-over price for Edmundsons' ordinary stock (31s 6d for £1 unit) is not an entirely inadequate basis for compensation. The accounts before you are not themselves a complete answer to this question, but they show this much:—

£	
There is in the Corporation's balance sheet a reserve of.....	1,350,674
To this can be added:—	
E.P.T. refund	178,764
Provision for taxation	135,000
Proposed transfer to reserve.....	20,000
Carry forward of	304,994
Excess of market value over book value of the marketable securities	109,375
Total disclosed reserves are there-fore.....	2,098,807

The most substantial reserve, however, is undisclosed. It lies in the true value of our investments in our subsidiary companies. If the ordinary shareholdings alone are valued on a 4 per cent. basis, which appears to be the approximate basis of valuation upon which the take-over prices of like securities has been fixed, there is a further reserve of over £4,000,000 making a total of £6,200,000, or more than 18s per £1 unit.

Furthermore it can also be argued that nothing has been taken into consideration for future prospects, including earnings upon capital expenditure not yet remunerative. I have no hesitation in saying that the ordinary stockholders of this corporation would not be generously compensated if the take-over price were considerably more than £2 instead of the price fixed by the Electricity Bill, namely 31s 6d.

TRIBUTES

Lord Royden concluded his speech with a warm tribute to the loyalty and zeal of the 12,500 men and women comprising Edmundsons' staff. "I feel," he continued, "I should be guilty of a grave omission if I were not to refer to the outstanding leadership of Brigadier-General Wade H. Hayes, our managing director. Since 1932 he has carried the full weight of the heavy responsibilities which are inherent in a rapidly-expanding business like Edmundsons. The results achieved are his most striking testimonial. A great edifice has been built of which he was the architect and inspiration."

The report and accounts were adopted.

GOVERNMENT RETURNS

For the 5 days ended July 5, 1947, total ordinary revenue was £45,464,181, against ordinary expenditure of £43,071,137 and issues to sinking funds £592,369. Thus, including sinking fund allocations of £2,941,384, the surplus accrued since April 1st is £219,693,130, against a deficit of £288,100,129 for the corresponding period a year ago.

Working Our Passage

A SHORT bout of impatience in Paris has brought Mr Bevin diplomatic results which months of patience towards the Russians failed to achieve. Western Europe now has, after five days' work, what is virtually a standing economic committee for answering and briefing Mr Marshall. Not only is Britain a member, but it is on Britain's leadership that its success largely depends. It would never have existed had not Mr Bevin pounced on a paragraph of Mr Marshall's Harvard speech of June 5th and hustled the European governments into conference. It will not survive unless the British interest is whole-hearted and intelligent. And what that means has not yet begun to dawn on the public. To revive a war-worn metaphor, it means that Britain has to work its passage back to prosperity through American favour, in company with fifteen other nations, plus western Germany. It means that the European Governments who need American aid have been marshalled into a queue in which Britain's place is uncertain. It means that the main objective of American economic policy abroad is now not to meet British needs, whether short or long-term, but to promote a general European recovery from which Britain can only benefit if it works, sacrifices and plans as hard as the French, the Dutch and the Belgians. So before Mr Bevin is accorded the credit he deserves for what has been achieved in Paris, these warnings should be firmly held in mind.

The Paris conference on economic co-operation, thanks largely to British leadership and French tact, has polished off the first part of its task in a week-end. When it met last Saturday, only five weeks had passed since Mr Marshall issued his challenge, to the governments of Europe to get together, take stock, present a balance sheet and offer a plan for using further American credits and aid. Those five weeks have seen Mr Molotov dismissing the American offer, also in the course of a week-end, and the governments of eastern Europe following his lead with varying degrees of reluctance. Fourteen other governments nevertheless followed the Anglo-French lead, and have left behind them in Paris a working organisation of a kind which a few months ago would have seemed impracticable and inconceivable. For such a general and willing rolling up of sleeves by the hard-pressed western Europeans there should be some reward, some payment for results. A word of appreciation from Washington, some lifting of the curtain which still surrounds the content of American economic policy, would have been timely. Instead there came on Tuesday the news that no plan to aid Europe can come before Congress until next year has begun. It almost looks as if it was haste rather than speed that Mr Marshall wanted. The *Washington Post* put it trenchantly last week when it said of the Europeans: "We expected them to jump six inches or so. But we never thought they would jump ten feet."

What has been achieved in this diplomatic spurt? There now exists a central co-ordinating committee for economic co-operation consisting of representatives of all sixteen participating governments. Under it works an executive committee of Britain, France, Italy, Norway and

the Netherlands. And below that are four technical committees of experts in economic stocktaking: their respective tasks are to study the needs and resources of member nations in food and agriculture, iron and steel, fuel and power and transport. They have approximately six weeks in which to complete the present stage of their work, although in fact no one seriously expects the four-year plan to reach the Americans before October 1st.

So far so good. What hints of future difficulties have revealed themselves during the five days? The Scandinavian representatives insisted that the work of the conference must not lead to interference with national economic plans. That is a fair enough warning, provided that it is understood that no European plan is likely to work without modifications of some national plans, freely and willingly made. Then the French made a very firm declaration about German recovery: "the resources of Germany should be utilised for Europe, including Germany," said M. Bidault; "any other interpretation" of the idea of promoting German recovery would be "a distortion." By which M. Bidault must have meant that Germany must not be given first place in the European queue. If so, that is a matter on which the conference might well adopt some vague formulae until American ideas on the precedence to be given in the queue are officially made known. It is also clear that several delegations, among them probably the Swiss and the Swedes, want the door kept wide open for their trade with eastern Europe; they were reminded that one of the rules of the conference will be that there shall "be no restriction to the beneficial development of European trade." Here then are some signs of future difficulty: reluctance to modify national plans and agreements to fit into a larger scheme; anxiety that the recovery of Germany should not get out of hand or take undue precedence over that of devastated nations; determination not to jeopardise existing political and economic relations with eastern Europe and Russia. These symptoms are not at this stage alarming; they should remain harmless enough so long as the conference concentrates on stocktaking. But once the attempt at planning begins they will become serious, unless the sixteen governments decide very soon what concessions each will make to maintain effective co-operation.

*

Taken all in all, the achievement of Paris is impressive. The sixteen governments which contributed to it represent a greater concentration of economic strength than is generally realised. Between them they accounted before the war for nearly three-quarters of the imports and exports of Europe, excluding Russia. They contain 212 million inhabitants, among them the most highly-skilled and best-educated workers of Europe. Five of them have great colonial possessions with over 237 million inhabitants (excluding India) and command immense raw material resources. Politically, they are mostly old friends and allies, agreed on most major issues. If they can also agree on an economic plan and stick to it, their joint power of negotiation should be considerable. Shy though they are of all talk of closer association, they should sooner or later make it clear that they will negotiate for American aid as one body. If Washington's recent attitude to London is any guide, the Americans will not like to see individual governments leaving the queue to make known their special needs and proposals behind the counter.

The future prospects of these European planners will clearly depend very much on the leadership they are given. If Paris and London do not continue to work closely together and fail to agree—for example on policy towards Germany—the pressure of Russian diplomacy may well detach some of the more timid and cautious governments. And if there is any suspicion that the British Government thinks of stretching one hand towards America in the European plan and another in separate British overtures, then the newly kindled flame of mutual trust will

flicker out. In other words, the major American contribution to Britain's dollar needs will have to be sought in the joint European reply to the Marshall offer; which means that the "twelfth hour" of which Mr Morrison spoke last week will strike before any Marshall plan is known in detail.

Mr Morrison said the hour would strike "in the autumn"; and it is now known that Congress will not begin to act until the winter. If this is the only prospect ahead—and the American reactions to Mr Morrison's speech suggest strongly that it is—the British public should be at once informed and made to understand the serious implications. Does it mean that no further American aid can be expected before the spring, and then only as part of a European plan involving modifications of our own economic policy? Or is it hoped that the presentation of a convincing and workable programme between now and October 1st may be sufficient to tempt American bankers to extend indirect aid to Britain, for example by special measures to feed and equip the Ruhr and western Germany generally? If that is the hope, what sacrifices will the British people be called on to bear in case the European plan proves unacceptable, either to Mr Marshall or to Congress? What precisely are the stakes in the gamble?

These questions demand serious public discussion, with facts given in more detail and prospects more clearly drawn than they were in the recent speeches of Mr Dalton and Mr Morrison. There is a grave risk of "the Marshall plan" becoming for the British public a phrase as dangerous and debilitating as was "collective security" in the 'thirties—an anodyne that is taken for granted before it even exists. Indeed the risk is twofold; not only is the phrase being used to cover a shiftless, mendicant attitude of mind, but Mr Marshall's initiative is being applauded without any thought of the sacrifices which may be involved in accepting it. For it is inescapable that the consultations of the next few months, which the Paris conference is now preparing, will bring to light in Europe striking discrepancies in standards of living, productivity, equipment and efficiency. The French worker, for example, accepts the 48-hour week as part of his national plan; the British worker does not. German workers in the Ruhr need houses far more urgently than British workers; the Danes need cattle cake even more than the British farmers; Belgian and French miners work harder than British miners and could stake prior claims on any European stocks of steel, timber and equipment. There is no reason to believe that any of these points would become major controversial issues; but it is important to understand that these discrepancies exist, that the men who will prepare the Marshall plan are aware of them, and that the doctrines of equality which the British Government so assiduously practise at home are likely to be applied by the United States in any new economic assistance for western Europe.

It will now be tempting for the Foreign Secretary to rest for the moment on some well-earned laurels, to point to the Paris conference as a success for British diplomacy and to draw what conclusions he wishes from the fact that a major European meeting has been held without the Russians. But, for better or for worse, he has now hitched the economic hopes and plans of the Cabinet to a European movement; and that movement was started by an American Secretary of State answerable to Congressmen who are hard-hearted judges of the British Socialist experiment.

If the British public are not told—and Mr Bevin is the man to do it—why they have been booked to work their passage towards better times with fifteen allies and former enemies, they will learn the reasons from American voices. For a fortnight past these voices have been developing the theme that beggars cannot be choosers and must work hard to live; and they will not be silent until British statesmen take courage at the twelfth hour to explain just what sacrifices and changes in British policy are needed even to keep a place in the European queue.

Iron Curtain or Open Door?

NO country from the Russian zone of influence has, after all, joined in the Paris talks on the Marshall Plan. But this uniformity has been achieved only as a result of direct Russian pressure. Left to themselves, the Czechs, the Poles and the Finns would certainly have attended—indeed, the Czechs officially accepted at one point and, in general, there was little ideological invective in the refusals received, save in the case of Yugoslavia. The mood was rather: "We would prefer to participate, but this is not an economic issue. It is political and our great neighbour, Russia, has left us in no doubt that to attend would be regarded as an unfriendly act. Since we are neither prepared nor anxious to offend Soviet Russia, regretfully we decline."

This united Eastern European reaction, coupled with the fresh evidence of Russian leadership, will naturally reinforce in the Western mind the picture of a closed bloc lying in captivity behind the Iron Curtain, controlled and tyrannised by local Communist parties, following a strict party line laid down in Moscow, its military policy subordinate to the strategy of Soviet Russia, its economic interests overlaid by the exigencies of Russia's Five-year Plan. And from this picture, the conclusion will be drawn that Europe has reached a decisive parting of the ways and that Eastern Europe must be written off as an integrated exclusive and captive client of Russian state power. But is this conclusion in fact warranted? The assumptions upon which it is based have been taken for granted so long that now they are barely examined. A careful examination of Eastern European development in the last two years suggests a far less uniform—and less depressing—picture. The broad fact of Russian influence is not in doubt, but the vigour and variety of the Eastern lands are equally real.

The most complete subordination of policy probably exists in the military sphere. Full-scale military alliances have been concluded between Russia and Poland, Czechoslovakia and Yugoslavia, with provisions for joint training, the rationalisation of weapons and equipment and staff co-operation. The three smaller partners have similar military agreements with each other, the whole forming a co-ordinated military network over most of Eastern Europe. The ex-enemy states, Finland, Hungary, Rumania and Bulgaria, have normally no military policy and their armed forces are restricted by the peace treaties. But their officers were mainly trained in Russia, Rumania has a military understanding with Bulgaria and at a recent East European military staff meeting held in Belgrade it appears that the Bulgarians were represented. There can be little doubt that, in the event of a war, Russia would be able to count on the co-operation of its neighbours. It does not follow, however, that they would be parties to aggression.

Military dependence is one aspect of a wider relationship between Russia and its Western neighbours — the absolute leadership exercised by the Russians in all major questions of foreign policy. Russia's dominance does not extend to every detail — indeed, the Poles and the Czechs have occasionally pursued an independent line on questions of some importance, such as participation in the European Commission. But, broadly speaking, Russian domination is the salient factor in the foreign relations of the East European states. This domination should not, however, be dismissed simply as the result of Russian pressure or military occupation. It is also accepted as the best guarantee against a revival of German power.

*

The almost complete measure of uniformity existing in East European defence and foreign policy is to be found in no other field. The Governments of Eastern Europe have in common a strong, in some cases overwhelmingly strong, Communist influence and in each country deep social changes have been brought about by such measures as the nationalisation of all major industries and the introduction or extension of land reform. But otherwise, there is surprising variety. At one end of the scale is Yugoslavia (and Albania) in which the pretence of other parties existing side by side with the Communists has all but disappeared and in which, as in Russia, an almost legendary national figure is at the same time the party's boss and the nation's dictator. The Yugoslav system of government is also distinguished by its ideological fervour and its sense of revolutionary purpose. Another type of government exists in Bulgaria, Rumania and Poland. They are governed by more or less bogus political coalitions, in which the Communists play the leading role and some sort of vestigial opposition carries on, although the recent arrest of Nicola Petkov in Bulgaria and the arrests among the opposition in Rumania and Poland have even further whittled away the opposition's scope. But there are differences between them. Rumania has retained a "constitutional" monarchy, for instance—a reflection on King Michael's skilful opportunism in a country in which opportunism certainly appears to be more dominant than ideology. Again, there is a world of difference between the status, within the coalitions, of the various parties. The agrarian and socialist rumps which work with Dimitrov in Bulgaria and Groza in Rumania have a shadowy existence and influence. But in Poland, the vigour of the Socialist Prime Minister, Cyrankiewicz, coupled with the profound unpopularity of the Communists and their Russian masters, have given the Socialist group genuine weight. In Poland the coalition is far less bogus, and the division of political power far more real than in either Rumania or Bulgaria.

Bonus Distribution

TRIENNIAL VALUATION
1944-46

Reversionary bonuses on With-Profit policies have now been allotted at rates per annum ranging from £1. 10s. to over £2. 10s. per £100 of sum assured, and 10/- % on all existing bonus additions

The Czechs and the Finns continue to work a system of parliamentary democracy based upon genuine elections. Alone in Eastern Europe, the Czech Communists earned their predominance by an unfalsified popular vote. In both Czechoslovakia and Finland, the government is a coalition, but the influence of the other parties is uncontested. Until recently, Hungary, too, belonged to this category and even today, in spite of the enforced purge of the right-wing of the Smallholders and the formation of a new coalition, the non-Communist parties, agrarian or socialist, have an independent existence and exercise some influence. But Hungary has, undoubtedly, slipped back in the direction of the counterfeit coalition.

The validity and significance of these varieties of political organisation in Eastern Europe can best be measured by comparing them with the political pattern which existed before the war. Since 1939, few areas in the world have suffered so complete a social and economic upheaval. Yet, now that the tides of battle and ruin and foreign occupation are beginning to recede, it is remarkable how familiar are the landmarks growing visible below the ebb. Finland and Czechoslovakia, the only countries to have genuine democracy in 1938, have succeeded in keeping it. Hungary, after a brief spell of greater political freedom than the country had ever known before, is returning to the old system of "controlled" parliamentarism. In Poland, the forces of dictatorship and of popular government are still locked in struggle. In Rumania and Bulgaria the old dictatorships are back, under new names, and in Rumania the old odour of cynicism, opportunism and corruption is quite unchanged. Only in Yugoslavia is there a sharp distinction from the pre-war system, for where there was Serb hegemony and dictatorship, now there is the dominance of a man and a party. Even so, the Yugoslav government was and is a dictatorship and even such features as the regime's profound hostility to the Catholic Church existed in milder form before. The greatest single change in Eastern Europe—it may not be lasting—is the abatement of intense nationalist ferment. Even the Czechs and the Poles have at last laid their Teschen quarrel aside. Otherwise, under the new mask, the old face of Eastern Europe is recognisable in all its customary variety and force.

The picture of Eastern Europe's economic relations most current in the West is one of Russian domination and of a steady absorption of the separate economies into a single co-ordinated system, serving the wider needs of Russian state planning. When the Americans refuse loans to the Czechs or withdraw them from Hungary, they are not only expressing disapproval of political policy. Consciously or unconsciously, they also feel they are keeping dollars out of Russia's pocket. Yet again, as in the field of politics, the economic development of East Europe is far from uniform and is still in a very fluid state. Russian economic dominance is most marked in the ex-enemy countries and is exercised in the first place through reparations. Rumania and Finland are each paying \$300 million, in current production and capital goods, and Hungary \$200 million. Since an elaborate system of fines and penalties has been attached to the delivery on time of goods on reparations account, the three nations are, in fact, paying considerably more and the scale of the burden can be measured by the fact that, in 1946, Finland's reparations to Russia were almost equal to 50 per cent of its entire foreign trade. In addition, the states have to make Russia a certain number of payments for direct "restitution" and a further burden has been added in the shape of the handing over to Russia of German assets. Finland, for instance, has had to pay Russia the balance of its clearing account with Germany and the Hungarians have been obliged, while seeing the much larger German debt to them cancelled, to agree to pay their quota to the Russians. In Rumania and Hungary, the transfer of German and ex-enemy assets has become the basis of what may prove a more permanent type

of Soviet penetration. Where Germans owned shares in industry and transport, the Russians have taken them over and established joint trading companies with the local government. The practice has also been extended to fields in which there were no previous German owners. Today, in Hungary and Rumania, there are joint Russian-Hungarian or Russian-Rumanian companies for timber, bauxite, air transport, Danubian shipping, and oil (incidentally, the transfer to Russia—as a German asset—of the Austrian shipping company, the *Donauschiffahrt*, gives the Russians almost a monopoly in Danubian shipping). These Russian practices do not apply, however, to each ex-enemy country. Finland has no joint trading companies (although by the transfer of Petsamo to Russia it has lost all its nickel) and Bulgaria pays no reparations.

★

Throughout 1946, Russia played a predominant part in the trade of Eastern Europe. The disorganisation of old markets, lack of transport, and uncertain political relations hampered the restoration of commerce with the West, and meanwhile, under the fourth Five-year Plan, the Russians allotted a fair supply of raw materials, particularly textile raw materials, to their neighbours to be worked up for re-export to Russia. This was the typical trade exchange of 1946 and, since the prices charged for the raw materials were high and the price paid in return low, a current East European jest dismissed the transaction as "reparations from current production." Nevertheless, this trade was the basis of whatever foreign commerce a number of East European nations achieved in 1946. In Hungary, 45 per cent of the exports went to Russia and 49 per cent of the imports came from there. In Bulgaria, 82 per cent of the imports came from Russia and 66 per cent of the exports went there. For Poland, the figures show that Russia supplied 74 per cent of the country's imports and took 51 per cent of the exports. There are no reliable published figures for Rumania and Yugoslavia, but the percentages are believed to be similar.

But, as usual, there is no uniform East European pattern. In 1946 the Russians provided only 9 per cent of Czechoslovakia's imports and took only 12 per cent of its exports. The new trade treaty, agreed in Moscow last week, may increase these proportions, but until specific figures are published, it is impossible to say by how much, and the impression must remain that the treaty was rather a political gesture than a serious re-orientation of Czech trade. What may be called the "Marshall countries" (with the addition of Austria) accounted for 42 per cent of Czech imports and 54 per cent of Czech exports. If the United States is added, the proportions are 50 per cent and 62 per cent. Finland, too, traded vigorously with the West. In 1946, Great Britain was its largest customer, buying 27 per cent of its exports and sending in 21 per cent of its imports (the Russian percentage is 20 per cent for exports and 21 per cent for imports). All the "Marshall countries," together with the United States, supplied 70 per cent of Finland's imports and bought 70 per cent of its exports. One last point, the tendency in some Eastern European countries in 1947 had been for trade with the West to increase and the direct Soviet proportion to fall. Such agreements as the recent Anglo-Polish trade agreement will accentuate the trend. On the other hand, the Czechs have concluded in the last months trade agreements with Yugoslavia (for five years), with Bulgaria (for four years) and with Poland (for five years). This last agreement is more ambitious and lays down terms of reference for the integration of the industries of both countries. This agreement mirrors the desire of Czechs and Poles to use their new Silesian resources as a base for replacing Germany's old industrial predominance in South Eastern Europe and, in the long run, it could possibly be the basis for a general integration of Danubian and East European trade. But this is still a very long-term project.

The fact remains that, for some years to come, the most highly-developed areas of Eastern Europe must pin all their hopes for really advantageous and profitable trade upon Western Europe. Russia is not in a position to provide either the technical equipment or, above all, the consumers' goods, of which every East European country is desperately in need. Nor will Russia provide a large and stable market for agricultural surpluses when they begin to reappear in the East European markets. Before the war, over 80 per cent of the exports of Eastern Europe were consumed in Europe, mainly in the Centre and the West. To cut off all links running westwards would demand a dislocation of trade which these communities could risk only under the pressure of an exceptionally grave political situation. So long as doors are open, they will be used.

This necessarily condensed survey of a large and complex region suggests one or two conclusions. There is no single exclusive uniform undifferentiated East European bloc. The dominant influence is Russian, but countries which traditionally looked westwards have maintained their individuality and are doubly anxious to maintain their old connections. In the case of Czechoslovakia and Finland, this anxiety is a pressing need owing to the pattern of their trade. All are in a precarious

Is It Well with India?

LAST night," wrote Karl Marx in 1853, reporting from London for the *New York Tribune*, "the debate on India was continued in the House of Commons in the usual dull manner." In 1947 the India Independence Bill has been passed almost without debate, dull or otherwise. The Government introduced it as a matter of urgency and appealed to the Opposition not to delay it; the Opposition, consoled by the provision for Dominion status, refrained from the lamentations and prophecies of woe which might have seemed appropriate to the occasion. Nobody, indeed, was able to deny that what was now being done was what British statesmen of all parties had been declaring to be the goal of British policy for a generation, and after so much storm and stress the final act of renunciation no longer aroused the emotions which had long ago been exhausted on both sides of the argument. It was a foregone conclusion, hardly more than a statement of historical fact. That we have reached this point in such tranquillity, with no sense of crisis or of being swept away of events, is a matter for congratulation both to Mr Attlee and to Lord Mountbatten on their statesmanship during the last few months.

Yet it is a time for stocktaking if British opinion is to be prepared for the new era of British-Indian (or rather British-Indian-Pakistani) relations which will open on August 15th. What is now formally about to pass away has been a structure so solid in the memory of men now living that it has appeared to be an institution of remote antiquity. But the British supremacy in India is less than 150 years old; it has been but a brief episode in a history which archaeology has now taken back to the great brick-built cities of Sind in the third millennium B.C. When the British stormed Seringapatam in 1799 the greater part of India was still under independent native rulers; twenty years later everything except Nepal and the Punjab was under the sway of the "Koompanny Bahador," the strange impersonal being made manifest for the Indian population in the princely magnificence of such conquering soldiers as General Ochterlony. In a few years the whole Indian scene was transformed and the British in India became the ruling race; Elphinstone was soon to complain of the high-handedness of "our younger politicians who have never seen the Indian states in the days of their power." Yet there remained

position, for their best hope, both for external and internal peace, lies not in their own hands, but in the chance that Great Power tension will grow no worse. Each new deterioration in the relations between Moscow and Washington is mirrored in the local community by more tense relations between Left and Centre and Right. What, then, should be the Western reaction? Stern hostility? A slammed door? A cutting off of relations? Such policy would surely work to the disadvantage of all. The dependence of Eastern Europe on Western skill and industry is great, but equally, the countries of Eastern Europe remain an essential part of the markets of a revived West. The pressure of Western production may seem a pipe dream today. It will not remain so. Whatever relationship—loose or close—develops between the "Marshall countries," there is not a single economic argument to be advanced against a development of vigorous trading relations between them and Eastern Europe (in whatever integrated or individualistic national pattern it may develop). The absence of all the East European nations from Paris means that they cannot share the potential advantage of greater dollar supplies or more economic pooling. It does not mean that they cannot share in and contribute to the enhanced European prosperity, which all hope will result from the conference.

always an underground of memories and sentiments which the new rulers could ignore, but not dispel. A British official in 1832 wrote of "the ghosts of former reverence still existing in the immense shadows that make up Indian opinion, ghosts still active and for the most part malignant to the British." Some of these ghosts showed their power during the Mutiny. They are still active, but today their malignancy is no longer so much for the British as for the would-be makers of a single national democracy of India to succeed to the British Raj. The Congress leaders in the time of their anti-British agitation spoke confidently for "the Indian people" and cast no glance into the "immense shadows" beyond the light of their vision. But out of the shadows has emerged Pakistan.

The name "Pakistan," an artificial verbal compound, said to have been invented by a Moslem Indian student in Cambridge, is unknown to Indian history and was not current in Indian politics until a few years ago. It is not a name which in itself can stir patriotic emotions or evoke mental images of past glory and greatness. But what it really embodies for the zealots of the Moslem League is nothing else than the old Mogul empire, the great monarchy which for a while did rule nearly all India and, long after it had ceased to have any real power, retained such prestige that even in the second quarter of the nineteenth century the Princes sought honours from the "King of Delhi" rather than from the British Governor-General. This is the significance of the shouts of "Emperor of Pakistan!" with which Mr Jinnah was greeted by his followers after the announcement of the partition scheme. Mr Jinnah modestly declined the title of emperor; after all, this is a democratic age. But he is going to be the Governor-General of the new Dominion. This move has apparently taken Congress by surprise, and Mr Jinnah has been accused of a breach of faith; in the Congress camp it is said that it was agreed by both parties that for the transitional period Lord Mountbatten should be Governor-General of both Dominions. In the absence of any written undertaking it is not possible here to say whether Mr Jinnah went back on a promise or whether there was merely a misunderstanding on the subject. But the question is certainly one of importance, for Mr Jinnah's claim has introduced an entirely new element into the conception of

Dominion status and has raised a constitutional problem which could be very embarrassing to this country.

The constitutional theory of a Governor-General in a Dominion is that he represents the King and bears the same relation to the Ministers forming the Government as the King does to his Ministers in the United Kingdom. It is recognised that the rights of a Dominion include the right of recommending a person for appointment as Governor-General. But that the Governor-Generalship should be held by an active party politician, who frankly states his intention of continuing his political leadership after assuming the office, is an innovation which radically alters the nature of the Dominion bond. The development is the more serious because Mr Jinnah's rule gives promise of being a very thinly veiled dictatorship. His motive in demanding the office of Governor-General is no doubt to obtain the position which belongs to it in the eyes of the Indian masses. The Viceroy as Governor-General has been hitherto, even though to a restricted degree in recent years, the supreme executive ruler and his Ministers have been simply the members of his Executive Council. By force of mental habit the man in the street will continue to think of the Governor-General as being more important than his Prime Minister.

There is this much to be said for Mr Jinnah's case: that if Lord Mountbatten were to remain in Delhi in contact with Mr Nehru's Government while the Pakistan Government were set up in Karachi, he would be unduly exposed to exclusive Congress influence, while if he moved to and fro between the two capitals, his official duties would suffer from the waste of time and energy. But there is no doubt that it was an essential part of the British Government's original plan that he should be concurrently Governor-General of both Dominions, so that he might provide co-ordination, guidance and conciliation during the critical period before frontiers were defined, assets apportioned or troops sorted out. Whatever Mr Jinnah did or did not agree to, it can only have been on such an understanding that the Congress leaders, with their passion for all the forms of sovereignty, accepted the continuation of a British Governor-General in Delhi after August 15th. Mr Jinnah's move has now not only enabled the Moslem League to appear ahead of Congress in "Indianisation," but it has destroyed the basis on which the hope of achieving a smooth transition was chiefly built. The situation is a serious one, for partition is not a solution unless it can be completed peacefully. It was in principle the only way out for the British Government when it became clear that the attempt to impose a union through a single Constituent Assembly would be met with armed resistance. Partition can mean that communities which are unable to live together in one state agree to live peaceably apart. But they can only do so if they can first agree on what each is to take from the joint inheritance, and in this case the range of disagreement is still a wide one.

The frontier in the Punjab is probably the most dangerous issue. The division by districts which was laid down in principle in the White Paper is only provisional; the frontier itself has to be drawn by the Boundary Commission and, although Sir Cyril Radcliffe is to direct its work, it is doubtful whether even his icy clarity of mind and austere legal presence will be sufficient to prevail over the passions that burn in that distracted province. The Sikhs are in a fighting mood; any line which adheres closely to district majorities is bound to divide their community which is widely spread over the central Punjab, and they are insisting on a frontier for Pakistan so far to the west as to include a great part of the Punjab Moslems—the real core of Pakistan—within Congress India. So much blood has already been shed in the Punjab and hatreds are so intense that a resort to arms must be expected if either party rejects the award of the Boundary Commission. Meanwhile Pakistan is threatened from the rear by the menacing territorial aspirations of Afghanistan. If the Punjab boundary

could be settled, India and Pakistan would no doubt combine to resist any external pressure and to maintain the frontier beyond the Indus. But if there is a deadlock over the Punjab boundary, the Punjab is so much more immediately important to Pakistan than the barren hills around the Khyber that Mr Jinnah might be moved to make concessions to the Afghans in order to have his hands free to deal with the Sikhs. All the indications unhappily are that the Moslem League thinks more of the conflict within India than of the defence of the gates of the sub-continent.

The decision to make Pakistan proper and East Bengal (Bangistan, as the Moslems call it) into one Dominion may seem to have avoided the disintegration of British India into three parts instead of two, but it may itself become an additional cause of trouble. It is hardly possible to administer as one nation two pieces of territory which can only communicate by a sea voyage of a couple of thousand miles. Mr Jinnah's proposal for a land corridor to connect them has rightly been dismissed as fantastic, but it is not too fantastic to have a powerful emotional effect on the Pakistani mind. After all, if there is a barrier between, why not try to break it down? Deep down in the unconscious—and not quite unconscious—soul of the new counter-nationalism is the thought that when the Moguls reigned in Delhi there was no frontier between the Indus and the Bay of Bengal. The Moslems have their own version of the unity of India.

★

To a situation already sufficiently complicated, at least two of the Indian States add factors of disequilibrium. Hyderabad is claimed by the Moslem League extremists as a third division of Pakistan in spite of its land-locked position in south-central India and its Hindu population majority. Its Moslem ruling group, having claimed the independence to which the British Government has declared the Indian States to be entitled on the lapse of paramountcy, is apparently planning some kind of alliance with Pakistan. Any military move against it might, therefore, involve general war in India; on the other hand, the persistence of this territory as a sovereign unit in the midst of Congress India will be a standing provocation and source of trouble. Equally, any adhesion of Kashmir to Congress India would be regarded as intolerable by Pakistan. The situation enables the ruling dynasties of these States to carry on a kind of political auction between the contending powers which seek their allegiance or alliance, and since there is no juridical principle by which their proper orbits can be determined, the temptation to make a trial of strength will be strong on both sides.

It is reported from New Delhi that General Sir William Slim and General Sir Francis Tuker are being unofficially tipped for the commands of the new Indian and Pakistan armies respectively. Presumably, if appointed, they will not wish to fight each other and will do their best to co-operate with Lord Mountbatten in preventing the blood-bath which threatens to engulf the hopes of Indian peace. Moreover it has been stated officially that both commands are to be subordinate operationally to a single supreme commander who will be responsible to the Chiefs of Staff Committee in London. The British observer, however, may be pardoned for feeling slightly bewildered. If the new Dominions are to be fully Dominions, these eminent generals cannot constitutionally be anything but servants of their Governments, which will dispose of their armed forces according to their policies. But perhaps one should not inquire too closely into these awkward questions and should simply be glad that such men are standing by for whatever happens. It has been said that the British Empire was acquired in a fit of absence of mind; it may be that, with a similar unawareness in the British public, the men on the spot will successfully achieve its transformation. We can only wish them good fortune.

Privilege and Pressure

ON Tuesday the House of Commons debated the report of its Committee of Privileges on the complaint referred to it at the instance of Mr W. J. Brown, Independent Member of Parliament for Rugby. Mr Brown has been closely associated with the Civil Service Clerical Association for most of his public life. At one time he was also a member of the Labour Party, and it was natural that during that time the minds of Mr Brown and of the executive committee of the union should follow parallel political channels. In 1931 Mr Brown left the Labour Party, and in 1942 he was returned to the Commons as an Independent Member. The political allegiance of the union did not change, and, naturally enough, the political views of Mr Brown and the executive lost their former common sympathy. More important, the situation suffered from the additional complication that there existed a written agreement between Mr Brown and the union by which he was to act as Parliamentary secretary to the union. The agreement expressly provided that Mr Brown should be free to think and vote as an MP in whatever manner he thought best. But the fact remained that Mr Brown was a union servant, drawing a salary and expenses from the union, and therefore linked by some legal and moral obligation towards the union, its members and its avowed aims.

It is important, however, to bear in mind that the question before the Committee of Privileges was not whether this agreement was in itself a breach of privilege. It was whether, in the course of negotiations between Mr Brown and the executive of the union for the termination or modification of the agreement, the actions of the executive amounted to improper pressure upon a Member and therefore a breach of his privilege of freedom from threats or pressure of any kind. On that issue, the Committee of Privileges decided that the actions of the executive did not constitute pressure, and their decision was affirmed by a free vote of the Commons by 275 votes to 114.

The development of this kind of situation is inherent in the Parliamentary life of this country as at present organised. An MP is not expected to be a full-time politician. He is now paid sufficient to enable him to live in reasonable comfort and to discharge his duties without depending upon any other source of income. But the margin is small. It is open to him, legally and by custom, to undertake other paid duties, and in general it is left to each individual to decide what those duties shall be. On the other hand he is not expected to enter into any commitment which will give any body other than his constituents the power even to attempt to influence his actions as a member of the Legislature. In this situation, it is perfectly obvious that preventing an unscrupulous or foolish politician from acquiring moral obligations that might be of the greatest embarrassment to him in his duty to preserve an open mind. Some men would, in fact, be completely independent in mind in the House even though they were bound by the most rigid legal contract of service with an outside body. Others would be distressed—and so influenced—at the thought of having to speak or vote in a manner inimical to a business acquaintance, or even to a man whom they had respected at school.

The MP is not alone in this dilemma, for in a modified way it confronts many public officials or professional men. True, these are less likely to become involved in such a sharp conflict of loyalties as the MP, for the civil servant may not enter into other employment, while the professional man rarely possesses the influence of an MP over public events. But the same pressures may be there. The auditor of a company is sometimes exposed to strains and stresses, to give only one example.

Yet, on the whole such men manage to survive them, and they, like the average MP, are no more than ordinary human beings.

But the business and professional world may offer some practical lessons. Professional men have always found that even those with the strongest characters are fortified by having some definite rules to supply a framework for conscience. Dishonourable conduct may happen from deliberate intention, but far more frequently it begins through lack of thought, and by the time the crucial decision comes to be taken the victim has already loaded the dice against himself by a whole series of previous actions and powerful precedents.

Clearly MPs must not make bargains, written or oral, by which they receive money, or gifts, or benefits in return for an obligation likely to influence their political independence. On the other hand, they can hardly enter into any spheres of activity or undertake any responsibilities outside Parliament which do not contain the seed of some possible conflict of interest. Speaking crudely, what matters is the money involved. It is not cynical to say that in public life it is money that has the strongest strings. Nor is it completely dishonourable that it should be so. The unscrupulous think of money in terms of what it will buy. The candid may also think in terms of the obligations that in fact they accept by its receipt. Most men like to believe that they earn what they receive. Bribery and corruption do not rest on the worst emotions alone.

★

If MPs are to strengthen each other in their resistance to these seductions, they must face the issue frankly as a body. If they wish to be free to supplement their official salaries by moneys earned elsewhere, then let them at least tell each other, and the outside world, what these other sources of income are. A company director, at a meeting or in a prospectus, is bound to disclose his own personal stake in the relevant contracts. So by custom does an MP in a debate which affects his interest. Why should not the MP also be bound to declare to the Speaker what his outside sources of earned income are, and the prospective MP make a similar disclosure in his election address? The MP may reply that it is well known that X is a union official, whose salary is supplemented from union funds, or that Y's connection with a particular industry or trade association is notorious. But how many of their constituents know the existence of such ties, still less their strength? And who would deny that the man who receives £100 from a particular source is less subject to possible pressure than the man who receives £5,000? Finally, MPs should set their face against the receipt of gifts. Nothing can be the result of more varied motives than a gift, and, to an honourable man, as to the dishonourable, no influence may be more potent.

If there is any general lesson to be drawn from the case of Mr Brown (which is doubtful, since Mr Brown is too much of an individualist to provide many lessons of general application), it is not of the wickedness of outside bodies who wish to pay for the services and influence of MPs. *Ex hypothesi*, almost these must be assumed to exist. It is that all MPs would be strengthened in their resistance to such influences by the knowledge that the extra-Parliamentary financial connections of all Members were public knowledge, to those of the public sufficiently interested to find out. Then any Member of Parliament could be more certain that what money he received was earned by him as an individual and not paid to him as a potential exception to the honesty of public life.

of towns like Bradford; for, by reducing the average number of electors in a constituency, the change would again make it easier to carve out average-sized units from the large and medium cities.

The awkward question is, what happens if the local boundary changes are not completed in time? The best answer is almost certainly to let sleeping dogs lie. If parliamentary boundaries are changed too soon they will in a few years become thoroughly unsatisfactory and have to be changed again. Continuous changes are a nuisance both to political organisers and to constituents; to say nothing (if he deserves so much consideration) of the political historian. Certainly there are gross inequities about the present distribution. But, when all is said and done, every part of the country is represented, and no one would seriously deny that the result of the last election represented the general feeling of the electors. One reshuffle of boundaries is needed; two would be more nuisance than they were worth.

* * *

That Little Man

Who exactly is this Little Man who has become the mascot of the Conservative Party? He is not the Common Man; for the Common or Proletarian Man's interests regrettably impel him to vote Labour. He is the small shopkeeper, craftsman, and perhaps professional man—though whether or not the professions come in depends a little on the definition—and before the war there were about a million and three-quarters of him in Great Britain. One in eight of all engaged in manufacturing, mining, building and public utilities was either a Little Man or one of the average of four or five employees of small firms—workers, that is, with a reasonable chance of becoming independent employers themselves. In shopkeeping and most service trades the proportion was, of course, far higher. As a factor in efforts to streamline British industry, raise PMH, and cut out waste, the Little Man clearly deserves a great deal of attention. And, as a political factor, he has provided a very substantial counterweight to the block vote of the trade unions; for on the whole he has been very faithful to the Right.

But is it only faith, or has the Right really done much to deserve his confidence? Or, indeed, the Centre or Left? The answer is unlikely to flatter Conservative complacency; for the most obvious fact to any investigator is that the Little Man is also the Forgotten Man. His life, when he newly enters into business, has been liable to be nasty, brutish and short. Before the war the chances were two to one against a new entrant into shopkeeping and the service trades surviving ten years. What exactly has been done either by Right-Wing politicians or by such bodies as Chambers of Commerce, by no means hotbeds of Socialism, to provide him with either the information or the capital needed to give him a better chance? And have the co-operative banks of the Continent, or the experience of the scheme for helping Service entrants into business after demobilisation, no lessons of permanent value? Even the more solidly established business man needs what he is promised in the Conservative Industrial Charter, protection against unfair forms of competition: but, once again, does this promise really mean what it says? Does it mean, for instance, a decision to knock the legal props from under price maintenance and restriction of entry, and give the small man with enterprise a real chance to fight his way through? Or does it mean, as it has in the case of Conservative policy for agriculture and transport, merely a blessing on the cruder forms of cartelisation? The Little Man is, in a sense, a legitimate preserve for Right-Wing politicians, and it may be that faith will keep this particular mountain firmly anchored in its present place. But, if it is asked whether a real policy for the Little Man exists, balancing his own legitimate interests against those of the rest of the nation, the answer is only too clearly that it does not and never has. And some day the Little Man may find out.

Fewer Police, More Crime

The cardinal facts in the report of the Commissioner of the Metropolitan Police for 1946 are two. The first is that on December 31, 1946, the Metropolitan Police was very much below strength. The total establishment of its uniform branch is 18,229 men and its strength was no more than 12,848 (the CID was rather better off, being just over 10 per cent below establishment). The second is that crime has increased. In 1938 there were 95,280 crimes in the "preventable" and "detectable" classes. In

1946 there were 127,796, a small decrease over 1945, but an increase of 34 per cent over the 1938 figure. The largest increase occurred in the class of "breakings" into premises, where the total in 1946 was 78 per cent greater than the figure for 1938. It is never possible to attribute an increase in crime to any one cause, but it is impossible to resist the conclusion that there were more police there would be fewer crimes of the "preventable" kind.

The Police Commissioner also analyses the facts about crime. The report is full of valuable data: the variations in the number of burglaries over the months, the age groups of various classes of criminals, and the times of day when road accidents most frequently happen. The report does not, moreover, ignore the social causes of crime, particularly in the young. Much of it is due, the Commissioner says, to lack of reasonable interests and occupation. Nor do the police stop short at advice—in many areas the police themselves have started new boys' and girls' clubs, or assumed responsibility for older clubs, in their leisure time. London has one more debt to its police, and to a Commissioner who encourages them to work in this way.

The Commissioner is not concerned with finance in his report. The Metropolitan Police have a twin head, a Commissioner responsible for duties and a Commissioner responsible for money and property. It is a recurrent cry in the London area that, although local authorities find more than one-third of the total cost of the Metropolitan Police, they have no say either in the control of the force or in the way it spends its money. There has never been much substance in the first criticism. The Commissioner is directly responsible to the Home Secretary, and there is no evidence that police efficiency lacks anything because questions concerning it must be asked in Parliament and not at a local council meeting. But there is still something in the old maxim, "no taxation without representation." It is to be hoped that when the local Government machine is overhauled, some place will be found for a liaison between local authorities and the Metropolitan Police spending departments, so that local authorities will have the right and the means of asking directly where their money goes and why.

"Free Greek" Government?

While the Security Council has decided to devote its next sessions entirely to the Balkan question, the situation inside Greece has deteriorated sharply. The guerillas have launched an attack in strength across the Albanian frontier and are threatening the frontier towns of Konitza and Florina. The area chosen is disquieting, for it is known to be thought most suitable for the establishment of a Communist "Free Greek" Government, a possibility discussed by the Greek Communist delegate at the French Communist Party rally at Strasburg in June, and ominously foreshadowed last week-end by the Greek Communist leader, Mr Zachariades, in the Athens newspaper *Rizospastis* where he wrote:

The present historic moment makes it imperative, for both external and internal reasons, to take a decisive step in this direction.

It is also disquieting that the guerillas should have felt able to make their attack at a time when the weather rather favours the Greek regular army, when the United Nations Sub-Commission of inquiry is at hand and when the whole affair is *sub judice* at the Security Council.

It may be, however, that the Greek Communists and their backers in the Balkans and Russia are pressing so hard now in order to have some base to work from in the event of American economic and military aid serving its double purpose—of restoring order and abating discontent. If so, Communist policy suggests a faith in the efficacy and speed of American help which is not borne out by the experiences of the last two years. Mr Griswold has just arrived and he and his team will need to work overtime if the benefits of his "new deal" are to offset the increasing severity of the measures necessary to keep the peace. The Greek Army is to be doubled and last week General Zervas, uncovering a Communist plot designed to produce a *coup d'état* on July 10th, ordered a mass arrest of Communist leaders. The suppression of the party and its press is under discussion. In view of the new menace in the North, it is difficult to criticise these measures, but they only underline the need for improved conditions in other fields to offset the depressing effect of more mobilisation, greater police powers and the accompanying undercurrent of suspicion, espionage and general distrust.

Terms for Turkey

The Turks, who are members of the Paris economic conference, signed last Saturday an agreement with the Americans which has novel and curious features. It lays down the conditions under which the financial, technical and military aid authorised by Congress last May is to be used and underlines some of the implications of the Truman doctrine. The Turkish Government undertakes to use any assistance furnished "for the purposes for which it has been accorded": in other words, there is to be no social or military extravagance. It further promises to give the American chief of mission—who has very large powers to represent his Government—"every facility and every assistance which he may request in the way of reports, information and observation concerning the utilisation and progress of assistance furnished." So far the guarantees are those normal between a creditor and a client.

But in articles four, five and seven the political and strategic ties which are to be knit are clearly revealed. Article four binds the Turks in the interests of security, to pass on no articles or items of information outside the country. Article five forbids them to use "any part of the proceeds" of any form of aid to repay or service loans from other governments. And article six leaves the Americans free to withdraw from the agreement "if the President of the United States determines that such withdrawal is in the interest of the United States." These articles will provide plenty of ammunition for Russian propaganda which will, of course, omit to mention that similar agreements exist in other parts of the world, but have not been made public.

It is therefore fair to mention that article three is the most unconventional of all; it guarantees to the "representatives and radio of the United States" opportunities to "observe freely" and "report fully" how American aid is being used, and binds the Turks to give "full and continuous publicity within Turkey as to the purpose, source, character, scope, amounts and progress of such assistance." This presumably does not mean for American newsmen the kind of closed shop they enjoyed for a period in Japan, or that the Turkish public should be surfeited with officially inspired propaganda. Throughout the document there is a note of arrogance which more careful drafting would have avoided, and which is out of tune with the moderation and tact of Mr Marshall's usual manner.

An Untenable Position

The Economist has already protested against the proposed reduction in imports of newsprint, and there is little need to add to the arguments put forward in a Note last week—the table of newsprint supplies and consumption there given was incorrect, and the following table should be substituted. The arguments

NEWSPRINT SUPPLIES (000 tons)			
Year	Imports	Production	Consumption*
1939	423	800	1,201
1944	135	148	281
1945	186	162	307
1946	105	295	374

* Figures after 1939 cover total home consumption and exports

have, however, been amplified this week in a statement issued by the Newsprint Supply Company. The cut proposed will save the £1 million of dollars in the next six months, but it only £1 million of dollars in the next six months, but it will compel the newspapers to reduce their size by the equivalent of one page per issue or to achieve an equal reduction by cutting their circulation. Even this trivial saving of dollars at such a cost would be accepted, the board of the Newsprint Supply Company points out, if it were part of a wide programme designed to preserve the standard of living all round. As it is the cut stands initially alone, "and the Press is entitled to protest in the strongest terms" against this undue discrimination.

The Government would, in fact, be well advised to reconsider this hasty decision—taken, it seems, like the industrial close-down decision last February, without any calculation of whether the saving is worth the cost. But, in spite of the gathering opposition to the decision, there does not at present seem much likelihood of its being reversed. This Government does not like the press, Sir Stafford Cripps's coldly formal words of sympathy—"I quite appreciate the value of the press and am very sorry that it has to be curtailed"—notwithstanding. Nor does it like to climb down—in fact, the weightier the arguments for the

Opposition the deeper does it seem to dig in its toes. The Labour leaders have still to shed the load of arrogance they assumed with the responsibility of government.

Reforms in Morocco

General Juin, the Resident-General of French Morocco, is walking a tightrope that is familiar to every modern mandatory, protector or trustee. He must find the mean between the nationalist aspirations of his wards and their unreadiness—in European eyes—for self-government. To left of him, Moroccan parties clamour for independence and profess their affiliations with the Arab League. To right of him, Frenchmen with a justifiable pride in their achievement as "protectors," and with a considerable economic stake in the country, adjure him to keep a hold on the brake. The political reforms that he has just announced are planned to appease both parties. Their object is to increase the share in the country's management that is taken by educated Moroccans. But even the new share is small, for there are not over-many of these. Perhaps the biggest failing in France's really remarkable effort in Morocco has been due to the attempt made to strike a balance—nowadays unstriking—between conducting a *mission civilisatrice* and, simultaneously, pursuing Lyautey's doctrine that Moroccan institutions must not be tampered with. This procedure has allowed a tiny minority to forge ahead by French standards, but has failed to harness into bi-national service the local Moslem universities, which have developed along fanatical anti-western lines.

Under the new reforms, a nominated Council of Ministers, half French and half Moroccan, is to direct all matters except foreign policy, defence and national economy. These remain the province of the Resident-General. The French ministers of the five other departments are in future to work with a Moroccan assistant of ministerial rank at their elbow.

Those who remember the bold speech in which the Sultan, visiting Tangier in April, failed to mention France and proclaimed Morocco's affiliations with the Arab League will wonder, and with some justification, why he signed the decrees establishing reforms of so mild a character. The answer is that he, too, is walking a tightrope, parallel to but distinct from General Juin's. The balance he must strike is that between hot-headed nationalists of the type that spirits renowned but awkward old firebrands like Abd-el-Krim out of French hands, and the French colleagues without whose presence his throne, and public security, and the possibility of exporting goods and collecting taxes with which to pay for many splendid economic developments now being planned, would all be in jeopardy. The role of Arab Sultan in a country largely composed of turbulent Berbers and Riffis is not easy. Islam is its binding force, so he stresses its affiliations with the East. But Morocco is on the Atlantic and, simultaneously, General Juin dubs it "a western country destined to develop along western lines." The problem that stretches before them both is this: whether they can keep a jump ahead of nationalist sentiments while evolving a pattern of government suitable to a community that must, racially speaking, remain a mixture, if it is to play the part it could play in the world's economy and strategy.

Egypt's Case for Uno

The Egyptians have lodged their case against Britain with the Security Council. As soon as a date is assigned for its discussion, a substantial delegation, led by the Premier, Nokrashy Pasha, will leave for New York. It will ask Uno to direct first that British troops shall leave the whole Nile Valley, and secondly—a new demand—that the present administration in the Sudan shall cease. The Egyptians do not say what, if they were to have their way, should take its place.

The document that supports these claims is based on such historical facts as suit them, but forgets those which do not. It argues that the troops must go but omits to mention that their departure by 1949 had been agreed upon and that the late negotiations broke down on quite another issue. It argues that the Anglo-Egyptian condominium of 1899 forced Britain's unwelcome presence upon the Sudanese without mentioning that but for that presence Frenchmen pushing from Fashoda, Belgians from the Lado Enclave and Italians from Kassala would have turned the Nile Valley into a less peaceful place than it has been. It argues that because the Anglo-Egyptian treaty of 1930 has "outlived its purpose" it is invalid.

Most of the Egyptian arguments (except the last, which calls in question the whole principle of treaty-making) amount to the tit for tat with which history abounds. Presumably the British answer will stick to the only two points which now matter: first, how soon can the British forces in Egypt wind up their commitments and leave; and, secondly, are the Sudanese to be free or not to be free to choose their own future. On the first point all Egyptians feel to be on firm ground, and are at one, and when they ask: "Why must exit from Egypt take longer than exit from India?" they are difficult to answer. On the second point they are on far less good ground, and some of them know it. Some, but not all, for the great bulk of Egyptians know and care little about what happens anywhere south of Cairo, and have swallowed whole the tale that all Sudanese yearn for union. The British, say the Egyptians, have weaned the Sudan from an ancient affiliation and fostered their separatism. Parochial the British servant in the Sudan may have been, but his parochialism is justified when he compares the near and smiling Sudan with the squalor and corruption that riddle Upper Egypt, next door. The flaw in the Egyptian case to Uno is that if it leads to an inquiry by unbiased superiors, this can but reveal that a great majority of the Sudanese want total independence and would regard a link with Egypt as a backward step. Therefore many faces will be saved if Uno simply decides that the dispute has not great dimensions and advises the parties to resume negotiations. Though Nokrashy Pasha could hardly do so, there are other statesmen ready to step into his shoes and try.

Disfranchising the African

Sir Godfrey Huggins, the Prime Minister of Southern Rhodesia, recently proposed that legislation should be introduced into the Colony's Parliament to prevent any more Africans from being added to the electoral roll, although those already on it should be allowed to remain. To compensate for this loss of voting rights he further suggested that two Europeans should be chosen to represent native interests in Parliament. Sir Godfrey Huggins stated, in making his proposal, that if the native franchise were not limited, in twenty, or at the most thirty, years the government of the colony would be entirely controlled by the African vote.

It is easy, of course, to condemn Sir Godfrey Huggins's proposal out of hand as reactionary and undemocratic. But before doing so people should ask themselves how they would feel if they were in the same position as the Southern Rhodesian Europeans who feel that all that they have done towards promoting the advance of the colony is now threatened. Southern Rhodesia's expenditure on social services for the African has hitherto compared favourably with expenditure in other African colonies, and it has been made possible by the capital brought into the colony by the European settlers. Nevertheless, even if the widest allowance is made for European feelings, it is impossible not to feel that the Southern Rhodesian Parliament will make a grave mistake if it allows the proposal to go through. It may be true, though it is by no means certain, that the British system of government is not suitable for the African. It is equally arguable that it is unsuited for the West Indian and the Ceylonese. But the Jamaicans have been given universal adult franchise; the Ceylonese have enjoyed it for many years, and are now within sight of Dominion status. Why should the Southern Rhodesian assume that the African will be unfitted to use the vote in thirty years' time?

The trouble is that to the Europeans in Southern Rhodesia, as in the Union of South Africa, the native is permanently and inevitably unequal. But they do not ask themselves whether his political immaturity is not in large part due to the racial discriminations already imposed on him—in particular, the industrial colour bar which prevents him from doing the same work as the European. Cannot the Southern Rhodesians learn from the deteriorating race relations in the Union, where the common citizenship enjoyed by the Cape native was restricted in 1936, that to limit the franchise would solve nothing? In neighbouring British territories, Africans are being chosen by Africans—admittedly not by direct suffrage—to sit on the Legislative Councils, the assumption thus being that they have a right, and are fitted, to have a say in their own affairs. The British Government should make it clear that if the Southern Rhodesian Parliament proceeds further with Sir Godfrey Huggins's proposal, it will exercise its right of veto.

Cereals Conference Disappointments

The Special Cereals Conference held in Paris last week ended, as was expected, in disappointment. It was convened on the initiative of the United States to make European countries realise that they could not continue to count on America feeding their towns while their rural areas fed only themselves. The conference therefore dutifully decided "to ration strictly, to assure the most rapid transport, to discipline prices, to assure the maximum amount of cereals for human consumption and at the same time to see that livestock obtained the necessary minimum of secondary cereals so that they were not fed with wheat." It also passed an emergency resolution, appealing for the maintenance of "fair and reasonable prices."

The European food problem is exceedingly complex. The grain shortage is due, among other things, to a lack of fertilisers, machinery and even manpower, and to post-war dislocations, which have caused fundamental social and political changes. The shortage of other foods like oils and fats, meat and sugar has itself increased the demand for cereals, which in turn has involved the diversion of feed grains and has thus delayed the post-war rehabilitation of livestock and prevented any increase in meat and fat production. It is the perfect example of the vicious circle. Moreover, Nature's blows in the past two years caused poorer yields. But despite the slow recovery of agricultural production, very few European countries are making the best use of their domestic output. Political and social backgrounds in Europe differ so widely that it would be impossible to adopt the British system of rationing (which the delegation expounded in detail) in other countries without serious modifications. The administrative difficulties of coaxing or requisitioning food supplies from unwilling peasant communities are notorious. In Europe, the black market flourishes because total quantities of food are inadequate, whereas in the United Kingdom food can be obtained in restaurants at relatively reasonable prices, to supplement the weekly rations.

*

To the United States, which is making great efforts to export large quantities of grain to Europe, the spectacle of a black market flourishing side by side with hunger is naturally galling. To some European critics America may reflect the apotheosis of prosperity, exporting foodstuffs not to prevent starvation but to maintain home prices and to increase its wealth; to America, Europe must often be compared to the irresponsible, prodigal son, squandering its resources. No conference can reconcile these two views. An international rationing system is undoubtedly the appropriate policy, but national sovereignty is too highly cherished to permit its implementation. But there must at least be genuine co-operation between suppliers and consumers. Europe must realise that America is not merely concerned with finding markets for its exportable food surpluses, and if the United States takes the initiative to sell grain cheaply to countries in need, its good faith ought to be unquestioned. If the recent conference has clarified these viewpoints, it will have served some purpose, even though it has failed to establish any agreed policy or any effective administrative machinery for world cereal distribution.

* * *

Geneva and Paris

Very sensibly the European Economic Commission in Geneva has resisted the temptation to take the role of Cinderella while the wicked sister, called the Committee for Economic Cooperation, enjoys herself in Paris. As seen from Geneva, the latter is an upstart taking over tasks and opportunities which the United Nations had reserved for itself. But there is still important work for the Geneva body to do. So just before the Paris conference assembled the EEC delegates met for the promised stormy debate between the French and British on the one side and the Russians and the Poles on the other, only to decide the storm should not break.

In this spirit of live and let live EEC has arranged to take over and reconstitute three international bodies with excellent records; the Emergency Economic Committee for Europe by the end of August, the European Coal Organisation by the end of the year, and the Inland Transport Committee by September 27. When that process is completed there will exist committees for research and discussion on the following European problems: inland transport, coal, electric power, industry and materials (comprising timber, fertilisers and alkalis) and housing needs. Obviously these bodies can and should help the committees set up last week-end in Paris, and the presence on them of delegates from eastern Europe will help to keep alive contacts across the Continent. The

It's hard to realise, till something brings it home to you, how much the world has shrunk. On Monday, a man's in West Africa. On Tuesday 'phones from London that he's catching the next train down! Hard to realise; and when realised, rather breath-taking. Distances between sons and mothers, parents and children, husbands and wives, diminished overnight when B.O.A.C. came into operation. Africa's one day away, now. India's 1½ days, Canada and the United States are 21 hours. Hong Kong is 6 days — Australia 2½. There's scarcely one of us out in the world today who can't be home in less than a week by Speedbird.

IT'S A SMALL WORLD BY SPEEDBIRD **B.O.A.C.**

CLOCKS

The CURRENT way of telling the TIME

this is **TI** to-day

A living thing has a way of growing, and TI have grown to mean much more than the name Tube Investments can convey. Yet it was the initial structure of the group which made possible, almost inevitable, the many later developments.

TI began as a free association of inter-dependent engineering companies who united their resources while maintaining the individual character of each concern. TI still adhere to this principle, but now concentrate technical knowledge and skill in many fields, to the benefit of their varied customers.

Precision tubes in steel and light alloys are an important part of TI enterprise; so are bicycles and cycle components, electrical appliances for the home and industry, light alloy sheet, strip and extruded sections; so also are such varied products as pressure vessels for ships, metal furniture, gas cylinders, golf shafts, traffic signs, fabricated light alloy goods, fishing rods, paints, cables and essential components of locomotives, cars, aeroplanes, to mention only a few.

All these activities are energised by the full resources of the group, and are subject to careful watch so that none shall fall below the jealously guarded standards set by TI at their beginning.

THE NAME SPENCE IS A household word in the world of heavy chemicals. SPENCE dates back to 1846 and its chemicals have always been respected for their high and consistent quality. Recently some interesting new products have been introduced, including materials for pharmaceutical specialities. An abridged booklet will gladly be sent to you giving a brief survey of SPENCE products, including:

Alum, Aluminium Sulphate, Aluminium Chloride, Aluminium Nitrate, Alumina White, Activated Alumina, Calcium Carbonate, Detergents, Pharmaceutical Alumina, Sodium Aluminate, Sulphuric Acid, Titanium salts, Silica, etc.

objection that can fairly be raised to this dual system is that there may not be enough experts to go round. Co-operation between Paris and Geneva should be encouraged, but it will be delayed if Mr Myrdal does not bring his commission out of the present mood of injured dignity.

Inconvenient Attorneys

The trial of General Tojo and other former Japanese leaders charged as major war criminals is still going on, though the world at large has quite forgotten about it. If, indeed, it were merely a matter of hearing the case against yesterday's rulers, the trial would not be news again until the delivery of the judgment. But it has taken a most surprising turn; the Tokyo courtroom has in fact become one of the battle-grounds of contemporary Soviet-American conflict. The Tokyo trial has from the beginning differed from the Nuremberg model in that the defence has not been confined to Japanese, but has been open to American lawyers, and these have fought as hard for their clients as if they were acting in an ordinary criminal case. A crisis involving a prolonged adjournment of the trial has now been reached on account of the Soviet prosecution's refusal to produce for cross-examination three Japanese generals whose signed statements obtained under Russian interrogation in prison have been produced in evidence. The point at issue is the responsibility for the outbreak of fighting on the Manchurian-Siberian border in August, 1938.

Letters to the Editor

More Light

SIR,—The news that a second "Economic Report of the President" (and of his "Council of Economic Advisers") is to appear six months after the first, throws a distressing light upon the relative progress of the United States and of Great Britain in the provision of the statistical material necessary for informed public discussion of the problems of planning. Our own Budget White Paper (which is our comparable document) not only appears no more than annually, but has abandoned the practice of giving anything but annual figures—although in its first issues quarterly figures were given. In these days, when we move from one crisis to another every few weeks, annual figures are nearly useless. The annual figures for 1946 were useless; it is already clear that those for 1947 will be little, if at all, more informative. In view of our more difficult circumstances, what we need is better, not worse, information than the Americans have.—Yours faithfully,

Nuffield College, Oxford

Export or Die

SIR,—Britain today is being weighed in the balance of payments—and found wanting.

I suggest a slight change in the vernacular might do more to bring this fact home to men's business and bosoms than the present constant drizzle of depressing propaganda.

In the palmy days of the past we have made use of the words, Importance, Important.

I suggest that the words Exportance, Exportant be substituted in future. We should discuss the Exportance of the various proposals which come before us; should seek out and honour the Exportant individuals.—Yours faithfully,

Hayle Place, Maidstone

LAURENCE CLARK

Civil Service Pay Claim

SIR,—In your Note in *The Economist* of July 12th you say that:

For thirty years the salaries of this class (the higher grades) of Civil Servant have been falling in relation to the rise in the cost of living... on an average the salaries of the top ranks of the administrative grade rose by 70 per cent over this period (1913-1947)... Civil Servants are not alone in suffering a fall in their standard of living since 1939, but in few cases can the relation between burdens and rewards have moved so far apart...

Russian official comment shows great anger at the truculence of the American defence counsel, and this is only natural in view of the Russian conception of what a political trial ought to be. "The defence," complains I. Lemin in *Soviet News*, "makes no attempt to assist the Court in getting a clear picture of the war crimes and the degree of individual guilt of each defendant." That defence counsel should actually try to defend their clients when State interests are at stake is in any case intolerable to minds trained in Communist ideology. But more is involved in this matter than the effectiveness of the Allied nations' prosecution of Tojo and his fellow defendants. The Far Eastern Commission in Washington has laid it down that the sharing of reparations from Japan is to be determined on "a broad political basis, taking into due account the scope of material and human destruction and damage suffered by each claimant country as a result of Japanese aggression, and taking also into due account each country's contribution to the defeat of Japan, including the extent and duration of its resistance to Japanese aggression." To make a good claim for themselves as victims of aggression, the Russians have to prove their version of all Manchurian border incidents from 1932 onwards. It is not only a question of Japanese guilt, but also of the cutting of the reparations cake to be divided among the Allies, and the action of the State Department in releasing diplomatic documents for the use of the defence lawyers may seem to the Russians to indicate motives going beyond a mere disinterested zeal for fairness to the accused. Hence the bitterness of the forensic duel, which has no doubt afforded some ironical pleasure to the prisoners in the dock and to the Japanese public.

May I mention to you a case where the burdens and rewards have moved even farther apart—the fighting services. The pay of a full Admiral is now £2,924, but was £1,825 in 1816, an increase of 60 per cent, not in thirty but in a hundred and thirty years. The retired pay of a naval Captain is now £900, but was £600 in 1870, an increase of 50 per cent in 77 years. The pension of a Rear-Admiral's widow is now £150, but was £120 in 1820, an increase of 25 per cent in 127 years. I do not know the movements of Civil Service salaries during the nineteenth century, but since 1913 the salary and the pension and the widow's gratuity of the head of a large Civil Service department have all increased by 75 per cent, and look like going higher.

The fighting services, alone of the community, are debarr'd by regulation from putting forward collective applications for the betterment of their conditions. How much they suffer from their inability to do so is strikingly illustrated by the fact that so eminent an economic journal as *The Economist* can completely overlook their claims at a time when senior Civil Servants are pressing for more money, and when it is already more remunerative to be a senior Civil Servant (£3,500) than to command the main fleet of the British Commonwealth of Nations (£2,924).—Yours faithfully,

RUSSELL GRENFELL

Campden House, Burley, Hants

Italy's Former Colonies

SIR,—I am a constant reader of *The Economist*, and for this reason I hope you will allow me to say that I do not consider the article in your issue of June 28th up to your usual standard. It is rather superficial and contains several incorrect statements.

It is true that all our colonies were liabilities, but it would be right to add that, as they were mainly developed by agricultural enterprise, a long time must elapse before paying results can be shown. Libya is the best example: it was just beginning to pay the hard labour of our colonists in a desert land which nobody else could have cultivated with the same results. The war interrupted all this. I would add that in Libya the colonists were over 125,000 and not 89,000. In a lesser degree the situation was the same in Eritrea (74,000 Italians) and in Somaliland (15,000 not 3,000) where our colonists, although the country is an "unappetising desert," have achieved results which are admired by your own people: for instance, the plantations of the SAIS Co. and of Genale along the Uebi Scebeli river and the more recent but very promising plantations along the Juba river. The native populations of all the territories are very sparse and quite unprepared, as yet, for independence. They also suffer from the consequences of the war and of the complete stoppage of trade

imposed till recently by the British Military Administration between Italy and the colonies. Thousands of colonists and their families are waiting to return to their farms and resume work in the general interest. Why prevent them? It is absolutely untrue that the natives do not want them back; any impartial person knows this.

The real misfortune of our former colonies is, in your own words, that they "all flank the main trade and strategic route along the Mediterranean-Red Sea passage," and that all "possess strategic possibilities" in the new world situation. That will be the main difficulty to find a just solution for their future.

What is Italy asking? That she should be given the single trusteeship of her former colonies, under all international controls and strategic limitations that Uno decides upon. Italy is morally and juridically fit to continue her work and lead the native populations towards self-government. The principle of administrative continuity which has been recognised and adopted for some former mandates transformed into single trusteeships should also be adopted for our former colonies, in particular in the interest of the native populations. This would not mean, evidently, that they would "fall again under Italian domination!"—Yours faithfully,
G. E. CORA

8 Via dei Benci, Florence

Vivisection in the Lords

SIR,—In your issue of July 12th you say that "the judgment of the Lords [that an Anti-Vivisection Society is not a charity] provides a refreshing current of sanity through an area which was becoming increasingly sentimental." Surely the question at issue was not one of sanity, or sentiment, or utility, but of law. Lord Porter in his dissenting judgment, to which you make no reference, said:

In my view the object of this society is the protection of animals from the sufferings believed to be involved in vivisection. That object is, in accordance with the decisions in what may be called the animal cases, charitable, and does not cease to be charitable, in spite of the finding of the Commissioners that its success would be gravely injurious to the public benefit.

You could not possibly afford space for me to discuss the legal aspects of the majority decision, but it is clear that it was largely affected by the fact that the claims of benefit to humanity derived from vivisection were not at any point in the hearings rebutted. They were not rebutted because they were regarded as irrelevant.

Books and Publications

"Rise of the Spanish - America Empire." By Salvador de Madariaga. Hollins and Carter. 408 pages. 21s.

THE spreading of Spanish civilisation over an area larger than Europe is an astonishing achievement, to which nothing in the record of the North European nations quite corresponds. In North America and Australia the problem of natives and whites was solved by the elimination of the natives. In India and Indonesia it looks like being solved by the elimination of the whites. In South and East Africa there remains a clear cut division between two civilisations living side by side. Only in South and Central America has there been anything resembling a real fusion of races on the basis of a European culture.

How did it happen? Señor de Madariaga has done a real service to British readers in presenting a truth as illuminating and even startling as Tocqueville's *Ancien Régime*. The Spanish America of the mines, the Inquisition, and the tropical corruption is indeed there. But so also is freedom, both intellectual and economic; a culture far in advance of anything attained in Anglo-Saxon America, and equal to almost the best in Europe; active scientific research and universities comparing only too favourably with the Harvard, Yale, and Oxford of their day; a sense of law and order, and a battle by governments and church to defend the native, often successfully, against the interests of white settlers; a relatively high standard of living for Indians and Negroes as well as whites; and above all an abounding vitality. It was a Catholic land in the fullest and most Chestertonian sense of the word: a land of cruelty and humanity, of silk turning to sackcloth, of conquered territory held without troops. A land where extremes met: and first and foremost a land where life was a very different matter from anything in the experience of the witch-burners of New England or the slaves of Jamaica or British-occupied Trinidad.

You add some comments which follow the usual pattern adopted by uninformed (and informed but disingenuous) supporters of vivisection. You accept that experiments on animals are beneficial to humanity, that expediency ranks higher than ethics; and you accuse anti-vivisectionists of sentimentality and of ignoring other cruelties. On the question of the utility of vivisection, may I advise that your readers at least study the arguments on both sides, and bear in mind that, even if they come to the conclusion that the million or so experiments on living animals done every year in this country have some utility, there may be alternative fields of research and modes of treatment not based on vivisection that are less open to objection and equally fruitful. On the ethical point, my only comment will be that you accept the majority view of this and every known age that might is more important than right. As for sentimentality, it is to be found equally among anti- and pro-vivisectionists and is equally to be deplored on both sides. The sob-stuff about "millions of lives saved" (but no names or addresses given) and "devoted research workers" is a commonplace in the press and elsewhere. On the point of ignoring other cruelties, this accusation is simply untrue. There may be odd exceptions, but anti-vivisectionists as a whole are opposed to the infliction of any avoidable pain, and a high proportion of them are vegetarians. They cannot support the NSPCA because there is no such society, but very many of them are active supporters of the RSPCA.—Yours faithfully,
W. TYLDESLEY, Secretary,
British Union for the Abolition of Vivisection
47 Whitehall, S.W.1

Knife Edge in Greece

SIR,—In congratulating you on your article on Greece in your issue of July 5th, may I draw attention to two inaccuracies?

First, it is said that the United Nations Inquiry Commission reached its conclusions "with Russia and Poland abstaining." This is inaccurate. The Russians and Poles voted against, France abstained.

Secondly, you refer to the Communists as "advocating the dismemberment of Northern Greece to the benefit of Greece's Slav neighbours." But in fact the Greek Communist Party has never on any occasion advocated any such dismemberment, and has always declared its determination to defend Greece's present frontiers.—Yours faithfully,
PAT SLOAN
Yew Tree Cottage, Melody Road, Biggin Hill

Then why did the experiment fail? Why did the connection break: and why has the former Spanish Empire collapsed into a rabble of minor powers? The answer is as illuminating for our problems as for Spain's. The first factor was technique and the energy to develop and use it. Morally, what the Spaniards achieved may perhaps have been better than the culture of Manchester, Zenith, and Chicago. But moral influence depends as much on power as on principles: and the seventeenth- and eighteenth-century Spaniards let the new economic sources of power slip by. Secondly, there was the decline of Catholic faith. The cold dawn of the Enlightenment provided some sort of a substitute, at least in the sense of an incentive to overhaul the machinery of government and economics. But it led also to two

other things. First, the church's passionate defence of the equality of men before God was forgotten, and, when the Liberation broke down the traditional control from Madrid, the Negroes and Indians learnt that the scorpions of a nineteenth-century radical plutocracy were infinitely worse than the whip of a conservative Catholic monarchy. And, secondly, under the false snare of an almost Bentham logic the Spaniards forgot to understand their own culture or the organic roots of their political system; and, in consequence, failed to pass on to America the clear understanding of these things which might have prevented both the break with Europe and many of the unfortunate later developments alike of Spain and of the American kingdom. Have we done better in India, or the Dutch in South Africa or Java?

Señor de Madariaga is a liberal of the school of Burke, not Bentham, and he deserves all praise for this latest of his many contributions to the hard task of convincing the elector that a study of history and the social balance of power is far more important than the planner's neat organisation chart. Every economist knows the difficulty of expounding the merits of free enterprise, global controls, and the equilibrium of competing forces over what at first sight seems the neater planned alternative. In politics the task is at least as urgent as in economics, and Señor de Madariaga has deserved well for so effectively attempting it.

The New Wage Structure

"Wages, Earnings and Hours of Work, 1914-47." By A. L. Bowley. London and Cambridge Economic Service. (Special Memorandum No. 50). 16 pages. 5s.

THE information contained in this compact Memorandum is essential to any student of contemporary economic affairs. Professor Bowley does not claim to make available here any statistics not already accessible in the relevant Government publications, but there are degrees of accessibility, and between the state of the subject as he finds it and as he leaves it there lies all the difference which separates a pile of bricks from a completed edifice.

The effects of the two wars on the wage structure have much in common. Each time, earnings gain on wages, thanks to the growth of overtime and the virtual abolition of short time and unemployment. Each time, the unskilled gain on the skilled, and women on men; the former tendency showing itself less, and the latter more, during the Second World War than during the first. Each time, both wages and earnings rise steeply in money terms, in a movement corresponding to the general rise of prices. A striking difference can, however, be observed when the ratio between earnings and the cost of living index is compared for the two post-war periods. In early 1919, wages were actually a point behind the cost of living in its upward race, and again, in 1922, a point ahead on the downward path. At no time in the period since World War Two ended has the rising cost of living even caught sight of the rocketing wage index, which in April, 1947, stood at 178½ per cent of its 1924 figure, while the corresponding proportion for the cost of living was 113 per cent. No doubt this divergence partly reflects the lamentable unreality of the moribund Cost of Living Index, but it also indicates a basic difference of economic policy and a corresponding change in the social structure of Britain.

War Economy

"Studies in War Economics." Oxford University of Statistics. Basil Blackwell. 410 pages. 25s.

THE collection in book form of these selected war-time papers of the Oxford Institute of Statistics, many of them now out of print and unobtainable, was an extremely happy thought. "Studies in War Economics" serves a triple purpose. Its historical interest, both to the general reader and to the historian in the search of materials and of further references, is obvious. By the illumination of several topics of abiding technical and theoretical interest it makes a lasting contribution to economic knowledge. And finally, several of the articles on controls and rationing, on the defence against inflation, on the problems of foreign exchange, and on the relations between those shaping and enforcing public policy and the leaders of the business world, throw a brilliant light on the corresponding problems of the post-war years.

The articles are grouped under eight main headings: Economic Mobilisation, War Finance, Income and Employment, Consumers' Rationing, Controls and Industrial Organisation, Prices and Consumption, War Contracts and Efficiency, Foreign Trade and Currency. They vary widely in length, in manner and in difficulty,

ranging from the short and straightforward notes, of two or three pages apiece, on the successive war-time Budgets, to Dr T. Balogh's massive examination, written with characteristic savagery, of "The Drift Towards a Rational Foreign Exchange Policy." Mr G. D. N. Worswick's fantasia on "Points, Prices and Consumers' Choice," and Mr J. L. Nicholson's "Rationing and Index Numbers," are unmistakably for mathematicians only, and the wisdom of including them in a collection of this kind is doubtful. The two articles on building costs, treating respectively of labour and of building materials, are quantitatively out of date (alas!) to an extent which leaves only their statistical procedure as a contribution of permanent interest. On the other hand the discussion of small savings, Dr Balogh's article on "Money Incentive and the Production Drive," Miss Ady's account of utility goods—these and many others are as fresh and as relevant as the day they were written. It would have been useful to add a sketch of the Oxford Institute's war-time role as a setting in which to place the articles which follow.

Economics of Advertising

"Advertising and Economic Theory." By E. A. Lever. Oxford University Press. 132 pages. 9s. 6d.

THE luck of the game has defeated Mr Lever; for Mr F. P. Bishop's "Economics of Advertising," which covers much the same ground, has beaten him in the snail's race to the book-sellers. And, into the bargain, Mr Bishop writes a much better book. Mr Lever is himself engaged in the advertising business, and comes nearest to making a valuable and original contribution to the subject where he draws on his own experience. But that, alas, he does only too rarely. A compendium of quotations from standard economists, a couple of unilluminating correlations, and a miscellaneous collection of statistics is no substitute for Mr Bishop's stimulating blend of economic knowledge with mature and practical wisdom. Some of the statistics quoted are certainly useful, in the sense that, though hardly original, they are not too easily accessible elsewhere. But even these figures, though useful for reference, lose some of their interest for the reader when Mr Lever so obviously fails to follow out the interesting questions which they open up. The analysis of selling and advertising expenses of 76 American industries, for example, raises a whole host of issues about the nature and inter-relationship of these expenses on which a writer with Mr Lever's experience should have been able to throw welcome light; but the chance is missed. It would be unfair to say that this book is bad or wrong-headed, for it is not; but it suffers the misfortune of challenging direct comparison with a book which is very much better.

From The Economist of 1847

July 17, 1847

Most of our contemporaries have complained . . . of the waste of time which is exemplified by giving up so many Bills at the end of the session; but they have neither traced out the cause of the evil nor suggested a remedy. Numerous as are the Bills put aside at the end of every session, it is still an important fact, that the number passed into laws every year is continually increasing. The number of public Acts passed last session was no less than 117. The waste probably does not bear any increasing proportion to the business done. . . .

There is no doubt whatever that a great many public Bills are pressed on the Legislature by "parties out of doors." Indeed, a large, perhaps the major, part of our legislation is so pressed on the Parliament. Protracted sessions—heavy debates—a great increase of business—and an annual massacre of innocents—all date from the Reform Act, and are mainly to be attributed to the increasing influence of the democracy over the Legislature. . . . As long as the House of Commons was mainly chosen and controlled by the aristocracy, the whole legislative business of the nation was in comparatively few hands, and the sessions of Parliament were then neither so protracted nor the business so extensive and so much neglected as at present. The Reform Act has both increased the quantity of business, and changed the influence under which it is introduced into Parliament; and those circumstances require a corresponding change in the mode by which it is conducted. We may hereafter consider what that change should be—whether or not the Houses should not be divided into committees, each with a department—one for trade, another for criminal law, another for religion—which should sift every Bill belonging to that department before submitting it for general discussion.

AMERICAN SURVEY

Preparation for the Marshall Project

(From Our U.S. Editorial Staff)

THE July issue of *Foreign Affairs*, analysing "Sources of Soviet Conduct," in an article thought to be by Mr Kennan, the top planner of the State Department, argues that, with the principle of infallibility of the Kremlin, and Party discipline, "the leadership is at liberty to put forward for tactical purposes any particular thesis which it finds useful to the cause at any particular moment. This means that truth is not a constant but is actually created, for all intents and purposes, by the Soviet leaders themselves."

When Mr Molotov answered his own question on the Marshall project—"What then would remain of the economic independence and sovereignty of such European countries?"—he illustrated this generalisation specifically enough to lift a great moral load off of the American mind. He said:

The Soviet government, while favouring the development of international collaboration on the basis of equal rights and mutual respect for the interests of the contracting parties, cannot lend its assistance to anyone in arranging his affairs at the expense of other countries of less strength or size because this has nothing in common with normal co-operation between states.

Americans have been sensitive to charges of imperialism. They have believed that American foreign policy ought to support the assurances of life, liberty and the pursuit of happiness contained in the bill of rights. They have held that extenuating circumstances should repeatedly be sought for apparent obstructionism. But when Mr Molotov wrapped himself in the mantle of Mr Wilson and championed the right to self-determination of small nations, the American reaction was, "Tell me another." Even the try-hards have come to certain conclusions about Russia.

Now that this point has been reached, what next? There are at least two alternative possibilities. One is to direct attention to the incompatibility of Russian and American aims, stressing that One World came to an end on July 2nd. The other is to concentrate on the vitality of the European economy, going ahead with however many countries will go ahead. The latter approach has several requirements. One is to examine the conditions of an adequate economic yield in Europe. Responsibility for initiating the plan on which American action will be taken is Europe's, but on this side, too, there must be an analysis of European capacities as a basis for judgment of what is a good risk.

Such analysis includes both the anatomy of the main commodities and services—coal, steel, power, transportation—required for renewed production, and the mechanisms of management which can make or break the transfer from paper estimates to three-dimensional operations. (At the far end of the latter, the relation to the World Bank must be considered—Mr McCloy and Mr Marshall were part of a team during the war, but use of international machinery has been little discussed during the present phase of the Marshall project.)

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our U.S. Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

The analytical, industry-by-industry approach would lead to open-ended plans fringing off one by one in Eastern Europe. The Dutch and the Swiss would be expected to carry over some of the former German trade relations with Eastern Europe. Possibilities arising from Czech and Polish needs for western outlets to maintain their standards of living would be anticipated. Further British-Russian negotiations, comparable to those now in process, would be assumed.

*

But these very concrete calculations can only be made on the basis of some larger assumptions. What kind of Europe is to be vitalised? Viewed in terms of economic yield, reconstruction of the past is almost as uninviting to Americans as continuance of the present: the creation of an area susceptible to production and distribution in the 20th century manner would be generally accepted as a condition of sound capital investment. But "creation of an area" would by no means necessarily indicate formation of a single entity, either politically, in a United States of Europe, or economically, in a customs union; a series of functional bodies, rather similar to the wartime Combined Boards, and burdened to the least possible extent with the trappings of sovereignty, would be more readily obtained and might be more effective. Where the regime of a country to which US aid is extended has an Old World flavour, as in Greece, Americans are correspondingly even more dubious of supporting the past.

On the other hand, the Continental know-how and experience of American businessmen—and hence some of their predilections—are related to the 19th century pattern. Most of the Americans who know Europe, and most of the Europeans whom they know, have or have had connections with the cartelised structure, restricted distribution and German dominance of the pre-war years. Yet those Americans are the nearest equivalent to trained personnel for relating the United States to the shape of things to come.

Moreover, some of the alternative prospects of a New Europe strike various groups of Americans unfavourably. Is the initiative taken by the countries assembled in Paris likely to propose a large measure of socialisation? If so, antagonism is likely to come from three sources here. Many Congressmen and others doubt whether there is a fundamental distinction between Socialism and Communism. Many businessmen and financiers doubt whether production can be efficient if managed by bureaucrats. These doubts are shared by some sectors of military government. Obviously, the proposals likely to come from Europe will envisage operation by public authorities of only certain segments of the economy. Ground exists for accommodation; plans for the British and the US zones in Germany will be a preliminary test of the capacity to reach it. But suppose it becomes clear that European initiative is rather solidly behind centralised public control of some main factors in reconstruction. Will the Truman administration then find that the most reliable way to get American support—moral and financial—for the Marshall project is to confront the public with a still worse alternative, take the catastrophic view of July 2nd, and discover a Communist crisis affecting Western Europe comparable to the previous discovery in Greece and Turkey?

It is not enough that, on the statistical level, preparation for this autumn's decision goes forward. The three committees to whom the President assigned the task of exploration are at

work. But tabulations or studies of industrial anatomy are only part of the requirements of American preparation for the Marshall project. They tell little of the meaning of support of indigenous initiative in an area where life and liberty are precarious and the pursuit of happiness offers small hope of catching

Bread upon the Waters?

(From a Correspondent in Iowa)

THE rains descended and the floods came, and beat upon the farms and towns of the western half of the Midwest Corn Belt. May or June floods are normal in the Midwest, which tries to drain every farm pothole, cuts and burns its forests clean, ploughs its grasslands, plants its maize in straight rows up and down hill, dredges and straightens its meandering rivers to make them run fast, dikes them off with levees from their natural overflow reservoirs, and turns these last to ploughland and towns. A day's heavy rain will send the brownish torrents across the corn fields. This year there were weeks of rainy weather, and then downpours of three to six inches in a day, several times in some watersheds, though a year's normal rainfall is but 31 inches.

The worst flood in 103 years hit St. Louis at the end of June, with the Mississippi and Missouri rivers both in flood at once. Dozens of small tributaries upstream were out of their banks: the Des Moines, the Raccoon, the Iowa, the Cedar, the Nishna, the Grand. Farmers worked day and night replanting fields only to have them washed out again. The town of Fort Dodge, which had never been flooded before, lost the use of its water works and electric power plant for days. Des Moines, spread out over 55 square miles of low hills and valleys, had one-sixth of its entire area under water. Ottumwa, a meat-packing town of 30,000 souls, is used to minor floods, but is sodden and groggy after deluges covered much of the town on four successive weekends. In big valleys and small ones, the June downpours were the last straw for many farmers whose ploughing and planting and cultivating had already been dangerously delayed by ground too wet to work. A million acres of farmland in Iowa alone were flooded; half a million acres will bear no crop at all this year. Less serious for the individual farmer, but far more damaging to national crop prospects, was the cold, rainy weather which left the crop backward on millions of acres, across the whole Corn Belt from Ohio to Nebraska, so that only fine weather in July and a late frost can pull it through without a lot of soft maize, fit only for feeding to livestock as ensilage or pasture, or for distillers.

First warning of flood comes from Weather Bureau rain gauges, then from their elaborate system of stream level gauges ("stages"). At once public employees and those threatened go to work: getting people and if there is time, movable property out of the path of danger, sandbagging levees, establishing patrol and communications systems, shelters and soup kitchens. Volunteers in numbers soon join them, especially bottom-land farmers and their neighbours, boat owners, and volunteer teams organised by the local Red Cross offices, which have standing Disaster Committees in all the larger centres. Street and highway departments with their trucks and labourers and sand, their shovels and bulldozers; police and sheriff's men with their patrol cars with two-way radio telephones; Army Civil Air Patrol aeroplanes, Navy walkie-talkies; Army Engineers—all rally around. In the big towns, police and National Guards patrol, under orders to prevent looting by shooting to kill; yet there and elsewhere, there is much real neighbourliness.

It is a full decade since Franklin Roosevelt proposed to dot the nation with multiple-purpose river valley "authorities" on the order of the Tennessee Valley Authority, for flood-control, soil and water conservation, electric power, navigation, and in

up, and yet where the values contained in these words are longed for and understood. Unless that meaning is borne in upon the country as high policy over the next four months, next autumn's legislative tactics may distort the participants in Europe's initiative into the semblance of pawns.

Of these, the proposed Missouri Valley Authority has acquired a certain political following and the status of a perennial Bill in Congress. "Normal" floods every year and catastrophic floods several times a decade are powerful material arguments for some such co-ordinated attack on the valley's problems. But while the Missouri's watershed covers one-sixth of the land surface of the United States, the perennially flooded bottom lands are narrow strips strung through many states and congressional districts, most of them solidly and conservatively Republican. Republican political leaders distrust MVA proposals as "New Deal," "Socialistic," "spend-thrift,"—even though they would mean the nation investing heavily in their own region. In Nebraska itself, the state where the late George Norris' enthusiasm led to public ownership of all electric power facilities, the reigning Republicans know not Norris, and are anti-MVA. Private electric power companies elsewhere feel that they are fighting for their lives and "the American way of life," and their influence is large in Republican local and national politics. So far the present MVA bill has not been allowed public hearings in the valley by the Republican leadership.

This June's floods stirred up Congress, but in the pre-TVA patterns. "This is a matter of life and death," said Senator Hickenlooper of Iowa, and helped rush through an emergency \$15 million appropriation to repair levees damaged in the floods. The regular annual appropriations for new flood control works are being considered in the traditional way—the limited overall appropriation is doled out to as many as possible for the hundreds of dam and levee projects already given preliminary approval after surveys by the 39 Army Engineer Districts. Each Congressman wants to be sure his constituency gets "its share." The energetic new chairman of the Flood Control Subcommittee of the House of Representatives Appropriations Committee, Mr Albert J. Engel of Michigan (this state also had some floods this year) hopes to reform this system enough so that at least some projects will be completed in a reasonable time before a lot more are started, but that will be hard going, for Congressmen from each of the newly flooded areas are already beginning to trumpet for priority for their areas.

So far there has been little to show in the Missouri Valley for the Congress of Industrial Organizations' and National Farmers' Union's crusades for an MVA except a compromise worked out in 1945 between the Army Engineers' plans for flood control for the lower river and the Bureau of Reclamation's plans for irrigation works on the upper river.

The 1947 floods will undoubtedly boost the cause of soil conservation. President Truman has endorsed, not only MVA, but a broad programme of flood control for the Missouri, the Mississippi and Ohio River Basins. Torrential rains show more graphically than anything else the value of terracing, ploughing on the contour, grassed slopes and waterways, etc., and now at last there are samples of these sufficiently well distributed in the Corn Belt so that farmers need not go far to see it with their own eyes. But only time can show whether the present catastrophe is indeed a case of casting bread upon the waters.

The war led to ploughing up much more grassland for up-and-down-hill row crops. Topsoil losses this year have been very heavy—115 million tons in Iowa alone in three weeks of June, off one-quarter of the total acreage—the most serious

loss in any one year, though loss has been rapid since the plough came to break the tough prairie sod. Yet on the eve of the floods, Republican congressional leaders were cracking the whip to make Midwest Congressmen vote for cuts in the various Agriculture and Interior Department soil conservation appropriations, and to make Western Congressmen vote against irrigation programmes.

Damage to topsoil is done, like corn fields washed out too late to replant. But much of the rain damage is still conditional. The official July 1 estimates forecast a maize crop of 2.6 billion bushels, compared with 3.2 billion bushels in 1946. Unofficial estimates late in June were that there would be a lot of soft maize, its maturing caught short by frost; that the Iowa crop would be only 65 to 70 per cent of last year's record crop, but still twice that of dry 1934; that the country as a whole still had an excellent chance for a "fair to good crop"—but hardly another bumper one. Maize prices reached \$2.21 a bushel early in July, the tenth all-time high in four weeks. Farmers with large amounts of stored grain from the previous harvest are more hesitant to sell it, for fear they may need it to feed their livestock next winter.

The Federal Department of Agriculture late in May scheduled 12 million bushels of maize for export during July, on the basis of relatively optimistic crop forecasts. A month later it proposed 6½ million bushels for export during August. But in Congress, press, and throughout the country, complaints have been rising—with and without factual basis—that exports are the chief cause of high prices and short supplies here, in all sorts of commodities, grains now join the procession, along with farm machinery, steel tubing for oil wells, sugar, coal mining machinery, petroleum, and other items.

During the war Americans discovered that wheat could be fed to livestock; more Europeans discovered humans could eat maize. This new partial interchangeability of the two grains makes the prospect of a short American maize crop portentous for a grain-hungry world. Americans are still revelling in their war and post-war heavy meat-eating, while a newly billion-conscious Congress is getting more and more critical of loans and grants and even commercial exports overseas. Grain-fattened livestock is the major industry of the Midwestern Corn Belt; it is the darling table piece of the American people, from coal miners to salesmen.

American Notes

Moves in the Marshall Campaign

In his speech to the assembled Governors at Salt Lake City Mr Marshall was almost wistfully regretful for the impediments placed by his office in the way of plain speaking. Supporters of the Marshall approach may well be disappointed that the Secretary of State did not choose to break through the curtain of secrecy that surrounds the views of the State Department. The strategy seems to be haste in Europe; delay in America. What did emerge is Mr Marshall's keen awareness of the campaign of education necessary before the American public can be brought to understand the emergency. These months in America bear all the signs of the "phony war" period. No battle has yet been joined, partly because the State Department has given the opposition so little to go on, partly because, one suspects, the average Congressman hardly takes the plan seriously yet. The silence is not consent; it is the lull before the storm.

The issue which it will be Mr Marshall's task to press home is that of security. This is a matter on which his authority is paramount. In his speech he said, and it is most likely that it was this theme which he developed later off the record:

Either America must finish the task of assisting these countries to adjust themselves to the changed demands of a new age, or it must reconcile itself to seeing them move in directions which are consistent neither with their own traditions nor with those of this country. In this latter case, the United States would be faced with a radical alteration of its own position in the world. I ask you to consider most carefully the implication of such a development for the future prosperity and security of our country.

In some quarters there is doubt whether the theme of Communist domination, which was so prodigally resorted to in the debate over Greece and Turkey, can once again whip a laggard Congress into line, no matter how persuasively it is portrayed by

Mr Marshall and Mr Molotov. Senator Ball, whose internationalist reputation makes him a useful stalking-horse for the opposition, has already urged that if the choice is between Communism and Socialism in Europe, "then it is hopeless, and we had better conserve our resources for the inevitable conflict." Even Mr Stassen has not thought better of his plan for making a return to free enterprise a condition of American aid. Much more of the economic emphasis characteristic of Mr Acheson's able discussions before he resigned may not only be desirable, but necessary.

American friends of the Marshall plan have been offended, for example, by the tone of Mr Morrison's and Mr Dalton's comment. Any reference to a revival of Lend-Lease might well have carried with it a reference to the "most unseemly act in human history" rather than the intimation that the Marshall plan is a scheme of self-help for American exports as well as for European imports. The very natural reaction has been to point out that if that were true the money might more profitably be spent inside the United States, on building a Missouri Valley Authority, for instance. Only an American voice can point out that such a re-allocation of resources from the export trade to domestic public works would be painful; that corn and wheat farmers cannot be taken from their homes and taught overnight to pour concrete for new dams.

The Time-Table in Congress

Reliance on any time-table which requires Congressional action must always prove shaky. Congress has, indeed, this week extended export and import controls in a form satisfactory to the President, but at what might more properly be called the thirteenth than the twelfth hour, for these controls expired on June 30th, and were only kept in being by temporary legislation. But Mr Truman has now agreed with leaders of both Houses that no special session of Congress will be called to consider the American part in European recovery. The Senate Foreign Relations Committee may be recalled, but the plan will not reach Congress as a whole until the beginning of the next regular session in January. It will thus compete for place with urgent domestic measures, and discussion will almost inevitably be prolonged until early summer. It never seemed very likely that the Marshall plan could be kept free of domestic controversy; now, even if the Republican leaders refrain from making it a campaign issue, it will suffer from the split mind that afflicts the United States in election year.

How many devices are available to Congressional intrantsents was shown this week by the determination of the economy bloc, led by Mr Taber, not to pass the appropriations for post-Unrra relief, or for Greece and Turkey, until every dollar of prospective expenditure has been approved. The Bill for aid to Greece and Turkey was hotly debated for three months; it was signed seven weeks ago by the President. Yet it remains still-born as things go from bad to worse in Athens, and all the money that is available is an advance from the Reconstruction Finance Corporation. This is nothing more than a delaying action, but it is instructive. Senator George has insisted that no long-term commitment for European aid is possible; Europe will have to come to Congress once, perhaps twice a year, for the life-giving transfusions of dollars. Each occasion will present new opportunities for re-opening the debate and delaying the programme.

This is a peril which will attend success, but there are other bridges to be crossed first. In making arrangements for regular meetings with the Foreign Relations Committee of the Senate, Mr Marshall has carried a formal step further the technique of prior consultation which stood Mr Hull and Mr Byrnes in such good stead in past crises.

Inflation Again!

The terms of the coal wage agreement have banished all recent discussion of deflationary possibilities ahead. The stress is now on a further upward twist to the price spiral, and most authorities predict a new wave of buying, and new peaks for activity. Senator Taft is taking evidence from industrial and union leaders as chairman of the Joint Economic Committee in Congress, and he declares quite simply that industry cannot afford to absorb fresh cost advances without a corresponding price adjustment. The spokesman for the Labour Federation, Mr Matthew Woll, has declared that any fresh increase in food prices must bring new wage claims, although in another context he warned union leaders that any attempt to tie wages to food

prices would bring a further and general inflationary movement. For Mr Woll, the solution is equally simple: wages must go up, and prices must not move—unless an "industry by industry assessment" gives support to claims for a downward price revision. Meanwhile, the bituminous coal price advance will probably be little short of \$1 a ton, and the steel manufacturers are talking of a \$5 a ton rise for raw steel next month. The railroads too, are seeking freight rate concessions estimated to yield at least \$1 billion yearly, and over a wide range of durable goods, there is a general belief that higher freight and fuel charges must bring another round of price adjustments.

President Truman is now plainly anxious concerning the trend of prices. Having been so largely responsible for the process known as sowing the wind, the Administration is a little scared now that the whirlwind looks as menacing as at any time within the past year. A special report has been submitted by the Council of Economic Advisers, and Mr Truman will send his own conclusions to Congress within a few days.

Since the President lacks any specific authority to deal with the present situation, the forthcoming report to Congress will presumably repeat the advice given earlier this year by the Council of Economic Advisers, and embrace a general appeal for sagacity and courage on the part of industry and labour. That advice will not carry very far, and Mr Truman already possesses evidence of what success can follow from the publication of pious generalities on the evils of the price spiral. The inflationary pressures now evident are not confined to wage boosts. They include crop damage which promises to sustain farm prices at higher levels than were recently expected; the tax manoeuvres detailed below; new Congressional pressure for "Veterans' bonus" payments, and last, but by no means least, a new wave of forward buying moved precisely by the new evidence of still-rising costs and charges.

The price situation, of course, is not without bearish factors. A fresh general wave of wage advances will not come in the immediate future. The petition for higher freight rates will probably meet with considerable delays. And ever-increasing production gives some assurance that raw material advances will not find an immediate reflection over the general list of durable goods. Behind all the current clamour for goods, there is, apparently, a rather more competitive position for finished manufactures—apart from automobiles. For the time being, however we must apparently postpone hopes of any relief from present US price-levels.

Cash Down for Veterans

The week's developments included continuing efforts by the Congressional majority to force through the Tax Relief Bill, already passed by the House of Representatives. The Senate vote of 60 to 32 last Monday all but reached the level necessary to override the second Presidential veto already promised by Mr Truman. When that veto comes, the Senators will be unable to mobilise further votes in favour of tax reduction, and must rely upon an actual turn-round of earlier voters—an unlikely development.

The Administration thus barely escapes from a first-class defeat on the tax issue, though passage of the new Bill would not have affected the immediate business situation, since the tax cuts were not scheduled to begin until January 1 next. From another angle, however, Congress is now busily engaged in undermining any remaining restraints on mass purchasing power. The Federal Reserve Board has already given notice that it will no longer seek to control consumer credit, since Congress will clearly refuse to grant overall powers for control. And the bonus payments to Veterans, approved last year by the Senate in the form of Five-year Bonds, will now be redeemable on demand, if Congress has its way. On present estimates, such a development will probably add \$2 billion to current purchasing power. There is always a tremendous pressure for service benefits and Congress has refused to listen to all suggestions that 1947 may well be the worst possible time to encash the Bonus Bonds. This pressure for bonus payments has whittled down Treasury estimates of debt redemption possibilities over the rest of 1947. Whereas estimates of the amount to be taken from the income stream by government operations at one time ranged between \$4 billion and \$5 billion, it is now thought that the maximum amount possible will be short of \$2 billion. While this sum is quite substantial, it is regarded as too modest to affect the rate of business activity in the months ahead.

With only modest possibilities ahead for the reduction of marketable debt, and with no effective controls elsewhere, the

Treasury turned reluctantly to the adjustment of short-term interest rates, discussed last week. The first open bid for Treasury Bills, since 1942 brought an average rate of 0.594 per cent, against the 0.375 per cent wartime "peg." The New York Money Market is now awaiting the next logical step—the removal of the "peg" on the One-year Treasury Certificates, the rate on which has been held rigidly at ½ per cent.

Dewey Moves West

The trail blazed by Mr Wallace last month is attracting other political pioneers. Governor Dewey has reached the Governor's Conference at Salt Lake City, which was one of the ostensible reasons for his Western tour this summer. The other was his desire to show his sons some of the wonders of the West. Among those wonders is a phenomenon more interesting, one imagines, to the elder than to the younger Deweys: the enthusiasm with which prominent Republicans have been rolling up to register their organisations' intentions of voting for Mr Dewey at the Republican Convention next year. Loyal delegations have been received from Missouri, Oklahoma, Texas and Arkansas. It is one of the oddities of American politics that although a Republican candidate can count on virtually no help, in the final election, from the Southern States (the election of 1928 was a notable exception), the votes cast by the Southern delegations at the nominating convention carry the same weight as those cast by States normally returning heavy Republican majorities.

These "rotten boroughs" of the Republican Party are usually thought to be in Senator Taft's pocket. This is particularly true of Texas. Thus in his trip West, Governor Dewey may not unfairly be described as picking Senator Taft's political pocket. It is too early to jump to the conclusion, put forward by some Dewey enthusiasts, that the Governor is now certain to be nominated on the first ballot. The Governor has always enjoyed a popularity in the West which is not easily explained. His tour was accompanied by none of the mass excitement created by Mr Wallace, but it confirms that he has gained rather than lost ground with those key figures who deliver the delegations. The Governor's happy exemption from the painful responsibilities of national politics, particularly the Labour Bill, is a current source of strength.

In another camp his example is being taken to heart. The strategists of the Democratic Party feel it is none too soon for President Truman to make a swing round the grass roots. Champ and challenger alike know there is still gold in the golden West.

Shorter Notes

Output of steel ingots over the first six months of 1947 reached the record peacetime rate of 42 million tons, almost 15 million tons higher than in 1946, and double the output in the first half of 1939. Almost throughout 1947, operations have been well above 90 per cent of rated capacity.

The first issue of Bonds by the World Bank—still regarded by Congress and Wall Street as the main channel for overseas assistance—has been heavily oversubscribed. The Bank this week issued \$100 million ten-year 2½ per cent Bonds, and \$150 million of twenty-five year three per cent Bonds.

Among the measures receiving top priority in the final fortnight of this session is one laying down a six-point "loyalty" standard for government employees. President Truman swept the initiative away from Congress on the issue of Communists in government some months ago, but Congressmen are dissatisfied with the scope and speed of the purge that is being carried out. If this law is passed, disclosure of confidential information, under circumstances indicating disloyalty, and membership in, affiliation with, or sympathetic association with, any foreign or domestic organisation designed as subversive by the Attorney General, would become grounds for dismissal.

THE WORLD OVERSEAS

Birthday Mood in Russia

“AGAIN and again the Soviet people smashes to smithereens the hopes of its overt and covert enemies that the might of the Socialist State will be weakened! Relying on its own forces, on the great advantages of the Soviet system, our people are achieving a high tempo of post-war reconstruction under the tested guidance of the Communist Party. . . .” In this hurrah tone *Pravda* recently commented on the latest report of the State Planning Commission about the economic situation in the second quarter of this year. The report and the comments provide the sharpest possible contrast to the alarmist official accounts that came from Moscow in the beginning of the year (see *The Economist*, March 15, 1947, p. 380). It seems that the greatest optimism of official Russian sources, like their earlier pessimism, should be taken with a grain of salt. It is never quite certain to what extent the accounts of the fulfilment or non-fulfilment of the economic plans are coloured by considerations of propaganda.

There are at least two reasons why the Soviet Government should now wish to show its people and the outside world a rather bright economic prospect. There is the need to offer a promising alternative to the co-operation in the Marshall “plan” which Russia has now refused. Even more important is perhaps the approach of the thirtieth anniversary of the October Revolution, which will certainly be celebrated with great élan and during which the undoubtedly great economic achievements of the Soviet regime will be treated with a due amount of exaggeration and over-emphasis. Just now the anniversary mood is beginning to spread over the columns of the press and to dominate official pronouncements; and much that will be said in Russia in the coming months will be dictated by it. Incidentally, the whole country is now being spurred on to complete the economic plan for the current year two months ahead of schedule, just in time for the great November parade at the Lenin Mausoleum in Moscow.

Having made allowance for the seasonally increased output of confidence, it is only right to say that the reports on the recent economic improvement appear to be true in some respects. “Bottlenecks” in the iron, steel and fuel industries have been broken for the time being. There has been in recent months such a vigorous pressure of economic and administrative energy on those “bottlenecks” that an improvement is quite natural. Very considerable percentages of overfulfilment of the plans have also been reported from the chemical, electrical, and transport engineering and machine tool industries. The output of agricultural machines, which very seriously lagged behind in the first quarter of the year, has now also been stepped up almost to 100 per cent.

Direction of Labour

At least in part, these satisfactory results have been achieved by resuming the direction of labour, about which the Government was hesitant last year. The newly formed Ministry of Labour Reserves has guaranteed the allocation of labour to the basic industries, while the other industries have been asked to fend for themselves and obtain labour without the help of the central authorities. The shortage of manpower is still acute. Even after the intervention of the Ministry of Labour Reserves, the shortage is still causing competition for labour between the various trusts and enterprises and a great deal of “fluctuation” of labour. The less essential industries are still able to lure workers from the basic industries, if they can offer them better housing and living conditions. In spite of the theoretically strict regimentation, actual labour discipline is often fairly loose. (Reports from some of the big heavy industrial works state that more than half of the workers that took on employment there in the first quarter of the year left their jobs in later months.) Since fluctuation of labour constitutes an obvious threat to planning, the Ministry of Labour Reserves has decided to make the supply of labour to the various enterprises conditional upon the preparation by their managers of tolerable housing and living facilities for the workers. The Ministry has announced that

it will stop the supply of labour if living conditions on the spot are bad. In cases of striking negligence on the part of managements, the public prosecutor will intervene.

It can be seen from this that the chief “bottleneck” reported earlier this year, that of housing, has not been broken. This is also obvious from the communiqué of the State Planning Commission which says that “in the first half of this year Government enterprises and institutions and local Soviets built or repaired and turned over to tenants 1,800,000 square metres of floor space for homes.” The housing plan for this year provided for the completion of 14,000,00 square metres of housing space. Thus, less than one seventh of the annual plan appears to have been fulfilled in the first half of the year. This is even less than last year’s performance—6,000,000 sq. metres—which left the plan unfulfilled. The housing problem also stood at the centre of the debates at the session of the Supreme Soviet of the Russian Republic which has just closed. The Russian Prime Minister Rodionov stated that in his republic the housing plan was only 64 per cent fulfilled. On the other hand, independent information from rural areas in Byelorussia and the Ukraine speaks of much quicker progress in the reconstruction of destroyed houses than is suggested in official Russian reports.

Behind the difficulties with housing there looms the still critical shortage of building materials—timber and bricks. The report of the State Planning Commission puts the output of timber at 97 per cent of schedule. But this is contradicted by the Russian Prime Minister, Mr Rodionov, who states that in his republic, which supplies nine-tenths of all Soviet timber, the plan up to June 1st was only 80 per cent fulfilled. The wish to bring about a radical improvement accounts for the appointment of Mr C. Z. Ginsburg to be the Minister of Building Materials. Mr Ginsburg is one of the “shock brigadiers” in the All-Union Government—during the war he was the Minister in charge of the construction of war factories. The output of building materials is thus at last being given a top priority.

Wheat Versus Dollars

In recent months, the attention of both the authorities and the public has been centred more on this year’s harvest than even on the indices of industrial output. In some weeks *Pravda* or *Izvestiya* have looked more like a farmer’s gazette than like the central organs of the party and the Government. The papers have published an endless series of “Letters to Comrade Stalin,” in which numberless collective farms pledged themselves to produce a bumper harvest. Each farm stated the exact acreage it would harvest and the yield per acre it would obtain, as a matter of its obligation to Stalin personally: an obligation, that is, that carries much weight. Technical advice to farmers on almost every phase of the sowing and the harvesting has filled the pages of the Moscow press to an extent that must look queer to any foreign reader. However, this sustained concentration on the harvest and the reported favourable weather will probably produce results. According to the Gosplan “the increase in the planted area for the 1947 harvest of all agricultural crops amounts to some 20 million acres as compared with 1946.” This is not at all bad. At present, all attention is given to prevention of wastage, which is usually very high (last year the wastage in some eastern areas was, according to official reports, as high as 3-4 cwt. per hectare); and also on the quick delivery of agricultural produce to the Government. Hopes are very high; and in the Ukraine the output of flour is expected to be five times as high as it was after last year’s drought.

This year’s harvest is not merely a matter of domestic interest. On it depends, up to a point, the scale of Russian influence in international trade and politics. The countries of the “Russian zone” are anxiously waiting to see what quotas of food they can get from Russia; and Russian grain and timber surpluses may perhaps be Mr Molotov’s counter to the Marshall plan in Western Europe. In the words of *Pravda*, the better economic prospects “will evoke among our people a new rise of vigour and will strengthen still more its trust in its own strength.”

That trust in Russia’s own strength certainly underlies Mr Stalin’s attitude towards the Marshall offer. By a queer coincidence it is now almost exactly thirty years since Mr Stalin, then the still unknown editor of *Pravda*, first came out against an offer of an American loan. This was after the famous “July days” of 1917 which ended in a severe, though temporary, setback for the Bolsheviks. The Government of Mr Kerensky then hoped to obtain an American loan to the amount of five billion roubles which would have helped him to continue the war. Mr Stalin’s party was opposed to the war and to foreign loans. In an editorial of the Bolshevik daily (under the title “American billions”), Mr Stalin made the following comment: “It used to be said in Russia that the light of Socialism comes from the west. And this was true. For it is there, in the west, that we have learned revolution and socialism. Since the beginning of the revolutionary movement in Russia the situation has somewhat changed. . . . Now the west exports. . . servitude and counter-revolution rather than socialism and liberation. . . .”

Many of Mr Stalin’s old writings are now considered by himself to be out-of-date. It is not even quite safe to quote some of them in Russia. But his saying about the “American billions” is now certainly thought there to have acquired new topicality.

Dutch Foreign Trade Problems

[BY OUR HAGUE CORRESPONDENT]

FROM the point of view of reconstruction policy in Holland one of the most serious aspects of the Indonesian problem is the shortage of manpower it creates for industry at home. Some 100,000 Dutch soldiers are already in the NEI, while a further 25,000 are being trained for duty there. The war had already caused a lack of industrial trainees; the men now in the forces belong to the very generation which might have formed the backbone of industry. What is more serious, the maintenance of a large military force in the NEI for two years has severely increased this country’s financial burden, already heavy enough owing to the wide gap between imports and exports.

Before the war the import and export situation was more or less like that of Great Britain. Dutch exports were worth some 1,000 million guilders and imports some 1,500 million guilders. The balance was made up by “invisible exports,” such as the income from overseas capital investments (in the NEI and the United States), and from shipping. As was shown in last week’s article, the total yield of Dutch overseas investments has fallen considerably, and Dutch shipping has not yet recovered its pre-war capacity. Furthermore, the balance of payments has developed unfavourably since liberation; in 1946 imports were worth 2,300 million guilders, against a mere 800 million for exports. The estimate for the current year is: exports 1,600 million guilders against imports amounting to 3,900 million guilders. This year the gap will amount to some 2,200 million guilders, only partly reduced by the liquidation of foreign assets estimated for the current year at 800 million guilders.

A more important source of income, foreign securities—especially American—is being gradually liquidated. There have been strong complaints that this process was not begun before the latter half of 1946; but the main reason for delay appears to have been the “purge” of securities from the American end, which did not coincide with the methods used on this side of the Atlantic. Now that liquidation has finally begun, it has to proceed very gradually, since a forced sale would cause values to drop. But even if liquidation were completed earlier, it could provide only a partial and temporary relief. The existing gap cannot be narrowed so easily. Earlier this year the Government set up a “priority board” to ration imports, but neither the needs of consumers nor those of industry can be restricted without damaging the health, welfare and productivity of the Dutch population. Nor, indeed, can productive power and the export capacity of Dutch industry, which needs in addition to raw materials and new machinery a considerable amount of equipment.

Need for Foreign Loans

“Stimulation of Exports” is an admirable slogan, but on the whole Holland has to work with obsolete material and to produce for a “world market” which is only a caricature of what the

economic text-book understands by the word. It is now not so much a question of exchanging articles which can best be produced by the selling country for products which other countries produce better as of getting rid of specialised luxuries or surplus goods, and hoping to receive in return essential foodstuffs and much-needed raw materials. In this battle for existence a small country like Holland is at a distinct disadvantage, especially since the economic ties with Indonesia are much slackener than before the war—to say the least of it—and since exports to Germany have practically disappeared.

In these circumstances foreign loans, either from the United States or the World Bank (if there is any difference) are necessary, at least during the next few years, to fill the gap between exports and imports and to set a re-equipped Dutch industry on its feet. The need for re-investment over the years 1946-52 has been calculated at 20,000 million guilders; 8,400 million are to be found in Holland, the balance by other means, largely by foreign loans, the prospects for which are as yet not too bright. The Dutch Minister of Finance, Professor Liefstinck, recently remarked: “We do not live close enough to the political storm centres to be eligible for political loans.”

What Germany means to Holland as an outlet for exports will be seen from the catastrophe which will occur, for instance, to its production of garden produce and fruit if it proves impossible to secure other markets, for example, the United Kingdom. Trade with Germany is developing along unsatisfactory lines, for which several factors are to blame. The pauperised German community lacks purchasing power, which makes Dutch vegetables too much of a luxury, and the occupying powers can make up for this deficiency only to a limited extent. The supply of vegetables by Holland to Germany should therefore be seen more in the light of “relief” than as a normal profit-giving transaction. Then there is the German lack of means of payment. A great deal of trade with Germany is done on a sterling and dollar basis—expensive currency to the Dutch. Holland is fully prepared to conduct her German business on a credit basis, provided the German mark is stabilised and that a long-term trade agreement can be worked out.

Frustration in Germany

Finally, there is the immense and immovable bureaucracy of the occupying powers, restricting and delaying all possibilities of trade development between Holland and Germany. In some cases the fault may be lack of faith, in others sheer incompetence; but red tape causes endless delay and involves useless negotiations with every kind of authority.

TRADE OF THE NETHERLANDS WITH THE ZONES OF OCCUPATION IN GERMANY*

	Imports in millions of guilders		Exports	
	May-Dec., 1946	Jan.-Mar., 1947	May-Dec., 1946	Jan.-Mar., 1947
British.....	70	5	50	10†
American	0.5	1	0.043	
French.....	0.024	0.004	4.5	2
Russian	2.5	1	...	3.5

* Deliveries of armies of occupation excluded.

† Included vegetables which may be delivered gratis.

This is especially the case in the British Zone, less so with the Americans. To give one example: just across the border, near Gronau, stands a German cotton mill, which could be efficiently put into operation by the Dutch. As far back as August, 1946, the Control Office in London gave the Dutch permission to work it, provided 15 per cent of the production remained in Germany. For all parties concerned a profitable transaction; but up to this moment the British authorities in Germany have been unable to fulfil a promise made in London almost a year ago! Imports from the British Zone now consist mainly of coal from the Ruhr (85 per cent). The Netherlands Government offered to send iron ore to the Ruhr in exchange for steel, observing that this would save coal, since only high quality ore would be delivered. But in this matter too the British authorities have not seen fit to conclude an agreement and revise Dutch-German trade.

Because Dutch buyers and sellers are unable to contact their German opposite numbers in person, a trust company has been founded in Amsterdam by private enterprise and with the bless-

ings of the Government. It has a number of agents in all Zones, and in Berlin an agency for the Russian Zone was recently established with the assistance of the Russian authorities. But the trust company itself is a target for complaint because, in these days of manpower shortage, its staff does not seem as capable as might be expected. Besides, only a limited number of commercial travellers are allowed in the combined zones, and then only as prospective buyers. Salesmen still have to keep out.

Trade with the French Zone has begun, but only from the Dutch side. Only recently have the French begun to fulfil their side of the agreement, but neither party will be able to reach the proposed target, \$3,000,000 for six months. In estimating all these figures it should be borne in mind that in 1938 (at much lower prices) Dutch exports to Germany were worth 159 million guilders, while imports from Germany totalled 308 million.

Great satisfaction is expressed by the Dutch authorities over the recently concluded trade agreement with the Russian occupation authorities, valid from June, 1947, to May, 1948. The total amount involved is 20 million guilders. The agreement includes several processing transactions; in return for metals sent from Holland the machinery will be sent to this country. The Russians will send glass, against which the Dutch will supply electric bulbs. Holland is to receive potassium and timber and send herrings and superphosphates.

This agreement with Russia still has to be executed, but its extent and nature prove that, even with a poverty-stricken Germany and under the present trade restrictions, far more is possible than has been hitherto realised. Complete recovery of the Netherlands could not have been expected within two years, certainly not in international trade. But the foundations have been laid.

Czechoslovakia and Her Neighbours

[FROM OUR PRAGUE CORRESPONDENT]

It is becoming more and more evident that Czechoslovakia's economic policy is at present largely concentrated on trying to step into Germany's shoes as chief supplier of consumer and capital goods to the less industrialised countries of Central and Eastern Europe. It already has commercial treaties and barter arrangements with Yugoslavia, Bulgaria and Rumania which point in this direction, and it has just concluded agreements with Poland and Russia which will show the same tendency.

In present conditions such a policy can be justified on many grounds. Czechoslovak industry is still more or less intact. German industry is in no shape to compete. Granted that, Czechoslovakia can get the necessary raw materials, it can supply the goods which its neighbours need and is nearer to them than other potential suppliers. Moreover, being a small country, there is no danger that it will acquire economic control of her customers as Germany designedly did before the war. Again, its relations with the Soviet Union are such that there are no political obstacles to close economic ties being established between Czechoslovakia and any of the countries named. Quite the contrary, in fact.

So far as Yugoslavia, Bulgaria and Rumania are concerned the only real problem that arises at the present time is the question of payment. The products of all three countries are largely agricultural, and Czechoslovakia, though not self-supporting in food, is near enough to being so to make it inconvenient to accept permanently large quantities of food and drink in exchange for industrial exports. Yet it is already being forced to do so. It is incongruous to find, for example, Bulgarian and Yugoslav wine on sale in Czech restaurants when the wine vaults of Moravia and Slovakia are inconveniently full of excellent wine which must be got rid of, if room is to be found for this year's vintage. This time last year, when there was a sudden glut of fruit and vegetables, Dr Ripka, the Minister for Foreign Trade, justified it by pointing out that, if Czechoslovakia wished to sell, it had to accept payment in goods and some of its customers could only supply agricultural products. Fortunately Yugoslavia and Bulgaria can do a little better than merely supply Czechoslovakia with wine. Yugoslavia has in addition various badly needed metals and Bulgaria can send tobacco, of which Czechoslovakia is very short. Bulgaria can also supply farm labourers, of which there is a great scarcity in Czechoslovakia.

Rumania in normal times could perhaps exchange her oil for

Czechoslovak finished goods but is not able to do so at present because most of it goes to Russia. Today Rumania can scarcely pay at all. Two years of drought have created famine conditions and many railway waggons of food are actually being sent from Czechoslovakia today labelled "Help for starving Rumania." It is not forgotten in this country that Rumania—under King Carol, be it noted—was the only ally which stood firmly by Czechoslovakia's side at the time of Munich and after. There are and will be again many reasons why Rumania and Czechoslovakia should be on friendly terms, and the future will probably bring much closer economic ties between them.

Poland as a neighbour is a different proposition. Until just before the Moscow Conference relations between the two countries were extremely strained with claim and counterclaim for territory being bandied between them. Today, solely as a result of pressure from Moscow, there is a Czech-Polish Treaty of Alliance and a cultural pact. Statesmen of both countries lose no opportunity of stressing that their interests are common and last week a five-year trade treaty was signed which becomes the centre of a network of East European arrangements.

New Start with Poland

This treaty provides for extensive development of communications and transport between the two countries and "regulated relations" between their respective industrial and agricultural systems. A bilateral council of economic collaboration has been set up and trade exchanges have been planned for the period July 1, 1947, to June 30, 1948. In that period Polish exports to Czechoslovakia will amount to \$35 million and Czech exports to Poland to the same value.

It is beyond question that the two countries should gain enormously if they really can settle the political disputes which have divided them since they obtained their independence after the first World War. Post-war Poland does not need Teschen, or any other parts of Czechoslovakia; and though there is more substance to Czechoslovakia's claim to be allocated certain parts of Silesia which the Poles have annexed from Germany with Russian approval, the importance of being on good terms with Poland outweighs it. Czechoslovakia needs the Oder route through Germany and the Polish Baltic ports for her overseas trade. It needs Polish coal and other raw material, and even Polish salt now that the salt mines of Sub-Carpathian Ukraine are within Soviet territory. Poland needs Czechoslovak industrial goods and technical skill—apart altogether from the political and strategic advantages of good neighbourly relations. It remains to be seen, however, whether their ancient animosities can be got rid of permanently by a few strokes of the pen on a series of pacts. Meanwhile, however, the Poles have made a good beginning by granting rights to the 30,000 Slovaks living in the annexed parts of Orava and Spiš after persecuting their Czech and Slovak citizens ever since the war ended. Profitable trade relations can do much to cement political friendship and the sooner the trade negotiations are brought to a successful conclusion the better.

Dispute with Hungary

Relations with Czechoslovakia's other neighbours, Austria and Hungary, are also still not clarified. Negotiations with Austria have been going on spasmodically for some time, so far without much prospect of a really comprehensive agreement, although the two countries already do a fair amount of business with one another. With Hungary, there is also a fair exchange of goods in spite of the old tension over minorities. This still shows no sign of easing, although an exchange of populations is actually in progress. But the exchange only affects from 80,000 to 100,000 persons on each side and there are altogether between 500,000 and 650,000 Magyars in Slovakia. The new Hungarian Government, like its predecessors, demands full minority rights for these people, which the Czechoslovak Government regards as tantamount to saying that it intends to raise the old revisionist slogan as soon as possible. Consequently, the Czechoslovak Government demands the transfer of all Magyars in Slovakia except those digible for "re-Slovakisation"—a process applicable only to politically reliable folk whose transformation into Magyars has come about within the last two generations. The two Governments are far apart on this vital issue and there seems little prospect of reconciliation. While the dispute goes on, not only is there no hope of friendly relations between Czechoslovakia and Hungary, but there is also no firm basis on which to build a sound political and economic structure for the countries of the Danubian basin.

Styled for tomorrow in 'Sheerline'

TODAY'S MOST TALKED ABOUT CAR

The new **AUSTIN '110'** six-cylinder

"Sheerline" styling, luxurious equipment, supreme comfort, sparkling performance—that is the new Austin '110' six-cylinder. A quiet, smooth-running, safe cornering, highly individual quality car—the finest that Austin has yet produced. Special features include independent front suspension, hypoid final drive, power jacking, steering column gear control, built-in radio and interior heating.

SHEERLINE '110' Saloon as illustrated above £999 plus £278.5.0. Purchase Tax, also available as the PRINCESS '120' Sports Saloon, with individually built coachwork by Vanden Plas, and a more powerful engine, £1,350 plus £751.10.0. Purchase Tax.

AUSTIN—you can depend on it!

port"—the elimination of contract "A" licences from the long-distance road haulage work of the Transport Commission. A contract "A" licensed vehicle is one operated by a haulier for hire or reward to carry the particular goods of a trader; it provides a road haulage service under contract. The intention of the amendment is to leave hauliers who undertake such work outside the new public transport organisation. But in view of the freedom which has, very rightly, been given to "C" licences, it is difficult to follow the argument that contract "A" licences operating over long distances should not properly form part of the public transport organisation.

This might be described as a "whittling-down" amendment. So is the elimination of the carriage of milk from the definition of long-distance carriage to be acquired and operated by the Commission. The carriage of liquids in tanks (including milk) was always excluded from the definition, and the amendment would merely enable some long-distance road hauliers to continue to carry milk in churns in their ordinary vehicles. A further amendment carried against the Government provides that the Commission's road passenger charges and goods services will have to be approved by the area licensing authorities. This amendment is based on the contention that because some road transport will not be taken over by the Commission, and will still have to be approved, for licensing purposes, by the area authorities, the Commission's activities, too, should be subject to the same authorities. Thus it raises the same fundamental point: whether the Commission, which is charged with the duty of providing a system of unified public transport, is to be given a proper degree of freedom—subject to the overriding directions of the Minister and the supervisory duties of the Transport Tribunal—to carry out its statutory duties; or whether its work on road passenger and haulage services is to be qualified by the need to obtain the approval of authorities who are charged with quite different statutory duties. There remains the last-minute amendment which was carried against the Government ten days ago by which a Scottish Executive is to be added to the others. This Scottish Executive is intended to embrace all Scottish transport. It superimposes on the functional or departmental organisation of the Commission and the Executives a regional or divisional scheme for a part of the country. Politics rather than economics have been responsible for this amendment, but clearly the Scottish spokesmen for it are anticipating a great deal which at present is sketched in the Bill in a permissive way. The Commission begins with each branch of transport organised departmentally; the fusion of the branches will have to follow later. Possibly it will have to take a regional form, but it is too early to take a plunge on this possibility. A regional organisation for Scotland would make the initial stages of the Commission, while the separate parts of the transport system are being gathered together and new standards are being laid down, even more difficult. It would prejudice the future

course of development, and might well involve friction between the unlike Executives.

This does not exhaust the list of amendments passed against the Government. One demands that inquiries into objections to schemes dealing with road passenger transport and docks and harbours must be conducted by persons who are not servants or officers of the Minister of Transport, and was resisted on the ground that it reflected on the Minister and the Civil Service. It is true that civil servants frequently carry out inquiries without any question being raised about their impartiality. But in the matters arising from the Bill, a servant of the Ministry would at least be a departmentally interested person, and recent experience of local inquiries under the New Towns Act suggests the desirability of finding quite independent persons to hold inquiries under the Transport Act.

★

Part V of the Bill, which deals with charges and facilities, attracted no amendments of substance in the House of Lords other than the decision to bring the Transport Commission under the area licensing authorities. The clause dealing with the preparation of charges schemes by the Commission was clarified, and checks have been provided during the transitional period before the charges come into force. This part of the Bill is crucially important; it received only limited discussion in Committee, and it called for a more constructive approach by the critics. In both Houses, the Opposition made the important point, that no principles on which the new charges schemes are to be based are inserted in the Bill. But no amendments were moved to provide them. None of the organisations of users of transport have offered proposals on this point; nor have they suggested that the Bill should be held up until the principles had been determined. If this is the position after eighteen months of discussion, it is a little futile to criticise the Government for their absence. On the third reading in the House of Commons, Sir David Maxwell Fyfe threw out a last-minute suggestion that the new charges schemes should be based on operating costs. Unfortunately, this does not stand up to examination; for example, only about 30 per cent of railway costs are variable (or "operating") costs, and the proposal leaves open the difficult question of how the remaining 70 per cent should be apportioned.

The solutions to the problems posed by Part V will clearly have to be reached by experience. A heavy responsibility will rest on the Commission, the Transport Tribunal and the Minister to reach wise decisions on these principles. The temptation towards "feather-bedding" may not be easy for the Commission to resist. The Transport Tribunal will have to be alert to protect the public interest, and to avoid any tendency to become subservient to the Commission or to the Minister. In this

most important matter, the Bill is a step in the dark. All the vaunted advantages of co-ordination will be dearly bought unless the right methods of charging are discovered, vigilantly applied and regularly reviewed. This point was emphasised in *The Economist* when the Bill was introduced last December; it has never received adequate explanation from the Government, or effective consideration by the Opposition. The Commission will have two years' grace to find the answer; it will have an entirely free hand, unfettered by any Ministerial declaration of policy on charges. And it will take over its duties at a time of rapidly rising operating costs, which, by some process of equity or necromancy, must be passed on to the transport user. The

After July 15th

THE great day has passed and without any untoward events. The Treasury did not, in fact, find it possible to complete the full series of its arrangements to make currently earned sterling a freely transferable or expendable currency by July 15th. That may have been due, in small part, to the immensity of the task and to the unbelievably small expert staff available on the British side to complete it. But prodigies of effort overcame most of these obstacles. The greater gaps that still remain in the series of sterling arrangements are due either to the unwillingness of the other parties to come into the network of these agreements or else to the prevalence of such conditions of economic and political chaos in the countries concerned as to put any such agreements out of court for the time being. Certain important agreements, such as those with India and Iraq, had not been completed by July 15th, but these particular gaps are likely to be filled by interim, if not by final, arrangements in a matter of days.

Of the countries which remain outside the scope of transferability agreements the most interesting is Switzerland, which has persistently refused to enter any such arrangements. The essence of these arrangements is that the countries with which they are negotiated should be prepared to accept sterling from other countries, as well as to transfer sterling to these countries for current transactions. Switzerland is unwilling to accept any foreign currency except under bilateral arrangements where it has full control over the amount of the exchange it accumulates. Apart from this rather special case, there is a considerable group of countries which have no recognised and effective Government, or in which economic conditions are so chaotic as to place the negotiation, and even more the operation, of monetary or payments agreements out of the range of practical reality. This group includes China, Paraguay, Rumania, Bulgaria, Greece, Yugoslavia, Hungary, Austria, Germany, Japan and Korea. Also outside the range of these agreements which discussions are under way but are not within immediate sight of completion. The American authorities have agreed to extend the deadline for these agreements to September 15th.

It should not be assumed that this large group of countries now lies outside the scope of free transferability of sterling. Some of the critical comments which have been arriving from the United States about the exclusion of many countries from the completed agreements make the wholly mistaken assumption that trade and payments between Britain and these countries will incorporate certain discriminatory features, and therefore constitute a breach of the Anglo-American financial agreement. This is far from being the case. There is no reason why sterling held by these countries should not be granted full convertibility by administrative action, in which each case is judged on its merits. It is certainly the intention of the authorities in Britain to grant such "administrative con-

financial advantages of co-ordination will have to be great indeed if the user of public transport is to obtain a better and a cheaper service. And the speed with which this Bill has been forced through Parliament, without adequate preliminary inquiry into the fundamental nature of the transport problem and without even tentative decisions about the ultimate organisation and economics of a co-ordinated transport industry, is a frightening portent. There is no certainty that, in the long run, the Bill will confer benefit on the community; there is a real danger that, in the short run, its disturbing effects will be supplemented by a further deterioration in transport facilities and costs.

vertibility" wherever formal arrangements have not been completed and wherever special cases justify that course.

The countries with which agreements have been completed or are in sight fall into three groups. The first is the dollar area, which comprises the United States and the whole of Latin America with the exception of Argentina, Uruguay, Brazil and Paraguay. These last four countries do a considerable trade with Europe and Africa and do not look so exclusively north as do the other republics of South and Central America. Current payments with the countries in the dollar area are canalised through American accounts, the sterling credited to which has, since the creation of these accounts during the war, been regarded as equivalent to dollars and fully convertible.

The second group comprises the sterling area, whose membership remains unchanged—with the exception of Egypt which, on her own volition and largely for technical reasons, has ceased to be a member. Within this area payments will continue to be made without restrictions except for the control of capital transfers which has been operated by Dominions such as Australia and New Zealand for a number of years. The normal sterling area machinery will continue to function even though a considerable part of the sterling assets of sterling area countries will be segregated and immobilised. There is no reason why countries like India and Iraq should not remain members of this area even though their accumulated balances are immobilised.

The third group will be the countries with which transferable accounts arrangements have been negotiated, or to which the less formal facilities of "administrative convertibility" have been granted. Transferable accounts are now operated by Argentina, the Belgian, Dutch, Portuguese and Spanish monetary areas, Canada and Newfoundland, Italy and the Vatican City, Brazil, Norway, Finland, Czechoslovakia, Egypt, Uruguay, Iran and Ethiopia. The "administrative convertibility" group is made up of smaller countries, such as Saudi Arabia, Afghanistan and Nepal.

The main link joining these three groups is provided by the official sterling-dollar rate of exchange, which is maintained at 4.02½ to 4.03½ by the operation of the British exchange equalisation account. There is no obligation either under the Anglo-American financial agreement or under the International Monetary Fund agreement to make sterling generally convertible into other currencies for current purposes. The obligation under the loan agreement is to make current sterling available for payments in any currency area in the world, and this is being achieved through the grant of transferable account facilities. The members' obligation under the International Monetary Fund agreement refers only to bilateral convertibility. It would, for example, enable the monetary authority of any country which holds sterling to convert that sterling into its own, but not into any other, currency.

—although it is not yet clear how specific the formal agreement is on this point—that the arrangements definitely leave Uruguay free to use the blocked balances for purchase of the British-owned utility enterprises in the country, and that the purchase of the railways has been discussed. The Uruguayan Ambassador, it is understood, will address to Mr Bevin an invitation to arrange for a British delegation to visit the country for further discussions on this matter.

It appears that funds are being specifically earmarked for the completion of the purchase of the Montevideo Tramways, which was agreed upon earlier in the year, and the consummation of the projected acquisition of the other two utility concerns looks tolerably well assured. At this stage, however, the future of the railways must be regarded differently; but the Stock Exchange has quite ignored the distinction, and this week treated the coming invitation to specific discussions as sufficient justification for marking-up the aggregate market capitalisation rapidly towards the figures of a possible purchase basis which rumour has freely tossed to and fro.

Boom in Oil

Evidence of the pressure of world demand upon oil supplies continues to accumulate. During the first few months of this year, the consumption of oil products in the United States increased at a record pace. The prophets who, on the basis of earlier trends, had the hardihood to forecast a setback in American demand after the war, have certainly been confounded. One side-light on the pressure on supplies and prices is to be found in this week's report that the Venezuelan Government is seeking bids for 25 per cent of the oil royalties which it takes in kind from companies operating in Venezuela. The present marketing opportunities, especially in the United States, are highly favourable.

The difficulty encountered by the oil industry in meeting the world demand for oil was referred to in the chairman's statement issued with the "Shell" Transport and Trading Company's accounts last week. In 1946, the "Shell" group's production reached a record total of over 230 million barrels, in spite of the failure of Far East oil-fields to achieve even their pre-war level of output. Progress continues at the group's properties in the United States, although there has been a temporary decline of 6 per cent below the 1945 level in the company's crude oil output there. The production of chemicals has made further progress at the plants in California and Texas, and the new chemicals plant at Thornton, in this country, is well on the way to completion. The fact that an increasing proportion of Europe's crude oil will have to come from the Middle East has been instrumental in changing the group's refinery policy, for it has been decided to erect refineries in this country. The pressure on shipyards has forced the group to augment its tanker fleet by purchasing a number of American tankers of the large T2 type.

Another striking indication of the expansion of the oil industry comes this week from the accounts of the Anglo-Iranian Oil Company, which show a record trading profit for 1946 of £12.2 million. Sir William Fraser, in his chairman's statement, reveals that production in Iran last year was double that of 1939, and the Abadan refinery on the Persian Gulf achieved a record throughput of 17.7 million tons. Capital expenditure is planned on a large scale. The Abadan refinery is to be expanded, though a shortage of equipment is expected to delay the programme. The Iraq Petroleum Company, in which Anglo-Iranian has a 23½ per cent interest, is extending its pipeline capacity from Iraq to the Mediterranean by some 9,000,000 tons throughput a year. Further development is planned at Kuwait Oil Company's properties, in

which the company has a 50 per cent interest. The new 30 inch pipeline from the Persian Gulf to the Mediterranean, to be built in co-operation with Standard Oil of New Jersey and Socony-Vacuum should lead to important savings in transport costs when it becomes available "some years hence."

Anglo-Iranian's large-scale development plans have an important bearing on the prospects for world oil supplies. The growth of Anglo-Iranian (in whose £20 million capital the British Government has an interest of £11.4 million) underlines two important economic factors in world oil. Firstly, its record profits point to the emergence of the Middle East as the chief reserve of world oil supplies within the next few years. Secondly, the urgency with which pipeline schemes are being put in hand and the recent agreements to sell oil to its two new American partners show that the oil problem is not one of production, but of refining and transport. The Middle East oil is there in plenty, but the chairman's statements both from "Shell" Transport and Trading and from Anglo-Iranian show that the world steel famine is imposing a most effective constriction on its movement to the world's main consuming centres.

Recovery in Rice?

The significance of rice in the world economy was little realised before the war; yet a bountiful crop in the past two seasons would have afforded considerable relief to the world food shortage, particularly in grains. Small rice rations in Asiatic countries have reduced the efficiency of labour and caused a restriction in the output of other commodities; and the International Emergency Food Council's food allocations have diverted cereals destined for Britain, Europe and elsewhere to the hunger-stricken parts of the Far East in order to prevent mass starvation.

The rice producing countries have been seriously affected by the war and rehabilitation has been slow. In the past two seasons the weather has been unfavourable in the major exporting areas. Moreover, the acreage in Burma, French Indo-China and Siam is still little more than half the pre-war levels. The clearing of the paddy fields requires a large amount of labour which is not now available. The Japanese occupation and the present lack of confidence in domestic security have caused a flight of farmers from the outlying areas, whilst political and financial instability have discouraged effort and output. Transport facilities were destroyed or worn out during the war and badly need replacement, while the shortage of consumer goods, in particular textiles, is aggravating the inflationary tendencies. The problem is no longer one of price; indeed, in many areas where inflation is already rampant an increase in price might even cause a reduction in output.

The world output of rough rice in 1946-47 has been estimated at slightly over 100 million tons, and although this represents an increase of 11 per cent on the previous season it is still some 5 per cent below the pre-war average of 106 million tons. But in the main exporting countries, notably Burma, French Indo-China and Siam, production is only about 60 per cent of the 1935-39 figure and the difference is nearly equivalent to their pre-war exports of 5½ million tons.

FRESH Horizons

To those private citizens who feel that in Australia and New Zealand lies the way to a fuller life. . . . To those industrialists who may contemplate establishing a factory in these Dominions. . . . The Bank of Australasia offers the benefit of a long experience and practical knowledge of local markets and conditions. The Bank has been in existence for over one hundred years and has numerous branches throughout Australia and New Zealand. Enquiries are welcomed by the Overseas Department at the address given below.

THE BANK OF AUSTRALASIA
(Incorporated by Royal Charter 1835)

Head Office: 4 Threadneedle Street, London, E.C.2. (Manager: G. C. Cowan)

WORKING TOGETHER—the District Bank and
its customers.

DISTRICT BANK LIMITED

THE BRITISH LINEN BANK

INCORPORATED BY ROYAL CHARTER 1746.

LONDON OFFICES:

City Office:

38, THREADNEEDLE ST., E.C.2.

West End Branch:

198, PICCADILLY, W.1.

SHARE CAPITAL
Authorised £255,000 Divided into 1,020,000 Shares of 5/- each, fully paid Issued and Fully Paid Up £255,000
There are no Debentures, Mortgages or Loan Capital outstanding.

The List for Applicants will open on Wednesday, 23rd July, 1947, for an

OFFER FOR SALE OF 600,000 SHARES OF 5/- EACH AT 11/- PER SHARE

The Offer for Sale shows (inter alia) that:—

1. The Company carries on an old established business as a high-class retail Store in Glasgow, selling a wide range of House Furnishings, China, Glass, etc. Bow's Emporium Ltd., its recently acquired wholly owned subsidiary, carries on a large and flourishing retail business as House Furnishers and General Warehousemen.
2. Both businesses are very well known in Scotland, have extensive freehold premises in prominent sites in the main shopping areas, which they have occupied for many years and are remaining under the same management as in the past.
3. The combined net assets, exclusive of goodwill, of the two Companies, according to recent valuations of the premises and the last audited Balance Sheets, amount to £374,596.
4. The combined profits for the year ended 31st January, 1947 (before deducting all Taxation) amounted to £71,675.
5. The Directors anticipate that the profits for the year ended 31st January, 1948, in the absence of circumstances beyond their control, will be not less than those earned during the year ended 31st January, 1947, and propose in this event to recommend the payment of a dividend on all the Issued Shares of the Company at the rate of at least 15% per annum for the year ending 31st January, 1948. This is equivalent to 6.8% on the price at which the Shares are being offered for sale.

Full Offers for Sale, on the terms of which alone applications will be considered, and application forms will be obtainable from:—

or from the vendors of the Shares:

QUADRANT TRUST LIMITED, 55/56, PALL MALL, LONDON, S.W.1.

regain the pre-war level of output would still be insufficient to feed the increased population in these areas at the pre-war level, for the number of consumers is estimated to have risen by 10 to 15 per cent.

Production in 1947-48 should show some improvement, given good weather and normal yields. In China the acreage planted is thought to exceed last year's figure, although in India, particularly in Bengal where jute may replace rice to some extent, a slight decline is expected. Continued expansion is anticipated in Burma and Siam, but it may take 5 years before conditions become normal, while in French Indo-China much depends on political developments. An exportable surplus of 3 to 4 million tons is hoped for—an improvement on the current figure of 2.2 million tons but still appreciably below the pre-war level of 7.8 million tons.

* * *

The Banks' Half Year

Each of the large banks has now made its interim dividend announcement for 1947, and, needless to say, in no case has there been any change in the distribution. The days are long since passed when the banks' half-yearly statements were of particular interest to bank shareholders; their significance now lies almost exclusively in the light they throw upon monetary policy. But, even on a long term view, this past half-year may well be notable. It may mark the moment at which the eight-year phrase of credit expansion, the greatest in Britain's financial history, was halted and a reverse movement first became discernible. Nearly all the half-yearly balance sheets of the large banks which have so far been published have shown a decline in deposits over the half-year, though all, of course, show a large increase on the levels of mid-1946. This movement, moreover, has occurred despite an acceleration in the upward movement of advances. For the clearing banks as a whole, and taking the figures to end-May, the advances total has gained no less than 28½ per cent in twelve months, and for the first time the aggregate figure has stood at well over £1,000 million for a succession of months. Hence even the average for the half-year shows an increase of some 12 per cent on that for the first half of 1946. Meanwhile, investment portfolios have been further expanded, though it is noteworthy that one of the "Big Five" banks shows a decline and another only a modest increase.

The rate at which the principal earning assets—advances and investments—have been expanding suggests that the banks have been securing an important set-off against the inroads which have been made into gross revenue by the fall in interest rates and the rise in establishment costs. In this context, a comparison of the changes over a two-year period yields rather striking results. The average level of net deposits during the past half-year was, at about £5,400 million, approximately £1,000 million higher than the average for the first half of 1945. Thanks to the ending of window-dressing and to the institution six months ago of a day-to-day target cash ratio of 8 per cent compared with the former "published" ratio of over 10 per cent, even this large increase in deposits has not required the provision of any additional cash in the balance sheets. Thus the £1,000 million has been employed wholly in the two main groups of liquid and earning assets. In the liquid group, the really flexible items—the bill portfolio and call money—there has been a spectacular expansion, averaging not much less than £790 million—almost 80 per cent of the additional deposits. But the increase in floating debt borrowings which this expansion implies has been accompanied, as is well known, by the Treasury policy of switching into Treasury bills from Treasury deposit receipts, the banks' average holdings of which declined over the two-year period by roughly £370 million. Hence the net increase in the banks' average holdings of short-dated assets was equivalent to little more than 40 per cent of the additional resources available. The remainder, amounting to almost 60 per cent, was employed in investments and advances. The investment portfolio in the past half-year has averaged roughly £300 million (or nearly 27 per cent) more than in the first half of 1945. The expansion in the average total of advances has been almost as great—amounting, in round figures, to £280 million, but the rate of growth here has been even more striking, equivalent to nearly 37 per cent.

* * *

Electric Power and Staggering

Building and civil engineering work on power stations valued at £75 million is to be undertaken during the next two years, and has been given priority for supplies of materials by the Ministry

of Works. Site work is in progress on 63 projects which will house plant with a capacity exceeding 5,260,000 kilowatts and plans have been approved for 13 projects to house a further 1,205,000 kilowatts of capacity. Altogether, these arrangements will provide more than sufficient house-room for the Central Electricity Board's expansion programme of 5,892,700 kilowatts for the period up to 1950.

Unfortunately, the empty shells of power houses will not generate electricity, and there is every likelihood that if this building programme is completed by the due date (unlike most programmes nowadays) it will far outstrip the maximum potential rate of installation of generating equipment. To achieve the CEB programme by 1950, more than 1.4 million kilowatts of capacity will have to be installed on the average for each year from 1947 to 1950. The rate of delivery to the domestic market of steam turbo-alternators exceeding 10,000 kilowatts capacity was 30,000 kilowatts in January and February, and 72,500 kilowatts in March. Even the March rate of production amounts only to some 850,000 kilowatts a year and not all of it would be power-house equipment. There is clearly no hope of getting anywhere near the average figure in 1947 and little enough chance of doing so in 1948; the burden of overtaking the arrears of power generating capacity must be transferred to the later years.

The officially estimated gap between available capacity and maximum demand next winter is put at 2,000,000 kilowatts. This estimate clearly takes account of the increasing gap between the manufacture of new machinery and the growth of demand and the obsolescence of old equipment. Even without the present steel shortage, it would be quite impossible to stage a last minute spurt to fill such a gap. And even if there are adequate coal stocks to keep the power stations running uninterruptedly throughout the winter, serious power cuts will be inevitable. The Government are now considering the possibility of compulsory staggering of the industrial load, which has been recommended by the regional boards through the National Joint Advisory Council. This step is said to be necessary because in certain districts voluntary agreement on staggering has been frustrated by a recalcitrant few. But the difficulty which has yet to be solved is to find a sanction against those who continue to take power outside the permitted hours; this involves some knotty points of contract which have not yet been resolved.

* * *

Delays to Locomotive Conversion

Last October it was announced that 1,217 railway engines would be converted from coal to oil burning as part of the Government's plans to save coal during the winter of 1946-47. Only a week later the Minister of Fuel and Power, in a debate on the coal situation, stated that earlier estimates of a total saving of three million tons of coal by April, 1947, from locomotive conversion would have to be revised to 1,000,000 tons. "The railways," said Mr Shinwell, "have had difficulties about tanks and the like."

Judging by an announcement last week, progress has been painfully slow ever since. So far, 37 locomotives have been converted to oil burning, nine are undergoing conversion and about 40 should be ready by August 1st. The main problem is to build sufficient oil storage capacity, and this is related to the shortage of steel. The conversion programme of 1,217 engines presumably includes all schemes already approved, for which, therefore, fuel supplies have been assured.

Estimates published from time to time during the last ten months give an approximate idea of the proportionate part which the conversion of locomotives to oil burning will ultimately play in the oil-firing programme. The locomotive conversion programme, when completed, will involve the consumption of 16,000 tons of oil a week—say 800,000 tons a year. If all the engines in the programme were converted by the autumn of next year, they would account for about 13 per cent of the anticipated increase of six million tons in this country's fuel oil consumption above the 1945-46 level. The current annual rate of consumption, assuming that all the locomotives already converted are running, can hardly be more than about 25,000 tons. This is only a meagre fraction of the rate at which the steel industry alone expects to consume oil this autumn. Such a comparison, however, should not belittle the contribution which locomotive oil conversion may make towards saving coal. But it does emphasise the need to speed up the conversion programme if it is to produce the anticipated saving of a million tons of coal a year.

A London Metal Market Again?

The new offensive for the opening of the London Metal Exchange has gained a partial success before it has been launched. The Ministry of Supply announced this week the withdrawal of restrictions on the issue of licences and contracts covering copper, lead, zinc and tin metal. Hitherto their issue was limited according to the applicant's rate of consumption, stocks and forward purchases; in future, applicants will only need to give a guarantee that their applications for metal are against orders for their products and that they have made full allowance for the consumption of scrap. The intention here is clearly to prevent consumers from building up stocks. This move will undoubtedly reduce the burden of administrative work, but it does not mean the end of bulk purchase and freedom for private merchandising. It is, however, a welcome relaxation, now that the period of acute shortage is passing, and it is therefore some encouragement to the protagonists of private trading. The need for international commodity markets is obvious. A futures market for copper has already been re-opened in New York, and experience in cotton shows that other countries are anxious to seize any available opportunity to set up an international commodity market. If London is to remain an important trade centre for metals, it will be necessary to re-open the Metal Exchange soon, even if its activities have to be restricted—say on the model of the rubber market. The case for organised commodity markets is patent, except to those who regard bulk purchase by Governments as the only cheap and moral form of international commerce. Such markets provide Britain with valuable foreign exchange through the *entrepôt* trade; they also induce foreign merchants to use British services such as banking, insurance and shipping, which are still valuable "invisible" exports.

There would, however, seem to be little purpose in re-opening a market if dealings could not take place either because of currency restrictions or because of lack of supplies. World supplies of non-ferrous metals did not show any great expansion last year. World production of copper (excluding Russia, Japan and Yugoslavia) in 1946 totalled 1,621 million tons compared with 1,898 million tons in 1945 and 1,741 million tons before the war (1936-38 average), whereas consumption totalled 1,947 million tons; there was a further large reduction in stocks accumulated during the war period. Lead is still in shortest supply. Output in the United States, Canada and Mexico showed a decline last year—it was, in fact, 22 per cent below the 1938 level of 795,000 tons. This downward tendency was also evident in Australia, Germany, Burma, Peru and Yugoslavia. World production in 1946 was probably 6 per cent lower than in 1945 and 38 per cent below the 1938 figure. Zinc is in a freer supply and although the output of ore in many areas declined in 1946, it was nevertheless maintained above the pre-war level—at least in the western hemisphere. Australian production, however, which in 1938 was second only to the United States, totalled only 130,000 tons in 1946—a drop of 26 per cent compared with the pre-war level. World consumption of zinc in 1946 was estimated at 528,500 tons, or approximately the same as in 1938, while the production of spelter was calculated to be 1,312,600 tons. Full details of world production and consumption of non-ferrous metals were published in last week's issue of the *Records and Statistics Supplement*.

It would seem, therefore, that although from the general point of view it is desirable to resume private trading in metals as soon as possible the current shortages of the main non-ferrous metals would provide inadequate scope for free dealings. But as output improves—and current indications are more favourable—the Government should keep in mind the need to reopen the London Metal Exchange at the earliest opportunity.

Modest Reduction in Copper

A reduction in the Ministry of Supply's price for copper had been expected for some weeks, but the modest cut of £5 per ton for electrolytic copper to £132 per ton announced this week has caused some stir. In New York, copper has fallen from 24 cents a lb at the beginning of last month and has become stabilised, temporarily at least, at 21½ cents—equivalent to £119½ a ton. It was widely expected that the British price would be reduced by at least £10 a ton in conformity with the lower American price. Indeed, the Ministry's announcement associates the £5 reduction with the lower price at which the Ministry is now buying copper overseas. The small reduction does not mean that the Ministry's current purchases are made at prices

above the world level or that Ministerial overheads are so large that British consumers are forced to pay more than their foreign competitors. It means merely that the Ministry is averaging the cost of its purchases; that it bought too freely at the higher prices; and that the consumer will not yet enjoy the full benefit of a reduction which his American competitors already enjoy.

Electrolytic copper, which was stabilised at £62 per ton from September, 1940, to April, 1946, rose at a spectacular pace during the ensuing twelve months. On January 1, 1947, the price was raised by £19 to £117 per ton, and at the end of February and March it was raised by £10 on each occasion to £137, where it remained until this week. These increases have moved in parallel, subject to a certain time-lag, with movements in the "world price" of copper, which is controlled largely by American demand. During the last six weeks the American market has been easier, although there has been no sign of the steady fall in prices which was anticipated. This week's reduction in the British price is the first since the beginning of the war, and it is a welcome omen that the supply and demand for copper are moving at last towards equilibrium. Even if the New York price should remain at 21½ cents, the British price should sooner or later come down to the equivalent level of £120 a ton.

Meanwhile, the previous restriction on forward purchases of copper to seven months' supply has been withdrawn; consumers may now buy any quantities forward at the current ruling prices. Forward purchases made before this week's reduction, however, will have to be paid for at the higher price. The relaxation of control on purchases may assist manufacturers to quote firm prices to their customers, and some will no doubt avail themselves of this facility. But if the market trend has turned decisively downwards, such forward buying is likely to be restricted.

Tyre Production Problems

Some weeks ago the tyre industry was forced to put most of its employees temporarily on short time, owing to the shortage of an essential material in tyre manufacture called channel black. This is a special variety of carbon black which is a product of natural gas. The dangers to the country's road transport system of a continued shortage of tyres were emphasised in a dramatic statement last week by the Road Haulage Association.

So far this year, the tyre manufacturing industry has produced little more than half the output of which it is capable. Production had returned to pre-war levels by September last year when the industry's monthly consumption of raw rubber reached 9,000 tons. But the shortage of textile materials from Lancashire, coupled with the fuel crisis which soon followed, rapidly reduced its output. Raw rubber consumption, which was still as high as 8,855 tons in January, amounted to no more than 3,259 tons in February. The shortage of textile materials has been partly overcome—by securing finished cotton from Italy and tyre cord from America. Plans are also going forward to expand tyre fabric capacity in this country, particularly by the growing use of rayon, which now accounts for about one-third of the industry's requirements. Since the fuel crisis, supplies of textile materials have become more plentiful. But in May, labour trouble in the United States oil-fields, whence carbon black supplies for this country are obtained, interrupted the flow of production and exports. Since the British tyre industry had been operating on very low stocks, it felt the full force of the fall in carbon black imports from 82,037 cwts in April to 43,193 cwts in May.

It may be possible eventually to reduce the dependence of road transport on carbon black imports from the United States by encouraging its production in the Middle East and in Britain—and even by some further extension of the re-treading industry. But in the short period, British tyre production can only be increased by securing larger supplies of essential channel black from the United States. There is some promise of improved supplies by next month, which may be in time for the industry to provide sufficient tyres for essential motor transport this winter. If not, the critical shortage in road transport facilities, which the Road Haulage Association fears, will be especially damaging, for it is bound to coincide this winter with a shortage of railway wagons.

A Manganese Shortage

The United States Government's decision to raise the size of its strategic stockpile of manganese ore from 3 to 5 million tons has given rise to certain fears that a serious and possibly prolonged shortage may develop. Such a shortage would certainly

Watch Clause 63

Under the TRANSPORT BILL, as it left the House of Commons, the Government proposes to appoint a Commission which would have virtually unlimited power, subject only to the Minister, over the whole BUS system of Great Britain.

CLAUSE 63 specifically empowers this Commission to prepare SCHEMES for promoting the co-ordination of the passenger transport services of any area, and under any such scheme a body may be set up to take over any existing undertakings.

THIS CLAUSE AFFECTS THE INTERESTS OF EVERY BUS PASSENGER IN THE COUNTRY.

The general effect of CLAUSE 63 and the two following clauses, if they go through Parliament unamended, would be that before very long a series of public monopolies, staffed by public officials, would acquire every bus service as well as the railway services with which they are in competition, and run them both under stereotyped control directed from Whitehall with little regard for local conditions or local requirements.

The magic word
"SCHEMES"

means in effect that

Competition between road and rail would be abolished.

Fares would be equalised—upwards.

Some services would be eliminated, others would be cut down.

Speed and comfort would be secondary considerations.

Existing incentives to spend money on constant developments would be replaced by the repressive hand of the Treasury in Whitehall.

There is still time for Clause 63 to be amended, if it is made clear that public opinion insists that the interests of the BUS PASSENGERS must be protected.

See how they run—

Some liquids 'run' easily. Others are sticky or viscous. Some substances are so viscous that their movement can be detected only by periodical observation over months or even years. Pitch, for example, when examined under laboratory conditions, flows so slowly that at ordinary temperatures it would take tens of years to move only a few inches. The chemist frequently needs to find exactly how 'thick' or how 'thin' a given liquid is: in other words, to determine its viscosity with accuracy. Viscosity can be measured by noting the time taken for a sample to pass through a hole of standard size. The newer type of viscometer is more elaborate and enables a detailed analysis of viscosity to be made. In one form of instrument the liquid to be tested is placed in a metal cup which rotates about a closely-fitting plunger suspended from a fine steel wire. As the liquid is carried round it exerts a drag on the plunger causing it to turn and thus to twist its supporting wire—the greater the viscosity of the liquid, the greater the drag. The degree of twist is shown on a finely graduated scale from which readings can be taken. These provide figures from which viscosity can be calculated with great accuracy. It is this new accuracy that, to give one example, enables the oil-refiner to achieve complete uniformity in every grade of oil he produces, for the British chemical industry uses the viscometer in a hundred ways to further its ability to serve the public.

involve difficulties for steel production, for nearly 95 per cent of the world's output of manganese is used by this industry as a reducing agent; its use as an alloying element is quite limited.

The American decision, however, is unlikely to have any immediate repercussions, as the stockpile is to be built up over a period of years and purchases are to be made as far as possible from supplies in excess of current industrial demand. The actual impact of this policy will be felt by American producers, as the stock-pile will be made up largely of domestic ores, which in any case are low grade and do not generally enter the world market. But this in turn will cause the American steel industry to become more dependent on foreign supplies unless home production of manganese is expanded beyond domestic requirements.

World production of manganese in 1937 reached a peak of 6 million tons, the main sources being Russia, India and South Africa. Current output is probably not above an annual rate of 4 million tons owing largely to reduced supplies from Russia and India, which are both high-grade producers. During the war alternative sources were developed—in particular the Gold Coast (whose exports expanded from a pre-war peak of 500,000 tons to 700,000 tons), Cuba and Brazil. The production in the latter two countries, which consists of low-grade ore, has since declined, but shipments from West Africa are being maintained. Russia's potential output has increased with the expansion of the Tschiatouri mines in Georgia and the restoration of the Nikopol mines in the Ukraine, but exports have been small. A gradual recovery has been apparent in both India and South Africa but expansion is hampered by a shortage of equipment and labour, and in the case of India, by internal transport difficulties.

The loss of Germany and Japan, two leading pre-war importers, has to a large extent been counterbalanced by increased shipments to the United States and the United Kingdom. American imports in 1946 totalled 1,560,000 tons or 165,000 tons above the previous peak of 1941. British arrivals last year amounted to 194,450 tons—slightly higher than the 1938 figure—while in the first five months of 1947 imports amounted to 119,676 tons compared with 79,990 tons in the corresponding period last year or 80,298 tons in an average five months of 1938. At the moment there is a relative shortage of high grade ore and if world steel production expands more rapidly than high grade manganese output a real shortage may develop. There is, however, a surplus output of low-grade ore which could always be utilised at the expense of certain technical difficulties and higher costs.

Steel Exports and Production

The war has profoundly affected the international trade in iron and steel. Like other great export industries, such as textiles and chemicals, steel is seeking a post-war readjustment in the light of three new factors. In the case of steel these are, first, the dislocation to Europe's steel export trade, especially the

eclipse of the German industry, and secondly, the emergence of the United States' industry as the world's largest steel exporter. The third development is the growth of steel capacity in what were formerly importing countries. These factors are analysed in the June issue of the British Iron and Steel Federation's statistical bulletin.

EXPORTS OF IRON AND STEEL ('000 Tons)

	U.S.A.	U.K.	Belgium-Luxembourg

Total	3,475	2,609	3,889
1946	3,764	1,564	1,577

NOTE.—The 1946 figures cover about 80 per cent. of total iron and steel exports: such finished products as castings are omitted but non-commercial exports for relief and rehabilitation are included.

In 1937, Belgium-Luxembourg was the largest exporting area with a figure of 3,889,000 tons, closely followed by Germany and the United States. Britain came fourth with an export figure of 2,609,000 tons. By 1946, the United States was exporting, in total, over 4,143,000 tons, Germany had disappeared, Britain was reduced to 1,860,000 tons and Belgium-Luxembourg to 1,577,000 tons. This redistribution of the world export trade has taken place within a total world steel trade which has shrunk over the same period from 19 million to 9,000,000 tons. Accompanying this shrinkage, there has been a changeover in the geographical distribution of markets, as the table above indicates. The United States for instance, has switched much of the supplies which formerly went to the Middle and Far East, to continental Europe and South America. Britain's reduced exports have been largely at the expense of the Empire.

Output of steel ingots and castings in June was at the rate of 13.2 million tons a year, compared with 12.7 million tons in May and an average of 11.2 million tons in the first quarter of the year. But this higher production has been achieved only by drawing upon stocks of pig-iron and other materials. The slight improvements in pig-iron and steel production are less encouraging when allowance is made for the effect of the Whitsuntide holidays on output in May, and the shortage of coal deliveries continues to affect output seriously.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Shell Transport and Trading; Anglo-Iranian; The Zinc Corporation.

Rising Clothing Sales

A sharp increase in sales of household goods is the main feature of the Board of Trade's retail trade statistics for April. In May, this improvement was not quite maintained, but purchases of other goods increased more than sufficiently to offset this small decline. The accompanying table shows the recent trend of sales and stocks reported by the large shops, and the trend is confirmed by the Board of Trade's statistics from independent retailers which are summarised in this week's *Records and Statistics Supplement*.

INDEX NUMBERS OF SALES PER WEEK
Average for 1942=100

	Apparel	Household Goods	Non-Food Merchandise	Food	Total
May, 1946.....	135	185	142	127	133
April, 1947.....	157	225	158	130	141
May, 1947.....	159	222	165	135	147

INDEX NUMBERS OF APPAREL STOCKS
Average for 1942=100

	Women's Wear	Men's and Boys' Wear	Footwear
May, 1946.....	84	67	65
April, 1947.....	109	79	83
May, 1947.....	114	90	83

There are two points of interest in the May figures. First, it is quite clear that the increased retail turnover has not occurred at the expense of stocks. These, according to the table, increased during the month in women's and men's wear and were unchanged in footwear. Secondly, there are indications that retail trade conditions varied widely in different regions in May. The improvement in non-food merchandise sales, for instance, was much less noticeable in Central London and the West End than elsewhere. The fall in the London area (excluding suburban London, where experience was more in line with that in the Provinces) was concentrated on clothing. But this decline was more than offset by large increases in Scotland and the North of England. The largest expansion in food sales was in the London area (central and suburban). Sales of tobacco, too, seem to have

been curtailed much less in the London area than elsewhere. Compared with May, 1946, tobacco sales in the Provinces were down by anything from 2 to 8 per cent. But they increased by more than 20 per cent. in the Central London area and showed a 6 per cent. increase in suburban London. The decrease in the cash value of tobacco sales for the country, as a whole, was 2½ per cent compared with the increase in price for popular brands of cigarettes of 43 per cent after the Budget. Thus although the Chancellor's punitive increase in tobacco duty had a limited effect on tobacco purchasers in London, it produced a cut, during the first month, of about 30 per cent in tobacco consumption.

Shorter Notes

The Bonus Issues Tax was already destined to be the most anomalous impost in the British fiscal system; it is now evident that it will also be the most uncertain. On the Report stage of the Finance Bill, the Chancellor declined, after all, to meet the request that the Commissioners of Inland Revenue should be required to make definitive estimates, in advance of an issue, of the amount of duty which would be payable—on the ground that, if anybody had to make a guess of share market valuations, it was better that the company should do it. In most cases the amount of duty will thus become a gamble which must be added to the other uncertainties in making an issue—but, if this prevents issues being made, the Chancellor now bluntly admits that he would "not think that an evil thing." The political motive of this extraordinary duty is indeed unmasked.

Provisional trade figures for June show that imports were slightly higher. Imports in June at £153.8 million compared with £153.2 million in May. United Kingdom exports were £93.1 million, compared with £89.7 million in May; and corresponding re-export figures were £7.1 million and £4.1 million. It is expected that the volume of exports will be "a little higher" than the May figure of 104 (1938=100).

On the last day of the committee stage of the Companies Bill, Labour back benchers reinstated the provisions for the disclosure of the beneficial owners of shares held by nominees, which had been withdrawn in the House of Lords, on the ground that they would be impossible to enforce.

COMPANY MEETINGS

OTTOMAN BANK

REVIVAL OF INTERNATIONAL TRADE COLONEL E. GORE BROWNE'S SPEECH

The eightieth annual general meeting of the Ottoman Bank was held, on the 16th instant, in London.

COLONEL E. GORE BROWNE, D.S.O., O.B.E., T.D., A.D.C. (the chairman), in the course of his speech, said: The year 1946 has been our first full year's working under post-war conditions. But, as you all know, conditions in Europe and the Near East, not to mention a wider field, are still far from normal. A period of general readjustment was to be expected after the cessation of hostilities, but in many of the countries in which we work there have been, and still are, political and economic difficulties and anxieties.

Heavy expenditure by the Allied Forces in some countries, and the high prices received for exports in others, while largely increasing the national income, resulted in an expansion of purchasing power out of proportion to available commodities, the more so in view of the scarcity of imports. In some countries the necessity for maintaining large national forces still further increased this purchasing power while diminishing the possibilities of production.

In the circumstances it is doubtful whether the most drastic measures could have prevented a heavy rise in internal prices and in the cost of living (such as has taken place in varying degree in all the countries of the Near East). The year 1946 was a very active one for trade and commerce throughout the Near East. In this activity your bank took its full share and, in spite of rising expenses and of difficulties to which I shall refer later, was able to make a satisfactory profit.

BALANCE-SHEET FIGURES

The balance-sheet before you shows a total of £64,156,900, against £67,659,000 at the end of 1945. This decrease is due in the main to the devaluation of the Turkish pound, which took place in September, 1946. But for this the total of the balance-sheet would have shown an increase on that for the previous year. Our deposits, for the same reason, show a decrease: £56,487,000 in 1945, against £60,364,000 in 1945.

On the other side of the balance-sheet, our cash is down to £9,631,000, showing a fall of about £1,700,000 on the previous year. You will notice, however, a compensating increase in the "money at call and notice." "Bills receivable" have also fallen by some £4,700,000, but, on the other hand, our investments have increased from £13,600,000 to £17,100,000, since we have maintained in 1946 our policy of seeking an improved yield on our funds by increasing our holding of short-term British securities. The decrease in the item "Advances to customers and other accounts" is due to the devaluation of other accounts, and, in some degree, to a conservative policy regarding commercial advances.

Our profit and loss account shows a balance for the year of £186,562 1s. 9d., an increase of about £52,000 over the previous year's figure. After adding the amount brought forward from 1945, there is, therefore, available in the profit and loss account a sum of £218,489 8s. 5d. A transfer of £50,000 has been made to provision for contingencies, and I shall later submit to you your committee's recommendation for the disposal of the balance of £168,489 8s. 5d.

TURKEY'S PROGRESS

Turkey, during 1946, adopted a bold policy of reimposing pre-war trading conditions and of encouraging private enterprise and healthy competition. Rationing and restrictions were relaxed. Taxes were drastically reduced and

Customs tariffs adjusted. Requisitioned premises were vacated, and the official and semi-official controls which had sprung up between the producer and his market were abolished.

In September, as I told you at our last meeting, Turkey readjusted her currency to a basis—from about 5.20 Turkish pounds to about 11.35 Turkish pounds to the pound sterling—which brought the prices of her goods nearer to world levels; this enabled her to abandon the involved "premium" and "compensation" systems which had burdened her foreign trade and, ultimately, to become a member of the International Monetary Fund and the International Bank for Reconstruction and Development. The Turkish authorities, moreover, did not allow the devaluation to unbalance the domestic market. They checked speculation and inflation by making gold available to the public at a fixed price, without restriction. The success of these measures was assured by an exceptionally bounteous harvest.

The net trading figures for the year are difficult to compare with 1945, owing to the changes in conditions attendant upon the devaluation of the Turkish pound, but it may safely be said that Turkey's trade in 1946, both export and import, showed a 50 per cent. increase upon the previous year. The exports were more than twice the amount of the imports. Turkey's public finances continue to be sound.

With regard to our own activities in Turkey, you will understand that it was a very busy year. It was also a reasonably profitable year and one which afforded repeated evidence of the esteem and regard in which your bank is held in Turkey, both by the Government and also by financial and commercial circles.

RESERVES STRENGTHENED

After dealing with events in Egypt and other countries in which the Bank operated, he went on: When we met last year I mentioned to you the possibility of achieving a transfer of profits from Turkey. In 1946 the Turkish Government permitted your bank to transfer part of the accumulated Turkish profits for the years 1939 to 1945. We were thus enabled to cover the depreciation in Turkey and to reinforce our reserves.

A further strengthening of reserves has been made by the transfer of £50,000 to provisions for contingencies, already mentioned, which leaves a balance available in the profit and loss account of £168,489 8s. 5d. This enables me to propose to you an increase in the dividend which you have voted in the last two years. We propose a dividend of 6s. per share, which will absorb £150,000 and leave £18,489 8s. 5d. to be carried forward to 1947. In view of the difficulties which we have had to face, I hope you will agree with me that you have no reason to be dissatisfied with the results of your undertaking for the year 1946.

My colleagues in Paris and London, and I myself, attach much importance to close collaboration and mutual understanding. We try to work as a team and the committee of your bank is, I am proud to think, in no small degree, a standing example of that "Entente Cordiale" upon which, in my view, the future of our countries and, indeed, of Europe, depends.

The report and accounts were adopted unanimously.

The formal business was duly transacted and the proceedings terminated with a cordial vote of thanks to the chairman, the general committee and staff at home and abroad.

BRITISH SHAREHOLDERS TRUST, LIMITED

IMPROVED PROFITS

The twenty-fifth ordinary general meeting of The British Shareholders Trust, Ltd., was held on the 16th instant, in London.

Mr B. H. Binder, F.C.A. (the chairman), in the course of his speech, said:

The accounts show an improvement both in the capital value of our investments and in our gross and net profit. The improvement in profits is in a large measure due to an increase in the new issues of capital during the year sponsored by the company, all of which were favourably received by investors.

The gross profit was £111,597, an increase of £27,670 over the previous year, and after providing for administration and taxation, the net profit was £48,929, a figure more than double the amount shown in the last accounts. From this sum your directors have allocated £3,000 to the staff pension fund and have transferred £16,000 to general reserve. From the balance of the year's profit, namely, £29,929, there must be deducted £8,880 in respect of the interim dividend of 3 per cent., less income tax, paid last December and £20,721 for the proposed final dividend of 4½ per cent., and a bonus of 2½ per cent., less income tax, which makes the total distribution for the year 10 per cent., thus bringing us back to our pre-war standard.

THE DIVIDEND

The total distribution for the year of 10 per cent. on the issued capital is only about 5 per cent. on the capital employed amounting to £991,349, represented by the issued share capital of £538,212, plus the reserves and undistributed profit totalling £453,137. If the value of the company's investments in excess of their book value is taken into consideration, amounting to £169,396, the total capital would be increased to over £1,150,000, equivalent to more than double the nominal amount of the company's issued capital.

During the year there has been an increase in our quoted investments and a decrease in our unquoted investments, and it is expected that this tendency will be continued in the current year. Your directors are satisfied that the unquoted investments which are shown in the balance sheet at £167,512 are conservatively valued at £165,366, and the small depreciation is much more than offset by the substantial surplus value of the quoted investments.

Our subsidiary, the Record Electrical Company, Limited, made a satisfactory profit for the year ended March 31, 1946. Its accounts for the year ended March 31, 1947, have not yet been completed, but they are expected to show less favourable results. Its operations at present have been hampered by the lack of semi-finished materials necessary for completing its manufactures.

Many of you are connected with industry and are fully aware of the difficulties of maintaining a satisfactory flow of raw materials and other supplies. These difficulties which, in some directions, are becoming intensified require to be carefully assessed when any new financing is undertaken and the degree of success attached to one's estimate of the future of any business is not helped by the constantly shifting order of priorities which the authorities award to various industries.

It is as yet too early to give any definite indications as to the outlook for the current year. So much depends on circumstances beyond our control. We have several financial proposals under consideration, but we shall not depart from our long-established practice of supporting only those undertakings whose record and management justify confidence. Given a continuance of reasonably favourable conditions, there should be a satisfactory volume of suitable business for us to deal with.

The report was adopted.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION LIMITED

Chief Offices: General Buildings, Perth, Scotland
General Buildings, Aldwych, London, W.C.2

BLEACHERS' ASSOCIATION, LIMITED

CAPITAL REARRANGEMENT COMPLETED

SIR ALAN SYKES ON POSITION AND PROSPECTS

The forty-eighth ordinary general meeting of this company was held on the 4th instant in Manchester, Sir Alan Sykes, Bt. (the chairman) presiding.

In proposing the motion for the adoption of the report and accounts, Sir Alan said:— Since our last annual general meeting, we have, with your approval and with the sanction of the Court, put through the scheme of arrangement which, as you know, we have had in contemplation for several years past. I think I can claim that the scheme, which you have approved, fulfilled the promise that I made at our last annual meeting that it would not do injustice to any class of stockholder. It received unanimous approval from the financial press and was described by two of the leading financial journals as "a model of simplicity" and as "eminently fair." We have redeemed our obligations to the preference stockholders in respect to the arrears of dividend due to them, and although we have reduced the nominal value of the ordinary stock, the holders of that stock still retain unimpaired their full rights to the equity of the business, subject only to the temporary intervention of the charges for interest and amortisation of the Funding Certificates issued in respect to one-half of the arrears of preference dividend.

VALUE OF ASSETS

If you will turn to the balance-sheet you will see the effect which the scheme has had in relation to the value of the assets of the association. The first two items on the assets side—land, buildings, etc.—£5,500,244 and shares in subsidiary companies (being the excess of the assets over the liabilities of those companies)—£439,651, represent the fixed assets of the association and its subsidiary companies—a total of £5,939,895. The total of the corresponding items appearing in the balance sheet at the end of the previous year was £7,808,557. The difference—a reduction this year of £1,868,662—is accounted for by our having written down the value of the fixed assets by £1,909,368, which corresponds exactly with the reduction in the nominal value of the ordinary stock, and by the net addition for capital expenditure during the year after deducting the charge of depreciation.

Those of you who have followed the history of the cotton industry since the first world war will know that it has involved a continuous contraction of productive capacity in the face of declining demand from our former very large export markets and, in our case, this has meant the closing down of works which could no longer remain in profitable operation. The final stage in this process (for I hope and believe, that it is the final stage) came with the Government's scheme for compulsory concentration during the last world war. I refer to this prolonged contraction of our output capacity, because I am glad to be able to tell you that the reduction of capital authorised by the scheme of arrangement has enabled us to write down the value of those assets which have ceased to be revenue earning to a figure which represents their current value in the form in which they now exist.

Before leaving the subject of the value of the fixed assets, I should like to refer to the provision made for depreciation, which, at £80,000 for the year, is less than the sum which it has been customary for us to provide for a number of years. The reduction is justified by the major transaction of writing down the value of the fixed assets by the amount of the reduction in our capital liabilities, since we have in the past had regard in fixing the provision, to the book value of the plant and machinery without regard to whether it was operating or not.

Now that we have written down the values of all non-operating plant, so large a provision is no longer necessary. Moreover, we have very substantial reserves against the renewal of our plant in the existence of stocks of machinery and equipment in those works which have been closed but which have not been dismantled, or from which the usable machinery has been removed and carefully stored.

STRONG CASH POSITION

The next item in the balance sheet—advances to subsidiary companies—£849,245, represents the net balance of working capital in the hands of our branches. Cash with bankers at £360,824 shows an increase of £216,000 over the corresponding figure last year. The balance has been maintained at this higher level to meet the payments that will become due in respect of the redemption of Funding Certificates and the payment of dividends. Tax reserve certificates appear in the balance sheet at £100,000, the decrease against last year's total of £200,000 being accounted for by the value of certificates applied to the payment of income tax.

INVESTMENTS PROFIT

Investments amount this year to £1,033,125, compared with £1,428,441 last year—a decrease of about £395,000. Some investments were sold to provide the cash for the payment of one-half of the arrears of preference dividend under the scheme of arrangement and others were sold and the proceeds reinvested. The profit on the sale of those investments appears in the profit and loss account. Four-fifths of our investments are in gilt-edged securities, and the market value at the date of the balance sheet was in excess of their cost.

On the liabilities side of the balance sheet there are one or two changes to which I should refer, most of which are consequent upon the scheme of arrangement. The ordinary stock capital has been reduced by one-half to £1,909,368, but there are no other alterations in the capital structure of the company.

There are no important changes under the heading of Credit Balances, which appear in total at £795,829, but the General Reserve Fund has been reduced by £228,113 to £471,886. The deduction represents the amount of the cash payments to preference stockholders in respect to the arrears of preference dividend.

This brings me to the profit and loss account, the balance of which appears in the balance sheet at £376,109.

The balance brought forward from the previous year was £143,667 and the trading profit for the year amounted to £418,456, an increase of about £15,000 over the corresponding figure for the previous year. Directors' fees, depreciation and debenture interest absorbed £184,776, which is less than the amount charged in the previous year by nearly £60,000 as a result of the reduction which we are now able to make in the charge for depreciation.

TRADING PROFIT UP

The net trading profit for the year was £233,679, an improvement of £74,000 over that of the previous year, and to this we have to add £67,169 for the profit on the sale of investments making a total profit for the year of £300,848. Including the amount brought forward, we thus have a total available profit of £444,516.

When I informed you last year of our intention to submit to you a scheme of arrangement involving a reduction of capital, I said that it would put us in a position to

resume the payment of a dividend on the ordinary stock, provided there were no further deterioration in our trading conditions. That was the goal we had set before us, and that is the goal we have reached, although not without encountering obstacles that might have defeated us.

During the year we had to meet substantial increases in the prices of many commodities that enter into the finishing of cotton piece goods and, in November, we had to meet the added cost of a substantial increase in wages coupled with a reduction in normal working hours. Those are benefits to our workpeople which we do not grudge, but we have every right to complain that, under the price control established by the Board of Trade, we should have to bear the added cost of these increases in the cost of production for five months before we could obtain permission to adjust our selling prices to meet them.

FUEL CRISIS LOSSES

The volume of output of our trade, which was one of the essential conditions to the attainment of our goal, was well maintained until nearly the end of our financial year, and then we encountered the climax of the fuel crisis. The threat of a stoppage through shortage of fuel, coupled with deterioration in quality, had been overhanging industry for many months and, in February, the storm broke with the prohibition of the use of electrical power for industrial purposes. We ourselves lost in the financial year the equivalent of about two weeks' output, but the full repercussion of the stoppage will extend into the current year.

However, we reached our goal in spite of the difficulties, and we have felt justified in recommending a dividend of 3 per cent. on the ordinary stock.

I am sure that you, as stockholders, will share with me the satisfaction which I and my co-directors feel in being able after so long a lapse to resume the payment of a dividend on the ordinary stock.

The directors have paid an interim dividend on the preference stock for the half-year ended on September 30, 1946, amounting to £68,406. They recommend the payment of interest on the 4 per cent. Funding Certificates for the year, which will require £8,934, and the payment of the final dividend on the preference stock, which will absorb £68,406.

The scheme of arrangement requires that a minimum of £20,000 shall be set aside out of the available profits of the year for the redemption of the Funding Certificates. This we have provided for, and we recommend also that £65,000 out of the profit of £67,169 on the sale of investments should also be applied to the redemption of these certificates.

Finally we recommend the payment of a dividend of 3 per cent. on the ordinary stock which will require £57,281, and that the balance of £156,487 be carried forward to the next accounts.

FOREIGN CLOTH PROBLEM

The continuing menace of a shortage of fuel and power still overshadows the prospects for the future, and although, subject to this, there appears to be every probability of a continuation of the slow but progressive increase in the output of cotton cloth, it is not likely to reach a volume that will require the employment of our full capacity. The importation of Japanese and German cloth for finishing in this country, and for re-export, may help to provide us with a little more work, but it is a poor substitute for the product of our own spindles and looms, and it is difficult to understand why, unless the condition has been imposed upon them, the Government should have decided to export this hybrid product rather than to direct it into the home market and to send our own goods abroad where they could re-establish the goodwill upon which our export trade depends.

The report and accounts were adopted.

WHITEHEAD IRON AND STEEL COMPANY, LIMITED

INCREASED PROFITS

The fortieth annual general meeting of the Whitehead Iron and Steel Company, Limited, was held on the 15th instant at Newport, Monmouthshire.

Mr G. H. Latham, chairman and managing director, in the course of his speech, said: The profit and loss account shows that the trading profit for the year to March 31, 1947, amounted to £666,458, an increase of £126,029 compared with the previous year. This increase is partly due to considerably improved results at the works of our subsidiary and associated companies, and partly to the extensions now coming into full operation, which have increased the capacity and general efficiency of our plant.

The net profit of £325,513 is £104,651 more than the corresponding figure of last year. Adding the sum of £54,666 brought forward, the total amount available is £380,179 out of which an interim dividend of 12½ per cent. (£53,889 net) has been paid, leaving a balance of £326,290. It is proposed to transfer £190,000 to general reserve, and to pay a final dividend of 17½ per cent., less tax (making 30 per cent. for the year), and to carry forward a balance of £60,846. The general reserve will then stand at £1,050,000.

STRONG POSITION

This strong position is the result of consistently following a prudent financial policy over a long period. We have seldom distributed, by way of dividend, an amount exceeding the allocation to reserve. This is true of the present year, despite the increased rate of dividend.

As a consequence of ploughing back substantial profits into the business, our reserve has grown quite out of relation to the nominal capital, and the rate of dividend consequently appears to be high. If we take the actual capital employed in the business the return would be approximately 8 per cent. This long-term policy of retaining in the business a substantial proportion of the profits for the purpose of extending, and maintaining, the efficiency of the plant, is in accordance with the best principles of business and national economy. A natural sequence to this would be the issue of share bonuses in order that the issued capital may truly represent the capital employed in the business. For the time being, however, your directors have decided to postpone consideration of a bonus issue.

For the last 24 years we have distributed each year to the whole of our staff and workmen, in the form of a bonus, an amount based upon the rate of dividend paid to our shareholders. During the year under review this bonus payment represents no less than 7½ weeks' wages to all our employees (as against the general practice of granting one week's holiday with pay), so that shareholders and employees alike have benefited from our progress.

COURTYBELLA WORKS

Our main works at Courtybella, Newport, is one of which the stockholders are justifiably proud. It represents the last word in modern rolling mill practice—in hot rolling, cold rolling and bright drawing. We are now reaping the full reward for the high class quality and finish of our products resulting from the application of our scientific research. Consequently, with such a magnificent plant, together with a splendid team of executives and workmen, we are able to supply our customers with products unsurpassed in the history of rolling mills.

It is a sad reflection that this splendid plant has not for some long time been operating at more than 50/60 per cent. of its capacity, although our products are in such great demand. This is entirely due to an acute shortage of semi-finished steel throughout the industry. The iron and steel development plan has been delayed through circumstances beyond the control of the industry

—the most important of which is the shortage of coal. As the Government has now decided to give the industry priority in obtaining an additional quantity of coal over and above the Cripps plan, it is hoped the steel trade will be able to increase the production of steel from the present level of 11,000,000 tons to 13,000,000 tons per annum by the end of the year. Even so, the demand for steel will by far exceed the supply. Unfortunately, our re-rolling industry suffers directly to a greater extent than other sections of the industry from this shortage, notably of billets and slabs.

Our research department has been actively engaged on problems relating to our rolling mills, as well as with developments in the works of our associated companies. Much work has been carried out during the expansion of the steel, cast iron and non-ferrous foundries at our Westgate iron works, where the most modern melting equipment is being installed.

THE FUTURE

As to the future, the capacity of our combined plants has now reached such magnitude that your directors think it wise to be independent, to a large extent, for the purchase of our raw material, and we are now busily engaged in the preparation of a plan to make our undertaking self-contained. This is more than ever important in view of our contemplated extensions in the form of a new continuous mill of the latest design for the manufacture of flat rolled products. I am satisfied that, given adequate supplies of raw material to enable us to use our works fully, we are in a position to meet competition from any direction, and I look forward to the future of our company with optimism notwithstanding the difficult period through which we are now passing.

In conclusion I would pay a warm tribute to all our employees, who by their co-operation and enthusiasm, have helped so much in the development of our company. The report was adopted.

HUDSON'S BAY COMPANY

RECORD STORES RESULTS

The 278th annual general court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held, on the 17th instant, in London, Sir Patrick Ashley Cooper, the governor, presiding.

The following is an extract from his statement which was circulated with the report:—

Since the close of the financial year the land, buildings and equipment, which appear in the first item of the assets side of the balance-sheet, have been transferred to a wholly owned subsidiary company. As this step would produce important changes in the balance-sheet and might be confusing to the proprietors, the directors hope to submit a consolidated balance-sheet at January 31, 1948, which will allow a comparison with the figures now presented.

The turnover of the various departments has been maintained or exceeded. The fall in net profits is largely due to the sharp fall in inventory prices in the fur trade which occurred near the end of the year.

Raw fur markets throughout the world continued very firm until mid-1946, when there was some evidence of a weakening in prices in New York, which later in the year developed into a state of uncertainty, with resultant decreases ranging from 30 per cent. to 50 per cent. in the prices of raw furs. Other markets moved in sympathy with New York.

This year the retail stores department again broke all previous records of sales and great credit for this is due to the managers of the stores and their staffs. Nevertheless, the rate of gross profit was lower and expenses higher, resulting in a somewhat smaller net profit.

The report was adopted.

BOOTS PURE DRUG COMPANY, LIMITED

LORD TRENT'S SPEECH

The 59th annual general meeting of Boots Pure Drug Company, Limited, was held, on the 10th instant, in Nottingham.

The Rt. Hon. Lord Trent (the chairman), in the course of his speech, said:—

We have had a record year for sales and the total number of prescriptions dispensed reached over 12 millions.

The net profits for the drug company and the home retail subsidiary companies come out at £1,063,830 against £826,241. These profits have been earned on a capital of approximately £10,000,000. For some years the share capital has not shown the real picture of the company's strength. Out of the drug company's net profit of £756,470 against £619,459, plus balance brought forward £180,887 making £937,357 your directors recommend the allocation of £100,000 to freehold property reserve, £42,000 for overseas development, £200,000 towards further provision for pension funds. . . . and there is a final balance of £190,145 to be carried forward to next year.

NEW SHARE CAPITAL

As we wish to be in a position to take advantage of any opportunity that may arise from time to time of purchasing a business or businesses which would be worth acquiring by your company and which purchase might involve an exchange of shares, we are asking you to pass a resolution as shown in the report to increase the number of ordinary shares. The whole of the 6,400,000 ordinary shares authorised have already been issued, so that if the circumstances arose to which I refer we should be unable to obtain the business on a share exchange basis. I may say that at the present moment we have no such project in view, but opportunities may be open to us and we wish to be in a position to take advantage of them.

We are negotiating for the acquisition of land near Irvine, Ayrshire, on which we can develop and build, as and when required, factories for our chemical department.

Plans are being prepared for a research institute to be erected on the Beeston site.

EXPORTS

Our total export sales show a slight reduction on previous figures, owing to the natural reduction of the demand for products connected with war purposes. On the other hand, export sales to our subsidiary companies abroad and to our agents throughout the world have shown a much larger increase than in any other year.

Having laid a solid foundation in most of our Empire markets, we are now seeking ways and means of developing our trade with "hard currency" countries. Visits have recently been paid by senior executives to the U.S.A., Canada, and the South American Republics in order to investigate the possibilities of increased export business there.

FUTURE PROSPECTS

Although spokesmen of the Government continually proclaim that we are "up against it" and that we must "export or perish," not even they have ever claimed that the state of legislation to which Ministers and their highly efficient departmental chiefs are devoting so much of their time and attention is assisting industry to rebuild its home and foreign trade.

If the future of your company depended upon our own skill and enterprise alone, I should have no hesitation in discussing our prospects in terms of unqualified optimism, but enterprise and expansion continue to be thwarted by conditions over which industry itself has no control. As long as these conditions persist, it is not possible to predict business prospects, but we shall do our utmost to maintain the confidence which immense numbers of the public have in our company.

SUEZ CANAL COMPANY

AN END TO LITIGATION

The annual general meeting of the Suez Canal Company was held on the 24th ultimo, in Paris.

The Marquis de Vogüé, the chairman, in the course of his speech, said:—Your directors are happy to be able, at last, to submit final accounts and bring to a close the distressing period of trial with which circumstances have taxed your patience. The Court of Appeal of Alexandria, in its judgment of May 17th, and there is no appeal from it, has put an end to the litigation which, over-long, has interfered with your legitimate interests and paralysed our means of action.

As was pointed out by the Court, the prime cause of this litigation, or rather this series of litigations, is to be found in the "complex personality" of your company "which is at the same time Egyptian and universal"—Egyptian by its territorial status and universal by the position it occupies in the general economy of the world. This universal character becomes paramount in matters affecting the various nations which are the company's clientele, particularly on the financial plane.

THE POINT AT ISSUE

The special point in dispute was the basis of redemption of the debentures. In two previous judgments, in 1925 and 1940, the Alexandria Court had already given its viewpoint. In 1925 certain debenture-holders had asked for redemption of the debentures and payment of the interest on the gold basis. In 1940 the point at issue was whether the decree of 1935 abolishing the gold clause in international contracts was applicable to the company. The standpoint adopted by the Court in both cases is referred to, and confirmed by, the judgment of May 17th. It has, in fact, never changed, and its effect, about which the judgment is so explicit as to leave no room for doubt, is that, precisely by reason of its universal character and for the very purpose of respecting all conflicting rights, the company must pay the debenture-holders on the basis of the Germinal franc of the year XI, equivalent to one-twentieth part of the louis d'or, "an ideal franc," says the Court, "which, although having no material existence, fulfils a useful function as a currency for international accounts, and has a fixed and unalterable value." Thus is your company's monetary regime definitely linked with gold.

This exceptional position, of which without doubt there are very few comparable examples, is due to the very nature of the company, to which repeated reference is made in the judgment of May 17th, and which places it on a footing apart from other companies. Here is official recognition, by the highest judicial authority in Egypt, of the position occupied by the company in international economic affairs, and of which its own history is indeed a justification.

EXTRACTS FROM THE DIRECTORS' REPORT

For the first time in 12 years we are in a position today to put before you results which are accurate and final, owing to the fact that the Mixed Court of Appeal of Alexandria, in its session of May 17, 1947, has fixed, in the ultimate resort, the precise nature of the currency for payment of our debentures.

We have been very pleased to see that the highest Egyptian legal authority, by overruling the Cairo Tribunal's judgment of May 20, 1946, has adopted, as had also, previously, the attorney-general on behalf of the public prosecutor, the argument put forward by the company that: for application of the decree of 1940 establishing that the currency for the company's debentures is the gold franc, the conversion of this gold franc into Egyptian money must be effected through

the intermediary of the U.S. dollar, an independent currency officially pegged to gold, and on the basis of the dollar-Egyptian-pound rate of exchange at each due date.

The general state of good repair of the canal has enabled dredging to be curtailed during the year 1946. Total dredgings were under 2,000,000 cubic metres and only represent two-thirds of the average yearly excavations for the last few years before the war. The present state of the canal-bed, which is in every way as satisfactory as before the war, provides ships having the deepest authorized draft of 34 ft. (10m.36) with one clear metre of water under the keel.

Of the three floating bridges built during the war only one now remains, at kilometre 74. On the other hand, the railway bridge at El Ferdan has still not been dismantled in spite of our repeated representations on the subject, in particular after it had been struck by a transiting vessel; this accident, which took place on November 14, 1946, was fortunately not serious.

A short while ago the general management of the Egyptian Railways notified us of the Egyptian Government's great desire to retain a rail link with Palestine if the company should think it feasible. They are examining the possibility of erecting a new bridge, nearer to Port Said. We are offering all necessary assistance in this investigation and we are pressing the Egyptian Railways for the construction of the new bridge with the least possible delay so as to permit the removal of the El Ferdan bridge, as promised by the British authorities, who are responsible for it.

There were 5,057 transits through the canal in 1946, representing a total net tonnage of 32,732,000 tons. The net balance of receipts for 1946 is 3,366,488,413 francs. The profits for the years 1943, 1944, and 1945 totalling 3,127,807,536 francs and which were carried forward last year pending the outcome of the lawsuit may now be incorporated into the 1946 accounts, bringing the total figure to 6,494,295,950 francs. We were able, after the decree of May 17th, to start payment as from June 15th of the entire amounts in reserve which corresponded to the difference between the value in Egyptian francs and the value in gold francs of the redeemed debentures and of the coupons due since 1935. As for the amounts due to shareholders in respect of statutory interest and redeemed shares, these will be paid on July 1st next, at the same time as statutory interest for the first six months of 1947.

PROPOSED DIVIDEND

Having thus discharged this debt, we shall be able, subject to your passing the resolutions before you, to declare a dividend payable on July 1st next, this being the first time since 1940. At a figure of 3,900 francs—approximately £8—the dividend would be higher than the average for the 10 years preceding the war, when it approximated £5. If one takes into account the increase of prices in sterling, such remuneration is in no way excessive; it becomes extremely moderate when one considers that for seven years there has been no distribution at all and that the present appropriation is more than half made up from profits which, had it not been for the debenture lawsuit, would have been distributed in respect of past years.

The available profits of Frs. 6,494,295,950.34, less appropriations which amount to Frs. 2,050,000,000, will leave an available amount of Frs. 4,444,295,950.34. The suggested distribution will absorb Frs. 4,394,366,197.18, leaving Frs. 49,929,753.16 to be carried forward.

A copy of the full report will be sent on application to the company, 1 Rue d'Astorg, Paris (8), or 6, Bishopsgate, London, E.C.2.

RICHARD THOMAS AND BALDWIN, LIMITED

SATISFACTORY RESULTS

The ninety-eighth ordinary general meeting of Richard Thomas and Baldwins, Limited, will be held at Grosvenor House, Park Lane, London W., on the 30th instant.

The following is an extract from the statement by the chairman and joint managing director, Mr. E. H. Lever, circulated with the report and accounts:—

The year has been a very difficult one in many respects. The shadow of nationalisation, the shortage of coal and other raw materials, and the abnormally severe weather of last winter have all taken their toll. In these circumstances, I am sure that you will agree that the results shown by the accounts are very satisfactory. Before providing for tax, there was an increase in profit of over £713,000. Unfortunately, this increase has been almost entirely absorbed by the increase in the provision for taxation, so that the increase in the net profit is a very modest one. In March last your board declared a dividend of 3½ per cent. (in addition to the fixed dividend at the rate of 6½ per cent.) on the preference shares and an interim dividend of 5 per cent. on the ordinary shares, both payable on April 19, 1947. Subject to satisfactory trading results, it is our intention to pay interim dividends in future in December of each year.

On January 1st of this year all our colliery interests were vested in the National Coal Board. In spite of every obstacle, we have pressed ahead, together with allied firms in the industry, with our scheme for the erection of new trip mills in Wales, and the Steel Company of Wales was registered on May 1, 1947, to carry this scheme into effect. The scheme as a whole has been endorsed by the Iron and Steel Board, and has already received Government approval.

In addition to this major development, we envisage the expenditure of substantial capital sums over the next few years for expansion and for further modernisation at Ebbw Vale, Redbourn, Panteg and elsewhere. We expect to be able to finance all these developments, including our contribution to the Steel Company of Wales from present or anticipated internal resources. We do not expect therefore that it will be necessary to raise for these purposes any new share or loan capital for Richard Thomas and Baldwins.

FUTURE OF THE INDUSTRY

We are not aware of the Government's proposals concerning the future of the iron and steel industry, nor do we know when they are likely to be carried into effect. Uncertainty in this respect is naturally a considerable handicap, but while responsibility remains in present hands the clear duty of the industry is to press ahead with its plans and not to do anything to retard national recovery. In the execution of these plans there will, from time to time, be decisions to be made which involve considerations transcending the normal functions and responsibilities of limited liability companies.

In any matter which comes within the category of problems involving overall national policy, it is proper, and the iron and steel industry has always accepted, that the community, through the Government of the day, should not only have a voice, but be the final arbiter, provided the decisions are taken after full consultation not only with the industry, but with all the parties concerned. We, however, still hold firmly the view that this objective can be achieved without resort to the extreme methods of State ownership and management.

WIGGINS TEAPE AND COMPANY (1919), LIMITED

INCREASED OUTPUT OF PAPER

Mr L. W. FARROW'S STATEMENT

The twenty-eighth ordinary general meeting of this company was held, on the 11th instant, in London, Mr L. W. Farrow, C.B.E., the chairman, presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts for the year 1946:—

The output of paper from the mills of the group for the year 1946 showed a substantial increase over that for the year 1945. The Board of Trade, through their paper control, continue to regulate the quantities and types of paper permitted to be made, the uses to which such paper can be put and the maximum prices which can be charged in the United Kingdom for such paper. Within the limits imposed there is much that can be done and the directors and employees of your company are constantly contriving to use to the best possible advantage the resources available to the company.

I informed you last year that the factories of our subsidiary company, Pirie Appleton and Company, Limited, had been largely engaged during the war period on the manufacture of munitions. During the year 1946 this type of work was negligible and the normal production of envelopes and manufactured stationery made good progress towards its pre-war proportions. The export of the products of Pirie Appleton and Company, Limited, to South Africa has in the past been handled by our subsidiary company, Alex Pirie and Sons (Africa), Limited, who have also operated a small stationery factory in Johannesburg. We have decided to equip two new factories for the manufacture of these products in the Union and to form a local company there to carry on the business.

TRAINING COURSES

We have instituted training courses (a) for young people entering our employment, (b) for ex-service men returning to our employment and (c) for employees, who are either foremen or likely to be appointed to that position. We also have additional courses for others in our employment both at home and abroad. These courses are much appreciated by those attending them and are proving a great benefit both to the employees and the company.

The report of the directors makes reference to the additional capital which has been raised. In my last year's statement I informed you of the purposes for which this capital was required. There have been delays in obtaining the necessary licences to proceed with the work, but I am glad to say progress is now being made on all the schemes upon which we have embarked with the exception of the new machine at our Stoneywood Paper Mills, the installation of which has been temporarily postponed.

We have been able to execute certain repairs at our mills which had of necessity been postponed during the war period, with the result that the charge against profits for repairs executed during the year 1946 amounted to £417,486, compared with £208,848 for the year 1945. We have not charged any of this deferred repairs expenditure to the reserves previously created for that purpose as we prefer to keep these reserves intact until we can estimate finally the ultimate cost of expenditure necessary.

IMPROVED PROFITS

The trading profits of the group for the year 1946 show an increase of £159,648. These improved profits are due to the larger production to which I have referred and to the increase in our merchandising business overseas. The deductions for charges including taxation and profits retained in subsidiary companies are higher by £111,069,

leaving the net profit of Wiggins Teape and Company (1919), Limited, for the year 1946 of £382,119, showing an increase of £48,579 over that of the year 1945. With the amount brought forward the available profits at £314,924 show an increase of £56,521. After providing for interest on debentures and dividends on the Preference and Ordinary stocks, your directors have transferred the sum of £150,000 to the general reserve.

It will be seen that your directors are recommending a final dividend of 5½ per cent., free of tax, making, with the interim dividend, a dividend of 7½ per cent., free of tax, on the Ordinary stock for the year 1946.

THE DIVIDEND

It has been pointed out by my predecessors on several occasions that the dividend on the Ordinary capital of this company is a very moderate return on the aggregate of the Ordinary capital and the reserves which have been ploughed back into the business. The reserves thus created together with premiums on shares now amount to the substantial sum of £2,648,216. It should be noted that the gross Ordinary dividend amounts only to about 5½ per cent. on the aggregate of these reserves and the Ordinary capital.

This must be considered a moderate return when the risks of business such as the starting of the photographic base paper manufacture and the production of grease-proof paper, two industries which were new to this country, are taken into account. Unless there is a prospect of some reward being gained from embarking on new enterprises, how can a board of directors be justified in taking these risks? In both the cases to which I have referred risks were taken, considerable losses were incurred in bringing the ventures to successful issues and who is it that should condemn a moderate profit being earned by those who have risked their capital to bring to this country the manufacture of important products hitherto entirely imported from foreign countries?

FINANCIAL POSITION

The summary of balance-sheets presents the financial position of our group of companies regarded as a single undertaking. The total of the surplus and specific reserves shows an increase of £229,806. The net liquid position of the group on December 28, 1946, shows a further improvement of £224,721, compared with that at the end of 1945. It is estimated that with the £1,500,000 raised by the new issue of shares, there are sufficient funds to pay for the cost of our projected capital expenditure and to provide the additional working capital required for the business of your group. The stocks of finished products and the trade debtors on the one hand and the trade creditors on the other show considerable expansion. This is due to the increased turnover of the group, especially on the merchandising side of our business.

With regard to the prospects for the current year, the output of our mills has been affected by the coal position, though to a smaller extent than we at first expected. Before the coal crisis descended on us, we had already partially converted our largest mill to the use of oil fuel and this conversion has now been completed. We have installed diesel plants to ease the coal consumption at certain mills and are doing everything practicable to use the fuel available to the best advantage. The results for the first four months are good and there is every hope of our meeting next year with a satisfactory balance-sheet.

The report and accounts were unanimously adopted.

ASSOCIATED BRITISH PICTURE CORPORATION, LIMITED

DISTRIBUTION OF 30 PER CENT.

The twentieth ordinary general meeting of this company was held on the 8th instant in London. Sir Philip Watter, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to March 31, 1947:—

The trading profits of the group at £2,542,274 are higher than last year at some £308,000. The trading profits before E.P.T. show a substantial decline, but, since the group earned more than its standard profit, it has benefited by the application of the reduced rate of 60 per cent. for the year to 31st December, 1946, and the termination of such tax at that date.

The net profits are approximately £306,000 higher at £956,174. The directors have placed £450,000 to general reserve, which now stands at £2,500,000. They increased the interim dividend on the ordinary stock from 7½ to 10 per cent.; an increased final dividend is recommended of 20 per cent., making a total of 30 per cent., less tax, compared with 25 per cent., less tax, last year.

The gross theatre receipts at the 418 theatres operated by the group for the first ten months of the year under review showed an increase, but, owing to the restriction of showing time imposed during the fuel crisis and the shortage of fuel in many of the theatres, the total figures for the year were slightly lower at £19,955,004 than those for the year to March 31, 1946.

FILM PRODUCTION

Despite the restricted studio space available it has been possible during the year to produce three important films: "Piccadilly Incident"—the winner of the "National Film Award"—"While the Sun Shines" and "Temptation Harbour." The public reaction to these and other British films has been encouraging and it is the policy of the board to continue to improve the number and quality of our productions so that the Corporation may play its part in achieving a better trade balance between this country and the U.S.A. The severe weather coupled with shortage of labour and materials has delayed the constructional work on the Elstree Studios. Plans are being made for the production of a series of major pictures, which will receive world distribution through Warner Bros. Pictures Inc., owners of a considerable chain of theatres in the U.S.A.

During the year the Corporation acquired the share capital of Anglo-American Film Corporation, Ltd., and secured the distribution rights of all films produced at British National Studios, Elstree. The business of the Anglo-American corporation has been merged with Pathe Pictures, Ltd. Owing to the increasing demand for short films and our endeavour to improve still further the quality of "Pathe News," it has been decided to modernise and re-equip the laboratories.

The peak in cinema attendances has now passed and we must anticipate a somewhat lower level of receipts. One of the factors is the falling off in matinee attendances resulting from demobilisation and the return of industry to more normal working hours. The coal position continues to be a source of anxiety and much will depend on our being permitted to build up stocks during the summer months. All items of overhead expenses are appreciably increasing. The weekly wages bill in the theatres has increased by more than 25 per cent.

As an offset the repeal of E.P.T. will ease the burden of taxation and it is reasonable to assume that the net results of the current year's trading after taxation, while not reaching the level of the figures before you, will prove satisfactory.

The report was adopted

CAWNPORE ELECTRIC SUPPLY CORPORATION, LIMITED

PURCHASE TERMS—GOVERNMENT'S ATTITUDE

MR K. A. SCOTT-MONCRIEFF'S REVIEW

The annual general meeting of The Cawnpore Electric Supply Corporation, Limited, was held on 8th instant in London. Mr K. A. Scott-Moncrieff, M.I.E.E., the chairman, in the course of his speech, said: Receipts from the sale of electricity are down by £25,006. The supply of electricity in bulk was less than in 1945, so also was the supply for street lighting. There was an increase in supplies for other purposes but the total units sold was about 3½ per cent. less than in 1945. I am sorry indeed that this setback has arisen in what will be our last full year of operation.

During the current year we have suffered not only from strikes affecting our consumers, but also from a strike by our own employees, and it was only with great difficulty that a few of our senior staff were able to maintain some of the most essential supplies.

Stockholders' interest in the corporation has now largely passed from the trading results to the payment which we are to receive on purchase of our property by the Government of the United Provinces. The terms of purchase are that we be paid the fair market value of our lands, buildings, works, materials and plant at the time of purchase. The Government, under the terms of the Electricity Acts, have notified the Corporation that it will acquire its undertaking on September 15th of this year.

QUESTION OF VALUATION

In March, 1945, Government wrote to us to ask whether we would accept a valuation made by an eminent firm whom they named, subject to the condition that such valuation should be final and binding on both parties. An agreement to give effect to this arrangement was settled between the three parties. I regret to say that Government changed their view on the matter, and did not sign the agreement. On February 2nd this year the terms of the two agreements were settled with the Minister responsible for electricity, Mr Mahomed Ibrahim, and his advisers. One of these was a tripartite agreement between Government, the valuers, and the Corporation, dealing with the valuation and the other between Government and the Corporation, providing for the valuation being final and binding. Again Government have decided not to enter the second agreement. They now decline to agree to the inclusion in the agreement of any reference to the figure which the valuers are to name as the value of the undertaking and imply that if they are not satisfied with that figure, the matter shall be referred to Arbitration.

RECENT STRIKE ADJUDICATOR'S AWARD

I have mentioned earlier in my remarks that our employees recently went on strike. They put forward certain demands to which we could not agree. Government appointed an adjudicator to deal with the demands, and in doing so declared that if the strike took place, it would be illegal. Within the last few days we have received a copy of the adjudicator's award which has been confirmed by Government. The effect of this award if enforced would be that the employees are to receive 50 per cent. of the value of all the Corporation's Reserve Funds, after meeting liabilities, which are not clearly defined. The legality of such an award is open to question and your board will take all possible steps to have it revoked.

The report was adopted.

ARGENTINE ESTATES OF BOVRIL, LIMITED

LORD LUKE'S REVIEW

The thirty-ninth annual general meeting of this company was held on the 15th instant, in London.

In his address, Lord Luke, the chairman, said there would be general disappointment at the year's results, the net profit on trading being down from £70,781 to £15,047. The reasons were as given in the directors' report, and it would be observed that the circumstances were quite beyond the company's control.

Owing to the poor results in the year under review, no provision for taxation had to be made, and the net profit was £2,521, compared with £24,833 last year. This profit was insufficient to pay the preference dividend for the year without drawing on the amount brought forward from last year's profit and loss account, which stood at £75,711. The carry forward to next year's accounts was therefore reduced to £61,732. The directors regretted that no dividend could be recommended for this year on the preferred ordinary shares, which had received 3 per cent. in each of the last four years.

The chairman said that he had paid another visit to Argentina during 1947, and that Mr Powell had visited Argentina for the first time. It had been possible, by personal contact, to resolve on the spot many problems which would otherwise have necessitated long and possibly ineffective correspondence.

Since the close of the year under review, Lord Luke said that the company had been experiencing difficulty in moving their products, pending final arrangements with the Argentine Government Institution, which was now the sole exporter of most Argentine agricultural products, including meat (I.A.P.I.); but there were signs that shipments would be made fairly soon.

HENDERSON'S TRANSVAAL ESTATES, LIMITED

RECORD DIVIDEND

The thirty-fifth ordinary general meeting of Henderson's Transvaal Estates, Ltd., was held on 9th instant in London, Sir Joseph Ball, K.B.E., (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the report:—

The report and statement of accounts discloses another satisfactory year and your directors have felt justified in recommending, for the second year in succession, an increase in the dividend, on this occasion to 15 per cent., as against 12½ per cent. in respect of the preceding year. This dividend is a record for the company, which during the last ten years has paid dividends amounting to a total of 115 per cent.

The increase in revenue from dividends and interest is due mainly to larger distributions received during the year on our holdings in White's South African Portland Cement Co., Ltd., and in the Delagoa Bay Development Corporation, Ltd. One of the company's main assets is its large holdings in the Twefontein United Collieries, Ltd., and during the course of my recent visit to South Africa I had an opportunity of inspecting both the Twefontein and Waterpan Collieries, Ltd., installed at the Waterpan Shaft a storage bin of 2,000 tons capacity, and I am happy to say that this is proving invaluable. Good progress had been made with the construction of a new modern coal-handling plant at Klipplaat, which includes a storage pile and washery capable of delivering a saleable output of 120,000 tons per month of high-quality coal. The demand for coal in South Africa, both for domestic use and for export, is still on the increase.

MOSS' EMPIRES, LIMITED

SATISFACTORY TRADING RESULTS

The forty-eighth ordinary general meeting of Moss' Empires, Ltd., was held at the company's London offices on the 16th instant.

The following is the review by the chairman, Mr Prince Littler, of the past year's operations:—

Profits for 1946 just fall short of the 1919 figure which held the record up to 1945, but six theatres were silent during 1946 owing to war damage, etc. Net profits of £107,468 compare favourably with the figure for 1945 of £54,476. Heavy provisions are again necessary for imperial taxation. Income tax and excess profits are fully estimated and appropriate provision made on all profits earned to December 31, 1946. The balance-sheet shows considerable changes owing to sales of properties, the repayment of 4½ per cent. debenture stock and issue of the new 3½ per cent. debenture stock to provide in part and among other things for purchase of the eight music hall properties from General Theatre Corporation, Ltd. Full information has already been given in the directors' report now in your hands.

I am convinced that the company will benefit by what has been done notwithstanding the difficulties which lie ahead. The fuel crisis and the exceptionally severe winter undoubtedly adversely affected theatre business. However, I am not dissatisfied with trading results for the current year.

After a long period of valued service Mr R. H. Gillespie has resigned on medical grounds. The board have expressed their confidence by appointing me chairman.

The directors recommend a final dividend of 7½ per cent., making 12½ per cent. for the year less income tax.

The report was adopted.

OHLSSON'S CAPE BREWERIES, LIMITED

INCREASED TURNOVER

The ordinary general meeting of Ohlsson's Cape Breweries, Limited, was held on the 17th instant in London, Mr Geoffrey Dent, the chairman, presiding.

The chairman said that the profit from trading and rentals of £745,429 showed an actual increase over the 1946 figures of £30,529, but in view of the very heavy cost of their plant renewal programme, the directors had thought it prudent to increase the depreciation figure from £20,000 to £40,000. The increase shown was therefore reduced to £10,529. Turnover had increased by £185,000.

During the year some degree of rationing had been necessary and demand still exceeded supply. That demand might have been influenced to some extent by the acute shortage of wines. All their breweries had been working to capacity. Plans had been approved for extensions and re-equipment at all of them, but owing to the uncertainty of delivery dates for new plant it might be some time before they could meet all demands for their products.

The position with regard to brewing materials had been a little easier, but owing to the partial failure of the South African barley crop their allocation was insufficient to keep their maltings fully supplied, and they had to malt some imported barley. The hop position had been easier, thanks to the increased acreage under hops on the farms the company owned jointly with the South African Breweries.

The directors recommended a final dividend of 1½ per cent., making 22½ per cent. for the year.

The report was adopted.

GOVERNMENT RETURNS

For the week ended July 12, 1947, total ordinary revenue was £45,970,938, against ordinary expenditure of £34,415,540 and issues to sinking funds £270,000. Thus, including sinking fund allocations of £3,211,384, the surplus accrued since April 1st is £230,978,528, against a deficit of £281,999,379 for the corresponding period a year ago.

UNIVERSITY student having done advanced statistics and 3 years' honours mathematics wishes to find a temporary post for 2 or 3 months in a statistical office to gain experience.—Box 507.

unified and productive whole. The cog wheels are turning, but they do not mesh, and the reason for this maladjustment is hardly economic at all. It is political and moral, and its roots lie in distrust. The truth is that France has not yet achieved the measure of social cohesion necessary for its economic system to work smoothly. The dream of the Resistance has faded and French society is back in the *impasse* which destroyed the Popular Front in 1936. The *bourgeoisie* are not reconciled to the passing of a large measure of political and even economic power to the organised working class, and their response today, as in 1936, is a sort of concealed strike. Then it took the form of a flight from the franc to foreign currency. Today, exchange control restricts this possibility. The answer is therefore hoarding, tax evasion, failure to invest and luxurious spending. The Government, lacking sufficient revenue from taxation and unable to induce saving, cannot balance the budget and has resorted to inflation. But the workers, pinched by rising prices and conscious of their greater political influence, resort to the weapon of the open strike for higher wages, and thus the inflationary spiral spins the faster. The peasant, unable to purchase consumer goods and losing confidence in the currency, eats more himself and feeds wheat to his animals. Now, for the first time, he has himself threatened to strike, in order to receive a better price for his deliveries of grain. Thus he adds his spin to the spiral of increasing food costs and wage demands. Strictly speaking, the economic answer to all these problems is known—to increase taxation, to ensure investment, to cut state expenditure, to balance the budget and to restore confidence in the franc. But the political answer is one that has eluded Frenchmen for the last thirty years.

What are M. Ramadier's chances of achieving the minimum social cohesion necessary for his task of stabilisation? The answer concerns not only the prospects of French recovery, but the chances of revival throughout Western Europe for, without France as an active partner, it is hardly possible to talk of a Marshall Plan at all. In some ways, the outlook today is rather more promising than it was a few weeks ago. The parliamentary mechanism of the Fourth Republic is clearly working more efficiently than that of the Third, however much politicians may have retained their old idiosyncrasies. More important, however, is the evidence of a new approach in industry. For the first time since 1936, the employers' organisations and the CGT and the Christian unions have conferred together on problems of wage and industrial policy, and in quick, good-humoured session, reached agreement upon an increase in minimum wages, the provision of more consumer goods (at prices ensuring a "reasonable return") and joint consultation within industry. The substance of the agreements is, of course, inflationary in effect. They will be backed by the Government in a general 10 per cent increase in the minimum wage and a general removal of the old 5 per cent cut in prices. In other words, the *expérience Blum* is to be formally buried. But the willingness to hold talks and the publicity given to them in the trade union press suggest a more hopeful atmosphere in industry. There is some evidence that the workers are tiring of "political" strikes. Recently, many Communist mass rallies have been poorly attended. Such a mood will not lead to a Communist change of heart, but it could herald a change in tactics. The metalworkers' union last week issued a special call to its members for greater effort and higher production. It is possible that, for a time, the strike wave may abate.

Unhappily, these signs of a greater reasonableness within the French economy are almost nullified by the increasing division on foreign policy. At this point, the analogy with 1936 breaks down. So long as Germany loomed on the French horizon, the vast majority of Frenchmen were at least united in the search for security. The removal of the Germans as an actual menace leaves the nation suspended between the Easternisers

and the Westernisers, and the split over the Marshall offer has made the division more acute and bitter. The Communist Party is obviously determined to work with all its strength to prevent any integration of Western Europe and has found in the fact that the American Government wishes to include Germany in the Plan a formidable engine of attack. Thus, while the Plan might, from the economic standpoint, provide precisely that element of confidence which is lacking, it runs the risk of increasing France's divisions in the political sphere.

It is here that British and American diplomacy can have an important, even a decisive, effect upon the restoration of French stability. Both countries have vital interest in making every contribution within their power, since the alternatives to M. Ramadier's coalition—a Communist Government on the left or a Gaullist combination on the right—would write "finis" to broad plans of democratic revival in Western Europe or on the Continent generally. In theory, the economic assistance possible under a Marshall Plan might turn the scale between stability and further disintegration next winter. American assistance could pursue a double policy in attacking the basic problem—lack of confidence in the franc. The provision of dollars or gold could underpin the currency and imports of consumer goods, could begin to create a corrective process by tempting food and goods market, restoring the purchasing power of wages and increasing the incentive to produce more. Against such a background, a devaluation of the franc could mean not the first step in a fatal *dégringolade*, but the firm establishment of the currency at a more rational level. The chief American contribution to its ally's stability is thus to ensure that the Marshall conception is accepted by Congress and supported as a factual plan at the earliest possible moment.

At the same time, the economic clauses should not be fitted into a political framework which nullifies them. British and American diplomacy has been remarkably clumsy in recent weeks. By preparing on an exclusively Anglo-American basis a new project for a revived German industry, just at a time when the discussions on the Marshall offer were beginning, the two allies have delivered a diplomatic rebuff to M. Ramadier's Government on which the Communists have instantly and joyously seized. By allowing the belief to grow that this revived industrial production in the Ruhr would have priority in the Marshall approach, they have drawn from M. Ramadier the bitter remark that "the victims should at least be considered before the executioners." The wise decision to postpone the announcement of the proposed level of industry plan creates the opportunity to repair the diplomatic blunder, but clearly, M. Ramadier cannot survive Communist criticism of his co-operation with Britain and America unless he can provide solid guarantees that France's "security" is not to be sacrificed. The American offer of a 40-year military pact is a first step and indeed, in the light of American history, a revolutionary step. But a military guarantee is only an earnest of final victory, whereas France is anxious not to become a battlefield at all. The crux of the problem, therefore, lies in the Ruhr itself—in ensuring that its industrial development is not achieved at the cost of France's recovery and in associating the French, as soon as possible, with the control of the area.

If the British and the Americans can make specific proposals on these points, they can do more than simply weaken Communist criticism. They can give the Ramadier Government an important political victory and thus add to its own internal stability. Since confidence is the commodity in shortest supply in France today, any accession of strength behind the Coalition must have a beneficent effect throughout the body politic. So far, M. Ramadier has done little more than keep his balance. To exercise genuine leadership, he needs firmer ground beneath his feet. Both economically and diplomatically, Britain and America can contribute to that underpinning, and of all their tasks in Europe, none is more urgent or promises a better reward.

What is Wrong with the Press?

THE Royal Commission on the Press announced last week-end an interim dividend. It took the form of eighteen-pence worth of evidence submitted by the National Union of Journalists and published by the Stationery Office. It will raise no new hopes of an impressive final statement by the Royal Commission; indeed, it may damp down those that were raised by the heated debate in the House of Commons last October. For there is nothing in this expensive document of twenty-three pages which could not have been obtained and published without the protection and authority of a Royal Commission. And when it is recalled that the agitation for inquiry into the press was really begun by the NUJ and was presented by MPs as a spontaneous explosion from an indignant public and frustrated profession, one is puzzled that men so skilled in presentation have not done a better job. There is, of course, oral evidence still to come, and the members of the Commission will doubtless elicit by cross-examination much that has not yet been said. The questionnaires already circulated by them to proprietors, editors, managers and practising journalists show that they intend to explore every nook and cranny of Fleet Street and the Gray's Inn Road for the true "story" of the press, its control, conduct and organisation.

They might well be left to pursue the task in peace were it not for two things; firstly, that the newspapers have been singled out to be victims of the first of the new import cuts which are to herald Mr Morrison's twelfth hour. The speeches made by Ministers in last week's debate served rather to confirm than to remove the impression that the cut was intended to express displeasure at the use made by the daily newspapers of their occasional extra pages. The preliminary bombardment of the press lords and their forces began eighteen months ago; forces were joined last year in the House of Commons and in the press itself; isolated actions were fought—and apologised for—by the Attorney-General; and now the general engagement has begun in the purlieus of the Royal Commission. The press is certainly, in some quarters, being deemed guilty until it shall have proved itself innocent.

A second good reason for not leaving everything to the Royal Commission is that a new generation is coming into journalism, after the war years. It is preparing to "learn the ropes" from men who are in many cases practising and teaching theories and methods which are a quarter of a century old. Certain editorial practices which have brought British newspapers into disrepute originated in the minds of followers of Newnes and Northcliffe. But those pioneers, if they were alive now, would certainly not offer the techniques of *Tit Bits* and *Answers* and the halfpenny *Daily Mail* to a public which regards the Brains Trust and the Transatlantic Quiz as first-class entertainment. There are fewer initiators among the proprietors of today, and the popular press as a whole has not yet found the way to combine intelligent presentation of news with human interest and entertainment. There is no reason why a popular paper should not be a ment. There is plenty of evidence that it does. Many of the criticisms of the popular press that are made by superior intellectuals are irrelevant because they ignore this clear popular demand. But there is an element of sacredness about news, and though it may be printed on the same pages as entertainment, it should not be treated as entertainment. Too often the handling of news is entrusted to men who are in fact professional entertainers or showmen; and at the time that the proprietors are dining of an evening the balance and emphasis of the day's news treatment is being decided in their offices by

specialists in make-up or presentation. Many of these specialists have little knowledge of, or interest in, the political or social significance of the stories they are handling; and the distortions of fact that are of daily occurrence are much more often the result of the ignorance of the journalist than of any instruction from the highest quarter to "splash" this or "run" the other political story.

*

These objectionable journalistic practices, which produce distortion of news and the dramatisation of the insignificant, which cheerfully sacrifice the content of a news item to the form of its presentation, are handed down from generation to generation, from sub-editor to sub-editor. It is by quick and thorough grasp of them that the new recruit makes his way, in provincial as well as in London journalism. The better educated and the more critical the recruit, the more difficult he will find it to "learn the ropes"—the more he will have to stifle in himself the sentiments and principles that make a journalist a conscientious servant of the public. Yet some of these practices could be quite quickly suppressed if a few vigorous personalities in Fleet Street thought it worth while trying to do so. Reform need not wait upon proprietorial edict; indeed, only those one or two newspaper proprietors who have a real flair for the technique of the profession could understand what is required. There is no reason why steps to improve the accuracy of reporting, to check sensationalism and to encourage a greater sense of responsibility in newspaper men should not be taken by the members of the National Union of Journalists, either within the NUJ or within their respective offices. If they should try, and fail, then they could tell the Royal Commission—in the course of the years that it will doubtless sit—that only a properly constituted professional association or statutory body can improve the press. And that is in fact the first and most substantial of the constructive suggestions printed at the end of the NUJ evidence.

What is surprising—indeed shocking—in the NUJ document is that the evidence given of inaccuracy, of "the splash," of "irresponsibility producing contradiction" and of sensationalism is not in any way related to the general charge that the condition of the press is somehow due to monopolistic tendencies. Yet the ordinary reader would certainly gain the impression that these abuses were due to the policy of the proprietors. If that were true, of course, it would be necessary to postpone all efforts at reform until the Royal Commission had thought out some way of legislating against the proprietors—an idea which has been most vigorously disowned by the NUJ itself.

It is evident that several different grievances against the press have become mixed up. Firstly there is the grievance of the Left, of the supporters of the Government, that they often get unfair treatment from the preponderantly Right-wing daily press. The complaint has some substance, but the propaganda of the Right-wing dailies against the government of Mr Attlee seldom approaches in virulence and cynicism the propaganda of the Left-wing press against the governments of Mr Baldwin and Mr Chamberlain. (Incidentally it is a striking fact that of 26 examples of distortion, inaccuracy and sensationalism given in the NUJ evidence, 23 are taken from Right-wing newspapers and only 3 from newspapers of the Left.) The *Daily Mirror* escapes all notice and so does the *Daily Worker*. Secondly, there is the grievance against the concentration of power in the hands of four big groups, Associated Newspapers,

Kemsley Newspapers, Westminster Press, and Provincial Newspapers. (The NUJ evidence includes London Express Newspapers, Ltd., under the heading of "Smaller Groupings," together with Odhams Press and its *Daily Herald*.) This complaint gets much of its impetus from the first; but there may be genuine public concern at the tendency of independent newspapers to disappear. Thirdly, there is the grievance against the financial ambitions of the newspaper proprietors, who are accused of putting profits before public duty, of serving the interests of advertisers, and of sacrificing all standards for the sake of circulation. This is a charge which is also brought against the makers of films, the managers of circuses, the makers of patent medicines and other persons whose activities the public finds indispensable. It is a charge which looks less serious when it is realised that some newspapers—especially on Sundays—deliberately set out to entertain, rather than to inform.

And lastly there is the grievance of serious-minded people of all political colours against the flippancy and irresponsibility with which political and economic issues—both international and domestic—are often treated. They complain that insufficient facts are given for the reader to form an independent judgment or that commentators, ill-qualified even to present the facts, are allowed to deform them. The accusations certainly find their mark in a number of offices. Yet salaries have risen; and it is easier than it used to be for the university man to get into newspaper work.

All these grievances, strung loosely together, make quite a formidable indictment; but it is not one with which a Royal Commission can deal. Even a board of press governors like that of the BBC, or a Council like that of the medical profession—two of the NUJ's alternative suggestions—could not find the remedies alone; for there are bad doctors and there are some rather doubtful news experts in the BBC. Only journalists themselves can find the cure, by picking their staffs carefully, planning their needs well ahead, giving young men and women the experience and training they will require, and then guaranteeing them the security of tenure without which no professional man can maintain his independence of outlook.

It may well be that the structure of the newspaper industry and its commercial competition make such reforms difficult. But the present agitation, inspired by the NUJ and encouraged by the Labour Government, is concentrating far too much on matters of ownership and is ignoring far too completely some

of the other charges that can be brought against the press. To the question "what is chiefly wrong with the press?" one of the answers—and perhaps the most comprehensive answer—is "the low general standard of education and responsibility among the journalists." It is all very well for the NUJ to say:

We seek, above all else, as a body of professional men and women, that the industry in which we serve the community should be directed and managed primarily in the public interest but they might first apply the same test to themselves. What exactly do they mean by that proud contrast between their "profession" and the proprietors' "industry"? Are they sure they deserve it?

No one would maintain that a raising of standards—one is tempted to say the creation of professional standards—among the journalists themselves is a complete prescription for the ills of the press. But it is certainly an important part of a full prescription. If this country is to have a good press, it requires from its journalists a much more sober approach to the responsibilities of their calling than the great mass of them now exhibit. It requires a much higher standard of education, not in the sense of examinations passed and diplomas secured, but of real knowledge and understanding of the matters of which they write. It requires, not indeed a dull stodginess of writing, but a determination that the truth, and a fair balance of the truth, shall never fall a victim to the desire to be amusing. It requires every journalist to approach every piece of writing with a real desire to enlighten his readers' minds and not merely to give a good personal performance on the stage of Fleet Street. No doubt the proprietors, and the mood they have been in these fifty years, are partly responsible for the absence of these qualities. A determined proprietor could undoubtedly raise the professional standards of his staff. But he would have to be very determined, and anybody who knows Fleet Street knows that the most obstinate obstruction and the loudest derision would come from the working journalists themselves.

These things—to repeat—are not all that is required of the press. But it is not right that they should be passed over in silence or that the NUJ should be allowed to take its seat in court among the prosecuting attorneys and not among the defendants in the dock. It is for that reason that, in this article, the professional faults of the journalists have been insisted upon before the argument proceeds, in a second article, to proprietorial sins and to the defects of organisation.

the West Indies, but look how loyal the colonial peoples were when war came. It is a pity that Malta had to lose its constitution in the 'thirties, but the islanders have since worked their passage home and are about to receive an even better constitution than they had before. The Colonial Office did not need the searchlight on West Indian poverty provided by the Royal Commission to establish the policy now known as "development and welfare." It had already been working towards it.

What, in fact, one misses from this report is the overtone of urgency which day-to-day events seem to justify. This week began with the news of the assassinations in Burma and the Dutch action in Indonesia. Should these events not be a warning to the Colonial Office that matters within its province may not be falling into their place in the scheme of things quite so inevitably as it tends to assume? The staid reference to the aspirations of Cyprus, which begins: "The end of the war has been followed by some recrudescence of the campaign among the Greek-speaking element of the population in favour of

'Enosis,'" is in striking contrast to the impression of tension among the islanders given by a correspondent on a later page of *The Economist* this week. Are the present happenings in Cyprus ephemeral and unworthy of mention by the Colonial Office recorded of ten years hence? Or are they of great significance in the evolution of the British colonial empire?

There is at present in this country an African from Nigeria called Azikewe, known in Nigeria as Zik. Most people in this country have probably never heard of him, but in his own country he is a man of influence. He owns a group of newspapers which circulate in Southern Nigeria, and if newsprint were more plentiful he would by now have established a newspaper in the Moslem Northern Provinces. By a calculated confusion of factual reporting and editorial comment, relieved by personal attacks on European officials, Zik preaches a creed called Zikism—a doctrine of Africa for the Africans—which is inspired by a dislike of the white man's presence in Africa in general, and of the presence of the British in Nigeria in particular.

People in this country, reading his scurrilous articles and observing his scant regard for facts, may smile tolerantly and say that Zik should not be taken too seriously. Such extremism, they will say, will defeat its own ends because sooner or later it will be discredited. Zik has at times lost face—as at the time of the general strike in 1944. But today, when he unfurls his own special banner at Onitsha, his home town, the faithful are suitably spellbound, and the existence of British rule gives him a readily available whipping boy to flog whenever the spell wears a bit thin.

Neither the Colonial Office nor the Nigerian Government makes the mistake now of under-estimating Mr Azikewe's influence, as witness the Nigerian Government's official corrections of his extravagances. They know the harm he can do by misrepresenting their policy in Nigeria and abroad. But what is not so certain is whether they take Zikism seriously, for it is not the man himself, but the popular feelings which he personifies, that will have the most lasting influence. Zik is an Ibo, and the Ibos are, at the moment, progressing well ahead of the other diverse elements that make up the population of Nigeria. They are a restless, energetic, politically-conscious people; conscious, too, of their own superiority over the Moslems of the north and the Yorubas of the south. They have the will and the ability to forge ahead, and they know it.

For a people such as the Ibos, British colonial rule, as illustrated in this record of the last eight years, is anathema. Zik is in England at present, financed by his own countrymen, to protest against Nigeria's new constitution. Judged by any rational standard, this new constitution is a good one. It allows for the fact that it has to cover not one colony but three—three colonies, too, with very different cultures—and allows for them all to progress at their own pace towards the goal of self-government. It also gives an unofficial African majority in the Legislative Council. But to the Ibos it means that their activities are restricted to their own province. They claim, without justification, to be Nigerians and to speak for Nigeria, and, unconsciously perhaps, they look, like the Chinese in Malaya, for a constitution which will allow them to swamp the slower, less energetic peoples of the other provinces. They cannot wait for the emirates of the north to catch them up. They want independence in their own lifetime, and they regard the new constitution as a typical British ruse to try to head them off. It is not, perhaps, going too far to see in the Ibos the future Congress Party of Nigeria.

Zikism is not confined to Nigeria, though it is potentially more important there than elsewhere—does not the colony contain over twenty million of the colonial empire's fifty million inhabitants? Zik himself has his counterpart in Mr Bustamante, Prime Minister of Jamaica, who makes the same popular appeal

by the same wild extravagances. The Jamaican House of Representatives recently passed a resolution asking for what would amount to full self-government, subject only to the Governor's reserved powers, although the present constitution is not due for review until the end of 1949. In other colonies there will be found the same impatience with British rule, the same resentment at having to accept political advancement as a favour at the hands of the British, the same aspirations fostered by the sight of independence elsewhere—if Burma, why not Ceylon; if Ceylon, why not us?

★

It is probably true that, judged by their fitness to govern, the dependent peoples of the Empire are—the Mediterranean colonies apart—being led towards independence as fast as is practically possible. It is also true that the element of nationalism—the Mediterranean colonies again excepted—is not very large, especially in Africa. The Emirs of North Nigeria certainly do not want to exchange British rule for the rule of the Ibo. For the peace and prosperity of the colonies the even tenor of British colonial policy, as illustrated in the Colonial Office's record, is amply justified. But the Colonial Office would be wrong to ignore this nationalism merely because it does not conform to its plans for orderly development. There is probably not a country of the Empire that has achieved full self-government according to plan, when, that is, all the criteria had been satisfied—economic stability assured and communal rights protected. Nationalism always pushes the date forward, and the problem before the Colonial Office is how to canalise the nationalism at present stirring in the colonies before it becomes strong enough to make claims for far too premature independence irresistible.

It is not an easy problem to solve; nor is the solution likely to be the same throughout the colonial empire. A partial attempt has, it is true, been made in recent years through the "development and welfare" policy, by encouraging the colonial peoples to help in framing the development and welfare plans, and thus to feel that they are helping themselves towards economic independence. This attempt, however, has not had the success hoped for. The Nigerians do not feel that the ten-year development plan is theirs, partly through the opposition of Zik, but also because the African is not interested in long-term schemes of irrigation any more than in an indefinite promise of future independence. He wants to see water flowing out of a tap. But could not more be done in associating the colonial peoples more directly with the responsibilities of government? The African has an immense, an avid, enthusiasm for education. Would it not be possible to find a Nigerian, or a Gold Coast African, capable of assuming responsibility for their country's education? If intelligent Africans could be given more responsibility than they are at present, some counterweight to Zikism might be provided.

Secondly, there is no doubt that there is much in the British colonial service, especially at the top, that stings the dependent people into opposition. This does not mean that Governors should be chosen from ex-trade union officials. But could not there be less of the state visits, the ceremony, and other outward symbols of the British raj that irritate the sensitive, educated African as much as they impress the illiterate? British colonial rule is the best in the world. But as administered by the top ranks of the colonial service, it merely serves to emphasise British power and sovereignty.

When Mr Creech Jones speaks in the colonial debate next week, he can justly claim that the two years of Labour's administration of the colonies have been impressive. But it is to be hoped that the achievements of office will not prevent him from showing the same awareness of undercurrents, the same appreciation of apparently insignificant events in the colonies, that he showed as a back-bencher.

Nationalism in the Colonies

AS only to be expected from an official record, the account of the colonial empire in the years 1939 to 1947, which was published (Cmd. 7167) last week-end, is pitched on a low note. These years have seen enormous advances in the political and economic development of the colonies: new constitutions, sometimes giving a large amount of responsibility, have been granted right and left; and a determined effort to attack colonial poverty has been launched. The sober, measured tones of the Colonial Office's recorder place all this progress in its proper perspective. There has been no reversal of policy. What some colonies have achieved in the last eight years, and what others are in process of achieving, is the goal towards which all official policy has always been directed. The tempo may have quickened, but that is all.

The historical approach is appropriate for the official record. Its drawback is that the impression given by the narrative tends to be over-complacent. The colonies are all right, the narrator seems to be saying. There was considerable criticism of our policy just before the war when there were serious riots in

NOTES OF THE WEEK

M. Bidault's Veto

Difficulties over Germany have now formed themselves into a new pattern. Within a month of Mr Molotov's disappearance from the counsels of western Europe, M. Bidault—or is it M. Thorez?—has taken on his role of obstruction. Admittedly he plays it with courtesy and good-temper, but he is none the less conscious of the bargaining power he now enjoys. The conference of sixteen governments, which is to present eventually the answer to the Marshall offer, cannot succeed without Anglo-French leadership; and should that leadership be not forthcoming, Mr Marshall's European policy might collapse too. The problem which might produce such disagreements and disasters is the old one of Germany, now appearing in a new form.

It has been quite clear in the last three weeks that the Americans want to see the stimulation of Ruhr coal and steel production playing a major part in any Marshall plan offered to Congress. What is more, they want that part of the plan to start right away, with joint action and policy in the British and American zones. They have promised sufficient food to guarantee a regular distribution of 1,500 calories; they have explored the possibility of bringing private capital into the Ruhr; and they have made it clear in the directive to General Clay published last week that he is henceforth to regard his zone as a contributor to and beneficiary of the economy of western Europe. They have agreed with the British on a higher level for German industry, and may even have gone so far as to see in increased aid to the Ruhr an indirect means of relieving the British dollar shortage. From the economic point of view this was all very sensible; but serious political difficulties arose directly American intentions became generally known.

In the first place, the British want the Americans to bear an increased proportion of the cost of feeding and administering western Germany. On any basis of calculation the present fifty-fifty arrangement is inequitable; in the present British economic situation it is indefensible. Moreover, should the French be invited to join their zone to the other two western zones in the course of next year, they would first of all insist on their inability to share the present dollar expenditure which occupation requires. Knowing that the Americans want to get on with plans for the Ruhr the British for once have been in a strong position to insist that any discussion on Germany, in Washington or elsewhere, should cover British as well as German needs.

In the second place, to make things even more difficult, the French took fright last week at the suggestion that the Ruhr might have priority in any Marshall plan, and that the British and Americans might make decisions with which the French Communists and Russian propaganda could belabour the present French government. Reproachful Notes were sent to London and Washington, and even M. Ramadier was put up to protest publicly against rumoured American intentions. The result has been that the Anglo-American agreement on a new level of industry has not been—and will not be—published; that American advocates of a great Ruhr recovery plan have temporarily taken cover; that the British and Americans are sitting in their corners instead of sparring (as they were ten days ago); and that nothing of any importance—except the establishment of a regular ration—is likely to happen in western Germany for some time.

Stocktaking in Paris

The stocktaking stage of the Paris Economic Conference was started at the beginning of this week. The politicians having helped one another over some awkward obstacles, the technical committees are now working at answers to a questionnaire of twelve paragraphs and an annex. The delegates are asked, first of all, to look backwards: to explain what their countries have suffered from the war, what they have done for their own recovery, what help they have received from others. Then they are asked to look forward four years (the period fixed by the British and Americans for the recovery of exports from their zones of Germany); to estimate their probable deficits and surpluses in food and raw materials, their import requirements, their possible exports of equipment goods, and the probable state of their balances of payments.

This can be regarded, of course, as a straightforward technical task, but it would be wiser to prepare for political difficulties even at this stage. It will be hardly possible, for example, for the British experts to estimate British coal exports in the next four years without having French grievances on this score in mind; or for the Dutch to present their estimates of food surpluses without pointing out that their farmers will not go on producing them if the German market remains closed; or for the French to estimate their steel production without references to their need for Ruhr—as well as British—coal. But these difficulties will not cause real trouble if they are dealt with vigorously through diplomatic channels outside the Committee. A task of great delicacy confronts Mr Marshall and Mr Bevin: the task of persuading the smaller countries—particularly the Benelux and the Scandinavian groups—that they are not being drawn into a political bloc, but must nevertheless be ready to make some sacrifices of national interests for the common benefit.

These "matters of substance," as the Swedes called them last week, have been kept on one side in the Paris discussions, while the echoes of Mr Molotov's defence of "national sovereignty" were allowed to die away. But they cannot be left on one side, especially as the United Nations Economic Commission for Europe in Geneva has been very attentive to the claims and dignity of the smaller Governments. By a vote in which they had British, French and American support against a Russian group, the Czechs and Poles abstaining, the smaller Governments have secured their share of interest in the affairs of Germany. The Secretary of the Commission is to go on trying to establish liaison with the Control Authority in Berlin and to make "organisational arrangements" enabling the coal, inland transport and other committees of the Commission to give effect to their decisions wherever they affect Germany. When the Paris Committee passes, as it must very soon, from stocktaking to rough planning, the Geneva Committee may be a very useful cushion between the Eastern Governments on the one hand and the more timid Western Governments on the other. And it must not be forgotten that the Americans sit in the Geneva Committee but forbid themselves to sit in the Paris one.

But Where is the Rabbit?

Mr Morrison's christening oration on the Economic Planning Board has left its aims and objects shrouded in a mystery which, rumour has it, even the Board's own members still find it hard to penetrate. No one denies that the Government needs more advice and constructive thought; the question is merely whether Mr Morrison's remarks on these subjects have much relevance to what the Board can actually do. In principle, the Board might have any or all of three functions. It might actually take decisions; but this has been rightly ruled out by Mr Morrison as the responsibility of Ministers or their direct subordinates. It might serve to improve the contacts between Government and industry; but for that also, as emerged clearly from the brief discussion in Parliament at the time when its membership was first announced, it is not particularly well suited. It does not in any sense represent the great mass of small or medium firms, which are precisely those whose contacts with the Government are least close. Its representation of even the larger firms and trade unions is absurdly inadequate; three extremely busy nominees of the Federation of British Industries and the Trades Union Congress can scarcely claim to speak for their nominal constituents in any sense that is more than symbolic. Finally, the Board might act as a real general staff, assembling facts, working out plans, and proffering carefully digested advice. But that is quite clearly a job for full-time specialists. There is sense in the idea of Sir Edwin Plowden as economic Chief of Staff, with his own staff of specialists—including specialists in commerce and industry—around him and the assistance of the Economic Section of the Cabinet Secretariat. But does anyone seriously imagine that occasional meetings between a dozen of the busiest men in the kingdom will add much that could not have been secured, to better advantage, by direct and separate contact between members of the full-time staff and the individuals and organisations most concerned? Mr Morrison is adept at multiplying cocked hats; but what, if any, rabbit does he really expect to emerge?

Room for Planners to Breathe

The basic trouble in all this is the eternal and natural preference of overworked Governments and departments for creating another committee in preference to doing something for themselves; for there are in fact at least four directions in which, by changes of policy, departmental reorganisation, or the speeding up of prospective measures, something really effective could be done to give Sir Edwin Plowden's work the backing it requires. The first is a policy decision designed to limit the Government's commitments, stage by stage, to the point where they can be handled without gross overwork on the part of senior Civil Servants—a policy, in fact, of giving Civil Servants time to think. The decision will not be popular in the Government; but that does not make it less essential. Secondly, pressure of work must no longer be treated as an excuse for understaffing the sections of departments which deal with research and development, or for overloading them with current work. In a well-run firm, a managing director who informed his board that pressure of work made adequate attention to research and development impossible would be out on his neck in the street; and it is time that these functions were taken equally seriously by the Government. Thirdly, it would do no harm to bear in mind that the planning problems to be faced today, notably in connection with raising productivity, are largely qualitative; and might it not be possible to secure more skilled manpower for hard thinking about these problems by reducing commitments for purely quantitative work. And, finally, if Mr Morrison really wants organised contact with a representative cross-section of industry, could he not do something to accelerate the advent of the Development Councils proposed in the Industrial Organisation Bill?

No doubt other avenues could be found as well; but it is enough to indicate these. The point, after all, is clear enough. No one can relieve the Government of its responsibility for policy; no one can relieve its full-time advisers of the task of doing the necessary thinking and research; and the way to secure efficiency in both directions is not to pursue philosopher's stones in the arid wastes of advisory committees, but to cut the work down and increase the efficiency of doing it until Ministers and Civil Servants can do their job adequately themselves.

Marshall Plan Under Fire

Russian hostility to the whole conception of American aid to an integrated Western Europe remains implacable and the main lines of the counter-attack are now reasonably clear. To the world at large, the Russians denounce America, Britain and France as violators of the United Nations Charter in that they have taken their "plan" outside the United Nations and have specifically by-passed the Economic Commission for Europe. This was the burden of a strong speech delivered by M. Thorez in Paris on Wednesday and there is a chance that the Russians will raise the issue at the General Assembly in September (if the Americans counter them—as a growing body of American opinion wishes to do—by proposing the abolition of the veto, it is difficult to see how the exodus of the Eastern bloc from the United Nations can be avoided).

The full weight of Russian opposition is, however, felt primarily in Eastern Europe. The Communist press attacks the plan as a shield for the penetration of Europe by American finance-capital

—“the trusts”—and significantly enough, has pounced upon the vexed issue of Germany's place in the plan. All Germany's old enemies are told that America's aim is to subordinate European reconstruction to German industrial revival and an article reputed to be by Mr Randolph Churchill, and to have appeared in the *Daily Mail*, is widely quoted as saying that in the next war the Germans may be found among the defenders, not the enemies, of Western civilisation. From these premises the Russians deduce that any man or group still hankering for Western aid is a saboteur or a spy. The opposition are denounced as paid agents of Western imperialism and the supporters of the various governments are urged to “close their ranks.” What this means in practice is strong criticism of the Socialists and pressure on them to fuse with the Communists in a single working class party. The Communists in Finland accuse the Socialists of “retarding democracy” by co-operating with the Rightwing groups. In Hungary, the Socialists are charged with trying to attract “fascist votes” in the present electoral campaign and of coming under the influence of “foreign socialists.” In Poland, the arrest of 23 members of the pre-war socialist party for espionage and connections with the underground opposition in Poland and the dissident groups abroad has been made the occasion for renewing pressure for fusion. The old chairman of the Socialist Party, Mr Osobka-Morawski, has resigned and the new chairman, Mr Kazimierz Rusinek, while denying that a resolution on fusion will appear on the agenda at this year's Party Conference, admitted that the creation of a single working class front was basically his party's aim.

Eastern Europe Reaction

The reactions of the Eastern European nations to the new situation have varied according to their degree of internal strength and cohesion. There is a strong undercurrent of disappointment in Prague that the invitation to Paris was first accepted and later refused and the Socialist leader, Dr Fierlinger, felt compelled to make a long, reasonable and conciliatory explanation of the reasons which had led to the Government's change of front. In Poland, too, the reaction so far has been restrained. The Poles this year are encouraged by some remarkable results in the economic field. In many branches of industry they are back to pre-war levels of production and in some—electricity, coke and various metals—well above it. These feats were the theme of their celebrations on their National Day (July 22nd) and a significant increase in the stability of the regime could be read into the fact that the Catholic Church gave official support to the festivities.

But not all Eastern Europe enjoys the relative calm and stability of Czechoslovakia and Poland. In Hungary, the political parties are locked in struggle. Elections will be held at the end of August and the question is whether the combination of a new electoral law and Communist pressure will still further undermine the autonomy of the Smallholders and the Socialists within the government coalition and destroy the chance of a genuine Opposition. The electoral law makes it difficult for new parties to be formed and disfranchises about 50,000 people. The chief Opposition group so far, the Freedom Party, led by Mr Solymosy, has dissolved itself on the grounds that intimidation and violence give it no alternative. On the other hand, various Rightwing splinter parties, including a new group led by Father Balogh, intend to contest the elections. The real struggle, however, goes on within the governmental alliance. The Smallholders and

Socialists have succeeded in avoiding a *bloc* with the Communists. The parties will fight the elections separately although in alliance. The critical question is whether the Communists will permit their partners to choose their own candidates.

In Rumania, the impact of the new division of Europe is seen at its worst. The regime is in any case unpopular and corrupt. The bad harvest and near-starvation have brought tempers to boiling point. For some time, the Government's reaction has been oppression and arrest, while the Opposition, the National Peasants, the Liberals and the Independent Socialists, have been more and more reduced to underground Opposition. Last week, the crisis came to a head. On the charge of "plotting with Western reactionaries" most of the Opposition leaders were arrested, some on the airfield as they tried to escape. The veteran Mr Maniu is also a prisoner and all the arrested deputies have lost their parliamentary immunity. A strong British note of protest has had as little effect as all the previous protests and will be used to "prove" the subservience of the opposition to the West.

The Lords and the Curate's Egg

The Town and Country Planning Bill goes back to the Commons very much as it came; very good, in parts, good enough in others, and in some sections very bad indeed. Its three great initial blemishes remain; for, as they were part of the basic fabric of the Bill, the Lords were unlikely to perform more than a minor operation on them. The cumulation of permits and charges to be secured, paid, and worried over by the rash individual indulging a taste for private enterprise still rises as mountainous as before. There is little or no sign of a realisation on the part of the Government of the disastrous effect which progress from Ministry to Ministry, Board to Board, and authority to authority—however admirably efficient each may be—is likely to have on enterprise in more normal times. Government departments still remain exempt from planning control, along with Government-sponsored projects of local authorities and public utilities; and a determined effort to compel departments to state and defend their own case at public planning inquiries has ended in an expected failure. There is material for a worthy sermon in the contrast between the spirit of the British constitution, with its respect for the rule of law and the rights of the individual, and the Lord Chancellor's deft utilisation of the niceties of constitutional practice to ensure that in planning matters Ministers and their Civil Servants remain above the law. It is left only for the citizen to pray that inter-departmental consultation may be a little tenderer of his feelings and interests in future than in the past.

The third great defect of the Bill, the gross inadequacy of the compensation for the nationalisation of development rights, emerges from the Lords actually more serious than before; for even more categories of landlords have been granted a preferential cut from the proceeds, and the remnant for rewarding the less effective lobbyists may well prove to be miserable indeed.

No one can fairly blame the Lords for refraining from a direct challenge to the Government on these matters; and on minor issues they have performed their usual successful tidying operation. A particularly useful pair of clauses were inserted, in one case against the Government's wish, to safeguard the income of Churches, colleges and other charities; and it may be hoped that the very mild measure of exemption from the general law implied in Lord Samuel's clause to protect charity investments will not be removed in the Commons. The Lords have also affirmed, in relation to the Central Land Board, the recognised principle that a commercial body in a monopoly position (as formerly the railways) should be liable to justify its charges before an independent tribunal; and here also it may be hoped that the Government will give way.

Bellenger on Booty

Fresh publicity was given in the House of Commons this week to the currency losses incurred through the transactions of the armed forces in Europe. The occasion was a debate on the second report of the Public Accounts Committee, which gave some very serious criticisms of the attitude of the War Office towards the losses. It also expressed concern lest losses were still being incurred. The Secretary of State for War certainly does not come out well from the affair. He may be exonerated from deliberately concealing from Parliament the real amount of the losses; they were given, when the matter was first raised last February, as £20 million, and it was only subsequently that, almost in an aside, their real total was given—£58 million (plus, it should be noted, some "unrecorded losses"). But he seems to

have been quite oblivious of the fact that such losses reflect very seriously on the administration of the Government Department responsible for them. If the loss were merely a sterling loss, it would be bad enough; as it is, the cigarettes and food which the troops bartered were provided largely out of this country's limited supplies of dollars.

There was a time when an occurrence of this sort would have created a stir big enough to remove the responsible Minister from office. Ministers do not resign these days; nor are they dismissed. In any case, the public as a whole is quite apathetic towards the loss, presumably because so many of its members were concerned in it. But it should be put down as a big blot on the present Government's administrative record.

That Song Again

Once again, on the Third Reading of the Finance Bill, there bursts forth the irrepressible melody in Mr Dalton's heart. The revenue is buoyant; expenditure, though well maintained, has been more than matched by income; the first quarter of the financial year shows an unprecedented surplus of £234 million; and oh! what a good boy is the Chancellor. Really, this will not do. Certainly a surplus is better than a deficit; but where, as is so obviously the case at present, the buoyancy of the tax yield is the symptom and outcome of a never-slackening inflationary pressure, of that "too much money chasing too few goods" of which Mr Dalton himself has warned the country, there is no excuse for paeans of victory, even if modulated occasionally into foreboding passages on the state of the external balance.

Inflation in a controlled economy may be a budgetary blessing; of its effects on other and more fundamentally significant aspects of economic life, some fresh and interesting things are said by Mr J. R. Hicks in the current *Lloyds Bank Review*. One of these effects, hitherto less discussed than others, is a constant sucking dry of the economy's internal pipe-lines. This depletion of stocks does not accompany inflation when controls are weak or absent; then the problem is to tempt on to the market hoards which are being held for the rise. When the rise is legally prohibited, however, stocks will be drawn on whenever an interruption or deficiency of supply threatens the consumer's normal intake; and as they diminish every accident to which the economy is prone—blizzard, harvest failure, lightning strikes—will translate itself immediately into a crippling lack of some essential. The sucking power of inflated incomes can be checked by taxation and limited by rationing; but neither method has proved adequate—for much of the trouble is not a matter of currently accruing income at all, but of private savings backing the long-past demand for new durable and semi-durable consumers' goods, and of business reserves backing an equally long-frustrated demand for new equipment. So Mr Hicks, taking a deep breath, plumps for a temporary rise in interest rates and a temporary capital levy or forced loan. Lessen the suction and let the pipe-lines fill; restore the buffers against the inevitable accidents of Nature and failures of the human element; and the bumping from crisis to crisis may stop. The latter if not the former half of the prescription might appeal to Mr Dalton; but it would certainly involve his singing, on the next appropriate occasion, a different tune.

Cacophony on Coal

Those seeking light on Britain's fuel prospects from the spokesmen of the Government and the miners have had a bewildering week. In Parliament, Mr Shinwell discussed the outlook in tones of what used to be called sober optimism. Stocks, starting from a position considerably below last year's, have reached one higher by two million tons. Production in the first 28 weeks of 1947 is up by over four million tons on the corresponding period of 1946. Recruitment is bringing in, net, nearly a thousand new workers a week and the mining manpower target is in sight. True, household coal stocks are low, absenteeism has rebounded from its lowest point, and losses from lightning strikes have increased. But the full benefit of the new recruits will be felt when their training is complete, more machinery is on the way, the lightning-strike nuisance is being dealt with, and while one cannot prophesy (Mr Shinwell is wiser than of old) about the chances of the White Paper's 200 million-ton target being reached, there is hope of a trickle of exports being possible by the end of 1948.

Meanwhile, Mr Bevin pitches his voice much higher. Deliverance from the "dollar grip" depends on the miners doing much better than at present; may depend, indeed, on their working a few hours more while the Government's reorganisation plans

go through. But lest anyone should think this an official hint of the possible suspension of the five-day week, Mr Shinwell proclaims that nothing will induce him to tamper with miners' hours. Nothing, that is, except the miners themselves approaching him "as a body"; which may, in turn, be regarded as a hint to Mr Horner. Mr Horner's warning is the gravest of all; he declares flatly that the target will be missed by five million tons, implying crisis on last year's scale; but the reintroduction of Saturday work is not, so far as he is concerned, in court at all. More recruits are wanted—"whether from the Forces or elsewhere is immaterial"—and the miners must not be blamed if, owing to lack of reinforcements, they fail to deliver the coal. Add to these contrasting notes the minor blasts of the Parliamentary back-benchers—especially Mr Daggar's scornful denial that the industry could absorb any substantial number of new recruits—and the cacophonous concert is complete, and nearly as depressing as the coal situation itself.

Canberra versus Washington

The United States has extended to the other ten nations who are members of the Far Eastern Commission an invitation to discuss preliminaries for the Japanese Peace Treaty in Washington on August 19th. The British and Dominion Governments have had to plead a prior engagement, for they had agreed to hold a Commonwealth conference in Canberra to discuss the same subject on August 26th. The State Department was no doubt officially ignorant of this impediment and is willing to change the proposed date, which was only a "tentative suggestion"; however, in view of the strong comment in certain quarters in the United States on an alleged "ganging up" of the Commonwealth against America for the impending peace conference, the choice of date may have been meant as a reminder of American disapproval of this kind of diplomacy. Tempers are not likely to be improved by talk of adding South Africa and Burma to the eleven nations now represented on the Commission; in the American view such piling up of votes of the "British group" is unjustifiable, and the Canberra Conference will inevitably give colour to the idea that there really is a single Commonwealth policy which London will try to put across.

With the Soviet Union the American proposal has given rise to difficulties of another kind. Russia, still adhering to the method of Great Power decision, used for making the treaties with the European satellites, wants the Japanese treaty preliminaries to be assigned to the Foreign Ministers' Conference. It is certain that Australia will never consent to this, and in any case there is not much left now of the idea that Great Power talks produce results more quickly and surely than larger assemblies. The Russians, however, may decline to attend discussions on an eleven-power basis and may make inclusion of Japan on the agenda a condition of taking part in the Foreign Ministers' Conference in November.

Meanwhile one part of the Japanese treaty has already been brought formally into effect. The United States has taken over under United Nations Trusteeship the former Japanese Mandated Islands in the Pacific, which have been under American occupation since they were overrun during the war. Pending the formation of a permanent civil service for them, the islands remain under the Navy Department and the Commander-in-Chief of the Pacific Fleet has been appointed temporary High Commissioner.

Gangsters in Rangoon

The armed attack which caused the death of Aung San and six other members of the Burmese Government was an act directed against the leadership of AFPIL (the Anti-Fascist People's Independence League) by one of the political groups in opposition, but at the time of writing it is not known which group was responsible. The gunmen escaped as swiftly as they came and the police action took the form of arresting all the prominent opposition leaders. Of the three foremost, two, U Saw and Thakin Ba Sein, were found in their homes and taken into custody, though U Saw did not give himself up until his body-guard had fought a gun battle in his defence. The third, Ba Maw, was absent, but is now reported to have been found staying with relatives.

The experts in detective fiction may differ as to which behaviour is the more suspicious—to be at home after a murder or to be absent. The guilty man might well suppose that the best way to dispel suspicion and make a show of innocence would be to remain quietly in his house until the police came. On the other

hand, at such a moment the risk of being "shot while trying to escape" would be rather high and the strain of awaiting the AFPIL police very hard to bear; it might be wiser to get away in time to a good hideout. In any case, the killings were not followed by any attempt to seize power; they were the manifestation of a *maquis* which cannot fight a pitched battle, especially when there are British troops still in the country to support the Government in case of need. The raid was either a mere act of hatred and revenge without regard to the consequences or it was inspired also by the hope of so weakening AFPIL that it would gradually fall to pieces and thus later on give an opening to rival factions.

U Saw was the Prime Minister of Burma at the beginning of the war; being discovered in secret communication with Japan, he was arrested and interned by the British authorities. Aung San, who fled to Japan in 1940, came back with the Japanese when they invaded Burma, and Ba Maw, a previous Prime Minister, also joined them. The formally independent Burmese Republic was set up under Japanese occupation with Ba Maw as its President and Aung San as Commander-in-Chief of the army; between these two there was increasing personal enmity. Aung San soon got into secret contact with the British and promised to bring over his army at an appointed time—which he did; Ba Maw stayed with the Japanese to the end and at the end of the war was politically rather under a cloud. U Saw returned to Burma after the war, but his internment had prevented him from building an armed force or working his passage. Both U Saw and Ba Maw, and also another nationalist leader, Thakin Ba Sein, each with a separate party of his own, remained outside Aung San's political combination, the AFPIL, denounced him for concessions to Britain, and boycotted the general election which gave AFPIL an overwhelming majority of seats. Also in intransigent opposition was one of the two factions into which the Burmese Communists had split; the other contested the elections and has been bargaining with AFPIL. Against this complex political background the question "Who done it?" has now to be answered. It is to be hoped that British influence in Rangoon is still sufficient to ensure that the verdict is given according to the evidence and not otherwise.

Refugees: Hope Deferred?

Nothing could underline more dramatically the plight of the Displaced Persons in Europe than the fate of the 4,500 Jewish illegal immigrants, who may now, it seems, be condemned to spend the rest of their days on the high seas. The British have sent them away from Palestine. The French, after much indecision, will permit, but not compel, them to alight in France, from where they set out, but Colombia, for which country they had forged visas, refuses on any account to receive them. Their fate appears the more dramatic because they have taken steps to remedy it, but essentially it is shared by 850,000 Displaced Persons who still sit and wait and rot in Europe.

If the governments of the world were really alive to their moral responsibility, it would not be possible for the problem of the refugees to be as neglected and as forgotten as it seems today. The International Refugee Organisation under its new Director-General, Mr William Tuck, a veteran relief worker, has come into being under the most depressing auspices. It faces two main difficulties; the first is to acquire sufficient funds to meet the running expenses of maintaining the refugee camps in Europe. When the experts originally considered this problem they made the estimate that \$250 million would be necessary to meet the cost. The United Nations reduced this figure by \$100 million and told the Organisation to go ahead once 75 per cent of this figure had been guaranteed. Today, however, although \$122 million have been promised, only about \$3,000,000 have actually been paid, and the IRO lives on begrowed money from Unrra and from the governments whose military authorities are for the time being carrying executive responsibility for the refugee camps. Incidentally, few people are entirely satisfied with the military methods used in running these camps, and the new Refugee Organisation can only exercise rather restricted rights of supervision.

The greater difficulty is, however, to secure a future and a living in new lands for these wretched thousands. For two years now they have lived on in their camps, buoyed up with the prospect of better days. Now their hearts are sick with hope deferred, and despair and demoralisation are widespread. What

is needed above all today is a wholehearted and generous decision on the part of the United States and the British Empire to do away with this sump of human misery within five years. The United States has at least taken the first step. President Truman has sent a message to Congress demanding special legislation to permit the immigration of a large number of Displaced Persons. The Stratton Bill has been introduced, providing that 400,000 Displaced Persons should be allowed to enter the United States over a four-year period, and a similar Bill has been brought in with the backing of both parties, which safeguards American interests by laying down screening tests for the potential immigrants. All the major newspapers in America are unanimously in favour of the legislation. Many of them point out that it is better to acquire the refugees' skill and work in America than to pour out money to maintain them in idleness in Europe. Yet, unhappily, there seems little hope of securing the legislation before Congress adjourns, in which case no lead can be expected from America for at least another six months. Thus the responsibility of the British Empire becomes all the greater.

* * *

Persia and the Powers

After sixteen months without a parliament the Majlis has met. Mr Qawam, the premier who ran the elections, continues in office. Parties—in the sense of bodies to which their members owe loyalties that transcend personal issues—scarcely exist in Persia. Only *Tudeh*, the Russian-sponsored group which abstained at the recent elections, had such a hold. About eighty individual deputies, out of a House of 136 members, have signed a declaration of policy formulated by Mr Qawam's Persian Democrat Party. Proof of their solidarity with him is yet to come.

For in June, when he reshuffled his Cabinet, his stock had fallen low because he was thought to have entrusted too many posts of importance to men interested only in lining their pockets. Persians who, in their mistrust of all foreigners, seem to need a national figure on whom to focus enthusiasm, had turned rather towards the Shah. The success of a royal tour of the northern provinces can be measured by the five miles of carpet over which he drove into Tabriz. If he is able by his influence to implement some of the speeches on social reform which he made in the schools and like institutions that he visited, he could prove a national leader of importance.

Reforms of the type he mentioned are one of the urgent items on the Majlis's agenda. The other is the Soviet oil concession. In an interview given in June Mr Qawam reiterated that he was under an obligation to present this to Parliament. But he added that times had changed since he gave the Russians his word, and that he was not in a position to say which way his fellow deputies would vote. Many of them have in fact made it clear that they dislike so eager an offer for the northern oilfield, which no one has yet tapped with any commercial success. They fear its smack of political domination.

What, then, is their view of the Anglo-Iranian company, with its increasing stake in the south? Its record operations for last year were reviewed in *The Economist* last week. They do not like it—just as they do not like the idea, now afoot, of a \$250 million loan from the International Bank. Both savour of foreign pressure, if not dollar diplomacy. And no Persian wants Persia to become a forward observation post in the Truman Line.

On the other hand, no Persian government can do without these financial aids. The present Cabinet is, on paper, committed to a seven-year plan of economic reforms that is scheduled to cost 60,000 million rials (over £400 million at present rates). Compare the anticipated ordinary revenue for 1947-48, which is 5,559 million rials (or about £40 million), as against anticipated ordinary expenditure of 7,762 million rials, the difference between the two sums being met by the value of stocks in hand and the expected yield from increased prices for kerosene and cigarettes. How is any social development programme to be transferred from paper—its present resting place—into practice except out of the yield of the maligned Anglo-Iranian and the reviled dollar loan?

* * *

The Manpower Debate

The debate about the distribution of manpower goes on, but in a circular fashion. The Trades Union Congress has now tossed the ball back to the Government and asked for more information about the economic position. This seems extraordinarily like a time-wasting device, and hardly squares with the trade unions'

own complaints that the Government has "no sense of urgency." Any reference to the Statistical Digest or to the figures issued by the Ministry of Labour and the Ministry of Fuel would, it might have been thought, have provided sufficient information about the progress made with the recruitment to undermanned industries, coal production, exports and imports since the Economic Survey was published. In addition, Mr Morrison keeps the public fairly well informed about the general picture through his fortnightly press conferences.

A more positive contribution to economic progress is the decision of the National Joint Advisory Council to urge industries to extend the system of payment by results, so as to provide greater incentive to individual output. Building is the industry mainly concerned, and it is satisfactory to learn that, at long last, the building unions have declared their willingness to accept some form of incentive payments—even though the condition is added that these should be linked with a general increase in minimum wages.

Mr Deakin's kite, about "a limited measure of direction of labour," which he flew so sensationally at Hastings last week, appears to have met with remarkably little enthusiasm either from his colleagues on the TUC General Council or the Government. The alternative of providing special inducements for recruitment to the undermanned industries, which was adopted at the Margate Labour Party Conference, is still the policy of the Government. The Government, however, has yet to produce a policy for meeting the other criticism—that too much labour is being wasted on non-productive and non-essential activity.

* * *

Parks Before Plans?

The report of the Hobhouse Committee on National Parks* is a statesmanlike addition to planning literature. While avoiding the wilder extravagances of the amenity-mongers, it proposes machinery likely to be as strong and effective as the absence of government within the Government will allow. There should be a National Parks Commission nominated by the Minister of Town and Country Planning, and financed, to the tune of £750,000 a year plus £91 million for initial capital expenditure, by the Treasury. The Commission would appoint the chairman and 50 per cent of the members of a Park Committee to exercise planning control over each National Park, the remaining members being appointed by the local planning authorities. It would also be responsible, through an Assistant Commissioner and staff in each park, for the actual management of the parks, and for promoting and supervising any development properly undertaken by private enterprise; such, for instance, as the provision of hotels or youth hostels. Government departments would be expected to consult the Commission over any developments in National Parks which they proposed either to undertake themselves or to sponsor on the part of local authorities or public utilities—that is, over the classes of development exempt from normal planning control under the Town and Country Planning Bill. And, the Committee add, with bitter recent experience of "the accepted methods of inter-departmental consultation" in mind, there should be a permanent Cabinet or Ministerial Committee responsible, in the last resort, for settling inter-departmental disputes over land use. In all, it is suggested that there should be twelve National Parks. There would also be a much larger number of Conservation Areas, in each of which the National Parks Commission would have the right to appoint members to an advisory committee to assist the local planning authority.

In a way, of course, the report is yet another blow at local government, and there is again reason to regret that the reform of local authorities has not moved faster. But the reform of local government was not the Committee's business; and, apart from this, the only qualms about its admirable proposals arise from the terms in which they are defended by their friends. The Friends of the Lake District have issued a pamphlet† pointing to the need for something of this kind in order, among other reasons, to frustrate the misguided attempts of Cumberland local authorities to use certain of the natural resources of the Lake District to help with the rehabilitation of the West Cumberland Development Area. The national interest, as the pamphlet observes, must come first. But the Society's view of what the national interest is seems curiously perverted. To ruin Ennerdale Water would certainly be highly regrettable. But to fail to remedy the depression of the West Coast would have been a national disaster. To insist that

* [Cmd. 7121]

† "National Parks: their purpose and their administration."

the amenities should come first is rather as if one were to say that it is more important to go on holiday than to live. No one interest—industrial, amenity or anything else—has in fact an absolute priority. It is always the case of a delicate balance of marginal considerations. This balance the Hobhouse Committee has, on the whole, achieved.

* * *

Prison Report

The report of the Prison Commissioners for 1945 has now been published (Cmd. 7146); and since it covers a period which ended eighteen months ago, and includes in the main statistics no later than the year 1944, its utility loses a good deal in consequence of this delay. But it contains one sentence of the highest significance, to be found in the chapter dealing with the training of prisoners. In November, 1944, there was an appalling explosion at an RAF bomb store near Burton-on-Trent, which killed some 100 men and devastated over 350 acres of land. In the following February the Governor of Stafford Prison was asked to find a small working party from the prison to help to rehabilitate the ruined land, which he did. By the end of the year some miles of fencing and ditching had been completed and start made on an afforestation scheme. The men had been given a useful, constructive job to do; and they could see their own results. The Governor in his Report goes on to say:

Freed from the prison machine, men behave naturally and the good can be sifted from the bad.

Therein lies the crux of the case against the present system of prison punishment. Men are fed into the prison machine before the good can be sifted from the bad, and inside that machine there is no normal work through which the good can become better and the bad prevented from becoming worse.

It would be unjust to suggest that the Prison Commissioners, or the Home Office, or the majority of prison governors, are unaware of this situation. It would be unjust, too, to gloss over the enormous difficulties in the way of any immediate change. Yet it is true to say that the Commissioners themselves, to judge from the tenor of their report, also lack a sense of urgency. In a sense they owe the public an explanation in the case of every man who receives a second prison sentence, for it is not until that standard is attained that imprisonment for the first time can be fully justified, save as a means of segregating from the rest of the public those whom the public has decided to write off once and for all as citizens. The seeds of all these notions are contained in this report, but the report gives the impression that many of the seeds are still lying on stony ground.

* * *

To Tip or Not to Tip

The tipping problem has baffled the Catering Wages Commission, which has been making a special study of it for the Minister of Labour. The Commission found that it was a physical impossibility to arrive at any general assessment of the cash value of tips, because of the wide variations between different establishments and different employees. It reached the conclusion that tipping could never be wholly eliminated, but recommended that Wages Boards, in fixing minimum wage rates, should disregard tips, which should "cease to be relied upon as an essential part of a worker's living wage."

The abolition of tipping, if practicable, would be generally welcomed. The problem of how much to leave has become one of the minor discomforts of life, and the tipping habit has undoubtedly become more prevalent in recent years—although it has not yet reached the fantastic proportions found in France, where tips are looked for in cinemas, theatres and churches, as well as in railway stations and restaurants. Even where a 10 per cent service addition is made to a bill, there is usually a general expectation that some "token of appreciation" will be left behind. Nor is there even any certainty that where a tronc system is operated, the proceeds are in fact equitably shared between all the staff and that those in the nether regions of kitchen and scullery get their fair share. The difficulty is that nobody would fight more vigorously for the retention of tipping than the waiters and waitresses themselves. It would be very hard to convince them that they were not being deprived of a birthright.

The minimum wage rates proposed by the Commission for unlicensed places of refreshment are probably less than a worker, who receives tips, would normally expect to get in a week, but considerably above those which would be received by kitchen staffs.

They are certainly higher than the Hetherington scales for domestic workers in hospitals and institutions. The rates proposed vary according to the area—there is a London rate and two provincial rates—and to the type of work. Thus a waitress would get, for a 47-hour week, 57s. 6d. in B province and 62s. 6d. in London, compared with 77s. 6d. in B province and 82s. 6d. in London for a waiter. A female chef in B province would get 100s. a week, compared with 125s. for a male chef in London. A female assistant cook would get 65s. in province B and a male assistant cook 90s. in London. The Hetherington rates are £3 5s. for a non-resident head cook, for a 48-hour week, £3 for an assistant cook, £2 15s. for a general maid and £2 12s. 6d. for a maid. Tipping apart, the nationally more important job once again offers a less attractive financial reward than is found elsewhere.

Shorter Notes

The Registrar-General's return for the first quarter of 1947 shows a birth-rate of 22.8 per 1,000, which is the highest rate for a March quarter since 1920 and compares with 17.1 per 1,000 in the March quarter of 1946. The infant mortality rate was 55 per 1,000 live births, which is 11 per 1,000 below the average figure for the first quarters of the years 1937-46. The return contains, for the first time, a summary of the Social Survey's morbidity inquiry. It shows that in the last three quarters of 1946 illness and injury of some kind was reported by 72.3 per cent of the sample interviewed.

*

A new monthly called *Eastern World* has been in publication since April. It deals with Asia from Afghanistan eastwards, and the early numbers have provided a substantial fare with a refreshing variety of subjects and opinions. This is a praiseworthy British venture into a field which such American periodicals as *Asia* and *the Americas* and *Amerasia* have hitherto had more or less to themselves in the English-speaking world.

*

Up to July 12th this year, 545 cases of infantile paralysis have been notified, of which 110 are attributable to the week ended July 12th alone. What is disturbing about the present outbreak is that the normal seasonal rise has started earlier than usual; the peak months are August and September. In 1938, when over 1,400 cases were notified in the whole year—the highest figure recorded since the disease became notifiable—only 142 cases had been notified by July 16th. Moreover, the highest weekly incidence in that year was 85.

*

The House of Commons has now confirmed the abolition of an annual tax on solicitors which has been in existence since 1784. The present amount of the tax is £9 for London solicitors and £5 for country solicitors, and has been paid by them in the form of a stamp on their annual practising certificates. However, lest anyone should think that solicitors will be that much better off in the future, it should be pointed out that from this year each solicitor will be required to present to the Law Society an accountant's certificate about the correctness of his financial records before he can obtain his annual practising certificate; the cost of obtaining this certificate is not likely to be less than the amount he has hitherto paid to the Government.

The approach to an age in which dictatorship has been so salient a feature in Central and Eastern Europe is appropriately made through an essay on Napoleon III. The French Second Empire anticipated so much of the technique and spirit of modern Fascism, yet one is conscious also of the contrast when one compares this regime with the monstrosity of the Third Reich. When he comes to Germany and contemplates "the contrivers of Europe's desolation and debasement," Professor Namier does not shrink from a "grand inquest" on the German nation. He has his view of the Germans and expresses it with force: "unfree and unfitted for freedom, they seek release in organised violence; war is the German version of revolution . . . if congregated, the Germans are merely regimented: for the typical German is an introvert . . . there is such a thing as a Belsen of the mind and spirit." But if he is unsparing in his condemnation of Germany, Professor Namier is also severe in his judgment of the world of East Central Europe which offered such easy opportunities to the Nazi revival of German imperialism. He points out that of about 100 million inhabitants of six states—Poland, Czechoslovakia, Hungary, Rumania, Yugoslavia and Bulgaria—after 1918, nearly 30 millions were unwilling or unwanted national minorities; he points out also that of these states only Czechoslovakia achieved anything resembling the Western idea of democracy, and he claims that "the false educational system of Eastern Europe, which at best encouraged chauvinism and at the worst helped to destroy all conceptions of morality, is one of the fundamental causes of the misfortunes of these peoples." He wrote before the creation of the Russian orbit in East Central Europe, and it is a pity that he has not supplemented his survey by a comparison of the regimes of Bierut and Tito with those of Smigly-Rydz and Stoyadinovitch. Of Russia, and of what Russia stands for in contemporary Europe, Professor Namier has less to say than one would expect in a book of this kind; he has not the direct acquaintance with Russia which he has with Europe as far east as Galicia, and the Russian remains a somewhat indistinct figure in the background of his picture. Politically Professor Namier is—or was when he wrote in 1943 and 1944 three essays which he now reprints—in favour of "spheres of interest" and no interference by the Anglo-Saxon Powers "where they cannot act." But he certainly indulged hopes doomed to disappointment when he wrote that "a clean frontier and non-interference in each other's internal affairs" must be the basis for future friendship between Russia and Poland.

The last three essays of the book deal with anti-Semitism and Zionism. They are related to the rest of the book in so far as the problem of Palestine is, for Professor Namier, indissolubly bound up with that of the Jews in the dispersion. He holds that Zionism is the only solution for the Jewish question, and he seems to take it for granted that this solution should have priority over the wishes of the local Arabs. Only with their own state, he argues, can the Jews be "a nation, like unto all nations, a nation and not a problem." Many will disagree with his advocacy, but in his study of the failure of "assimilation" and his forebodings of new movements of anti-Semitism he is unpleasantly convincing. Fifty-five per cent of Jewry, he points out, is now in English-speaking countries "and the question is whether on that stage too the recurrent Jewish tragedy is to be re-enacted."

Last Days of Fascist Italy

"Empty Balcony." By Pietro Saporiti. Gollancz. 128 pages. 7s. 6d.

On a warm summer evening in September, 1943, the record of the National Anthem which followed the news broadcast from Radio Rome was never finished. The needle sticking in 'one groove ludicrously repeated the same bars until the transmission was suspended. The worn record seemed to symbolize the breakdown of civil government in Italy. Three days earlier, the botched Armistice had been announced. Badoglio had appealed to Italian troops to "resist aggression from whatever quarter it should come," and promptly bolted from Rome with the Royal Family. But the soldiers, like most of the population, were in any case no longer capable of an emotional response, and their one desire was to escape home with all speed. By midday on Sunday, the 12th, the Germans were in control of Rome and a guttural voice read out over Rome radio Kesselring's very clear and concise orders. Italy's long expiation had begun.

"Empty Balcony" describes the principal events which preceded and followed the four days of confusion. It opens with the preparations for the fateful meeting of the Fascist Grand Council which, summoned for the first time since December, 1939,

was to vote after an impassioned debate to restore power to the King. Why did Mussolini not react vigorously to the challenge to his authority? Saporiti suggests it was due to over confidence, but perhaps it was rather because military defeat and internal disorder, assisted by sheer fatigue, had momentarily undermined confidence—a lapse no dictator can afford. No official transcript appears to exist of the proceedings and the writer has relied on Bottai's account. There follow chapters describing Mussolini's arrest and detention, and the dramatic release from a 9,000 ft. high platform on the Gran Sasso by S.S. Captain Skorzeny; the secret negotiations for an armistice; the puppet "Republican Fascist" Government; and the trial and execution of the six Grand Council members in Republican hands. The negotiations conducted by S.S. General Wolf and Colonel Dolman are a fascinating story against a Swiss background of the moves which led to the peaceful surrender of Italian troops in North Italy and procured immunity for the principals. The book concludes with a rather confused account of the capture and summary execution of the fleeing Republican government, and of Mussolini and his mistress, in which the Communists revealed themselves as possessing a policy of their own. No mention is made of the highly controversial fate of the "Dongo treasure," the banknotes and jewels supposedly taken by the fugitives, which according to one account got "dispersed" about the countryside, and according to another found their way to Communist Party coffers.

The events described happened from two to four years ago; the fact that they still belong to the realm of contemporary history excuses the somewhat journalistic approach of this book. (In passing one wonders why it was necessary to make such play with the reproduction of the eight important documents, or to include Mr Brown's poem at all.) A final account can only be written when the records of governments are finally laid bare. In the interval personal accounts of historic events, such as M. de Wyss's "Rome under the Terror," and Countess d'Origo's "War in the Val d'Orcia," and a dispassionate compilation of contemporary records as "Empty Balcony," concerned as they are with events which have played a part in our own lives, should be read to enlarge the understanding and purify the emotions. Seldom was there a clearer case of "hubris" than that which led to Mussolini's downfall, and it serves to underline the present great need for humility in temporal rulers.

From The Economist of 1847

July 24, 1847.

A REMARK made to us [at the Royal Agricultural Society's annual meeting], somewhat in disparagement of the awards, by a plain but intelligent-looking farmer—a stranger to us—when standing by the prize Leicester sheep, was worthy of notice. He said, pointing to a pen of Leicester ewes, which had obtained one of the highest prizes: "They are pretty sheep, but I should like more size; 'tis always the pretty things which obtain the prizes at these shows." . . . It must be recollected that breeding prize stock is in itself a business, and that to obtain the symmetry we all so much admire, some sacrifice of size is necessarily made, for in all very large animals there is usually a disproportion of parts. Now, the object of the prize breeder is to correct these disproportions, to produce a level, even-shaped animal, with all the good points of the particular breed fully developed, but no one point exaggerated so as to be greatly out of proportion. To succeed in this, implies the production of an animal of moderate size; and a moderately sized animal of good proportion is just what we, as practical farmers, at first sight, are apt to designate "pretty." . . . It was jocularly remarked to us by a shrewd observer, after meeting at dinner a large party of the leading breeders of prize stock, that they justified the poet's language—"He who feeds fat oxen should himself be fat"—for many of them seemed to be as phlegmatic and calm-tempered as the animals they had passed their lives in rearing. And we believe it to be perfectly true that a certain sort of philosophic calmness, that absence of excitability which is usually found to accompany eminence in experimental science, is essential to high success in the breeding department of husbandry.

[Extract from the Queen's Speech Proroguing Parliament: "I rejoice to find that you have in no instance proposed new restrictions, or interfered with the liberty of foreign or internal trade, as a mode of relieving distress. I feel assured that such measures are generally ineffectual, and in some cases aggravate the evils, for the alleviation of which they are adopted."]

Lewis Finds a Way

(From Our US Editorial Staff)

IT was unfortunate for Messrs Taft and Hartley that the first major engagement fought under their new rules should have had to be with Mr John L. Lewis. The Labour Act had only been law for a few days before Mr Lewis and his team of lawyers swept a clear passage through its minefields and won the greatest of all their victories. Their path was easier because the field had not been completely laid, some of the provisions of the Act not coming into force for 60 days. How many other unions will be able to use the same channel is doubtful. The Act may not be the useless weapon it seemed when used against Mr Lewis. Most lawyers, however, think it aimed at too many targets. It was conceived in emotion, and the reaction of the unions to it has so far been only emotional. The United Mine Workers made it look silly, but it may still seem more effective when other people try conclusions with it.

Mr Lewis, as is usually the case before he risks battle, had secured certain positional advantages, legal, economic and political. Having no contract with the employers, he had a free hand in his attempts to circumvent the provisions of the "Lawyers' Full Employment Act (1947)," as the Taft-Hartley Bill is called in the Department of Labour. Mr Lewis left litigation and arguments over the constitutional validity of certain clauses to more public-spirited unions. His lawyers got their employment finding ways round them. This is an occupation for which American lawyers are uniquely trained. The passing of laws—not their repeal—is always the main consideration of Congress. Dead laws are not removed from the Statute Book; they are overlaid by new ones. Pelion is piled on ossified legislation. So there is always a dense undergrowth through which lawyers must cut a path for their clients.

The Republicans, who for ten years had been threatening what they would do to the Wagner Act—Labour's "Magna Carta," passed during the heyday of the "New Deal Terror"—did not repeal or amend a clause of it except by implication. The Wagner Act gave unions a set of rights and privileges. The Taft-Hartley Bill, in theory, gave management a parallel (and, in many cases, more potent) set. The Wagner Act was passed, after some years of high unemployment, to ensure to workers the right to organise and bargain collectively. At that time the financial strength of industry and the pressure of workers on jobs had put management in a strong position. The Taft-Hartley Bill was supposed to remedy some of the abuses which the greater prosperity of the unions had brought about. Full employment and the growth in strength, political and economic, of the big unions had, in the view of more than just Congressional Republicans and the Southern Democrats, put management at a disadvantage. They insisted that legislation was needed to correct this, and the Labour Act was born.

It may be true, as an official of the American Federation of Labour said last week, that "most of the sponsors of the Bill seem to be aiming at one man, John L. Lewis." If so, their aim was poor. It is already clear that the big unions are not

going to be hit. The victims will be the small ones (for whom Congress affects much verbal solicitude) and those yet unborn. The organisation of new unions—particularly in the South, where serious attempts to unionise labour met with opposition last year—is going to be more difficult. Mr Lewis, as he has proved, is going to be little troubled.

What the Act does is to freeze the existing monopolies of the big unions and protect them and big industry from competition. They will be free to continue their formalised quadrille of litigation without the danger of any brash youngsters cutting in. But, curiously enough for a piece of Republican legislation, that Master of Ceremonies, the Government—in the person of the National Labour Relations Board—will be interfering with the pattern of the dance more than ever before. As Mr Gerhard Van Arkel, who resigned his post as General Counsel of the NLRB the moment the Bill became law, said: "The Wagner Act brought them (the union and the employer) together and left them there. This new Act is with them day and night thereafter." This is a feature which industry, now that it is licking the sweets of victory, is beginning to see. The more management studies the Act, the less it seems to like it.

The second of Mr Lewis's advantages arose from the trading position of the steel companies, whose coal stocks were low and whose unfilled orders were large. On the management side, the negotiators were Mr Benjamin Fairless, president of United States Steel, and Mr George Humphrey, chairman of the board of the Pittsburgh Consolidation Coal Company. Mr Fairless was involved as representative of the "captive" mines (those owned by the steel companies). Mr Humphrey's company is one of the Mellon group, which is also interested in steel. It is no exaggeration, therefore, to say that the negotiations were carried on less in the interests of the coal owners than of the steel companies, who are in no position to plead hardship. The industry is operating at nearly full capacity, its profits are more than satisfactory, and it has orders enough to keep it in this happy state for some time to come. These facts were inclined to make the steel companies feel indulgent towards Mr Lewis and provided strong political reasons within the industry for not desiring a stoppage at the moment.

The Eastern steel interests have, moreover, another problem on their hands. There have been suggestions that the steel industry in this country needs expanding. The suggested expansion would come on the West Coast. The Eastern companies, who have fought the development of Western steel, recently assured a Senate Committee that "existing facilities should be more than enough to bring supply into balance with demand." They would prefer to prove this statement true, and a coal strike at this time would be embarrassing if it increased the backlog of unfulfilled demands.

Mr Lewis's legal and economic advantages were obvious. His political position is more obscure. He is the most important Republican trades union leader and might have been expected to attack his own party for betraying labour. It is true that he made formal protests and threats, but the violence of his language, which is a natural form of expression with him, obscured the fact that they were merely formal. He is believed to have reached agreement with Governor Dewey and to have promised support to him for next year. Mr Dewey, whose chief quality is caution, was careful not to commit himself on the Taft-Hartley Bill until the fight had been won. He is now reported to have expressed his approval—which

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

involves him in its fortunes during the next year. He may well feel the necessity for doing this to ensure nomination, and Republican Labour can hardly withdraw its support from him for that reason, as his only apparent rival, Senator Taft, is even more involved.

With the passing of the Bill its sponsors have gone their separate ways. Representative Hartley, a straightforward man and not a candidate in 1948, spoke his mind about the Lewis contract. He believed that his own law meant what it said and asserted that the Lewis-Fairless agreement "reflects collusion between the mine operators and the United Mine Workers with the intention of violating the law." Mr Taft, who had perhaps had news from Ohio of the effect of the Act on his Presidential chances, announced that the contract was no violation. "The whole theory of the Bill," he claimed, "is that employers and employees should be able to make any contract they want to under free collective bargaining." This was news to many who had voted for it.

If the political consequences of Mr Lewis's victory are uncertain, its economic consequences are just as vague. Indeed, no two authorities can agree even on the amount by which miners' wages have been raised. Some maintain that it is 44½ cents an hour, but Mr Truman has issued a statement proving that it is no more than the 15 cents which has been the standard increase in all major industries. This figure is calculated on the

daily wage, which now becomes \$13.05 instead of \$11.85; but the day becomes eight hours straight instead of seven hours at standard rates plus two at overtime rates. The rise is therefore \$1.20 a day, which is 15 cents an hour on an eight-hour day, as the President says. Somewhere in this calculation the operators have lost an hour's work. They have gained, on the other hand, a certain operating efficiency which will compensate them in part. Overtime will not be paid on Saturday except to men who have already worked the full five days. Previously it was possible, and even habitual, for miners to work on Saturdays at overtime rates instead of on weekdays at normal rates. There will be a saving of overhead expenses on Saturdays in future.

Mr Truman has made an appeal to the producers of coal and steel not to raise prices "until a fair test has been made of the actual effects of the wage advances." He thinks that "they have been enjoying their full share of the high profits which are flowing to industry" and "will want to invest a portion of these profits in the maintenance of business stability." But it is estimated that the increase in "take-home pay" for the miners will be close to \$150 million, and no industry would like to absorb such an amount. Though steel prices have not yet been raised, an increase of \$1.50 a ton is forecast. The coal companies, in spite of the President's appeal, have begun to announce increases. The first rises were of 50c to \$1.00 a ton. The dykes have not burst yet, but the water is beginning to trickle round Mr Truman's fingers.

Coal Comfort

(From Our US Editorial Staff)

THE more Mr John L. Lewis succeeds in forcing up the labour bill that the coal industry has to meet, the more will mine managers hasten to perfect the labour-saving devices which technological research has already marked out. More capitalisation, more machinery, more chemistry and less man-hour expense—this is the indicated path of development for the coal industry in the United States. Experiments already in progress are bearing fruit important not only to Mr Lewis but also to mine operators in Britain and in Europe who seek ways of recovering from too heavy a load of obsolete methods, labour intransigence, or wartime destruction.

In the United States the coal industry, not overly famous for foresight, has gone far beyond the simple process of taking coal out of the ground in order to deliver it for burning in the furnace of a manufacturer or the grate of a householder. Most of America's coal is still used in that way, but the small remainder holds the key to a future in which coal is made into gas, petrol and chemicals at central stations, and neither manufacturer nor householder is loaded with the inefficiencies attendant on carting in coal and carting out ashes. It has even been suggested that the process of rationalisation go one step further and that coal be burned where it lies in the ground, thus by-passing the costs of mining and handling. This latter dream, not yet made commercially practical by sufficient research, may be one of the nightmares that is driving Mr Lewis to get what he can while the getting is good, and before the miner's trade withers away.

Coal and lignite constitute 98.8 per cent of America's fuel energy reserves in mineral form. They underlie vast areas, and are said by the Bureau of Mines to total 3.2 trillion tons. Petroleum, far better advertised and exploited, makes up only 0.2 per cent of those resources, though the American pools still rank as the largest known body of oil reserves in any one nation. Natural gas and oil shale together make up the other 1 per cent. How badly depleted America's oil reserves were by the late war has been definitely announced neither by the government nor by the oil producers, though the angry voices raised by the latter when it is suggested that supplies might be nearing a foreseeable end are revealing. In any event, it is becoming increasingly clear to many people that petroleum cannot be counted on for

increased consumption except at increased cost, and even then for a limited time only.

Twenty years ago such a situation would have thrown this oil-consuming nation into a panic. That industry, the army and the public now view it, in so far as they understand it, with reasonable calm, is due to the chemical engineers who have, in that period, moved from the familiar analysis of the chemical structure of coal and of crude oil, to the discovery of practical methods by which to join their component molecules or take them apart as though they were beads on a string. By so doing they have shown the way to make from the one products hitherto expected only from the other.

It was during the menacing nineteen thirties that British and German scientists succeeded in producing petrol from coal, but at costs several times greater than those of producing it from petroleum. The Germans, working in a totalitarian state where war needs had priority, could afford to do it at whatever expense their processes demanded. The problem facing American industry has been to do it with costs low enough so that the resulting synthetic fuels could compete with natural fuels obtained with far less effort and expense. In view of ample oil reserves and continued improvement in extraction processes, that problem seemed before the war reasonably academic; American rights to I.G. Farben patents for the hydrogenation of coal (which turned it into petrol) were allowed to elapse.

Meanwhile another process toward the same end, the Fischer-Tropsch process of hydrocarbon synthesis, was perfected by the Germans in 1926, and put into commercial operation by them in 1933. Here, too, the costs of the German method are too high for the American competitive economy in peacetime, but experiments already tried suggest they can be reduced. It is in this field that the American genius for taking an expensive, complicated and hand-made foreign process and adapting it for mass production is now at work.

The problem is to turn America's cheapest and most abundant mineral fuel, bituminous coal, into fuels and chemicals which will be more variously useful to the public and hence more profitable to the converters than is the raw material in its present form. The German device—the Winkler gas generator

for turning coal into synthesis gas, which is the first step—will do the job, but the method is clumsy and the costs exorbitant. The Standard Oil Company, under the spur of war, took an important intermediate step by starting part way up the chemical ladder and turning natural gas, abundant in the Southwest, into synthesis gas and from there into light and heavy oils.

In terms of supply, however, natural gas is to coal as 0.2 per cent is to 98.8 per cent. Obviously the next step is to start at the foot of the ladder and work from coal itself. For this purpose the coal and oil interests have joined hands in a new experiment that holds significance for miners and mine operators all over the world. The Pittsburgh Consolidation Coal Company, one of the largest independent producers of bituminous coal in the United States, and the Standard Oil Development Company, are together building a \$300,000 pilot plant at Library, Pennsylvania, which is to lead the way toward coal refineries capable of the fluidised turning of coal into synthesis gas. Standard Oil, intent on pushing fluid catalysis one step further, built a preliminary pilot plant along these lines late in the war. The Massachusetts Institute of Technology and the US Bureau of Mines are also doing exploratory work. The Library plant's purpose is to perfect low-cost, commercial processes for transmuting coal into gas, which will then be combined with the process of hydrocarbon synthesis for making chemicals and liquid fuels out of gas. The end result will be integrated methods of making out of bituminous coal a supply of synthetic petrol and oils, gas fuel of high BTU content, and a range of chemicals, principally alcohols and related compounds. It is not expected that the Library plant will discover new processes. Its specific functions are, first, to obtain design data for commercial plants, and, second, to work out in life-size experiment the practical operating factors and engineering methods that cannot be investigated in a small laboratory.

The new experiment, and the opportunities it implies, present the coal industry with new problems in mining practice. It has

formerly been recognised as desirable to produce as high a percentage of coarse coal as possible because of the greater demand for that size. The coal-oil refinery will, on the contrary, operate on coal crushed to powder. Moreover it appears that a reasonably high content of ash can be handled by the gasification process without great difficulty. The industry is therefore called on to work out a new programme of developing mine machinery and underground transport methods so that in the regions where coal refineries are located, new mines with new equipment and new operating techniques can feed gasification plants with the cheapest coal that has ever been produced from underground sources.

It is at this point, where technological improvements in coal use meet current practices in coal mining, that Mr Lewis and his miners come in—or go out. So also do British and European mine operators, who face the needs of their fuel-hungry countries with machinery obsolete or ruined and management practices inadequate to the demand.

American Notes

Exports and Prosperity

President Truman's mid-year report to Congress this week made some interesting comments on the relationship between the current "export boom" and the very high level of industrial activity. The economic witch-doctors of the Kremlin have for some time predicted that the United States must face in the very near future an industrial slump on the scale of the early 'thirties, and their cries have been echoed far too readily by critics of the Marshall offer nearer home. It is obviously true that an export surplus, running at the rate of \$10 billion yearly, must exert a very powerful lever on industrial trends, and Mr Truman minimised the impact of marginal pressure when he declared that shipments abroad had brought only minor strains within the domestic economy. At another stage in the report he declared that movements in the net balance of payments accounted for no

THE BANK IS INTERESTED

It is interested in its customers, in their affairs and in their business ventures; it is ready, by direct assistance and friendly counsel, to help those affairs forward, for it recognises that the prosperity of the Bank is to be found in the prosperity of its customers. It is, therefore, good business to keep in touch with your Bank. The Manager at any branch of the Westminster Bank will be glad to discuss with you any problem in which the services of the Bank can usefully be employed.

less than three-quarters of the advance in gross national product between 1946 and 1947, and he warned Congress that the net export balance must decline in the absence of new dollar aid for restoration in Europe.

Export problems, however, were put into their true perspective by Mr Truman when he contrasted the present rate of shipments with total American productivity, and with a gross national product which has now reached an annual rate of \$225 billion. It is essential on this side of the Atlantic to bear in mind that the current rate of business activity is supported also by a vast back-log of demand both in respect of capital equipment and consumer goods. Continuance of the export surplus at current levels would be less than sufficient to sustain national income and employment, if home demand were to slacken. Indeed, the grant of "Marshall aid" by Congress on any conceivable scale will not be sufficient to hold exports at the rate of early 1947, since North and South America together have been taking between forty and forty-five per cent of shipments from the United States, and have been straining their own resources on a scale which cannot last and which is already bringing counter-measures. As events are now shaping, the economic position of the United States would be strengthened, rather than weakened, by at least a temporary setback in exports, since their present effect is less to maintain the volume of output than to exert a very strong marginal pressure on the price level. This is true particularly of farm products. The Marshall offer does, of course, proceed from a clear realisation that world stability is desirable for American security and longer-term prosperity. But it is not based on fears of a more or less immediate, prolonged, and incurable slump.

Despite all this, it remains true to say that Congress will be more willing to listen to Mr Truman and Mr Marshall in the event of a fall in exports and a temporary break in the business boom. For, while such a development seems almost inevitable within a fairly short-term period on domestic—apart from export—probabilities, attention will obviously fasten upon the export decline as a source of troubles. The Presidential elections are well over the horizon and Congressmen will be reluctant to incur the charge that their obstruction and delays contributed to a decline in employment and incomes. But it is fully apparent from Mr Marshall's present efforts that "sales resistance" is still met with in some force on Capitol Hill. The immediate mood has been well defined as a blend of "healthy scepticism and unhealthy cynicism." There was a very natural shock not many days ago when the President declared against a special session of Congress, and a disposition in Europe to believe that Washington was waiting for some drastic action on this side before going ahead. No doubt Mr Truman and his supporters in Congress wish to see a more realistic policy in London and Paris. But, machiavellian turns apart, the year-end may be the best time to demand a speedy decision in Congress.

Funds for Foreign Relief

Mr Truman's cautious first lesson in the economics of the Marshall plan followed a victory by the Secretary of State in the battle for foreign relief. The House has finally voted the appropriations to finance American relief in Europe and Asia and American loans to Greece and Turkey, with the only cut finally enforced against relief for Poland and Hungary. Even this may be rescinded in the Senate. This was a battle which it had erroneously been thought to be won six weeks ago; but in this session of Congress nearly every battle has had to be fought twice. It is a pity, however, that Mr Marshall should be forced to cry "Wolf!" so often or that sympathetic Republicans like Mr Eaton should so easily invoke the nearness of war.

The debate in the House lasted only an hour, but it had one instructive moment when an amendment denying aid to any nation which failed to co-operate in the Marshall plan was shouted down. It was rejected not on the ground advanced by Mr Harold

Stassen last week (that the United States should not turn its back on the eight countries that have abstained from co-operation with Mr Marshall), but on the ground that such an amendment might imply advance approval of Mr Marshall's programme. The House is jealous of its prerogatives and will refuse to be hurried. It has just appointed its own special 19-member committee to study needs abroad and resources at home.

One reason for the President's habitual vetoes of tax-reduction measures may be the desire to have on hand funds for financing the Marshall plan without either increasing the debt or appealing for new taxes. But latest reports suggest that the budget surplus may now prove to be smaller than either the President or Congress had hoped. The Senate has refused to be "Taberized"; it is busy restoring many of the cuts imposed by the House, particularly on activities dear to the farm states. The rapid rate of spending of the British loan, the \$400 million loan to Greece and Turkey and the higher costs of administering the new labour law will help to keep the surplus down. Uncle Sam, unlike Uncle Dalton, is not ostentatiously jingling the spare cash in his pocket.

The Domestic Scene

On the domestic side, Mr Truman's report was able to give some remarkable evidence of national prosperity. "Month by month the recession has failed to materialise." There are now sixty million jobs in the roll of civilian employment (presumably not counting Mr Henry Wallace). Gross national product, at an annual rate of \$225 billion in the first half of 1947, compares with \$204 billion in 1946 (all recent figures have been revised upwards), while personal incomes are now two and a-half times those of 1940, and more than four times the low point of 1933. Meanwhile, the consumers' price index gives the less than generous assessment of an increase by 20 per cent over January, 1946, while food prices are up by 50 per cent, and clothing prices by almost one-third.

As suggested here last week, the President can do no more at this stage than to repeat his earlier warnings to industry and labour on the dangers of the price spiral. The danger of fresh advances in the immediate future has been reinforced by damage to the corn crop, which the President now estimates to be at least twenty per cent below that of 1946, given favourable weather conditions until autumn. It is perhaps more than a little difficult to measure the precise value of these economic reports issued by the President, following consultations with the Council of Economic Advisers, and based, in the main, upon the conclusions reached by that Council. The report issued this week was clearly of value in the context of the Marshall offer because it gives an overall picture of the economic situation, linked to the requirements of foreign countries, and to the desirability of plans for rehabilitation. Moreover, the CEA reports, apparently, accelerate the pace at which economic information flows from the government agencies.

It seems more than a little doubtful, however, whether this information represents any net addition to the information already reaching the White House through the Department of Commerce and the Federal Reserve Board. This lack of fresh information is not in itself a valid argument against the CEA as a co-ordinating agency. But if the CEA is to make any particularly valuable contribution to economic debate, it must surely draw a sharp distinction between the long-term, analytical work designed to cover the whole range of government activities, and specific, short-term measures upon which Congress and the President should concentrate at any given point. For example, the Council could at this time have made specific recommendations (one way or the other) concerning such recent controversies as consumer credits, service bonus payments, tax relief, and state control of rents, now that Federal controls have been abandoned. And it should also be prepared, surely, to suggest the mechanisms which may be necessary if heavy grants for overseas restoration do coincide with full employment at home. On the other hand, it should make adequate preparations for a flexible tax policy to become operative as and when the present inflationary situation gives way to a slower pace of activity. It is far too early to suggest that the CEA is no more than just another agency for the accumulation of data which most Congressmen are unwilling to study. But it is not too soon to suggest that it must be prepared to give more definite rulings on short-term policy.

Outlook for Construction

One point stressed by the President's report to Congress deserves special mention. In noting a slackening pace for some equipment expenditures, and in the rate of inventory accumulation,

the President declared that a "compensatory expansion in construction, mainly residential, did not appear on an adequate scale, because building costs remained high." This warning on costs reinforces earlier forecasts from such agencies as the Department of Commerce, which in April revised the construction estimate for the current year from \$15 billion to between \$12 billion and \$13 billion, suggesting that the physical volume of building, including repair and maintenance work, would not in fact show any decisive change on the level for 1939.

Authoritative estimates certainly do not confirm the joyous forecasts given by the construction industry following the abandonment of price, priority, and allocation controls, and the decision to allow a general relaxation of rent controls. Residential construction figures have been especially discouraging in recent months. In 1946, operations in this sector were held up by labour and material shortages, and although a start was made on about 1,000,000 housing units (670,000 permanent) performance fell well below promise, the total of permanent units completed being 454,000 only. Estimated construction this year is not more than 800,000. With the building labour force considerably higher than a year ago, and with the restoration of pre-war organisation for merchandising and contracting, the industry should be capable of far higher levels than this, and building delays which raised costs heavily throughout 1946 have been reduced to a point which compares fairly well with pre-war years. But costs remain obstinately high—they are now probably double those of 1939—and the average purchaser is now very unwilling to meet 1947 charges. A recent survey of the consumers' market (discussed briefly on June 28th), moreover, revealed that a very large proportion of potential buyers simply have not funds available for the high deposit now necessary. A further factor in the uncertainty surrounding the residential trade is the curtailment of loan powers for ex-service buyers, formerly held by the Reconstruction Finance Corporation.

A recent survey in the *Federal Reserve Bulletin* reached the conclusion that "construction markets seem (now) to depend to a considerable extent on the volume of work that can be undertaken without the usual regard for cost. There is a real question whether current and prospective levels of income, for both business concerns and consumers, can continue to support the present level of construction costs or of real estate prices." In so far as potential demand is concerned, the position is no doubt healthy enough. But some very vigorous action is needed to reduce building costs, and it may well be that, as suggested in these columns not long ago, maladjustments in the building industry are already working towards the point where reactions will not be confined to that industry alone.

Flood Crest

The most destructive floods in the history of the modern United States have provided an opportunity for Mr Truman to demonstrate the superior manoeuvrability of the Presidency, even when Congress has the final word. Earlier this year he snatched the Communist issue from the Republicans; last week he made flood control a Democratic war-cry. On this issue the Republicans are particularly vulnerable, for during the past session the House, at least, has slashed funds for irrigation, flood control, conservation and power developments in the West.

In his message to Congress, Mr Truman said:

The major opportunity of our generation to increase the wealth of our nation lies in the development of our great river systems. I urged in the State of the Union message, on January 6, 1947, that the programme for improvement of our rivers be pushed with full vigour. Since that time the urgency of one phase of our water resources control programme has been demonstrated forcefully and tragically.

Since 1937, over a billion dollars' worth of damage has been suffered in the Mississippi basin, the rich central core of the United States; and there has been a washing away of soil re-United States; and there has been a washing away of soil re-United States; and there has been a washing away of soil re-United States; and there has been a washing away of soil re-

The President, who is on record as favouring for the Missouri Valley a creative authority like the TVA, once more expressed his belief that the most efficient and economical approach was through multi-purpose dams, which not only harness floods in the lower reaches, but conserve water and soil up-stream, improve naviga-

tion and supply cheap power. But the TVA, now having its funds slashed, is no happy example to cite to economising Congressmen, despite the spectacular exemption of the Tennessee Valley from this year's floods. Flood control alone is far less controversial.

Yet even this summer's catastrophes will ensure no speedy action. The Republicans will prefer to introduce their own flood control programme next year; and even among friends of the valley authority idea there is strong criticism of the President's suggestion that \$237 million of the first year's funds should go to the army engineers. Taking the middle course guarantees, if nothing else, that the President will be under fire from both sides—while the Middle West is under water.

Line of Succession

In the phrase so beloved by the American press, only a heart-beat now stands between a Republican and the Presidency. Both the Senate and the House have now passed the Bill providing that in the event of the President's death when there is no vice-President, the Presidency should fall, first to the Speaker of the House, and in the event of his death, to the President *pro tempore* of the Senate. There is no question of a Presidential veto, as the law embodies a suggestion of Mr Truman's expressed both before and after the Republican victory at the last election.

It is Mr Truman's belief that no President should have the right to appoint his own successor, as would have been the case during the years when the Secretary of State stood next in line. But this is an argument of limited application, for no one would deny that Mr Roosevelt, in the years of his authority, chose his own successor, in the persons of Mr Wallace, and, as it proved, in fact, of Mr Truman. The willingness of the Republicans to pursue the Presidential suggestion arises not so much from a desire to see Mr Martin succeed to the White House—a possibility calculated to make even the Republicans pause—as from the fact that Mr Truman's death in office would, under the existing law, make President the man most capable, if he so desired, of engineering a Republican defeat in 1948: Mr Marshall, the Secretary of State.

The new law returns to the line of succession which prevailed before 1886. It is difficult to see that it improves the quality of possible Presidential timber; and it may even prove unconstitutional. With all deference to Mr Martin, his record does not suggest that the Speaker of the House is usually better fitted to succeed than the average Secretary of State. The Speaker is chosen for ability as a politician, rather than as a statesman; he may be closer to the will of the people than an appointed member of the Administration; but he is chosen as a Representative of one small constituency, not as a possible President. The new law may raise the level of the Speakership, but it has not always had that effect on the Vice-Presidency. In times when, as at present, Congress and the Administration are of different political parties, the new law would, on a President's death, change the whole character and tenor of the Administration without direct popular consent.

The possibility that the new line of succession may be declared unconstitutional arises from the fact that the Constitution declares that "an officer of the government" shall succeed in the event of the deaths of both President and Vice-President. Neither the Speaker nor the President *pro tempore* of the Senate (now Mr Vandenberg) is usually so regarded. The line of succession established in the new law is largely hypothetical. The Presidency has never passed beyond the Vice-President. But if changes are to be made, various other suggestions, such as that for two Vice-Presidents, would seem to have more merit if the chief aim is to name an heir-apparent worthy of the office.

Shorter Notes

Advocates of the "white primary" received a rude shock last week when a US District Judge ruled it illegal to bar negroes from the Democratic primaries in South Carolina. In 1944 South Carolina repealed all the state laws pertaining to primary elections, in the hope that this would enable white Democrats legally to bar negroes from participating in a white man's club. The judge branded this "pure sophistry."

A moving story from South Carolina tells the tale of a negro war veteran who won a \$3,000 Cadillac car in a Kiwanis lottery. When it was discovered that he was a negro, the ticket he held was declared to be "unauthorised" and the car was given to a white doctor who already possessed a Cadillac. This aroused such a roar of protest from the national Kiwanis organisation that the negro is now to be given a second Cadillac—though, as he remarked plaintively, the money would have been more useful.

Inflation versus The Monnet Plan

(From Our Special Correspondent)

NO better and no worse capital could have been chosen than Paris for the discussions on the economic integration of Europe. None better, because in France every problem of Europe's economic disintegration crystallises. Here around one is all the evidence of war-shattered economies, of the clash between concepts of security and reconstruction, of the deep cleavages between political parties (irreconcilable by normal democratic methods) that have to be understood and allowed for in any realistic appraisal of the European economic situation. None worse, for certain minor but important practical reasons; because even by European standards France can be so inefficient; because, for example, so much time can be wasted, so much frustration and hopelessness can be engendered and experienced in what should be the simple task of putting through a local telephone call. Whatever design for Europe is evolved in this setting and with these object lessons strewn around, it should be imbued with a sense of reality and conceived in full knowledge of the problems that have to be overcome.

The economic situation in the midst of which the negotiations are proceeding could hardly be bettered as an illustration of the difficulties that must be surmounted before Europe becomes a self-supporting and viable economy. The French economy is attacked by two main enemies each with its host of subsidiaries. The first is clearly visible. It is the lack of coal—that common denominator of all European economic prostration. The second is more concealed and therefore more dangerous. It is monetary inflation and all that goes with it: loss of confidence in the currency, inadequacy of savings, breakdown in the distributive system, interruption of production by periodic labour strikes as the spiral of wages tries to catch up with that of prices, negation of all intelligent estimation and planning.

Coal Bought with Dollars

The problem of coal supplies is fundamental. The French economy is geared to the use of about 70 million tons of coal a year. Last year it had to make do on little more than 50 million tons, and, though the plan for this year puts consumption at 64½ million tons—53 million tons domestic and 11½ million imported—there are grave doubts whether that target will be achieved. If it is not, the fault will lie with France's overseas suppliers and not with its own producers. The latter have brought output well above the immediate pre-war figure, though it is only just getting back to the 1929 level. In 1938 the monthly coal output averaged 3,963,000 tons. Last year the figure had risen to 4,108,000 tons. By last April, the latest month for which figures are available, the output was 4,209,000 tons. This recovery, however, has been accomplished with a much larger labour force than was available in 1938, and the daily output per worker—which in that year was 1.22 tons—was still as low as 0.96 tons last April, though this represented a considerable improvement on the figures for 1945 and 1946.

The coal gap, however, is seen most clearly in the import figures, and the following table points unerringly to the culprits responsible for France's deficiency:—

	1938	1945	1946
Great Britain	6,500	1,320	718
United States	...	2,450	5,181
Belgium	4,900	170	426
Germany—Saar	1,700	420	1,295
Ruhr	5,500	816	2,088
Poland	1,600	...	561
Others	2,600	...	121
	22,800	5,176	10,390

Apart from the latest total being inadequate, this distribution of coal imports is wholly abnormal. Coal from the United States is already uneconomically expensive when it is loaded in American

harbours. By the time freight has been paid across the Atlantic and allowances made for the fact that the ships return to the United States three-quarters empty, these imports have become an intolerably heavy drain on France's very exiguous dollar resources. The main deficiency, as compared with 1938 is in British coal. This applies not only to France but many of the countries now represented in the Marshall plan discussions.

Efforts have been made by the French to work up imports of coal from Poland. In spite of Polish intransigence in the matter of payments—they insist on payment in dollars—it is hoped to raise imports from this source to an annual rate of three million tons. It is, however, to the Ruhr that France looks for its main additional supplies of coal. The present plans for industrial production assume minimum imports of 500,000 tons a month from the Ruhr for the second half of 1947, rising to 1,000,000 tons a month from the beginning of 1948. This expectation raises the whole problem of the level of industrial output in Germany; it will unquestionably provide the most controversial of all those topics that will be drawn into the vortex of the Paris discussions, which are to produce the answer to Mr Marshall.

In spite of the shortage of coal the French industrial plan for 1947 is not going seriously awry. Industrial output as a whole for the first half of 1947 was about the same as that for 1938, which, admittedly, was a poor year. The excellent recovery in production which was made in 1946 is being rather more than held, but the impression is that the momentum of last year has been lost and that 1947 is proving a period of somewhat halting and painful progress. None the less, the following figures show what is being achieved in some of the basic industries:

PRODUCTION IN FRENCH BASIC INDUSTRIES

	Monthly Average, 1938	Monthly Average, 1946	April, 1947
Pig iron (thousand tons)	501	288	416
Index	100	57.5	83
Steel (thousand tons)	518	369	508
Index	100	71.2	98.1
Electric Power (million k.w.h.)	1,548	1,848	2,110
Index	100	119.4	136.3
Cars and Trucks (units)	3,260	5,215	6,370
Index	100	160	195.4
Woolen goods (tons)	6,650	4,210	4,702
Index	100	63.3	70.7
Cotton goods (tons)	12,083	8,442	10,339
Index	100	69.9	85.6
Rayon goods (tons)	2,334	2,575	3,300
Index	100	110.3	141.4

This is a picture of solid progress, though, it should be added, the progress falls appreciably short of what had been envisaged in the Monnet plan. Shortage of coal is probably the main cause of the deficit, but it is not the only one. The increasing pressure on the French balance of payments and the consequent curtailment in imports of certain essential commodities, notably of lead and tin, may have played a part in retarding the rate of progress. This, however, is unlikely to have been an important part. On the contrary, the evidence suggests that France has gone headlong into her foreign exchange crisis, at a pace even greater than that maintained by Great Britain, and with an equal lack of corrective cuts in the import programme.

That import programme has kept very close to the plan, and, given the rise in dollar prices, it converts itself into much higher monetary terms than those incorporated in the estimates. The Monnet plan envisaged imports to the value of 190 milliard francs for 1947. The actual figures, for the first half of the year alone, amount to over 120 milliard francs.

While imports are running at well above the estimated figure, exports are falling somewhat short of the Monnet Plan estimates. The exports from metropolitan France were estimated in the plan at 134 milliard francs, or at 178 milliard francs expressed in terms of January, 1947, prices. The figure has already been readjusted

downward to about 140 milliard francs, reflecting a considerable reduction in the expected volume of exports. In some part this is due to low production and the absence of goods available for export. But a more serious factor is now coming into play: it is the rise of French costs and prices to a point at which French goods are becoming too expensive for the export markets, even for the sellers' markets which still obtain to-day. That is a factor which leads straight to the complex problem of monetary inflation.

Before turning to factors of essentially monetary and fiscal character, mention must be made of the deterrent effect of bad planning and administrative inefficiency. Much of the administration of distribution and price control is unintelligent to the point of ineptitude.

In fixing the price of wheat at about four times its pre-war level, while the price of meat has been allowed to rise on an average to eleven times, that of butter fourteen times, and that of potatoes over twenty times the pre-war figures, complete nonsense has been made of the whole machinery for distributing and retailing foodstuffs. The result is clearly evident in France today, where farmers are refusing to give up their wheat to the authorities and are either hoarding it or feeding it to their cattle; while the maize which should be used as feeding stuff is being consumed by the people in the form of maize bread. This example of inept

price fixing is typical. The whole system is riddled with discrepancies and contradictions of this character. When allied to inadequate and ineffective control machinery they lead to the development of inordinately profitable black markets, such as those that flourish in tobacco and petrol, or else to complete disregard of rationing systems, as in the case of textiles, where the coupon scheme has recently been abandoned solely because the shopkeepers refused to work the system.

A recent report of the Comité Central d'Enquête sur le Cout et le Rendement des Services Publics pleaded for an increase in the number of officials who today are vainly attempting to enforce the rationing and price control systems. The report received most sympathetic consideration by Ministers, but none the less the relevant appropriation was one of the first to be cut in the recent budget pruning. There is, therefore, little hope of improvement on this sector of the economic front. Yet the other alternative, namely, the return to free markets, is unthinkable at the moment, because of the absence of confidence in the currency, of the propensity to hoard which is already so strongly developed, and of the real shortages of consumer goods with which France is likely to be faced for months and perhaps years to come.

[A further article will examine the fiscal and monetary problems facing the French Government.]

Indonesia—The Real Issues

(By a Correspondent)

ON Sunday Dutch Forces in Java opened military operations against the Indonesian Republic, and so far appear to be meeting with only slight resistance. The object of what the Netherlands' Prime Minister, Dr Beel, describe as "police action" is, in his own words, "to achieve what the Republic itself appears incapable of doing," that is to re-establish peace and order, industry and commerce by implementation of the Linggadjati agreements.

The Netherlands-Indonesian Union, as outlined by the Linggadjati Agreement signed between the Netherlands Government and the Republic of Indonesia, is an ingenious pyramidal structure intended to unite the 70 million people of the 3,000-odd islands of the Indonesian Archipelago and eight million people of Holland in a new federal constitution under the Dutch Crown. This federation will consist of two units: the Kingdom of the Netherlands (comprising the Dutch West Indies) and the United States of Indonesia, whose components may in turn be also smaller federations. So far the USI consists of two equal members: the Republic of Indonesia based on Jogjakarta, the royal and ancient capital of Java, which was proclaimed by President Soekarno on August 17, 1945; and East Indonesia, with its capital at Macassar in Celebes, established by decree of the Lieutenant-Governor General, Dr H. J. Van Mook, in December, 1946.

By the Linggadjati Agreement the Republic of Indonesia has now been recognised by the Dutch as exercising *de facto* authority over Java, Sumatra and Madura; while East Indonesia comprises the islands of Celebes, the Moluccas and the Sundas. In Dutch Borneo two states have come into existence: West Borneo based on Pontianak, and Great Siak, comprising South and East Borneo, based presumably on Banjarmasin. These may either federate into a single State of Borneo which then in turn may join East Indonesia or they may apply for direct affiliation to the USI. But the Minahassa in North Celebes, Ambon in the Moluccas and Dutch Timor in the Sundas have petitioned Queen Wilhelmina for self-government within the framework of the Kingdom of the Netherlands, as they are unwilling to join either the Republic or East Indonesia. The Menadonese in the Minahassa and the Ambonese are mainly Christian communities and hitherto provided the Dutch with the bulk of their native army. These facts have to some extent estranged them from other Indonesians, whose dominion they fear on account of possible reprisals. Dutch New Guinea will in any case probably remain under the direct administration of the Crown owing to its political and economic backwardness.

Since the Linggadjati Agreement, Netherlands-Republican negotiations have been concerned with the formation of an Interim Government to administer the whole area from now until the USI comes into being on January 1, 1949. Directly it was signed the Dutch, still confined to the occupation of bridgeheads in the Republic area (Medan, Sabang and Palembang in Sumatra; Batavia, Surabaya, Semarang and Bandoeng in Java) began to press the Republic to start putting it into force at once. On May 27th the Dutch Commission-General issued what really amounted to an ultimatum, that the Republic should at once take part in establishing a single currency; joint boards for the control of imports, exports and foreign exchange; and military co-operation to terminate the hostilities which still take place on the perimeter of the Dutch bridgeheads. Thus when at last a political agreement seemed to have been reached, a new breakdown threatened on the economic and military issues.

What the Dutch allege to be recalcitrance on the part of the Republic is more easily understood when set against the underlying issues which are seldom formulated by either party. Before the war the entire economic life of the Indies was a capitalist economy under the Dutch. In particular, they controlled—apart from the staffing of the administrative services—shipping between the islands, a huge industry of which the bulk is in the hands of the K.P.M. shipping line; and the profits on all exports. Now the Republic has declared for a Socialist economy in which all these activities would be nationalised. If it should succeed in cutting the Dutch monopoly of these three sources of profit, it has been

calculated that the present standard of living in Holland would fall by 30 to 35 per cent. Under the present system the world prices of rubber, for example, are dictated by capitalist concerns in New York, London and Amsterdam, over which the Indonesian has no control whatever. In common with all other Asiatic countries, the Republic now demands an increase in internal wages and a major share in the profits on its own exports. So the fundamental issue behind the current negotiations is a new expression of the world-wide struggle between the forces of private enterprise and state Socialism.

End of the Old System

Ostensibly the present disagreements turn on the structure of the joint Interim Government. Is this to be, as the Dutch propose, merely a "reconstruction of the Netherlands Indies Government as a central apparatus of the future Federation" with the incorporation of a larger proportion of Indonesians as the only major difference from pre-war days? Or is it to be, as the Republic desires, not merely a new form of government, but a government harnessed to a new purpose and embodying at least some Republican institutions? Before agreeing to co-operate in forming joint economic controls, the Republic wants some guarantee that Indonesian representatives will not become mere stool-pigeons, manning and financing a system it is their declared purpose to destroy.

In conformity with Linggadjadi, it has so far been agreed that the head of the Interim Government will be a representative of the Netherlands Crown which, during the transitional period, remains sovereign over the whole area; that external relations will be conducted by a joint federal foreign service; and that all property in Republican territory will be unconditionally restored to its legal owners. The last two points represent concessions by the new Prime Minister, Amir Sharifuddin. He, though a Christian and educated in Europe, stands on the left of the Socialist party, and is likely to prove less conciliatory than his predecessor. The Republic is adamant in refusing to admit Dutch personnel to the internal police force in Java and Sumatra. Considering the narrow interpretation which the Dutch formerly placed upon civil and political liberty, and their rigid repression of the Republican movement in South Celebes since liberation, Republican intransigence on this point is hardly surprising.

Despite the adoption of an embryonic constitution, the political situation everywhere in Indonesia is still very fluid. Within the Republic there have been signs of separatist movements among the Sundanese in West Java and the Batak in Sumatra. In some non-Republican areas, where the Dutch retain strong influence, though not their old power, there is strong nationalist support for the Republic, especially in politically volcanic South Celebes and in Bali. Though the Republic still aspires ultimately to absorb the rest of Indonesia within its own unitary and socialist constitution, it has now officially "recognised" its rival state of East Indonesia. Possibly Jogjakarta reckons that the East Indonesian Parliament, which opened at Macassar on April 22nd, is too virile to remain long in Dutch leading-strings, and that sooner or later the Republican heaven will "out." The Prime Minister of East Indonesia, Najamoeddin Daeng Malewa, the "prau king" of Macassar, who, as a potential tammany boss, is perhaps the most significant Indonesian politician, recently declared that "East Indonesia stands for planned economy and social justice."

America Steps In

The overriding concern of the Dutch and of the outer world, especially America, is to re-start international trade in the products of Java and Sumatra. As Mr Bevin emphasised at Margate, "were the NEI at peace the far rationing difficulties of the world would, in twelve months, be solved"; though he omitted to add that in July, 1945, Britain had to reject an offer of 10,000 tons of copra because it was unable to supply the textiles in which half-payment was required. The USA is making Indonesia a new theatre of dollar diplomacy. When Linggadjadi was signed a reconstruction loan of \$300 million was proposed, and in the recent crisis the US Government has been bringing pressure on both parties to implement Linggadjadi by forming an Interim Government as "a pre-requisite to rehabilitation"—in other words: No Interim Government, no American loan. This sense of urgency is not shared by the Republicans, as their food situation is adequate and Java's rice surplus is being exported to India in exchange for the all-important textiles. Though fully alive to the need of foreign development loans to buttress their newly won political independence with economic stability, the Republic has no intention of purchasing economic reconstruction at the price of that independence. In this connection it is noteworthy that

Prime Minister Najamoeddin has expressly opposed the acceptance of American loans, though desirous of loans from Holland and other small countries.

A young Dutch woman of the Dutch WVS, returning from Indonesia last year, succinctly expounded the situation as she had absorbed it from the long stream of repatriate internees: "You see, we cannot give up our Indies because without them we should have no money and no jobs for our young men." Dutch anxiety to recoup their war losses from Indonesia has received a fresh impetus from the loss of the German market which formerly absorbed the bulk of Holland's agricultural exports. As a race, the Dutch are more reluctant than ourselves to confront an unpleasant situation. So, though there is little to justify the hope that their former prosperity will ever return on its old scale, they still tend to be imbued with the 1918 spirit that everything is bound to get better and better. Due partly to this attitude of mind, the final ratification of Linggadjadi was held up for four months while the Netherlands Government at The Hague tried to browbeat the Republic into adopting as an integral part of the Agreement unilateral interpretations of it in the form of (1) an "explanatory memorandum" by the Dutch Commission-General; (2) a "statement" by the Minister of Overseas Territories. This rather irregular procedure did not succeed, and eventually the Netherlands Government was obliged by foreign pressure to ratify the original text without amendment.

Diehards at The Hague

After this delay on the Dutch side it is not surprising that the Republic jibbed at the shock tactics introduced by the Dutch after signature. With the opening of full-scale hostilities the patient conciliatory policy, after which Dr van Mook has striven so tirelessly, was abandoned, and one is obliged to question whether after all he has been out-maneuvred by the diehards at The Hague, having as their real motive for holding up the agreement a desire to gain time in which to complete their military preparations, so that the concessions contained in it may be whittled down when hostilities end.

The difficulty of his position during the past two years as the storm centre between reactionaries in Holland and extremists in Java has not been fully recognised in this country. The persistent rumours of his impending dismissal, circulated by his enemies at home, were scotched by an official statement on June 11th, that he is to remain in office "until the political situation allows his request to be relieved of his post to be met." That van Mook only induced The Hague to make the concessions represented by Linggadjadi by threat of resignations if they refused is generally understood, and his presence in Java is the best assurance that when, as eventually they must, both parties meet again across a table, the Republic will not receive worse terms than before, and that what he described as the Netherlands Government's "unchanged desire to execute the political programme of Linggadjadi" will in fact be observed.

Deadlock in Cyprus

[BY A CORRESPONDENT]

"THERE is grave danger ahead if the trustee power lags too far behind," prophesies an African in a new book on Nigeria. If so, "nationalism will know no moderation; when it is in the saddle, it rides hard." If this prophecy may become fact in Nigeria, it is already so in Cyprus, where a population that is mainly European in descent, and at least equal to wide tracts of the Balkans in culture, has long been restless and is now openly hostile to the British rule. Its goal is "national rehabilitation," alias *enosis*, which means union with Greece. Within the months since its prospects were reviewed in *The Economist* of October 26th, the mood of its *enosis* has hardened. "Enosis or nothing" is now their cry. A new governor is trying, by means of internal reforms, to soften their intransigence. Can he succeed, or are they set in a gallop via misunderstanding to deadlock?

Recent facts are soon told. Lord Winster arrived in March. At the time of his arrival the Cypriot Left was strongly against the British support of the monarchy in Greece, and believed that Greek union would allow them to throw their weight into Balkan politics; Right-wing elements, although nominally adhering to the idea of union, were considering whether, with the position in Greece, this was the time to press their claim. When a former Secretary of State for the Colonies, Mr Amery, visited the island earlier in the month, he was quick to realise this, and wrote a

reasoned article advocating a British-Greek condominium, offering double citizenship to all who wished it. If this had been pressed, and the Cypriots could have been convinced of British *bona fides*, it might have enabled the Right-wing to co-operate without loss of dignity or support.

On Lord Winster's arrival, the Left-wing, fearing the possibility that the Right might come to terms with the British either on autonomy or future promises of some sort of Greek citizenship, proposed a complete boycott of the Government Ten-Year Development Plan which should be emphasised by a refusal to attend the new Governor's first reception. There is every indication that a number of Right-wing leaders were opposed to the idea, and there are amusing stories of domestic quarrels with wives who bought new dresses for the occasion; but a polite reception by the Right, in the face of abstention from the Left, would have resulted in accusations of fawning to the British or of scheming for autonomy. Either would have meant a serious loss of popular support. They therefore abstained.

Lord Winster had not been in the island long enough to judge the position first hand or to realise the character of the Cypriot. He was forced to rely upon the advice of the old machine, and promptly dismissed the abstaining members from the Advisory Council, which was then left with only two Turkish members. The action was necessary to uphold British dignity. What he did not take into consideration was that he was the successor to a line of Cyprus Governors who had possessed dignity and very little else.

To say the least, the action was unfortunate. It removed the last hope of any co-operation from the Right, and made the chances of forming any sort of Advisory or Administrative Council negligible. In addition, it strengthened a jubilant Left. The AKEL party, for the first time, identified their demand for Greek union with their Communist claims, and the *Enosis* movement was widened to include open support for Left-wing movements in Greece.

Lord Winster is a sincere person, and those who know him are impressed by his desire to come to a real understanding with the Cypriots. But few Cypriots are disposed to meet him informally or with constructive ends in mind. He set about the usual opening round of visits to villages from which the element of patronage

is difficult to eliminate, and he started upon his proposals—ultimately issued on July 9th—for a Consultative Assembly invited from among the mayors, the Bar, the doctors, the press, the trade unions, the chamber of commerce and other bodies of local standing. The purpose of the Assembly he proposed was to frame the island's future constitution.

Meanwhile, however, the *Enosis* movement had received new impetus. Its focal point has always been the Church—the body which, seeing in a Greek future its best chance of survival—preserved Greek national characteristics and consciousness throughout 300 years of Turkish domination.

In fulfilment of a promise made from London, elections for a new Archbishop of the island were held in June. The man elected was Bishop Leondios of Paphos—a remarkable and highly educated person who went to Colombia University and who is regarded as a possible successor to the ageing Ecumenical Patriarch of Constantinople. Bishop Leondios is a confirmed *enosis*. He promised his flock the establishment of a new Ethnarchy Council to conduct the "national struggle," and advised them to "seal their ears" to the Governor's proclamation establishing a Consultative Assembly.

To whom will they respond? The Briton who tries to work out the answer should remember that the Greek Cypriots, though they have never been administered from Greece since 300 B.C., push aside history as British propaganda and maintain a sincere belief in their connection with Athens. The peasant follows the Church's lead. The industrial workers, bound together by strong Left-wing trade unions closely allied to the Communist AKEL party, see in Greek union the chance of a weak government and struggle for the overthrow of imperialism. The professional classes, embittered by years of playing second-fiddle to higher-paid Britons, look towards Greece as a country in which they would possess equal social and economic status. The politicians, remembering the example of Venezelos, and Crete, see in Greek union a chance of enlarging their sphere of activity.

Given such a state of mind, the Archbishop starts the contest at an advantage. The British Government would be wise to strengthen Lord Winster's hand by thinking out an offer to be made in conjunction with the Greek Government. There is now no other way out.

To those who are struggling to moderate their smoking, we suggest that the transition can be made smooth and pleasurable by a change to Rothmans Pall Mall de Luxe—a delectable blend, too good for chain smoking.

THE BUSINESS WORLD

Transport for Oil

THE post-war pattern of the world's oil industry is unfolding. On the demand side there are three dominant factors: the high level of consumption by the United States—now increasing at a record pace; the slow but potentially great expansion of demand in Europe as industry and transport recover from the war; and the growing importance in all markets of oil products other than petrol—especially diesel oil, heavy fuel oil and oil for chemicals. On the supply side are two outstanding factors: the growing importance of Middle East oil supplies and the changing position of the United States from self-sufficiency to that of an importer of crude oil to provide marginal supplies for its refineries. A high, sustained demand and a shift in emphasis from America to the Middle East as the world's primary source of oil are the keystones of the situation. That these factors are helping to shape the policy of the oil companies has been clear from the recently published accounts and chairmen's remarks of Shell Transport and Trading and the Anglo-Iranian Oil Company.

Important changes in the direction of the international oil trade are involved. If the potential demand for oil is to be equated with supply within the next few years, some considerable increases in tanker and pipeline capacity will be required, for the present capacity of each is insufficient for the purpose and its geographical distribution has to be radically changed. Given the present cost and price structure, the obvious strategy which the oil industry is now working out is to use the Middle East oil supplies particularly as a source for petrol and fuel oil for European markets and to use American oil reserves outside the United States for the United States and West Indian oil refineries to supply world markets with petrol, kerosene and heavier oils.

The emergence of the Middle East as a major source of supply was visible ten years ago, when foundations of the post-war transport pattern were laid with the construction of the first Middle East pipeline by the Iraq Petroleum Company from Iraq to the Mediterranean. The crop of inter-group oil pacts in the Middle East seven months ago showed that this enormous field has now become the object of major decisions of Governmental and oil company policy to ensure continued oil supplies. But to raise oil is useless if it cannot reach the market, and success in equating the potential world demand for oil with supply during the next few years depends in a

large degree upon sufficient transport capacity. The problems involved can be summed up in three questions. Are there enough tankers to move the oil? Can they be mobilised for international trade? And, finally, can pipeline capacity be expanded quickly enough, especially in the Middle East, to ease the burden on tanker capacity in carrying the increased flow of oil required?

Table I shows world total tanker tonnage and the principal owning nations in 1939 and 1946, together with tonnage under construction at June, 1947. The war saw a remarkable expansion of 40 per cent, despite sinkings, in world tanker tonnage. It also saw a revolution in the disposition of that tonnage. In 1939, the United States owned 26 per cent of the world total: by 1946 it owned 59 per cent. Britain and Norway had lost ground heavily by 1946, but Britain has been trying to improve its position since. In June, 52 per cent of world tanker tonnage under construction was building in this country. Building new tonnage, however, can only slowly rectify the balance in the ownership of world tonnage; meanwhile the United States has a surplus, while Europe is desperately short for its own needs. To transfer the American surplus to Europe would be theoretically an attractive solution, but for several reasons it is not practical. Under the Merchant Ship Sales Act, tankers built during the war for the United States Government must be offered first to Americans, and only in the second place to foreign buyers. After the end of this year, the unsold balance of these tankers will be immobilised into a reserve. Further, these surplus tankers must be sold at not less than 87½ per cent of the pre-war cost—and dollars are scarce in Europe. Finally, many of these ships are of limited suitability for Europe's needs; they are large and fast, but expensive to run and suitable for deep harbours only.

Tanker tonnage during the next few years will therefore be governed by the amount of government-owned American tonnage which is immobilised after the end of this year and the rate at which new tonnage can be built by the oil companies. The rate of expansion of the oil companies' tonnage can be estimated in round figures. World tonnage totalled 23.5 million tons deadweight, in June last year. By December it was about 23.7 million, and by June this year it was about 23.9 million. These figures indicate a rate of expansion of

some 400,000 tons a year. Taking into consideration the fact that world gross tonnage under construction at the end of June was 617,000 tons, and that it takes roughly 18 months to two years to build a tanker, the recent rate of expansion will probably be maintained in 1948, and it cannot be much more rapid owing to the world shortage of steel. So if the United States immobilises, say 5 million tons deadweight of tanker shipping (a not improbable figure), the world's tanker tonnage will be perhaps 3 million tons above the pre-war level by the middle of next year, an increase of 18 per cent. But the major part of this tonnage will be owned by the United States and other countries will have to pay dollars for its hire.

These tonnage figures have to be viewed against the background of the probable demand for oil. How much oil will have to be shipped to world markets? Table II shows the imports of crude oil and finished products for the three main consuming areas in 1938 and 1946—Continental Europe, Britain and the United States. Adding all kinds of oil and oil products together, these three areas imported 47.8 million tons last year, compared with 41.9 million in 1938. This increase was due primarily to higher American imports of crude oil and finished products and to larger imports of gas and fuel oils into this country, which together offset the heavy falls in European imports. On the assumption that rehabilitation in Europe called for an increase in oil imports next year to the level of 1938 (a modest target compared with Europe's eventual requirements) and if imports to the other two areas were no higher than in 1946 (which is highly unlikely unless there is a slump in America and drastic petrol rationing here) the demand for imports of oil would rise to 55.6 million tons—an increase of one-third compared with 1938. Even this modest expansion would involve tremendous pressure on tanker capacity, beyond its present ability to absorb.

How far can such pressure, if it develops, be relieved by increased use of pipelines, especially in the Middle East? If the plans which are going forward at present for increasing pipeline capacity in that area could be carried out by the end of next year, the immediate economy in tanker space would save what may be a critical shortage of transport facilities. A ton of oil piped from Iraq to Haifa, refined and sent to the United Kingdom needs to be carried only 3,300 tanker miles, compared with a journey of 6,500 by sea if it goes from Abadan via Suez. Likewise, oil shipped from the Levant to Britain instead of from Venezuela or the Dutch West Indies would save 900 miles by sea. It is not suggested that Britain or the rest of Europe should cease to import oil from the West Indies or South America. But the long-term pattern of world supply is for the United States to draw its imports from the southern half of the Western Hemisphere, and for Europe to rely more and more on the Middle East, and there is much to be

said for accelerating that development when tankers are in short supply and Europe's demand for oil is increasing.

There is at present a record demand for oil equipment. Middle East pipe-lines are only a part, although an important part, of a world expansion programme. The cost of the pipeline alone from Abadan to Haifa is estimated at about £12 million. The American-Arabian pipeline from the Gulf of Persia to Haifa, which is somewhat longer, but of about the same diameter (about 30 inches) would, on the same basis, cost about £15 million. Further north, Iraq Petroleum are installing another 1,200 miles of pipe of 16 inches diameter from Kirkuk to the Mediterranean. The total investment in pipeline schemes in the Middle East can, therefore, be conservatively put at £32 million to £35 million. In addition, several tens of millions of pounds will be required for pumping stations and ancillary equipment. Sir Frank Smith, of the Anglo-Iranian Oil Company, recently declared at Manchester that a line with the diameter and the length of the proposed pipe from Abadan to Haifa would have a throughput of 13 million tons a year. This pipe, plus the American-Arabian pipe further south, might thus have a combined throughput of 25 million tons. Allowing 8 million tons for the new Iraq Petroleum pipes, total throughput from East to West would eventually be about 38 million tons compared with a present total capacity of just over 4 million. These figures may be compared with total European imports of oil and oil products in 1946 of about 29 million tons.

Such estimates of capital investment and oil throughput need to be treated with caution. Costs of equipment are already three times higher than before the war, and they are still rising. Capital commitments may, therefore, have to be revised before the schemes are much older. But even such tentative estimates as these emphasise the enormous cost of investment in the oil industry, which is likely to intensify the development of Middle Eastern oil by groups rather than companies. They also show that Middle East oil schemes will have to join the long queue for steel before they get delivery of their equipment. The first of Iraq Petroleum's new lines will not be in operation much before 1949, while the two big pipes from the Gulf of Persia to the Mediterranean cannot be in operation until after 1950. The position in the short period, that is prior to 1950, seems to be that the pipelines may add a further 4 million tons a year by 1949.

A solution of the oil transport problem is of the highest importance to this country. When the present coal-to-oil reconversion is completed, Britain will be importing 6 million more tons of fuel oil from the Middle East than in 1946—enough to keep about 60 tankers a year fully occupied. Bids for so much tanker space against the increasing calls on world tanker tonnage will have only limited success unless tanker tonnage is quickly expanded.

TABLE I: WORLD TANKER TONNAGE

	Owned: '000 tons (dwt)		Under Construction (gross tons) End June 1947

Will the Shipping Boom Last?

INVESTORS can hardly complain at the current spate of shipping news, for most of it is good. The 1946 accounts of several leading companies have revealed increased earnings; only this week the Cunard White Star report has shown how generous is the current rate of return on the luxury cross-Atlantic trade. Yet the cautionary overtones of the chairman's speech (discussed, with the report, in a detailed note in the *Records and Statistics* supplement) have not gone unheeded. The decision of Court Line to liquidate a profitable tramp shipping company on the ground that replacement costs are prohibitive, and that of the Stock Exchange Council to retain the ban on dealings in Stanhope Steamship shares have also been responsible for a rather questioning tone in the shipping share market, only partly allayed by the success of the Silver Line issue. And shareholders of OSN Realisation are now puzzling out the comparison between the price of 40s. which has been offered by Cunard Steamship Company for the OSN holdings of Cunard White Star shares and the markedly favourable earnings and break-up value of the shares which is suggested in the latest report. This offer is examined in a later note on page 167.

British shipping is not a homogeneous industry, and the factors which affect its prospects are complicated and infinitely variable. Shipping is an international industry, extremely sensitive to political and economic conditions in widely different parts of the world. Its present circumstances are, of course, completely abnormal. They bear some similarity to those after the First World War, though there are also significant differences. In 1919, despite war losses, the total tonnage of merchant ships in the world was higher than in 1914. Its quality and its distribution among flags, however, had completely changed. The surviving ships were older, overworked and undermaintained, and the wartime replacements were largely of standard design. The American shipbuilding effort had enormously increased the tonnage under the American flag, while British and other merchant fleets had been reduced both in quantity and quality. But British shipowners, in two years of uncontrolled freights, had built up splendid reserves from profits, and neutral owners, whose earnings were never subject to control, did even better. The increased price of shipbuilding, therefore, did not deter them from restoring the balance of tonnage and quality; and such energy was put into new shipbuilding that the reconstruction programmes were largely completed by the end of 1920—by which time all remaining controls over freight levels had been abolished. Rates immediately rocketed, but a panic slump quickly ensued and before long millions of tons of merchant ships were being laid up.

The apparent world-wide shortage of tonnage during the war years and the period of reconstruction had been, in fact, illusory, for it resulted largely from the reduction of the technical efficiency of shipping in war conditions, the necessity for travelling in convoy, with its consequent congestion in the ports, and from the delays resulting from overloaded ship-repairing facilities. Wartime cargoes had often to be hauled greater distances than normally, Government control and direction of voyages and cargoes necessitated long voyages in ballast, and a large number of ships were withdrawn from commercial service for use as military transports and naval auxiliaries. All these factors reduced the carrying capacity of the available ships, and created an impression of shortage which would have readjusted itself automatically with the return of normal operating efficiency.

The post-war period of World War II is still making its own history, and it has yet to be seen whether shipping will follow the dismal precedents of the 'twenties, when the volume of

international trade failed to fulfil the expectations of optimistic builders. Once again, world shipping tonnage has increased, despite even heavier losses, owing to the gigantic shipbuilding effort in North America. But the average quality of the world's shipping capacity, unlike its quantity, has decreased to a far greater extent, mainly because of the loss of over 11 million gross tons of British ships, of which a large proportion was valuable specialised tonnage such as refrigerated cargo liners and "handy" short-sea traders. The United States, which had a declining merchant navy in 1939, emerged from the war with five times as many ships, most of them new but of "utility" design. Such ships are not well suited for certain needs, such as the carriage of passengers or oil, and for many trades they are too big; many of them, therefore, have been laid up. Meanwhile British and other Allied shipowners have embarked on large-scale replacement programmes, and the Americans now seem more disposed to accept a return to pre-war strength in commercial shipping—perhaps realising, in the words of the Economic Adviser to the US Maritime Commission, that "it was not on the cards that the United States should build and operate the world's ships any more than it was on the cards for Britain to build the world's automobiles."

Since British merchant shipping is still well below its pre-war strength and quality, despite post-war building and the stop-gap purchase of American surplus ships, there is still plenty of employment for every ship that can be put in service, including many on bareboat charter from Dominion and foreign flags. The increased earnings of 1946 are due partly to tax reliefs and partly to the release of additional ships from Government requisition. High freights and an acute demand for tonnage still prevail, but other factors, which did not exist in 1920, must be taken into account. Shipowners, who naturally wish to participate in the present prosperity, complain about high shipbuilding costs, which are becoming a deterrent to the placing of new contracts, but they are more seriously affected by the declining output of British shipyards, owing to shortages of steel, timber and components. The increasing costs of manning and operating ships have also to be offset against the benefits of higher freights, but the most alarming factor in operating costs is the delay which ships are suffering, particularly in overseas ports. All these factors tend to create a feeling of frustration for owners, because they detract from the earning capacity of existing ships at a time of opportunity. It might perhaps be argued that continuance of controls, by restricting the efficiency of shipping, may have the advantage of warding off a surplus of tonnage until world trade expands, but such artificial limitations on shipping efficiency are more likely to reduce it below the requirements of world trade, and also to handicap British shipping *vis-à-vis* its competitors. This is true of passenger liners and, to a smaller degree, of tankers. Employment for both these types of ship is assured for years, owing to the demand for travel, migration and oil; yet the former are seriously affected by delays in reconversion and the latter by delays in delivery from the berths.

The effect of long-distance air transport is not yet certain. Only ships which rely mainly on passengers for revenue are likely to be affected, and the results neither of British and American airlines nor of Cunard White Star so far indicate that sea transport is falling out of favour. The entry of the *Queen Elizabeth* on the North Atlantic run last October, in fact, caused much concern to airline operators, and the re-entry of the *Queen Mary* next week is not likely to reduce it. It is not altogether a matter of luck that these two liners should have survived the war, despite their energetic and unhesitating use as military

transports. The foresight which led to their building amply rewarded the Government during the war and for several years they may be expected to reward their owners and earn valuable dollars. Their replacement, however, will eventually raise formidable problems, the solution of which may be much influenced by technical advances in marine engineering when the time comes. On the more distant passenger trades, a certain readjustment will probably be necessary when the Indian and Far Eastern situation becomes clearer, but there is reason to suppose that, migration and repatriation apart, sea transport requirements will best be met by fast liners which carry more specialised cargo and fewer passengers than before the war. Of such ships there is a world deficiency which only new building can make good.

In the movement of bulk commodities, shortages of tonnage can be alleviated by the more efficient employment and allocation of ships and cargoes. The forthcoming transfer of certain executive work in this connection from the Ministry of Transport to the industry (October is mentioned as a likely date) will give it an opportunity to demonstrate how British shipping resources can best be used in existing circumstances of shortage. The power of the Minister of Transport to license or to direct voyages will in no way be restricted, but the return to more normal commercial methods of chartering on the Baltic Exchange should help to restore London's position as the world's chartering centre. The success of British shipowners and shipbrokers in this task, however, will necessarily be conditioned by future cargoes—a matter on which the continuance of bulk purchasing has a marked and disputed influence.

The more gradual relaxation of control over freight rates, compared with 1920, has done much to prevent the consequences of a sudden boom: indeed, free freights have been known to fall below schedule rates. A sudden fall in general rates would seriously affect the earnings of British tramp companies, for the present level of freights has to cover the regrettable absence of adequate outward bulk cargoes, particularly of coal. The prospects for the tramp industry depend very largely on the expansion of trade and the resumption of coal exports. The worst disaster for British shipping would be a recrudescence of economic nationalism and its concomitant, state subsidies for merchant fleets. Against national Treasuries, even the strong financial reserves of British companies, so essential for survival in the lean years, may dwindle away.

The accompanying table relates these reserves to the liabilities for new tonnage on existing contracts—which do

not represent the total costs of post-war building programmes. Present indications suggest that the industry will need generous financial resources to restore the efficiency of its fleets and, possibly, to provide a buffer of strength against the possibility of some future decline in earnings from the present level. Most companies, in addition, have maintained a handsome margin between their ordinary share earnings and their dividend pay-

ments—a feature perhaps most marked in the recent record of John I. Jacobs, though it is present to a considerable degree among the passenger companies. Many of the shares listed in the table are evidently valued on the basis that some increase in dividends should be forthcoming during the next year or two. Yet it is perhaps questionable whether holders of shipping shares will participate in the present earnings boom except at the fringe. The best shipowners are the most cautious, and at this time of possibly peak earning power it is not difficult to discern the arguments in their favour. But one can have too much even of caution, and shipping shareholders—who know that their directors will never be profligate—will expect some modest recognition of the fortunes of the industry. If they are disappointed, the present level of shipping shares can hardly be maintained.

Business Notes

Support for Tired "Daltons" ?

This has been another bad week for the gilt-edged market, which added the trouble in Burma and Indonesia to its many worries and was quite unable to stem a further fall in prices. The gains in the recent rally are now wholly extinguished, and Old Consols have fallen further below 90, with 2½ per cent "Daltons" reaching new low levels. Yet the dreary situation is not without its piquancy—especially for those financial scribes who, despite the abuse and ill-informed accusations of partiality now so regularly levelled at them, still manage to mingle a little humour in what Mr Tom Johnston, ably following the Chancellor, calls their "dismal prognostications."

The high light this week has been the result of the North of Scotland Electricity issue, of which, confounding all market prophets, no less than 71 per cent was taken up—all but a fraction by subscribers north of the border. True, it might have been reasonable to look for stags in the Highlands; but there were certainly no such animals among those who thus swiftly rallied to the relief of the "public stag"—the National Debt Commissioners—for this stock looked even dearer when the lists were opened than it did upon the first announcement. One small deal opened to have been put through at three points discount, but

the loyalty of tight holders has ensured a nominal market enjoying the fantastic quotation of 96-101. The "success" of this issue is indeed a Pyrrhic triumph for the Chancellor, whose rallying cries for British patriots evoked no response, but who now finds that Scottish patriots prefer smaller returns from the stocks of their own public boards than they could obtain from those of the British Government. Perhaps they have not noticed that the Electricity stock is Treasury guaranteed?

On a more sober plane, the City remains at a loss to understand the attitude of the authorities in the face of the decline. Sections of the market are now in danger of seizing-up in such fashion that only another violent turn in the whole mechanism will restore freedom of movement—unless the authorities apply some lubricant where the friction is greatest. There were rumours this week of small support for the irredeemable (or should one say, irretrievable) "Daltons," which admittedly are looking very weary. However that may be, setting sentiment aside, it is elsewhere in the market that the lubrication process might be more effective. The steady stream of (presumably) mainly industrial sales of the short bonds, in a market lacking the normal institutional off-take, has had effects closely paralleling those of the autumn of 1945. Then heavy sales of shorts (for the purpose of financing purchases of the last of the 3 per cent Savings Bonds)

quickly took up all the slack in the discount market which provides the main jobbing cushion. Now, despite the intervening 50 per cent expansion of Lombard Street resources, the same thing is happening, with the result that prices of the shorts, instead of being determined by the fine yield basis to which the discount houses can work (mainly by reason of their special tax position), are marginally fixed by the appetites of the outside ring of buyers. It is now possible to obtain gross redemption yields of some 2½ per cent on five-year bonds (the 2½ per cent National War Bonds, 1951, return £2 2s. 4d. per cent gross to the earliest date and £2 4s. 11d. per cent to the latest, whilst the comparable yields for the 1952-54 issue are £2 6s. 6d. and £2 7s. 6d. respectively). If the normal margin between yields on these shorts and those on the medium-longs is put at no more than ½ per cent—and it has been more than that recently—these prices for the shorts are discounting a yield of fully 3 per cent from the longs when the market is in equilibrium. If the effect is not to spread right through the list, the authorities will surely need to restore flexibility to the short market.

Finance Bill Postscript

Last week's debate on the third reading of the Finance Bill was necessarily little more than a postscript. But even postscripts can be worth reading, and this one was notable for a contribution from Mr Oliver Stanley which, for insight and delicacy of wit, was outstanding even by the standards of his speeches. The Finance Bill emerged from Committee greatly improved on numerous points of detail, but—except for the large changes in the clauses dealing with retirements and pensions schemes—with little alteration in principle. Necessarily, no further change was expected at the third reading, and none was made. Nor has the Government thrown any fresh light upon its policy on the more contentious issues. The anomalous Distributed Profits tax, and the still more anomalous Bonus Issues tax, go to the Statute Book in broadly the shape in which they were initially cast; the prolonged discussions between the Opposition and the experts on the one hand, and the Government with its mainly political motives in these matters on the other, have done little or nothing to bridge the chasm between the opposing points of view.

Mr Dalton's main contribution—and it was a useful one—was to survey the tax concessions and changes which have marked the progress of the Bill. In the field of Customs and Excise and motor taxation these changes (mainly in purchase tax and in the arrangement for supply of tobacco to old-age pensioners) will cost about £10½ million this year and £17½ to £18½ million in a full year. Inland Revenue concessions—chiefly the exemption of transfers to charities from the increased stamp duty—will cost £1,000,000 this year and £9,000,000 in a full year.

On the wider issues of economic policy, the Chancellor's speech unfortunately contributed nothing at all. It simply demonstrated his own "Bourbonism," if not in capacity for learning, at least in incapacity for forgetting. Upon his Budget accounting he remains unrepentant and unmoved by the consensus of expert criticism, still preening himself upon the reality of his "record" surplus—with Mr Glenvil Hall lamely rallying to his support by claiming that he had looked "only yesterday" at the returns and there saw the surplus, "bogus or not," in the "kitty in hard cash." On that point all that need be said is that the experts have looked at the returns, too. Unhappily, there is a reality behind these apparently petty squabbles pitched on the plane of book-keeping. By juggling with the accounts the Chancellor is able to claim that his policy is doing what it is not—restraining inflationary pressures. But on the really vital aspect of current economic policy, the Chancellor does not even seek debating points to demonstrate that he is doing the right thing. He says frankly that "this Budget does not directly touch" the crucial problem of the overseas deficit, and "indeed purely fiscal measures cannot do the major part of what would be required in that field." Perhaps not. But they could do a great deal more than the Chancellor either contemplates or seems to realise.

* * *

Russian Trade Deadlock

The optimistic prospects last week-end of concluding a trade agreement with Russia have been followed first by doubts and finally by a definite breakdown. As this issue goes to press, one slender—very slender—hope remains, for Mr Harold Wilson, who was to have returned from Moscow to London on Thursday, has agreed to stay on for one or two days more.

The agreement broke down on grain prices. Reports suggest that the Russians were willing to accept a price about half-way between the American and Canadian levels—say \$2 a bushel, or approximately £20 a ton—whereas Britain was unwilling to go above the Canadian price of \$1.55. In view of Britain's urgent need for increased grain imports, the British objection to the Russian demands needs elucidation. The quantities of grain involved were 6,500,000 tons over four years, worth some £130 million. In addition, the financial concessions offered by Britain in mitigation of the outstanding debt due from the Russians would have been equivalent to a further £18 million. Thus the deal as a whole would have involved a total cost to Britain of £148 million over four years. As this sterling would have been currently earned, it would have been convertible, at Russia's option, into hard currencies, and might have led to an additional strain on British dollar reserves. The Russians intimated that they would like to purchase steel rails, timber-cutting machinery, and oil equipment—all of which Britain could sell in dollar areas and some of which, like oil equipment, it has itself to purchase from the dollar area. Thus, from the Britain viewpoint, the whole of the £148 million had to be considered as potentially convertible into dollars.

This factor alone might not have led to a breakdown in the negotiations, for it would seem that Britain, in addition, was unable to concede a higher price for grain to the Russians because of the stand she took last April at the International Wheat Conference; this ended unsatisfactorily because Britain refused to be party to an agreement fixing prices at what it considered to be too high a level. It would be paradoxical, to say the least, if Britain now agreed to pay higher prices to Russia, and if it did, there would be no alternative but to accept the International Wheat Agreement at the next Conference. Moreover, the Canadian wheat contract, which was concluded at favourable prices to this country, evoked considerable Canadian opposition, particularly from the grain merchants. These two reasons were sufficiently strong, politically, to prevent the British delegation in Moscow from offering higher long-term prices than those fixed under existing contracts.

The timber contract has already been signed, and although it is not linked specifically to a wheat agreement, both sides were discussing the two in conjunction. Thus it may be that even the small amounts of timber agreed upon will not in fact be shipped to this country. The moral to be drawn from these negotiations is simple and depressing. As state trading authorities have to concern themselves with political consistency as well as economic factors, their forecasts and precedents cannot afford to be wrong. That many have been so wrong in the past, and so permanently binding for the future, causing the British taxpayer or industry to bear the burden, must surely add to misgivings about governmental purchasing.

* * *

Coal Outlook—No Change

The coal debate on Thursday last week again brought under review the only too familiar facts of the coal situation, and it offered no new evidence of any firm prospect of achieving the target of 200 million tons by the end of the year. Government spokesmen declined to project the current production trend into an estimate for 1947, but concentrated their attention instead on short-term plans for increasing output. These schemes—such as the "concentration of coal faces," more intensive work at selected collieries, training schemes for labour and the development of drift mining—are entirely praiseworthy. But such prescriptions will have to produce results quickly if the 1947 coal programme is to be achieved. On present evidence it seems much more likely that the year's output will not exceed the recent estimate of the Parliamentary and Scientific Committee of 195 million tons.

Coal production totalled 106 million tons in the first 28 weeks of this year, leaving 94 million tons of the 200 million ton target to be won in the last 24 weeks. This will require an average weekly production of 3,900,000 tons, including the weeks of lower production in the holiday period. Provisional production figures for the first two weeks of July reveal outputs of barely 3,800,000 and 3,500,000 tons respectively. If production were to settle down half-way between these figures for July and August, an average production of 4,100,000 tons would have to be achieved from September and December to reach the target. The best weekly figure since the five-day week was introduced in May was just over 4,000,000 tons. If the present labour force could consistently raise the same output during the last four months of the year as it did in the first enthusiasm of the five-day week, the gap would still be of the order of 100,000 tons a week. Towards filling this, some 30,000 tons a week could be obtained if unofficial

July

July is the month when the farmer surveys his crops and prospects. Between seed time and harvest he reviews his position; forecasts of grain and root crops are made; hay harvesting begins. In all seasons the modern farmer calls on his banker for some necessary service; he can always turn to his bank for counsel and help in the day-to-day transactions of this basic yet ever changing industry. The Midland Bank, so intimately concerned in agricultural conditions throughout England and Wales, is ever ready to give the farmer the specialised service he may require.

stoppages could be eliminated. If a further 6,000 face workers could be trained and drafted to the mines by the closing weeks of this year (which is the number of face workers to be recruited by December under this year's target of a labour force of 730,000), an additional 70,000 tons a week could be cut, given the present rate of face workers' output.

It is possible to construct figures to close the gap on such assumptions, but they err on the side of optimism. The pace of labour recruitment has fallen, and is now no higher than a net rate of 400 a week, which would provide a total force of just over 728,000 workers by the end of the year unless the intake of new workers improves. In any event, increased output must depend largely on the reduction of voluntary absenteeism which is now increasing. Imported coal from America and Poland may add perhaps a million tons to supplies between now and December, but the critical margin amounts to two or three million tons of coal, and this will determine whether industry can keep going without serious interruption next winter. The Ministry of Fuel and Power is now working out the winter allocations; they will need no reminder that the fuel crisis last February was caused by a shortfall of only two million tons—and cost about £200 million in exports alone.

Drawings on the Loan

Hopes that the accelerated rate of drawings on the dollar credits in recent months might conceivably reflect precautionary measures so as to permit a slackening of the demands after July 15th now seem doomed to disappointment. Last week two further drafts on the dollar loan were announced from Washington within only two days, and although the real interval of drawings was probably longer than this, there was certainly a fresh draft in each of three successive weeks, the latest being £37½ million in the "Revenue return week" ended on July 19th. Previously the shortest interval between any two drafts had been a fortnight and from February 22nd to June 7th the interval was invariably three weeks. It is true that the amount drawn on each occasion was then usually £50 million, whereas the latest drafts have been for smaller amounts, but the fact remains that drawings in the first three weeks of July have reached the alarming total of £100 million. This brings the total demands on the U.S. credit up to £612½ million, so that the amount still remaining to be drawn is only £325 million, as the following table shows.

	U.S. Credit : Amount Drawn*	Approx. Weekly Average £mn.

* In Revenue Return weeks ended on dates shown.

As has previously been pointed out in these columns, it cannot be taken for granted that the dollars are spent (or earmarked against known commitments) immediately they are drawn. There was always a possibility that Britain was still adding to her hidden reserves of gold and hard currency, the gross total of which rose by no less than £100 million in the second half of 1946, the latest period for which figures are available. It is noteworthy, too, that Mr Dalton, in the debate on import policy, emphasised that the figures he was giving related only to drawings; he remarked that he preferred not to say anything about the state of the gold and dollar reserve. If the position really is better than the disquieting figures of the credits suggest, the public is surely entitled to be given the full facts without further delay. As it is, the only assumption which can be made in computing the period for which the credits will last is that the dollars from each

drawing are either used or definitely bespoken before the succeeding drawing is made. On this assumption, the rate of exhaustion in the six weeks from June 7th, when the interval of drawings was first shortened, works out at about £23 million per week, but on the basis of the figures for the last fortnight of this period (ended on July 18th) it would be over £30 million per week. This last calculation of course takes no account of the latest drawing of £37½ million; if that were to suffice until the end of the month, the weekly drawings for July would average about £25 million per week.

Staggering by Order

The Minister of Labour's announcement that, as from October 1st, firms will be liable to prosecution for "unreasonable failure" to comply with the approved schemes for staggering working hours follows representations made by both sides of industry that compulsory powers would be needed to enforce the spreading of the electricity load. Under a Defence Regulation [55 (A) (2)] fines up to £500 or one year's imprisonment, or both, may be imposed, though the Government has promised that proceedings will not be instituted except after careful scrutiny. An alleged breach of an agreement will be subjected to investigation both by the Regional Board and by the Electricity Sub-committee of the Joint Consultative Committee before it is referred to the Minister of Fuel. He may then issue a direction to compel a firm to bring down its consumption to the required level. The Government hopes that these powers will be required only very exceptionally, and that industry generally will co-operate voluntarily in making the scheme work.

The situation is such, as Mr Isaacs emphasised, that "drastic plans" to safeguard power supplies are needed. The demand for electricity is now 70 per cent greater than it was in 1939, and is steadily rising, and the progress made with the renovation and expansion of generating plant, though assisted by the priority accorded earlier this year, was never expected to be sufficient to bridge the gap between total generating capacity and maximum demand. Industrial users consume about half of the total amount of electricity, and it is from them that the main economies are sought, the aim being to transfer one-third of the industrial load outside the normal daytime hours. The renewed appeal for continued economies by domestic, shop and office users is salutary, for inadequate co-operation on their part might absorb much of the saving made by industry.

The question of whether any disciplinary action will be taken against workers, who refuse to comply with union instructions and work the shifts required of them has been left surprisingly vague. Employers and union leaders at the national level may agree on terms and conditions for night shift and overtime working—for which an analogy may be found in the recent agreement in the engineering industry for accepted night shift rates, normal rates for Saturday mornings where these are worked to make up the 44-hour week and normal overtime rates for any hours beyond 44. But individual workers in the factories may resist what they might regard as a threat to the five-day week, even though the total number of normal working hours is not affected, and there may be reluctance, genuine or otherwise, against working night shifts. Will the worker have any right of appeal in these circumstances, and who will be the arbiter? And what happens to works which fail to get a sufficient muster of labour on late shift? Have they any appeal against the retiming of their permitted hours, or must they suffer loss of production? Mr Isaacs takes the view that these things are best left to the unions, but experience shows that union authority is not always sufficient to ensure the practical co-operation of the rank and file.

Building Materials and Output Incentives

A resolution passed this week by the Amalgamated Union of Building Trade Workers calling for a State corporation for the building industry can be dismissed as a political gesture rather than a serious contribution to the problem of building new houses. A more realistic approach would have concentrated on the industry's two basic problems—the supply and distribution of building materials and the need for increased output per worker.

The original voluntary rationing scheme for building materials, introduced fifteen months ago, has worked with only moderate success. The problem is to devise a system of distribution which would ensure that the limited supplies of materials are used on

building work approved by the licensing authorities—that is, by the local authorities. But the diverse trade channels by which materials reach a large number of firms, ranging from large building contractors to a host of jobbing builders, has always left ample scope for a flourishing black market. The voluntary WBA priority scheme requires building merchants to deliver materials on a scheduled list only against forms signed by the licensing authority. But without a large inspectorate to supervise the scheme, materials have leaked away, particularly into repair work.

Alternative schemes have all broken down on the difficulty of finding man-power to operate and supervise a watertight rationing scheme. It now seems probable that the list of priority materials will be reduced, but that the revised WBA scheme will be reinforced by sanctions. This would at least have the merit of reducing the amount of form filling and of concentrating the industry's energies on its job of building houses and factories. But it is no substitute for the only satisfactory solution—to produce sufficient building materials to obviate the need for rationing and controls.

This may be a remote dream at present, but it is not so fantastic as the proposal to nationalise the building industry, which has been aired at Worcester this week. Such proposals completely overlook the fact that the building industry needs not an increasingly complex central administration, but more realistic calculation of the output which existing building resources can provide, given the optimum distribution of building materials. The unions' pre-occupation with the idea that more central planning is a panacea for the industry's ills is on a par with the further discussion at Worcester that an increase in wages, irrespective of an increase in output, can be secured without increasing building costs. The war-time defence regulations which forbade incentives payments to building operatives is being relaxed this week, and the Government will no longer reserve powers to fix a ceiling for wages. The way will thus be open for both sides of the industry to negotiate wages and conditions of work without the restraint of a fixed minimum for the industry. This has long seemed the most promising line of development in raising building output, and the union showed belated signs of a more realistic approach to the building problem on Wednesday when it gave its executive power to join in negotiations with the employers on incentive schemes.

Bank Deposits Rise Again

The complete figures for the clearing banks as at end-June, when compared with those for the May "make-up," rather spoil the pattern which had begun to emerge of a declining tendency in bank deposits. During the month, net bank deposits rose by £58.9 million to a level actually a shade beyond the peak reached last January. By contrast with last year, of course, the position is greatly improved—in June, 1946, net deposits rose by no less than £112 million. The extent of the past month's rise is, however, a little unexpected, and sits ill beside Mr Dalton's latest self-congratulation on the size of his book-keeping surplus in the national accounts. Of the recent additional bank credit, a substantial proportion was created specifically for the requirements of the public as distinct from the Government—bank advances during the month rose by £29 million and investments by £9,500,000. But even if the credit created under both these heads is regarded as "private" finance, there would still remain £20 million of additional finance ostensibly required for Governmental purposes. Yet in the five weeks to end-June the Exchequer return figures suggested that the Government should have had a net surplus of resources.

The "above-line" account showed a surplus of £10 million; net payments to small savers were roughly balanced by net receipts from Tax Reserve Certificates; and "below-line" outgoings (loans to local authorities, War Damage Payments, Post-War Credits, etc.) totalled £40 million, thus leaving a net deficit of about £30 million. But during the period the Government received £30 million by way of gifts from the Australian and New Zealand authorities and also drew £77 million on the North American credits. It is true that not all the gifts represented "new" money for the Exchequer because a part—possibly more than half—of the Australasian funds had previously been lent to the Treasury. It is true, too, that the "above-line" surplus was struck after including some purely nominal revenue—during the period £40 million was credited from receipts from trading services, miscellaneous receipts and sales of surpluses. But even an allowance for these two factors would suggest that the Government's net requirements for finance amounted to no more than £55 million, before allowing for the £77 million of drafts on

the credits. In sum, if anything like the whole of the dollars drawn in the period from the credits were used during the period (thus providing the Government with sterling paid to it by the spenders of the dollars), the Exchequer might have been expected to have been able to reduce its net borrowings from the banking system instead of requiring additional bank finance. Some day, perhaps, the puzzles which these figures regularly present will be resolved—but not until Mr Dalton decides to release more information about the operations of the extra-budgetary and departmental accounts.

New Investment Record

Meanwhile, of particular interest to the gilt-edged market is the further increase during the month in the clearing banks' investment holdings, which now stand at the new high level of £1,479 million, compared with £1,382 million at mid-1946. The month's increase, of £9½ million, is approximately the same as that which occurred in May. By the standards of the heavy purchases of 1945-46, this is, of course, a modest movement, but it affords a complete answer to the suggestions recently made—evidently on political grounds—that the banks have been partly to blame for the change of climate in the gilt-edged market. At the same time, it is worth noting that the month's increase is principally attributable to the operations of one bank. Two of the "Big Five" disclose slightly smaller holdings than in May and one of them—the National Provincial—has reduced its portfolio by £10 million in the course of two months.

In money market circles it has been suggested that, if the authorities really want to induce the banks to increase their support for the gilt-edged market, the right course would be for the Treasury to switch its floating debt borrowings substantially from Treasury deposit receipts to bills. This policy certainly played an important part during the phase when the banks were buying gilt-edged securities aggressively, but now that the ratio of clearing banks' money market assets to deposits is relatively comfortable (at least by contrast with the stringency of two years ago) it is perhaps questionable whether it would have similar effects now. If the banks feel that their attitude towards gilt-edged ought to be more cautious than in the past, one would have thought that the mere increase in the volume of their most liquid assets, at the expense of a decline in TDRs with their only slightly higher interest yield, would not by itself induce them to change their policy. A more promising line of action, assuming that the departments are reluctant to support the market extensively themselves, would simply be to increase the volume of clearing bank cash by open market operations. Even this expedient would not be certain in its results, but, now that the banks work to a virtually stable cash ratio, it might conceivably be more effective than it would be if ratios were still permitted to move within their former wide limits.

What Price Cunard White Star?

The City has been much exercised by the offer of Cunard Steam Ship to acquire the balance of 3,800,000 shares in Cunard White Star from OSN Realisation at 40s. per share. OSN Realisation holds 1,274,216 shares, and has the right to receive the proceeds of realisation of 2,525,784 shares, held by the Treasury and the Ministry of Finance for Northern Ireland, in excess of £3,274,378. These two authorities refused to approve a scheme prepared by the directors of the OSN Realisation by which its shareholders would retain an interest in the Cunard White Star shares held by the company and by the two governments. Meanwhile the Cunard cash offer was received.

Approximately 50 per cent of the voting rights of the "B" and "C" shares of OSN have been informally cast in favour of the offer of 40s. per share which was arrived at after the directors of OSN Realisation had seen advance copies of the latest accounts of Cunard White Star. They show impressive results for 1946, with a 22 per cent increase in operating profit and a 3 per cent rise in earnings for a period which included only 2½ months' revenue from the *Queen Elizabeth*, though the figures have been very much tempered by the chairman's cautionary review of future prospects.

Accepting the balance-sheet values for assets, the break-up value of Cunard White Star shares would be around 33s. a share, but the figure of £9,589,075 for the book value of the fleet must be taken as conservative. The real criterion, of course, is earning capacity. By July 31st the company will have the two

* To earliest redemption, except if flat yield and † assumed average life 17 years 6 months. † Excluding draw.

30th. On that date work on hand was 31,234 tons gross higher than at the end of March and 298,006 tons higher than at the end of the June quarter of 1946. The tonnage of ships launched during the quarter, however, totalled 243,644 tons gross, compared with 270,543 tons for the first quarter of the year, while in the same period the tonnage on which work was begun declined from 294,902 tons to 272,703 tons gross. It is apparent, therefore, that the cuts in the allocation of steel for shipbuilding may have a greater effect on output than either the fuel crisis or the hard winter. The following table suggests that the output of 1,250,000 tons projected in the *Economic Survey*—by no means optimistic in normal conditions—will not be achieved by a serious margin, and that the Minister of Transport's more recent estimate of 750,000 tons is more realistic. The inevitable consequence will be a reduction of earnings from ships built for export and of British ships in foreign trade.

MERCHANT SHIPS UNDER CONSTRUCTION IN GREAT BRITAIN
(gross tons)

Quarter Ended	Launched	Commenced	Total under Construction	Percentage of Foreign Orders
Sept., 1946	268,715	369,156	1,874,878	20.6
Dec., 1946	267,760	339,060	1,937,062	24.7
Mar., 1947	270,543	294,902	2,031,715	25.5
June, 1947	243,644	272,703	2,062,949	28.1

The slower pace of output from the shipyards is illustrated even more strongly by the figures published in the *Statistical Digest*, which show the tonnage of shipping undergoing or awaiting repair or reconversion. This figure has increased by 500,000 tons since the beginning of the year and now reaches the amazing total of 3,500,000 tons gross—practically 25 per cent of all the shipping on the United Kingdom register. The effects of this creeping paralysis will become more noticeable by next spring, for by that time 1,000,000 tons gross of American ships at present on charter will have been returned across the Atlantic.

Ships under construction in British yards amount to 53.6 per cent of the world total of 3,846,656 tons gross. Vessels building in foreign yards amount to 1,783,707 tons, the increase of 72,107 tons over the previous quarter being accounted for mainly by fuller information from Poland and France. No returns are recorded for Germany, Japan and Russia. Sweden's share has increased to 266,905 tons, France's to 236,678 tons and Holland's to 224,428. In the United States shipbuilding work has further declined to 183,236 tons gross.

Railway Charges

Mr Barnes, who has shown some reluctance during the past four months to grasp the nettle of increased railway charges, gave a virtual promise in the House of Commons last Monday to make a statement before the Recess. The Minister disclosed that the estimated deficiency on the railway control accounts this year would be £37 million, and an estimate on a similar basis for 1948 (when in fact the railways will have passed to the British Transport Commission) indicates a deficiency of about £28 million. The 1947 estimate is not far out of line with the figure suggested in *The Economist* a fortnight ago, but Mr Barnes made it plain that both estimates, for 1947 and 1948, took no account of the additional cost that would be incurred if effect is given to the recent recommendation of the Court of Inquiry into charges and hours of railwaymen. Rough estimates of the effect of this recommendation indicate a total deficiency on net revenue account for 1947 of about £50 million and for a full year of some £70 million.

Mr Barnes refused to be drawn into discussing the suggestion that the railways should be subsidised to mitigate the incidence of increased charges on costs of production, and his reference to "the necessity of making a decision to meet the existing circumstances" hardly took matters very far. Obviously a considerable increase in railway charges will be needed to cover the accumulating burdens of rising costs, for there is nothing in the current trend of traffic, with its scarcely relieved minus signs (apart from coal) to encourage the hope that an improvement in gross takings will come to the relief of rising expenditure. So far, however, there is no indication whether Mr Barnes, in reaching his decision on increased charges, will follow the line of action suggested on page 78 of *The Economist* of July 12th.

Grantham In Retrospect

The complexities and invidious decisions which may be involved in the allocation to commercial firms of Government-owned factory space have been vividly illustrated by the recent disclosures in the Grantham Productions case. The problems of making a choice from among rival applicants in such cases were, in fact, foreseen before the end of the war, but they do not appear to have been successfully solved. Grantham Productions, which attained public prominence in its recent but abortive efforts to organise production of a "people's car" went into liquidation some time ago. Both the coalition Government and later, the caretaker Government, had already allocated the factory run by Grantham Productions to the firm of Aveling Barford for the production of agricultural tractors. But Grantham Productions were able to produce evidence satisfactory to the present President of the Board of Trade that they had sufficient backing from a financial group to carry on. So the factory space was re-allocated to them to continue producing tractors. The Ministry of Agriculture apparently made a routine examination of the tractor's merits for peace-time purposes but no official comment was elicited, despite questions in the House of Commons, on the group's technical credentials. The financial backing for the new enterprise was provided by a group represented in the negotiations by Mr Cotton. Mr Kendall, the Independent Member for Grantham, who was responsible for building the factory and operating it during the war, claimed that the production of tractors did not cease while these negotiations were proceeding, although it appears that no steel allocations were made to the company after July, 1946, and that no tractors have been ordered by county agricultural committees.

The factory space was allocated to the Cotton syndicate by the Board of Trade upon the evidence of a binding contract, arrived at between the liquidation of Grantham Productions and the syndicate. But since the contract has not been completed, the allocation has been withdrawn. Fresh applications are to be considered by the Board of Trade.

Judged by results, a mistake was made in this particular instance in placing the advantages of continuity of production and management above the need for a thorough investigation into the technical and financial qualifications of the group and their product. But that does not seem to be the entire story. Official inquiries appear to have been formal if not perfunctory, and the tendency to hedge in official answers in the House, followed by the unwillingness of the Lord President to allow time for a motion to appoint a Select Committee to examine the case, has left an unsatisfactory impression. The motion for a Select Committee of inquiry was well supported, and its dismissal by Mr Morrison because of lack of time can only increase the speculation which the case has caused.

Shorter Notes

Ever since the Chancellor of the Exchequer announced his intention to take power to alter the basis of the valuation of imported films for taxation purposes (which is now provided in the Finance Bill) repeated but unavailing attempts have been made to obtain estimates of the dollar earnings and expenditure of the British film industry in America. On Tuesday this information was again refused in answer to a question in the House, on the grounds that the information should not be given in a public statement when it concerned the business of a single undertaking. It is somewhat illogical at a time when public attention is pre-occupied with the dollar problem that the size of dollar remittances from American films shown in this country should be provided in the *Economic Survey* and in the revised import programme, but that information should be withheld on the profit and loss and capital account of British film exhibition in America.

Certain exceptions will be made to the doubling of stamp duty on share transfers which becomes effective on August 1st. These include transfers to charitable organisations and trustees and transfers presented after August 1st for bargains made but not executed before that date. To rank for the current rate of duty, these will need endorsement by a member of a recognised Stock Exchange that they were delivered to buying brokers or lodged for certification before August 1st.

Difficulties in obtaining spare parts are now seriously interfering with the London Passenger Transport Board's bus operations. There is now a daily shortage of about 100 vehicles in scheduled requirements for coach and central services representing about 1 per cent of the total bus fleet of 6,900.

COMPANY MEETINGS

CUNARD WHITE STAR, LIMITED

IMPROVED OPERATING PROFIT

DOLLAR EARNING POTENTIAL OF FLEET

MR F. A. BATES' STATEMENT

The following are extracts from the statement of Mr F. A. Bates, M.C., D.L., chairman of Cunard White Star, Limited, reviewing the operations of the company in 1946.

EXPANDING PEACE-TIME SERVICES

Taking now the accounts, it will be observed that our gross operating profit for the year at £2,040,088 shows an improvement of £566,945 over that for 1945. This is due in part to the introduction of the *Queen Elizabeth* into peace-time service, and also in part to the operation of our cargo tonnage, supported by chartered ships. Increases in operating surpluses are in these days essential to shipping companies, because they are drastically eaten into by having to provide for the unknown cost of deferred repairs and keeping the ships up to date, which of course includes amenities for the comfort and convenience of our crews as well as of passengers.

On the debit side of the profit and loss account depreciation is up by £90,000, for which the newly acquired cargo ships are mainly responsible. Income tax shows a modest increase over the previous year. On this difficult subject of tax I may say that we have provided for all our estimated liabilities to date, but it is expected that this item will be of an onerous character in 1947, as the heavy losses—including unearned wear and tear allowances—which the company incurred in earlier years have hitherto been a set-off against subsequent profit and this relief will soon be no longer available.

After meeting outgoings and providing for deferred repairs and maintenance of fleet, the profit for the year is £1,036,606, out of which it is proposed to transfer £100,000 to reserve, to provide a sum of £350,000 for the pension funds, the need for which I will refer to later, and to pay a final dividend of £275,000 net, which is the same as last year.

RECONVERSION ACHIEVEMENTS

After dealing with various items in the balance sheet, the statement continues:— "There has been much activity in rebuilding the company's business on both sides of the Atlantic. The release of British shipping from Government control, except for a measure of direction through licences, began on March 2nd, but many passenger vessels still remain under control for carrying troops and various kinds of sub-standard traffic. The *Queen Elizabeth* was, however, returned at that date to be reconversioned, and this work was completed in October at Southampton. She then proceeded to the Clyde for her trials and while she was lying at the Tail of Bank on October 8th, the company had the great honour of a visit by H.M. Queen Elizabeth accompanied by their Royal Highnesses the Princess Elizabeth and Princess Margaret. Her Majesty inspected the ship and the Royal party remained on board while the vessel put to sea and underwent speed trials on the measured mile off the Isle of Arran.

The completion of the reconversion of this ship at Southampton enabled similar work to be commenced on the *Queen Mary*. This has been in progress for ten months under pressure to get the ship into service, in order that her dollar-earning potential may be available to the country as quickly as possible. In this respect she will join the *Queen*

Elizabeth and the *Mauretania* in this country's effort to restore the shipping industry, with all that this means to our national economy. When she sails shortly, it will bring to a close what I think must be regarded as a remarkable performance on the part of John Brown & Company, the builders, in association with our management and staff.

Later in the year the *Mauretania* was also returned, and her first post-war commercial sailing to New York was made from Liverpool on April 26, 1947. In her case the work of reconversion was no less efficiently carried out at the Gladstone Dock in Liverpool by her builders, Cammell Laird and Co. Here again its successful conclusion was a triumph of organisation on the part of the staff of that company and of those of our own people at Liverpool specially delegated for the job.

The *Britannic*, another of our large passenger carriers, came off Government service in February last, and is now in the hands of her builders, Harland and Wolff, at the Gladstone Dock in Liverpool for reconversion and alterations, the same team of our own staff which dealt with the *Mauretania* being engaged on this work.

RECONVERSION IMPACT ON FINANCES

The impact of all this work on our finances it is impossible at this stage to gauge, under the conditions which obtain to-day, or to assess the overall cost to the company. It is estimated, however, in respect of the four ships I have mentioned that we shall require to find from our own earnings between two and three million pounds, in addition, of course, to the recovery of amounts from the Ministry of Transport for that part of the work for which they are financially responsible. From this necessarily wide estimate of the company's liabilities can be deducted £500,000 to cover the cost to December 31, 1946, which has been taken care of as maintenance in the 1946 accounts.

The Government still retain control of a number of our passenger ships, all of which are much needed at the present time in our own business in the North Atlantic. Our Canadian connections in particular have been seriously prejudiced by the continued shortage of passenger ships in that trade. For example, the Canadian Government have had under consideration plans to extend the admission of immigrants, but the absence of ships is having a restraining influence upon their ability to put these into effect.

The shareholders will see from the report the present position of our shipbuilding programme, and will note the progress in the delivery of new tonnage. When the new ships are all in commission this will complete the first stage of our building programme, at an estimated cost of over £8,000,000.

REPLACEMENT COSTS

The increased cost of building new tonnage is obtaining a good deal of public attention at the present time. It is an upward movement which receives constant impetus as time goes by—either as the result of the scarcity of supplies, increased cost of raw and finished materials, or reduced working hours in the shipbuilding yards. The effects of shortages and rising costs are grave and must inevitably impose a limit on the ability of shipowners to place orders. One example in our own experience emphasises the position. The *Caronia*, of approximately 30,000 tons, smaller

than the *Mauretania*, which was delivered in 1939, will, we anticipate, have a finished cost of considerably more than twice that of the *Mauretania*. The net result is that if a company is to be in a position to replace its tonnage without financial strain, it must be able to set aside an annual appropriation from profits at least twice the pre-war figure currently allowed by the Inland Revenue on the existing ships.

As regards our future prospects, it is impossible to speak with any degree of certainty. I have endeavoured to convey some idea of what it is costing us to keep our fleet up to date as we get the ships back from the Government, and what we must set aside by way of replacement reserves, in order to maintain our ability to rebuild as and when the ships outlive their usefulness. There are all kinds of influences, political and otherwise, at work in the world nowadays which make for the pursuance of a policy of caution. The trade of the company lies almost wholly between the American Continent and countries short of currency and supplies essential to their needs. The restrictions imposed by governments anxious to preserve their financial stability, whether in the direction of curtailment of imports or the spending power abroad of their nationals, are too well known to need emphasis on my part. These influences, which seem to be gaining strength all the time, must in their repercussions affect all types of commerce, but he would be a bold man who would prophesy what the outcome is likely to be in relation to our prospects. For myself, I remain an optimist, feeling that the march of progress will demand all the opportunities of trade and travel which 20th Century development can offer and to which this company has endeavoured to make its contribution.

THE PENSION SCHEME

On the subject of the transfer of £350,000 to augment the company's pension funds to which I alluded earlier in my remarks, I have this to say.

During the years of Atlantic depression, when the vicissitudes of trade made the struggle to maintain company solvency very hard, all alike, staff and shareholders, suffered. There were cuts in salaries as well as no dividends; and pension prospects were reduced. A further weakening of the position has been introduced by the fall in rates of interest, which cuts severely into the actuarial position of all pension schemes. It has been the Directors' task to endeavour to regain for everyone concerned a sound financial background and to build the company's finances for the future, always with an eye on the risks which may so easily arise from the ever-changing conditions in the Atlantic. In the directors' view, salary scales having been improved, the time has come to take another step in reconditioning our Pension Funds.

In my statement to the Cunard Company's Stockholders, of the 9th April last, I referred to the intention of the Cunard Directors to continue the policy of improving the scale of pensions under that Company's scheme, and I now have the permission of my colleagues on the Cunard Board to say that at the appropriate time they will recommend that that Company shall take parallel action for its staff, present and retired.

It will remain for the directors of Cunard White Star Limited, after full examination, to decide on the best way of applying the £350,000 proposed now to be transferred. Subject to actuarial calculations, I am bound to warn all concerned that owing to the low interest rates obtainable under present conditions, the proposed allocation may not go so far as I at first hoped. The Directors, in taking this course in connection with the Pension Funds, would like to place on record the gratitude of the company for the devoted service of all those, both ashore and afloat, who are applying themselves so diligently and so successfully to the promotion of the company's business.

STANDARD BANK OF SOUTH AFRICA, LIMITED

VERY SATISFACTORY POSITION

SIR JASPER RIDLEY'S SURVEY

The one hundred and thirty-fourth ordinary meeting of the Standard Bank of South Africa, Limited, was held on the 23rd instant, in London, the HON. SIR JASPER N. RIDLEY, K.C.V.O., the chairman, presiding. The following is an extract from his circulated statement:—

The position shown in the bank's balance-sheet is very satisfactory.

Since 1942 we have referred with each issue of this statement to a steep rise in the amount of deposits. As more goods have become available traders have been able to commence the replacement of their stocks and employ the funds that had accumulated over the period of war, and on this occasion it will be observed that the pace at which this increase of deposits has taken place has slackened. Although the item deposit, current and other accounts is still higher by a little more than £12 million at over £226 million, this may be compared with an increase of £35 million last year.

INDUSTRIAL ACTIVITY

Another sign of the quickening of industrial and commercial activity may be seen under the headings bills of exchange purchased and bills discounted, advances to customers and other accounts. The amount of bills of exchange purchased is about £7 million higher and that of bills discounted, advances to customers and other accounts about £23 million greater than the figures reported at March 31, 1946. Arising from these movements it will be seen that cash in hand, at call and short notice, at the date of these accounts, at £71 million is about £25½ million less than the amount reported last year. This item, however, reflects a satisfactory ratio of slightly more than 31 per cent. to deposit, current and other accounts.

Investments at over £81 million are more by about £7 million and, with the exception of the investment of £500,000 in the capital of our subsidiary company, Standard Bank Finance and Development Corporation Limited, this increase is accounted for entirely by purchases of Government stocks and a small amount of Union of South Africa Municipal stocks. Customers' bills for collection also indicate the prevailing high degree of traders' activities. Compared with last year this item has risen to £19 million from the figure of £14 million shown at March 31, 1946.

It was specially brought to your notice last year that a further stage in our progress had been marked by the fact that the total of the balance-sheet had for the first time reached and exceeded £200 million. On that occasion the figure was £237 million, and you will now observe that it has increased by a further £18 million to the new record of £255 million.

PROFIT AND DIVIDEND

Turning now to the profit and loss account you will observe that the balance of profit for the year ended March 31, 1947, after making an appropriation to contingencies account, amounted to £819,015 as against £661,298 last year. This increase of £157,717 results from the increased volume of business transacted by us, to which reference has been made earlier in this statement when explaining certain items of the balance-sheet, and also to the effect of the provisions of the Finance (No. 2) Act, 1945, in accordance with which Dominion income-tax relief or double taxation relief applicable to the sum paid as dividends is reflected in the profit and loss account instead of being applied in reduction of the rate of income-tax

deducted from dividends in accordance with the practice followed before the passing of that Act.

After adding the amount of £185,292 brought forward from last year there is £1,004,307 for disposal. The interim dividend of 7s per share paid in January last absorbed £175,000 and, after appropriating £75,000 to bank premises as against £50,000 in 1946, a balance of £754,307 remains.

It is recommended that £250,000 be allocated to officers' pension fund, and that a final dividend of 9s per share be paid, together with a bonus of 4s per share, making a total of 20 per cent. for the year, leaving a sum of £179,307 to be carried forward. The final dividend and bonus now recommended compares with a final dividend of 9s and a bonus of 3s distributed last year, and it should be explained that, after taking into account the requirements of the Finance (No. 2) Act, 1945, to which reference has been made in explaining the balance of profit for the year, the distribution now declared represents a slight increase in the amount distributed to shareholders as a final dividend and bonus last year.

PROGRESS IN THE UNION

During the period under review further progress has been made in the Union of South Africa towards the attainment of more settled conditions, although in many respects the path has not always been smooth and untroubled. Among other influences shortages of materials and transport difficulties have continued in varying degrees to be retarding factors: No country can remain unaffected by conditions elsewhere, and the impact of shortages and industrial troubles, in some cases of a protracted nature, which in some parts of the world have interrupted the movement towards recovery, have not been without disturbing results.

Notwithstanding these obstacles to progress, a considerable amount of expansion has been achieved in South African industry and trade. Evidence of the confidence with which the prospects of development in South Africa are viewed generally is reflected in the number of new companies established which have experienced little difficulty in obtaining their capital requirements.

OTHER COUNTRIES

In Southern Rhodesia business conditions have been marked by the continued steady rise in activity, and turnovers were stimulated by the expansion in imports. The most important industry in Northern Rhodesia is centred in the copper mines. That the operating companies look with confidence on the future is evidenced by the programmes of expansion upon which they are engaged, both in the development of mining and in refining. In Nyasaland fairly favourable weather conditions assisted farmers, and the exports of the main crops further improved. Business conditions were active although limited by shortages of imported merchandise.

There was a marked acceleration of business activity in South-West Africa. The East African Territories have made progress during the year. The development of Tanganyika should be accelerated as the result of the scheme fostered by the British Government. I believe that in the forthcoming year we may look forward to a continuance of progress in South and East Africa, and I feel sure that we shall play a full part in the development of the resources and trade in those countries.

The report was adopted.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

ANNUAL MEETING

The annual general meeting of the "Shell" Transport and Trading Company, Limited, was held on the 21st instant in London.

Sir Frederick Godber the chairman, said that his statement on the past year's operations had been circulated with the report and accounts. Since it was prepared the need for making available the largest possible quantity of all products had become more and more pronounced and the group companies were continuing to bend their every effort to that end. He then moved the adoption of the report and accounts and the payment of a final dividend for the year 1946 on the ordinary capital of 1s. per £1 unit free of income tax, making 1s. 6d. for the year.

Sir Robert Waley Cohen, K.B.E., seconded the resolution which was carried unanimously.

LORD MARCHWOOD'S TRIBUTE

The Viscount Marchwood, proposing a vote of thanks to the chairman, directors, management and staff, said that shareholders appreciated the splendid results which had been achieved in the past year, which had not been an easy one either for the "Shell" group or for any other combination in the world. Governments made things more difficult every day and he was afraid that they were in for it for some time yet. The detailed survey which the chairman had circulated gave them an inkling of the responsibilities which rested on the shoulders of the board.

With an organisation of this magnitude, spread all over the world, with ground and aviation facilities, the world upheaval of the past seven or eight years might easily have damaged the structure of their group, but this had not taken place. Losses there undoubtedly had been, but the speed and efficiency with which many of those had been replaced was a remarkable achievement which could only have been accomplished by co-operation, efficiency, loyalty and drive.

Mr. L. S. Sedgwick Rough seconded the vote of thanks and it was unanimously accorded.

CHAIRMAN'S REPLY

The chairman, in acknowledgment, said that it was true that they were passing through a very anxious time, but the fact that they had the body of shareholders firmly behind them gave the board not only some relief from its anxieties, but also courage to face the future and prepare the great plans which were a matter of almost daily consideration. He was glad that the management and staff of the group had been included in this vote of thanks, because upon them also rested a very heavy burden.

One asset of great value which did not appear in their balance sheet was tradition. That also could not be built up overnight. For many years there had been a sorting out of men and the applying of them to the jobs for which they were best suited. As a result they had built up what was probably the most loyal and efficient of staffs. The group had been built on the foundation of fine tradition and the board regarded it not only as a money making concern—which it was and of which they had no need to be ashamed—but also as an enterprise performing a great service to the Commonwealth and indeed to the whole world, of which they might also be rightly proud. It had been the life work of many of them, and in these days when tradition and great enterprise were often frowned upon, he thought it only right that he should remind his hearers of these things. (Applause.)

The proceedings then terminated.

METAL BOX COMPANY, LIMITED

CAPITAL INCREASED

SIR ROBERT BARLOW'S REVIEW

The twenty-sixth annual ordinary general meeting of the Metal Box Company, Limited, was held, on the 17th instant, in London, Sir Robert Barlow (the chairman) presiding.

The secretary (Mr John Cartner, A.C.A.) read the notice convening the meeting and the report of the auditors.

The following is an extract from the review by the chairman, which had been circulated with the report and accounts for the year ended March 31, 1947, and was taken as read:—

The consolidated profit and loss account shows a total profit on trading of £896,969 as compared with £854,424 for last year. The total reserves and undivided profits including E.P.T. post-war refund of £362,983 now amount to £2,862,305 and the balance of current assets over current liabilities is £3,403,716.

Tinplate supplies: Whilst fortunately we are not entirely dependent on tinplate it remains by far our most important raw material. Restrictions on its use continue as acutely as during the war and are a gravely limiting factor not only on our own activities but on all those industries which must use a tinplate container for their products. The United Kingdom production of tinplate in 1946 was 573,000 tons as compared with an average for the five pre-war years of 800,000 tons.

OPERATIONS

The year's production has been at a record high level despite the fuel crisis in February. Sales amounted to over £16,000,000. In my Review last year I said that we had committed ourselves to an expenditure of over £1,000,000 on buildings and improved plant. Of this £815,000 has been installed during the current year. Our Sutton-in-Ashfield factory, though much delayed due to shortage of materials and weather conditions, came into operation in January, 1947, and has already proved very successful. Indeed we are planning an extension to it. We have recently obtained a licence to extend our factory at Neath in South Wales at a cost for buildings and services of about £600,000. It is not expected that this factory will come into operation before 1949. We expect shortly to receive a licence to rebuild a paper-printing factory at Southwark which was destroyed during the war.

Our three existing paper and carton factories are quite unable to meet demands and this new factory will greatly relieve the pressure. I referred last year to the acquisition of a factory for cork products and another for the production of specialised machinery. Both of these have been subject to delays beyond our control but I am glad to say that they will be coming into operation very shortly. We have further plans in hand for extensions or improvements to buildings and for considerable replacement of plant which are likely to involve an expenditure of upwards of £3,000,000 over the next three years.

OVERSEAS ACTIVITIES

The Metal Box Company of India.—The continual development shown by our company has been the means of enlarging the scope of many industries in India. We are steadfast in our belief that our technical knowledge and support will be sought by all parties and receive their due reward. Our policy is to co-operate with the new Governments and in the industrial progress of India and to equip ourselves to do so effectively.

The Metal Box Company of Africa has made very satisfactory progress in re-equipment since the war. A new factory is being built at Port Elizabeth in addition to those at Cape Town, Johannesburg and Durban. From our point of view the position in South Africa is potentially most important. As we see it, the Union's economic position demands that secondary industries should be encouraged; the soil and climate are particularly suitable for the production of vegetables and fruits of many kinds; the fisheries are extensive. In our judgment the canning industry of South Africa has a great future before it, and we are anxious to foster and develop it to the best of our ability, realising that it must be prepared to meet competition both in quality and price from other parts of the Commonwealth and the United States.

The company has also operated during the year a small plant in Palestine to which it supplies partly fabricated cans for assembly there for the packing of citrus fruits and juices, and in that country, too, despite political difficulties, we believe we have a contribution to make. We have purchased a site for a factory at Dar-es-Salaam in East Africa, and have commenced developments in Malaya. In both these territories we believe that we can do a great deal to stimulate the production and preservation of foodstuffs, for both are rich in natural resources. It will take a considerable time before our investments are remunerative.

In all these efforts at home and overseas thus briefly outlined your Board believe that the company can make, with advantage to its shareholders and employees, a contribution alike to the national economy and to the communities which it serves.

FRESH CAPITAL

For all these purposes we shall require some additional finance and we have applied to the capital issues committee for permission to raise it.

As to the form, after discussing the matter with the company's financial advisers, the Board decided that the most appropriate course would be to provide the money partly by a pro rata issue of ordinary shares to ordinary stockholders and partly by the issue of new redeemable cumulative second preference shares to be offered to all stockholders.

Although there has not been time for the decision of the capital issues committee to be received, the board has thought it would be inappropriate to hold the annual ordinary general meeting of the company without at the same time seeking the shareholders' approval to the creation of the proposed new preference shares and also—although the company has a sufficient number of unissued ordinary shares to carry through the proposals the directors have in mind—to effect an increase in the ordinary capital. Accordingly, there will be an extraordinary general meeting immediately following the ordinary meeting, at which approval will be sought for the creation of 1,500,000 4 per cent. redeemable cumulative second preference shares and an additional 200,000 ordinary shares.

It must, of course, be understood that the shareholders can do no more than authorise the increase of the authorised capital and that subsequent action must depend upon permission from the capital issues committee. The report was adopted.

NEW CAPITAL ISSUE

At an extraordinary general meeting which followed, the chairman said that Treasury

permission having been granted the directors had decided to issue 1,350,000 4 per cent. redeemable cumulative second preference shares at 22s. 6d. per share and 194,659 ordinary shares at £5 per share. The preference shares would be offered to debenture, preference and ordinary stockholders; the ordinary shares would be offered to existing ordinary stockholders in the proportion of one new share for every complete £8 of ordinary stock held.

The directors had also decided to redeem the whole of the outstanding 4 per cent. mortgage debenture stock on December 1, 1947, at 102 per cent. The debenture holders would be given an option to convert their holdings into preference shares at the issue price of 22s. 6d. per share.

The resolutions approving the capital increase were passed.

A vote of thanks to the chairman and directors terminated the proceedings.

WM. CORY & SON, LIMITED

COAL DISTRIBUTION WELL MAINTAINED

The Rt. Hon. Lord Leathers, C.H., Chairman of the Company, presided, on the 24th instant, at the fifty-first Annual General Meeting of Wm. Cory & Son, Limited. The following is an extract from his statement circulated with the report and accounts.

The accounts show a profit of £725,302. The distribution of coal in this country has been well maintained, and our discharging berths are considerably more active than for some years past. During the time of the fuel crisis your Company was called upon to render its utmost service in carrying coastwise the maximum amount of coal, discharging it on arrival with all speed and ensuring its delivery to final destinations by water, rail or road.

Our interests on the Continent have shown satisfactory movement towards recovery and certain expansions have been made. The coal export trade, however, has practically ceased to exist. There is not only no exportable surplus of coal, but a necessity for importing coal to ensure against another fuel crisis next winter. The U.S.A. have conditionally allocated to Britain 600,000 tons over the third quarter of this year, and your Company has undertaken to contribute its share in the responsibility for the purchase and freighting of this coal, and its distribution in this country.

The Oil Department's revenue from oil bunkering shows a further increase over last year, and progress has been achieved in the industrial field.

SHIPPING INTERESTS

We have acquired the shares held by outside interests in a shipping company in which we were already interested. We now have a substantial holding, with other coastal shipowners, in a new company formed to undertake the carriage of coal for one of the biggest electricity undertakings. There has been planned for this new company a large future development programme, and we shall take our share in the financing of the new capital required. We have already transferred two of our modern steamers to this company.

When the Transport Bill was first issued, many of the extensive services at the ports which we have developed over a century were threatened, but amendments were subsequently proposed by the Minister which went a long way to clarify the position.

The Bill, as originally drawn, provided for the acquisition of most of the privately owned railway wagons, on terms that were unfair to the point of substantial confiscation, but the Minister introduced an amendment embodying a list of wagon values agreed with the industry.

The report and accounts were unanimously adopted.

ANGLO-IRANIAN OIL COMPANY, LIMITED

RECORD RESULTS

The thirty-eighth ordinary general meeting of the Anglo-Iranian Oil Co., Ltd., was held, on the 22nd instant, in London, Sir William Fraser, C.B.E., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1946:

The trading profit of £12,199,247 is the highest figure yet attained. After provision for income tax, which has had the benefit of the various additional allowances provided by the Income Tax Act, 1945, the profit brought down available for dividends and reserves is £9,624,938. The directors have allocated £500,000 to preference stock reserve, making the total £4,000,000, and £2,000,000 to general reserve, which now stands at £3,500,000. They now recommend a final dividend of 25 per cent., less income tax, making 30 per cent. for the year.

PRODUCTION DOUBLED

The production of crude oil in Iran during 1946 amounted to 19,189,551 tons, and was drawn from four main producing areas—Haft Kel, Agha Jani, Masjid-i-Sulaiman and Gach Saran. This shows an increase of 2,350,000 tons over the production of 1945, which was itself a record year. The measure of development in the scale of the company's operations in Iran is, perhaps, best shown by the fact that our production from the country in 1946 was double that of 1939.

Throughput at Abadan refinery was the highest yet achieved, with an aggregate of 17,673,000 tons of oil handled during 1946.

The refinery is being further extended by the provision of plant for the production of lubricants for local sale, by the addition of a catalytic cracking plant and by a major increase of storage capacity. The new cracking plant will be of particular value to us in maintaining the quality of our products at the standards currently required and in facilitating adjustment of our refining processes to meet changes in market demands.

In a refinery working over long periods to full capacity, as is the case at Abadan, a great load is placed on all plant which serves the refinery. Water, steam and electricity are at present required in quantities which leave little reserve. A new water pumping station is about to be commissioned at Abadan. With it in operation the water pumping capacity will amount to nearly 28,000,000 gallons an hour. Our electricity generating plant has already been augmented and plant for a new power station has been ordered. After these additions, the total generating capacity will be 140,000 kilowatts. Unfortunately, the present shortage of materials and manpower prevents as rapid a fulfilment as we would desire of our programmes for the expansion of the refinery and its services.

I gave details last year of the conditions prevailing for workers in the company's service in Iran and of the efforts we had made for their well-being. It was evident that the extent of the company's activities in these spheres had been largely unappreciated. The company's efforts in health, housing, education, etc., are in all ways on a plane with those in its purely industrial and commercial activities, and the post-war programme for the improvement of education and the provision of amenities generally is now gaining momentum. In the provision of housing, unfortunately, we are hampered by the universal shortage of building materials and have not yet been able to make up all the leeway caused by the rapid war-time expansion of our refining and other operations.

It is fitting at this point to record that the company's relations with the Imperial Iranian Government have remained excel-

lent. The Government, its Ministers and Officials have given us considerable assistance during this period of general rehabilitation and we are grateful for their collaboration.

WORLD-WIDE SEARCH

Our search for oil in parts of the world other than the Middle East has been resumed after the interruption caused by the war. We are engaged in exploratory work in the Bahamas, where we have a wholly-owned subsidiary company, and in certain areas in Papua, India and Africa, where we are associated with other companies. We have also entered into arrangements with other parties to explore large areas in Australia.

Our production of oil in England in 1946 has, I regret to say, again declined, by some 16,000 tons, to 55,387 tons. Six further areas have been drilled during the year, without finding oil. The search for additional structures continues. The financial results of the operations of the Scottish shale industry were slightly better in 1946 than in the preceding year.

For the first time since 1939, it can be reported that, with one exception, all the company's refineries are in full operation. In addition to Abadan our smaller refineries in the Middle East, at Kermanshah, Iran, and Alwand, Iraq, have operated normally.

THE TANKER FLEET

The British Tanker Co.'s fleet, which I last reported as comprising 82 vessels of 899,000 deadweight tons, has now increased to 96 ships of approximately 1,100,000 tons. The increase is made up of 11 ships built for us in British shipyards and 4 large tankers recently purchased from the United States Government, less one small 26-year-old coasting tanker of which we have disposed.

I expressed the hope last year that we should, within the year, have raised our fleet again to its pre-war tonnage of nearly 1,000,000 deadweight tons, thus completing the replacement of our war-time loss of 44 ships. We have been able, owing mainly to our purchases in the United States, to improve considerably on that hope—actually by nearly 100,000 tons—but, even with the additional tonnage, our tanker fleet remains inadequate.

EXPANDING WORLD DEMAND

The world's demand for oil products has continued to expand, and at a much greater rate than was thought likely under post-war conditions. This is especially so in the case of fuel oil. War-time pooling systems in the markets have been replaced by a return to individual company distribution, with the outstanding exception of the United Kingdom where distribution is still conducted by the Petroleum Board.

Substantial advances took place during 1946, and in the present year, in the price of crude oil and were reflected in market prices of products. Costs everywhere throughout the oil industry are greater. Wages and salaries have increased, tanker costs have risen steeply, all plant and materials are more expensive. In comparison with the rise in price of other commodities, the increases which have taken place in prices of oil products are moderate.

The distance of the company's oilfields in Iran from the large consuming regions west of Suez has always imposed upon us the disadvantage of a long and expensive tanker-haul. The arrangements which we have recently made with the Standard Oil Co., of New Jersey, and Secony Vacuum Oil Co., will help us to overcome some of this disadvantage and will benefit us in other ways.

The report was adopted.

UNITED KINGDOM GAS CORPORATION, LIMITED

INCREASED REVENUE

The annual general meeting of United Kingdom Gas Corporation Limited was held in London, on the 22nd instant, Colonel W. Moncrieff Carr, O.B.E., the managing director, who presided, said:

It is with profound sorrow that I have to announce the sudden death of our Chairman, Mr. Bruce Ortle, on the eve of this meeting after an illness lasting only a few days. It is a great shock and a severe blow to all his colleagues on the Board of our Corporation who owe such a lot to his wide knowledge of affairs, delicate judgment and deep humanity.

The net revenue for the year, after providing for Income Tax, interest and other expenses amounts to £160,090 which compares with £137,470 for the previous year. This reflects to some extent the results of your directors' policy, followed ever since the Corporation's inception, of forgoing dividends in undertakings requiring major reconstruction, and in other cases, ploughing back to the immediate benefit of the consumer, and now the shareholder profits which could have been distributed in the way of dividend. We have felt justified in recommending a final dividend of 4½ per cent. on the ordinary stock, making 7 per cent. for the year as compared with 6 per cent. for the previous period.

MAGNITUDE OF ENTERPRISE

Your Corporation now controls 76 gas supply undertakings and the West Yorkshire Gas Distribution Company. In the year under review the supply undertakings sold 14,008 million cubic feet of gas and the West Yorkshire Gas Distribution Company 3,616 million cubic feet of gas, a total of 17,624 million cubic feet. The supply undertakings also sold 308,557 tons of coke, and over 9 million gallons of tar.

The number of domestic consumers served was 428,278 representing just about 4 per cent. of the total number of consumers served by the entire British Gas industry. Your Corporation is now the third or fourth largest gas enterprise in this country.

Gas sales to domestic consumers accounted for approximately two-thirds of the total, the balance being sold for industrial and commercial use.

Indicative of the efficiency with which our undertakings have been conducted is the fact that the price at which our gas has been sold has averaged 10.445 pence per therm in the year under review as against 8.682 pence per therm in 1939, an increase of only 20 per cent., although the price of coal, our raw material, has risen in the same period by 98 per cent. and our expenditure on salaries and wages by 145 per cent.

EXPANSION SCHEMES

With regard to the development of the schemes which we had prepared at the end of the war we have now received sanction from the Ministry of Fuel and Power to proceed with new works and distribution plant to the value of approximately £3,000,000; these schemes will eventually involve a total capital outlay in the region of £4,500,000 and will be capable ultimately of carbonising some 1,162,000 tons of coal yearly and of producing an annual total of 22,500 million cubic feet of gas, over 500,000 tons of coke and 13 million gallons of tar. By and large they will eventually more than double our present productive capacity. Taken jointly, these schemes constitute a very large contribution indeed to the country's fuel economy.

The report and accounts were unanimously adopted.

GOVERNMENT RETURNS

For the week ended July 19, 1947, total ordinary revenue was £93,202,496, against ordinary expenditure of £48,097,300 and issues to sinking funds £260,000. Thus, including sinking fund allocations of £3,471,384, the surplus accrued since April 1st is £275,823,724, against a deficit of £284,569,936 for the corresponding period a year ago.

BANKING DEPARTMENT

The West Indies

We can assist you to investigate trade possibilities in this expanding field where we have been established since 1899. Correspondents the world over.

London Offices—6 Lothbury, E.C.2. E. B. McInerney, Mgr.
2-4 Cockspur St., S.W.1. L. R. Newman, Mgr.

THE ROYAL BANK OF CANADA

Head Office: Montreal
Offices in New York and Paris

Over 600 branches in Canada, Newfoundland, the West Indies, Central and South America.

Incorporated in Canada in 1869 with Limited Liability.

REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000
ASSETS EXCEED £97,000,000
CLAIMS PAID EXCEED £181,000,000

1946 Accounts

SECRETARY-ACCOUNTANT (33), single, at present completing the final examination of the Chartered Institute of Secretaries, seeks an appointment with a progressive Company. Wide experience in accountancy, taxation, costing, office organisation and management, staff control and all secretarial duties. Ex-Captain Royal Artillery, with six years' War Service, including 2½ years in India. S.E. Essex or London Area preferred. Salary £500.—Box 517.

YOUNG POLISH LADY, fully proficient in English; perfect German, fluent French; translations; efficient typist; exp. in secr. and admin. duties, seeks suitable employment.—Box 529.

HOLIDAYS? Join party of professional and university people not "overorganised." Special terms ex-service. Switzerland, Scandinavia. House parties Cornwall, Devon, Eire and Scottish Music Festival, July-October. Wintersports. Erna Low, 118, Gover Street, Euston 2368.

YOUNG WOMAN, economist graduate, seeks employment, preferably of academic nature, in which intelligence and adaptability required. Administrative and sub-editing experience.—Apply Box 518.

URGENTLY required by a student for an External London B.Sc. (Econ.), a copy of "The British Constitution," by Greaves.—Box 522.

SWEETS AND ZEITLINGER, Booksellers, Keizersgracht, 471, Amsterdam, want to purchase "The Economist," 1910-1946, and ask subscribers who are willing to sell their volumes to communicate with them.

CHARTERED or Incorporated Accountant required for British Mercantile firm in India, under 35. Three years' agreement. Commencing salary, Rs. 1,200 per month, plus dearness allowance; six months' leave on full pay at conclusion, first-class passages paid, including wife, if any. Endowment assurance and pension schemes.—Write with copy references, to Box ZV81, Deacons Advertising, 36, Leadenhall Street, E.C.3.

HOVE.—Suitable tenant offered share private house with exceptionally fine rooms, three minutes Hove Station and Park.—Box 523.

SEMI-RETIRED Sales and Management Consultant would like to place his services at the disposal of manufacturers to assist with their selling and office organisation problems. If you would like to discuss your problems without obligation, please address your enquiries, which will be treated in strict confidence, to Box 527.

ARE YOU IN the London Telephone Directory? No? Then how can your friends get in touch with you? It's very simple. For details write to Dept. 21, FINDERS, LTD., 77, Dean Street, London, W.1, or phone, Gerrard 9050.

SIR ISAAC PITMAN & SONS, LTD., publishers of the A.B.C. Telegraphic Codes, announce that, owing to increased production costs, the prices of the 5th, 6th and 7th editions will be raised to £10 10s. net each with effect from September 1, 1947.

INTERESTING POSITION as Secretarial and Administrative Assistant to Business Executive in London sought by lady, 27, passed final examination Chartered Institute of Secretaries; 19 years' experience Legal, Personnel and Company Secretarial work; expert shorthand and typing.—Box 526.

EXPORT TRADE. Many thousands of names of Overseas Buyers, the goods they import and their British Buying Agency are contained in the 1947 (56th) Edition of The Mercantile Year Book and Directory of Exporters, which has just been published. Supply is limited. Order now, 25s. 8d. post free.—LINDLEY-JONES & BROTHER, LTD., 54-60, Bishopsgate, London, E.C.2.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at Brettenham House, Lancaster Place, Strand, London, W.C.2. U.S. Representative: R. S. Farley, 111 Broadway, New York, 6.—Saturday, July 26, 1947.

The Planners' Last Chance

THE minatory chorus is growing louder. From every side there are warnings that the economic crisis is reaching desperate proportions. And from every side there is a demand that the Government should do something about it. That the Government are failing to give the country any leadership is too obvious to be argued. Nevertheless it is difficult not to have a certain sympathy with Ministers. For while everybody is clamouring that they should do something, very few indeed are putting forward any very sensible suggestions about what it is they are to do. It is understandable that any Cabinet should hesitate to order a massive restriction of imports, knowing that the immediate consequence would be unemployment and privation. How many of the critics who are now clamouring for action will be outraged by such action when it is taken? A mere restriction of imports, they will say, is purely negative; what is needed is a consistent policy of bold constructive action by the Government. Quite so; but in what exactly would such a policy consist? It is here that the critics are strangely silent.

The truth is that it is not, in general, the Government's policy that is at fault, but the whole community's. In part, it is wrong to speak of "fault" at all, since there is unquestionably a large element of pure misfortune in the present plight of Britain. No Government could have prevented the disastrous rise in world prices or the disappearance of Britain's overseas assets, and no Government could, in the last two years, have done anything effective to offset them. Ministers deserve some charity. But not as much as they take. They have a tendency to claim that what is within their control has been done well, and that what is bad is beyond their control. And there is a further tendency to equate what has been done well with what has been done inside this country, and to ascribe the impending disaster to the madness and badness of the outside world.

There is no such sharp separation. Some part of the deficit in the balance of payments, it is true, is the result of disturbances in the outside world over which the British Government have no control and which, it can reasonably be hoped, will reverse themselves in due course. Without overloading this article with statistical argument, the guess can be hazarded that about half of the deficit is of this character. It would be foolish to attempt to adjust the whole British national economy to these temporary conditions if any way of avoiding it can be found. But the other half of the deficit is of our own making. It originates either in the over-heavy political and military commitments the British people have undertaken, or else in the muddled and distorted state of our domestic economy. The picture of a sane, temperate, balanced Britain striving to keep its head above water in a mad world is a dangerous distortion. The world is economically mad, true enough. But we are very nearly as mad as the rest and the sooner we realise it the better.

The accepted doctrine, which the Government is proclaiming on every hoarding, is that the general output of the country is too low and that the remedy lies in greater individual effort all round. There are sectors of the

national economy where the trouble is manifestly under-production: coal and textiles are the most important and the most obvious examples. It is also true that an atmosphere of slackness is widespread. But it is certainly not true that the aggregate output of all goods and services is low. On the contrary, it is very high, judged by any of the available tests. The estimates of national income, when adjusted by any reasonable allowance for the change in prices, show a higher level than in 1938. All the familiar indications of general business activity give the same result. Steel production, the volume of traffic on the railways, the consumption of gas and electricity—all of these are above, and some of them well above, their pre-war levels. Even the consumption of coal in this country—as distinct from its production—is no lower than it was before the war. There is really very little room for doubt that the aggregate output of the British community today is from 10 to 20 per cent higher in volume than it was in 1938.

But consider for a moment the burdens that the British community is laying upon its productive output. The following is not even a complete list of the programmes and policies that have been set on foot by the unanimous agreement of the whole British people:

The further increase of a standard of consumption which, in the aggregate and on the average, was, in 1946, already as high as in 1938.

In particular, the maintenance of a standard of nutrition which—whatever it may be for the average of the whole people—is definitely higher than prevailed before the war for fully half the people. In the face of a world shortage of food, high consumption is encouraged by subsidies.

Creation of a national health service and the extension of the national educational system.

A considerable extension of social insurance.

The creation and full employment of a building industry larger than ever before.

Repair of war damage and overtaking of wartime arrears of maintenance.

Re-equipment of several major industries.

An export programme of 175 per cent of the pre-war volume. Servicing of a vast war debt.

A large colonial development and welfare programme.

Maintenance of peace-time armed forces at least twice as large as ever before.

Acceptance of responsibility for a large slice of Germany.

Is it any wonder that the national output, large though it is, is too small for the tasks that have been set it? Is it any wonder that, even with the output index at 110 or 120 per cent of what it was in 1938, there is universal evidence of shortage? Yet the essential point to remember is that there is not a single item in this grievous overload that would have been substantially different if Mr Churchill had been in office. There is not one that the Conservatives have publicly repudiated. The main subject of party controversy, the Government's nationalisation programme, whatever its ultimate effects may be, is of sublime irrelevance to the present economic situation. That situation is not the Labour Government's fault; it is the fault of the whole present generation.

*

It is not the output of the British economy that is mainly wrong but the requirements that are put upon it. It is not the supply side of the equation that is at fault, but the demand side. It is not greater effort that is chiefly required of the great mass of the people, but greater abstinence.

This is what the economists mean when, with a singular unanimity, they ascribe the country's present economic woes to a state of suppressed inflation. The word, it has become apparent, is dangerously misleading, for it suggests a purely monetary defect, for which there is a purely financial cure. The present malady naturally expresses itself in a monetary form;

but its basic nature concerns manpower and materials rather than money. What is basically wrong with the British economy at the moment is that, as a nation, we are trying to consume much more than we produce. We do not, of course, succeed in doing so—except to the extent that we are borrowing from foreign countries or using up our working capital—but, in the effort to do so, untold harm is done. Like a flash of lightning seeking to complete its circuit to the earth, the great spending potential forces its way down every channel that is open to it, consuming all that stands in its way. Scarce goods and materials are sucked out of the working capital of industry. Every service industry that can increase its output with little use of materials is vastly over-expanded, so that labour is drawn into football pools and the like and away from more essential industries. The trade unions exploit the shortage of labour to extort more pay for less work, so that the very fact that the supply of goods is below the demand for them leads to a further restriction of supply. The Government—to change the metaphor from fire to water—overdrives its administrative machine in the effort to dam the flood and prevent it from swamping the supplies of really vital materials such as fuel and dollars. But yet it overflows. In this country, as Keynes once pointed out, it is the poor who consume the imports, and with the income of the wage-earners higher than it has ever been before, it is quite inevitable that imports, for all the controls, should be higher than they would otherwise be. It is also quite inevitable that the lack of incentives for either employer or wage-earner and the tremendous suction applied by the domestic market should make exports, for all the controls and for all the patriotic appeals, lower than they would otherwise be. It is inflation that makes it impossible for the miner to spend his wage, and it is inflation that deprives him of all apprehension of any retribution for slackness. It is therefore inflation that is responsible for the shortage of coal.

*

The first and most vital step in any positive policy to solve that half of the problem that is within our control is therefore to get the inflationary poison out of the national economic system. Once again, the terminology is dangerous, for the opposite of inflation is deflation, and that conjures up visions of mass unemployment and destitution. Let us therefore rather say that the first essential is for the nation to make up its mind that it will not try to consume more than it produces—nobody is proposing that it should consume any less. Since the nation cannot, in fact, consume more than it produces (with the exception previously noted), no real sacrifice would be involved. But it would certainly seem like a sacrifice, since it would involve the abandonment of many universally cherished dreams. It is for this reason that Ministers hesitate, and that the Opposition's clamour for a policy is so unfair, for the adjustment to reality will involve more than the abandonment of a party programme, it will involve a re-shaping of basic assumptions in all parties. Yet since there is no dodging reality, it must be faced. For a time after the war ended there was some justification for cherishing dreams, since no one could then say what post-war Britain would or would not find possible. But there is no excuse any longer. To regain control of our economic destiny we must deal in facts and not in illusions.

There are two ways in which a policy of economic realism could be pursued. Capitalist economics of the orthodox type can successfully cope with situations such as this. If all markets were free, prices would rise until the excess demand was choked off. High interest rates would reduce programmes of capital investment to what was indispensably necessary. And the doctrine of balanced budgets with low taxation would limit Government expenditure. Thus the three constituents of total demand—consumption, capital and government—would all be shrunk to fit the available resources. This process has many

obvious and familiar defects. It pays no attention to equity as between individuals; it hurts the poor more than the rich. It is socially blind in its incidence. And once it starts it may (but does not always) go too far and cure over-consumption by under-consumption. But whatever the defects of the "free" capitalist dis-inflation, it does work. It does produce the necessary result of restoring the reign of reality.

Is there any method by which planning can achieve the same result, without the social irresponsibility and the headlong momentum of a "natural" deflation? If there is, it would be greatly preferable. *The Economist* has long ago committed itself to the view that it is both desirable and possible to have, not indeed a detailed control over all economic processes, but a certain measure of purposive direction of the general economic climate. It must be confessed, however, that the experience of the last two years has considerably dimmed that faith. Here was a situation that should have been easy to diagnose, and a set of controls already in existence more far-reaching than any socialist planner had ever dreamed of. Yet if "planning" is defined not merely as the efforts of the small group of self-confessed planners at the centre, but as the net cumulative effect upon the economic system of all the actions and policies of the state, there can hardly be any room for doubt that it has been bad. If ever a community has been more planned against than planning, it has been Britain in the last two years. There has been quite a singular unwillingness to face facts, to adjust ambitions to resources, or to reduce the policies of the various Government departments to a coherent pattern. There is still a chance for the technique of planning to get the country out of its mess. But it will require planning of a kind quite different from what has been seen hitherto.

It is not very difficult to sketch the outline of a Plan for Realism. It can be set out formally in the following stages—

First, form a realistic estimate of what the community can produce, based not on wishful thinking nor on believing that shorter hours produce higher output or that poster campaigns will reduce absenteeism, or that there will be no strikes, but on a hard-boiled and sceptical estimate of what will actually be produced.

Second, deduct from this the resources, calculated in manpower and materials, that will be needed for all the Governmental activities and programmes with which it is decided to proceed.

Third, deduct further the resources needed for all the projects of capital creation, public and private, that are to be authorised—this to include, of course, all building and repair work.

Fourth, deduct exports and add imports, both calculated realistically.

Battle for Western Germany

TWO conferences are now to consider the future of Germany—an Anglo-American conference on coal production in the Ruhr opening in Washington next week, and a tripartite conference between Britain, France and the United States to take place at a later date and designed to secure agreement, if possible, on the vexed problem of the level of German industry. French protests at the fixing of a new level of industry for the Ruhr are the cause of this second conference, for it is realised that the Marshall Plan can hardly succeed if France disputes the place of Germany in it. The Washington Conference, however, faces the more immediate problem—the restoration of productivity in the Ruhr.

The most recent bulletin issued by the British element in the Control Commission paints a dark picture of the British Zone. The rise in coal production has come to a standstill at about 219,000 tons a day, the steel figure is still well below 3,000,000 tons a year, the food position is no better, the transport system

Fifth, the resultant will be what is available for the consumption of the people and steps must be taken—by taxation, by wage policy or otherwise—to see that they do not have for spending (after they have done their spontaneous and voluntary saving) more than is enough to buy this remainder. In cutting down spending money, the Government can be as egalitarian or as non-egalitarian as it wishes.

Sixth, go back to the beginning and drastically reduce Government expenditure and capital programmes in order to make the consumable residuum large enough to prevent riots in the streets.

This, of course, would be a very painful process. For the politicians, it would be even more painful than "natural" deflation, since the sacrifice of pleasant dreams that it involves would be more conscious and deliberate. But it is the way in which the planning philosophy would meet the present situation and those who have not the stomach to face it had better seek refuge in *laissez faire*. For if our economic policies are to be deliberate, what possible justification can there be for going on pretending? There have already been cries of outrage at any suggestion that the housing programme should be curtailed. But, if that is sacrosanct, what else can be jettisoned? The famous "commitments" that cause such heavy Government expenditure will certainly have to be drastically cut. But even the complete elimination of all Government overseas expenditure would not be nearly enough to do the trick. What other nominations are there for the elimination stakes? To look at each item in turn and say that it cannot be touched is in fact to decide that all of them shall equally fail and, in failing, obstruct each other. The most crying need of the nation today is not a policy of priorities but a policy of posterities.

This is not a party matter, in the sense that one party is right and the other wrong, and there are few, if any, sections of the public that can afford to point the finger of scorn. But since the Labour Party is in office, it is the fate of the Labour Party that is primarily at stake. Ministers and members are beginning to realise, as they have often been warned here, that a storm is brewing that could blow them out of the pages of political history. But something more than the Labour Party is at stake: the fate of an experiment to which many people who are not Socialists had attached their hopes, the effort to assert man's control of his economic environment. For unless the planners make haste to plan for realism, the blind forces of economic nature will take over—either because something snaps and the people revolt against controls, or through the massive growth of black markets. It is the planners' last chance.

is so much worse that without emergency measures more coal could not be handled if it were raised. All are agreed—British and American alike—that the present stagnation presages a winter of collapse, and that under these conditions, far from there being a German contribution to a revived Europe, the ruin and misery in Germany will continue to drag the Continent down. The British Government has therefore agreed to send a delegation to Washington to discuss the central issue in the Ruhr—coal production—even though the Americans are unwilling to consider wider bizonal issues (such as food deliveries) which the British not unreasonably believe to be inseparable from the problem of coal output. The fact that in recent weeks a series of American experts have visited the British Zone and brought uniformly critical reports back to Washington has not increased British anxiety to be summoned to Washington and put on the mat.

Nor is this the only reason for British hesitation. Criticism of

British management—of poor discipline in the pits, of confused lines of authority and lack of clear decisions in the administrative hierarchy—is only half the picture. Most of the American reports insist on the positive demand for new incentives to production in the Ruhr and new outlay to make them effective. For instance, it has already been agreed that some foreign exchange earned by coal exports shall be reserved for purchasing consumer goods for the miners and that the percentage shall increase with each rise in exports, that each miner reaching his production target shall be rewarded with a food parcel equal to 40,000 calories, and that all previous incentives in food, tobacco and Schnaps shall be fully honoured. For the general consumer, Mr Anderson, the American Minister of Agriculture, has promised guaranteed imports of 300,000 tons of grain a month, and since the aim is to raise the ration to 2,000 calories a day as soon as possible, the imports figure might well increase. Other suggestions include the import of foreign coal to provide stockpiles for next winter, an emergency programme for transport, and even the import of some steel. From all these proposals, one conclusion is already obvious. They must add enormously to the costs of occupation.

At this point, the British Government must ask itself and its American colleagues some very searching questions. That a severe economic crisis will overtake this country before the year is out no one now denies. The first problem today is not to incur more commitments, but to reduce those that exist. The cost of maintaining the British Zone last year amounted to over £118 million, the cost of the Army of Occupation to £84 million. The estimate for the current year is not so heavy, but military and civil costs together will hardly be less than £100 million. But the actual figures in sterling do not reveal the full gravity of the situation. A fair percentage of the outlay has had to be disbursed in dollars. Food can only be bought in hard currency and, under the Anglo-American agreement on the fusion of the two Zones, the British undertake to shoulder 50 per cent of the trading deficit, largely in dollars, and over the next three years to provide £125 million in capital investment, also partly in dollars. No figures have been published of the extent of the drain on Britain's supplies of dollars, but it is known to be large and is likely to be larger in the coming year.

★

But how, in fact, can these commitments be reduced? Already voices have been raised in this country suggesting that nothing short of a complete British withdrawal from Germany is sufficient to meet the British crisis. Speaking in Sussex last weekend, Mr Douglas Jay, the Labour MP, said, more graphically than grammatically:

We shall have to present America with the dilemma of actually paying the costs themselves or [the British], evacuating and leaving them, or the Russians if you like, to take over the Zone.

And Mr Jay is not alone. A growing body of opinion sees salvation in a ruthless reduction of foreign commitments—military and civil—and Germany, involving great expenditure under both heads, inevitably stands high on the list.

Yet a moment's reflection must show that the international repercussions of so desperate an act as a British withdrawal would be quite disastrous. In the United States, a likely reaction would be a decisive strengthening of that body of opinion which already regards Europe as a finished continent and further American aid as good money thrown after bad. The chance of piloting a Marshall Plan through Congress would be greatly diminished, possibly destroyed. A very possible consequence might be a decision by the American Congress to throw in its hand, abandon the American Zone and leave Europe to go to perdition in its own way. And the mere possibility of

such an outcome would undermine the whole political balances of Europe. The Germans in the West are already uncertain and perturbed by a (wholly unjustified) fear of an Anglo-American withdrawal from Berlin. Any hint of the British leaving the Ruhr would create a mood little short of panic from which only the Communists could profit. Most serious of all, the suggestion of a Western withdrawal would lead to a decisive reorientation in French policy. In France, fear of Germany is still dominant. If the possibility arose of the Western Powers abandoning their control, the French Government, whatever its political colour, would turn to Russia for re-insurance.

These reasons are obviously weighty enough to lead any responsible Government to reject the policy of withdrawal so long as there are any possible alternatives. To withdraw would be the worst of *pis allers*, the confession of ultimate bankruptcy and defeat. But since bankruptcy is precisely one of the possibilities staring the British in the face, it must also be emphasised that the maintenance of the present position is equally impossible. If the choice is forced upon the British of deciding whether to maintain and even increase their present commitments or to withdraw altogether, they may not in another six months be free to choose. Economic collapse may dictate their decision. This is the dilemma which exists quite apart from any questions of British preference or inclination; and it is this dilemma which the Washington Conference on increasing German productivity should be compelled to face.

★

Any unbiased examination of the dilemma will show, however, that it is to a large extent unreal. The British and the Americans are not compelled to consider only two alternatives—total British co-operation or total British withdrawal. To argue so would be the equivalent of arguing during the war that since Britain and America were involved in the same operation, they should contribute precisely equal shares. Then it was recognised that each nation should contribute to the extent of its power and resources. Today, if the fact is accepted that the restoration of Germany in a wider European framework is a joint enterprise of importance almost equal to the winning of the war, common sense alone dictates that the same effective and rational methods of pooling should again be employed. Nor is the argument based simply on a wartime analogy. The concept underlying the Marshall Plan is that each nation should contribute what it can to the restoration of European prosperity and that America should make good the deficit. The Americans are insistent—rightly—that the Western Zones of Germany should be included in the Plan. But their inclusion involves not only the contribution Germany could make to European revival. It also involves the question of how much the British and the French as occupying Powers and as good Europeans could make to the revival of Western Germany without endangering their own recovery. Contributions in dollars would clearly be ruled out, but not necessarily in raw materials, in administrative and managerial manpower, or in grants made in sterling or francs. Once their contribution had been assessed, then would be the time to determine what American figure would be necessary to fill in the deficit between the needs of Germany—and its Occupying Powers—and the contribution each could make. Such an estimate would certainly be larger than the American contribution made now (on the basis of parity with Britain), but it would be very much smaller than the American expenditure which might follow on a British or French collapse. This, then, is the only realistic framework for the Three-Power Conference on Germany promised by Mr Marshall. Only in this way can the German problem be genuinely brought into the orbit of the Marshall Plan.

What in practical terms would such an approach entail?

The first point should be a redrafting of the financial commitments involved in the occupation of Germany. Hitherto only an Anglo-American agreement has existed. It would need to be extended to include the French Zone and its basic principle would be the lessening of the economic burden on the two weaker partners. But obviously such a policy would work more efficiently and productively if it were applied, not to three separate Zones with three separate administrative structures, but to a fused Allied administration controlling a genuinely unified Western Germany. Such a fusion demands the most diplomatic and delicate handling and inevitably it would take time, but the lesson of the war is again that a unified operation cannot be accomplished without unified direction, however much the local corps commanders maintain their national independence and work on different fronts. The local administration in the three Zones could remain British, American and French, just as the commands of Montgomery, Bradley and Koenig were geographically and nationally separate even at the height of the Battle of Western Europe. But the prime necessity is to render this local diversity effective by superimposing on it unity of command—in other words, by building up in Germany for the "Operation Marshall" a new inter-Allied command on the lines of Shaeff. The possibility that General Clay's authority will now be diminished brings nearer the possibility of smooth and easy Anglo-American relations, but the resulting improvement would be only a preliminary. To give the necessary leadership and to convince Europe of the scale and gravity of the Allied purpose, nothing would be more effective than to bring back General Eisenhower, in his new civilian status, to head a new civilian administration.

The Ownership of the Press

NEWSPAPER proprietors and editors share with Cabinet Ministers and civil servants one secret dread: that they should one day be asked seriously and publicly to explain "how policy is made." Policy is in fact generally "made" by methods so normally human, so consciously easy-going, that to reveal them would raise a great shout of relief and laughter from readers and voters. This is said, not to cast doubt on the high seriousness and care which are often devoted to statesmanship and editorship, but to throw light on the fact that it is the exception rather than the rule for men in either calling to pursue a long-planned, far-seeing course, of which the strategy is fixed and only the tactics need from time to time be debated. There is nothing so Machiavellian about editorial conferences. Whims, fads, eccentricities, bursts of anger or fits of aspiration, personal prejudices and traditional affections may all go to the making of a considered editorial decision; their influence may be conscious or unconscious, blatant or barely visible. The belief in "success" which so subtly inspires the *Daily Express* is no more a policy in the ordinary sense of the word than is the clever opportunism which makes the *Daily Mirror* march "forward with the people"—or with two or three million of them.

These things would be scarcely worth saying had they not been lost sight of in the agitation against alleged sinister influences in the press, which led to the appointment of the Royal Commission now sitting. The confused ideas and charges then engendered have begun to proliferate. Proprietors and editors have now on their desks a request from the Royal Commission to answer 32 questions. They tempt one, both by their frankness and by their naivety, to the writing of 32 leading articles. Some of the answers—if honestly given—will be unpublishable; for who could expect the much-abused "press lords" to reply to this question:

Should a paper be a mouthpiece of a particular set of opinions

Within a framework of genuine Allied co-operation, the three problems which have so far eluded all solution—the level of German industry, the scale of assistance necessary to reach the new level and the administration, German or otherwise, to run it—could be discussed in an entirely new atmosphere. The administrative solution most earnestly canvassed in America today—the establishment of a Ruhr Authority under international management—is a possible line of approach and the building up of a civilian Shaeff would be a useful preliminary. The scale of assistance needed is no problem, once the United States accepts primary responsibility for financing it, and the remaining problem—meeting France's fears in the matter of increasing German industrial capacity—can at the very least be deferred, since, as Frenchmen such as M. François Poncet and M. Reynaud are beginning to point out, even the Potsdam level of industry for Germany cannot be achieved for some time to come. Meanwhile, it should not be impossible to give France a pledge that under the Marshall Plan, French revival shall enjoy priority over that of Germany.

The problem of the Ruhr, like so many Allied problems, has reached deadlock because within the present framework of discussion no solution is either economically practicable or politically possible. The situation resembles the terrible wasting stalemate of the winter of 1940. But the creation of a new framework—in that case Lend-Lease, in this case the Marshall Plan—can, if it is adopted, resolve the lesser problems in the wider approach. The moment for such an initiative has come at the twelfth hour, it is true, yet victory or defeat in the new Battle for Europe depends upon the courage and vision with which this last opportunity is seized.

or should it present several points of view on a given topic? Which policy do you adopt? And how is an editor of a popular, "live" daily to reply to this one?

How far are inaccuracy and distortion due to deliberate sensationalism either in the choice or in the presentation of material? Is sensationalism increasing? Can it be checked? What—it may be asked—have these questions to do with the main avowed object of the Royal Commission, which is to

"inquire into the control, management and ownership of the newspaper and periodical press and the news agencies, including the financial structure and the monopolistic tendencies in control?"

Clearly they have nothing to do with it, unless it is assumed from the first that the freedom and accuracy of the press are mainly endangered by the manner in which the industry is organised.

It was argued in a previous article that much that is complained of in the daily newspapers arises from bad traditions, inadequate education and false values among journalists, that the remedy lies largely in their hands, and that it is grossly unfair to assume that the only culprits are the proprietors or the shareholders. It is not even easy to establish a good *prima facie* case against them. The National Union of Journalists has tried to do so in the written evidence it has prepared for the Royal Commission. It set out to show that the control of the press is passing "to half a dozen financially powerful men"; that the public's choice of newspapers—especially in the provinces—is being restricted by the activities of the chains; that the status of editors under these proprietors is declining; that directives and "black lists" are circulated to newspapers by the head offices of chains; that the "press lords" do not give a left-wing government a fair deal. The last thesis is not stated in

so many words; but it is clearly implied by the tone in which the treatment of the fuel crisis and bread rationing by right-wing dailies is denounced.

The political grievance can be quickly disposed of. It is evident that until some six months ago the national dailies were almost exactly divided in their support for or opposition to the present Government; *The Times*, *Manchester Guardian*, *News Chronicle*, *Daily Herald*, *Daily Mirror*, *Star* and *Daily Worker* would usually give its case fair, or more than fair, treatment. And for influence on really effective public opinion, this group must be rated higher than the opposition group of the *Daily Telegraph*, *Daily Express*, *Daily Mail*, *Daily Graphic*, *Evening Standard* and *Evening News*. It is surely obvious that any attempt to set a pro-Government group of responsibly conducted, independent, fair and sober newspapers against another group of arbitrarily managed, dependent, unfair and sensational newspapers leads straight to confusion and dishonesty.

The other charges that are brought against the present ownership and organisation of the press boil down to a large number of variations on the three salient themes of "commercialism," "monopoly" and "private ownership." These charges criss-cross each other in a most confusing way; but essentially they are three separate issues, which can be considered separately.

It is quite true that a modern newspaper is a large-scale business. It has to be. In no other industry has the success of trade unionism in forcing up scales of pay and costs of output—whether in the editorial department or in the printing works—been nearly as spectacular as it has been in the newspaper business. It is now a very costly business to produce a newspaper, and if it is not to be done at a loss, it must be done on a large scale. This is the basic reason for "commercialism," for the close attention that proprietors are compelled to pay to their profit-and-loss accounts, to their advertisement revenues and to their circulations. Moreover, "commercialism" is not all loss. Before the critics condemn it out of hand, they would do well to study the history of *The Times* and learn how that newspaper gained its prestige and pre-eminence by a shrewd and lively commercial sense exercised by educated gentlemen. As in any other trade, the better paper is usually the more successful, and the richer paper can certainly be the better paper. Commercialism, it is true, has its dangers, such as the alleged influencing of editorial policy by advertisers; but the way to counter them is by the creation of standards of professional conduct, not by denouncing the proprietors for being successful businessmen. Given equal purity of intentions, a rich and successful paper will serve the public better than one that can never afford to buy the best—and much better than one that goes bankrupt. It is the purity of the intentions, not the degree of commercial acumen, that is the test.

The modern necessity for operating on a large scale to cover costs is also the basic cause of the decline in the number of independent local newspapers. Successful trade unionism, here as elsewhere, has bred monopoly. To the extent that the newspaper "chain" is a co-operative enterprise (as some of them are), it is an attempt to combine local independence with the economies of large-scale operation, and as such surely praiseworthy. The tightest monopolies of all, the Press Association and Reuters, are rarely attacked—at least on this ground. A chain can obviously afford to hire much more, and much better, journalistic talent than a struggling independent paper. Even the much-derided syndicated leading article may be a much better leading article than any of the papers in which it appears could produce for itself. Nine times out of ten, the objection to the "synthetic unanimity" of the Kemsley Press is not to the fact that all these papers speak with one voice but to the fact that it is Lord Kemsley's voice with which they speak. Once again, the question comes down to the motives and the responsibility of the controlling individuals.

This third issue, that of the individual private ownership of

newspapers, is the crux of the whole matter. There is undoubtedly something very dangerous about putting so much power into one pair of hands unless it is accompanied by a high sense of responsibility. Examples can be quoted of proprietorial edicts, some of them sinister, some of them merely comic, such as the refusal, as alleged by the NUJ, of the Thomson Press of Dundee to have any mention of Mr Churchill's name in their papers all through the war. But, once again, a distinction must be drawn: it is not the fact that one man is in a position to issue such instructions that is dangerous, but the fact that some men, placed in such a position, issue the wrong orders. It is in the nature of a newspaper that there must be a strong concentration of authority, as in any other enterprise where far-reaching decisions have to be taken at a moment's notice. It is no more possible to run a newspaper than to run a ship by committee government, or a system of checks and balances. Indeed, many of the proposals for reform are designed to protect the authority of a single man, the editor. Yet if there are reasons for believing that all editors can be safely entrusted with absolute authority, while no proprietor can, they at least do not leap to the eye. May not the thirst for personal power be just as corrupting as greed for gain? Moreover, in a modern newspaper, the editor, if he is a good editor, cannot oversee the whole enterprise, and the authoritative individual whose integrity needs protecting is the active head of the whole concern rather than the head of the editorial department.

It would therefore seem to be a mistake to try to prevent the concentration of authority in newspaper offices or to swallow without examination the complaints of journalists as a class against proprietors as a class. But there is one point of substance to which the reformer may cling. Whoever the man in authority in a newspaper office may be, he should not nominate himself, nor should he be appointed by some other self-nominated individual. Editors, after all, have to prove themselves before they are appointed; proprietors appoint themselves, either by inheriting wealth or by making it. The community surely has a right to insist that there shall be some conscious and deliberate act of selection, either by a disinterested panel or by a body of persons numerous enough to reflect variety of judgment—that is, either by a judge or by a jury—before any one man is put in a position of authority, either as editor or as proprietor, in a newspaper office.

One attempt to secure this object is represented by the new French Press Law, which prescribes a minimum number of shareholders for every newspaper company, and though such a provision is easy to evade, there might be ways of tightening it up. Another line of approach that has become familiar in this country is the creation of an impartial trust to pass upon appointments or changes in ownership, or both. It would ill become *The Economist* to argue against the trust idea. But it does have two defects as a prescription for universal application. The first established; to insist on trusts for all papers would be to increase the difficulties, already great, in the way of any new venture. The second is that, if trusts were prescribed by law, the community would at once have to face the dilemma of either accepting as trustees whomever was nominated by the existing proprietors or else of imposing a right of review by some public body, which would involve what the NUJ calls "the shadow of Government control."

This, it may be suggested, is the basic issue that confronts the Royal Commission. How can the choice of the men to exercise authority in the press be a free choice, and yet a wise choice? It is a special facet of the age-old problem of how men can be made good by Act of Parliament. Nothing that has been said in this article should be taken as detracting from the crucial importance of the problem, when fully analysed and properly defined. But the Royal Commissioners will have to be very clever men and women if they can solve it.

The Indian Princes

THE contemporary political map of India has the same remarkable patchwork quality which is characteristic of eighteenth-century Germany or Italy in historical atlases of Europe. Interspersed among the provinces of British India are numerous areas of varying shapes and sizes, corresponding to the lesser entities of the old European order from Bavaria or Tuscany to the petty jurisdictions of the Knights of the Empire. In Europe, the great majority of these feudal units have long disappeared—though one or two of them, such as Monaco and Liechtenstein, have managed to survive successfully as independent states—and the problems involved in the unification of Germany and Italy seem to this generation rather remote. Indeed, during the last few years, many people in this country were inclined to think how much better it would have been if they had never been unified at all. But it is generally admitted that, where a sense of nationality really exists, the process of unification at the expense of former feudal *Klein-staaterei* is an irresistible one and that rights of ruling dynasties, which do not correspond to popular national sentiments, have to be set aside in the making of national states.

In India, the "Indian States" (or "Native States," as they used to be called) are scattered over the country from Kashmir, which reaches to the Pamirs in the extreme north, to Travancore, which includes Cape Comorin in the extreme south. The Indian States comprise nearly half of the total area of India and nearly a quarter of the population. They are simply all of India which was neither annexed by the British crown to form "British India," nor left as wholly independent States as Nepal and Bhutan were. At a certain stage in the expansion of the East India Company's power in India, the idea of "paramountcy" emerged as descriptive of the relation which should exist between the Company and other ruling powers, great and small, within the geographical confines of India, in order to produce an orderly system. After a period when the greater part of India had been under the effective rule of the Mogul emperors in Delhi, a time of extreme disintegration had ensued. The new independent rulers were sometimes heirs of old dynasties which had accepted subordination to the Moguls, sometimes viceroys and governors appointed by the Moguls, who set up as local monarchs on their own, sometimes adventurers who carved out realms for themselves by the sword. The boundaries of these succession states were constantly changing in accordance with their mutual wars, and some did not even claim fixed boundaries, but consisted merely of a group of forts from which plundering raids were made on neighbouring territories. In all this confusion the British Governors-General

had to devise some method of dealing with Indian rulers whose territories the Company did not want to annex. Thus developed the system of "dependent states," which remained apart from "British India," but under a firm British supervision. Some of the rulers gained their position as allies of the British in wars against their neighbours; others, having fought against the British and been defeated, were allowed to retain reduced territories on condition of accepting the control imposed on them. Few can be said to have survived by their own strength; many had to be bolstered up by British power to prevent their violent absorption by more powerful rivals, and some were specially created as local rulers for reasons of policy. All, whatever their origins, titles or importance, came to be known in common English usage as "Princes."

From the Princes' point of view the bargain was in most cases very satisfactory, for, even though they lost the right to have foreign policies of their own and had to accept a certain amount of interference in their internal administration, they were secured against external attack, rebellion and "palace revolution" and their revenues, no longer dissipated by wars and invasions, provided them with great personal wealth. It is just this aspect of the system which has been so severely condemned by nationalist and democrat critics in modern India. In the old days there was a certain survival of the fittest; the despot might be, indeed had to be, cruel, but unless he had a certain competence he was liable soon to be wiped out by external or internal enemies. Under British paramountcy, however, the Princes have been artificially preserved and the "natural" processes of amalgamation and unification have been suspended. India has been divided into two parts, in one of which has functioned a uniform central administration of unprecedented strength, while in the other the fragmentation produced by a period of utter collapse has been permanently fixed and even accentuated. The category of "States" includes units from the size of Hyderabad, which is as large as England and Scotland together, down to dwarf territories such as Virampura, which has one square mile and 135 inhabitants. The dwarfs are, indeed, grouped together in Agencies for administrative purposes, but even so, an extraordinary patchwork of local personal jurisdictions has remained, in extreme contrast to the theory and practice of modern administrative organisation, as exemplified in British India.

Formerly, the Princes had no unity or cohesion among themselves and it was indeed the policy of the Paramount Power to prevent any combination among them, unions such as the old Maratha confederacy having been forcibly dissolved. But,

The Chairman said —

"... the Society's With Profit policies will stand comparison with those of any other office. This is particularly true when the strength of the Society as disclosed by the triennial investigation is borne in mind."

Extract from Chairman's speech, 27th March, 1947

EQUITY & LAW
Established 1844
LIFE ASSURANCE SOCIETY
20, LINCOLN'S INN FIELDS, LONDON, W.C.2.

in 1921, a consultative Chamber of Princes was formed for the whole of India, and the Princes were thus given a definite status, not only as local rulers, but as a class, a hereditary aristocracy confronting the rising middle-class lawyer-politicians and commercial magnates of British India. When a scheme of federation was worked out for India and embodied in the Government of India Act of 1935, it provided that the Princes should have for their nominees 125 out of 375 seats in the Lower House of the Federal Legislature and 104 out of 260 in the Upper; as most of the States were still autocracies and the constitutional reforms which had been introduced in some of them generally fell short of parliamentary supremacy, the participation of the Princes involved a severe restriction of the representative, democratic system desired by the British Indian leaders and ensured a preponderance of socially conservative forces in the projected Legislature. But without the States' participation no unity of India could be achieved, and the British Government would not consider any compulsory unification; it was held that they were independent units, except as bound by treaties with the British Crown, rights arising from which could not legally be transferred without their consent, and hence each must be allowed to choose whether it would join the Federation or not. The Federation was, indeed, itself made conditional on a sufficient number of the Princes joining it; it could only come into existence when

enough States to fill 52 seats in the Upper House, and comprising not less than one half of the total population of the States, had acceded to it. Being thus endowed with a virtual power of veto over the whole scheme, the Princes began to bargain over terms of accession, and when the war in Europe broke out in 1939 no agreement had been reached.

In the post-war Indian settlement the creation of the Indian Union and Pakistan has not been allowed to depend on the accession of a sufficient number of States, but the latter have still retained in theory the right to join or not as they choose, or rather they now have three choices—to join the Indian Union, to join Pakistan or to assume full independence. Lord Mountbatten has been strongly urging them to join one or other of the new Dominions, according to their geographical position, conceding at least defence, foreign affairs and communications to the central authority. So far only three—Hyderabad, Bhopal and Travancore—have claimed independence, and it is not certain that all of these three will maintain their stand; there is already a report that Travancore has

reversed its policy. This is significant, for Travancore would probably have the best chance of keeping its independence, apart from coercion by direct military attack, for it is a seaboard State with a flourishing overseas trade; Hyderabad and Bhopal are inland States entirely surrounded by Indian Union territory, so that their external communications would be at the mercy of Delhi.

The question of independence or federation is, however, complicated by the communal issue, which particularly affects Hyderabad and Kashmir. The former has a Moslem ruling dynasty and a Hindu popular majority; in Kashmir the relation is reversed. Geographically, Hyderabad has no contact with Pakistan and would naturally, if it were going to federate at all, enter the Indian Union; as the Moslem dominant minority fears subjection to Hindu rule, and at the same time does not wish to emphasise the communal issue, the path of independence has been taken. Kashmir, on the other hand, has common borders, both with the Indian Union and Pakistan, and on geographical grounds can suitably adhere to either. It has not proclaimed independence. Pakistan claims it because of its Moslem majority (the "K" in Pakistan stands for Kashmir), but its Hindu rulers are expected to opt for the Indian Union. Both Hyderabad and Kashmir can be sources of serious trouble between the Indian Dominions.

Quite a different issue has been raised by the speech recently made by Sir Ramaswami Aiyer, the Prime Minister of Travancore (now in hospital after an attempt on his life), in defence of his State's reluctance to join the Indian Union. He said that the Congress Party had entered into diplomatic relations with the Soviet Union and was failing to suppress Communist revolutionary agitation in India. This speech was evidently addressed beyond the borders of Travancore to sympathisers in the right wing of the Congress Party itself, who are no less alarmed at the rumblings of social revolution and suspicious of the forces of radicalism, with which Congress has allied itself in its struggle for power. Like the Kuomintang in China after 1927, Congress is rallying towards the Right, and its more conservative leaders now look to the Princes, no longer as the "breakwater" for the British Raj against Indian nationalism, but as a future "breakwater" for themselves against the storms of social revolution in an independent India, the gravity of whose impending social and economic problems is only just beginning to be perceived.

The re-integration of ex-British and Princely India is bound to be a task of great difficulty. It might have been effected by revolutionary violence—and there still may be violent passages in the relations between these sporadic monarchies and the Indias of Nehru and Jinnah. But an attempt is being made for amalgamation by peaceful constitutional process and there is a hope that it may be successful. There is plenty of administrative talent in the States—where ambitious Indians have often found opportunities not open to them until very recently in British India—and some of the States have preserved traditions of an older India by which even a progressive democracy can be enriched. So much that seemed impossible only a year ago is now in process of being realised by peaceful means in India that it would be wrong to be pessimistic about the outcome of this particular problem. Everything depends on moderation on both sides. If the Dominions have the sense to make it easy for the Princes to accede and do not force them to pass through the Caudine Forks, very few of them will give trouble. (In passing, it may be remarked that their willingness to join British Dominions is likely to be greater than their willingness to join wholly independent states.) But, on the other side, the Princes would be very ill-advised to stand on their purely legal rights, in the face of both economic and political facts. Fortunately, one of the discoveries of 1947 is that moderation is a quality that is not wholly lacking in India.

NOTES OF THE WEEK

Coalition Rumours

There is a renewed burst of rumours of an impending coalition. Nothing is impossible; but a coalition between the Labour and Conservative parties is, to say the least, highly improbable. It is significant that all the talk comes from the Tory side. It is, of course, natural for politicians to seek office. But why anybody should seek office in present circumstances is very hard to understand. The most elementary prudence would counsel the Tories to keep out for the present.

The argument seems to be that the imminent economic crisis reproduces the situation of 1931; a coalition was found necessary then, so why not now? But the history of 1931 is by far the strongest reason why there will not be a coalition now. The circumstances are now quite different. Then the Labour Party had no majority; now it has a majority which shows no sign of splitting or crumbling. Then the leader of the Labour Party decided that he could no longer accept the policy of the party; now Mr Attlee is a loyal party man beyond, above and almost to the exclusion of all else. Coalitions can only come about if somebody of the very highest standing in the party in office—the Prime Minister or one of his chief lieutenants—wants to have a coalition, and the fate of Ramsay MacDonald after 1931 ranks as an Awful Warning to any Labour leader who might feel tempted to toy with the idea. The overwhelming probability is that this Parliament will run its course and that the Labour Party will remain alone in office until the General Election.

Not only will there not be a coalition; there ought not to be. Coalitions are bad governments; they are compromise elevated to a principle. They are justified only when two conditions are met. The first is that there should be a wide measure of agreement between the parties over substantially the whole range of the Government's programme. The second is that the execution of that programme should be impossible without the commitment and support of the Opposition. Both conditions existed in 1940, when there was agreement on what had to be done and the active co-operation of the Labour movement was needed to do it. Neither condition exists today. There is no agreement on what should be done, and if the present Government could once make up its mind, it could do whatever it wanted to without the co-operation of the Conservatives. So long as the Cabinet is a party one and faces an Opposition, there is always the possibility that, to save its own skin, it will sink its internal differences and decide upon a policy. With a coalition, particularly one forced by circumstances, every item that appeared on the Cabinet agenda would become a field of manoeuvre.

Government by alternation of parties is by no means perfect. But it is better by a long chalk than government by coalition.

* * *

The Lords, the Commons and the Bill

The solemn comedy of the conflict between the Houses of Lords and Commons over the Transport Bill is not yet at an end. Indeed, it is not yet possible to say absolutely for certain that it is only a solemn comedy, though everybody (the Conservative peers not least) would be astonished if, after a sufficient number of stately rituals have been gone through, the Lords did not in the end do as they are told.

The original set of the Lords' amendments were considered by the Commons last week. There, throughout an all-night sitting that was enlivened by some quite unnecessary personalities, the Government's attitude was entirely unyielding. What they had freely accepted when the Bill was before the Lords, they would advise the Commons to accept. What had been written into the Bill by the Lords against the Government's advice must come out again, every last word of it. This was a bit too much for the Lords who, on Tuesday of this week persisted in the attempt to force amendments on the Government. The Bill will therefore presumably come once more before the Commons. The Commons will stand pat and then, unless all the prophets are wrong, the Lords will bow to the Government's wishes. The stately comedy will be over.

The Lords, however, have played their role much better than the Government. They have been dignified, moderate, judicial. The Conservatives have not abused their majority, and though many of their amendments could not stand if the principle of the

Bill is to be accepted, all of them were reasonable matters of divergent opinion. The Government would have been very well advised to have accepted at least one of the controversial amendments. As it is, by their rigidity, they have given the impression of being hasty, petulant, obstinate and arrogantly convinced of their own infallibility. The Tories may well be satisfied with this achievement. They have certainly no wish to plunge into a constitutional crisis.

* * *

Coal to Europe—and Swansea

The theme that Britain must export coal to Europe to lend power to Mr Bevin's policy has been stated in the last ten days with vigour and noise. But the variations on the theme have been few and unimaginative. Mr Morrison, for example, might have given British miners some graphic instances of Europe's needs, of its dependence on American aid and of the actual amounts required to change the whole picture. All the figures are available, and simple division and multiplication will do the rest.

For example; in the year ending June 30th Europe received from the United States 25½ million tons of coal and coke. This is equivalent to seven weeks' production by British pits, working at the levels reached in May of this year. In other words, one extra hour a day in a five-day week would make American imports unnecessary and save Europe over \$560 million a year. Such calculations may irritate the miners' leaders; but they are the kind of rough estimate that is being made by foreign critics of Britain and by the men who will draw up the Marshall Plan.

The particular case of France is even more striking. The present French coal deficit is 12½ million tons. Partly because of it the Monnet plan is in danger and French policy towards Germany is continually colliding with British policy. This deficit could have been made good by the export from Britain of three and a half weeks' production; and France, whose dollars will run out in two months' time, would have been saved over \$100 million.

The last report of the European Coal Organisation has appeared just as American ships have arrived in this country bringing coal to Swansea—of all places in the world. It shows that in June Europe received 3,263,000 tons of coal from the United States and none from Britain; it also shows the significant fact that Polish coal exports to Europe at 810,000 tons have nearly caught up with west German exports at 848,000 tons. In the circumstances, it is not surprising that Americans are saying that we should fight another Battle of Britain before we talk about more Lend-Lease.

* * *

Breakdown in Moscow

The breakdown of the Anglo-Russian trade talks created the maximum disappointment because the publicity given to them was so badly handled. Common sense should have dictated that when an inexperienced—though able—junior Minister is bargaining with so old a hand as Mr Mikoyan he should not be embarrassed by optimistic leakages. The idea of getting wheat from Russia without paying dollars was getting quite a grip on the British newspaper reader; now it seems that we shall get no Russian wheat partly because we would in fact have had to pay for some of it in dollars.

The British Mission wanted 6,000,000 tons of wheat and small quantities of timber. It also hoped to pave the way for regular trade relations with the Soviet Union, which would in the course of time bring in flax, hemp and dairy produce. The Russians wanted capital equipment and better terms for the settlement of their outstanding debts. Unfortunately, the British could not guarantee delivery of capital equipment nearly sufficient to cover the cost of the wheat; the balance would have had to be paid in sterling convertible to dollars and in amounts that Britain is unlikely to have available in the near future. Moreover, the wheat prices offered over a period of years were substantially above those accepted by Canada in long-term contracts; and the Russians made concessions on their debts a condition of negotiations instead of treating them as part of the general bargain. But the question remains: if the Russians really have a surplus of grain for export and an urgent need for capital equipment, why were they so stubborn?

Testing the Sellers' Market

The answer can perhaps be found in the Russian explanation of the breakdown. They have so far refrained from introducing any political note into their account. It would, however, be surprising if Soviet propagandists were not to try to fit the event into the familiar theme of Britain's reluctance to co-operate with Soviet Russia and its subservience to dollar imperialism. The main reason given for the breakdown is that "the Soviet side could not accept a situation in which Russia alone entered definite obligations," while the British delegation has refused to do so. By this is meant that the Soviet Government was prepared to guarantee the size and the timing of the Russian exports to this country while the British delegation could not similarly guarantee that British goods asked for and promised to Russia would be delivered in the quantities and at the dates desired by the Russians. This may be true, for Sir Stafford Cripps cannot control the direction of British exports in the same way that Mr Mikoyan controls Russia's foreign trade. This is a difficulty that has always arisen in trade negotiations with the Russians, when these have been conducted between Government and Government and not between the Russian trade agencies and the foreign exporters concerned. The difficulty has proved greater because the Russian demand for steel and engineering supplies from this country has by far surpassed the capacity of British exporters to meet it in view of their commitments to other buyers. According to Russian suggestions, it is this unpleasant circumstance that has really caused the failure of Mr Harold Wilson's mission to Moscow.

The Russians were not at all pleased at the prospect that they would receive "convertible sterling" in payment for amounts of grain and timber exported to Great Britain in excess of the quantities that would be paid in British goods. The Russians are little interested in accumulating dollar assets at a time when they have little or no chance to spend those dollars in the United States on the engineering goods they most urgently need. The chief problem facing the Russians is not their balance of payments—in this respect Russia's position is quite different from Britain's. It is, therefore, almost certain that the Russians would have been far less concerned with the terms of the repayment of the 1941 credits if they could have hoped to receive from this country the quantities of steel, mining and timber-cutting equipment which they wanted.

Shortly before the British Trade Mission went to Moscow, it was suggested in these columns (see *The Economist* of April 19, 1947, p. 578) that the Russians were now eager to find out whether and to what extent the sellers' market was beginning to weaken. After a long and exacting test of British capacity and patience they have satisfied themselves that the sellers' market, especially in the goods they most need, is still firm.

Housing at Eatanswill

The more politically explosive a subject is, the less likely it is to be considered on its merits; and housing still remains political dynamite. Monday's debate degenerated into the usual party dog-fight, with a brilliant sparkle of debating points and a proper quota of personal abuse; but with astonishingly little attempt on any side to answer the real and awkward questions of which even Mr Bevan must now be becoming aware. Is the Government still trying to build too many houses, even after the enforced cut in its programme earlier this year? Obviously not in relation to the need for accommodation; but, equally obviously, far too much is being attempted in relation to the need to save foreign exchange and defeat inflation at home. Is it not a fact that the building labour force is now too large in relation to the materials available, and that Mr Bevan is guilty of the hoarding and concealed unemployment of workers of which Labour propagandists rightly accuse certain private employers? Are the right sort of houses being built; or is it a fact that, as one Labour Member hinted during the debate, the temporary housing programme has justified itself precisely because, though three rooms may not be much to go on with, there is no real hope of building enough Bevan mansions to come anywhere near meeting the need? Half a house, as the man said when the lorry with the front of his bungalow went into the river, is better than living with Mother; and ought the Dudley-Bevan standard of size and amenity not to be recognised as the luxury which at the moment it is? And, finally, are the houses going to the right places? Mr Bevan laid down during the debate the fantastic doctrine that house-building should be spread evenly over the country. Some of it certainly should; for there is always the core of genuinely immobile building labour whom no inducement can shift beyond splashing

distance of its parish pump. But the chief need—if need and not politics is to be the criterion—is concentrated today in two or three special sectors: in the farming districts, the more productive coalfields, and perhaps some of the steel towns. The case for getting more workers to these places is a matter, not of two women having to cook on the same stove, but of whether or not either of them is to have anything to cook at all; and at the present moment the measures which give most direct help to production and the balance of payments are entitled to absolute priority.

A few rays of light illuminate the gloom over housing, including particularly the building operatives' decision to accept payment by results, discussed in more detail on page 213. If properly implemented, this decision should lead to a sharp drop in the industry's apparent labour requirements, and so release a useful contingent of workers for other trades; though the building workers may reasonably ask that release should be largely under their control, and should be accompanied by definite reinstatement rights. The country should be thankful for small mercies. But over the housing field in general, on the Opposition as well as the Government side, Eatanswill remains triumphant.

Tinplate and Patronage

The motion put down by Mr D. Grenfell, MP, inviting the House of Commons to disagree with the decision under the Welsh tinplate and sheet scheme to site a cold reduction plant at Llanelly instead of Swansea, draws attention to some of the more disturbing aspects of the present control of the location of industry. The objects of the control are, of course, reasonable and even admirable, and there can be little objection in principle to the methods employed in actually persuading firms to settle in one place rather than another. In practice there is delay and a great heaping of straws on the camel's back; but these are incidental defects which could and should be removed by detailed administrative reform. The point at which real uneasiness begins to spread is the determination and revision of policy. For the fact is that the decisions which have to be taken are strictly political, in the sense that they are and must be based largely on a qualitative judgment of political and social factors, and not purely on technical data; and that, except in special cases or in the broadest outline, they nevertheless do not usually receive publicity or come under any public review—least of all any review in the areas most concerned. Strings are pulled behind the scenes and memoranda circulate; but it is only rarely that a case like Mr Grenfell's arises in which the full facts can be dragged out into the open for public debate. The whole process smells a little too much of the antechamber.

The remedy seems to lie mainly in two directions. The first is to have the combined physical and economic development plan for each area recorded and published in a form which facilitates public comment. An admirable opportunity for doing so will arise with the formulation of development plans under the new machinery set up by the Town and Country Planning Bill; and it is particularly important to avoid the danger that these plans may turn out to be nothing more than glorified zoning schemes of the traditional type. And, secondly, it ought to be possible to return to something a little more like the ideal of control of the location of industry which was emerging in the last year or two before the war. The present control appears to people in the areas concerned as the distribution of industrial manna from Heaven by the agents of Whitehall—something, that is, quite out of end, was to provide for local competition for enterprise within nationally controlled limits; and it is evident that this approach standing and responsibility and in reducing the fear of favouritism by national authorities. Provided that the nationally imposed limits can be drawn tightly enough to prevent purely wasteful competition, the advantages of this latter approach are obvious; and, while it has admittedly been impracticable to draw them tightly enough in the past, it should gradually become possible to do so in future as the new town and country planning machinery evolves.

Mr Rank and the Dollar

Mr Rank's statement, following his return from a three-months' business visit to the United States, on the dollar-earning potentialities of the films produced by his organisation, is opti-

mistic but studiously uninformative. Net monthly returns, after deduction of the dollars necessarily spent on promotion, are steeply on the upgrade, having increased from March to April by 20 per cent, by a similar proportion in successive months, and by an estimated 30 per cent from June to July; but to what original total these percentages refer is Mr Rank's secret. In a little time, he thinks, net dollar earnings would amount to much more than the £15 million to be saved by the proposed tax on films imported from America. But the figure of £15 million is itself mere guesswork; no rate has even been settled for the tax, which the Government has merely taken power to impose. If Mr Rank's purpose was to forestall any inconvenient comparisons between the leniency of Government policy towards dollar expenditure on films with its savagery in the matter of newsprint, he has not achieved it.

He may, of course, be perfectly justified in his optimism. He knows his stuff. On the production side he has worked a near-miracle on an industry which only a decade ago was artistically and financially a laughing stock; he has displayed that gift for picking the right men and then giving them a free hand, which is one of the surest hallmarks of the first rate administrator; and while his control of the major exhibiting circuits certainly represents a regrettably lopsided predominance of power, he has not exploited that power to crush his independent pacemakers. There is, it is true, some evidence that the wily Americans were one too many for him in his first Transatlantic ventures. The best of British films may be killed dead as mutton by, say, a midsummer launching at an obscure theatre; and though some Hollywood producers genuinely welcome the British lead towards intelligence and integrity in picture making, there are others who have no use for either, whatever its provenance, but a good deal of power to back their dislikes. The hiring of a chain of cinemas, like the purchase of others in several of the Dominions, is part of a campaign to counter this policy of blackout. So is the current exchange scheme by which two Hollywood companies are to exhibit Rank pictures in return for exhibitor facilities on the Rank-owned British circuits for an equal number of their products.

On a long view, these arrangements may be unexceptionable. But is this really the precise time for casting dollar loaves on the waters in the hope that they will come back buttered? The onus of proof lies on Mr Rank; and no proof has as yet been provided.

France Between East and West

Only two groups in France have accepted wholeheartedly the growing division of the world. The Communists are the busy first fiddlers in Russia's European orchestra, and play loudly the tune of France selling out to "the Trans-Atlantic Trusts" and America seeking through the Marshall Plan to enslave the French. At the far side of the political arena, General de Gaulle has been parading his brass and drums through Brittany to end in Rennes with an oration blasting the Communists as "a party at the service of a foreign country," and offering his *Rassemblement du Peuple Français* to lead the struggle against the Eastern bloc.

But in between these two extremes few people rejoice in an ideological division which they see tearing not only Europe but their own country apart. The mood of the average Frenchman was well mirrored in last week's debate in the Assembly on foreign affairs. Apart from the Communists and a few fellow-travellers, speakers from Left, Centre and moderate Right repeated to a remarkable extent the same formula—that France, without damage to its own claims in the Saar and the Ruhr and on reparations, must mediate in Europe between East and West, that nothing must be done to weaken its links with Eastern Europe, and that acceptance of the Marshall Plan must represent not a "drift to the Right" as the Communists suggest, but the acceptance of much-needed help in an economic situation of unparalleled severity.

Against this background, M. Bidault had little difficulty in securing an overwhelming majority for his policy. Naturally, he would not yield an inch on France's claims. Of course, the lines to the East were open. Had he not offered the Czechs and the Poles treaties on the lines of the Anglo-French Treaty in recent weeks and received no reply? There could be no question of American hegemony or of drifting to the Right. The plain fact was that France, with only two months' reserves of gold and dollars, had to choose not between "the yellow bread of dependence and the black bread of freedom," but between bread or no

bread at all. But France would in no circumstances abdicate from "its place in history," and would continue to consecrate itself to the reconciliation of the world.

After that, the Chamber clearly felt that there was little more to be said. Even the Communists abstained from voting their disapproval, and M. Bidault received his vote of confidence by 525 votes to 6.

"Scorched Earth" in Indonesia

The Dutch have so far had substantial military successes in their warfare in Java and Sumatra, but they may have to cope with a prolonged guerilla resistance similar to that which is still going on in French Indo-China. Meanwhile the "scorched earth" policy, long threatened by the Republicans in the event of new Dutch military moves, has been put into action and considerable destruction has already been carried out—though, as is usual in such cases, the effectiveness of the method is restricted both by local unwillingness to co-operate in destroying means of livelihood and by lack of time for completing demolitions. In some cases the Republican Army—which seems to have been subject to little control from the Government in Jogyakarta—began demolitions near the Dutch perimeters some time before the outbreak of hostilities, presumably in the belief that they were inevitable; the Dutch took political advantage of this destruction of assets to reinforce their *casus belli*, and they may have been influenced in their final decision to strike by the knowledge that "scorched earth" action was going on in any case. With competent technical staffs the Dutch no doubt hope to get production and transport going again soon, even if only on a reduced scale as compared with pre-war times, and it may be that in the short run they will find their war profitable, for the actual campaigning is not much more costly than maintaining large forces in idleness under local blockade, and exports of commodities may bring in the much needed foreign exchange for the Dutch economy. The world market will also be the better off for any renewal of supplies which have been so long held up.

But the Dutch must realise that they have involved themselves in a struggle which it is unlikely that any quick military victories can really resolve, and a road to reconciliation with Indonesian nationalism will not be easy to find. The nationalist opposition to European colonialism in Asia today is something very different from the local risings or agitations of earlier times. It has a confident, persistent international character, which makes it infinitely formidable. Already India—with Pakistan, concerned for its Indonesian co-religionists, in full accord with Congress—has expressed official sympathy with the Indonesians and has raised the matter with the Security Council. So also has Australia. Juridically the Dutch position cannot be challenged, but the "inherent rights of Asiatics" will be very loudly and forcibly proclaimed as never before in a world forum.

Shadowplay in Italy

An apparently inexplicable and meaningless debate has now occupied the Italian Assembly for nearly a week. Count Sforza, supported by the Christian Democrats and the Centre, wishes to ratify the Peace Treaty. The extreme Left, led by the Communists and the Socialist followers of Nenni, have joined hands with Monarchists and Qualunquists to prevent ratification, and day after day, the debate continues. Count Sforza's argument is simply that, once the treaty is signed, Italy can take its place officially among the nations. The Communists have protested that nothing can be done until Russia has ratified the Treaty. The Right reject ratification on the obvious grounds of wounded nationalism. Both the alliance of Left and Right and the arguments seem unreal and now a further note of confusion has been added by Russia's decision not to ratify the treaty until Italy has done so.

But, as is the case in most apparently unaccountable political incidents today, behind the shadowplay lurks the universal issue—the division of Europe between East and West. The ratification of the Italian Treaty sets into motion a series of arrangements concerning the evacuation of troops. After the ratification of the Italian Treaty the Russians are pledged to reduce certain of their garrisons in Eastern Europe, but at the moment they clearly find the international outlook too uncertain for any reduction in their military guarantees. A postponement of the ratification of the

Italian Treaty leaves the military *status quo* unchanged and this for the time being is apparently what the Russians seek. To those who protest that it cannot be either in the Russian or the Italian Communist interest to prolong a situation in which British and American troops remain in Italy, the answer unhappily is that the "Anglo-Saxon garrisons" in Italy are all unwittingly among Russia's best propagandists and friends.

* * *

Stevenage in the Lords

The judgment of the House of Lords on the appeal of the Stevenage objectors to the original designatory order made by the Minister of Town and Country Planning is likely to bring to an end such hopes as objectors to any new town may still be cherishing; and the terms of the judgment, delivered by Lord Thankerton, would seem to destroy a great many of the illusions within which landowners threatened by compulsory purchase under the New Towns Act have been sheltering. The substance of the objections from Stevenage was, first, that the Minister in his speeches had betrayed such enthusiasm, or partisanship, for the idea of Stevenage as a new town that he had shown himself incapable of discharging the quasi-judicial functions imposed upon him by the Act; and, second, that he had not effectively dealt with the difficulties over water supply, which, in the view of the objectors, made the whole scheme impracticable. The first objection is obviously the one with the wider implications. The House of Lords took the view that the Act imposed no judicial or quasi-judicial obligation on the Minister. His duty was purely administrative; that is, he had the duty of holding a public inquiry and of reading the resulting report, and, provided his mind was not completely closed to the considerations presented to him in this way, his duty to the objectors ended there.

In one sense the result of these legal proceedings is satisfactory. It presents the issue now before the public with clarity. The question of whether there shall be new towns was settled by Parliament when it passed the original Act. The question of whether there shall be a new town at X or Y is now still a matter for Parliament, as it is wholly an administrative decision, made by a Minister, for which that Minister is answerable to Parliament. On the whole, it is not satisfactory if a Minister is in part answerable to Parliament and in part answerable to whomsoever is the High Court judge before whom any proceedings based on an objection happen to come. In the long run the balance between private ownership and public interest is more likely to be fairly held if Parliament is strengthened in its duty, and its determination, to scrutinise the action of Ministers, and if MPs are not left with the vague feeling that after all the High Court can be left to look after the fair operation of all subsequent details. But certain unsatisfactory features remain, including particularly the lack of any obligation on the Minister, under either the New Towns Act or the Town and Country Planning Bill, to justify his own views before public—and particularly local—opinion. Justice must appear to be done in addition to being done; and the Stevenage objectors have done good service, though at heavy expense to themselves, in forcing this issue on the general public's attention.

* * *

Poles in Suspense

The categorical refusal of the Amalgamated Engineering Union to allow the employment of Poles in engineering provides an example of the wide gap between precept and practice in the trade union movement. The TUC, as a whole, has agreed to the employment of Poles, subject to certain conditions, one of which is that the individual local trade union concerned should be consulted. There have, however, been great difficulties about the absorption of Poles in civil employment. In certain coalfields, particularly Scotland and Yorkshire, in spite of appeals from the miners' leaders, local lodges have refused to accept Polish workers in the pits. In all, by the middle of July, 3,316 Poles had been placed in mining, and 1,668 had actually started work. It is reported, however, that 700 trained Poles are without jobs and that, each week, the 300 who are leaving training centres are finding it increasingly difficult to find work. This state of affairs is quite unforgivable. The blame, however, does not rest with the miners' leaders, who, after their long delay in agreeing to the Poles, have done their best to persuade local lodges to accept them.

In the case of the engineers, local opposition has been supported

by union headquarters and the Minister of Labour has been obliged to intervene. The opposition is in part economic and in part political. The argument is that, unlike mining, agriculture and iron founding, engineering is not an "undermanned" industry, and the fear that Polish labour will deprive British workers of their jobs is a real one, in spite of the Government's assurances that Poles will only be used where there is a shortage of British workers and that they will be the first to be discharged if there should be any unemployment. The political hostility, both among the rank and file and shop stewards, who are very Left, and the AEU leadership, some of whom are also very Left, is strong. The Government should take steps to override political prejudice. There are still some 70,000 Poles in the Resettlement Corps. It is true that the contribution they can make to the manpower shortage is not large, but what sort of an impression is created at the present time, when every pair of hands is needed, by this stupid restrictionism on the part of the AEU?

* * *

The Care of Old People

Is there a place for charity in a Socialist state? The second report of the Nuffield Foundation, the largest charitable trust in Great Britain, should finally dispose of this question. Its three objects—the advancement of health and the prevention and relief of sickness; the advancement of social well-being; and the care and comfort of the aged poor—are in theory provided for by the state. Yet not one of the many and varied projects described in the report can be called superfluous. If charity is to be of real use now and in the future, it must be dispensed with forethought. This criterion the Nuffield Foundation fulfils.

Where charity has in the main become superfluous is in the provision of income. The state system of insurance together with assistance will from next year provide an income sufficient for the reasonable needs of a person who, for reasons of health, unemployment or old age, cannot provide for himself. In the non-monetary field, too, the state is always assuming new functions; but state provision always tends to be behind the times, to come into being only after charity has pointed the way. Nowhere, perhaps, is all this more clearly seen than in the provision, charitable and national, made for old age. As the Foundation's survey committee (the Rowntree Committee) pointed out in its report on charitable trusts providing for old people, the state system of pensions and assistance for old people has made charitable income in many cases superfluous; an old person receives a smaller payment from the Assistance Board to the extent that the income he receives from charity exceeds 7s. 6d. a week, and the charity, to that extent, relieves the taxpayer instead of the old person. Similarly, as the Assistance Board makes an allowance for rent in its assistance scales, the rent-free almshouse accommodation provided by many charities has become superfluous. The Rowntree Committee also found that a great deal of pioneer work had already been done in providing for the non-monetary needs of the old—in establishing special dwellings, hostels and Homes, and welfare services. What is now needed is to make this provision adequate in quantity and up to standard in quality, and this, the Foundation has decided, can best be achieved by the establishment, announced this week, of a National Corporation for the Care of Old People, which will make grants and loans to the cost of schemes for the welfare of old people. This central allocation of funds should help to ensure that such schemes are properly integrated, do not overlap and are up to standard. It is to be hoped that persons wishing to make charitable gifts for the welfare of old people will do so through the Corporation, which will ensure that their charity is wisely directed.

Gall from Paris

The whole affair of the *President Warfield* and its pitiful cargo of 4,500 Jewish men, women and children is deplorable. It shows how unpredictable can be the effects of bursts of official bad temper. But there is as little doubt about the right of the British to send the ship back to its French port of departure as there was about the duty of the French to prevent it sailing once they had been warned about it. It had been anchored at Villefranche since April, and everyone knew what it was there for. Nevertheless, this lake steamer of 1,700 tons, with papers authorising her to sail only in fine weather and without passengers and cargo, was allowed to leave for Palestine crammed to the hatches. That was the beginning of the inhumanity which the Paris press is now

COMPLETE distribution to meet the total needs of the country depends on goods finding their way through all the widely-scattered retail outlets. But these goods must be directed through some channel, and that is where the wholesale textile distributor comes in.

Through the wholesaler, who buys in bulk and carries stock according to the standards laid down by the Wholesale Textile Association, the manufacturer is relieved of much costly detail and ensured a nationwide distribution.

Issued in the interests of Economic Textile Distribution by

The Wholesale Textile Association, 75 Cannon Street, London, E.C.4

ANCIENT and MODERN

Line drawing from actual photograph.

This permanent bridge of 60 ft. span was speedily erected from standard-unit parts and is suitable for the normal traffic of the district. Larger and heavier bridges are just as easily built from the same standard-unit parts by the Butterley Standard-Unit System. Specially applicable to permanent road and railway bridges in undeveloped country as all parts are easily transportable and bridges of a wide variety may be built from stock parts. Full particulars on request.

portraying in its most scurrilous manner, ignoring the fact that conditions in the three troopers which returned them were incomparably better than those in the *President Warfield*.

Englishmen working in Paris can recall nothing since the liberation comparable to the abuse now being hurled at the British by French journalists. It can hardly be mere chance that the campaign coincides with a division within the French Government and a manifest desire to revive memories of friction over Syria. The French Socialists are openly sympathetic to Zionist claims in Palestine, and have taken partisanship to the point that the Ministry of the Interior has entrusted the handling of the ugly situation in Port-de-Bouc, near Marseilles, to an official of Zionist sympathies. Such behaviour is incomprehensible at a time when there is sitting in Paris a conference on the future of western Europe, the success of which depends on full Anglo-French co-operation.

None the less the British authorities in Palestine should have thought twice before sending back the Jews from the *President Warfield* in circumstances which, observed by French journalists from boats, might be described as "inhuman." Ships suitable for the passage from Haifa to Cyprus are not suitable for a trip the length of the Mediterranean, and it should have been foreseen that the French might regard the incident as a serious slight to their prestige.

*

Meanwhile, in Geneva, the United Nations commission of inquiry is drawing up its report. From what has been observed of the attitudes and interests shown during their presence in Palestine it would be rash to hope for a unanimous report. Should the delegates disagree, the Security Council will certainly also disagree about what is to be done in Palestine. It would therefore be wise for the British Cabinet to assume that it will have this intractable problem before it for months to come. And that calculation must decisively influence the cuts in military commitments which are now being discussed.

* * *

A Fresh Start in Malaya

It is not often that a Government Department admits itself to have been wrong with such refreshing frankness as in the scrapping of last year's scheme for a Malayan Union. The Colonial Office in a fine frenzy of ill-considered planning produced a project for a Malayan Union which had every merit except that of recognising the existence of the Malay people. Sir Harold MacMichael was sent out to get the assent of the Malay rulers and notables by a sign-on-the-dotted-line tour which hardly did credit to the British reputation for fair play. The Colonial Office probably did not suppose that the Malay rulers would like the scheme, if they had time to think about it, but seems to have been genuinely astonished at the manifestations of popular Malay hostility which followed. However, having got over its astonishment, it very wisely decided not to suppress the opposition, but to revise the scheme.

The Malays' dislike of the scheme was primarily due to their fear of being overwhelmed politically by non-Malay, that is, mainly Chinese, elements, if all traditional institutions were swept away in favour of a unified Malaya with a common citizenship. The Malay, Chinese and Indian communities in Malaya have a common interest in good order and economic well-being, but they cannot be fused into one people simply by calling them Malaysians any more than Arabs and Jews are fused together simply by calling them both Palestinians. Once the Malays had sufficiently emphasised this point by their agitation, an attempt was made to meet their point of view and work out a new solution in concert with their representatives. A Working Committee was set up and arrived at a formula which preserved the Government's principle of a common citizenship for "all those who regard Malaya as their real home and as the object of their loyalty," but also asserted that the Malays "occupy a special position and possess rights which must be safeguarded." From these discussions have now emerged new proposals which provide for a Federation of Malaya (instead of a Union), for the preservation of the nine states as political units with their own Sultans and State Councils and for a strong Federal authority with a British High Commissioner presiding over an Executive Council. The new proposals appear to meet the not unfounded fears of the Malays while at the same time affording more political scope for the immigrant communities than they formerly possessed and an administrative unity which the country clearly needs.

Confusion at Frankfurt

At best, the bi-zonal German authority set up some weeks ago was a clumsy machine. It was based on three levels of responsibility—a general Economic Council roughly corresponding to a parliament, yet representing not the mass of voters but the *Länder*, an Executive Committee which would bear to the Council the relationship of a Cabinet, and five bi-zonal offices, each headed by a Director, who might be classed as a permanent civil servant save that he was responsible not to the Executive Committee but to the Council and was a completely political nominee. Each level was to be supervised by an appropriate Anglo-American team and for the government of a rump state in Germany, the whole hierarchy seemed dangerously complicated and top-heavy. The one hope of making it function lay in discovering among the German politicians an animating spirit of unity strong enough to drive legislation and administration through the choked and tortuous channels of government.

The first days at Frankfurt, where the new authorities are established, have dispelled any such hope. In the Council, the Christian Democrats have the majority, in the Executive Committee the Left have the decisive voice. Now, however, all Social Democrats have been excluded from the Directorships and Socialist Ministers in the Committee will have Christian Democrat chiefs-of-staff. Even this inconvenience might be surmountable, were it not for the complete inability of Socialists and Christians to find a common ground. With their country in ruins around them, they can compromise on no single point. This is the background that makes nonsense of certain American proposals that the West German coal industry should be immediately handed over to a board of management representing German experts from both zones. They would hardly speak the same language. The Allies have "federalised" better than they knew.

Shorter Notes

The Minister of Food has announced that entry into the retail side of the greengrocery trade is now to be practically unrestricted, while entry on the wholesale side will be as free as is consistent with maintaining necessary controls over imported fruit and vegetables. Mr Strachey deserves every credit for his decision. Housewives will watch with interest to see whether Co-operative and other retailers can now show sufficient new enterprise to bring prices down significantly. The Minister has done his share; it is now for private enterprise to show what it can do.

*

Wednesday's debate in the Lords on the newsprint cuts provided as inadequate a reply from the Government as did the earlier debate in the Commons. Lord Hall raised the old cry of food before newsprint—although the saving of £2 million of dollars obviously makes not a ha'porth of difference to the security of food supplies—and his statement on future supplies of newsprint and pulp were vague and unsatisfactory. Nor did he go into the longer-term question of how North American supplies will be safeguarded in the future if the contracts with the Canadian manufacturers are dishonoured.

*

According to a parliamentary answer, applications for foreign currency for holidays abroad during the first six months of this year amounted to £11,500,000 in respect of 250,000 people.

Letters to the Editor

Prices and Exchange Rates

SIR,—In your article in your issue of July 12th, "How Big is The Gap?", it is pointed out that the rise in prices in overseas markets, notably in the United States, accounts for the increased deficit in our external balance of payments; yet this increased deficit does not represent any significant change in the bulk of goods imported over that of last year. This rise in prices, particularly in the American field, in fact indicates that the terms of trade are becoming adverse to Britain: prior to the last war the international method of redress was that of alteration of the exchange rate, a process which proved in the 1930s highly dangerous if indulged in without due restriction. One of the chief American aims at Bretton Woods was to obviate this menace to international economic equilibrium by placing obstacles in the way of arbitrary alteration of exchange rates; but the Charter of Bretton Woods allowed for an alteration of exchange rates *in extremis*: under present conditions, which are well known, Britain's economic position approaches such a crisis, when the rise in American prices has reduced the value of her loan to this country by 28 per cent. Would we not, therefore, be justified in claiming a readjustment of exchange rates to correspond with this damaging rise in prices?

It is realised that great enough difficulties are already experienced in exporting to America and the hard currency areas, without a relative rise in prices of British goods, but at present British costs of production in the lines of goods exported to America, particularly textiles, are considerably cheaper than those in America, and such adjustment of exchange rate is therefore not likely to alter materially the market for our goods, which would appear to be inelastic.—Yours faithfully,

DEREK E. HILL-SMITH

British European Airways, Northolt Airport

Wages of Hospital Workers

SIR,—In the Notes of the Week on page 147 of *The Economist* of July 26, 1947, reference is made to the Hetherington scales for domestic workers in hospitals and institutions. Since April, 1946, however, there has been a National Joint Council for Staffs in Hospitals and Allied Institutions, whose wage scales are much higher than those recommended by the Hetherington committee, and have been generally adopted.

Examples of these rates are: £4 11s. for a 48-hour week for a non-resident female head cook in a hospital with less than 500 beds; £4 5s. for an assistant cook in a similar hospital; £3 11s. for a senior maid and £3 7s. for a domestic assistant. Men generally receive £1 3s. a week more.

These figures should therefore be substituted for those shown for a fair comparison to be made with the wage rates in the catering industry.—Yours faithfully,

T. RIPPINGTON

Parkdene, Sylvan Terrace, St. Austell

[The purpose of the reference to the Hetherington scales was to compare the *minimum* wage rates they lay down with the *minimum* rates proposed by the Catering Wage Commission. It was not intended to compare actual earnings of hospital workers with those of domestic workers in catering establishments.—EDITOR.]

British Liberty

SIR,—I am an Italian journalist, correspondent of the *Corriere della Sera* in Milan. As a correspondent of this newspaper I was supposed to leave for Tripoli a few days ago aboard the ship *Campidoglio*, which took back to Tripolitania a certain number of Italians. Accordingly, I asked the British authorities in due time for a permit for disembarking and staying in Tripoli for a couple of days; but, in spite of its recent declarations of hospitality to the Italian Press, the authorities in Tripoli objected firmly to my request. No explanation was given for this, and, in fact, there is no sensible explanation, for the prestige and the objectivity of a newspaper such as the *Corriere della Sera* are too well known to be stressed. This attitude is very discouraging. It means that the iron curtain is hanging not only on the eastern frontiers.

The British came to our country in the name of freedom of speech and freedom from fear. For the sake of those words we appeal to the principles of British liberalism and the gallant tradition of the British Press, so that we may still believe in what we were once taught.—Yours faithfully,

CLARA FALCONE.

Palestine's International Balance

SIR,—One of the publications recently issued by the Government of Palestine, primarily for the information of the United Nations Special Committee on Palestine, contains detailed statistics of Palestine's trade and economy during the last two years. Some of the data may be of interest to your readers—in supplementation and emendation of the information contained in the column on Palestine in the issue of *The Economist* dated April 5, 1947.

Figures of Palestine's international balance of payments for 1945 and 1946 are provisionally given as follows (in thousands £Ps):—

Item	1945		1946	
	Debit	Credit	Debit	Credit
VISIBLE ITEMS.				
1. Retained imports involving payment by Palestine, i.e., less imports for which Palestine is not debited (e.g., crude oil imported by the oil companies)...	31,975*	...	56,506*	...
2. Recorded import of bullion and specie	191	...	756	...
3. Exports involving payment to Palestine, i.e., less exports for which Palestine is not credited (e.g., refined petroleum products exported by the oil companies)	...	14,034	...	14,645
INVISIBLE ITEMS				
4. Military expenditure	...	24,300	...	23,500
5. Transfers to Jewish National Institution and all religious and charitable institutions	...	7,000	...	9,500
6. Transfer of private capital (net)	...	2,000	...	4,500
7. Amounts received by foreign residents, diplomatic corps, etc.	...	3,500	...	6,500
8. Immigrant and emigrant remittances (net)	...	1,000	...	1,500
9. Interest, profits and dividends	...	1,500	...	2,000
10. Government Finances:—				
Grants-in-aid	...	120	...	50
Other Government Finances (net)	4,000	...	4,000	...
11. Insurance, commission and brokerage	1,000	...	1,000	...
12. Tourist expenditure (including passage)	1,500	...	1,500	...
13. Changes in bank assets abroad	5,500	...	1,000	...
14. Changes in currency in circulation	6,920	...	...	5,020
15. Miscellaneous (including film royalties; payment for use of patents, copyright; unrecorded import of merchandise and gold)	2,500	...	2,500	...
TOTAL	53,586	53,454	67,262	67,215

* These figures include £P.2,999,000 (1945) and £P.3,567,000 (1946) to cover purchase within Palestine of refined petroleum products from the oil companies.

Yours faithfully,

N. DEVONS

31 Gaza Road, Jerusalem.

Distribution of Manpower

SIR,—If the compulsory direction of labour is to be ruled out as impracticable, the Government will have to think out other plans to attract workers from unessential to essential industries.

A high proportion of the young men called up for service in the Forces is rejected on medical grounds. But, though they may not be up to the Services standard of physical fitness, most of those rejected are fit enough for some kind of productive employment. On the principle of equality of sacrifice it would not be unfair to call upon them to put in a year's service in under-manned essential industries for which they are suitable. Another possible idea is a national appeal to persons employed in unproductive or unessential work to volunteer for transfer to productive industries on a statutory guarantee of reinstatement in their jobs if and when they wished to go back. The vacancies thus created could be filled up by a reversion to the wartime expedient of substituting women for men, "clippies" for men bus conductors, for example, and the re-engagement of retired employees, especially in the distributive trades.—Yours faithfully,

Larchfield, Churt, Surrey

GEOFFREY BRACKEN

Books and Publications

An Indictment of Stalin

"I Chose Freedom." By Victor Kravchenko. Robert Hale. 496 pages. 15s. net.

THE Russian language has a special word (*nevozvrashchenets*) to describe an official or just a Soviet citizen who, like the author of this book, refuses to return to his country from a mission abroad. The character has been so frequent that he has well merited a place in the vocabulary. The *nevozvrashchentsy* fall roughly into two categories: the disgruntled dignitaries and the disillusioned idealists. The reliability of their inside reports on Russia varies greatly from category to category. If some stories of such eye-witnesses were to be taken at their face value it would be very difficult indeed to explain why the Soviet regime did not collapse in the first days of the war. Mr Kravchenko's place seems to be somewhere between the two categories. The serious reader of his book will be struck by its stylistical over-dramatisation which has made it a "best seller" in the United States. The direct responsibility for that over-dramatisation rests not with the author but with the American "re-writer" of his book.

Nevertheless, Mr Kravchenko's report on Russia is essentially truthful, at least in its three major topics: the purges of the 'thirties, the cost, in terms of human suffering, of Russia's industrialisation, and Russia's narrow escape from defeat in the war. This picture of the great purges has a truly nightmarish quality, but nobody who has studied the problem with an unbiased mind will deny its basic accuracy. What Mr Kravchenko reveals is the mass scale of those purges and the inexorable monotony with which they were carried out not only among the top political leaders but amid the middle and lower strata of administrators, engineers and party-men. Equally shocking, though not new, is his report on the use of forced labour in Soviet industry, although the author himself takes off some of the sting of his criticism when he claims that without the use of such labour Russia's war economy would not have been able to cope with its task. Finally, the account which he gives of the poor state of Russia's economic and technical preparations for war in 1941 tends to dispel at one stroke two myths: the myth of the wise and far-seeing Stalin who allegedly concluded his truce with Hitler in 1939 only in order to destroy him the better later on; and the other myth of Stalin, the sinister plotter scheming since 1939 for the conquest of an exhausted and prostrate Europe.

Mr Kravchenko's book is a passionate indictment of Stalin's regime. The author undoubtedly bases his charges on facts; but he fails to explain—he does not even pose the question—how and why these facts have occurred. He offers, that is, no conception or analysis of recent Russian history, unless one were to regard the rather naïve suggestion that Stalin's satanic personality is the first cause of all evil in Russia as an adequate substitute for sociological or political theory. Like most Russians of his generation, Russians that have been brought up on the official Stalinist text-books, Mr Kravchenko is not even aware of many a salient chapter in the history of the Soviets; and this accounts for his inability to present a coherent view on the social and political evolution of his own country.

Nor does Mr Kravchenko try to suggest what may be, for the mass of the Russian people, the way out of the impasse of totalitarianism. He "chose freedom" and attained it by the simple refusal to return to Russia. But in what way can the young Russian generation, which is not in a position to choose voluntary exile, "choose freedom"? Mr Kravchenko's book is very depressing because of both the things which it says and the things which it omits to say or even to imply.

Second-rate Thought

"The Economic Mind in American Civilisation." By Joseph Dorfman. 2 Vols. Harrap and Co. 36s.

ALL but the stoutest hearts must admit to a certain sinking feeling when confronted with the thousand closely printed pages of Professor Dorfman's industry. So much about so many who were worth so little. These volumes are a monument to the card-index technique of *Kulturgeschichte*. Everyone is here, from the Reverend Laurens Perseus Hickok, whose "Rational Psychology" sought to slay the Gorgon of Kantian idealism, to Samuel B. Ruggles, who almost opened a Red Gap in the 1830s by arguing that perhaps railroad construction should not be left to private enterprise. It is hard to believe that a single book, or a single

chapter from a book, bearing on political economy and creeping into the immortality of American print between 1607 and 1865 can have been omitted from this compilation. Unfortunately Professor Dorfman's researches do not overthrow one's conviction that America's contribution to economic thought began with Henry George, and "Progress and Poverty" did not appear until twenty-five years after the conclusion of Professor Dorfman's second volume. The overwhelming mass of the procession which winds its dim way through his pages consists of second-rate pedlars of second-hand thoughts. And true though it is that the movement of history in the United States as elsewhere is for much of its length little more than the accumulated expression of second-hand thoughts, it does not follow that the way to capture it is to pin down these dead drab moths, indistinguishable members of a few simple species, who ought by rights long ago to have found a natural scorched oblivion in the flames of time.

Unfortunately, it is much easier to collect specimens than to formulate the laws which govern the origin and development of species, and it is no crime of the author's that he is a kind of cultural Cruden rather than a historical Darwin. His book has the usefulness which attaches to any thorough compilation. He has digested a great many books without partiality or prejudice. But to conclude, as the title suggests, that the result is a history either of American economic thought, or of economic attitudes below the level of philosophic reasoning, would be a grave error. For such an enterprise Professor Dorfman has provided the raw materials, but scarcely more. He seems himself to lack the historical perspective (witness his chapters on the seventeenth century) and the inductive breadth and power requisite for such an enterprise. But what he has done—and it would be churlish not to acknowledge it—is to make the task incomparably easier for anyone possessed of those qualities who may tackle it after him.

Headache in Ulster

"Rural Life in Northern Ireland." By J. M. Moge. Geoffrey Cumberlege. 240 pages. 15s.

IN 1940 the Northern Ireland Council of Social Service set on foot an inquiry into the way of life of the Ulster countryman, designed particularly to measure the drift from the land and estimate the influences behind it. Five typical areas were chosen, one in County Fermanagh and two each in County Down and County Antrim, and Mr Moge was appointed as Survey Officer. His book is a straightforward account, area by area, of the survey's

From *The Economist* of 1847

July 31, 1847

Sir Robert Peel did the country excellent service in office. He gave up his own opinions to the necessities of the times, and carried into effect the principles of free trade. But he seems destined, from the great authority he bears, to be as useful to free trade in opposition as he was in office. . . . The opposition and censure of Lord George Bentinck and his friends seem only to have piqued Sir Robert into additional boldness; and on Wednesday, at Tamworth, he gave utterance to these truly humane, Christian, and free trade sentiments:—

. . . I am not seeking a return to office or resumption of party power; but to Parliament, should you so decide it, I shall return honoured by the possession of your confidence upon public grounds, and not perhaps altogether without power. (Loud cheers.) I will support that which I believe to be right, and I will support those principles of free trade which I believe to be founded on justice. . . . should some military tyrant again try a false appeal to military glory, and thus to disturb the peace of the world to satisfy his own corrupt ambition, I hope that an enlightened people, enjoying the advantages of a flourishing interchange of their productions with other countries, will look at such war with disgust, as calculated to destroy the kindly feelings that ought to prevail between nations, and that a great intelligent people will rebuke that military tyrant, and refuse to see wives made widows and fathers left without children, and children without fathers, not in defence of a nation against aggression, but to satisfy the corrupt feelings engendered by military ambition, and will show him that public opinion prefers the maintenance of friendly intercourse, and the interchange of commercial commodities, as the best means of obtaining political good, and increasing as well as of securing the unquestionable blessings of peace. (Great cheering.) These principles, gentlemen, I will maintain during my future course; and, standing as an isolated individual—if I should so stand—I shall have perfect confidence in the ultimate triumph of those principles.

findings. The sum total is a disturbing picture of economic backwardness and social decay. The flight from the land has indeed proceeded fast, but not fast enough to relieve the pressure on the means of subsistence or allow Ulster smallholdings to become an economic proposition; and, though there are signs of progress, new institutions have not yet grown up to fill the social gap left by the collapse of the old co-operative way of life.

Mr Mooney drives home his economic lessons with solid facts—diagrams of farm layouts, descriptions of soils and farming methods, and finally a mass of income data to show that, even with war-time prosperity, Ulster farmers and their relatives working with them were often earning distinctly less than even the low county minima for labourers. What he does not do is to answer the questions he raises. One would have wished for a review of possible changes in the structure of Ulster farming and society such as Dr Orwin and his collaborators provided for North Oxfordshire in "Country Planning"; but it would hardly be fair to blame the author for what after all was a defect in his terms of reference. In the same way, it would have been well worth while to follow up the Survey's comments on the need for leadership in building up new social institutions with an investigation of what is actually happening to the rural middle class—the clergy, teachers, doctors, and the like. But the ancient and regrettable tradition that the poor are survey material while the rich are entitled to privacy appears to have won the day. All in all, this is hardly a classic of sociology; but, within the field laid down, it is a very competent and interesting introduction to one of the worst economic and social headaches in the British Isles.

The Human Habitat

"City, Region and Regionalism." By R. E. Dickinson. International Library of Sociology and Social Reconstruction. London: Kegan Paul French. 327 pages. 25s.

BOOKS have their own fates, and the fate of books about human ecology is to be dull. For the dulllest stage of any inquiry lies in assembling the data from which the well-digested meditations of innumerable minds will eventually distil the artful simplicity of the classic textbook; and there can be few fields in which it is harder than in this to pass to the general from the particular.

Human ecology covers, broadly speaking, everything to do with economic, social, geographical, and political characteristics of the places where people live, the reasons why they live or, given the habits of the modern potential parent, cease to live there, and the relations between the different types of neighbourhood, district, town, country, and metropolitan unit. To establish general guiding principles in this vast field is bound to be difficult; and, into the bargain, as Mr Dickinson points out, the study of these things is a good deal newer to this country than it should be.

In the circumstances it is very much to his credit that he does at least avoid the depths of dreary burrowing after facts only too common among the longer-practised Americans. "City, Region and Regionalism" is a very solid and useful introduction to the literature, theories, and case-histories of a subject whose importance in these days scarcely needs to be stressed. Town planning and the structure of local government are in the melting-pot; more and more services are being decentralised from Whitehall or reorganised in larger units locally; and only the type of study here analysed can provide a solid basis for reform. Though a great deal has in fact been done in recent years by official or semi-official agencies—in the Middlesbrough Survey, for instance, or the West Midland Group reports, or the various projects of the Ministry of Town and Country Planning—a vast amount of further work still lies ahead. And a vast amount of preliminary education will have to be undertaken if the new town and country planning authorities, in particular, are to deal as they should with their statutory duty to carry out planning surveys. Town planners themselves are sometimes, not unreasonably, a little cynical about the value for their purposes of the wilder extravagances of the civic diagnosticians. But that only makes it more important that the advantages for other purposes, such as health or educational or housing policy, of the type of survey which Mr Dickinson recommends, should not be overlooked because of exaggerated claims for its usefulness in one limited field. And a special prayer may be directed to Whitehall to heed his recommendation that a series of new institutes, linked to the Universities, should be set up to handle this work; for without such institutes it is unlikely that Government departments or local authorities will be served with the research which they need. The student who ploughs through this book will indeed find that his road winds uphill all the way; and he will find no easy answers at the end. But, in retrospect, he should find the achievement worth the trouble.

"I'll give you one more chance"

NERVOUS debility reacts on the digestive organs and so aggravates the condition. Palliatives are inclined to do the same. What your digestion needs is rest. A cup of Benger's at night, being pre-digested by enzymic action, soothes and strengthens the nerves of the stomach. Its rich nourishment is absorbed without strain and sends you to sleep warm and satisfied.

From 1/9d. a tin at Chemists and Grocers everywhere.

BENGER'S LTD., HOLMES CHAPEL, CHESHIRE

Linen
Trousers
NOW

We have just got in some coloured linen beach trousers. They are well cut and cool—perfect ashore, afield or afloat—and can be washed again and again. Waist sizes are from 30" upwards. — 5 coupons. £3.11.0

Incidentally the idea for these trousers came from our Exhibition of Modern Men's Wear.

AUSTIN REED

13 Fenchurch St., E.C.3.

AMERICAN SURVEY

The State of the Economy

(From Our US Editorial Staff)

EXTENSIVE readjustments continue within the American economy, but they are not apparent in the overall figures, being concealed by what President Truman called "temporary props" in his midyear Economic Report to Congress. The transition from wartime influences to peacetime operation has yet to be completed. The adjoining table of figures taken from the President's Report show the significant indicators for the past year and a half.

The volume of industrial production rose gradually to a high of 190 in March, and by midsummer was back to about the level of the last four months of 1946. The volume of agricultural output for this year is in question: extensive floods in recent weeks have damaged the corn crop and the weather during the balance of the season may either do further harm or, alternatively, remedy some of the harm already done to corn as well as to other crops. The number in civilian employment reached a new peak of slightly over 60 million in June.

While industrial output thus seems on a plateau and agricultural output is not likely to be above last year, if as large, commodity prices and costs of production have been pushed to new high levels. The Index of all wholesale prices made a new high record of 150.3 in the week of July 19th; the recent rise is almost entirely due to advances in the prices of foods and farm products. The average gross weekly earnings of manufacturing employees also reached a peak of \$48.91 in June, and average hourly earnings of the same group reached \$1.22. The coal settlement extracted by Mr Lewis has already set off price advances in coal and steel, which may spread outwards despite Mr Truman's plea that such a course be avoided.

Largely as a consequence of the price rise—since the volume of output has remained fairly stable—dollar figures have mounted to new highs. Gross national product, national income, consumer expenditures, profits and similar statistical measurements showed hitherto unequalled totals in midsummer.

The most significant of the factors causing the price rise—of the President's "temporary props"—was the huge rise in exports not covered by imports. The table shows "net foreign investment" in the first half at a rate almost double that of the last quarter of 1946, and the President remarked that "This increase in the annual rate of the net foreign balance constituted about three-fourths of the increase in the annual rate of the total gross national product from the last quarter of 1946 to the first half of 1947." The sharply reduced prospect for the corn crop and perhaps other agricultural output gave a stimulus to many prices, and so did the coal settlement. The accumulation of inventories is still occurring, though at a slower pace than last year. The expansion of credit, both to consumers and to business and agriculture, is playing a part. Some consumers,

particularly in the lower income groups, are reducing their accumulated liquid savings. And the proportion of individual incomes being saved is still declining—though this may be the establishment of a new post-war pattern instead of a non-recurring condition.

Psychology, too, has become more hopeful. The stock market rose by some 15 per cent after the recent low price in May; this was both a resultant of and a contributor to more encouraged sentiment. *Fortune* has just published the first of its Forecasts of Business Prospects by polling business executives, which shows 74 per cent expecting declining business. But the poll was taken in May, and the figure in all probability would not be so high today.

But the basic problems of unbalance remain. Indeed, in at least some respects, they have been aggravated by these recent developments. The price rises affect the entire population, while the rises in income accrue only to a part. The real per

capita individual income left after taxes ("disposable") has been steadily declining for many months. The recent price rises and the effects of the partial de-control of rents are adding further to the squeeze between costs and dollar incomes. This is a major factor in the decline in savings and in the recent fairly sizeable decline in sales of life insurance.

Continuation of the present level of exports seems wholly impossible. Unless imports can have a fantastic increase, which seems out of the question in view of present foreign capacity to export, the means of payment will shortly be exhausted—indeed, this is already occurring. And by no possible stretch of the imagination can it be conceived that aid under the Marshall plan will be of such magnitude as to make possible continuation

of an excess of exports of anything like \$1 billion a month.

The accumulation of inventories by business firms, already slowing up, cannot remain indefinitely a sizeable factor of demand. Construction, after a dull spring, has shown a little improvement recently, but is still so beset by inordinately (outrageously would not be too strong a word) high costs that it cannot approach need and can hardly rise to compensate for declines in demand from exports, inventories and the reduced consumption of those consumers who have been "priced out of the market." Productivity is reported to be improving in not a few individual cases, but generally remains low; though the measure is very rough, it may be noted that industrial production, as measured by the Federal Reserve Board, rose by 1.7 per cent from September to June, while non-agricultural employment rose by 2.7 per cent.

The question remains what it has been for many months: can the American economy move from its present abnormal and unbalanced state to a more stable and balanced condition with-

out at least some recession? The President and his Council of Economic Advisers avoid a conclusion: "As they (the temporary props) weaken, we shall need to make many basic readjustments to complete the transition to a permanently stable and maximum-level economy. . . . They must be made before the lack of them produces serious unemployment and business decline. . . . Thus far we have avoided the economic misfortunes which followed World War I and then culminated in a disastrous depression in 1929. Today we are wiser, more experienced, infinitely more blessed with material riches, more united as a people, stronger as a nation. If, calmly and

realistically, we assess our strong points and our weaknesses and boldly take necessary steps in time, we can place the high production and the high employment that we have today on a firm foundation of enduring prosperity and peace."

Consideration of the structure of the American economy does not provide grounds for confidence that the transition will be made without some fall in income and output, and some rise in unemployment. The longer the present unbalances prevail, the more difficult the adjustment may be. However, even among the more cautious there are few indeed who think that a large or long enduring decline will be experienced.

Holiday Patterns

(From our US Editorial Staff)

WHEN Secretary Marshall was summoned back from a fishing holiday to deal with a new Greek crisis the country sighed in sympathy. Fishing holidays or their equivalent are what everyone would like. It was understood that the Secretary of State should feel he needed one after telling the assembled Governors what a mess the world was in. It was also understood that he did not feel he could take one when a new crisis intervened.

For most Americans the summer holds a series of new crises, new clients, new break-downs. This is not like last summer, when the populace devoted itself to sprawling in the sun and letting the bread and soda pop bought by "separation pay" drop into its collective mouth. The United States may be prosperous, but they are no longer idle. Business is business this year, and the holiday must be fitted to the demands of the job. Sixty million men were at work during June, two million more would have taken a job had it reached out to claim them; school boys toil on Western ranches, school girls are busy "baby-sitting," and even adjourned Congressmen make hay.

Nor is this picture vitiated by the fact that a sizeable proportion of the summer's industry centres on the vast and disjointed series of businesses known as recreation. Figures brought together recently by the Twentieth Century Fund indicate that 4.6 per cent of the consumer's dollar went in 1941 for recreational "goods and services," which means, among others, baseball bats, bathing suits, tennis racquets, bicycles, fees for dance hall and bowling alleys, money spent on pet dogs, and cinema tickets. An equivalent proportion was spent on vacation travel, and the 1947 total is estimated at somewhere in the neighbourhood of seven billion dollars. To this might be added some two hundred million spent by the Government on such recreational facilities as would have enabled Mr Marshall to have been photographed while catching a fish, had he so desired, and the Greeks not intervened.

The pattern of holiday varies with the age, occupation, economic status and geographic location of the holiday maker. It used to vary more with sex than it does now. The great common denominator is the pull of the elsewhere, for a holiday at home is a contradiction in terms abhorred by every right-thinking American. In wartime they endured it because patriotism and necessity persuaded them, but they did not endure it happily. Now that the trains are free to offer civilians such luxuries as a trip from coast to coast without change of cars, the automobile industry is struggling to catch up with demand, the petrol supply is unrationed, Americans have shaken off their wartime sense of claustrophobia. Plane travel is recovering from a series of bad accidents. Boats, buses and trains for almost anywhere are crowded past capacity. Those who have cars are on the highway and those who have not may rent them and drive themselves wherever they want to go.

The highway meanwhile, has changed in length, direction and hospitality. No longer are Americans limited to the 3.25 million miles (more than half of it surfaced) within the borders

of continental United States. For several years they have been able to penetrate deep into Mexico on a highway which is destined ultimately to string petrol stations the length of the hemisphere. For the first time they may drive direct to Alaska if car, equipment and finances meet the requirements of the Canadian Royal Mounted who are charged with policing the much discussed new road. The Alcan highway, built at great expense as a war necessity, is open for three summer months to civilian traffic. With time out for fishing, the journey would take five weeks from Chicago to Fairbanks and back again, and would cost, for two in a car, an estimated \$914 including depreciation—of car if not of passengers. Petrol stations and inns are still scarce (a two-hundred mile stretch has neither) but adequate for the hardy.

On more familiar roads the problem is not too little population but too much. The American highway system, undermined during the war, burdened with a shoe-string rash of coloured hoardings and small traps for spare cash, is showing a new set of wide places in the road where passers-by may eat and sleep and buy such necessities as bubble gum and dolls that imitate nature all too well. In some sections these excrescences spring up to light a wilderness, in others they dribble out of towns like spaghetti, achieving such a linear decentralisation as town planners never dreamed. Creatures of the motor age, they supply man's basic necessities and challenge old ways of satisfying them. Called auto camps, auto courts, or "motels" (a portmanteau word compounded of motor and hotel) they give shelter to man and his hundred mechanical horses as coach inns and post houses offered food to man and beast a century ago. They are now bidding for the plane patrons set down at airports, which are also on the town's edge.

The difference between the three types is sometimes measured in gradations of plumbing, beds and food, and sometimes in terms of semantics. All of them started in the west, where spaces are wider than in the east, hotels less various, and the frontier tradition that says a man sleeps best beside his horse is of more recent memory. All three stem from the familiar arc of one-room cabins swung off the highway with space beside each for the car of the man who rents for a night. This combination of room plus garage space, roofed or not, is the basic constant, and an invention which now threatens the monopoly hitherto enjoyed by the vertical hotel in a crowded town where parking is at a premium and noise is constant.

The auto camp is still primitive, though housing shortages have in some places forced its patrons to stay longer than the single night for which its drab facilities were designed. The auto court has, in Southern California and Florida, become an established pattern of bungalow villages in or out of cities. The "motel" originated with a Californian entrepreneur. Starting in 1930 with twenty-six cabins connected by an arcade, \$4,000 in cash and a petrol pump, he soon found that more people were hungry than sleepy, and that he could

hold them for more than a single night if he added food and drink to clean beds. He has since widened his web and increased his income by adding glamour in the form of swimming pools and dance halls. He now takes in as much in a single day as he put originally into the business.

In essence, the "motel" is a horizontal hotel composed of individual units that can be re-shuffled as fashion dictates, built on cheap land at the edge of a town for a third of what a vertical hotel in the centre of the same town would cost. It thrives best in the easy climate of the west and south, and has yet to try its luck in northern regions where the touring season is short and rooms must be heated eight months in the year. Its customers come easily and go easily, leaving no address behind. Under those circumstances it is perhaps not surprising that the trade's eighteen thousand proprietors have not yet agreed on codes or ratings whereby travellers may know what kind of a "motel" they are stopping at. Whether their neon lights are the lamps of their consciences, or lanterns luring travellers to profane disaster, is still a matter of individual choice.

Some Americans travel for the fun of travelling, others for the purpose of getting somewhere else. That "somewhere" may be a national park where a neat presidential candidate can be photographed while photographing bears and geysers; it may be lakes and mountains opened up to summer campers by the Tennessee Valley Authority; it may be Jones Beach on the fringe of New York City, where a hundred thousand people can enjoy sand and sea at one time; it may be the summer theatres which play in barns or the summer schools which work in universities; or it may be racetracks.

Recreation, like vacation which is the American equivalent of holiday, is a word which has surrounded itself with a highly moral atmosphere, but lists recently compiled show changes in the manner in which Americans amuse themselves hardly support that pattern. The most spectacular gains in popularity during the past two decades were made by racetracks and gambling machines. Indoor pastimes, not necessarily hearty,

healthy, or wholesome, were nearly three times as well patronised in 1941 as in 1929, while outdoor sports failed during the same period to hold their own. Consumers spent 60 per cent more on spectator sports in 1941 than in 1929, and the most fantastic gains were made by horse and dog racing. Of all the recreation devices and services showing increased popularity, the cinema gained the least.

What all these changes mean is anybody's guess; the figures of 1941 are assuredly not the figures of 1947. Uneasy commentators note that the nation is older and less active, that gambling is an adult sport which blooms best when money is easy, that the nation's leisure is increasing, the two-week vacation has reached even the United Nations, the five-day week is spreading. Predictions for 1950 are that 10 per cent of the consumer's dollar will go to travel and recreation. The popular thing to do may then be preaching or pinochle; prediction is difficult.

American Notes

Both Sides of The Record

The Eightieth Congress adjourned not many days ago after a session which began with mutual pleasantries and pledges of co-operation and closed with a determined struggle between the President and the Republican majority for campaign issues in anticipation of 1948. Though an influential section of the press is already demanding a special autumn session, the general impression in Washington still seems to be that Congress will not meet again before January.

The Congressional record for 1947 is not particularly impressive, despite the commanding lead of the Republican Party majority in both House and Senate. In this respect, Congress no doubt deserves some sympathy, since a period of frustration is more or less inevitable with so direct a clash between the executive and legislative branches. But the majority party has suffered from other defects, perhaps more damaging than its inability to control the executive branch. Personal and inter-House rivalries (again in anticipation of 1948) have contributed to obstruction and delays.

JULY 1947

A Study of Readership of Newspaper and Magazines

The recently published Hulton Readership Survey is the first comprehensive study of the post-war reading habits of the British people. It shows which people, of what age, sex, class and locality, read which newspapers and magazines—and throws into relief certain functional groups, such as motorists, mothers of young children, cinema-goers, gardeners and others.

● The sociologist will find in the Hulton Readership Survey much that is important to the study of national behaviour and characteristics.

● A mass of fresh statistical information, obtained by the most modern research technique, gives the economist new insight into the pattern of British spending habits.

● The picture given of the position of British publishing houses will be of considerable value to students of the British Press.

NATIONAL BUILDINGS - MANCHESTER 3

A considerable time was taken to settle routine and procedure under the Legislative Reorganisation Act, and it now seems to be apparent that whatever ground has been gained by the heavy cut in Standing Committees has been lost again by the pressure of work now demanded in sub-committees. Next year may be better; but next year will also reveal the full scramble for Presidential honours.

It is, therefore, scarcely surprising that influential Republicans now stress the value of "preparatory work" rather than the record. On one major issue only have they succeeded in their work against the outright opposition of President Truman—the Taft-Hartley Labour Act. Here Mr Truman was forced first to declare the measure unworkable, and then to declare his intention of using every method possible to ensure smooth working. But the new law is regarded, even by many militant employers, as something less than an unmixed blessing; it has failed to stay the continuing success of Mr John L. Lewis, against whom it was primarily designed, and it may yet prove to be vulnerable in the courts.

On the issue of tax reduction, Congress failed twice, within a few weeks, to override Presidential vetoes. And failure in this respect was matched by an entire inability to make adjustments in the appropriation lists on a scale that would have given support to the repeated Republican charges of administrative waste and extravagance. The Representatives fastened with a whoop of joy on the Presidential budget estimates of \$37.5 billion for expenditures, a level which they quickly replaced with a new "ceiling" of \$31 billion. But as the weeks dragged by in committee it became more and more apparent that the cuts imposed with such haste and ferocity were quite haphazard and would impair governmental efficiency at home and abroad. Much more important for the forthcoming electoral tests, they threatened a widespread loss of prestige in many States. The more sober Senate disagreed, and while it is difficult to determine precisely what emerged from the Congressional mill in the pre-adjournment scramble, a budgetary list of about \$35 billion remains far in excess of all earlier levels supported by the Republican Party.

* * *

Presidential Programme

On the other side of the record, the President has been obliged to watch one more session in which a substantial number of his own supporters joined with the Republican majority to oppose, or to bury in committee, a number of useful measures. Prominent among these may be numbered the Taft-Wagner-Eilender Bill for the promotion of low-cost housing projects, sponsored by Senator Taft and supported by Congressmen of both parties. The Congress also refused to support Senator Taft's proposals for Federal aid to state educational programmes, and no action was taken on Bills for military training (to replace the end of selective service), for the admission of displaced persons on the relatively modest lines laid down by the Stratton Bill, for the general expansion of health insurance and social security benefits, or for the establishment of a Fair Employment Practices Committee, banning discrimination in employment on the grounds of race, religion, or colour. The Republican attempt to enforce action on the annual Bill to ban poll-taxes met with the usual blockade by Democratic Senators. Late in the session the President had the doubtful blessing of full support by many Republicans for a new "minimum wage ceiling" of 65 or 70 cents an hour, against the now generally ineffective level of 40 cents established by the Fair Labour Standards Act. But the Republicans took care to ensure that this support did not entail action in 1947, and thus prevent a useful campaign call next year.

One decided victory for the President was establishment of the Atomic Energy Commission, and the appointment of Mr David Lilienthal to supervise development work, with the transfer of authority from military to civil hands. Elsewhere, the President retained export control powers which will assist foreign economic policy to no small degree, and persuaded Congress to go all the way on foreign relief programmes. The foreign programme, indeed, embracing ratification of the peace treaties with former Axis satellites, the Greek and Turkish Aid Bills, and relief and administration grants totalling about \$1.5 billion, ranks as a major

accomplishment of the session, though most of it was put through on the basis of an emergency response to Soviet intransigence, and actual appropriations were delayed until near the close of the session, when Mr Marshall, the Secretary of State, seems to have thoroughly scared the exponents of economy in terms of foreign affairs. The major test on the bipartisan programme, however, has yet to come.

Altogether, however, it may be said that the President and his Cabinet have emerged from the session in decidedly better shape than seemed possible a year ago. Even the most determined opponents of the President concede that he has gained in authority and confidence, and it is worth noting that a quite recent Gallup Poll indicated that the Democrats might now command an electoral response that would bring a useful majority in Congress. A great deal may happen between now and November, 1948, but the poll does indicate a remarkable revival of fortune since the low point touched by the Truman Administration in October, 1946. Party leaders, therefore, are not unduly concerned by the present liveliness of the "Wallace for President" campaign in California. They point out that Mr Truman has a strong following both with organised labour and the farmers, and that a majority of voters express approval with his policy. A notable development has been the complete reversal of policy by Mr A. F. Whitney, head of the railroad workers, whose organisation last year voted a fund of \$2.5 millions for defeat of the President in 1948. Mr Whitney now declares that a third party movement would be suicidal to labour, and that all organisations should support Truman-Democrats next year.

* * *

Black Weeks for Reds

The drive against communist activities has now reached a point where Congress is apparently willing to take irrevocable action on the flimsiest of evidence and against any Federal employee with the vaguest tinge of pink. In March last, President Truman, who may be described as being fully aware of communist dangers, proposed a general investigation into the political loyalties of all Federal employees, and the establishment of loyalty boards covering separate departments. These proposals secured a fairly general approval following from the realisation that government has now to contend with parties and movements far more dangerous than in the days when Federal employees were specifically safeguarded from inquiries into their political beliefs.

The President, however, sought to make provision both for defence and appeal and his proposals were designed to give "equal protection from unfounded accusations of disloyalty." Shortly before adjournment, however, the mood of Congress was far removed from all considerations of safeguards for loyalty. A House Bill, sponsored by Edward Rees, Republican, proposed the establishment of a five-man board of review, acting as prosecutor, judge and jury, before which accused employees could not appear, and against which (if deemed guilty) they would possess no right of appeal or review. The Board, moreover, was instructed not to reveal the source of charges, and summary discharge might follow from "reasonable grounds" for the belief that any accused person had "sympathetic association" with a subversive organisation. Despite the pleas of many influential witnesses who declared that the Bill demolished civil liberties to a degree never before tolerated in peace or war, the House went on to pass the measure by an overwhelming majority. The Bill was then blocked in the Senate.

During the past year, very nearly 800 Federal employees have been discharged for disloyalty, and the Civil Service Commission expects an eventual list of more than 3,000—from a payroll covering more than two millions. Additionally, there is a growing list of persons sentenced by the courts for their refusal to give evidence on oath before the House un-American Activities Committee.

* * *

Steel is the Key

The battle over steel capacity—which began last year—has reached a decidedly interesting phase in recent weeks following prolonged hearings by a special Senate Committee on Small Business, headed by Senator Martin, Republican, of Pennsylvania. As recently noted, output of steel ingots over the first half of 1947 reached a new high point for peacetime operation at 42,267,000 net tons. Almost throughout this period, the operating rate was held at well above 90 per cent of rated capacity, and in Pittsburgh it has recently gone above theoretical capacity.

But the famine in steel continues at home and abroad. The oil industry demands steel for casing new wells, for refineries and pipe-lines; there is a drastic hold-up in steel for freight cars, in

heavy grades for construction, and in sheet and strip for automobiles, containers, and an extensive list of consumer goods. Most of the evidence given before the Senate Committee seems to have centred on the alleged abuses covering steel distribution, and the latest suggestion seems to be that this particular quarrel can be settled by round-table talks between the industry's leaders and the Senators concerned.

This procedure, however, can only ease immediate pressure at the expense of some favoured customers. The issue of long-term capacity has yet to be settled and Senator Murray, the father of the Full Employment Act, has drafted a Bill to enforce a measure of expansion through federal grants for small steel producers. He maintains that present shortages follow naturally from the grip of the "steel monopoly," and that only small producers should be given assistance, and permission to expand.

Backing Senator Murray are the expansionists in the Federal agencies. Their argument is reinforced by a recent report from the Bureau of Labour Statistics estimating long-term demand for steel ingots at between 100 million and 120 million tons, under conditions of full employment. Official evidence is a little conflicting, but in general, the argument is that only a very serious short-fall in national income and employment can bring demand down well below that range; in any event, it is alleged, the industry itself declares that plant with an annual capacity of 10 million tons is registered as uneconomic, and obsolete, except at times of abnormal demand.

To these demands, the steel industry returns the answer that present demands are based largely on back-logs and inventory deficiencies. For very many years before the war, it says, steel capacity was far in excess of normal demand. This plea, however, neglects the very substantial rise in population over the last decade, and presumes continuance of the very low rate of construction and equipment in the decade before the war. It neglects too, the probability of a much higher export tonnage for some years ahead. Fortunately, the steel battle looks like being taken

out of the Congressional arena by the Council of Economic Advisers, which has for some time planned a special survey of US plant and equipment, and will make a particular study of steel. Although plans were made for this survey some time ago, it will now assume a special importance in its relation to the overall survey of national resources which will form the background to Congressional debate on the Marshall offer.

Shorter Notes

Washington reports suggest that the "farm bloc" in Congress is worried by a Geneva decision on export subsidies. The sub-committee working on the subsidy definitions in the charter of the International Trade Organisation is understood to have put a definitive limit of two years on all export subsidies operating without approval of the ITO, and to have rejected the American plea that member countries should decide for themselves whether or not particular products are in "burdensome supply."

*

Mr Wallace's appeal to labour and small farmers to wipe out the "reactionary feudal leadership" of the Democratic party in the South as the "one course to save the Democratic Party" suggests that Mr Wallace is seeing political flying saucers. The South is the base on which the Democratic Party relies; it is up to liberal Democrats in the North to elect the Congressmen who will pivot the direction of party policy. Mr Roosevelt, it is true, might have won the last election without the solid South; but neither Mr Truman nor Mr Wallace have the same political magnetism, and even Mr Roosevelt failed miserably when he tried to purge the party. Mr Wallace is seeing the red corpuscles in his own rather starry eyes.

THE WORLD OVERSEAS

The French Economic Crisis—II

A Question of Confidence

(From Our Special Correspondent)

It is on the financial front that the main threat to economic stability and industrial rehabilitation is to be found. The Monnet Plan was based on the assumption that "as from 1947 the equilibrium of the current budget is established without any equivocation." That assumption, unfortunately, has not been realised. There were some attempts to establish a balance of the budget for the current year and, though the original estimates showed expenditure of 660 milliard francs and revenue of 550 milliard francs, giving a deficit of 110 milliard francs, by compression of the expenditure and substantial projected increases in taxation, these figures were later adjusted to 610 and 590 milliard francs respectively. These latest estimates have, however, been thrown into the melting pot again partly as a result of the new social security programme and partly through rises in civil servants' pay that have been conceded while the budget was in course of discussion before the assembly. The effect of these cannot yet be measured with accuracy. It will, however, be surprising if the gap between revenue and expenditure in the ordinary budget can be narrowed to less than 100 milliard francs for the current year.

This deficit and its impact on confidence in the currency have created a vicious circle of inflation. There have been substantial debt maturities in recent months which the public have not been prepared to renew and which, therefore, have had to be taken up in large part by the Central Bank. The ceiling of temporary advances from the Bank of France to the State was recently raised from 100 milliard to 200 milliard francs, and by July 3rd this particular item had already risen 17½ milliard francs above the previous ceiling. The course of inflation and its impact on prices and wages can be measured by the table which follows.

The observer cannot help remarking how much of the excellent

work which is being achieved in France is being constantly eroded and undermined by monetary inflation, the most pernicious of all economic enemies. It distorts production, it puts people in the wrong and unproductive jobs, it destroys the desire to save. When added to an artificially held rate of exchange, it plays havoc with import and export trade and must nullify any planning of the balance of payments.

	Average, 1938	Average, 1946 (in milliard francs)	1947
Bank of France—			
Note Circulation ...	101.7	605.1	(July) 816.4
Advances to State ..	46.7	450.4	652.1
Prices—			
Wholesale	100	648	(Apr.) 847
Retail	100	645	837
Salaries	100	375	(Jan.) 480
Ordinary Shares	100	875	(Feb.) 1,028

The deterioration in this balance of payments has gone appreciably beyond the estimates of the Monnet plan, partly because of the impact of higher import prices but also because of the short-fall in the export programme. The original estimates for 1947 showed a deficit of 188 milliard francs, or 1,555 million dollars. The later estimates show a prospective deficit of over 1,800 million dollars; the main items of which are given in a table on the next page.

The main sources from which this deficit is being covered are the mobilisation of private investments, which is expected to yield about 400 million dollars, external loans of 640 million dollars, mainly from the United States and Canada, the restitution of gold by Germany to the value of 95 million dollars, and the balance of about 660 million dollars mainly out of the gold reserves of the

Bank of France. These have been dwindling fast and are now at the equivalent of 540 million dollars, which begins to appear very close to the irreducible minimum. France, in other words, is in a graver balance of payments crisis than even Britain. And it was admitted in the course of last week's debate on the budget that at the present rate of drawing France will have come to the

	Original Estimates (in million dollars)	Revised Estimates
Payments—		
Imports.....	2,785	3,158
Exports and tourists	1,230	1,500
Current Deficit.....	1,555	1,658
Contribution to Monetary Fund	...	147
Total Deficit.....	1,555	1,805

end of her gold reserve in two months. In viewing the inflationary situation this factor should not be lost to sight. If the flow of imported articles which is now coming in on the basis of credits is arrested or even seriously curtailed, without a corresponding expansion in domestic production, all the forces making for increased prices are bound to gain added momentum.

What hope is there of remedying this unsatisfactory situation? The budget problem is fundamental. Any scope for further retrenchment is far more than neutralised by the increasing scale of expenditure that rises almost inevitably in the wake of mounting prices. Rates of taxes are high. If only they applied to the whole of the taxable income France's budget problem would be solved. Unfortunately they do not. The cynic's remark still applies: "La France est un pays de fiscalité excessive heureusement tempérée par la fraude." Large sections of the population, farmers, shopkeepers, doctors, dentists, all those who do a cash business, are by and large defrauding the revenue. The need is not for higher taxation but for the enforcement of existing taxes.

The position might have been different had the government on the morrow of liberation introduced a drastic currency purge but it is useless to cry over this lost opportunity now. The damage has been done, and the task ahead is to break this vicious circle of lack of confidence in the government's credit and in the stability of the currency. The solution must obviously be provided not merely in terms of financial technique involving ultimately a further devaluation of the franc but in terms of political action which will restore confidence in the stability of the regime. The prospect would seem dismal were it not for the natural wealth of the country and for the fundamental qualities which the French still possess: a capacity for hard work and a thrift, which has miraculously survived all the inflationary discouragements against which it has had to contend.

Germany's Growing Proletariat

[BY A CORRESPONDENT]

THE distribution of manpower among occupations in Germany has been fixed in its main features for some time ahead, by the general economic situation of Germany and by social regrouping. Today more than three-quarters of the population, as against —?— per cent before the war (1938), must be considered, because of the occupations they follow and their incomes, to belong to the lower classes.

The country and industrial proletariat, propertyless and exposed to crises, comprises one half of the population. The middle class has been reduced from its former percentage of 38-39 per cent (including 1-2 per cent upper class) by almost a half and is continually losing members to the lower social grades.

Factors responsible for this trend are the continual wastage of capital, insufficient employment opportunities for the maintenance of previous standards of life, and the partial exclusion of men from their former occupation groups by denazification.

The number of men workers has fallen, absolutely as well as relatively. In 1939 there were 22 million male workers, of whom 12 million were labourers. In October, 1946, the day appointed for the census of population and occupations ordered by the Control Council, there were 17 million male workers including 9,000,000 labourers. On the other hand, as a result of the loss of men in the war and post-war years, the census shows 140 women against every hundred men.

The industrial worker, overwhelmingly represented by unskilled labour, seldom now works more than a 40-hour week, on an average. In the French zone the working week in the metal-working and high-grade machine industry is seldom more than three working days. Raw materials, power, and often the financial resources to employ workers on unproductive clearance work or repairs, are all lacking in the factories. Wages and salaries have been rising, but the prices for essential goods have on the average risen, although the price stop is being maintained by military governments. The earnings of the industrial worker are no longer sufficient to satisfy essential needs and to feed a family.

Access to Grey Markets

The industrial worker in the country, for example, in south and south-west Germany, is far better off than the worker in the large cities of the north and west. This is not the consequence of differences in earnings—although there are a few differences in favour of the city dwellers—but of the easier access to the grey market. This access is a vital necessity for every German who is not employed in agriculture, and its absence produces the severest physical and psychological consequences. Already many are no longer able to buy in this market, either because their incomes are too low or because of their lack of personal possessions. A method of alleviating their plight which is being increasingly adopted, is the attempt of managements to give their workers each week or month, in addition to their pay—or to sell them at cost price—materials and finished products up to a certain proportion of their industrial output. These regularly accruing goods, in the form of textiles, bicycle tyres, metal goods, and so on, relieve the workers' modest budget, and so far as they exceed his own personal needs, serve him as welcome objects for barter on the grey market or for sale at black market prices.

The skilled worker is also in a better position because he is himself a factor "in short supply." There are far too few skilled workers, partly because of the heavy losses of the war and partly because many years' training were missed by the young. Businesses do their best to keep their skilled workers and carry them as a fixed charge even when work is short and labour is cut down. The skilled worker is generally sure of his income, even when unskilled workers are being turned on to the street.

Artisans without Tools

In Germany to-day the artisan is undoubtedly the prince of all manual labourers who are not employed on the land. For it is to him that tens of thousands turn each day to prolong their middle-class existence with repairs to their houses, clothing, shoes and cars. His work puts him at the centre of the primitive barter economy which now prevails. But he has kept up his income amid the chaos of the German currency only by appearing as a supplier in the black market—in many cases as a monopolist in his particular sphere. There is no doubt that this has often occurred, for few could resist for long the opportunities that now exist. Three key shortages affect the artisans: Firstly, there are too few of them to meet the much increased demands for repairs and new goods. Secondly, there are not enough workshops in the bombed cities, where the demand for their work is most urgent. Thirdly, there are not enough tools, instruments and raw materials. Nails, wood, dyes, glue, paintbrushes, studs, saws, planes, screws, and a thousand other articles are short. So are spare parts for cars, machinery, and equipment. Distribution of those available cannot be changed to meet the different degrees of urgency, which are continually changing. Moreover, the farmer appears, directly or indirectly, almost everywhere in the same market as the one strong competitor with the artisan.

The great gaps which the war has torn in the ranks of artisans have not been filled from the stream of refugees. The greater part of these consists of women, children, old men and the sick. Many artisans and skilled workers have been retained in those countries of Eastern Europe which are turning Germans out—for example, in Poland—generally as useful work-slaves, partly to provide makeshifts and often with some assurance of a long stay being rewarded with the grant of citizenship. The conditions among refugees who have been received into Bavaria are typical for almost all districts of the British and US Zones. To-day 20 per cent of the Bavarian population are refugees. A quarter are engaged on totally new jobs. Half of them are workless, and this half represents three-quarters of the unemployed in Bavaria.

The problem of recruitment to handicraft occupations is difficult to solve. Young people are not favourably disposed to handicraft as a life work. And it is also significant of the general trend that a larger part of the recruits than in normal times comes from the ranks of the middle-class, seeking immunity from crises.

A further source of recruitment may be the retraining of clerks, former officers and soldiers and the politically tainted, who have left their occupations.

The number of retail and wholesale businesses has continuously declined since 1939. The smaller volume of goods, the enrolment of shopkeepers for war service, the closing of undertakings not important for the war, the destruction of business premises, warehouses and delivery firms by bombing has reduced the number of middlemen's offices. Half the pre-war wholesale trade has disappeared. The concerns which still exist are working at a loss. The circulation of goods has fallen to about a quarter of the pre-war figures. The disappearance of the middlemen's trade is undoubtedly a cause of the reduction in the middle classes. On the other hand the business of the middlemen in Germany has not broken down. It still exists to carry out its distributive function, even if transactions are not profitable.

Hungry Civil Servants

In most countries the number of clerks and officials in the public service has grown appreciably in the last few years, but in Germany the growth has been quite disproportionate. Today the proportion of employed persons in public service in Germany is 17-20 per cent. This growth cannot be explained merely by the extension of the State's functions. The chief reason is that goods available for circulation are so scarce that priorities and correct distribution must be most closely examined. The grotesque result is that to distribute some goods requires more men than to produce them.

Another reason for the growth in the number of officials is that there are four different zonal authorities. In the British and US Zones alone there are eight different governments with fully-staffed ministries, including the denazification authorities with their investigating staffs and camp personnel. In addition there are the bi-zonal offices, whose staffs are estimated at several thousand.

The social and economic position of the public employees in Germany is unique in that this group stands outside the circle of barter, receives no earnings in kind and is generally compelled to act in an upright and non-party manner. Undoubtedly this standard is maintained by the overwhelming majority, but it is also a fact that civil servants and their families are among the worst nourished people in Germany. They are deprived of every opportunity to make extra provision for themselves by the rigidity of their incomes and temporary overwork. It was not surprising to find the head of the bi-zonal economic department in Minden, Dr Agartz, temporarily unable to continue his duties owing to "hunger-sickness." There are, of course, exceptions; some public employees or officials have acquired so much power that compensation comes to them either indirectly or by quiet bribery. But this can develop only in a limited provincial, or still smaller framework, and broadly speaking has no significance for the general situation.

A Country of Clerks

Germany has for a long time been a country of clerks—the white-collar proletariat with a bourgeois and middle class outlook. Unemployment is greatest among clerks; for example, in Bavaria out of 430,000 clerks, 171,000 are unemployed—i.e., 36 per cent of the total in Bavaria. In Hesse the proportion is 40 per cent and in Hamburg and Lower Saxony (Hannover) almost 60 per cent. Among refugees are many unemployed clerks. In the Russian zone there is not the same degree of chronic unemployment, since the ruthless enforcement of the obligation to work and the worse material conditions led earlier to a change of occupation, partly into agricultural employment. The position of clerks is particularly difficult in areas which were centres of trade, such as Hamburg, which before the war conducted the major part of Germany's foreign trade. Here there was a concentration of clerks which could only be broken up by their moving to other occupations, retraining or setting up on their own.

Among intellectual workers the present situation is marked by two fundamental facts. Firstly, they are—with few exceptions—outside the barter economy, and dispose of no goods to supplement their earnings. But, unlike some officials, they do not have functions which alter the chance of earnings in kind. This applies to the many artists, scientists and writers who work directly for the public. They receive no extra rations of any kind for long or heavy work. Secondly, the intellectual with private means of the pre-war years has for the most part given place to the "working intellectual." The intellectual worker is therefore dependent almost entirely on the direct fruits of his work. To

acquire a steady income of capital from intellectual activity is impossible; so he has to rely on his earnings from job to job. With these he has to meet his expenses in the grey and black markets either by money or by sale of valuables which he still possesses.

Corruption of the Intellectuals

Yet it is to this class that the task of developing the ideals and practice of a new German democracy is entrusted. Taking the line of least resistance, he is seeking to meet his basic needs in three ways: by entering an occupation which provides food, even if only temporarily; by spending part of the day doing business in food and stimulants on the black market; or by revising his philosophical and political attitude to seek a place in the social organisation of eastern Europe. One thing is certain: the present situation does place many of those with creative intelligence before decisions which lead straight to intellectual corruption. Above all, there is still a shortage of intellectuals. Denazification has removed some of them. But a main cause of the shortage is the recognition that intellectual activity requires effort of a high order, in which production is not limited to the eight hour day of other occupations. One consequence is that the new German press is not getting the editors or staffs needed to fulfil its function.

How will it be with the coming generation? The universities are filled to over-flowing. The desire to study which was repressed in the war years and the loss of such centres as the great universities of Königsberg and Breslau have caused accommodation crises. The future prospects of employment for students may seem quite fair because denazification has torn large gaps in the professional ranks. But it must not be forgotten that court proceedings and amnesties (in the western zones the average waiting period is five years) will rehabilitate many persons who will be able to return to their former professions. On the other hand the living difficulties of many students and their despair about German recovery is leading many of them either to take up practical work or to join the growing intellectual proletariat.

A Trade Policy for Scandinavia?

[FROM OUR STOCKHOLM CORRESPONDENT]

THE presence of Scandinavian delegates at the Paris conference to consider the Marshall offer has stimulated discussion, even at official levels, of the extent to which their countries can collaborate and frame a joint economic policy. The debate on economic collaboration has of course been going on for more than three quarters of a century. But up to now it has not produced any concrete results, being mainly conducted on an ideological or even sentimental level by interested private organisations. This article records some of the lines along which discussion is being conducted in Sweden.

The main reason for examining the possibilities of wider Scandinavian economic collaboration is the present evidence of strong autarkic tendencies in the international field. Against this background there is an urgent interest in breaking down the walls between the northern countries and in trying to establish some sort of co-ordination of economic and commercial policy. To make this possible it is, however, necessary to weed out from the debate all sentimental arguments that have been obstacles in the past. In the first place this collaboration must not be a goal in itself; each

individual country has to get some concrete gain out of it. In the second place all plans in this field must be worked out with the proviso that it is impossible to lock at the Scandinavian countries as an isolated unity. This is evident if one analyses their foreign trade figures. During the last pre-war year, 1938, only 12 per cent of the Scandinavian states, total foreign trade was in Scandinavian products. Even if it were possible by various measures to increase this percentage, it is clear that the states with their 17 million inhabitants can never avoid being dependent on such markets as Great Britain, the USA or South America.

This last reminder is of special importance when discussing the possibilities of increasing inter-Scandinavian trade. Here the question used to be how these countries could redistribute their foreign trade to embrace more Scandinavian and less "foreign" goods. This is obviously not a very fertile basis for discussion. The object instead should be to evolve a better division of labour between the countries and thus create means for increased productivity in their economies.

Resources in Common

A cursory survey shows the similarities in the economic structures of the four nations. All have a labour force of the highest quality with old handicraft traditions. For Sweden, Finland and Norway the forests are one of the most important sources of raw materials, providing the basis for a considerable percentage of domestic and export industry. These same countries, especially Norway, have big reserves of water power. Except possibly in Sweden, manufacturing industry is by no means predominant, agriculture still being considered the "mother trade." Both in Sweden and Norway, and partly in Denmark, fishing plays a considerable rôle. Sweden has special advantages in her big iron ore deposits and her traditions in the iron and steel and engineering industry. It is significant that more than 40 per cent of Sweden's industrial workers are employed in heavy industry. Sweden's higher degree of industrialisation is the main reason why more than half of inter-Scandinavian trade in 1938 concerned Swedish goods.

An expansion of inter-Scandinavian trade cannot be built on their traditional export products. Before the war Denmark's exports consisted of 80 per cent of agricultural products, and this item will no doubt dominate her trade balance in the future. The capacity of the four countries to absorb more of these commodities is very limited, as they are more or less self-supporting in agricultural products. The pre-war exports of Finland were based to the extent of 80 per cent on forest products. As the corresponding figures for Norway and Sweden were respectively 25 and 37 per cent, the result also here is in the main negative.

Expanding Home Markets

Another approach to this problem may be attempted. Efforts to expand trade between these countries might instead be made with commodities that have so far not been included in their export statistics or perhaps not been produced there at all. In other words, attempt might be made to create for these commodities a more stable and extensive "home market"—embracing the four states—than each individual country alone can offer. Experience—especially from the USA—shows that a primary condition for developing a mass production industry is a big domestic market, which makes it possible for firms to produce in long series without paying much attention to export prospects. By this means the Swedish cheap-furniture industry or the Finnish

glassware industry might become world exporting industries, the production of certain household appliances in Scandinavia would no longer be uneconomic, and so on.

Norway has two big potential export articles which could be directed towards this northern market. Norway has big unused water-power resources, while Sweden is beginning to run short of easily accessible waterfalls, and Denmark has to rely on coal for her electricity output. The problem here—besides the technical one of transferring electric power over big distances—is primarily to find a method of financing the necessary new construction. The shortage of capital, labour and building materials in Norway will remain for many years ahead. It should not be impossible, however, to work out some sort of solution whereby Danish and Swedish capital, raw materials and technical assistance are supplied, while in return Norway delivers over a number of years a certain percentage of the output of the new water power stations. The other latent export commodity is provided by Norway's tourist attractions. With rising standards of living the Danes, Finns and Swedes will more and more go abroad on their holidays. Norway could probably attract a great part of this tourist traffic to its fiords and mountains.

Tariffs and Autarky

To carry through a programme for establishing a Scandinavian "home market" pre-supposes among other things agreement that one country will not start subsidising production of something which another member of the group is already producing in substantial quantities. Another condition is the reduction—and finally abolition—of tariff walls between the four states. That such a scheme is not just day-dreaming is evident from the recently published treaty between Belgium and Holland, which has the same object. One should not, however, close one's eyes to the fact that autarkic tendencies have since the war made themselves strongly felt in Scandinavia. Norway seems intent on building up a heavy industry in imitation of the Swedish iron and steel industry. Finland is working in the same direction under the compulsion of its reparations obligations to Soviet Russia; and the disappearance of Germany as a supplier has had a similar effect on the Swedish economy. But if present bilateral tendencies in the international field continue, they should act as a stimulant to the Scandinavian countries to start multilateralism at least in their part of Europe.

Speaking as One State

Future economic collaboration should not be limited to the expansion of trade between the four nations. Prospects for arranging co-operation seem favourable in other fields as well. One is reminded of the close collaboration in the export markets that existed even before the war between the timber industries of Sweden, Finland and Norway. If such measures are not considered as infringements of the international trade charter, this form of collaboration might be extended to other commodities and markets, and perhaps in the future might embrace a common policy on international commerce. These small countries would gain greatly if they were able to speak as one state. And in this connection stress can be laid on the exceptionally successful example of collaboration that exists in the recently established inter-continental airlines company, the Scandinavian Airlines, which is owned and operated jointly by Denmark, Norway and Sweden. By pooling their resources these three countries have managed to create a highly competitive and efficient organisation.

Internal problems, too, could be solved through co-operation

between the four countries. A few examples of a technical and organisational nature may be mentioned. Research is not only becoming essential in industry but is demanding more and more money and elaborate laboratories. The individual country is generally too small to afford what is necessary. It should not be impossible to create joint research institutes, not for production problems, but for work of a basic nature, preferably attached to the universities. The Scandinavian states might also plan the standardisation of commodities in order to limit the number of types produced in each field.

Two things should be emphasised in conclusion. Firstly, that for obvious reasons Finland's chances of taking part in a scheme of collaboration are very limited so long as it is making reparations payments. And account must be taken of the fact that Russia has discouraged Scandinavian co-operation in the field of military and foreign policy. Economic collaboration might be less frowned on. Secondly, it must be borne in mind that to build up Scandinavian co-operation would be a slow process, during which many national differences and vested interests would show up. But the idea should never be considered impracticable. What is needed is that it should be taken up on a more formal basis.

Another Purge in Rumania

[BY A CORRESPONDENT]

THE arrest of Mr Maniu, leader of the Rumanian National Peasant Party, and several of his chief lieutenants, marks a new stage in the consolidation of the dictatorship. A group of prominent members of the party were arrested by the police as they were about to set off in an aeroplane for Turkey. The group included Mr Mihalache, who may be described as the co-founder of the party, and has in the eyes of many of its supporters a prestige equal to that of Maniu. It seems incredible that Mihalache would have left the country without informing Maniu. To that extent therefore the Rumania authorities are probably entitled to accuse him of "complicity." Certainly none of these men would have been given exit visas if they had applied legally for them. Moreover the present regime has allowed them no opportunity of peaceful and overt political activity.

That these men should have felt helpless and should have wanted to leave the country is understandable, though to many of their followers it might look like desertion. It is less easy to see what they hoped to achieve abroad. Here inspired comment in Bucharest has offered the usual explanations. The "American imperialists" are to blame. A few weeks ago a committee was set up in the United States of exiled Balkan peasant party politicians, which has the blessing of Dr Macek (Croatian Peasant Party), Milan Gavrilovic (Serbian Agrarian Party), Ferenc Nagy (Hungarian Small Farmers' Party—ex-Premier) and Dr G. M. Dimitrov (Bulgarian Agrarian Union). The American *Time* recently stated that Rumanian representatives were shortly expected, and this is asserted by the Rumanian Communists to be "proof" of the "guilt" of Maniu. Rash would be the man who would exclude *a priori* the possibility that official or unofficial Americans may have made suggestions to Maniu and his friends. Another possibility is that the whole affair was a trap set by the authorities.

Whatever the true explanation, it may be safely assumed that the opportunity will now be taken to liquidate the opposition. Hitherto Rumania has been some way behind Yugoslavia, and even behind Bulgaria, in her "evolution" towards "the only true democracy." Though organised opposition activity was prevented by local police terror—conducted of course on instructions from the government—the opposition leaders remained at liberty and there were at least two opposition newspapers in the capital. This was a result of the Three Power Conference in Moscow at the end of 1945, at which further undertakings were given by the Rumanian Government to maintain political freedom—in virtue of which it was recognised in February, 1946, by Britain and the United States. The existence of even this slight opposition activity, coupled with the knowledge of the Government's unpopularity in the country—especially among the peasants—gave some support to non-Communists inside the Government, above all to the Social Democrats and to the Liberal group of Tatarescu. Now the screw has been given several turns, the opposition will be driven underground, and any non-Communist politicians who do not come to heel can expect swift treatment. A further bastion will have been created against "international reaction" and "Marshall dollar diplomacy."

Stay at the BURLINGTON HOTEL, EASTBOURNE

Two frontages to the sea and world-famous carpet gardens. The Hotel offers rooms unequalled on the South Coast for Luxury and Comfort.

PRIVATE BATHROOMS — FULLY LICENSED — GARAGE

Special inclusive week-end terms (Friday evening to Monday morning), 4 gns. per person. Special permanent residential terms from 7½ guineas weekly inclusive.

Particulars from the Manager, Burlington Hotel, Eastbourne (Telephone: Eastbourne 2724; Telegrams: Burlington, Eastbourne), or from the London Office: 4, Whitehall Court, London, S.W.1 (Telephone: Whitehall 3160), where reservations can be made.

ANNUITIES

(Single lives: Last survivor: "Capital-protected": "Capital-redemption": Reversionary: Certain: Deferred, etc.)

Owing to high income tax, coupled with a substantial fall in interest yields, the purchase of annuities has become attractive to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded, wholly or partly, against loss due to premature death. The undersigned has specialised for many years in every kind of annuity issued by the various Insurance Companies (for all of which he acts impartially), and is in a position to advise on those giving the highest NET yield with complete safety.

Descriptive Brochure, without obligation, to bona-fide applicants.

Portents for Investors

THIS has been a bleak week on the Stock Exchange. In terms of falling prices, it compares with the slump of May, 1940, or with the fuel crisis losses of late January and early February. And the atmosphere, moreover, has reflected bewilderment and a sense of crisis. Investors are rightly perturbed when they find stocks like Alexanders Discount and Distillers marked down 6s. 3d. in a single day. In the gilt-edged market, all the theoretical resistance points have been pushed aside with each successive fall in prices. By an ironical change of fortune, Mr Dalton now finds himself indeed confronted by "the solid phalanx of the 3 per cents." But the Chancellor appears to have abandoned his role of the Galahad of cheap money, and assumed instead that of Ferdinand the Bull. His part during the last week or two has been entirely passive; he has not even taunted the dealers in gilt-edged for "loss of nerve"—nervous they undoubtedly are, but he appears to have forgotten their existence. And the "patriots" whom he applauded for their part in the 2½ per cent Treasury Stock issue last winter are now wondering if patriotism is enough to compensate for a capital loss, in the space of six months, equivalent to ten years' net interest.

Deserted by their inflationary champion, fearful of the impending economic crisis, and yet disturbed by the possibility of political changes, gilt-edged and equity markets alike have become increasingly confused and disjointed. The gilt-edged market, in particular, felt the need for some symptoms of recovery last Monday, and when recovery did not come, the volume of selling quickly increased. The market put out distress signals, but the authorities did not, apparently, think it expedient to launch the lifeboat. Investors have been quick to draw the obvious inference—that the authorities think that conditions are too rough to make rescue operations worth while, perhaps because the lifeboat itself is loaded to the gunwales with Treasury 2½'s and other issues which the general investor has not taken aboard. The 2½ per cent cheap money target has been implicitly abandoned, and the reality of 3 per cent, it would seem, already conceded. Treasury 3 per cents, 1966 or after, have fallen to 99½, including 19s. 1d. of gross interest, to yield £3 2s. 0d. per cent on the possibly optimistic assumption of repayment in 19 years. Savings 2½'s, 1964-67, fought for their resistance point around par, and lost; they now stand at 96½ to yield £2 15s. 4d. per cent over 20 years. As for the undated stocks, they were out of line with the 20-year issues and with the shorts. For who could defend the logic of £2 17s. 11d. per cent on 2½ per cent Consols and £2 18s. 4d. per cent on "Daltons" when the 20-year issues and the nearer-dated Savings 3's now stand on, or close to, a 3 per cent yield basis, and when even on a 5-year stock like 3½ per cent War Loan the gross redemption yield is as much as £3 1s. 6d. per cent? On such comparison the falls in Old Consols and Treasury 2½s to 83½ on Thursday are wholly justified.

These adjustments illustrate the reappearance of selective support in the market. Already, as the detailed analysis of the yield structure on page 208 suggests, they are giving professional investors plenty of scope for switching operations, and there will

be greater opportunities when the market has grounded. It might be argued that investors are in danger of over-estimating the gravity of the British economic problem, just as three weeks ago they were guilty of discounting it too lightly; that the Chancellor has lost face, but not the whole of his power; that enough American aid, in time, will transform the situation; and that one-way markets like these always exaggerate the effects of bad news. But the counter-arguments to these points leave little room for encouragement. The investor may be justified in his fears about the economic prospect precisely because he sees that the Government has decided so late to do something about it. He may admit Mr Dalton's residue of power to intervene, but he is also aware that within the next five months the ground may have to be prepared for the issue of compensation stock to railway stockholders on the best terms the Treasury can secure. Even the authorities cannot do everything, and they may have to choose between support now or support later. Timely American aid is in the lap of Congress. As for the technical position of the market, it has not been strengthened by the ready-made opportunities which the bears have enjoyed during the last ten days to cover their positions, and some observers think that a partial recovery might bring out more selling from disappointed camp followers of the cheap money policy, and also from industrial holders of gilt-edged.

The fact that the authorities have been forced into acquiescent retreat with the market throws some doubt on the chances of stabilising the gilt-edged list even on a 3 per cent basis, but the balance of possibilities suggests that this will become the new datum level. Three per cent is widely accepted as a reasonable limit to which cheap money should be driven. The Chancellor over-reached himself with 2½ per cent Treasury Stock, and he is now reaping the consequences. An element of bluff is an essential ingredient in all forms of promotion, and a cheap money promoter, no less than any other, cannot afford to have his bluff called. Failure in this respect invites a sacrifice of all the advantages which the cheap money policy has yielded in cheaper long-term borrowing—but the sacrifice falls, not on the Exchequer, but on the investor who took the Chancellor's intentions at their face value, and was not opportunist enough to secure a ready-made capital profit as the cheap money drive progressed. It also falls on holders of a very wide range of investments outside the gilt-edged list. Shares of banks and insurance offices have been particularly affected this week, not merely because these institutions are large holders of gilt-edged securities and might have to make special provisions against investment depreciation, but also because their relatively stable dividends make them sensitive to change in the market rate on gilt-edged stocks.

Where do equities stand after this week's events? The *Financial Times* industrial ordinary share index, which touched 140.6 on January 17th, stood at 131.8 on July 23rd when the storm was gathering. A week later, the index had fallen to 122.5, well below the earlier low point of 124.4 during the February crisis. During a period in which 2½ per cent Treasury Stock has depreciated by 14 per cent, leading industrial equities

have fallen 13 per cent from the January peak—though this was admittedly something of a false peak. The loss of market confidence and the rise in interest rates have together exerted a powerful pull on ordinary shares and the sceptics may be wondering wherein lies the vaunted value of equities as a hedge against inflation. Yet the equity element has been at work. It is illustrated in the accompanying chart, which compares the course of ordinary share prices with ordinary dividends and earnings computed from *The Economist's* records of company profits. During the first quarter of this year, company reports showed an increase in ordinary share earnings to 30.4 per cent (compared with 21.0 per cent for companies whose reports appeared in the first quarter of 1946), while the average rate of ordinary dividend rose from 15.1 per cent to 22.9 per cent. The reduction in EPT to 60 per cent clearly had a significant effect on these figures, and its total removal in 1947 would, in the ordinary course, produce even more spectacular results. But the course is not ordinary. Investors have received ample warning that the effects of the February fuel crisis will not be fully visible in company profits until next year. To guess whether they will be outweighed by the disappearance of 60 per cent EPT (minus the extra 7½ per cent distributed profits tax) is quite fruitless, for the incidence of the crisis, like the incidence of EPT itself, varies with every company and with every industry.

In any event, the market has long since exhausted its search for the so-called EPT beneficiaries. Its business now is to attempt to discount the possibility of a fuel and power breakdown next winter, unless industry gets sufficient stocks of coal and the staggering of the industrial power load proves effective. And it is rightly paying close attention to the rising trend of costs, to the growing evidence of concealed unemployment in many industries which cannot secure a regular flow of raw materials, to falling productivity resulting in part from the five-day week, and to the decline of the seller's market, not only in export markets, but also in some sectors of the home market. If the Government takes serious measures to reduce the external deficit, production is bound to suffer in many industries which have hitherto enjoyed some degree of priority, but which would be pushed below the line under conditions of ultra-austerity. Producers of consumers' durable goods, for example, would rank below producers of capital goods. The profit-earning capacity of many of the smaller concerns in the metal fabricating industries, which have done well, within their quotas of raw materials, during the past year or two, would be radically changed. And even the basic industries, with their superior standing in the priority lists, might well find it difficult, in such circumstances, to secure enough coal, steel, non-ferrous metals, timber and other scarce materials to maintain a regular flow of production. One of the painful lessons of the February crisis was the renewed discovery that industrial profits are a small residuum, after meeting all costs of production—and the costs of non-production. And ordinary share earnings represent only a part of this residuum, and are, consequently, the more vulnerable to any interruption of industrial activity.

Whether the British economic problem is solved by a positive policy of disinflation, or whether it solves itself by a further bout of inflation, rising prices and scarcities, is still an open question. But investors should beware of accepting too automatically the doctrine that equities provide a safe refuge against inflation. There is no evidence at present which points to a fall in industrial profits as a whole—indeed, all the signs suggest that a further increase in profits is to be expected during the next year or two. But there are several reasons why this

broad expectation of a further expansion in earnings should not be interpreted as a general sign for indiscriminate buying of equities, merely because they are equities. First, if a serious policy of disinflation is undertaken by the Government, it is bound to affect the level of output and profits of particular industries, by reducing their supplies of raw materials and perhaps their labour. Alternatively, if there is no attempt to compress the exigent force of demand, these industries will be further forced to scramble for scarce raw materials, their stocks will be run down still lower, and they will find it increasingly difficult to sustain a regular flow of output. For these industries, the expectation of a further rise in profits is far less assured than for the basic industries, like steel, engineering and textiles. Rising profits, however, are not the only component in rising ordinary share prices, for an advance in equities also depends on the rate at which expectations of future profits are discounted. That rate is rising partly because the prospective course of earnings during the next year or two

ORDINARY SHARES, EARNINGS AND DIVIDENDS

has become more uncertain. To take only one illustration of this point, the investor may recall the events of last February, when many industries were prepared to ride the crisis, to retain their labour forces and pay them for standing still. The effect of this policy on costs and profits has yet to be seen, but industry as a whole calculated that it was worth paying the price to be ready to resume production at the earliest moment, in order to satisfy the high pressure of demand. But next time the costs may be greater than some industries can afford, because the demand for their products is already falling.

The conclusion seems to be that, although profits as a whole may increase further, the expansion will not be uniformly spread throughout the various sectors producing capital goods, consumers' durable goods and articles for direct use. And even those industries with full priority for materials may be affected by any recurrence of last February's difficulties. Meanwhile, the capitalisation of prospective earnings should be much more cautious than it has been during the past two years, partly because the rate of interest is rising, and partly because the industrial risk factor is greater. The post-war boom in equities has always been based on the assumption that industrial earning power would expand to keep pace with the fall in the value of money. The doctrine still holds good, but its application to particular industrial share groups must now become far more selective. Investors will delude themselves if they base their policy on the possibility of a general upswing in industrial earning power, or if they accept any group of equity shares as an automatic hedge against inflation.

Is Copper Too Dear?

WHEN the Ministry of Supply reduced the price of copper a fortnight ago, from £137 to £132 a ton, it was welcomed as a belated step in the right direction. But it also stirred up the old controversy whether the price policy of the non-ferrous metals directorate of the Ministry was sufficiently flexible, and its purchasing programme sufficiently far-sighted, to give the British consumer a fair share of the world's copper supplies at reasonable prices. It is no secret that the Ministry of Supply would gladly be rid of its responsibilities for bulk purchase of non-ferrous metals. It is shedding the load of control, in a tentative way, by enabling consumers to buy their supplies forward, and Mr Wilmot's speech last Thursday week almost looked forward with favour to the day when supplies of non-ferrous metals would be sufficient to support an active metal market.

This is a great change in the Government's thinking on bulk purchase and official prices. But it emerges from a very different set of conditions compared with those of a year or two ago. During the war, when copper played an important role in munitions production, its price was pegged at £62 10s. per ton in the United Kingdom and 11.775 cents a lb. in the United States. Demand for munitions purposes fell later in the war, and the recovery of consumption during the early stages of reconstruction was underestimated. Hence, between April, 1946, and March this year the price jumped from £62 10s. to £137 a ton and the New York spot quotation reached 23.75 cents a lb. But since May the market has perceptibly eased; new orders by American fabricating plants have slackened; and in New York three distinct copper prices became discernible. The highest was 23½ cents for foreign purchasers; the lowest was approximately 19½ cents paid by certain American fabricators who are financially interested in American copper mines; and the third was an intermediate competitive price of 21½ to 21¾ cents a lb. At the beginning of July this confusing position was clarified and the New York spot price settled down at 21½ cents a lb.* The reduced price now quoted by the Ministry of Supply is supposedly in conformity with the "world trend," but £132 a ton is still high compared with New York. As the Ministry is required to cover its trading costs, the new price reflects the level at which supplies have been purchased and the modesty of the reduction must presumably mean that the Ministry still has to dispose of copper bought higher up. A further reduction, however, must be expected sooner rather than later, for quotations on the recently reopened New York markets are tending to fall. Some metal is being sold at 17.75 cents a lb. for delivery next March, whereas some days earlier the quotation was 19.30 cents for May.

The problem of the proper price for copper is complicated by the history of the metal during the past five years. The highest wartime rate of consumption was concentrated in the early war years, when production of armaments and ammunition was being increased to meet prospective strategic requirements. In the last two years of the war, however, demand declined. Similarly, civilian demand in the first eighteen months or so of the post-war period was high; pipe-lines had to be filled and stocks built up. When this process is completed, consumption is bound to settle down at a lower and a more stable level. And there are already indications, at least in the United States, that this period is now approaching, although in Britain it is undoubtedly some way off. In this situation there is some relevance in examining the prospects of normal supply and demand, and in discounting some of the extreme consequences of scarcity during the past year or two.

The chief user of copper is the electrical industry; in the United Kingdom about 50 per cent of total consumption is so used and in the United States 40 per cent. In this field copper is meeting competition from aluminium, but future prospects of expansion are clearly favourable. The electronic age is in a stage of early development and the demand for copper will expand with it. Shipbuilding is the second largest consumer of copper in Britain, and accounts for about 20 per cent of the total used. In America, this proportion before the war was much smaller, and an expansion of demand depends upon the prospects for shipbuilding which at present are not very favourable in the United States. With the increasing use of electrical equipment in marine engineering, however, the quantity of copper per ship is increasing, and this trend will be encouraged by the use of radar and similar equipment for marine navigation. The motor-car industry is another important copper user; in Britain it accounts for only 5 per cent of the total amount, owing to the relatively small output of vehicles, but in the United States the automobile industry ranks as the second largest consumer. So far no satisfactory substitute for the copper radiator has been developed; this requires 20 lb. of copper in a representative 10-h.p. car, out of a total of 40-45 lb. for a complete car. Copper is still largely used, either in a pure or alloyed form, for gaskets, petrol feeds, hydraulic brake lines and bearings; in locomotives copper fire-boxes, boiler-tubes and valves are generally fitted. The demand for new locomotives and vehicles to meet present requirements will ensure a correspondingly active demand for copper.

The building trade may offer an opportunity for increased copper consumption in this country. In America the building trades accounted for 10 per cent of the average annual pre-war

copper consumption. It may be that the tenacious preference of the British plumber for lead will be broken down by the acute shortage of that metal, but the change will hardly occur without re-educating the building trades in favour of copper. In other uses, particularly in decoration, brass and other copper alloys have given place to newer materials, like plastics. Brass door-knobs and electric fittings, like brass bedsteads, are relics of a past age and although part of this market may be retained by the development of new and improved copper alloys, the competitive effects of plastics and light metals in this field cannot be ignored.

The demand for copper can be broadly divided into two groups. The first group consists of users who require copper for its technical properties—its high conductivity and resistance to heat and corrosion—and in the short period their demand will be relatively inelastic; hence a rise or fall in copper prices is unlikely to induce any significant reaction in consumption. Copper will be used for marine cables, and aluminium, because of its lightness, for overhead cables, without much regard to the present price differential of £52 a ton between the two metals. The second group consists of those users for whom technical considerations are of smaller importance; the demand of such industries will be more elastic, and it depends not only on the price of copper but also on the relative prices of possible substitutes. This group covers a large number of industries, although it represents a smaller proportion of the total demand.

The trend in world consumption is given in Table I, which covers the two peak years of 1929 and 1937, the depression year 1932, 1938, and the post-war demand of 1946. Since in many cases secondary metal (that is, scrap copper recovered and remelted) is included, the figures must be treated with caution. Nevertheless, they show that the general trend in pre-war years was upwards and that last year's consumption (even with Russia and Japan excluded) almost equalled the high level of 1937. World consumption is naturally dominated by the United States, with Britain as a poor second—and that only because of the eclipse of the German copper fabricating industry. Significant increases in consumption have occurred among smaller European countries, including Sweden, Belgium, Switzerland, Spain and the Netherlands, but these do not compensate for the loss of Germany, and total European consumption is therefore still below the pre-war peak. In the short period, world consumption of copper will depend directly on the level of prosperity in the United States and any serious setback there would be quickly reflected in the price of copper. But there is every reason to believe that the secular rise in consumption which was evident before the war will be continued in the post-war period, even if it is occasionally disturbed by short-term fluctuations.

World production of copper reached a war-time peak in 1942 and since then has declined each year. The trend over the past decade is shown in Table II. Low output last year resulted from a complex of factors, the chief of which perhaps was labour difficulties. Strikes in the United States in the first half of the year led to a sharp reduction in the output of mines and refineries, and the shipping strike caused further complications. Chilean output was also reduced through labour troubles, while Northern Rhodesia suffered from a lack of coal. A further consideration was possibly timidity on the part of producers. Memories of over-production in 1937 and the consequent introduction of a partial restriction scheme had by no means disappeared, and the industry was reluctant to expand production fully during the uncertain period of post-war transition. This miscalculation has had unfortunate consequences upon supplies. Nevertheless, it has been estimated that, in the absence of strikes last year, world production would have been some 400,000 tons higher, reaching the 2,000,000 ton mark, compared with 2,300,000 tons in 1942.

The future trend of output will depend on the relation between copper prices and the costs of the least efficient producers. American output has been aided during the war years by a system of premiums paid to high-cost producers but even after the lapse of these subventions, it is probable that output will decline by no more than 5 per cent. Nevertheless, American deposits are becoming more difficult to mine and many of them are unlikely to be competitive if an appreciable fall in copper prices should occur. Chile also has certain mines which would have difficulty in maintaining present output at lower prices. In Northern Rhodesia and the Belgian Congo, on the other hand, a fall in world copper prices would be unlikely to cause any restriction in production, for although costs in these producing areas have risen fairly sharply, they rank among the cheapest producers in the world. In Canada, copper output is governed largely by nickel, as it is mined as a joint product.

The overriding problem of all producers is undoubtedly that of labour costs. Wages have been forced up with the price of copper; it is much less certain whether they can be reduced if copper prices fall. This situation will confront Chilean producers with political difficulties, as the copper mines are foreign-owned. A substantial fall in the price of copper, however, would have a significant effect on world output, and particularly upon production in the United States and South America. A certain amount of development work is proceeding, but this is largely confined to the low-cost producing areas such as Rhodesia and the Belgian Congo. These two areas may well account for a larger proportion of world supplies in future.

The long-term expansion of copper consumption depends in the main on the increased demand for electrical, electronic and transportation equipment, which seems fairly well assured. The only risk that copper runs in these fields is the exploitation of substitutes, particularly if copper prices remain high relatively to other metals. Production in the first five months of 1947, however, has expanded; in the United States it is running 55 per cent above last year's level, in Chile 22 per cent, in Northern Rhodesia 11 per cent and in Canada 6 per cent. On this basis world output in 1947 may total 2,160,000 tons, which would not be far out of relation with normal world consumption. In the short-term, however, the demand for copper may be restricted by the slowness of industrial recovery in Europe owing to lack of fuel and perhaps by lack of dollars to purchase American manufactures, but normally world demand should tend to be above rather than below 2,000,000 tons a year. Copper, therefore, may be one of the first metals to reach a rough post-war equilibrium between demand and supply; if so, the prospects would favour a further fall in copper prices.

Business Notes

Gilt-edged Yield Disparities

During the steady erosion of gilt-edged prices in May and June, the yield structure managed to preserve some consistency; after the precipitate falls of the past ten days, it is not surprising that so many disparities are now to be found between short and long-dated stocks. For example, 3½ per cent War Loan, if valued on what has hitherto been accepted as a certain basis, namely, redemption on December 1, 1952—the first optional date—is now yielding £3 1s. 7d. per cent. For a 4½-year stock, this return is clearly out of line with, say, the yield on 2½ per cent National War Bonds, 1954-56, which yield no more than £2 10s. 8d. per cent to final redemption. At the other end of the scale, Treasury 3 per cent, which is redeemable from April 5, 1966, has fallen to 99½, including practically a whole point of interest in the price, to yield £3 2s. 1d. on the now possible optimistic assumption of a 19-year life, whereas 2½ per cent Treasury Stock on Wednesday was giving a flat return of £2 18s. 4d. per cent at 86½, though the yield on Thursday rose to 3 per cent clear.

The steadier conditions among the dated stocks which were evident from the middle of the week, coupled with the continued fall of the "irredeemables," shows that some of these anomalies are in course of correction. But evidently the date has to be a firm, and not an optional, date. If, as some sections of City opinion are now disposed to think, the market finds a new resistance point now that the "irredeemables" are on a 3 per cent level, there will still be an unusually narrow margin between the yields on many of the middles (of which 3 per cent War Loan, 1955-59, is a good example) and the 20-year issues.

Compression of the yield structure has been a familiar consequence of the cheaper money phase, and it is at first sight surprising to find it associated with the return of higher interest rates. Perhaps this paradox can be explained by the fear that, in the short-term, rates might be stabilised at a higher level, while in the longer-term it may be possible to restore the cheaper money trend. Crudely summarised, this might be put as the doctrine of 3 per cent until the early 'fifties and 2½ per cent by the middle 'sixties. But this is a very tenuous basis for justifying the present yield structure after the rough-and-tumble in gilt-edged during the past fortnight. Before it can be accepted as more than a possible interpretation of the present relations between the "shorts" and "longs," there is room for further adjustment among the "longs" themselves.

Equities Revalued

Dow and Hatch operators alike have made much of the fall in the *Financial Times* index of industrial ordinary shares to the critical level of 122.5 on Wednesday. The only consolation which the market could draw from that day's dealings was the slightly less severe character of the fall in prices, compared with that on earlier days. Indeed, but for the alarming disclosure of a further draft of \$300 million on the American credit, it is possible that share prices might even have staged a partial improvement. Events, however, are pushing Ordinary equity shares hard, and the preparation of public opinion for the Government's measures to meet the dollar crisis has prompted a further re-assessment of their prospects. The main pros and cons for ordinary shares in the crisis conditions of the coming winter are examined in a leading article on page 204; the table accompanying this note shows how far investors have already moved from the cheerful acceptance of a level of prices and yields based on the continuance of an inflationary boom and an uninterrupted expansion of profits.

As in the gilt-edged market, however, the present level of prices is a symptom of dealing conditions, as well as a rational calculation of the outlook. Dealers are not ready to take stock, though on the other hand, stock is not being relentlessly pressed for sale. It is arguable whether, on the immediate outlook, a new datum level for gilt-edged securities would help the equity markets to find some degree of stability. In the money stocks, like insurance and bank shares, evidence of greater resistance is already noticeable. And the relation between gilt-edged and ordinary share yields, which has widened from an exiguous one per cent at the end of last year to nearly 1½ per cent this week, is a factor which, within limits, should strengthen the position of equities. The question remains whether these limits are yet wide enough—whether with a 3 per cent yield basis for gilt-edged, coupled with the manifold uncertainties of the industrial outlook, a more radical revision of the equity yield basis will not eventually be required.

Whether this revision will come through a further fall in prices, or whether there is still a sufficient expansionist element in prospective industrial earnings to justify present prices, may become clearer after the revelation of the Government's economic plans next week. Meanwhile, the course of equities is bound to be hesitant. But it may be that a belated realism by the Government will be a better pointer for equities in the long run than a negative policy of drift. If so, some ordinary shares in the essential industries might not have much further to fall.

The Fleeting Dollars

The acceleration in the rate of drawings on the US line of credit has reached a point at which the exhaustion of these facilities now appears to be in sight well before the end of the year—in October if the pace maintained in July is kept up. The biggest single drawing, one for \$300 million, was made at the end of last week. It brought total drawings for July up to \$700 million, and this left unutilised exactly \$1,000 million. The steady acceleration in the rate of drawings on the US loan is shown in the following table:—

	U.S. Credit Amount Drawn* £ mn.	Approx. Weekly Average £ mn.
1946		
July 15 to Dec. 31	150	6.3
1947		
January 11	50	
February 22	25	
March 15	50	
First quarter	125	9.6
April 5	50	
April 26	62½	
May 17	50	
June 7	50	
June 21	25	
Second quarter	237½	18.3
July 5	37½	
July 12	25	
July 19	37	
July 25	75	
Month of July	175	44
Total drawings to July 25	687½	
Unutilised portion	250	

* In Revenue Return weeks ended on dates shown.

The recent rate of drawing is well in excess of any conceivable figure of the current balance of payments deficit, whether in the aggregate or with hard currency countries. There is little doubt that the anticipation and immediate after effects of July 15th have brought additional pressure on the dollar reserves. Mr Dalton stated in the House this week that the drain on dollar reserves had not "substantially" changed during the two weeks since July 15th compared with "the immediate preceding period"—a statement into which it is possible to read almost anything. The latest drawing may, in fact, be assumed to anticipate considerable dollar expenditure on the part of countries to which releases of accumulated sterling balances have been granted in connection with recently negotiated agreements. It had been assumed that a good deal of the sterling released to such countries as Egypt would be used gradually. The effect of the oncoming dollar crisis has been to encourage most countries with free sterling to use it as rapidly as possible while the going is good.

It is, therefore, permissible to hope that the peak of the exceptional pressure on the dollar and gold reserves caused by the completion of the convertibility arrangements is within sight. It is even possible that the anticipated expenditures which are reflected in the latest heavy drawings will not take place and that a considerable diminution in the rate of drawing on the US loan may become apparent in future. This, however, will merely make a difference of a few weeks to the exact moment when the credits are exhausted. Whether it will be October or early in 1948, the drawing of the final dollar in the line of credit is now in sight and the date for drastic remedial measures, long overdue in any case, can no longer be postponed.

Rigid Short Term Rates

The appreciable rise which has recently taken place in the yield on Government securities has so far had no reaction whatever on short-term rates for loans, bills and Treasury deposit receipts. The artificiality of the present short-term rate structure is such that the increasing margin between these rates and those of securities in which there is anything like a free market has not raised the slightest ripple of doubt or question in Lombard Street. The tacit assumption is made that short loan and discount rates will remain at the level dictated by the Government. And yet some astonishing discrepancies are beginning to occur in the interest rates structure seen as a whole. Quite apart from the disparities in the yields between comparable securities (which can be explained by the length of time needed for the necessary

adjustments after a decline in prices such as has recently occurred), there is considerable abnormality in the margin which now separates rates for securities having lives up to six months from those of longer date. Yields of £1 19s. 0d. per cent on 2½ per cent National War Bonds, 1949-51, and of £1 13s. 11d. per cent on Exchequer Bonds, 1950, compare a little oddly with ½ per cent on Treasury bills, ½ per cent for short loans to finance these bonds, and even more with the six months TDR rate of ½ per cent.

The rigid resistance of short-term rates shows a marked contrast with the recent rise in the bill rate in New York. Following the unfreezing of the three months Treasury bill rate from the figure of ½ per cent, at which it has been held since 1942 by the readiness of the Federal Reserve Bank to buy the bills at this figure, the rate has now jumped to ¾-1½ per cent. In former days a gap of this size between the three months bill rates in London and New York would have been quite inconceivable. Today the two levels can be reconciled by the restrictions on free movement of funds between the two centres. Nonetheless, with current sterling restored to the rank of a convertible currency, the reconciliation of disparities of this kind must create increasing difficulty as time goes on, and it is surprising that so little interest should have been displayed up to now in the complete resistance of London money and discount rates to influences of both domestic and external provenance, which in former times would have had immediate and drastic effect on Lombard Street.

"Switching" in Foreign Securities

The notices sent out by the Bank of England at the end of last week which govern future dealings in foreign securities do not make simple reading, but their upshot can be briefly summarised. Residents in the United Kingdom will be able to "switch" in dollar and other foreign currency securities so long as no change in the currency is involved. But in the case of Canadian securities there is to be no relaxation of the present restrictions and Canadian dollars realised from sales of such securities must be surrendered and may not be used to make new purchases of Canadian dollar issues. The new arrangements (which will come into force on a date to be appointed by order under the Exchange Control Act) will allow a resident in the United Kingdom to sell dollar securities not merely to other residents in this country, but also to, say, the New York market and to reinvest the proceeds within two months in recognised securities in the same currency which must then be deposited in the usual way.

To give the necessary flexibility for such "switching" transactions, the authorised depositaries will be allowed to release securities to "temporary recipients," such as brokers, discount houses and others, provided that securities so withdrawn are re-deposited within one month. By this means, securities will be able to circulate in the market with some degree of freedom. A gradual improvement in dealing facilities should therefore be possible in foreign currency securities in London, and requisitioning of dollar securities is to be formally terminated. Inevitably the floating supplies of dollar stocks will not be generous, for the bulk of the British holdings was vested during the war, and dealing difficulties will remain, even with this new improvement in the machinery. By limiting "switching" to securities of the same currency, no leakage of scarce currencies should occur; but the new facilities should enable British holders of dollar stocks to improve the average quality—though not to increase the quantity—of their portfolios, and they will in due course iron out some of the anomalous differences in prices in certain dollar stocks in London and New York.

IMF and Sterling

Mr Dalton failed sadly in answering a question on convertibility of sterling planted this week through Col. Crosthwaite-Eyre. The question asked whether sterling purchased by member countries from the International Monetary Fund was to be regarded as convertible sterling. The questioner presumably intended to obtain from the Chancellor an admission that the pressure on Britain's dollar reserves might be increased by the operations of the IMF. Mr Dalton played admirably into the hands of the attackers. His answer was that no arrangement with members of the IMF regarding the convertibility of sterling was necessary "since sterling received from the Fund is not distinguished from other sterling currently accruing." On the basis of that answer and of others to supplementaries, horrifying prospects are now being conjured up of sterling being taken from the IMF in order

to finance purchases in the dollar area. Mr Dalton might have quoted the text of the relevant clauses of the articles of agreement of the IMF which reads as follows:

Article 5, section 3, subsection (a), a member shall be entitled to buy the currency of another member from the Fund in exchange for its own currency, subject to the following conditions:—

(i) the member desiring to purchase the currency represents that it is presently needed for making in that currency payments which are consistent with the provisions of this agreement.

This puts on the Fund the onus of seeing to it that sterling is not sold by it for conversion into another currency. Once the sterling in question has been sold there is clearly no possibility of segregating it from other currently accruing sterling. But if the Fund does its job properly the dangers envisaged by the question cannot arise. Mr Dalton need only have stated this fact to set these fears—real or simulated—at rest. Instead he merely gave them further encouragement.

* * *

Gold Dealings Ban

The Bank of England informed London banks and bullion brokers towards the end of last week that all dealings in foreign gold at a price higher than the official quotation would be banned. This step was taken following a similar intimation to the New York market by the New York Federal Reserve Bank. Both followed the earlier request from the International Monetary Fund that members should prohibit dealings in gold at prices other than those indicated by the official parities, where these dealings were of international character and therefore involved exchange transactions at rates other than the indicated parities.

The operations so banned in the London market are those which banks and brokers have handled as agents for non-residents. All gold held in this country on resident account has been compulsorily sold to the authorities at the official price. But the free markets for gold in the Middle and Far East and the readiness of certain sellers to satisfy the demand for gold at the high premiums which have been quoted in those markets, provided opportunities for profitable agency business in gold which never passed through this country. This business involved no net loss of hard currencies and brought in appreciable earnings in commissions. At the same time it should be pointed out that these sales of gold were in certain cases made against sterling payments which ultimately served to put additional pressure on Britain's gold resources.

The initiative taken by the IMF in this matter had been encouraged by the British representatives on that institution. Britain stands to benefit from the effective banning of all gold transactions at other than official rates. The issue which last week's ban raises is whether Britain stands to gain from a ban which is imperfectly and only partially operated. If the ban means that London houses are now forbidden to transact business which is merely diverted to another market, then Britain gets the worst of both worlds: the traffic in gold continues, but no longer brings London any of the profits which it yields. It is precisely this position which may arise. Although the New York Federal Reserve Bank has requested the New York market to abstain from such operations and although the reputable banks in the United States will abide by this request, it has already become evident that the appropriate departments in Washington are prepared to grant export licences for gold and certain American financial interests have declared themselves unwilling to abide by a request which has no sanction of law behind it.

* * *

Transport Bill Tug-of-War

The only product of the all-night session on the Transport Bill in the House of Commons on Wednesday last week—apart from physical exhaustion and noisy demonstrations—was the total rejection of the amendments which had been inserted at the insistence of the Opposition during the Committee Stage in the House of Lords. The constitutional aspects of this struggle, which were referred to by the Marquess of Salisbury when the Bill was returned for reconsideration by the House of Lords on Tuesday this week, are considered on an earlier page of this issue. The Opposition majority in the Upper House has not insisted on retaining its original amendments which were rejected a week earlier in the Commons. Instead, alternative amendments were passed by vote against the Government, save in one case where sweet reasonableness prevailed; the Government agreed to accept an amendment requiring the Minister first to consult with the Transport Commission before appointing members of the various

Executives. But this sensible compromise cannot be regarded as a major step forward, for it merely restores the method of appointment to the Executives which was laid down in the Bill when it was first introduced last November.

The amendments voted against the Government include an extension from 25 miles to 40 miles of the radius within which a vehicle will be able to operate independently of the Commission, and a similar amendment to Clause 52 increasing the radius of operation of long distance road haulage. Whether 50 miles (which the Opposition Peers originally demanded) or 40 or 25 miles is the right radius is not open to proof; but it is unlikely, at any rate, that the efficient co-ordination of road and rail transport which the Bill seeks would be assisted by any significant extension in the radius of operation, and it seems improbable that the Minister, having already refused to accept 50 miles, will be any readier to accept 40 miles.

* * *

The Revenue Surplus

"Amid the encircling gloom" one bright shaft of light comes from the Exchequer Returns. Week after week they reveal a robust strength of revenue and a succession of surpluses which are almost unseemly at this period of the financial year. The latest return for the week to July 26th shows ordinary revenue of £57,099,000—a figure which exceeded ordinary expenditure for the same period by £4,774,000. For the financial year to date revenue totals £1,081,783,000, and the surplus over ordinary expenditure, £284,070,000. At the comparable date of the previous financial year there was an accumulated deficit of £277,450,000. The main sources of this transformation are first the size of miscellaneous receipts (£155,620,000 against £5,504,000 at this time last year) and secondly the sale of surplus war stores (£63,828,000 against £14,445,000 a year ago) thirdly, surpluses from certain trading services (£25 million against nil), and fourthly the drop from £985,389,000 to £655,414,000 in supply services expenditure. The current surplus is being used steadily to repay floating debt—mainly ways and means advances which since the beginning of the financial year have come down from £613,500,000 to £270,940,000. But debt in the hands of the market is not being reduced. The Treasury bills to be taken up this week were cut from the previous week's total of £170 million to £160 million but this last figure equalled maturities. This also holds true of Treasury Deposit Receipts for which there were this week neither new payments nor maturities.

* * *

Companies Bill Final Stages

Early on Tuesday morning the House of Commons completed the Committee stages and Third Reading of the Companies Bill. It is substantially the same measure which began its course through the House of Lords last February, and provides a rare and refreshing example of non-contentious legislation. The efforts of Government and Opposition benches in both Houses have been directed to improving in minor detail a Bill which was already acceptable in principle because it was fashioned so closely upon the recommendations of the Cohen Committee.

Indeed, the only manifestations of disagreement came, not from the Opposition, but from a dissident group of Labour back benchers who were not prepared to accept the declarations of the Lord Chancellor and of Sir Stafford Cripps that the original provisions about nominee holdings in the Bill, requiring the disclosure of the names of beneficial owners, would be unworkable. This group succeeded at one stage in securing the reinsertion of the nominee clauses into the Bill, but after discussions with Sir Stafford Cripps they were later pacified by his assurance that the Board of Trade would take strengthened powers to investigate the affairs of a company, including the ownership of its shares, on a case being put forward by owners of one-tenth of the shares, or 200 shareholders. Unless there is some good reason for keeping the report of the Board of Trade investigation secret, its contents will be divulged. The new clause which strengthens the powers of the Board of Trade is perhaps the most satisfactory compromise that can be reached to deal with this complicated question of disclosure. The original provisions were laborious and probably open to evasion, though they might have been made more workable if the Bill had been content with the disclosure of beneficial owners of nominee holdings representing 5 per cent or more of the issued capital, instead of the 1 per cent which was originally required. There are, unfortunately, many cases where it is desirable in the public interest to have such information without

*Prosperity is not without
many fears and distastes:
and adversity is not with-
out comforts and hopes.*

BACON

Banking business is daily concerned with its customers' problems of attaining and sustaining prosperity; and of enduring and overcoming temporary adversity.

The intelligent use of all the departmental expert services and ready counsel and co-operation offered by Martins Bank can do much to counteract such drawbacks and to enhance such compensations of which the great English philosopher gives at once wise warning and consolation.

undertaking the burdensome and invidious job of a formal application to the Board of Trade—which immediately takes the issue to a high official plane and may in some circumstances be interpreted as campaign levelled at the company itself instead of being a purely fact-finding investigation into its owners.

These difficult and contentious questions apart, the Bill is undoubtedly a major improvement in company legislation. It is an example of wise law-making based upon expert technical investigation and it will lay, as Sir Stafford Cripps claimed, a firmer and better foundation for the good reputation of British companies.

* * *

Argentine Rail Schemes Approved

Throughout this week meetings of the Argentine Railway stockholders have continued. The voting has shown overwhelming support for the directors' schemes for the distribution of the £150 million which the Argentine Government is to pay for the British-owned systems. There has been no sign of any determined opposition to the share-out, though some resistance was led by Mr A. B. Kavanagh at the Buenos Ayres Great Southern meeting last Thursday week, who declared that the interests of the preference stockholders in that company had been sacrificed for the benefit of the ordinary stockholders; the preference stockholders for whom he spoke would carry their submissions before the Court when the scheme came up for confirmation there. A similar declaration was made by a stockholder who argued for the repayment of Buenos Ayres Western 4½ per cent preference stock at 110, to which it is entitled on liquidation. This amendment was heavily defeated, though the preference shareholders present must have pondered very deeply on the chairman's observation that the scheme was not a liquidation but "a scheme of arrangement to get everybody satisfied."

If the schemes are confirmed by the Court, it is hoped that the Argentine Government may be prepared to ratify the Agreement by the end of September. After ratification, the purchase price is payable within 30 days, and repayment of the debenture holders would follow almost immediately. If this timetable is kept, it should be possible to make interim payments to preference and ordinary stockholders before the end of the year.

World Bank Operations

The International Bank for Reconstruction and Development is now flexing its muscles for the big tasks ahead. It is expected to have a major role to play in financing whatever specific projects may emerge from the Marshall offer discussions. The Bank has been encouraged by the reception of its recent \$250 million bond issue in the New York market. The bonds were quickly oversubscribed, the demand coming mainly from institutional investors and in particular from insurance companies. The short term 2½ per cent bonds rose to a premium of 2 points and the longer term 3 per cent to a premium of 3½ over the issue prices which in each case were par. Mr John McCloy, President of the Bank, has stated in Washington that after this test of the market the Bank has plans for making issues of up to \$3,000 million but that there is no intention of making another issue this year.

Meanwhile it has become known that the Bank has been studying the request of a loan from the Netherlands. The project has now run into rather heavy political seas with criticism in the United States that even though the loan is linked to specific reconstruction work in the Netherlands it will release resources that might be used to finance military operations in Indonesia. Until the situation created by this renewal of hostilities is clarified, it seems probable that the negotiations on the loan will mark time.

* * *

Small Dissavings

The continued decline in British Government securities is coinciding with a period of particularly disappointing savings figures. It would be pushing the argument too far to suggest that there is any strong mutual relationship between the two phenomena, but at least they fit logically into the same picture. Small savings have recently made an extremely poor showing, and last week new savings of this kind—Savings Certificates, Defence Bonds and new deposits with the Post Office and Trustee Savings Banks—fell short of encashments by £882,000. This net dissaving may be explained in terms of special holiday spending. But this excuse has been used by the National Savings Movement for the past two months and is beginning to wear somewhat thin. The total net savings for the first 16 weeks of the National Savings year is £51,567,000, and is now farther from the target of £366 million for the year than it was in mid-May. The savings

trend should improve after the holiday season; indeed, it must do so if the Government take appropriate measures to cut down domestic consumption and to achieve a better balance in the country's international payments.

* * *

Chemicals from Oil

The Anglo-Iranian Oil Company and the Distillers Company have announced this week an agreement in principle to undertake the joint manufacture of chemicals from petroleum in this country. This is the second large group this year to announce development plans for manufacturing chemicals from oil (following the pioneer work of Manchester Oil Refineries), for in March the Shell Petroleum Company announced a scheme to erect a new plant in Cheshire and the expansion of oil refining capacity to produce chemicals.

Anglo-Iranian and Distillers propose to form a new joint company, and the capital of some £5,000,000 which will be required, at any rate for the earlier stages of development, will be found equally by each company. Since Distillers is a Scottish company and Anglo-Iranian carries on refinery operations at Grangemouth on the Forth it seems a fair inference that the new plant will be established in Scotland. The Distillers Company has long been active in the manufacture of plastic materials and industrial alcohol, and the plant will concentrate particularly on those types of chemicals, though other chemical synthetics will also be produced.

The venture will be supported by the financial resources and organisation of two large concerns—an important consideration in a new industry involving heavy initial capital expenditure. Further, the use of Middle East crude oil from the Anglo-Iranian concessions will provide ample raw material without drawing upon slender dollar resources. The scheme should be as widely welcomed as its predecessors, for it promises a further expansion of an industry which, although requiring heavy initial capital outlay, is economical in its demands on manpower. The significance of these new projects lies in the increased supplies of high-grade solvents which they will provide for a range of industrial processes. The use of chemical solvents has made rapid progress in the United States, and hitherto this country has lagged behind. Perhaps the dwindling supplies and rising prices of molasses, on which the Distillers Company has hitherto based its distillation processes, may have increased the attractiveness to that company of using chemical solvents. Once these can be manufactured economically and on a sufficient scale a wide range of applications can be developed, of which the paint industry, now so seriously affected by the shortage of vegetable oils, is only one example. The speed at which the new project can be brought to the production stage is largely dependent upon obtaining supplies of steel and other building materials, but the possibilities of new chemicals for British industry and for export should ensure some priority for these materials.

* * *

Finance Corporation for Industry

The second annual accounts of the Finance Corporation for Industry were struck on March 31st before the corporation launched into the deeper waters of industrial finance for which it was specifically established. The total loans shown in the latest balance-sheet amounted to £1,862,051 against £254,500 a year earlier. Included in the latest total is an item of £210,600 in respect of advances to a company to which the FCI has since appointed a receiver and to which it has extended still further accommodation. But this past performance is trifling in comparison with the promise of commitments shouldered by FCI since the close of its last financial year. The total commitments to date, including £35 million for the Steel Company of Wales, amount to £40,733,451. Furthermore, negotiations have been completed, subject to contract, for loans amounting to £4,738,000. Given the measured pace at which it has extended its activities, the FCI was still operating "in the red" last year. The loss it suffered in that period was £9,142, which added to the loss of £16,086 carried forward from the previous accounting period makes a total debit of £25,228—a figure that should be rapidly overtaken when the corporation really gets into its stride. The new chairman, Lord Bruce, has decided not to attach a printed statement to the report, but to leave his explanatory remarks to the address he will make to shareholders at the annual meeting on August 13th.

New Cotton Export Scheme

Just before the fuel crisis occurred, a scheme was announced to remove the restrictions on the export of cotton textiles to hard currency areas which were inevitably associated with the system of allocation on a "country by country" basis. Unfortunately, the severity of the fuel shortage necessitated the complete suspension of export quotas for the first two periods of 1947, and since May deliveries for export have only been made against allocations outstanding from earlier periods.

This week, however, an open export scheme for the third period of this year (that is, from July to September) has been announced which revives the proposals made in February. Except for certain small colonies, there will be no direction of cotton textiles to specific countries. But the need to export to hard currency areas and to meet the requirements of countries within the British Commonwealth will set a limit to the yardage permitted for export to markets outside these three groups. Separate export allocations will not be made to home industries using textiles, such as garment-makers.

The control machinery in the cotton textile industry has now been adjusted to stimulate an export drive to hard currency areas. But the resulting hard currency earnings will depend, first, on the maintenance of the sellers' market; secondly, on the extent to which the urgently needed requirements of large colonial markets, such as West Africa and the Far East, can be cut without affecting their production of essential commodities for export; adversely and, thirdly, on the chances of increased production in Lancashire or more severe rationing of the home consumer. The difficulties are plain; but the need for increased hard currency exports is urgent.

* * *

Debate on Grantham

The debate on the Grantham Productions case on Wednesday was arranged when last week's issue of *The Economist*, commenting on the affair, was going through the press. But the discussion, though it ranged widely, was more remarkable for veiled suggestions than hard new facts, and it took the matter little further than earlier debates had done. The broad facts, which were summarised on page 170 of last week's issue were reiterated. In addition, charges were made by Mr Kendall, the Independent Member for Grantham, who has been connected with Grantham Productions, that pressure had been put upon certain firms supplying materials to Grantham Productions to withhold deliveries. For this reason, Mr Kendall demanded a "full-blooded inquiry."

The attempt of the Parliamentary Secretary to the Board of Trade to excuse an error of judgment on the part of the Board of Trade, on the ground that the bank which was consulted for its opinion on the financial resources of the Cotton group made a mistake, is not entirely convincing. Mr Cotton was a client of the bank and it was presumably in a position to pass an opinion only upon the conduct of his account there.

The motion for the appointment of a Select Committee to examine the case was defeated, but the Government departments concerned hardly come out of the affair completely free from a charge of administrative miscalculation. Certainly nothing transpired in the debate to weaken the case of those who called for an inquiry. New applications have now been invited for the allocation of the factory space; after this series of mishaps, the Board of Trade will be wise to ensure that the new allocation is more fortunate than earlier ones.

* * *

Building Incentives

At last, the way is open for the adoption of payment by results in the building industry. The Government has now amended the Defence Regulation (56AB) which in effect prevented the payment of bonus incentives on building sites. The executives of the seventeen trade unions included in the National Federation of Building Trade Operatives have agreed to recommend their members to accept Mr Isaacs' proposal for an increase of 3d. an hour in the minimum wage and for an incentive scheme to provide an increase in earnings to a level 20 per cent higher than the time rate. The building employers have not yet reached any formal decision, but they have expressed their desire to meet the unions for informal talks on incentives, and many of them are known to support the principle of payment by results. The proposed increase in minimum rates, however, may be something

of a shock for the employers, whose rejection of the unions' original claim for a 6d. increase in hourly rates had been upheld by the National Arbitration Tribunal.

There are still a number of technicalities to be completed. A ballot vote of the trade unions will be needed, and there still have to be negotiations between the two sides. These delays suggest that any national scheme can hardly be in operation before the autumn, and it is probable that it will be forestalled in many localities by *ad hoc* arrangements, which will have a greater flexibility. In any event, the removal at long last of what has hitherto been an insuperable obstacle—the adamant opposition of the union leaders—is very satisfactory.

No precise estimate has been made of what the increased wages will mean in terms of housing costs. An increase of 3d. an hour alone would add about £35 million to the annual wages bill, while provision for a 20 per cent incentive bonus would add a further unpredictable amount, dependent on the extra output which the men achieve. In conjunction with the rise in the price of building materials—the index now stands at 205.2 (1930=100) compared with 177.7 a year ago—the prospect of cheaper housing seems very far away. But if incentive payments do lead to higher productivity and an increased tempo in building, they will be worth while. Higher time wages for the building industry in the past have not been associated with higher output—despite union assurances that they would be. A great responsibility now rests with the building trade operatives and their leaders to justify wage concessions by improving their output.

Mr Wilmot on Bulk Purchase

It was surprising, and welcome, to hear the Minister of Supply declare ten days ago that he "had hoped before this to revert to normal trading" in non-ferrous metals. And later in the debate he gave at least an implied promise that when stringency of supplies and currency restrictions no longer exist, the London Metal Exchange would be reopened. If stringency of supplies were the only reason for the maintenance of bulk purchase, the resumption of private trading in metals might not be too far distant. A leading article on page 206 shows that the prospective production of copper in 1947 should cover world requirements. The world output of slab zinc in the first quarter of the current year was 9 per cent above the annual rate of 1,400,000 tons in 1946 and the output of refined lead appears to be running at 25 per cent or more above last year's figure. Although the quantities themselves are not yet adequate to satisfy all requirements, the upward trend in output of these metals at least suggests an approach towards the eventual equation of supply and demand.

But the case for government trading at the moment rests more

directly on the existence of currency difficulties and the need for purchasing supplies as far as possible from soft currency areas. The Ministry of Supply has no long-term contracts with other governments. All its trading agreements are made with producers or producer organisations and its contracts are on a commercial basis. In this type of bulk purchase policy, no question arises of developing new sources of supply. For their foresight in arranging the toll refining of rough copper and scrap brass in the United States, Canada and Belgium, however, the Ministry certainly deserves a compliment. The refined copper is already coming back to this country in moderate quantities to augment current supplies. Such an operation could be only effectively carried out by a government department, but it is a non-recurring operation and affords in itself no justification for governmental purchasing.

Given the need to continue state trading under existing currency conditions, however, it is still incumbent on the Government to assure flexibility in its purchases and prices, so that British industry should not be at any competitive disadvantage compared with foreign manufacturers. This principle is particularly important in a period of falling prices, when the controls, having operated so profitably on the bull rack, may be reluctant to pass on the fruits of falling prices immediately, because they want to avoid any trading losses. Moreover, sufficient information must be available to the trade, so that it can make reasonably accurate forecasts of future price movements. Under private trading, a firm which wrongly estimates future developments suffers alone; if the Ministry of Supply makes any misjudgments—as it has done in the past—the burden falls upon industrial consumers.

Shorter Notes

The consolidated net profit after taxation of Lever Brothers and Unilever, Limited, for 1946 was £1,548,541 higher at £6,187,647 and that of the Dutch associate "N.V." increased by Fl. 11,949,171 to Fl. 27,402,722. The ordinary dividend of "Limited" has been doubled at 10 per cent, and under the terms of the equalisation agreement a corresponding dividend will be paid to ordinary shareholders of "N.V." A fuller note on the preliminary announcement is given in this week's *Records and Statistics Supplement*.

*

Shareholders of OSN Realisation have accepted the offer of 40s. a share made by Cunard Steamship for the 1,274,216 Cunard White Star shares held by them. Votes representing 60 per cent of those eligible were cast in favour of the deal, which was discussed in last week's issue of *The Economist*.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Richardson, Westgarth; Lever Brothers and Unilever; Thomas de la Rue.

IN Flintshire, North Wales, Courtaulds have four factories. Three (Aber, Castle and Deeside) are in the Borough of Flint; the fourth (Greenfield) is in Holywell.

To meet the increasing demand for viscose rayon yarn, the Company purchased Aber works in 1916 and built Castle Works in 1920-1922. Then in 1927 Deeside Mill was purchased for rayon crêpe processing—that is, preparing and crêping yarn for use by textile manufacturers.

This new and vigorous industry helped to revive employment on the Dee estuary—a district amply supplied with water and coal, and near the great rayon weaving mills of Lancashire, Yorkshire and Cheshire. Today it contributes substantially to the national output of continuous filament rayon.

Between 1928 and 1933 units were set up in these factories to investigate the production and spinning properties of "Fibro"—Courtaulds' name for their viscose rayon staple. First made in 1918, this revolutionary product could be spun and woven on existing textile machinery into an unlimited range of fabrics.

Large-scale production of "Fibro" was essential, so in 1934 Courtaulds decided to build Greenfield Works—their fourth in the county—in which to concentrate an output of 20 million lb. a year.

One of the largest of its kind in the world, this factory started production in 1936 and today turns out 75 million lb. a year. Further large extensions are being made to it. "Fibro," a basic textile material, is now an important factor in the national economy.

Of over 21,000 people employed by the Company in the United Kingdom, more than 6,000 are hard at work in these four factories in the smallest county in Wales. *Rhydd hyn i'w hymdrech! — Ymlaen, Gymry!*

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

Issued by Courtaulds Ltd., 16 St Martins-le-Grand, London, E.C.1.

**How knowledgeable
are YOU about
British film
production?**

A survey has recently been carried out by Research Services Ltd. among top-ranking professional and business people, to discover how much they know about the J. Arthur Rank Organisation and its associations with the British film industry. These informants—they are for the most part readers of such papers as *The Times*, *The Observer*, *The Economist*, *The New Statesman and Nation*, *The Spectator* and *Tribune*—have shown that their general knowledge about British film production is by no means comprehensive.

For instance, although nearly all informants were able to name correctly 2 or 3 recent British films, 76% of them had no idea which producing company had made them.

Here are some of the principal films made in recent years by producing companies associated with the Rank Organisation.

J. ARTHUR RANK ORGANISATION LIMITED

COMPANY MEETINGS

BRITISH TIMKEN, LIMITED

MR MICHAEL DEWAR'S REVIEW

At the twenty-seventh ordinary general meeting of British Timken, Limited, Mr. MICHAEL DEWAR, the chairman, said:

Our accounts have been before you for some time and I would comment that the increase of stock and work in progress gives an indication of our increased turnover. At present it is running at the highest rate ever shown in the company's history.

Your company's balance sheet and the consolidated balance sheet show very clearly the large amounts of profits which have been ploughed back into this business which ploughing back will doubtless be as pleasing to the Chancellor of the Exchequer as his latest budget provisions, in which we find neither rhyme, reason or justice, are distasteful to us.

We, in company with all British industry, are bound to suffer unless the output of coal is increased; not only to take care of the British requirements but also to aid the recovery of European industry, and to help provide for imports of food from abroad.

We look ahead to months of increasing difficulty. There is no doubt that there will be many power cuts when the colder weather arrives and indeed, there seems every possibility of another shut-down through lack of power.

I cannot emphasise too strongly that, in a highly mechanised industry like our own, reduction in working hours is bound to cause proportional reduction in output. Automatic machines can only produce a certain number of pieces per hour. Greater output in shorter hours can only happen in industries where greater effort by the operative can increase the output.

On the other hand, there is no place for posters calling for greater effort in your factories. Our output per man hour compares favourably with pre-war standards, even allowing for improved manufacturing methods, and we gratefully acknowledge that your employees are doing a good day's work with a good day's pay.

That the economic position of this country is extremely serious must by now be obvious to everybody. The gradual strangulation of industry and individual initiative by bureaucracy is clear to see all over the country, and the extra effort involved in trying, in spite of restrictions, to maintain and increase production is very great. The following is one small example:

Steel is in short supply and we fancied we might help the bearing industry if we could import special alloy steels from the United States. Our associated company in America agreed to make some steel available. Under a system of private enterprise, this order could have been placed in two to three days; under the system of bureaucracy prevailing today, it took two to three months, thereby losing one month's supply; and even then some little "Jack-in-Office" took it upon himself to alter the specification of the steel without any reference to us, and it was only through direct communication with our American Associates and private enterprise that we discovered it in time.

Despite everything production per man-hour in this company is undoubtedly increasing. We are not behind any country or any of our competitors in productive efficiency and the use of the most up-to-date machines and processes—provided we can obtain raw material and power at competitive prices. The report and accounts were adopted.

BRITISH GLUES & CHEMICALS, LTD.

PROFIT DOUBLED

MR. ROGER DUNCALFE'S REVIEW

The twenty-seventh ordinary general meeting of British Glues and Chemicals, Limited, was held, in London, on the 30th ultimo, Mr. Roger Duncalfe, the chairman, presiding. The following is an extract from his review, circulated with the report and accounts for the year ended April 30, 1947:—

I am profoundly convinced that our most valuable asset is one which does not appear in the balance sheet; it consists of all those men and women who serve this company throughout the whole of our group. Under the brilliant leadership of our managing director, there has been forged a team which, in my view, is unsurpassed.

After providing for compensation payable under the voluntary scheme of concentration, depreciation, deferred repairs, and excess profits tax, and after provision of £75,000 against fall in value of raw materials purchased under forward contracts, the resulting profit of £217,827 is approximately double that similarly shown for the preceding year. The aggregate profits of our subsidiaries again far exceeded that of the parent company—indeed, they were more than double.

WORKS DEVELOPMENT

Owing to difficulties in securing labour and raw materials, progress in our restoration and development programme, though substantial, has not been as rapid as we had hoped. Orders placed on capital account for the above purposes at our works in the United Kingdom amounted at the end of the year to approximately £225,000, and our plans involve a further expenditure of some £75,000, making a total of £300,000, in addition to the £60,000 for deferred repairs for which provision is shown in the accounts.

Profits amount with the carry forward from last year to a total of £256,893. £70,000 additional to the tax deductible from dividends is needed for income tax and profits tax, dividends absorb £96,250 gross and £50,000 is allocated to our pension scheme, leaving a carry forward to next year of £40,643, against £39,066 brought in. As regards dividends, the proposed final dividend of 20 per cent. on the ordinary stock makes, with the 5 per cent. interim payable on February 28th last, 25 per cent. for the year, as against 15 per cent. a year ago, and the preference stock receives its full participation of 2 per cent., making, with the fixed cumulative dividend, 10 per cent. in all.

The story of the year, in spite of many difficulties, is one of achievement and of promise for the future. The progress of the Parent Company continues, however, to be hampered by the Fabon, Ltd., war-time concentration scheme. Inaugurated in October, 1942, this war-time scheme has now been extended by a bare majority vote of the trade to March, 1948, so that it covers nearly three years of war and three years of peace. Your Directors regard continuance as against the real interests of the industry in that adaptation to new conditions and the adoption of new techniques are delayed. A progressive industry should lift its sights, not fix its backward gaze on October, 1942, and on raw material conditions which may not return for some years. Your Directors will therefore continue to press for an early but equitable deconcentration scheme.

CANADIAN SUBSIDIARY

Our interests have been extended to Canada, where a wholly-owned subsidiary, Canadian Organic Developments, Ltd. (incorporated in December, 1946), owns a controlling interest in the glue manufacturing business carried on for many years in Toronto by Mr. Joseph H. Harris, M.P., and his associates. With our advice and encouragement both companies are organising and equipping themselves to meet the future.

I have already referred to the notable contribution which our United Kingdom Subsidiaries have made to the profit of the year. B. Young & Co., Ltd., has made a further outstanding advance in technique, turnover and profit; its output of "Spa" Brand Low Melting Point Pure Food Gelatine has been greatly increased, but the public demand still far exceeds the supply. Flavoursings have been added to the "Spa" range during the year. Croid, Ltd., has had a good year with great expansion in turnover. Our Soap Companies have more than held their own in a difficult year and substantial progress has been made at Ashby-de-la-Zouch in the factory development programme outlined in last year's statement. Murray's, of Mark Lane, has made a further notable advance. Calfos, Ltd., has made progress both at home and in the export trade.

All our products are in keen demand; licensing and allocation of some of the principal ones continue. Even with increased production, many of our old and valued customers, especially those abroad, remain unsatisfied. Our renewed thanks go to them for their patient consideration, and as our expanded manufacturing programme moves ahead we hope to meet their needs both at home and overseas.

THE FUTURE

The international outlook is still obscure, and industry will be profoundly affected by the outcome of the efforts now being made at Geneva to open the gates to freer world trade, and also by the prompt seizing of the recent generous gesture of the United States of America. At home everything will depend on the harnessing of all our actions to one common purpose—increased production—and for this the supply of fuel and power is of paramount importance. Your Company was fortunate in escaping the worst effects of the recent fuel crisis, partly owing to the essential nature of our products and partly by forethought and prompt executive action. Nevertheless, the effects are still with us; deliveries of structural work and plant and machinery have been slowed up noticeably and this is a matter for deep concern in view of the urgency of our production plan and of the shortage which exists both at home and abroad in the essential products we manufacture. The market is still a sellers' market but this will pass and the buyers' market will arrive.

Our main objective is, by improvements in our processes and by increased mechanisation, to reduce our costs and to improve our qualities and thus maintain the lead we have achieved. Our important reconstruction and development programme is directed to this end; it will largely absorb our liquid resources and call for ploughing back profits into the business for some time ahead.

Whilst stockholders should not, in my opinion, count on continuance of the profit level achieved in the past exceptional year, yet I expect continuing benefits from the expansion of our business and from the improved technique to which I have referred. It would be unwise of me to look too far ahead, but unless international or national conditions are such as to hamper unduly our enterprise, I look for maintenance of reasonable profits.

The report and accounts were adopted.

ASSOCIATED WEAVERS, LIMITED

HIGHER PROFITS

STRONG LIQUID POSITION

SIR FRANK NEWNES'S SPEECH

The eleventh annual general meeting of Associated Weavers, Limited, was held on 23rd ultimo, at the Savoy Hotel, Strand, London, W.C., Sir Frank H. Newnes, Bt. (chairman), presiding.

The secretary (Mr W. Sunderland) having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—the directors are pleased to place before you accounts which, as a result of greatly increased output and standardisation of products, show much higher profits which enable them to recommend a larger dividend and still maintain the policy they have always adopted since the inception of the company, of making ample reserves. The net profit of the company and its subsidiaries, before taxation, for the year under review amounts to £168,687, an increase of £99,268 on the previous year, and the directors recommend a final dividend of 45 per cent., making 65 per cent. for the year, and that £10,750 be placed to reserve, making the reserve £115,000, which represents more than the ordinary share capital, leaving a balance to be carried forward to next year's accounts of £31,450.

You will notice that at book values the company's capital reserves and undistributed profits amount to £608,000 on which we are distributing £45,500 net in dividends or about 7½ per cent. The real value of our fixed assets is substantially higher than the book value and allowing for this I estimate that our net assets amount to nearly £1,000,000 and our net dividends to about 4½ per cent. per annum thereon.

You will observe that our group's liquid position is very strong as current assets amount to £548,970 against current liabilities of £144,202.

NOMINAL VALUE OF SHARES

The directors are also putting before you resolutions for the purpose of converting our 4s shares into 1s shares. The price of the shares on the stock exchange is such that the market in them must be, to some extent, restricted, and this alteration should lead to a larger and freer market.

Since our last meeting we, as you know, made an issue of 200,000 five per cent. second preference shares, which issue was most successful, having been many times over-subscribed.

With this extra capital we are obtaining new plant for Associated Weaver's carpet and upholstery fabrics factories and also for Armoride Limited, (our main subsidiary), at its new factory in Earby.

OUR PRODUCTS AND THEIR FUTURE

I do not think it is widely known what each of our companies manufactures. I think, therefore, that it is advisable in our shareholders' interests, as well as the general public's, to enlighten you all as to the products we manufacture in our three main companies.

Associated Weavers, Limited, specialises in the manufacture of carpets and upholstery fabrics. The carpets are known as Axminsters and are made in stairs, body, rugs, broad loom and squares. Everyone is conversant with the extensive use of these articles. The upholstery fabrics of a varied nature are used for the covering of furniture in homes, in cinemas and theatres, etc., and for all forms of transport. The factories contain the latest and most up-to-date machinery in the world. They are planned and laid out to ensure efficient and economic working conditions.

MODERN CARPET FACTORIES

Our carpet factory, built in 1937, is one of the most modern carpet factories in Europe. There is no cramping, and broad aisles render the handling of raw materials and woven carpets speedy. Each loom is individually lit with fluorescent lighting. Similar improvements have, and are still being, effected in the upholstery fabrics factory. The mills are painted in restful and contrasting colours, so that night workers produce the same quality and quantity as day workers, without strain. You may like to know we have been making some research into pre-war and post-war production efficiency per-man-hour, and the facts provide interesting reading for all who are concerned about working conditions and to-day's call to "produce more." In the carpet and upholstery fabric factories, increases over pre-war days of approximately 20 per cent. and 10 per cent. have been achieved. Some contributory causes of these increases per man-hour are standardisation of products, improved factory and working conditions and the magnificent way in which our employees are working.

You will, no doubt, be interested to hear that we were one of the only two carpet firms showing at the British Industries Fair this year, where orders were taken for all parts of the world.

PLASTIC AND LEATHER CLOTH

Armoride, Limited, are manufacturers of plastic cloth and leather cloth for furniture, travel goods, shoes and slippers, ladies' handbags, fancy goods, and for all types of transport. In fact our special plastic cloth "Plaxide" was used in the furnishing of H.M.S. Vanguard, on which our Royal Family journeyed to Africa.

As I announced in my last year's speech, the new factory at Earby for Armoride is, I am pleased to say, in spite of the many difficulties such as shortage of raw materials, bad weather conditions, fuel crises in the early part of this year, at last taking shape. Production should commence there in the near future, resulting in a considerable increase in output.

ELECTRICAL APPLIANCES

Barshaw and Company, Limited, our engineering subsidiary, manufactures electrical

appliances of a domestic nature such as radiators, grillettes, drying cabinets, etc., and progress has been made under adverse conditions connected with the use of electricity and raw material shortages, but as I forecast last year a modest profit was made this year.

OUR PRODUCTS AS BASIC MATERIALS

It should be appreciated that although in Associated Weavers, Limited, we manufacture carpets as a finished product, the other productions of this concern and Armoride constitute the basic materials for a multitude of trades both at home and all over the world. The demand for these products has always been steady, and in the past has not been subject to the vagaries of extreme trade cycles, and I am glad to be able to tell you that in the first three months of the current year the output has further increased and constituted a record in the group's history. The demand for our products has always been very much in excess of our productive capacity and when our very large extensions are ready and machinery running, even this record should be surpassed. Hence I feel convinced we can look forward to the future with great confidence and enthusiasm.

The Government request for directed exports has already been noted and the full force of our directive abilities and organisation is being placed behind this export drive, in the country's interest as well as of our company.

TRIBUTE TO MANAGING DIRECTORS

Before closing I would like to tell you that during the course of the year under review, owing to the raw material shortages here, three of the managing directors of our companies have undertaken long and arduous journeys abroad in search thereof, and I am happy to say that they have been extremely successful. The full benefit of their work in this connection should accrue to us in the current year and I should like to pay my tribute to them for their valuable and persistent endeavours, not only in this connection, but also for the able management of these companies during the year and to the executive staff who have co-operated so well to make possible such a satisfactory year's trading. My thanks also to our employees who have given of their best and with whom our relations continue to be happy and cordial.

I now move formally: "That the directors' report and accounts and auditors' report be and they are hereby formally approved and adopted," and I call on Mr Lindsay Fynn to second the resolution.

Mr B. M. Lindsay Fynn, F.C.A., seconded the motion, which was carried unanimously.

The retiring director (Mr B. M. Lindsay Fynn, F.C.A.) was re-elected and the auditors (Messrs Boyce Welch and Company) were reappointed.

At a subsequent extra-ordinary general meeting a resolution was unanimously approved for the splitting of each of the fully paid ordinary shares of the company into four ordinary shares of 1s. each and their conversion into stock.

A cordial vote of thanks was given to the chairman and directors and the meeting then terminated.

AMALGAMATED PRESS LIMITED

RECORD PROFITS AND DIVIDEND

LORD CAMROSE ON FRUSTRATING CUTS

The twentieth annual general meeting of the Amalgamated Press Limited was held on the 29th ultimo in London.

Viscount Camrose (the chairman) presided and, in the course of his speech said:—
It is a pleasure to your directors to be able to place before you a report which again shows a satisfactory increase in profits.

As you will have already seen, the profit on trading, including interest and dividends, after providing for contingencies and various items, amounted to £1,560,154, or after debenture interest £1,477,529. This is £323,269 more than in 1946 and is a record in the history of the company.

We recommend a final dividend on the Ordinary shares of 15 per cent. which, with the interim of 7 per cent., will make a total of 22 per cent. for the year. This is a high-water mark in our history.

WIDELY SPREAD INTERESTS

As I have informed you on several occasions, our eggs are by no means in one basket, and our profits, therefore, do not come from one source. We have first the old and well established business of the Amalgamated Press itself, going back now for just on 60 years. Some of the original publications are still with us today, but of course, there are many more of recent date and the range of our periodicals is much greater than it was. They are the good hard core of a very large undertaking, and it is on the solid rock of the main company itself that our other interests have been built.

As on this occasion last year, I do not propose to discuss your various periodicals in detail. All have done well—that is to say, they have sold out to the utmost number of copies that paper restrictions permit. The small extra amount of paper authorised in October last was used in some cases to increase the number of pages, and in others to increase printing orders, thus permitting further copies to be purchased. But the demand for our periodicals still vastly exceeds any reasonable expectation of paper in the near future.

And so in our industry, for the eighth year now, frustration continues. Its effects, editorially, are unfortunate. Periodical editing is a highly skilled and specialised form of journalism. All editors are ambitious and rightly keen to embark upon new publications. We can admire the courage, ability and good temper with which they have done their best—and a very good best—under these severely restricted conditions. But when we remember how long ago the war actually ceased I think how these editors must tire of crowding a quart into a pint pot, and how eagerly they must be thinking of adventuring again upon their own—how eagerly they, and we, wish to embark upon that health-bringing competition which unrestricted paper, when it comes, will surely cause.

I would ask you, too, for some sympathy with our advertisers. Just at this moment when we are told that it is essential that industry should be encouraged it is disappointing to find that paucity of paper still severely limits the advertising necessary for the establishment, or re-establishment, of commercial ventures.

During the war we developed with considerable care a fair method of allocating space to advertisers. In the somewhat more difficult years which have followed we have continued on the same lines. It is not easy to work systems like these, but the understanding and good will shown by advertisers and their agents have made our job infinitely more pleasant than it would have been had they withheld their co-operation.

The Government's decision to reduce the

amount of imported newsprint has followed an increase in the price in this country of no less than £7 2s. 6d. per ton. This, of course, leads to a serious increase in our costs. We are taking every possible step to meet the situation and have already put plans into operation to offset, as far as we possibly can, the adverse effects of this added expense of production.

The fuel crisis in the early part of this year, which led to the temporary suspension of periodicals, involved the Amalgamated Press and its subsidiary publishing companies in a loss of approximately £50,000. Some part of this loss occurred in February, and to that extent is included in the present accounts. We have been able to recover a portion of the remainder by subsequent publication.

IMPERIAL PAPER MILLS

Turning now to our other interests, one of the most important is the Imperial Paper Mills, Limited, the Ordinary capital of which we own entirely, together with half that of the Preference stock. The trading of the mills was more satisfactory than in previous years but, of course, the output was still only a small proportion of the 1939 figure.

These mills represent in themselves an enterprise which has been a source of considerable profit to this company for many years.

Then we have our two book publishing companies, the Educational Book Company and the Waverley Book Company. The orders obtained by these two concerns for the year constitute a record.

We purchased our subsidiary, Weldons, Limited, in the early days of the war, a somewhat venturesome proceeding in those uncertain days. The Weldon fashion publications have maintained the pre-eminence in their particular field which they have held for many years, and the company is now one of the important assets of our business.

KELLY'S DIRECTORIES' PROGRESS

I have told you on several occasions of the progress of Kelly's Directories, Limited, in which we are very large holders. The balance-sheet for the year ended 31st December last was issued a few weeks ago. It disclosed a substantially increased profit and a sound financial position. The Ordinary dividend was increased to 30 per cent. after a transfer of £125,000, against £40,000, to general reserve. It was decided to split the £1 shares into 5s. stock units and they are now quoted in that form. We have every reason to be satisfied with our investment in this company.

DORSET HOUSE PUBLICATIONS

Kelly's Directories, Limited, in turn are the owners, as you know, of the Associated Iliffe Press. That company has made further additions to its list of trade and technical publications. It now issues from its headquarters at Dorset House 31 weekly and monthly journals of this character.

Taking all these investments together you will see that the business of the Amalgamated Press is not confined to its own list of periodicals and magazines, large although this is; nor is it restricted to one branch of the publishing field. Fortified in this way, by what I might call its outside ramifications, we can look to the future with a soundly based confidence. These are not the times for optimistic prophecies, but I am emboldened enough to say that the outlook for the current year justifies us in thinking that if national economic difficulties do not interfere too much the balance-sheet to be presented to you at our next annual meeting will not prove disappointing.

The report was adopted.

VAB PRODUCTS LIMITED

INCREASED NET PROFIT

The tenth ordinary general meeting of VAB Products Limited, was held recently in London. Mr. A. H. Redfern (the chairman), who presided, said:—

The net profit after charging all expenses and providing for depreciation, amounted to £29,808, as compared with £23,296 for the previous year.

After providing for taxation and bringing in the opening balance there remains a disposable balance of £17,413. Out of this, your directors have allocated £1,000 to preference share redemption fund, £2,500 to general reserve, against £1,500, and have declared a dividend of 6 per cent. on the preference shares and an interim dividend of 5 per cent. on the ordinary shares. Your directors now recommend a final dividend of 7½ per cent. on the ordinary shares, making 12½ per cent. for the year, and a participating dividend of 4 per cent. on the preference shares, which will leave a balance of £6,149 to carry forward, against £4,861 brought in.

CURRENT ASSETS

We have, on this occasion, in common with other public companies, issued a consolidated statement of assets, liabilities and profits. You will note from this statement that the current assets exceed the current liabilities by £36,758. I would draw your attention to the item of goodwill, patents, etc., and the surplus cost of acquisition of shares in our subsidiary companies. Although these items may appear to be high, a surplus of £61,418 appears on the other side of the consolidated statement, in addition to which the freehold and leasehold properties, plant, etc., are worth today much more than the book values and our goodwill, patents, etc., are of considerable realisable value today.

During the year, an issue of 250,000 ordinary shares was made to existing shareholders at 4s. each. The proceeds of this issue enabled us to complete the new factory for Fairylites Limited, at Southwick, to which I referred at the last meeting, and provided additional working capital for the increased turnover of our other concerns.

Reference is made in the statement attached to the accounts to a loss by a subsidiary company; this company was set up during the war and did excellent work, and last year your directors decided that it had served its main purpose. The best of the plant and equipment was transferred to our new Fairylites' factory and during the changeover a loss was sustained, which loss is fully provided for before arriving at the profits disclosed.

THE OUTLOOK

It is difficult to foretell the future, owing to the changing conditions and restrictions. Our businesses are firmly established, the progress for the first half of this year is most encouraging, the total turnover of the group during this period exceeded the turnover for the corresponding period of 1946 by over 25 per cent.—this in spite of the fuel cut and our businesses being put out of effective production for several weeks. I can only say that the results are attributable to our personnel, who have worked with courage, patience and foresight through a period of unprecedented difficulties, and I should like to thank personally on your behalf the managers and employees generally for their magnificent co-operation and the services they have rendered to the company and also to my co-directors for their loyal support and hard work.

The report and accounts were unanimously adopted.

W. J. BUSH AND COMPANY, LIMITED

A YEAR OF TRANSITION

EFFECTS OF DELAYS AND RESTRICTIONS

DR PERCY ISHERWOOD'S STATEMENT

The fiftieth annual general meeting of W. J. Bush and Company, Limited, was held on the 28th ultimo at Winchester House, Old Broad Street, London, E.C., Dr. Percy C. C. Isherwood, O.B.E., F.R.I.C. (chairman and managing director), presiding.

The secretary (Mr D. E. Arnold, F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement which had been circulated with the report and accounts, for the year ended December 31, 1946, and was taken as read:—

Since our last meeting we have lost from our board the Rt. Hon. Lord Hayter. Lord Hayter, or, as he was then, Sir George Hayter Chubb, became a director of the company on the date of its incorporation in 1897 and occupied this position until his death in November, 1946, and I wish to record the directors' regret at the passing of an esteemed colleague and friend.

Lord Hayter was also one of the trustees for the debenture holders and I am pleased to be able to report that his son, who has succeeded to the title, has agreed to fill the vacancy as trustee for the debenture holders.

THE ACCOUNTS

Turning to the accounts for the year 1946, our tax advisers have arrived at an estimate of the amount of excess profits tax post-war refund to which the company is entitled. This sum of £82,687 has been brought into the accounts and although it has not yet been received, approximately a similar amount has been expended on fixed assets during the year under review.

We have set aside £20,000 to pension account, making with the previous provisions a total of £100,000. There is a considerable amount of detailed work involved in the preparation of a contributory pension scheme, but we are hoping that this work will be completed shortly and that the scheme will be in operation before our next annual general meeting.

In view of the heavy strain on plant during the past few years, we have deemed it prudent to place a further sum of £15,000 to plant reserve, making the total £70,000.

RESEARCH DEPARTMENT

The year 1946 has been one of transition from war to peace, both in production and marketing. I need not particularise, but in common with most industries we have been subjected to delays and restrictions due to shortages of capital equipment and raw materials. Our research department has been active both in improving existing processes and initiating new ones. It is unfortunate that owing to the delays and restrictions to which I have referred full advantage of these efforts cannot be taken as early as we would wish.

Our export figures have been well maintained and constitute a record, and I think we can claim to have made an important contribution to the country's needs in this vital matter.

SATISFACTORY POSITION OF BRANCHES

Last year I again visited the U.S.A. and Canada where we have subsidiary companies, and I propose revisiting these countries in the near future. I am pleased to report that our branches and subsidiaries throughout the world have maintained a satisfactory position, and I wish to express the Board's appreciation of the loyal support it has

received from the staff, both at home and abroad, throughout the year.

I would like to close these remarks with an expression of faith. Our national history shows that this old country has great resilience and recuperative powers. To this the fine chemical industry and its ancillary activities are no exception and while not assuming the role of a prophet, I look to the future of your company with confidence.

The report and accounts were unanimously adopted and a final dividend of 8 per cent. on the Ordinary shares (making 12 per cent. for the year), less tax, was approved.

The retiring directors, Mr Montgomery St. Alphonse, and Mr R. R. Webb, were re-elected and the auditors, Messrs Turquand Youngs McAuliffe and Company, having been reappointed, the proceedings terminated with a cordial vote of thanks to the chairman, directors, staff and workpeople.

CROPPER AND COMPANY, LIMITED

DISTRIBUTION OF TWENTY PER CENT

MR FRANK SMITH'S SPEECH

The fiftieth annual general meeting of Cropper and Company, Limited was held at the registered office of the Company, Thatcham, Berkshire, on the 28th ultimo, Mr FRANK W. J. SMITH (chairman and managing director) presiding.

The following is the chairman's speech which has been circulated with the report and accounts for the year ended June 30, 1947, and was taken as read:—

This, ladies and gentlemen, is the fiftieth annual general meeting of the Company.

Last year I had to inform you of the retirement of Mr Shirley Cropper from the chairmanship of the company. This year, unhappily, I have to announce his death, which occurred in March last. I have also to record the death of Sir John Pakeman, another director. It is with deep regret that I report these sad events, as these gentlemen had been associated with your company for a great many years.

Notwithstanding the irritating controls and frustrations we have had to endure during the past year, I am sure that the balance-sheet which the directors have put before you will meet with your approval and satisfaction.

BALANCE-SHEET ITEMS

The floating assets (£444,641) cover the current liabilities (£149,907) nearly three-times; and the fixed assets stand in the books at £83,488, which is much less than their actual value.

During the year the company has received a net repayment of excess profits tax amounting to £10,407. A small part of this has been spent on new machinery, and the remainder will be similarly expended as machines on order are delivered.

Our subsidiary and associated companies have had a very satisfactory year and it will be noticed from the accounts that the profits of this company have increased considerably.

In view of this increase and in order to mark the fiftieth year since the formation of the company, to which I have previously referred the directors are recommending a bonus of 10 per cent. upon the ordinary shares in addition to maintaining the dividend at 10 per cent.

The report and accounts were unanimously adopted and the dividend and bonus, as recommended, were approved.

The retiring director, Mr Harry F. Smith, was re-elected; and the auditors, Messrs Deloitte Plender Griffiths and Company, having been reappointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

TIMOTHY WHITES AND TAYLORS, LIMITED

RECORD SALES

The eighteenth ordinary general meeting of Timothy Whites and Taylors, Ltd., was held in London on the 29th ultimo, Mr. Louis Nicholas, J.P., F.C.A., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:—

The profits of the company including dividends from its subsidiary companies and other income for the year ending December 28, 1946, show a satisfactory increase. The profits of the subsidiaries also show encouraging increases. Interim dividends amounting to 32½ per cent., less tax, have been paid as against 30 per cent. for last year.

The total sales of the group were greater than in any previous year of its history, but wages, salaries and other expenses show considerable increases. Bearing in mind the various restrictions upon building work, reasonable progress has been made in restoring the properties damaged by enemy action and in dealing with the repairs to the other properties belonging to the group deferred owing to the war.

The directors are continuing their policy of reducing the charge against the company in respect of interest on its debenture stocks and during the current year the £1,000,000 4% Debenture Stock has been redeemed and replaced by an equivalent amount bearing interest at 3½ per cent. This conversion, which was completed on May 1, 1947, will effect an appreciable saving in interest. The properties of the company have been recently re-valued and this valuation shows a very considerable appreciation over the figures contained in the balance sheet.

Owing to shortage of labour and materials and the severe winter, work on the Aldershot warehouse has been somewhat delayed but it is hoped that it will be completed and that the company will be operating from these buildings by the end of 1947. Application has been made for the necessary licences and permits to erect the remainder of the proposed buildings but considerable delay may arise before these licences are obtained and the work can be put in hand. It is difficult to estimate the cost of these additional buildings, but based on present-day prices your directors are advised that the cost should not exceed a further £320,000, making the total cost for the whole scheme £600,000.

Up to the present it has not been possible to extend the buildings at Leeds, but it is hoped that a substantial portion of the additional space required will be provided during next year. The increase in the stock-in-trade held by the company reflects the larger quantity of merchandise now becoming available.

THE CURRENT YEAR

As for the current year, despite the fuel crisis, sales, up to the present, again show satisfactory expansion and, although in certain directions costs have continued to rise, profits for the current year, subject to no unforeseen circumstances, should at least be comparable with those for the year under review. Up to now there is little sign of diminution in consumer demand, but your directors realise that a sellers' market cannot continue indefinitely. They are preparing for this change, which one day must occur, by endeavouring to expand and improve the business of the group.

Your directors hope that all their shareholders are also customers and that they and their families will patronise their local branch. I can assure them that if they do they, in common with all our customers, will receive every attention, while the price and quality of the goods will compare favourably with those elsewhere.

The report was adopted and at a subsequent extraordinary general meeting a resolution was passed giving the directors power to appoint junior directors.

MINING TRUST, LIMITED

IMPROVED POSITION AND OUTLOOK

The eighteenth annual general meeting of Mining Trust, Limited, was held, on the 25th ultimo, at Winchester House, London, E.C.

The Rt. Hon. The Earl Castle Stewart, M.C., J.P., chairman of the company, presided.

The following is an extract from the statement of the chairman which was circulated with the report and accounts for the year ended December 31, 1947:—

The unsecured advance of £75,162 is a long outstanding loan to Mount Isa Mines and this, together with accrued interest to May 24, 1946, amounting to £70,725, has now been repaid. The Mining Trust has applied the total of £145,887 thus received to the purchase of 145,887 shares of £1 in Mount Isa Mines, Limited, at the price of 25s. Australian per share.

Cash at bankers at December 31, 1946, amounted to £822,700. This large increase in cash resources is mainly due to the sale of £330,000 3 per cent. Savings Bonds.

The profit of £219,883 for the year has been applied to the reduction of the debit balance on income and expenditure account, which now stands at £272,289.

MOUNT ISA MINES, LIMITED

The net profit for the year ended June 30, 1946, amounted to £A.149,410 after debiting gross profit with £A.194,434 for interest on debentures and loans, and £A.133,796 to cover depreciation on buildings, plant and machinery. Net profit for the year thus exceeded that for the previous period by £A.23,174.

Ore Reserves—The reserves of developed and prospective lead-zinc ore were increased slightly to 7,312,294 tons containing an average of 7.7 oz. of silver, 8.6 per cent. lead and 8.5 per cent. zinc. Copper ore reserves were estimated at 2,922,700 tons containing 3.98 per cent. of copper.

The new issue of shares recently made by Mount Isa Mines, Limited, has been fully subscribed and the capital is therefore now available for the construction of all the plant necessary for the production of blister copper.

If the prices of lead, silver and zinc concentrates should continue to hold at approximately their present level, the mine should continue to earn profits at not less than the present satisfactory rate.

FUTURE POLICY

In the chairman's statement last year it was suggested that if Mount Isa were earning profits at such a rate as to warrant a distribution for its financial year ending June 30, 1947, it might then be both practicable and desirable that there should be a reconstruction of the capital of the Mining Trust. At that time it was not possible to foresee that the revenue of the Mining Trust for the year ending December 31, 1946, would be such as to reduce the debit balance from £492,172 to £272,289. It is now anticipated that the income for the year ending December 31, 1947, will be sufficient not only to discharge the whole of the remaining debit balance at profit and loss, but to leave the company with approximately £186,000 surplus balance at profit and loss before providing for income-tax and profits tax.

This review of the prospects for 1947 will, I think, make it clear to shareholders that it will now be unnecessary to reconstruct the capital of the Mining Trust.

The report and accounts were adopted.

GOLD COAST SELECTION TRUST, LIMITED

TAXATION POSITION

The seventeenth ordinary general meeting of Gold Coast Selection Trust, Ltd., was held on the 29th ultimo at River Plate House, London, E.C.

Sir Joseph Ball, K.B.E., chairman of the company, presided.

The following is an extract from the Chairman's statement, circulated with the report and accounts for the year ended 30th September, 1946:—

The total profit amounted to £254,470, and of this the profit on the realisation of some of our investment holdings amounted to approximately £170,690. Dividends and interest received amounted to £92,047, of which £81,491 was received in dividends on our holdings in Ariston Gold Mines (1929) Ltd., and Gold Coast Main Reef, Ltd. We received by way of accumulated interest on loans (since paid off) £11,518, and after providing £117,241 for taxation on the year's profits and affurther £187,500 in respect of dividend distributions aggregating 25 per cent., free of tax, there remains, after deduction of directors' additional remuneration, a credit balance to be carried forward on profit and loss account of £494,115.

APPEAL TO THE HOUSE OF LORDS

This figure is, however, subject to the assessments for taxation in respect of the years 1934-38, which came before the Court of Appeal in November of last year. I regret to inform you that the Trust's appeal was dismissed by that Court, but the matter is one of such importance, both to this and to other mining houses similarly situated, that we have asked for, and have been granted, leave to take the case to the House of Lords, and we anticipate that it will be heard in the autumn of this year.

Should the final Court of Appeal decide in favour of the Inland Revenue it will be necessary for the company to make provision for the additional taxation liability of approximately £200,000. If, however, the final decision should be in our favour, the payments already made will be refunded to the company.

THE INVESTMENTS

The book figures of investments show an increase of £229,922 over those of last year. This increase is due in the main to additional shares which we acquired when the new issue of shares was made to members by Amalgamated Banker Areas, Ltd., although we also accepted shares in Nanwa Gold Mines, Ltd., in satisfaction of loans, aggregating approximately £40,000, which we had made to that company. Since the close of the year under review further shares have been acquired in Gold Coast Main Reef, Ltd., as the result of the new issue made by that company. At middle Stock Exchange prices on 30th June, 1947, the value of our quoted investments exceeded £3,374,000.

The acquisition of the additional shares, together with the payments which the company has had to make in respect of the income-tax assessments which are still the subject of dispute, have temporarily depleted our liquid resources, and the question of paying an interim dividend on account of the current year has therefore been deferred until later in the year.

Apart altogether from the disputed assessments, which, in our view, represent a new form of tax which the inland revenue authorities seek to levy on mining companies registered in the United Kingdom, the operating mining companies from which the Trust derives its revenue are also, in our opinion, subject to unduly burdensome taxation of a discriminatory nature.

The report and accounts were adopted.

SPURLING MOTOR BODIES, LIMITED

ANOTHER SUCCESSFUL YEAR

The tenth annual ordinary general meeting of Spurling Motor Bodies, Limited, was held at Hendon, on the 21st ultimo.

Mr W. F. Spurling, chairman and managing director, said that it was with great satisfaction that he was able to report that thanks to sound planning, which had enabled them to grasp their opportunities, they had come through another year successfully. That was clear from the accounts, which disclosed a splendid and encouraging result, with a turnover of more than £1,750,000 and a net profit of £215,000. It was particularly gratifying to achieve that during a year which had possibly had more than its full share of setbacks.

The root strength of the company's turnover came from the products of Vauxhall Motors. They formed the basis of practically the whole of the business of the parent company and of Spurling Motors (Chiswick), Limited, and arose from the supply of Vauxhall cars and Bedford trucks, the maintenance and servicing of those vehicles, bodybuilding and the stocking and distribution of spares and replacement parts.

RAW MATERIAL SHORTAGE

In the bodybuilding department they had found the going very heavy during the past year, principally on account of the acute shortages of essential materials. They had had to cope with an increasing volume of orders and no improvement in the raw material position, resulting in rising costs, the inevitable outcome when demand was greater than supply. In common with others, they were still having to combat the inertia which had overtaken workers when war work ceased. They were endeavouring by general improvement in conditions not only to save the extra cost of the five-day week, but also to ensure that all hours they worked should yield at a higher level, thus obtaining a greater measure of all-round efficiency.

He was glad to be able to report that they had more understanding and co-operation in their shops to-day than they had had last year, and it was pleasing to mark that fact because it made them recognise that they were moving the right way, even if their progress was slow. Their Bodyshop order books were well filled and that department would be taxed to capacity for a long time.

SERVICE AND SALES DEPARTMENTS

Their service departments, covering Hendon, Aldermaston Street, Rushton Street, Mintern Street, Kensworth and Chiswick, including their Vauxhall and Bedford spare parts distribution, had given them great satisfaction. They stood on their own feet, paid their own overheads and made a really substantial contribution by way of turnover and profit. The obtaining of spare parts had been a constant nightmare. Their sales departments had eclipsed all previous high records and their order books were a continual source of embarrassment.

The volume of orders on hand and the enthusiasm of their customers convinced them that in the Bedford and Vauxhall group of vehicles they had the best value that money could buy. Last year had been a successful one. In spite of difficulties he could still be optimistic and had sound reason for saying that the current year would be a good one.

The report and accounts were adopted and the proposed dividend of 25 per cent., less tax, making 35 per cent. for the year as compared with 15 per cent. on a smaller issued capital for the previous year, was approved.

EXPERT TOOL & CASE HARDENING COMPANY, LIMITED

ORDER BOOKS FULL

The annual general meeting of Expert Tool & Case Hardening Company, Limited, was held in London on 21st ultimo. Mr A. H. Redfern, the chairman, who presided, said:—

I explained to you at the last meeting that our parent company, owing to the change-over from war to peace, had suffered a considerable fall in turnover. I am pleased to be able to tell you that the position is now gradually improving and I have no hesitation in saying that, if normal conditions in the engineering industry existed today, our output would far exceed what it has ever been.

Your subsidiary company—Waddells (Stratford Steel Equipment) Limited, has probably been hit harder than any of our companies owing to our quota of steel being restricted and our stocks held at the end of last year being considerably less now than then. We have also experienced labour difficulties, over which we have no control, but I can tell you that our order book is full and that our output on the outstanding orders could be increased very considerably if given adequate material and labour.

WORLD-WIDE MARKET

Herbert Hunt & Sons, Limited—this company, producing specialised machinery, is sending its goods all over the world.

Metal Frames, Limited—your Directors, visualising the demand for the products of this company when war conditions ceased, bought, during 1945, a minority interest in a similar business—Framestyles of Nottingham. You will see that this interest was represented in the 1945 consolidated balance sheet as an investment of £7,575. During 1946, your company acquired the balance of the shares, giving them 100 per cent. control. In the 1946 accounts this investment has been included in the item "Interest in Subsidiary Companies" which appears at £194,635 as compared with £173,644 last year. This company has greatly increased our production and I believe that the articles manufactured at these factories are equal to anything that the world can produce.

In spite of Government restrictions and labour difficulties our executive directors, managers and staff, by their far-sightedness and hard work have produced a greater net profit than last year.

It is difficult for me to forecast for next year. I can only tell you that the orders are there in each company, which should greatly increase production, but I cannot foresee what restrictions are going to be imposed by the various Ministries.

RESERVES

As you are aware, a great deal of our profit is put to reserves, which I am sure every shareholder is in agreement with, and, from a survey of the first six months of this year, I cannot see that our dividend is jeopardised, but the final allocation to reserve will be dependent upon the conditions ruling during the latter part of the year.

As you know, the issued ordinary capital of your company is £80,000 and you will see that our net profit for the year is £70,949 as compared with £68,872 for the previous year and your directors recommend a final dividend of 25 per cent. making 40 per cent. for the year, on the ordinary shares, the same as last year. After transferring £6,500 to the general reserve against £3,500 and bringing in the balance of £7,676 at the beginning of the year, there remains a balance of £10,654 on the profit and loss account to be carried forward, which I am sure you will agree is very gratifying.

The report and accounts were unanimously adopted.

BEECHAM GROUP, LIMITED

WORLD-WIDE ACTIVITIES

The nineteenth ordinary general meeting of Beecham Group, Limited, was held in London on the 30th ultimo, Sir J. Stanley Holmes, M.P. (chairman and managing director), presiding.

The following is an extract from his circulated speech:—

The trading profits and sundry revenue for the year ended March 31, 1947, earned by the companies and branches of the Beecham Group, operating in nearly every part of the world, amounted to £2,682,216, compared with £2,786,705 in the previous year. The setback was largely accounted for by the loss of profits on home trade directly attributable to the fuel crisis in the early part of the year. The profit on export and overseas trade, which is included in the above figures, was £644,745, compared with £543,580 for the previous year.

The home sales of the company's subsidiary companies showed an increase of 8.33 per cent. over those of the previous year. The basis of the business has been continually broadened. The sales of pharmaceutical products, which comprise 32 per cent. of the company's turnover, were more than maintained, while the sales of toiletries and foodstuffs showed a gratifying expansion.

The net amount available for dividend on the deferred shares and for reserve, after paying all charges, including preference dividends and taxation, was £504,409, as against £386,326 in 1946. The directors have already paid interim dividends of 36 per cent. and recommend a final dividend of 4 per cent.

For the first two months of this financial year our results show a substantial increase.

The report and accounts were unanimously adopted.

TRUSTEES CORPORATION, LIMITED

STRONG POSITION

The annual general meeting of the Trustees Corporation, Limited, was held on the 30th ultimo in London.

Mr Harold G. Brown (the chairman) said that this year the valuation of our investments showed a further large appreciation. Superficially satisfactory as that might appear, it must be considered along with the underlying realities of the present situation in this country and the basic features of British commerce and industry. The total gross revenue amounted to £278,996, compared with £247,424 for the previous year. Charging £110,634 for taxation and also interest, less tax, on the debenture stock and expense of management, they were left with a credit balance of £110,108, an increase of £20,493.

They had transferred £10,000 to building reserve, increasing it to £90,000. Having in mind the progressive expansion in the revenue from investments since 1941, on the one hand, and the uncertainty as to the prospects of maintaining such revenue on the other, they had thought it wise to allocate a further £12,500 to dividends equalisation account, thereby making a total of £70,000. That would be available for the purpose of stabilising future dividends on the ordinary stock at, they hoped, not less than 10 per cent. per annum. They now recommended the payment on the ordinary stock of a final dividend of 5 per cent. and a bonus of 2 per cent., both less income tax, making a total of 12 per cent. for the year to May 31, 1947.

The general position of the corporation was one of strength and a fitting tribute to the wisdom and restraint exercised by their predecessors.

The report was adopted.

ASSAM RAILWAYS AND TRADING COMPANY, LIMITED

DIVIDEND OF FIVE PER CENT.

The sixty-sixth ordinary general meeting of the Assam Railways and Trading Company, Limited, was held, in London, on the 28th ultimo.

Mr E. A. A. Joseph, the chairman, said that stockholders would have anticipated from what he said last year a substantial decrease in the general trading profit with, of course, some compensatory reduction of taxation. The drop of £25,000 shown in the accounts was illusory because the figures of the two years were not really comparable. They would notice in the net revenue account a writeback of £35,000 over-provided for taxation in former years and now no longer required. Dividends on the "A" Stock had been paid and the directors had decided to recommend the payment of 5 per cent. on the "B" Stock.

The coal production was suffering from the lack of an adequate provision of wagons, of which there was constant complaint. That had its effect, though not at all in the same degree, on their tea-chest and brick trade. In many ways life in India got more and more difficult. Employers of labour shouldered responsibility which in Britain would fall elsewhere.

He had little to tell them of the progress of the new method of mining being tried at Tipongpani, for so far they had not yet received the full equipment of machinery which had been ordered. Meanwhile costs continued to rise and to the political uncertainties which occupied the attention of India to the increasing detriment of sound administration must be added a not inconsiderable measure of labour unrest and agitation.

The report was adopted.

FORESTAL LAND, TIMBER AND RAILWAYS COMPANY, LIMITED

INCREASED STRENGTH

The forty-first ordinary general meeting of the Forestal Land, Timber and Railways Company, Limited, was held in London on the 23rd ultimo.

Mr Louis H. Kiek (vice-chairman), who presided, said that he thought it would be agreed that the balance-sheet showed a satisfactory position. The financial strength of the company, as illustrated by a comparison of the surplus of liquid assets after deducting all liabilities with those of the previous year, had increased from £1,753,000 to £2,220,000, an increase of 26 per cent. The dividend equalisation reserve had been increased by £100,000. When the uncertainties of the situation in all parts of the world were borne in mind, they would, he thought, be over-optimistic were they to expect the company's revenue to be as buoyant in the near future as it had been in the recent past.

The profit for the year 1946 of £853,519, together with the amount brought in, gave an available total of £1,044,212. After paying two interim ordinary dividends totalling 12 per cent., £214,255 remained to be carried forward.

The past year had not been altogether an easy one for the Argentine Company although the trading results had been very gratifying. The Natal Company had again had a very satisfactory year. The demand for its products had been such that it had been quite unable to meet all the business that had been offered from all parts of the world. During the past year 43.27 per cent. of its total production had been exported to the U.K., the remainder being shared by a long list of countries. The Kenya Company had also had a satisfactory year.

The report was adopted.

WELWYN GARDEN CITY LIMITED

ECONOMIC POSITION OF THE TOWN

SIR THEODORE G. CHAMBERS' REVIEW

The twenty-seventh ordinary general meeting of Welwyn Garden City, Limited, was held on Wednesday, the 23rd ultimo, at the Holborn Restaurant, 218 High Holborn, London, W.C.1. Sir Theodore G. Chambers, K.B.E., F.S.I., chairman of the company, who presided, said:—

One new item in the profit and loss account merits a word of explanation, namely, the deficit on accommodation provided for building operatives. Faced with the urgent need to recruit our building force the company took over a number of huts previously occupied by the National Fire Service and converted them into temporary accommodation for building operatives who were attracted to work in the town but for whom no housing accommodation could be found. This camp has accommodation for over 100 men.

Later an old mansion owned by the company, known as Digswell Conference House, was converted to similar purposes to house an additional 80-90 men. It was, of course, realised that in the early stages these hotels would not pay for themselves, but it was expected that when they were both fully occupied there would be little or no deficit.

SHORTAGE OF MATERIALS

Having established the Fire Service Camp on a reasonable footing progress was being made towards achieving the same result in the case of the Digswell Conference House, when the whole housing programme of the town suffered a severe set-back as a result of the shortages of materials. Apart from the three housing schemes now in hand, all of which will be finished before the end of this year, we had hoped to be able to start on 46 flats for our Housing Association, and at least two new schemes for the local authority, involving about 410 houses in all. This full programme, which would call for maximum energy and output from all those concerned, has suddenly been cut down by the Ministry of Health to 90 new houses for the local

authority only, and even this contract is unlikely to be started before the autumn. In consequence, the rate at which new houses will be completed in the town will fall by the end of the year from a steady four a week to none at all until some time in the late spring of 1948.

We have therefore had to abandon our plans to increase our building labour force to the modest 500 operatives which we had set before ourselves as a goal and the present use of Digswell Conference House as a hotel for operatives is performance being given up.

SIZE OF THE TOWN

It is, however, not only in the sphere of house-building that we have had to fight the sense of disappointment.

For 27 years we have set our minds on the production of a satisfactory, self-sufficient town of 50,000 people, and detailed plans have been steadily prepared for attainment of this objective. As time went on and the land requirements for urban development steadily increased, we acquired additional land and revised our plans accordingly. As recently as last year we purchased a further 664 acres of land to the north and east of the main estate which for several years had been planned in our minds as part of the total urban area for the final town.

A year ago I informed shareholders that we were becoming increasingly anxious at the prolonged delays in securing general agreement to our broad plans for the ultimate town and I expressed the hope that a helpful decision would be reached by all parties in a few weeks. Unfortunately discussions and committees multiplied until finally the matter came before the Minister of Town and Country Planning himself, who, at the beginning of this year, made the request that the final size of the town should be limited to only 36,500 inhabitants.

LAND AVAILABLE FOR COMPLETION

The land to complete the town is available and the local authority and the company have between them the full organisation to carry it to completion with the minimum of delay. In other words, Welwyn Garden City is already a going concern which has left the difficult initial stages of development successfully behind it. We can therefore make a much greater practical contribution in the next three or four years to the policy of

metropolitan decentralisation within the London area than seems likely in the case of any of the next towns now being promoted for this purpose.

It is in consequence somewhat difficult for us to understand why there should appear to be so many formidable obstacles in our path at a time when we are striving to recapture the enthusiasm and energy of earlier periods of the town's history during which the spirit of real enterprise was so noteworthy.

Having regard to our main objectives in building Welwyn Garden City one would have thought that it was impossible to go too fast, subject merely to the limitations of the community's capacity to absorb new population. I feel very strongly that it would reveal wisdom and statesmanship on the part of those in authority if every encouragement and assistance could be afforded us to reach our goal in the shortest possible time.

RICHARD THOMAS AND BALDWIN, LIMITED

ANNUAL GENERAL MEETING

The ninety-eighth ordinary general meeting of Richard Thomas and Baldwins, Limited was held on the 30th ultimo, at Grosvenor House, Park Lane, London, W.

Mr E. H. Lever (chairman and joint managing director) presided.

The chairman moved the adoption of the report and accounts and the payment of a final dividend of 10 per cent., less tax, on the ordinary shares, making 15 per cent. for the year.

Mr J. E. James (Deputy Chairman) seconded the resolution, and, after the chairman had replied to questions, it was carried unanimously.

The retiring directors (Col. Sir W. Charles Wright, Bt., Mr C. G. Gilbertson and Mr Cyril Watts) were re-elected; and the auditors (Messrs. Peat, Marwick, Mitchell and Co.) were re-appointed, and the meeting terminated with a cordial vote of thanks to the chairman and directors.

At a subsequent extraordinary general meeting a resolution was passed converting the issued preference and ordinary shares into stock.

C. AND J. CLARK, LTD., Shoe Manufacturers, Street, Somerset. Previous experience of similar work is essential. This post will appeal to those who like living in the country. Further information will be given on application. Full particulars of age, education and experience should be given on application, which should be marked "Personal" and addressed to the Personnel Officer.

OLD-ESTABLISHED progressive manufacturing company in Northern England, owing retirement seniors, offers career to young man have to start work 7.30 a.m. and learn manufacturing as well as commercial side. First-class character and education, intelligence, enterprise coupled with balanced judgment, all essential. Apply own handwriting, stating briefly all facts considered relevant.—Box 508.

AN important vacancy for a General Sales Manager exists in a large primary and of fabricated materials used in the manufacture of plastics. Many other applications are under development. The pro- of technical education, such as a University Degree in Science, or the qualification, is very desirable. The General Sales Manager will be responsible for leading the sales effort of the company. A man between the ages of 35 and 45 is preferred. Applicants must show thorough and successful experience in the post covers heavy responsibilities and the work will be arduous. To obligatory superannuation scheme. Residence near the headquarters of the company at St. Helens, Lancashire, will be essential. A rigorous selection will be made, and those with inadequate qualifications are asked not to apply. Address applications, with an outline of career, to M.D., c/o Fibreglass, Ltd., St. Helens, Lancashire.

LEVER BROTHERS AND UNILEVER, LTD., have a vacancy for an experienced Translator (woman) with good knowledge of type-writing. Fluent French and Spanish essential.—Apply by letter to Staff Department, Unilever House, Blackfriars, London, E.C.4.

GOVERNMENT RETURNS

For the week ended July 26, 1947, total ordinary revenue was £57,099,510, against ordinary expenditure of £52,324,328 and issues to sinking fund allocations of £3,531,384, the surplus being £1,243,802. For the week ended April 1st is £280,538,906, against a deficit of £280,832,917 for the corresponding period a year ago.

The Lash of Adversity

IT would obviously be premature to judge the Government's new economic policy from the Prime Minister's speech alone, particularly since the time-table precludes any extended comment on the speeches that were to be made on the second day of the debate by the President of the Board of Trade and by the Chancellor of the Exchequer. The new policy is an improvisation, and bears the marks of its hurried preparation; there is much in Mr Attlee's bare and bald outline that needs considerable amplification before it can be fully understood.

But in a matter that is in large part psychological, first impressions count for a good deal and if Mr Attlee's speech has given the country the wrong lead, no amount of later glosses upon it will catch up with the harm done. That any speech of Mr Attlee's would be arid and uninspiring is, unfortunately, to be taken for granted; he touches nothing that he does not dehydrate. But there was room for hoping that the substance of what he had to say would overcome the defects of the manner and jolt the country into a sense of reality. The measure of his failure lies in the almost audible sigh of relief that went through the country on Wednesday evening "Not so bad, after all" is the general comment; and there could hardly be a more disastrous reaction to have provoked. There are two tests that can properly be applied to the Government's plans. In part, those plans must inevitably be a purely passive adjustment to external circumstances; and there the test is whether all traces of false optimism have been adequately squeezed out. But the new proposals should also include a frank recognition that the economic policy pursued to date inside this country has been partly responsible for the present mess and a firm determination to seek and apply the remedies. Judged by the first test, the Government's proposals are not very satisfactory; and judged by the second, they are downright unsatisfactory.

Under the first head—that of the passive defence measures against the dollar stringency—there is some evidence that Ministers are at last frightened of the position that is developing, and that they are trying to frighten the public. But they cannot yet bring themselves to say more than "Boo" to a people that is by now enured to crises. None of the cuts in external expenditure that is proposed measures up to what the public had steeled itself, in the last few days, to expect. The reduction in the total of the armed forces by 80,000 by the end of the year is merely derisory. It has long been quite impossible to understand the Government's mental processes on this subject. They have committed themselves to a conscription policy that will bring the total of the forces down before long to somewhere between 600,000 and 750,000; why on earth cannot it be done now? People were expecting the total withdrawal of the basic petrol ration; but it is only to be cut by one-third. On travel allowances and film remittances, something much more drastic had been expected. And lastly, in the matter of food, there had been a dismal expectation of a halving of the meat ration and a cut in the fats ration. But all the Prime Minister said was that some items would be "up-pointed," that

there would be restrictions (unspecified) on meals in hotels and restaurants and that there might be further cuts (still less specified) later on. This is a dereliction of duty. The Prime Minister should have told the country squarely that it is necessary to choose between food and raw materials, and that it is the raw materials of productive industry that are really essential in the ultimate analysis. It is better to go hungry and still be able to work for salvation than to keep full stomachs and live on charity. Mr Attlee should have made the country realise that this is its bitter choice; instead, he has encouraged the belief that something will turn up to put off the necessity of choosing.

The most encouraging announcement in this part of the Prime Minister's speech was that the Government have at last decided to break their embarrassed silence on the ruinous nature of the conditions attached to the American credit and to tell the United States Government squarely that they cannot be borne. This should have been done two years ago; and it would have been done two years ago if the British negotiators at Washington had had a larger dash of realism and a smaller admixture of ideology. The Government have made no greater mistake in their two years of office than to gag the free discussion of the American loan in December, 1945. Something is said in two later articles of this issue about the issues that revolve round those two unintelligible abstractions, "convertibility" and "non-discrimination."

★

If the one half of Mr Attlee's speech was merely weak, the other half was definitely wrong-headed. Where there is need for a reversal of economic policy at home, he promised merely an intensification of the wrong policy hitherto pursued. It cannot be too often repeated that the present troubles of the nation are only in part of external origin; the other part is due to the mistakes that have been made at home. For two years the Government's economic policy has been made up of controls, rations, restrictions, priorities, exhortation and inflation. Now that it has landed the country in such a mess, all that the Government can think of to prescribe is a lot more of the same medicine. Since it failed to cure the patient, every ingredient is to be strengthened. There are to be new controls over capital investment, the one sure long-term remedy. There are to be tighter allocations of materials. There are to be new restrictions on the freedom of employers and workers. There are to be new priorities for exports—but without any real assurance that the suppliers of essential materials and components for the export trades will not get caught up in the new restrictions. (*The Economist* is, as to 50 per cent, an export business; one of the largest exporters in its industry. But we are less able than ever before to do our exporting duty.) There are to be plenty more exhortations, with new and higher targets set in blithe indifference to the fact that the old and easier targets are not being attained. And, lastly, there is to be more inflation. When supplies available for the home market are cut down without any reduction of spending power, that by itself intensifies inflation. But in fact spending power will be increased, for the extra hours that the unions are to be asked to work will have to be paid for at overtime rates, and the TUC's statement is significantly silent about the Government's plea for a truce to wage claims. Why should this intensification of the mixture-as-before be expected to work any better than it has worked hitherto?

These doubts about the attainability of paper targets apply with particular force to the policy of agricultural expansion now announced. It is not very easy to quarrel with the target. Unless British exports are to be much more successful in capturing and holding the world's markets than seems at all likely, some permanent limitation of British imports will be necessary long after the present dollar crisis has been surmounted. It is not unreasonable to say, in these circumstances, that an increase of

20 per cent in the output of British agriculture is desirable. But is it possible? Can it be done at all—and particularly within five years—without a far-reaching reconstruction of the whole structure of British agriculture? And if the attempt is made to accomplish it by the methods of the last eight years—that is, by giving farmers and farm workers ever-rising cash inducements—will not the cost be a very large fall in the standard of living of the British people? It is not because they propose inadequate targets that the Government's proposals fail to inspire confidence, but because they do not give any reason for believing that, this time, the targets will be attained.

Voices have been heard in the last few weeks urging that what is wrong with the country is not wholly economic, but largely moral. That is true. But the distinction between the economic and the moral is not as absolute as is often supposed. Faulty economic policies can lead to bad morale. At the moment, it is manifest that the country is languishing because its individual citizens do not react to the national calamity with sufficient effort and responsibility in their individual lives. But that is not due, or at least not wholly due, to any weakening of moral fibre or any dilution of patriotic spirit. It is very largely due to the fact that the national problem is not reflected in millions of individual problems. It was often remarked at the bottom of the slump that, though the national interest was obviously for expansion and free expenditure, the individual was compelled by circumstances to practise the most stringent economy. Today the roles are reversed. The community is faced with the necessity for the most bitter economy of its resources; but fewer of its individual citizens have a personal economic problem to face than ever before. Some of them are hard pressed: the pensioners, the over-worked and under-paid senior civil servants, the salaried middle-class generally, and particularly their womenfolk. But the whole of the working class, the great majority of those whose incomes are derived from business, and virtually every business firm, have a greater feeling of individual prosperity today, for all the shortages, than they have ever experienced before. Of course they do not react to a national emergency that is simply something they read about in the papers and do not experience in their own lives.

Not until the lash of economic adversity ceases to be a metaphor in statesmen's speeches and becomes something that the individual feels on his own back will the "moral" crisis be surmounted. If the Government wants real economy throughout the length and breadth of the land, it should so mould its economic policy that every individual starts counting his pennies again and every business firm begins to get anxious about its profit-and-loss account. It may be that the tide has already turned and that the inflationary pressure is relaxing; but if so, it is due to the despised "blind economic forces" and not to anything the Government has done. The healthy effects of Stock Exchange losses, after seven years of Stock Exchange profits, can already be perceived; but the Stock Exchange has fallen because of the collapse of Mr Dalton's policy, not because of any success it has had. The Government ought to be hurrying on the disinflationary process by every means in its power instead of impeding it for fear of creating unemployment. A moderate degree of unemployment would, in fact, be a god-send, since there is nothing else that will get the labour for the mines, for the textile industries and for agriculture, and that will really clear the way for exports. A moderate degree of unemployment in the next few months—enough to restore some elasticity to industry—is, in fact, the only thing that will now save the country from the mass unemployment that would follow upon a complete breakdown of imports. It is, of course, "unprogressive," "reactionary" and "socially irresponsible" to say this. But it happens to be the truth. And it is a truth that the Government, with the great mass of the people behind them, are still resolutely determined to ignore.

Back to Partition

THE murder of two young British soldiers by Jewish terrorists and the discovery of their bodies in a snare of booby traps do not, in one sense, represent anything new in the tragic history of Palestine in the last two years. The attack on the hostages was more repellent but not more murderous than the blowing up of the King David Hotel, and week by week, Palestine has been taking its toll of innocent life. Yet there comes a point when the repetition of violence becomes in itself a new factor and that time has now been reached. The British Government has no doubt a duty to the international community whose mandatory in Palestine it is. It has a duty to the Arabs. It has a duty to the Jews. All these several and collective duties have been stressed and re-stressed in recent months. But the culminating murders of last week should remind it of a duty rarely mentioned and apparently forgotten—a duty to the British people and in particular to the unfortunate British conscripts drafted to Palestine. The time has come not to examine international or Arab or Jewish or even American interests in Palestine, but to write the British balance sheet. Why should British soldiers continue to be exposed to this kind of killing? Why should the British community bear the cost? For one thing is certain. The cost of Palestine to Britain is incalculable—in its material burden on the overstrained British economy, but, much more serious, in the moral degradation to which it exposes young men living under conditions which by their monotony incite them to excess and by their violence are likely to send them home very perfect anti-Semites. To offset such evils, the advantage to the British community must indeed be very great and very clear.

The seasoned critics of British imperialism in America and elsewhere reply that the reason for Britain's interest in Palestine is crudely strategic. Only by the presence of British troops can Britain's large oil investments be safeguarded and the area preserved from Russian aggression. This argument certainly carried some weight with the General Staff and the Foreign Office in the past, indeed, in a quite immediate past. But there is now no intention of building a major base in Palestine, at Gaza or elsewhere. It is realised that the specific British interest in the Eastern Mediterranean as distinct from the general world interest in the stability of the area—is no longer so vital as to be worth the effort that would be needed to maintain it. America's great interests are believed to be sufficiently protected without any Middle Eastern concentration of American troops. The British need not show a greater concern. If, on the other hand, the reason for the absence of American troops is the unspoken assumption that Britain can do the job for America, the sooner the burden is shared, the better. In either case, no strategic advantage would be lost if the British withdrew immediately from Palestine.

The continuance of British occupation in Palestine today can therefore be justified only on grounds of moral obligation. What are these obligations? To the Arabs? After the last war, the British promised independence to the Arab world and the record in Iraq and Transjordan and, indirectly in Syria and Lebanon, goes almost the whole way to fulfil that promise. To the Jews, the British promised a National Home in Palestine. The Jews have now achieved it. At no time did the British Government promise a Jewish majority and a Jewish state. The obligation is therefore already fulfilled. To world Jewry the British have another obligation, an obligation which they share with all the civilised nations—to succour the Jewish victims of Hitler's persecution. But this duty does not entail an obligation to send the victims wherever they want to go. Any free and private poll among the Jewish survivors in Europe would demonstrate beyond question that the majority wish to go to the

United States. This fact does not impose on Britain an obligation to help them to get there.

All in all, the moral obligation to stay in Palestine is very small—quite incommensurate with the cost to Britain of continued occupation. If there were no more interests and duties involved than these, the British could and should begin their evacuation tomorrow. Other powerful arguments can be marshalled for such a move. In any situation of complete deadlock, the only hope is to introduce a completely new factor—a catalyst—such as was found in India when the Government announced a date for the transfer of power. If the policy of the catalyst worked there, could it not work in Palestine? The difficulty is that the circumstances are quite different. There is no compromise Arab and Jew can reach unaided. Nor would there be the remotest hope of avoiding war. The removal of British control would be the signal for a massive Jewish immigration. The Arabs' immediate resistance would be countered by Jewish forces trained in the British Commandos and by arms, equipment and finance provided by American Jewry. Local Arab opposition would be quickly beaten down—the chief reason for the terrorists' attacks on Britain is their conviction that the Arabs could be easily defeated if the British withdrew. But in the event of a Jewish military victory inside Palestine the Arab states would hardly stand aside, especially since Jewish extremists have spoken of annexing more than Palestine. The fuse lit in Palestine would set in motion a conflagration involving the whole Middle East, and however small Britain's direct interests in Palestine may be, its interest in the general peace of the Eastern Mediterranean and the Arab lands is very great. A British withdrawal cannot, therefore, be lightly or precipitately undertaken. So long as there is any other reasonable solution it must first be tried, even though a total British withdrawal should be held in reserve as a last resort.

★

But if a British withdrawal is not immediately practicable, does it follow that the British Mandate must be continued—with all the misery and demoralisation that it entails? This clearly is impossible. Even if there can be no immediate British withdrawal, a change in policy there can and must be, one which relieves the British taxpayer and the British soldier of the impossible burden of internal policing and administration in Palestine. There is only one such solution—the partition of Palestine and the creation of a small Jewish sovereign state, if necessary with certain transfers of population. The Arab areas could either be attached as separate communes to neighbouring Syria and Transjordan or be included as an autonomous province in a Greater Syria. Partition is the solution recommended by the most distinguished report on Palestine yet drafted—the Peel Report—and, since 1938, no alternative has been found. It is the solution which, but for a last-minute intervention by Mr Bevin, might under Mr Creech Jones' guidance have emerged from the conference with the Arabs and Jews, held in London last Christmas. Events since then—a hardening of opinion among the Arabs, a growing desperation among the Jews and the reference of the problem, in default of a British policy, to the United Nations—have made the carrying out of immediate partition more difficult. But it remains the only policy which, short of a total British withdrawal, gives the British community the relief it has every right to expect.

Yet if the decision is taken to introduce partition, some effort must be made to mitigate the new difficulties. The United Nations, having been consulted, cannot be ignored. Their Commission will presumably be reporting in a few weeks and no action should be taken until then. But it is in the highest,

degree unlikely that the Commission will produce a clear-cut solution of the problem that all parties can be induced to accept. The British Government should be ready, with its mind made up, to announce its firm policy as soon as it becomes apparent—as it almost certainly will—that the appeal to the United Nations has been a waste of time.

Could Arab and Jew be persuaded at this late hour to accept partition? On the Jewish side, the moderate leaders are probably still prepared to do so and those who, in spite of the terrorist fringe, still carry the most weight in Jewish affairs could almost certainly be persuaded to return to the conciliatory attitude they adopted—in private—last Christmas. The dire consequences of Jewish terrorism by now provide an added inducement to accept a policy which could bring terrorism to an end. Another undoubted inducement lies in the fact that a sovereign Jewish state could at once receive thousands more of Jewish refugees seeking to leave Europe.

The task of persuading Arab opinion would be more difficult and it is doubtful whether the Arabs in Palestine itself would accept partition, unless under pressure from other members of the Arab League. But a number of inducements could be offered: a British guarantee of the Palestine frontiers, for instance, the self-interest of Syria and Transjordan in extending their frontiers and even gaining territory on the Mediterranean coast, the gain to the whole Arab world if, with the co-operation of the American Administration and the United Nations' agencies, capital investment were offered to accelerate the economic development of the Arab lands—and Arab opinion might also be easier to persuade if the British Government, after con-

sulting the Dominions, were to couple the announcement of partition with an offer from the Commonwealth to accept a large body of refugee immigrants, with a generous quota for the Jews. The Arabs very naturally resent the fact that, as far as they can see, they are being asked by the world to make the greatest contribution to the resettlement of the Jewish refugees. Their resentment and opposition would be lessened if they knew that other, wealthier communities were carrying their share of the burden. A British decision on these lines might also hasten a similar decision in the United States.

If, however, the various inducements failed to impress Arab opinion, a sanction and a threat would be implicit in the new British position. For, if partition were rejected, the alternative would be a total British withdrawal, in which event the Palestinian Arabs' chances of withstanding Jewish pressure would be very slight indeed.

Thus the outlook for persuading both Arab and Jew, even at this late hour, is not hopeless. At least, it is not dark enough to nullify all chance of achieving partition by agreement. And it must be emphasised again that the reason for British advocacy of partition now is not primarily because it is in the best interests of the Jews or the Arabs, or the international community in general, it is simply because it is in the best interests of the long-suffering British and is, indeed, their last offer before they remove themselves lock, stock and barrel from an area which is a drain on their resources, a death-trap for their soldiers and a source of degradation, both to the men who are sent there and to the growing number of potential anti-Semites at home.

Articles Seven to Ten

WHEN the terms of the American Loan Agreement were published and ratified in December, 1945, *The Economist* got into very hot water, in both countries, for the warmth of language with which it denounced the "cruelly hard" conditions that were attached to the grant of a dollar credit. Our view was that the British Government had no option but to agree, since it must have the dollars, but that the conditions attached amounted to a policy of ruination for the British economy which was not likely to be any the less effective for not being deliberate. "It is for the Americans to say what pleasure they take in a bargaining victory won over their best friends at such a price. . . . Beggars cannot be choosers. But they can, by long tradition, put a curse on the ambitions of the rich." This was thought to be too strong language for polite society. We were unabashed at the time, and we are unrepentant today. Gladly would we have been proved wrong. But unfortunately every apprehension that we felt then has been justified in fuller measure, and with shorter delay, than we feared. If it is the disappearance of the dollars that brings on the present crisis, it is the conditions on which they were lent that make the crisis so difficult to solve. These are the first signs of a willingness in America to see how hardly the rigid application of theoretical principles can bear upon an economy that has been distorted by war and the willingness of Mr Marshall to discuss the subject brings some hope that these crippling restrictions will now be removed.

It is as well to recall what the conditions of the Agreement were. Article Seven requires "sterling receipts from current transactions" to be made freely convertible into any other currency by July 15, 1947. It is this that has brought the present crisis to a head. Article Eight commits the British Government to impose no exchange restrictions on current transactions from the same date. Under Article Nine, Great Britain promises (with a few exceptions) not to impose import restrictions that

discriminate against imports from any country. And under Article Ten it is provided that sterling balances will not be repaid except in freely convertible sterling. It is expressly provided, however, that Articles Eight and Nine, "which are in anticipation of more comprehensive arrangements by multilateral agreement, shall operate until December 31st, 1951." In the absence of "multilateral agreement" they will then presumably lapse.

In the inquest that is now going on into the causes of the present crisis, far too much stress is being laid on convertibility. It is true that the date was far too early and that it was its arrival which has apparently precipitated the crisis. But to restore some degree of convertibility to sterling is obviously a desirable objective if it is to survive as a currency of international commerce. And it could not be much longer delayed except for payment in hard currencies. What has done the damage has been the fact that the British authorities have had no room for manoeuvre. They could not offer the convertibility of sterling as a bargaining point since it had already been conceded to all as a unilateral right. In fact, they could hardly bargain at all in view of the principle of non-discrimination. To give only one example—in the present conditions of world-wide dollar shortage, several countries are cutting down their purchases from Britain in order to have a balance of "current sterling" which can be converted into dollars. Britain is powerless to redress its balance of payments with any such country without cutting down equally from all.

It is not, in fact, Articles Seven and Eight—the convertibility articles—that are the villains. It is Articles Nine and Ten—the non-discrimination articles. And they are not wrong merely in the context of the present extraordinary conditions; they are wrong in principle.

The various objections to the doctrine of "non-discrimina-

tion" will not be news to readers of *The Economist*; they have often been stated here. But they seem to have come as a surprise, within quite recent months, to His Majesty's Government and to most, if not to quite all, of their advisers. Very little seems to have been said about non-discrimination during the negotiations for the dollar credit in 1945. There were great arguments about all the financial questions, especially about the American insistence on making sterling convertible, but non-discrimination seems to have been accepted as the sort of principle to which no gentleman would take exception. Thus the British people were almost off-handedly saddled with what they now discover to be a great incubus.

The first set of objections to the doctrine of non-discrimination is that, in its American definition, it loads the dice unfairly against British interests. The widest argument under this head is that Great Britain, the world's greatest buyer, is in a very strong bargaining position at most times (though not at present), and should therefore not accept any restrictions on its ability to drive hard bargains, restricting access to its market to those countries which treat its exports well. But it is doubtful just how much strength there will be in this argument when more normal conditions return; and there is clearly very little strength in it today. For the purposes of this article, therefore, this wide and sweeping argument will be left aside.

Without any reliance on it, however, the doctrine of non-discrimination, as defined in Washington, can easily be shown to work unfairly against British interests, and it will continue to do so long after the present dollar crisis has been surmounted. There is a natural, but unmistakable, tendency on the part of the Americans to word their documents in such a way that all their own favourite methods of discrimination are to be retained, while the discriminations that favour the British are to go. Shipping, for example, is the one large international industry in which Britain has a large advantage over the United States, and British shipowners would greatly gain by the abolition of American flag discriminations, subsidies and other protective devices. But shipping is carefully excluded from the purview of the doctrine of non-discrimination. Again, there is no proposal that the United States shall abandon the discrimination of its "tied loans"—that is, the attachment to loans of the condition that all or part of the proceeds shall be spent in the United States. When America puts Brazil in possession of dollars by means of a loan, and stipulates that those dollars shall be spent in the United States, that is all right; when Britain puts Argentina in possession of pounds by purchase of goods and stipulates that those pounds shall be spent in Britain, that is all wrong. Furthermore, though it is considered legitimate for the United States to attach discriminatory conditions to the making of a loan, Article Ten prohibits the United Kingdom

from attaching discriminatory conditions to the repayment of a debt. Though it does not yet seem to have been generally realised, this amounts to a prohibition of repayment of the sterling balances, since the likelihood of repayment in dollars (or in pounds convertible into dollars) is obviously very small. In the absence of this clause, it would be possible to arrange for the repayment of the sterling balances by special deliveries of goods over long periods of years, to the mutual advantage of creditor and debtor.

★

The second set of objections to the doctrine of non-discrimination is that, even if it were adjusted so as to be perfectly equitable in its incidence on different countries, it would still obstruct any attempt by a country to make its foreign trade serve the objects of its full employment policy. For all those countries where foreign trade is more than a marginal quantity, non-discrimination and economic stability are incompatible with each other. This proposition requires a little argument.

Economic policy nowadays is mainly concerned—or, more accurately, will be mainly concerned when normal times return—with maintaining the level of general economic activity within the country. It is concerned, that is to say, with maintaining the total volume of economic activity, with keeping it high and keeping it steady; that is what is meant by the catchphrase "full employment." It is obvious that for a country such as Great Britain, and for most others, the objects of a full employment policy would be entirely frustrated if the volume of international trade were to fluctuate widely from year to year. It is, therefore, inevitable that countries should seek to stabilise the volume of their imports and particularly of their exports. Whether or not it is true that the doctrines of untrammelled multilateral trade would lead to a higher volume of international trade on the average of years, no one in his senses would argue that it would stabilise the volume of trade from year to year; on the contrary, it would leave the volume of trade free to fluctuate. No one country can control the volume of its trade—certainly not of its exports; the planned stabilisation of trade can only be effected by mutual bargaining between pairs, or small groups, of countries, each promising to sustain its purchases if the others enable it to sustain its sales. In other words, any extension of full employment policies into the field of international trade can only be achieved by means of bilateral bargaining which, though open to all comers, must inevitably discriminate against those who do not choose to assume the obligations of the bargain. If this sort of arrangement is banned—as under the American proposals it is—it would be idle to expect that countries will abandon the attempt to control the volume of their foreign trade—they could not do so without abandoning their full employment policies. Their only recourse will be to cut down their imports to what is indispensable. The result of a

prohibition on planned stabilisation of trade at a high level will be planned stabilisation of trade at a low level.

The third set of objections to non-discrimination is the most decisive of all. This is that non-discrimination, combined with a shortage of a major currency, is a powerful weapon for throttling international trade instead of being a lever to increase it. No more persuasive example of the truth of this could be given than what is happening all over the world at the present time. One country after another, finding itself compelled to cut down its dollar spendings, is also compelled by the American insistence on non-discrimination to cut down its purchases from all other countries as well. Because Britain and Argentina can neither of them buy from America, they are compelled to refuse to buy from each other. Nor is this likely to be a purely temporary state of affairs. It is true that the dollar shortage will not always be as severe as it is now; but the optimism so prevalent a year or two ago that the American balance of payments would by some magic bring itself into equilibrium has now vanished. It is much more likely (and always has been) that some shortage of dollars will persist for a long time. The great economic strength of the United States is a phenomenon to which there is no parallel in economic history. It is most unlikely that any adjustment of the American tariff to which Congress would conceivably consent would be big enough to solve the problem by an increase in American imports. Indeed, it is fully possible that there would still be a shortage of dollars even if the American tariff were completely abolished. A policy of massive dollar loans would do no more than postpone the problem, at the cost of intensifying it. It is much the most likely contingency that the problem

of the American balance of payments will have to be solved in the great majority of years in the same way in which it is being solved in 1947—by a universal restriction by all other countries of their purchases from the United States. But if this is so, the principle of non-discrimination merely becomes a device for doing the maximum harm to international trade.

*

Nothing that has been written in this article should be taken as an argument in favour of discrimination for its own sake. There is no desire here to glorify Schachtianism. What is asserted is that the sweeping and rigid dogma of non-discrimination à la Clayton would do, and is doing, far more harm than good to the cause it is intended to assist, the restoration of world trade. The International Trade Conference at Geneva would be occupying its time far more fruitfully if it were trying to define what sorts of "discrimination"—that is, mutually profitable bargains between pairs or groups of countries—could be accepted, not merely as temporary exceptions but as permanent devices for fostering the flow of international commerce. There is still time for the conference to make progress along these lines.

In any case, the attitude of the British Government should be clear. More vigorous protest against the doctrine of non-discrimination should have been made when the Loan Agreement was made in 1945. Every effort should be made to persuade the United States to release Britain from the obligation it then accepted, the ruinous nature of which is now clear to all. And it should be made clear that, when that obligation expires in 1951, Great Britain will be extremely unwilling to renew it.

A Question of Freedom

(By a Correspondent)

A FEW years ago, in one of the districts of Glasgow where people of Catholic and of Protestant Christian faith dwell in proximity with one another, a man was arrested in a street brawl and brought before a magistrate. In court the police produced a stocking filled with broken glass which had been taken from him. "And why were you in possession of this dreadful object?" sternly inquired the magistrate, and received the answer: "Please, your honour, it was a matter of religion."

We have moved so far since the age of the Wars of Religion that we now find a certain incongruity between the example of the Good Samaritan and the resolve to bash in one's neighbour's face with broken glass for the sake of a theology. But if the man had said it was a matter of politics, the story would have much less point. At all times in history there has been violence in contests for political power and the secularisation of dogmatic beliefs about the nature of the universe has not abolished, but only transformed, the *odium theologicum*; as G. K. Chesterton once wrote, in the old days men killed one another for the love of God, in our time they kill one another for the love of Man. Nevertheless, even in politics there is current in a part of the world the idea that all men have a right of free political opinion and criticism, which should be protected by the law against arbitrary official persecution or unofficial gangsterism, and that society is only in a healthy condition when its conflicts are peacefully resolved through public discussion, controversy and election to civil office. This belief and the institutions corresponding to it are now known as Western democracy.

The British Labour Party has never been much addicted to abstract theory and its leaders—except Mr Strachey—have been almost innocent of "scientific Socialism" as studied on the Continent. But, in the days before the electorate gave

them for the first time their absolute parliamentary majority, they were accustomed on occasion to show the party flag and challenge debate in the House of Commons on "the public ownership and democratic control of the means of production." This is what they meant and still mean by Socialism, and when they spoke of democratic control they really did mean democratic control. They believed—whether rightly or wrongly is a matter of opinion—that a system of production according to their formula was socially more desirable than the system of capitalist private enterprise; was more in the real interest of the majority of the electorate, and was better able to avoid the evils of slump, unemployment and international trade rivalry leading to war. But to their belief both parts of their formula were essential. It was not sufficient to have political democracy without social democracy, representative government without socialisation of the means of production; as long as the mass of wage-workers, the proletariat, had no share in productive property in modern industrial conditions, their merely political rights still left them economically disinherited. But without democratic control they had nothing to gain by public ownership. So much, indeed, was it assumed that the publicly owned property would be democratically controlled that it was little emphasised in debate.

As Mr Bertrand Russell has pointed out in one of his essays, nobody before 1917 supposed that Socialism, not even Marxist Socialism, was ultimately undemocratic in the ordinary sense of political democracy. Admittedly, some Socialists held that the victory of the working class over the bourgeoisie could only be brought about through violent insurrection and civil war. But even those who held this view, and argued that the defeated bourgeoisie would for a time have to be deprived of political rights, considered it axiomatic that freedom of speech, freedom

of party association and freedom of election would exist among the victorious workers themselves. They knew that the workers had a world to win and nothing to lose except their chains. But it never occurred to them that anyone but a born fool would imagine that the workers had won the world or lost their chains if the state owning the means of production were in the hands of a self-appointed, self-renewing irremovable corporation of ruling officials, who decided at their absolute discretion what use was to be made of the means of production, how much of the national income they would pay to themselves, and what wages and conditions of work they would allow to the great mass of state employees.

*

Since 1917, however, and particularly since about 1930, it is just that thesis which has been vehemently maintained by the sect called Communists—the faction of the old Russian Social Democratic Party who renamed themselves Communists thirty years ago and begat their like all over the world. The Communists do not, of course, admit that their system is undemocratic; on the contrary, they claim it to be the only true democracy. In the Soviet land, they say, there is no class conflict and therefore no social basis for more than one party; plurality of parties having been done away with, the people are virtually unanimous in support of their rulers. In the last Union general election 99.7 per cent. of the registered electorate voted and the Government list received 99.18 per cent. of the votes cast; *Pravda* proudly compared this to the British Labour Party's 11 million votes from an electorate of 33 million in 1945 or Roosevelt's 25 million from an electorate of 60 million in 1944. This solemn farce of "electing" candidates who may not be opposed and must be either nominated or endorsed by the sole legal party is formal homage paid to democracy by the Communists. But it is no more than that. In reality, all who are not members of the Party, the vast majority of Soviet citizens, are disfranchised, for they cannot criticise or change their rulers; their only right is to vote for them. Membership of the Party is a jealously guarded privilege, and its rank and file are perpetually under threat of expulsion; all real power is concentrated in a small clique of men who, whatever their behaviour, cannot in any way be called to account by those they govern. This is a system quite unlike the old idea of Socialism, which was supposed to give the people some control of what they were legally to own.

People who believe in the socialisation of the means of production are today divided between Communists on the one hand, and Socialists, Social Democrats and "Labourites" on the other. But, although the lines of division have been fairly sharply drawn in controversy among the Marxologists, there is still a remarkable confusion in the public mind about the whole issue. According to Professor Hayek, who so much influenced Mr Churchill's Central European electioneering in 1945, there is no real difference between various brands of economic collectivism; the grey mare is trotting down the Road to Serfdom with Clem Attlee, Hugh Dalton, Ernie Bevin, Herbert Morrison, Bill Rust, Old Uncle Joe Stalin and all. There are plenty of people who are convinced that Bolshevism already reigns in Downing Street; were it not for the too notorious failure of Mr Bevin and Mr Molotov to agree about anything at all in the international field, this opinion would, indeed, be almost universal outside the ranks of the Labour Party. Across the Atlantic the existence of this belief is a factor of great political importance. We are told that many business tycoons and Congressmen think that Socialism and Communism are really one and the same thing, and that it is no good aiding Europe, Eastern or Western, because the whole continent is going red anyway.

Curiously enough, this opinion, coming out of the camp of the ruggedest American individualism, exactly corresponds to

what the Communists are saying with incessant loquacity from their end of Europe. According to them—and their propaganda only amplifies what Generalissimo Stalin said in the audience he gave to Commander Stassen—there is only one great issue by which mankind is divided: the issue between "Socialism"—state ownership of the means of production—and capitalism. The Soviet Union has completed the Socialist revolution; let others admire and copy. The *bourgeois*, the reactionaries, the imperialists and the fascist beasts cannot, of course, be expected to; but for those who profess and call themselves Socialists, the choice is clear: either to fall in as humble camp-followers behind the party of Lenin and Stalin or to break working-class unity and range themselves on the other side of the barricades.

But the Western Socialists, apart from the sub-sect known in this country as the Zilly Zanies, do not admit either that the question of political democracy is unimportant or that the Communist regime in Russia has any of the characteristics of a political democracy except in the sense in which Mr Bevin can be said to have a slender figure—namely, that that is the way it started many years ago. Socialists claim to be democratic in two stages of intention: first, in that they aim at coming to power and carrying out their programme by means of fairly won parliamentary majorities; and second, in that, for the future Socialist society itself, they consider conditions of political freedom to be essential. The second part of the doctrine is even more important than the first; it means the contrary of Communism, not only as regards the means to be employed in attaining the social aim but also as regards the nature of the society which is desired.

*

The position of the Western Socialists is now very difficult. They are caught between two fires; under the stress of conflict with *bourgeois* parties they are driven towards alliance with Communism, and in recoil from Communism they find themselves in the camp of capitalism; they are threatened with rebellions and splits in their party organisations, between those who put Socialism before liberty and those who put liberty before Socialism. But in their great majority they may be expected to remain adherents of Western democracy on two conditions—that their *bourgeois* adversaries in each country play the democratic political game according to the rules and that American economic power is not used to thwart constitutionally adopted Socialist policies in Western Europe. Both these conditions need to be mentioned and especially the second. The vital point about democracy is that it is not in itself a specific social or economic programme, but the freedom of the people to choose between programmes.

For that vital principle the Communists substitute the doctrine that government for the people shall be carried on, at the Party's discretion, in spite of the people and never by the people. Those Socialists who still, in the last analysis, find it easier to forgive Communists for being totalitarians than to forgive liberals for being *bourgeois* must therefore ask themselves whether they are not destroying the very root of the faith which they have inherited, the faith in the capacity of ordinary men and women to live better and fuller lives once the security and privileges of the middle-class have been extended to them by freely elected governments. They must look at the development of Soviet institutions and ask themselves whether there is the slightest possibility of the Russian people attaining the freedom of choice which is the essence of democracy. Any refusal to conduct this self-examination, any tendency to toy with totalitarian alliances would weaken social democracy all over Europe, and convince the average American that there is little to choose between Socialists and Communists when it comes to a trial of strength.

NOTES OF THE WEEK

Paris Begins Planning

Most of the sixteen governments represented at the Paris economic conference have now answered the questionnaires about their resources and needs sent to them last month. The figures and facts submitted have now to be assembled into some kind of pattern, within the lines of which western Europe's reply to the Marshall offer will be drafted. It is at this stage that negotiation becomes really difficult, and there is little point in concealing the fact that divisions have already appeared within the main committee and in the wings of the conference. Circumstances are placing the British delegation in the role of the referee, and it is unfortunate that their hands should appear so weak just at the moment when firmness as well as wisdom is needed.

The chief difficulty before the delegates is the lack of any authentic forecast of what Washington would like to see in the plan submitted from Paris. Everyone realises that the Americans could—if they wished—dictate informally the main lines of the plan; and if the Americans would in fact dictate them some of the disagreements now smouldering could be quickly stamped out. For example, the Benelux group—who hold their heads very high in the throng of distressed Europeans—dislike and distrust the Monnet Plan to which the French cling with something like desperation. They maintain that the plan is beyond French means and that Europe should not be asked to foot the bill for it. The attitude of the Belgians, Dutch and Luxemburgers has its roots in their disagreement with the French over the future of German industry: to the Dutch at any rate, quick industrial recovery in western Germany, with Rotterdam coming into its own, and the Ruhr buying their farm produce, is a matter of life and death. By all three any attempt to build up the French steel industry at the expense of the German would be resisted to breaking point. Try as they may to keep the question of Germany out of their discussions and leave it to the four Foreign Ministers three months hence, it crops up again and again.

The Low Countries proposal, now being studied, for making the currencies of the sixteen nations freely transferable and convertible into dollars, is discussed on page 254 of this issue. But the motives behind it are clear: it is intended to impress the Americans and to force governments to put their currencies in order. France and Italy, for example, would have to "work their passage" into such a scheme by deflationary measures involving devaluation of the franc and the lira.

The French reply to Benelux seems to be threefold: that devaluation of the franc would be beneficial only after American aid had started flowing into Europe; that convertibility would be possible only after next spring; and that planning must look farther ahead than the eighteen months advocated by Benelux.

It is already obvious that during the discussions of the next few weeks delegations will have to accustom themselves to mutual criticism and to exchanges of proposals which will sound very much like projects for interference in one another's affairs. That trend is visible in the programmes of work which have just been passed to the expert sub-committees by the central co-ordinating committee: they include studies of proposals for developing hydro-electric power and organising and equipping a west European grid; for increasing the production of vegetable fats from colonial possessions; for using to the utmost existing steel-producing plants; for increasing tractor production; for allocating more coal to the production of fertilisers; for joint use of oil-refining capacity in Europe. There is every reason to believe that this is the kind of project of which Mr Marshall wishes to hear more.

Party Politics and German Needs

The record of the House of Commons in debating Germany has not been high, and, unfortunately, apart from one or two able speeches, the general standard of last Monday's debate was as low as usual. No doubt it is the duty of His Majesty's Opposition to oppose, but the opposition is not likely to be effective if it grotesquely distorts the problems under discussion in order to make party capital out of them. For what were the main points in the Conservative indictment of the Government's record on Germany but party capital? When Mr Law says

The Government are pursuing in Germany exactly the same policy that they are pursuing here. They are pursuing a policy of control

and restriction and are getting themselves bogged down by the same rigid insistence on party dogma. The same sort of thing is happening here as is happening in Germany.

he must lay himself open to doubts as to his intelligence or his intellectual honesty. He or Mr Macmillan or Mr Spearman must surely see that the root problem in Germany is not the present Government's administrative record, but the decisions taken at Yalta and Potsdam. At Yalta the division of Germany was agreed, and the removal to Germany of 11 million propertyless Germans. Then at Potsdam rump Germany was condemned to near-pastoralisation, and the British attempt to secure an annual steel figure of 11 million tons with proportionate industry was, as Mr Bevin pertinently reminded the House, defeated. Under these conditions, even if the French and later the Russians had consented to work Germany as an economic unit, its economy would not have been viable, its exports would have been insufficient to pay for its imports, and it would have faced the alternative of Allied subvention or starvation.

The isolation of the zones has aggravated all these problems. The American Zone, run on lines of relative free enterprise, suffers from them. Both zones, since a much relaxed system of controls was introduced in January, have grown worse, not better. The basic difficulty is not control, for if you decide to reduce a nation's economy below starvation point, how can you police that unnatural reduction without control? A member with half an eye for the truth could surely realise so elementary a point. The basic difficulty is shortage, and, as Mr Edelman pointed out in a speech of exemplary brevity and intelligence, the only way to remedy shortage, above all the basic shortage of food, is by dollar expenditure.

With so many Aunt Sallies set up to bowl over, Mr Bevin had little difficulty in allotting historical responsibility for the German tragedy and in reminding the House that only new American spending or an extra drain on Britain's dollar reserves—which he would not agree to—could stimulate genuine recovery.

Shaef, Civilian or Military?

The irrelevance of the Conservative attack was all the more unfortunate in that there are a number of fields in which an improvement in Government policy could be obtained without more outlay and dollar expenditure. For instance, Mr Edelman made an admirable point in stressing the need to simplify and drastically reduce the cumbrous machinery of the Control Commission. As he said

it is a machine which has too many drivers and too many brakes, but unfortunately no accelerator.

and his proposal that all but the highest level of Allied control should be removed deserved Mr Bevin's attention but did not receive it.

Nor is it simply a question of reducing the British element. Logically, the fused Zones need a fused administration and if the French Zone is to be coaxed in, the need for a genuinely unified Allied staff becomes all the greater. This point, at least, was unfortunately stressed the fact that a new "Shaef," a headquarters of British and American and French, working as a single team under a single head (Mr Macmillan suggested General Eisenhower) would be civilian, not military, and would be a method not of increasing military control but of gradually replacing it by a civilian administration. Since this point was not made clear, Mr Bevin was able to dismiss the proposal very unfairly as "the most muddled thinking he ever heard," and to denounce it as an attempt to perpetuate military dictatorship. It is to be hoped that Mr Bevin's second thoughts will bring him to think more kindly and constructively of the only satisfactory proposal yet made for creating a workable administration for the three Western Zones.

Winding Up The Session

Although, because of "the state of the nation," the prorogation of Parliament is not to take place until October 20th, the business of the session was due to have been completed by the end of this week, when Parliament was to have adjourned for the summer recess. As it is, both Houses will have to sit for a few

days next week in order to pass the Government's last-minute measure—the Supplies and Services (Transitional Powers) Bill, 1947. But to get through the rest of the business has put phenomenal pressure on Parliament in the last week or two. A few important measures, such as the Industrial Organisation Bill, received the Royal Assent only towards the end of last week. And the two major measures of the session—the Transport Bill and the Town and Country Planning Bill—were still being shunted between Lords and Commons this week. Last Friday, the Commons rejected the Lords' amendments to the Town and Country Planning Bill—those amendments, that is, which had been carried against the Government's wishes. On Tuesday, after an all-night argument, they rejected the Lords' substitutes for those of their amendments to the Transport Bill that the Commons had already rejected. On both these measures the Lords have made no further show of fight, and together with the Agriculture Bill, the Companies Bill and some minor measures they have received the Royal Assent this week.

In the middle of this last-minute legislative rush both Houses have given up two days to what, in subject at least, should have been the most important debate of the session. The state of the nation is indeed a sombre topic with which to bring this session of Parliament to an end. Ministers can hardly in the circumstances enjoy the much-needed rest which it was intended they should have through the early completion of the business of the session. And they might well reflect that a little more attention to the everyday needs of the nation would have been as much a mark of good government as is their eagerness to cram as many big and undigested measures as possible into a parliamentary session.

The New Bill

On the face of it, it is difficult to understand why the Government should have brought in the new Supplies and Services (Transitional Powers) Bill. From the manner of its announcement and the fact that Parliament has been asked to sit longer in order to pass it, the impression was given that vast new emergency powers were being taken to meet the present economic situation. If that had been the case, serious exception ought to have been taken to the Bill, for no Government, not even a Government which has such a passion for enabling legislation as the present one, should think that it has the right to assume wide war-time powers every time there is an economic crisis. The only occasion in which such powers can be justified is a time of external danger. They ought never to be adopted for an ordinary administrative crisis, which should be met by normal peace-time methods.

In fact, however, the new Bill gives no new powers at all. The Act of 1945 with the same title allows the Government to use certain defence regulations made under the war-time Emergency Powers Acts for four specified purposes, which may be summed up as the transition from war to peace. The defence regulations in question are, for the most part, those imposing economic and financial controls and the control of labour. But, it should be emphasised, the Act conferred no power to make new defence regulations, only to use existing ones, and to revoke or vary them, for peace-time purposes in the transitional period. Similarly, the new Bill allows no new defence regulations to be made. It merely specifies further purposes during the transitional period for which the defence regulations already authorised under the 1945 Act can be used. These purposes, in brief, are (a) promoting the productivity of industry, commerce and agriculture; (b) fostering and directing exports and reducing imports and (c) ensuring that the balance of trade; and (c) ensuring that the whole resources of the community are available for use and are used in a manner best calculated to serve the interests of the community. It might have been thought that these purposes were covered by the wording of the 1945 Act, which referred to the readjustment of industry and commerce in time of peace and to the relief of suffering and the restoration and distribution of essential supplies and services. But, presumably in the unlikely event of the Government's use of its existing powers in the present crisis being called in question in the courts, the purposes for which it can use them are now to be widened.

Egypt's Case Before Uno

The more one studies the case against Britain which Egypt, with Nokrashy Pasha as its spokesman, has laid before the Security Council, the more remarkable it seems that the Egyptians should expect to gain either satisfaction or credit from this appeal

to world opinion. From the narrowly legal standpoint they have no case at all. It clearly cannot have been the intention of the framers of the United Nations to make the Security Council into a species of tribunal before which alliances solemnly, publicly and unconstrainedly undertaken can be unilaterally denounced and attacked as "threats to peace." No Egyptian Government surely wishes to subscribe to the Hitlerian interpretation of treaties that they exist as long as they are convenient, and not a day longer. But if the Egyptians do accept the validity of treaties, then unquestionably the two "violations" of their rights of which they complain—the presence of British troops in Egypt and the continuance of a British administration in the Sudan—are covered by the Anglo-Egyptian Treaty of 1936 which remains in force for another ten years.

Yet the fact that Britain's legal position is perfectly unassailable does not necessarily mean that its moral position is equally so. The aims and methods which brought Britain to Egypt over sixty years ago were frankly imperialistic. May not the mere fact that the British are today still in Egypt and the Sudan confirm Nokrashy Pasha's accusation that they "simply want to make sure that Egypt is subordinated to their imperial aims"?

The Egyptians would be on strong ground here, had there been no negotiations between Britain and Egypt last year for the re-drafting of the Treaty. The British took the initiative in suggesting a complete reconsideration of Anglo-Egyptian relations precisely because they wished to remove all taint of imperialism. During the course of the negotiations, half the Egyptian case against Britain—the presence of British troops in Egypt—was satisfactorily settled and agreement was reached on the method and tempo of the British withdrawal. The breakdown occurred over the absolute Egyptian refusal to concede full rights of self-determination to the Sudanese. The British were not prepared to compromise on this point, especially since the Sudan has in recent years been making significant progress towards full self-government (only this week, the creation has been announced of a legislative assembly with an elected majority for the whole Sudan, from which a number of Sudanese will be drawn to serve on the central Executive). In a word, the Egyptians are asking the Security Council of the United Nations either to sanction a unilateral denunciation of a solemn treaty or to deny to a large national and historical community the right eventually to decide its own future. Neither request is likely to confer much credit on the petitioning Government.

Poaching by the Security Council

The action of the Security Council on the fighting in Indonesia has been rapid and superficially successful. Holland is not a Great Power, and has no veto right; unless, therefore, the Dutch can induce a Great Power to use the veto on their behalf, they are liable to be ordered about by the Council. France, which six months ago took action in Indo-China similar to that which the Dutch have now taken in Indonesia, was not challenged in the United Nations because of it, but the Dutch move quickly brought formal complaints to the Council from India and Australia, and Mr Gromyko, not unexpectedly, emerged as a zealous guardian of the Council's jurisdiction.

The only difficulty was that the Council under the Charter did not appear to have jurisdiction. Acts of aggression under the Charter can only be committed against States which are internationally recognised and have juridical existence; action against rebels cannot be considered aggression, and as long as the Netherlands is recognised as retaining sovereignty in Indonesia, its military operations there cannot be a matter for formal Security Council intervention, however much they may be criticised. This argument may seem mere legal quibbling; on the other hand, once the United Nations transgresses its own Charter and starts intervening in what are technically insurrections, there does not seem to be any logical end to the process. The position of Australia in this matter is somewhat surprising. However generous may be Australian enthusiasm for Asiatic colonial emancipation and however genuine Australian interest in peaceful conditions to the north-west of the continent, there is as yet no evidence that Australia is willing to open its doors to Asiatic immigration; this question will soon appear on the agenda if the clauses of the Charter intended to safeguard the internal jurisdiction of sovereign States are progressively weakened.

The Council, however, in its concern to restore peace, took the view that it had a right to take cognisance of warfare in Indonesia and summon both sides to cease fire, but without calling on the Dutch to return to their original positions. Britain and

France, holding to the view that the Council had no jurisdiction, abstained from voting. The Dutch meanwhile had accepted an American offer of mediation, and the Council was glad to leave the matter in American hands in spite of Mr Gromyko's objection that by so doing the Council "voluntarily puts itself aside." The Dutch were quite willing to agree to a cessation of hostilities because they had already attained their principal objectives in Java and Sumatra—control of the principal remaining ports and key rice-growing areas—and were not at all anxious to proceed to total occupation of the Republican areas. The weakness of Republican resistance has indeed been a surprise to the Dutch, who were afraid that foreign intervention might come before they had gained any satisfactory military result. As things are, the Dutch have got what they wanted strategically, the Security Council has asserted its authority—even if unconstitutionally—and American diplomacy, with the inducement of American credits as a powerful lever for obtaining agreement, has the task of clearing up the mess.

* * *

In Berlin to Stay

Berliners were doubtless relieved to hear on Tuesday that the British have no intention of leaving the city. The Deputy Director of Military Government in the British sector said that his troops would stay "as long as there are Americans, French and Russians in the city." The rumours to the contrary that had been going round may have been inspired by suggestions made in this country that Britain could no longer afford occupation. There would be no lack of persons in Berlin to enlarge on such suggestions, as the effort to bring the former capital under the exclusive control of the Communist-dominated Socialist Unity Party still goes on.

Since the Social Democrats won a decisive victory in the October elections the struggle for political supremacy has gone more and more in favour of the Communists, with the Allied Kommandatura looking on more or less helplessly. Nine months after this clear choice by the Berlin population the city still has no chief burgomaster, is divided by zonal barriers as drastically as the rest of Germany, and lacks any unified administration. The leading positions in the trade unions are held by members of the Socialist Unity Party and key posts in the police are held by Communists or Communist-trained ex-officers of the *Wehrmacht*. The police president, Major Markgraf, was a member of the Moscow Free German Committee. Dr Reuter, the man who was chosen as chief burgomaster by the Social Democrats, has not yet taken office, because the Russians in the Allied Kommandatura refuse to accept his credentials. The fact that he left the Communist Party in 1921, because he objected to its *Putsch* tactics, and rejoined the Socialists is something they will neither forget nor forgive.

If it were the assumption of British and American policy that there is to be no unification of Germany and that Berlin is unlikely in the immediate future again to become the German capital, then this travesty of democratic methods would be of little practical importance. Attention could be concentrated on developing Frankfurt as the capital of western Germany, leaving Berlin to fill the same role for the east. But Mr Bevin—with one eye on M. Bidault—is still hoping that a November meeting of the Foreign Ministers will bring results. And that hope involves the further assumption that Berlin may one day be the seat of the central administration which the Foreign Ministers agree should be established. It is most important that such an administration—if it is ever formed—should not begin its work in circumstances which would allow its members to be exposed to the intimidation and political blackmail which are now rife in the city. And the first step towards changing those circumstances is to insist that Dr Reuter should take the office to which he has been elected.

* * *

Mark of the Beast

As the crowds form and the stones fly and the synagogue windows shiver and fall, these groups of British citizens take—perhaps unknowingly—the first step down the long road at the end of which burn the funeral fires of Maidenek. It is true that the weekend's demonstrations against the Jews are a horrible consequence of a horrible act—the murder of the two British sergeants—but there is no point in talking about the terrorists' provocation. No provocation has been offered by Jewish shopkeepers in Glasgow, and the blood of two innocent British sergeants is not assuaged by beating up an equally innocent

synagogue watchman in Liverpool. These racial reprisals are only less vile than the acts against which they are made in protest, and it is to be hoped that every severity of the law and all possible vigilance on the part of the police will be engaged in combating the cruelty, hysteria and criminal irresponsibility of these outbreaks. If it is proved that organised incitement has taken place, the *agents provocateurs* should be treated with especial severity.

In fairness to the general tolerance and good sense of the British people, it may be said that the worst occurrences have taken place in towns which have a bad record for racial intolerance. The division between Orangeman and Catholic in Liverpool and Glasgow has often led in the past to bloody brawls in the streets and wherever a habit of violence has been acquired, hooliganism breaks out more easily on any issue. It is also true that years of shortage have created a large class of thieves and "spivs" who, according to police reports, have joined the rioters to do their own private work of looting. But the fact that violence and illegality inevitably breed more violence only reinforces the need to use every means to counter the spread of anti-Semitic demonstrations. They play their part in creating the habit of violence and if there is one thing more than another that stamps this country as a decent and civilised place, it is the tiny part that violence normally plays in the ordinary business of the community.

The Severn Bridge

It was announced at the end of last week that the Minister of Transport has authorised the construction of the Severn Bridge and the roads approaching it. This decision is based on the report of the public inquiry held at Bristol last autumn, and it marks the end of a long controversy. Opposition to the scheme in the past came chiefly from railway and shipping companies; the improvement in communications between South Wales and the South of England that will result from it needs no stressing, though it is worth pointing out that the bridge is a natural corollary to the industrial development plans for South Wales.

But why now? Amid all the detailed information given about the bridge—the length of its spans (it will be the largest suspension bridge in Europe and the third largest in the world), the size of the piers and anchorages and so on—there can be found not one word of justification for authorising its construction at the present time. Work would probably have begun on it before the war had it not then been decided that it would compete in labour and materials with work on rearmament. Will it not compete with similarly essential projects in the next few years? It may be that all claims on the Government's investment programme have been properly weighed, and that this one, costing in all £9 million, has been allotted a place after due forethought. All that can be said is that there is not the slightest sign that this has been done—Mr Attlee's denial on Wednesday that any work other than soundings and borings would be put in hand at present merely makes the whole matter more confusing, for it is complete conflict with the Ministry of Transport's announcement, which said that work on the breakwater would begin in the autumn and that it was hoped to start construction on the bridge in the spring. It is

probable, in fact, that Mr Barnes has struck out for the Severn Bridge by way of compensation for the curtailment, or rather postponement, of his Department's ten-year plan for roads announced in May, 1946. But, whether there was departmental pressure or not, until a full justification has been given, one can only assume that here is yet another example of how the Government continues to allow claims on the country's resources to pile up without attempting to calculate how they are all to be met.

* * *

Mass Education

The purpose of the Education Act of 1944, as was pointed out in last week's debate, was to enable every child in the country to have the kind of education which fits it best. How far has this purpose been achieved in the short time since the Act has been in force? A great many statistics were given in the course of the debate to show that both Ministry and local education authorities have worked hard to give it a good start. Nearly all the local education authorities have submitted their development plans, which are being actively considered by the Ministry. The physical arrangements necessary for the raising of the school-leaving age—that is, the provision of huts, furniture and equipment—are being carried out smoothly. The annual output of teachers from the emergency training colleges is 11,600 and from the colleges providing normal training courses 10,500. Progress has been made in providing special schools for handicapped children.

Yet no amount of statistics can dispel the impression that all is not well with education. It is not merely that schools black-listed in 1925 are still in use, or that there are still nearly 2,000 classes with over 50 children and nearly 3,000 with over 40. Nor, again, is it the coming crisis in primary education where, owing to the comparative shortage of women recruits to the teaching profession, the infants' classes are gravely short of teachers. All these deficiencies, serious as they are at the moment, need not be permanent. What is much worse is that the fervour which lay behind the Butler Act seems to have disappeared. Instead of creating a single system of education, providing for all needs, to which rich children and poor children alike would go, the Act seems only to have intensified the gulf between the independent schools and the State schools. Moreover, the link which formerly existed between them in the direct grant schools, which include many of the old grammar schools, is disappearing, for they are tending, even when they have retained their grant, to be identified with the independent schools. As for the maintained and aided grammar schools, Ministerial protestations notwithstanding, their status is declining.

It is difficult to allocate the blame for all this. It cannot be ascribed solely to the Act itself, for it merely set up machinery, and its failures are the failures of the men who work it. Nor is it necessarily the fault of the Government, though its emphasis on "the masses" does not help to heal the breach. The fact remains that, two years after the Labour Government was returned, the country's educational system is still divided into two parts, and, what is worse, any wish to abolish the division seems to have disappeared. And there is no doubt which part still gives the better education.

* * *

Consolidation in Eastern Europe

How much of the talk, current today in both Eastern and Western Europe, on the unification of the eastern countries under Russian leadership is based on fact? Undoubtedly the trend is in that direction, but it would be foolish to exaggerate the speed with which economic unity is likely to be developed or to underestimate the obstacles which stand in the way. The fact is that the economies of the various countries are not yet fully complementary. Russia has no large export surplus of industrial goods or of capital. Poland and Czechoslovakia barely satisfy their own needs of industrial reconstruction and expansion. They, too, have little or no surplus for stimulating industrial construction in the under-industrialised Balkan communities. Equally, drought and dislocation have for the time being drastically reduced the agricultural surpluses of such old centres of agricultural export as Poland, Hungary and Rumania. For instance, the Poles estimate that they will need at least 400,000 tons of grain in the coming year, and have received two disturbing setbacks in the last weeks—the first, the American decision to send them no post-Unrra relief, the second, the absence of Soviet grain deliveries in the new Polish-Soviet trade pact. There is, in fact, no natural balance at present between nations with an industrial surplus and those with agricultural exports. Needs and supplies do not overlap. It is understandable that the desire is strong in Eastern Europe

to keep trade lines open to the western world which continues to produce the great grain surpluses and which is also the only immediate source of industrial capital.

Nevertheless, most of the recent moves taken in Eastern Europe tend in the direction of economic unity. The Poles and the Czechs are elaborating plans for the co-ordination of their old and newly-acquired industrial areas. In the Balkans, matters have gone even further. For some time past, Albania has been in a virtual customs union with Yugoslavia. Last week Bulgaria moved in the same direction. An agreement, signed in Belgrade, provides for a fixed rate of exchange between the two countries, a customs union and joint plans in mining, transport, the extension of road and railway links, foreign trade, agriculture and electrification. This pact follows by a few weeks an agreement between Bulgaria and Rumania extending their economic ties, linking their hydro-electric schemes and improving their communications by such methods as the building of a bridge over the Danube. Both M. Dimitrov, the Communist Prime Minister of Bulgaria, and Marshal Tito have said repeatedly in public that their aim is a Balkans Union and its extension to a Danubian Union, including the Hungarians, the Czechs and even the Poles. "These economic and cultural conventions are only a beginning," said M. Dimitrov to the visiting Czech delegation in June. "We must have something bigger, serious, positive and lasting."

There would be every reason to welcome these signs of international pacification and economic unity in what has been the most turbulent corner of Europe, were it not for the co-operating nations' bellicose and threatening attitude towards Greece. At a time when Russia has vetoed the Security Council's eminently sensible proposal of a border commission to oversee the Greek frontier the Yugoslavs and the Bulgarians have agreed to concert their policy in face of the "frequent frontier provocation" of which they accuse Greece. This is playing with fire, and the sooner the Balkan nations are made to realise that a Greek frontier town such as Florina is no more remote from world politics than was Sarajevo, the better for the Balkans and for world peace.

* * *

Facts About Childbearing

For the first time since demobilisation began to produce its full effect upon the birth rate, the quarterly returns of the Registrar General show a decline: from 22.8 in the March quarter to 22.0 in April-June. Does this drop mark the end of that extraordinary boom in births which, ever since 1939, has confounded the prophets? If a period of economic difficulty is in fact going to coincide with the exhaustion of the first impetus given to natality by the high marriage rate of the last few years—a marriage rate which is itself the result of full employment and which, insofar as it implies younger marriages, has already borrowed from the future—a very sharp fall indeed may be coming. Unless there is to reopen before Great Britain the prospect of a precipitate decline in numbers, together with such a preponderance of pensioners as has never before been known, it may be necessary to take drastic and imaginative measures to make parenthood less unattractive.

The first issue of "Population Studies," the quarterly journal* of the Population Investigation Committee, contains the report of an inquiry into the circumstances of childbirth in Britain; a report full of significant information on some of the deterrents to parenthood. In the long run, of course, "it's not the capital cost, it's the running expenses," which count, but the capital cost, both financial and subjective, is in all conscience high enough, and presses with far more than proportionate weight on the poorer mothers. The report, based on interviews by health visitors with a wide sample of mothers, shows surprisingly that the cost of layette, maternity clothes, pram and so on is more of a burden than that of medical care, and one which moreover there is little possibility of reducing; the variations in reported average expenditure from the lowest to the highest income groups are extraordinarily small. Fuller midwifery and hospital services are obviously needed, but an adequate home help service scarcely less so; it is no use providing a hospital bed for a woman who cannot use it because she dare not leave her family without supervision; and the best of obstetrical attention is considerably stultified when the patient has to get up and cook two days after confinement. Relief from pain is available to—or at all events used by—only a minority of working class mothers; how far from necessity, how far from choice, is not explained, and the proportions would be interesting, but it is obvious that here, too, is field for improvement.

* Cambridge University Press; 30s. per annual volume, 10s. per number.

No financial or other privileges for parenthood, no multiplication of gas-and-air machines or subsidised prams, will save from decline a community which has ceased to value life. But that such vital impulses as do exist should be discouraged as heavily as they are now is surely unnecessary. Other things may have just now a higher priority than the social services. But within the social services there can scarcely be a higher priority than the relief of motherhood.

* * *

Conservatives in the Garden

The paradoxes of semi-planning as shown in the management of Britain's horticulture make a tempting target for Opposition arrows. The miraculous disappearance of soft fruit from shops and barrows the day after the imposition of price control is an annual source of fury to the thrifty housewife with a taste for real, as against "full fruit standard" jam; while neither the spectacle of cauliflowers priced at 1d. each to the grower and 8d. each to the consumer nor the pea-and-thimble vanishing tricks of the humble potato give the public an impression of efficiency and equity. On the positive side the opportunities for horticulture in a country with a dense population, fertile soil, and a large unsatisfied appetite, ought to be tremendous.

Altogether, there is plenty of scope for a new "policy for British horticulture"; the Conservative MPs who have just issued a pamphlet under that title had an opportunity to do a real public service as well as to make party capital. The latter chance they have most creditably forgone; but they certainly have not grasped the former. There are sound but unoriginal suggestions for the encouragement of district growers' co-operatives, of quick-freezing, canning and bottling; pious hopes for a better supply of equipment and of packing materials; a plea for a return to proper grading; a demand for the lifting of the Maximum Price Order from fruits; and a reasonable, though more controversial, argument for a return to the pre-war balance between "speciality" and staple crops. There is no hint that the chaotic inefficiency of Covent Garden might be due for reform, nor of any other means by which the gap between the growers' and retailers' prices might be reduced; that gap is, indeed, not even mentioned. The core of the Conservatives' "new policy" is anything but new, being simply more and better restriction on imports. The sinister foreigner must not have freedom to supply this northern island with the products of his unfairly earlier spring. The luxury market "must not be regarded as the foreigners' monopoly"—possibly there would be less objection to Italian peaches if Italy were somewhere near the Orkneys and had to compete fairly, under glass.

In its small way, in fact, this pamphlet casts a disconcerting light on the Conservative mentality. It is a reminder of a past which Conservatives with an eye on the floating, and particularly the Liberal, vote, would rather forget. Mr. Peter Thorneycroft really ought to have a talk with the authors of "Policy for British Horticulture."

* * *

The Farmer's Share

The Department of Economics of Bristol University has recently published the results of an extremely interesting survey of war-time changes on a sample of a hundred South-Western farms.* From an economic point of view, the most striking tables are those illustrating the shift in the distribution of farm income and the rise in output per head. Farm incomes (Table I) have undergone a double change—a vast increase in the early

years of the war in the share going to farmers, at the expense of both landlords and farm workers, followed by a rapid increase in the share going to labour and an absolute as well as relative decrease in the farmer's slice. The net result is to leave the farm worker's relative share very much where it was in 1938-39, while the farmer has gained heavily at the expense of the landlord. Farmers' managerial surplus rose from an average of -£43 in 1938-39 to £1,313 in 1941-42 and £782 in 1944-45. Even the latter figure is reasonably above the poverty line; though, as the report points out, both the size of the farms and the ability of the farmers in this sample are above the average.

The calculation of the change in net output (Table II) is based on an estimate of the total manpower employed, including the labour of farmers and their unpaid relatives. It is therefore a little rough and ready, though still illuminating as an example of what can be done by improved technique and heavy capital investment. The average of the years from 1942 to 1945, which shows an increase of about 21 per cent in net output per head over 1938-39, squares roughly with the estimate of 20-27 per cent which the Ministry of Agriculture appears to have used in its White Paper on the *Post-War Contribution of British Agriculture to the Saving of Foreign Exchange*.

TABLE I.—SHARES IN THE NET INCOME OF 100 FARMS, 1938-45:
PER CENT. OF TOTAL

	1938-39	1941-42	1944-45
Rent and rates.....	32	15	15
Wages.....	49	31	47
Farmers' income:			
Value of own labour.....	9	5	5
Interest on capital (at 5%).....	13	6	8
Managerial income.....	(-3)	43	25
Average net output per farm.....£	1,202	3,031	3,149

TABLE II.—NET OUTPUT PER WORKER PER ANNUM:
INCLUDING FARMERS AND RELATIVES

	Workers Employed*	Net Output (Corrected for Price Changes)	Net Output per Worker
1938-39.....	100	100	100
1941-42.....	112	142	127
1942-43.....	119	154	129
1943-44.....	121	149	123
1944-45.....	123	127	111

* In terms of the equivalent number of regular adult male workers. The apparent increase after 1942 is probably slightly exaggerated.

Shorter Notes

The Lord Chancellor's statement last week that a separate branch of the Parliamentary Counsel Office to consolidate and codify the Statute Book which is now in "a chaotic state," will be universally welcomed, by the ordinary citizen for whom at present the law is complex and uncertain no less than by members of the legal profession. Next session, the Lord Chancellor said, several consolidating Bills will be introduced dealing with a variety of subjects, but it will take ten to fifteen years before the Statute Book can be reduced to a satisfactory condition.

*

In his detailed account of British dollar expenditure in the first six months of this year, Mr Attlee revealed the fact that the British have spent £29 million in dollars for purchases for Germany. Even if expenditure continued only at the present rate, nearly \$240 million would have been spent on Germany by December. But every evidence suggests that expenditure will increase. Nothing underlines more strongly the need for a new Anglo-American understanding in financing the Zones.

*

The long, involved and at times almost farcical debates in the Italian Chamber on the ratification of the Peace Treaty have at last ended in a decision to go forward with ratification. Russian ratification will presumably follow, and the stage will then be set for the last stage in Italy's international rehabilitation—its admission to the United Nations. An interesting query is whether in that case it will be found to rank as a Great Power.

* C. V. Dawe: "Wartime Farming. One Hundred Farms."

Letters to the Editor

Chocolate Circus

SIR,—As an example of what Government controls do to a competitive industry the recent history of the chocolate and sugar confectionery industry may be of interest to readers of *The Economist*.

Before the war the industry comprised 190 firms (known as the Target firms) who manufactured over 100 tons per annum, another 400 or so who manufactured down to 26 tons per annum, and many hundreds of smaller ones. The 190 and the 400 were required by the Control Order of 1940 to obtain a licence to manufacture. The industry was highly competitive; its standard of efficiency was set by its most efficient unit. There was no overall plan; the manufacturers individually bought cocoa, sugar, milk, nuts and other raw materials where and when they could, either abroad or at home, and at the best prices which they could agree with their suppliers. They manufactured their products in factories large and small in the most economical way they could devise. They employed in all some 93,000 workers. The ability of each individual unit to sell and make a profit was conditioned by the quality of its goods, the price at which they could be offered to the public, and the efficiency of its production, marketing and sales organisations. In consequence, production increased from about 4½ oz. per head of the population per week in 1924 to 7 oz. in 1939, with a drop in average prices during the same period from 5½d. to 3d. per 4 lb.

The war introduced a completely different system, which has now gone on for eight years and as yet shows no sign of sudden departure. Its essential feature is that the industry is governed in all vital factors by the Ministry of Food, which regulates the total output and also (by the system of raw material allocations) that of the individual firms, buys the main raw materials and allocates them to manufacturers, fixes the maximum prices of the final products, and determines the method of distribution to the consumer. The main reason for the introduction of the control system was, of course, the wartime shortage of raw materials, which continues. The shortages are expressed through the system of controls in the form of a 4 oz. ration, and they have resulted in a contraction of the labour force to 54,000. The prices of the goods are controlled by Government Order, and, if the consumer has 9d. to spare after he has bought his new clothes, had a holiday, paid his income tax and cigarette tax, and suffered the many other impositions of the sellers' market, the coupon in the ration book will secure him his 4 oz. The system largely limits consumer preference, for, if the excellence of one firm's lines creates a demand for them, that demand cannot be met because of the system of allocations of raw materials. The system also prevents the entry of any new firm into the industry, for no one, unless he was manufacturing in 1940, can now manufacture without a licence, and, in the present condition of surplus capacity, no such licence is likely to be granted.

The industry in pre-war days may be likened to a large race-course with 190 horses going round in an endless marathon. They now go more slowly than they did eight years ago; in fact, they are not racing at all. They go round and round to the orders of the ringmaster, neither gaining nor losing but keeping the same order and precisely the same distance from each other as they did in 1939. The racecourse has become a circus. A large number of the horses don't seem to mind the new conditions, for, in spite of a very large hoarding at the end of the course on which it says, "Run harder or you'll starve, but no circus on Saturdays," they know that at the end of the day they will get their customary feed, and, at any rate, that is better than being losers in the elimination stakes. No wonder some people in the industry are asking whether they are ever likely, and if so when, to resume the competitive race or whether they are to belong to a permanent circus.

There are three ways in which an industry like this can be operated. The first is the present circus, consisting only of the horses who were running in 1939; except as a very temporary measure such a system cannot be supported—private enterprise working in a closed shop is indefensible. Secondly, some form of rationalised organisation under Government control; it may be said that such an organisation would still be a circus, but clearly it would not require 190 horses for a 4 oz. show; 50 good ones would probably suffice. And, thirdly, effective competitive enterprise. The industry has always assumed that it would go back to the competitive system, and it is understood that the Ministry

have indicated that such is the Government's intention. If this is indeed so, it could be attained, there is reason to believe, by raising the ration to 5 oz. It is to be hoped Mr Strachey will be able to allocate the necessary raw materials for 5 oz. in the very near future; otherwise the industry will continue to operate indefinitely in a circus where the slogan, "Work harder and produce more," is meaningless.—Yours faithfully,
Eastcheap, E.C.3

A. W.

The National Interest in the Lake District

SIR,—In a note on National Parks in your issue of July 26th you make some observations about the attitude of the Friends of the Lake District to the damming of Ennerdale which are based on a serious misapprehension. The society did not oppose the establishment of the proposed Courtauld factory at Sellafield: it only contended that the national interest in the preservation of Ennerdale was worth the extra cost of getting the water to that factory from the Bleng and the Calder instead of from the Lake. Subsequent events have shown, however, that a more fundamental objection would have been justified. It now appears that there would be insufficient labour in the district for both the Courtauld factory and the proposed atomic energy factory at Drigg. In consequence, I understand that the Courtauld scheme has been abandoned, that the atomic energy factory will take its place, and that the whole scheme for damming and damming Ennerdale is to be "reconsidered."—Yours faithfully,
Lower Heyford, Oxford

Italy's Former Colonies

SIR,—My attention has been called to the letter of Mr G. E. Cora, which appeared in your issue of July 19th. The Italian writer urged that Italy should be given the single trusteeship of

From *The Economist* of 1847

August 7, 1847

THE rejection of Mr Macaulay [at the general election], in consequence of his great talents, and his still greater reputation, seems, but is not, less defensible. He shares to the full all the unpopularity which belongs, as members of the administration, to Mr Hawes, and Major-General Fox, and he has causes of unpopularity peculiar to himself. . . . In Edinburgh, as in other large towns, there is a large number of Radicals, or Chartists, and to them Mr Macaulay was personally offensive, by the arrogant manner in which he has spoken of them and their errors. . . .

Throughout the election there may be traced, we think, a preference to men of active business habits; and to that rule the rejection of Mr Macaulay, a gentleman who makes, at most, three or four speeches in a session on some well-conned topic—who is never ready in debate, and takes no part in the ordinary business of Parliament—who is better known as a brilliant author than a servant of the people—is no exception. Notwithstanding his great talents, he has done little to promote the success of the great measures of the day. To the unwearied exertions of a Villiers, a Cobden, or a Bright, what has he to compare, but one or two flashy orations, in which there was always something to make us suspect . . . that he was not acquainted with the principles of free trade. . . . Men and women may be thankful for amusement, constituencies want services; and Mr Macaulay, for a man of his reputation and talent, has been one of the least efficient of our representatives. The Parliament may miss his oratory—the country may be reproached by literary men, because the Edinburgh constituency are too wise to sacrifice substantial benefits to glittering bubbles; but the people will never miss his services. We admit his great literary power; he may still exercise it as heretofore, with all the applause it merits: but the brilliancy of his reputation is no reason for the constituency of Edinburgh sacrificing their interests to bestow an honour on him that he seems to have learned first to prize from the poignant mortification of defeat.

her former colonies in Africa and that she was morally and juridically fit to continue her work. I feel that some of the statements in the letter should be corrected in the interests of truth and justice. About Libya I cannot speak with any knowledge. But the statement that the natives of Eritrea and Somaliland want the Italians back is absolutely unwarranted. All the people of Eritrea are agreed that the Italian rule should not return in any form, and of Somaliland the official English publication "The First to be Freed"—about the military administration of the former colonies—recorded that the Somalis "had a positive hatred of their ex-masters" and could not tolerate that any of them should have an administrative post. It is a travesty of the facts to assert that an Italian trusteeship would be in the interest of the native population. The writer states that there were 74,000 Italian colonists in Eritrea and 15,000 in Somaliland, but before 1935 the number of Italians in Eritrea was under 5,000 and in Somaliland much less. The others were brought there for the purpose of the invasion of Ethiopia. The Italian government may have done something for the Italian colonists, but it reduced the African peoples to the position of serfs. It did nothing for their education. In all Eritrea there were three schools, whilst now the British administration has established over fifty.

The writer notes that the "misfortune of our former colonies is that they possess strategic possibilities." Surely the best way

of meeting that complication is that Eritrea and Somaliland should be linked with Ethiopia to which they are historically, ethnically and economically attached. Any suggestion of an Italian trusteeship is an insult to the principles of the Charter of the United Nations and arouses the fiercest indignation of the African peoples.—I am, etc.,

NORMAN BENTWICH

"Hollycot," *Vale of Health, Hampstead, N.W.3*

Wages in the Catering Trade

SIR,—Some references to the new minimum wages for catering workers, which come into force on Monday next, tend to be misleading. The basic wages quoted are the cash payments to those workers who receive meals whilst on duty, and free laundering or cleaning of overalls or uniforms. In comparing catering wages with other industries, therefore, it should be borne in mind that the real remuneration—either in cash or in cash plus meals and laundering—is nine shillings a week more than the figure you quote.—I am, Sir, Yours faithfully,

L. GRIFFITHS HARRIS

Secretary, Caterers' Association

185 Oxford Street, W.1

Books and Publications

A Statistician's Hypothesis

"Esquisse d'une Théorie Générale de l'Evolution Economique Contemporaine." Jean Fournastié. Presses Universitaires de France. 31 pages. 40 frs.

THIS small but meaty pamphlet may be regarded either as a confident challenge by a champion of the inductive method, to the traditional schools of economic thought, or as the most modest and deprecatory of *ballons d'essai*. The challenge lies in the author's sweeping rejection of all economic generalisations not capable of statistical check (including the entire structure of Keynesian theory) and his equally sweeping claims on behalf of an economic science based on the application of the theory of probability to observed sequences of fact. "Statistical and enumerable data are the only bases of scientific reasoning in the economic field. Any construction relying on data other than statistical is as illusory as the efforts to discover the laws of universal gravitation before obtaining the measure of weight at the earth's surface and the measure of the orbits of the moon and several planets," he says; and elsewhere: "The essential weapon of the economist is the method of the graph, which is exact on the scale of the drawing. It is sufficient to choose the scale according to the order of magnitude of possible errors."

These explosive sentences occur in a three-page appendix on methodology; the bulk of M. Fournastié's "Esquisse" consists of an outline of the hypotheses which, in his view, contemporary economics should explore—using, of course, the statistical method. His leading idea, for which he acknowledges his debt to Mr Colin Clark, is that of the continuous shift in the emphasis of economic life from the primary activities (agriculture, mining, etc.) through the secondary (manufacture) to the tertiary (commerce, administration, services generally). Economic life today is in transition, having left behind the traditional epoch (roughly, before 1700) when technical progress was negligible, and heading towards a further epoch of comparative stagnation, when, all primary and secondary wants being satisfied by a very small proportion of the working population, the rest will be employed in tertiary activities wherein economic progress has little play. Within this framework (suspiciously elegant and symmetrical) there is sketched a syllabus for the theories of production and consumption; of money and prices; of population; of standards of living and hours of work; of productivity; of crises; of international trade; of capital, savings and interest; of public finance; of local regressions; of planning; and of the ultimate quasi-stationary tertiary state. On each of these topics M. Fournastié has an hypothesis to present; his 31 pages are well filled. But he goes no further than to suggest hypotheses, and he appeals explicitly to the economists, and others qualified in the civic sciences, to whom his pamphlet is addressed, to criticise in detail and in general, even if necessary to the point of destroying the whole scheme. Seldom can a champion so downright in his underlying belief have been so modest in his conclusions. It is an attractive combination. Economists should read this book.

Who is to Manage the Managers?

"The Rise and Fall of the Ex-Socialist Government." By Christopher Hollis, M.P. Hollis and Carter. 131 Pages.

ONE great merit of the Conservative Party, as of the Church of England, is that there is no need to accept its doctrines in order to belong to it. Mr Hollis, in spite of a wildly exaggerated admiration for Disraeli, is clearly one of those who vote Conservative because they dislike Labour, in perverse contrast to the preference of most of the electorate for doing the opposite; but what exactly he himself stands for remains to be revealed. Up to a point, his line is clear enough. He accepts, a little glibly perhaps, the theory of the Managerial Revolution. One might perhaps query his argument, linked somehow to the fantastic notion that British Socialism has something to do with Karl Marx, on the extent to which class privilege will and must survive; and, still more, his apparent belief that the politician and the trade union leader, like the capitalist, are, as political forces, already on the way to share the fate of Queen Anne. But, when all is said and done, he is clearly right in his main point, which is to emphasise that a new type of upper class is appearing, and to press the question of how, in the face of this, the social balance of power is to be preserved. Every new upper class has tended to grasp too much power into its hands; what is to prevent the same thing happening again? What can be done to strengthen the citizen as against the planner? Will the Labour Party persist as a "managerial" party, or turn back to its older and better tradition as the defender of the under-privileged? Will the Conservative Party take seriously its new-found belief in free enterprise, the small man, and the rest, or is it more likely to end, as history suggests, as the party of the new upper class—of the managers, technicians, and experts—as Disraeli once turned it from the party of the landlords into the party of industrial capital?

To these and similar questions Mr Hollis provides few answers, though those that he does provide are good; and, on the key question of industrial organisation, he leaves his readers simply with the irritating, if formally flawless, conclusion that there is no golden rule. But at least he is asking the right questions; questions which both his own party and the Government still find a little too pointed to be decent. And he asks them in fine English, and with a good temper of which the more viperish calumniators of the school of Bevan, Foot, Brogan and Hogg might well take note.

Mr Hatch

"The Hatch System." By Hargreaves Parkinson. 135 pages. Pitman. 15s.

SURNAMES beginning with H are not unknown in the investment world. Mr Cyrus Q. Hatch, though a legendary character, was a more beneficent individual than some of the others. For it was

he who made himself a dollar multi-millionaire by developing a simple and foolproof investment system, and yet felt well enough disposed towards his fellow-men to command Mr Parkinson to act as his literary amanuensis and to publish the system for the encouragement and profit of the English-speaking world.

Shorn of the whimsy which Mr Hatch seems inevitably to attract to himself, his system—or Mr Parkinson's—is simplicity itself. First, the investor takes the plunge into the stock market. So long as the market continues to rise he holds his stocks; when the market falls by 10 per cent he sells, and he remains out of the market until the fall has given place to a rise of 10 per cent from the bottom. In other words, the Hatch system is a lifeline by which investors can haul themselves on to dry land as soon as the investment tide ceases to make and becomes a dangerous ebb. It is nothing more than a rationalised system of placing selling and buying limits within 10 per cent of the market peaks and market bottoms respectively.

Mr Hatch was, of course, born under a fortunate star. He began to operate in 1871, and by the end of 1937 the average level of American industrial common stocks was 267 times higher than it was 67 years earlier. He had the inestimable advantage of operating on a rising trend of prosperity; but his system took him out of the market in the years of dangerous slump, and put him back as soon as the bull trend reasserted itself. Thus Mr Hatch profited to the full from the joint benefits of an expanding economy and a volatile Wall Street market. Mr Parkinson, with a wealth of arithmetical illustration, shows how the system can be applied to the British market—though it would have been interesting indeed to have from the originator of the system a detailed examination of Hatch operations during the bull market which began in the late summer of 1940 and which terminated, at any rate for Hatchites, when the *Financial Times* industrial ordinary share index touched 119.5 last week, and thus fell by more than 10 per cent from the January average of 136.4.

The pure milk of Hatch is simple and palatable enough. Whether the simple-hearted investor, for whom the system is primarily intended, should be tempted by its super-fatted variants, to which Mr Parkinson devotes the majority of his pages, is

perhaps another matter. For when the investor changes the area or the percentage rules under the Hatch system, the element of judgment becomes of primary importance, as the author emphasises. In these zones, scientific investment of the kind which Mr Parkinson has so shrewdly analysed in an earlier work is difficult because it has to be deductive. Even Hatch, the inductivist, noted that over 500 common stocks for one reason or another dropped out of the index which he used during the 67 years. Not the least intriguing among the many possibilities which Mr Parkinson examines in such close detail is the chance of a Hatch stalemate, because market movements in future might conceivably fluctuate over a much smaller amplitude. Of all his qualities, Mr Hatch was chiefly distinguished for singleness of mind; yet one is a little tempted to wonder whether he would have adopted and stuck to the same technique in post-war Britain. He invented his system because, as he said, he did not wish to make a sucker of himself. But he did not claim that in all market conditions it guaranteed a large, automatic profit.

Shorter Notice

"Planned Chaos." Ludwig von Mises. New York. 90 pages.

THE theologians have a word for it; invincible ignorance. Chamberlain, Joan Robinson, Triffin, and Keynes have fought the good fight in vain. Even Professor Hayek's determination has begun to crumble a little at the edges, but not the stubborn defences of Professor von Mises. Liberalism of the days before imperfect competition analysis or modern trade cycle theory, sauced with a sound academic acquaintance with the works of Marx, Lenin, Hitler, Roosevelt, and Pius XI, is presented in its rawest and least convincing form; and no one will regret the result more than liberals themselves. It is indeed necessary, as Dr. von Mises sees, to link the liberal doctrine more effectively to the social idealism which has provided the driving force of even the less prepossessing forms of Socialism. But not like this; for the Mises doctrine is one of those weapons which inspire more terror in its friends than in its enemies. As a means of promoting mocking laughter on the Left it is difficult to imagine anything better.

Half the people of Britain
read the Radio Times

In half the homes of Britain, the RADIO TIMES is a welcome week-long guest. But what a restless one! It's on the sofa. It's in the dining room. Annie's got it in the kitchen. Dad had it upstairs last night. How it stands up to a life of nine days is a paper-maker's problem. But there it is—always re-welcomed every Friday in 6,000,000 homes. Member of the A.B.C. AMERICAN SURVEY

United States and United Nations

(From Our US Editorial Staff)

THE discussion within the Security Council which was ended by a decision to call on the Dutch and the Indonesians to stop fighting was remarkable for the level of calm detachment with which a nasty situation was debated. Even Mr Gromyko, more concerned with the Balkans than with the opportunity which conflict in a far-off island gave him for girding at a capitalist power, spent less time than usual in sharpening the edges of his reproach. Outside, where people stood in queues for buses, the August sun was hot enough to make jungle fighting a not unimaginable hell. Inside, no bead of perspiration marred the serenity of members' brows; the debating chamber was artificially cooled, the chairs were padded, the walls sound-proofed, the lights focused and shaded to ward off glare. Until late in the afternoon the sense of unreality which accompanies such comfort on such a day was more irritating than reassuring. Then the persistence of Australia and the United States, supported thornily by Russia, won over the desire of older colonial powers to keep hands off and give time for the successful conclusion of a "police action" which they might themselves be taking as model in a not distant future.

The effect on the American people of this decisive move was immediate. The decision was announced in the early evening. The *New York Times*, almost ready for the newstands, took its editorial page apart in order to hail the importance of the decision. "The Council is not concerned with any one method of maintaining peace—it is concerned with peace itself," declared the *Times* jubilantly.

The precedent established is far more important than the American offer of mediation. . . . We obviously made no attempt to by-pass the United Nations, and there was no real conflict between our "good offices" and the action finally taken.

The sigh of relief which infused the *Times* leader was echoed across the nation on the part of people who honestly believe that the last hope of a peaceful world in their lifetime is bound up with the successful functioning of the United Nations, and that the successful functioning of the United Nations is to a large extent dependent on the continued good behaviour of the United States. There was, to be sure, a contradictory cacophony heard in Chicago, but even the invincible suspicion of a Colonel McCormick was for the moment muted. This was action on the part of an organisation which had shown too many signs of degenerating into a debating society, and action is what pleases Americans even when it must be directed toward stopping action. For once the United Nations had taken refuge neither in legalisms nor in the appointment of a committee to consider and report. Experienced diplomats might shake the head and warn that such haste was dangerous, but the man in the street was quite willing to risk whatever embarrassments might be entailed in an order to stop shooting which came after ten days of fighting and two days of debate.

The alarm and indignation which has prevailed in headlines, editorials and street corner conversations since the Dutch army opened fire in Indonesia is a vivid proof of the degree to which the United States has become sensitive to armed conflict in other nations. It can be argued that trouble is always news, but it should also be remembered that only two years have passed since American soldiers were fighting in both Europe and the Pacific, that American shores face both Holland and Indonesia, that the United States gave independence last year to its own oriental colony which is a near neighbour to Indonesia. The Pacific is very close these days, with General MacArthur's men in Japan, and China still bound—at least in American eyes—

by those sentimental and traditional ties which Europe finds so difficult to understand. When Queen Wilhelmina gave her Indonesian subjects conditional freedom the American public applauded. That she should, whatever the provocation, now seem to be trying to take it back looks to American eyes like "Indian giving"—a withdrawal when strong of what was proffered when weak.

This attitude on the part of the public was behind the State Department's hasty offer of "good offices" when the first day's debate on Australia's motion that the Security Council should take action seemed to be bogging down. It is possible to argue, with the *New York Times*, that the United States was not thereby intending to bypass the United Nations. The fact remains that had confidence in Uno been all that the most ardent supporters of the international idea might wish, there would have been no citizens' petitions asking the President to do all in his power to stop the conflict, and the gesture toward umpiring, whether intended as a mere nudge in the ribs or not, would never have been made.

That it was made, and had the effect of spurring Uno to accept those responsibilities which belong to it by virtue of its charter, should go a long way toward improving the public state of mind toward the things that happen, or do not happen, at Lake Success. Two years after the signing of the charter that state of mind is compounded of hope, ignorance, impatience and foreboding, with a seasoning of guilt. It may be sampled in the attitude of the driver of the bus that runs between the headquarters building and the railway station, who is neither more nor less rude than he would be to any group of passengers elsewhere in New York; in the attitude of the boy at the documents desk who obviously regards journalists much as the Duchess in Looking-Glass Land regarded her little boy and would like very much to treat them in the same way; in the lifted eyebrows of the housing official who resents the intrusion into his neat domain of races and customs he regards as alien and of debatable value; in the impatience of the official for whom everything goes much too slowly, and the beaming smile of the "do-gooder" who sees in the mere fact that she can travel out to watch debates at Lake Success a justification of all the envelopes she addressed to her fellow clubwomen and the telegrams she sent to her Congressman.

*

No amount of disillusion with what has (or has not) been accomplished in these two years has served to bring the American people to the point where they want to believe that the United Nations is moving toward the point where it must be written off as a failure. Some of them say so privately, some of them make speeches in public to that effect, but most of those are the cynics who never believed it would work or the enthusiasts of little faith who embraced the new creed with as much fervour as they are now turning against it. Much of the glow that buoyed the nation while the Charter was being framed at Dumbarton Oaks has dimmed, but the public has, in Russia's continual nay-saying, a convenient scapegoat to blame for the dimming, a scapegoat whose monotonous negativity goes far toward obscuring delays and deficiencies on the part of the other nations, not excluding the United States. The public pressure that forced Mr Vandenberg to assure the United Nations last spring that President Truman did not mean to bypass it when he enunciated his famous doctrine was not strong enough in July to force apologies for the calling of the Paris conference on Europe, even though that conference was

called outside the Uno preserves, and in apparent disregard of the Economic Commission on Europe which was then meeting at Geneva. Yet such weakening in public allegiance can be directly attributed to Russian intransigence between the two dates, and there have been signs in and out of the official world that while no other action seemed possible at the moment, the implied slight to Uno has left a sense of guilt and regret. One has only to scan the list of non-governmental organizations which seek or have obtained the status of affiliates of Uno to realize how many of them are still there because they believe such participation gives them prestige, because they think it gives them power, but most of all because they have faith in the United Nations.

The conversion of a people to a new religion is, however, not completed all at once, nor is back-sliding by intent or by omission a sin limited to those who would bask forever in the light of international amity. The calibre of man appointed by the American Government to serve as its representative on the various levels of Uno activity is not always such proof of earnest and intelligent support as well-wishers might desire. There are not enough Secretary Marshalls to spare for the day-by-day grubbing that goes on in sub-commissions or for the hard travelling that has to be done in Greece, Palestine, the Balkans, Asia. The ways of a Missouri President whose area of confidence in the human material of appointment seems bounded on the east by the Mississippi River and on the west by the Rocky Mountains turn up some curious specimens whose value in international affairs is more debatable than is their skill in foreign tongues. Yet even some of the most bizarre appointments can be defended on the ground that the present period is one of growth, education and exploration; that the task of "selling" international co-operation to the United States can only be accomplished by presenting it as a job to be done by all sorts of people; that in order to enlist majority approval and whole-hearted support which will hold when the going gets rough there must be, in a democracy like this, a continuous process of education by doing and telling.

Meanwhile the United Nations officials are not themselves entirely free from a suspicion of heightening the Looking-Glass unreality which is so disturbing to those who counsel patience and a firm persistence, as the best policy. Predicting a budget for Uno for 1948 which would be half again as large as the \$27 millions charged member nations for 1947, Mr Byron Price, Assistant Secretary General, recently explained that one of the greatest drains on the United Nations is not the keeping of the peace, but "the prodigious paper work that required translating mimeographing, printing and distribution." He told this to the working press a week after Britain had made its newest cut in newsprint, and further explained that the Secretariat have so much paper work on hand that they have not been able to finish the management survey begun last February for the purpose of increasing efficiency, cutting out duplication, simplifying record keeping, lessening the required amount of documentation and thereby the pressure on paper stocks.

It is in the light of such White Knight reports that one should read the three resolutions recently introduced into Congress looking toward the improvement of the functioning of Uno. They range from a demand that the President summon a general conference "for the purpose of making the United Nations capable of enacting, interpreting and enforcing world law" to a recommendation that the Charter be amended to "strengthen the United Nations as an instrument to prevent war and maintain world peace," and they are meant not as stones but as props. Mr Sumner Welles calls them impractical and dangerous, but they indicate the degree of solicitude for the United Nations which is a basic factor in American foreign policy today.

American Notes

Mr Taft on Foreign Policy

The Republican Party is still a very long way from a final choice of Presidential candidate for 1948. But the election campaign is now well under way, and Senator Taft has followed Governor Dewey on the westward trail from Washington. Mr Taft has not yet avowed his determination to drive for personal

nomination, but every political observer is aware that his present tour is the trial run, and that his speech at Columbus, Ohio, a few days ago marked the first bid in a powerful challenge for Presidential honours.

In that speech, Senator Taft was at great pains to assure his listeners that wicked New Dealers are still very much alive, that the Truman regime can bring only a continuance of waste and extravagance, that the Republican Party is firmly united, its Congressional record good, and tax reduction the only possible way to avoid a slump. This was all good party talk, and more than encouraging to his Republican audience. To his credit, however, Mr Taft also took an early opportunity of grasping the nettle of foreign policy—not too firmly, perhaps—but in a manner which contrasts rather refreshingly with the calculated caginess of Governor Dewey. On foreign issues, Mr Taft said:—

I believe that Congress should hesitate to interfere unless (the President's) policy involves us in the danger of unnecessary war, or proposes to drain the resources of our taxpayers and our productive labour to an unreasonable degree. I believe it is a field where Congress should not, except with great provocation, give foreign countries a picture of a divided America.

And, following some well-justified censure of earlier policy in Europe, Mr Taft continued:—

No country has ever been so generous. We have made dollars available in almost unlimited amount with little restriction of the use to be made of them. We are interested in reasonable loans to enable foreign countries to go to work, but I believe those loans should be confined to actual goods, machinery and equipment necessary to restore productive ability. We must move very cautiously and be sure that additional loans really furnish incentive to foreign peoples involved to work harder to support themselves.

Senator Taft's speech begged a great many questions, and shirked the issue of how far his own party has been responsible for conditions in which it has been next to impossible for foreign countries to secure the necessary share of productive equipment. On the record, Mr Taft deserves the gibe made by Ulysses S. Grant (at the expense of the Democrats) that his opponents preferred travelling with their face to the rear seats, and thus "see everything—after they've passed it." If Senator Taft turns his face to the future, his first call will be for caution, but it is none the less important to bear in mind that his views are shared by many responsible and influential American leaders—and that he has lately been in very close touch with Senator Vandenberg on foreign policy.

"Only a strong executive can hope to alleviate the situation" said Senator Taft at Columbus. "Certainly it is beyond the power of Congress, which cannot initiate foreign policy." But, even though loans be made, or grants be given, in terms of "goods and not dollars," Congress today holds a firmer grip on foreign policy than at any previous period, simply because it holds the purse-strings, and in the last resort, it is the dollar appropriations that will be decisive. Fully conscious of this power, the House has sent a virtual ultimatum to the White House, through the Republican majority leader, Mr Charles Halleck, and is demanding "complete co-operation between the executive and legislative branches" and status as "a fully-fledged partner in the conduct of foreign affairs." It was in this spirit that the House rank-and-file recently enforced its own decision for a study group of Congressmen to tour European countries during adjournment. This will be a serious study, embracing all grades of opinion, and backed by the resources of the State Department. Whatever they may learn, and wherever they may listen, it is safe already to conclude that subsequent debates on the Marshall project will hinge upon presentation to them of convincing evidence that, apart from draconian measures at home, each interested country in western Europe is prepared also to move towards a regional integration that has no roots in the past. The Congressmen will search for such evidence in the knowledge that Senators Taft and Vandenberg will back them both ways.

* * *

Spotlight Session

By no means every Republican Party supporter is so staunch a defender of the Congressional record as Senator Taft. A number of more thoughtful supporters contend that while the Eightieth Congress has been heroic enough in its decision to ignore the pressure groups for organised labour, it has been something less than heroic in the way in which it accepted briefs for such powerful groups as the wool growers, the private utilities, the sugar growers, the industrial monopolists, and the full-blooded protectionists. These misgivings were scarcely apparent in Congress where the party, as Senator Taft justly claimed, voted generally as a solid block with the exception of a handful of "liberal recalci-

trants" and a few irrepressible individualists, such as Senator Langer, of Dakota.

On a wider field, however, it is felt that a Republican refusal next year to face such important issues as minimum wages, social security benefits, low-cost housing, and better educational programmes, cannot but have the most serious consequences. But there is one way in which the Republican Party hopes and expects to attract the support of many voters—by a careful manipulation of the spotlight upon the past errors and omissions of the Democratic Party. For the first time since 1933 the Republicans can control such investigations at the taxpayers' expense (a privilege that Democrats rate no less highly when the pendulum swings), and they have recently voted themselves \$2 million for continuing investigations. Among the more important investigations planned for the 1948 spotlight are: Aviation, agriculture, housing, flood control, federal loan agencies, defence, cost-of-living and Government propaganda.

Almost literally these "probes" will range from the graphic and atomic to the anatomic and the nearly-pornographic. Senator Brewster's War Investigating Committee, at least, has got fairly near to the latter level, with a sizzling story of shapely entertainers listed (ultimately) on the taxpayers' expense sheets in order to induce service chiefs and government officials to support generous contract terms for Mr Howard Hughes, a Californian aeroplane manufacturer and Hollywood producer, and his wartime partner, Mr Henry Kaiser. Unfortunately for more serious students of wartime expense patterns, but more fortunately for a jaded Press, the attraction of the young ladies concerned has all but crowded out the more prosaic financial details, and the story so far has been far from complete. Mr Julius Krug, formerly War Production Board Administrator and now Secretary of the Interior, has issued a vigorous denial of charges concerning his involvement in these proceedings, and Senator Brewster has met with the counter-charge that his investigation followed directly from his support for Pan American Airways, and his corresponding dislike of the rival Transcontinental and Western Airlines, in which Mr Howard Hughes ranks as the principal stockholder.

Whatever may be the truth of these charges, it is reasonably certain that the investigation will be dropped at precisely the point where Democratic trails give way to tracks which might, possibly lead back nearer home. But the Republican Party is not abandoning the search for election material. In the foreground is the search for further evidence in the story of voting frauds in Kansas City (Mr Truman's home town) during the 1946 Democratic primaries. Here the *prima facie* evidence against the State machine is very strong indeed, and the Democrats have not helped their side of the story by filibustering against action in 1947.

* * *

Steel Prices Up

British and foreign buyers clamouring for American steel in the face of an impending dollar famine will scarcely find encouragement in the general decision of the industry to raise prices. The smaller manufacturers began the price-boosting process soon after the coal wage terms were announced, with advances ranging from \$5 to \$10 a ton; last week, "Big Steel," Bethlehem, and the rest followed suit with a general list revision of \$5. These moves are defended by the industry with the plea that steel is "still the cheapest basic commodity" and that advances of 7 to 8 per cent mean very little in terms of manufactured goods.

The one certain fact in these moves is that they demonstrate once again the entire futility of Presidential warnings to industry concerning price advances. Industrial profits in general are still at peak levels, but current labour and materials costs are now impairing profit margins in many areas, while for many industries the so-called "break-even points" are dangerously high by former standards. With backlogs so high, and business still so good, the remedy for employers is clear enough—for the immediate future.

Organised labour is responding to these price revisions by demanding further concessions wherever possible. Over the entire range of industry, the scope for revision is not so wide as the unions would like, but wherever "re-opening clauses" exist in

current contracts, the pressure for still higher wage rates is now increasing. The chemical workers are making a new wage bid, meat-packers and textile workers have gained new rates, and a number of smaller unions are displaying a more aggressive mood. This mood is covering contract negotiations under the Taft-Hartley Labour Act, with unions refusing to accept "no-strike" clauses which would enable employers to enforce suits for breach of contract. The automobile industry has already curtailed output substantially because disputes are delaying deliveries of accessories and spare parts.

All this news adds up to the probability of still higher prices over a very wide range of products before the end of 1947. The close of July brought wholesale commodity prices to a new peak, and over the rest of the summer, the pace of activity is not likely to slacken to any appreciable extent. Congress, moreover, has not assisted the position by its insistence upon immediate cash for service men's bonuses, or by forcing the President to abandon consumer credit controls later this year. These two moves may not be dangerous in absolute terms; the bonus payments may not total more than \$1 billion, and consumer credits have expanded very slowly in recent months. But, against the general background of rising prices, such steps serve merely to add fuel to the flames. The bearishly-inclined still talk knowingly of hesitant exports (June figures were very slightly below the abnormally high May figure of \$1.4 billion), of stability in terms of the physical volume of production, and of a probable relapse in construction work later this year. But for the time being, the scope for any significant setback in prices looks small enough by any standard of comparison.

* * *

Mission to China

Washington reports suggest that the Chiang Kai-Shek regime is looking for an early renewal of financial assistance, and for an extension of military aid, following the visit of General Wedemayer, who left Washington last month with the rank of Ambassador and special representative of the President in China. General Wedemayer was called upon to make an "appraisal of the overall situation"—in other words, to resume negotiations with the Chiang Kai-Shek regime more or less at the point where they were abandoned by Mr Marshall last January when his recall from China heralded his appointment as Secretary of State.

In Mr Marshall's opinion at that time, the American Government could trust neither the Chiang Kai-Shek regime nor the Communists, who still control Manchuria and northern China, and although lacking the manpower and equipment necessary to hold many key cities, carry on a devastating guerilla warfare against material stocks and communications. Mr Marshall had for some time worked to secure agreement between the Nationalist and Communist forces, and his declaration on the failure of a mission amounted virtually to a policy of splendid isolation.

At no time has there been any suggestion that the United States would abandon the Nationalists in favour of Communist control. But the State Department seems to have held consistently that the Communists were not under the direct dictation of Moscow, that they were carrying out valuable reforms, and that in contrast, China's regime was both inefficient and utterly corrupt. The growth of Republican control in Congress, however, has brought a steadily stronger movement in favour of active support for the Nationalists. The choice of General Wedemayer was in itself significant, for the General has held the rank of commander of American forces in China and is known to have opposed all attempts to form a coalition between Chiang Kai-Shek and the Communists.

Spurred by the new mission from Washington, Nanking has recently declared that no further negotiations are possible. "In perversion, malignancy and treachery the Communists are worse than any bandit, traitor or puppet in Chinese history." And General Wedemayer, in turn, has declared that he has now received "a variety of suggestions from authoritative sources submitted by Chinese truly interested in the establishment of a stable political and economic structure." For the Chiang regime these are very encouraging words. Apart from internal anarchy and chaos, Nanking is desperately concerned by the revival of Japanese industry, and is making new demands for partnership in the assessment of Japanese strength and for heavy reparations payments. Financial claims on Washington for relief and reconstruction may total \$2.5 billion. These claims will be weighed very carefully in Washington—against the claims of other regions covered by the Marshall project.

THE WORLD OVERSEAS

Brazil in Transition

(From Our Rio Correspondent)

WHETHER the Brazilian economy faces a "shakedown" into peace-time conditions or a major crisis is a question exercising public opinion here. Brazilians who read their newspapers have been told that, while it costs more to live in Rio or Sao Paulo than New York, the standard of living in their major cities is lower than in post-war Berlin. Such comparisons, however superficial, are a pointed commentary on the effects of recurrent food shortages, high prices, transport and travel difficulties, and an extensive black market.

In a country of small shopkeepers speculative prices defy Government controls, and have undoubtedly weighed heavily on urban consuming classes during and since the war. According to a Government index, retail food prices in the four chief Brazilian cities rose from 100 in 1939 to 452 in March, 1947, thereafter falling to 419 in May; and questions have been asked in Congress about the sale of foodstuffs, imported duty free, at 500 per cent profit. As for clothing—the demand for which is said to be fully met by home production—the retail price index compiled by the Municipality of Sao Paulo rose from 100 in 1939 to 470 in May, 1947, jumping 31 points during an export ban introduced to encourage cheaper and more plentiful domestic supplies.

Such figures indicate what is generally recognised, that neither the removal of duties on imported food a year ago nor a simultaneous export ban (since relaxed) has stemmed the rising cost of living in Brazil's urban centres, where wages have followed prices, but raggedly and generally at a distance. The gap between wages and prices is not noticeably lessening. Merchants complain that

the first effect of an import priority system, introduced in June to conserve Brazil's dwindling foreign balances, has been the marking up of prices by Brazilian manufacturers. The Government has since returned to the attack in the price control field by freezing retail textile prices at twice the factory prices—a move by which it is hoped to ensure prices a third lower than those ruling six months ago.

Scarcity may partly explain the resistance of Brazilian price levels of essential commodities to Government control, as to a greater extent it explains the prices—sometimes fantastic by British or American standards—of imported goods ranging from essentials to luxuries. An important retailer has described to your Correspondent how, to satisfy disappointed customers, he had been forced to supplement his stocks of articles imported directly from England by buying more of the same goods from speculative importers at two to three times the price he paid for his own stocks.

Discounting enforcement flaws, however—of which the Brazilian press is an unsparing critic—scarcity cannot wholly explain conditions said to have made Rio the dearest city in the Americas. High profits, like the high money rates which Mr Snyder, Secretary of the United States Treasury, described on a recent visit to Rio as "the exploitation of Brazilians by Brazilians," are endemic in Brazil. A project to limit them has found little favour among the business community, on the ground that it would interfere with free enterprise. How far they are likely to interfere with the competitive ability of Brazilian manufacturers in both their own and other markets remains to be seen.

OVER A MILLION CLIPPER PASSENGERS WERE CARRIED IN 1946

HOW FAR IS 20,000 TIMES AROUND THE WORLD?

It's a mighty long way—more than 500,000,000 miles, or five times the distance to the sun! Yet that is the distance flown by Pan American World Airways since 1927—a record unequalled by any other trans-oceanic airline.

In those 20 years, Flying Clippers have carried 6,000,000 passengers and have served 68 lands on six continents. That experience is behind the unrivalled service which you appreciate when you go by Flying Clipper.

Consult your travel agent or our general agents, U.S. Lines, Arlington House, Arlington Street, Piccadilly, S.W.1 (REgent 7292). Clipper Express (Air Freight), 50 Pall Mall, S.W.1 (WHitehall 3311).

This test may have already begun. While a leading Brazilian textile manufacturer claims he would close any mills not showing 100 per cent profit, a recession of the Brazilian textile industry has been under way for several months, and has thrown out of work (at varying estimates) from 10,000 to 50,000 millhands in Sao Paulo. The industry's difficulties have been ascribed, in complaints to the Minister of Finance by the Spinners' and Weavers' Association of Sao Paulo, to restriction of bank credit and the granting of "insignificant" export quotas. According to the Ministry of Finance, however, Brazilian cotton manufacturers succeeded in selling abroad, during the first quarter of 1947, only three-fifths of the export quota conceded to them for the period, which was 50,000,000 metres (a fifth of their established annual surplus of production over domestic consumption). Meanwhile, Italian silk has been selling here at less than the products of local silk factories, now reported to be at a standstill, and imported cottons were making increasing inroads on the domestic market until the imposition of import restrictions in June. Manufacturers are further alarmed by Argentina's recent suspension of textile imports, which closes their largest wartime market.

Allegations of credit restriction are perhaps better founded. In the view of some business men here who profess to see a "shake-down" of over-expanded industries rather than a breakdown of the whole industrial economy, such restriction is not only inevitable, but justifiable. These observers point out that the most efficient mills are in the hands of a few powerful interests untroubled by the shortage of credit; they claim that a "shake-out" of weaker interests will make for a healthier industry.

Government Aid Demanded

Sr Correa e Castro, the Minister of Finance, has denied any "undue" restriction of bank credit and described the industrial situation as "normal." In fact, published figures of six principal Sao Paulo banks for the six months ended in April (when complaints began) show that, during this period, their cash and loans dropped by 8 per cent and their deposits by 6 per cent. Lending rates meanwhile have risen as high as 15 per cent per annum, and smaller banks have been paying 5 per cent for three months' accommodation.

There are also signs that an unprecedented wartime building boom, which has changed the skyline of Rio and pushed the values of its downtown sites to £500 a square metre, is nearing an end. Speculative builders in Rio and Sao Paulo, many of them financed by mushroom banks at the high rates mentioned, are turning more and more to the practice of selling flats in unfinished blocks in order to finance their completion. Larger banks began a tactful retreat from the real estate field a year ago.

The wilting of industrial prosperity is accompanied by demands from primary producers for Government help. The Bank of Brazil is pledged to finance staple exports, including coffee (the production of which is said to have reached "statistical equilibrium") and cotton. These two mainstays of the Brazilian economy account between them for 54 per cent of all Brazilian exports, and in one view only a collapse of their apparently healthy prospects could plunge the country into a real crisis. Nevertheless, the protectionist claims put forward not only on behalf of industry, but of other primary products now in world demand, raise the issue of how far Brazil can afford to pay for an obviously desirable diversification of its economy.

Broadly, the country is in transition from a wartime economy of rapid industrial development in clearly defined zones to a peacetime one that must take account of: first, the effects of progressive wartime inflation; secondly, the prospect of resurgent competition in both home and foreign markets; and thirdly, the opportunity, now more impressive than ever in the light of world food shortages, for Brazil to develop its own resources, particularly of food. The fact that these resources are agreed to be vast cannot of itself stimulate their exploitation in a poorly integrated country covering half a continent, and lacking both capital and labour for a long-range programme of public investment that would open up and join up productive regions.

Too Little Transport

Reconversion seems an inadequate word to apply to these problems that confront the imperfectly expanded economy of an essentially new country. Some of the basic problems are of long standing, and have been overshadowed rather than simplified by the rush of wartime development. This is outstandingly true of surface transport and agriculture. Railways, roads, docks and warehouses are proving tragically inadequate to move, store and distribute basic crops such as rice, beans and maize, destined not for export alone but for domestic consumption. The citizens of

Rio, as a newspaper points out, are eating potatoes from Holland, beans and canned peas from America, onions from Egypt and butter and fruit from Argentina at prices usually well below those of the local products (where these are available). Transport deficiencies are also held responsible for the fact that, except for a favoured few, the Brazilian capital is virtually without a fresh milk supply.

While transport development has demonstrably suffered from wartime shortages of equipment, agriculture has actually declined. Both labour and capital have gone to nourish industry. There have been critical food shortages in the rich mineral region of the Rio Doce Valley, where labour during the war forsook the farms to find more profitable work in the mines; and malnutrition remains a chronic social problem in the north-east.

Decline in Food Production

Significant aspects of this picture were indicated in a recent memorandum to the Government from the National Federation of Commerce. Recommending the adoption of a "Monnet Plan" for Brazil, it claimed that the disproportionate growth of agriculture and industry, leading to a *per capita* decline in food production, was a root cause of "an undisguisably grave economic situation." According to the memorandum, while Brazil's population increased by 20 per cent from 1933 to 1944, the production of raw materials and foodstuffs showed the following trends during the major part of the war:

	(1925-1929=100)			
	Food		Raw Materials	
	1939	1944	1939	1944
Volume	132	125	273	352
Value	129	182	292	630

The proposals called for the creation of a National Economic Council and a Central Bank system (for which a Bill is now before Congress) with subsidiary banks to finance crops and industry. The aim would be the balanced development of industry and agriculture.

The Government's efforts are meanwhile directed more closely towards a balanced budget. Monetary inflation has become public enemy number one, and deflation a declared objective of Government policy. The Minister of Finance said recently that the note issue had not been increased since he took office in October, and that no further increase was contemplated except in extreme emergency. In fact, the note circulation, according to official returns, rose from 4,971,000,000 cruzeiros in December, 1939 to 20,489,000,000 in December, 1946, and has since slightly receded to 20,345,000,000 in June—or roughly four times its pre-war level. This expansion has its roots in Brazil's prosperous wartime export trade. Annual export surpluses increased from £10,000,000 in 1939 to £85,000,000 in 1946 (after a lapse to £3,500,000 in 1940) and the Bank of Brazil—with an exchange monopoly dating from the days of currency shortages—had to pay exporters many more cruzeiros for their foreign currency than it received from importers. Increased taxes and a compulsory war loan provided a negligible amount, and the gap was mainly bridged by the creation of more paper money—a deliberate Vargas policy calculated to leave in producers' hands capital for post-war re-equipment and expansion.

Dollars Running Short

Two important consequences of this monetary inflation have been noted by Sr Roberto Simonsen, an eminent Brazilian economist whose views have been sought by President Dutra, and show signs of having influenced present monetary policy. Sr Simonsen points out, first, that the internal value of the cruzeiro has been depressed to perhaps half its value in terms of the dollar; and, secondly, that this internal devaluation is only prevented from exercising its full effect as a stimulus to imports, i.e., to foreign producers competing with Brazilian industry, by the continued production difficulties of foreign exporters (and, of course, the recently imposed Brazilian import restrictions). He estimates that Brazilian production costs have increased since 1939 by 90 per cent in relation to those of the United States, and by 12 per cent and 26 per cent respectively in relation to those of Great Britain and Argentina. The competitive handicap implicit in these figures is a matter of concern to Brazilian industry, which has an estimated annual output valued at £650 million.

The prospect of a dollar shortage also causes concern. A growing export deficit with the United States (which now supplies 60 per cent of Brazil's imports, against 6 per cent provided by the United Kingdom), and a shrinkage of Brazil's total export surplus, are features of Brazilian foreign trade returns for the first quarter of 1947. The continuance of these trends would accelerate the exhaustion of Brazil's dollar reserves. These were

announced recently by the Minister of Finance to be \$350 million. This figure, however, is understood to include the gold backing for the note issue, apart from which backing there is good reason to believe that Brazil remains with only some \$25 million in New York—or twice its export deficit with the United States for the first quarter of 1947.

When Brazil's hard currency runs out, Sr Simonsen believes, a fall in the value of the cruzeiro is inevitable (in accordance with the theory of purchasing power parity). Meanwhile, he contends, no arbitrary alteration of the exchange rate would offer a real solution of domestic difficulties. Depreciation would aggravate inflationary pressure, and appreciation would not necessarily make deflation easier (since, although the Bank of Brazil would pay the exporter less cruzeiros for his foreign currency, it would also receive from the importer less cruzeiros with which to do so).

The battle for a stable currency is not the least critical of Brazil's difficulties.

Singapore Prepares to Vote

[FROM OUR OWN CORRESPONDENT]

A BILL to provide for elections to the Singapore Legislative Council was passed by the Advisory Council on July 3rd. It had a good press. A few diehards considered that now, in the midst of reconstruction, when all Government machinery is overworked and overheated, it is inopportune to add an avoidable complication. But the elections have to come sooner or later and it is wise to get them over quickly.

The Bill gives the suffrage to all British subjects over twenty-one years of age and resident in the colony for one year, with no disqualification for sex, lack of property or illiteracy. Three-quarters of Singapore's population are Chinese, most of whom are illiterate even in their own language. Illiteracy, however, is mostly to be found among the immigrant Chinese who constitute the greater mass of this fraction. British subjects form a relatively smaller part and to them educational facilities have been available. Hence the proportion of illiterate voters is not regarded as excessive, and their difficulties in voting for a candidate whose name appears in an unfamiliar script are being lessened by the simple device of allotting such easily recognisable symbols as an elephant's head, a house, a cart, a wheel, a ship or a violin to each candidate. The demarcation of constituencies is territorial and not communal, for in Singapore the communities are not segregated but thoroughly intermingled. It is unlikely that any but Chinese will secure election. Europeans are unlikely to be elected, not because they are Europeans but because they are a quasi-aristocracy with no local roots. The minority communities consist of Indians, Eurasians, Malays (Indonesian and Peninsular) and Europeans.

So far no parties have appeared, but the smaller communities are discussing their plans. There have been the usual threats from the Communists to boycott the elections, but this is regarded as a rubric in the orthodox ritual prior to active participation. Faced with a dilemma, the Indians are bewildered. In January, 1946, Pandit Nehru plainly warned them that they must choose between being Indian or Malayan for they could not be both. Yet they are divided among themselves into northern and southern Indians, Mahomedan or Hindu, Pakistan or Congress. What wood they will saw into planks for their electoral platforms has not been disclosed. The Malays are split into two main groups, the Malayan Nationalists and the United Malay National Organisation. The Nationalists want to throw in their lot with Indonesia and make a large and somewhat visionary Malaysia subject only to the United Nations, where the Malays will be ring-fenced from more hustling aliens and have a land fit for Malays to live in. Less intransigent, the Umno, under the brilliant leadership of Dato Onn, the Prime Minister of Johore, advocates preference for the Malays in their own country, but is not hostile to foreigners and follows constitutional methods.

Malayan Democrats

Potentially the most important group is the Malayan Democratic Union. It is composed of middle-class intellectuals of all races, derives much of its inspiration from the Fabian Society, and advocates equal rights for all, with no racial discrimination and a greater share of independence from the Colonial Office. It uses constitutional methods and gives perhaps the happiest augury for the future, for it possesses brains, public spirit, energy and courage.

The problem with the Chinese is that they are Chinese. For many years they have concentrated on the task of money-making and were content to leave well alone. Now political consciousness has been stirred and they have become doubtful of their status. By nationality, in the political sense, the Chinese form three groups: those born in the old Straits Settlements and called Straits-born Chinese; those born in the old Federated or Unfederated States; and the immigrant Chinese. The Straits-born are the most intelligent and public-spirited of all communities in Malaya; and it is from their ranks that the leading doctors, lawyers, educationists and business men are produced. The other Chinese, both in Malaya that was not part of the Straits Settlements, are protected British subjects and are not eligible for the vote, a decision that has caused some heart-burning. The China-born immigrants are not eligible for the vote, but all can, if they wish, become naturalised British subjects.

British or Chinese?

A local Chinese newspaper, the *Nan Chiau*, circulated a questionnaire among its readers, to which 4,344 replies were received. Twenty wanted Malaya to be a British possession, 1,875 wanted it to be an independent nation, 2,288 wanted it to be a Federation, 70 wanted it to be handed to Uno. Then 4,226 wanted Singapore to be joined to the Malayan Union, 38 were willing to give up Chinese nationality and become Malayan citizens, 4,275 wanted to be both Chinese Nationals and Malayan citizens, 3,961 wanted a popularly elected legislature. Against 41 who wanted English as the official language, 3,961 thought all Malayan languages should be the official language. It is not possible to say what class of person answered the questionnaire and deductions drawn from it cannot be therefore very accurate. But it seems clear enough that the Chinese wish to retain a dual nationality, and to have their tuppence and the bun. The 4,275 out of 4,344 who wish to make—and take—the best of both worlds form nearly 99 per cent. It is probable that this percentage holds good throughout Malaya and it explains why the Malayan Union is nervous about admitting Chinese to Malayan citizenship.

However, the Malayan Democratic Union and the Chinese people are sensible enough. They realise that sonorous platitudes are no substitute for a clear appreciation of what is possible, and that toleration, practical ability, good sense and a spirit of compromise are the basis of administration.

The innovation in the Bill lies in the grant of a member each to the European, the Chinese and the Indian Chambers of Commerce. The men elected from these chambers will owe their first loyalty to business interests, but they are likely to be able men who, when their first interests are served, will have regard to the general good. There was surprisingly little opposition to this markedly undemocratic proposal, because it was felt that this must be a temporary expedient to secure experienced men of affairs. The elected section of the Council will number nine; there will be four nominated unofficial members who can speak for the smaller communities and less than nine unofficials.

It seems easy at the moment to predict that the issues will be social and economic rather than racial and religious. The chief business of the elected members will doubtless be the putting of questions and criticism of administration. No attempt to cast the horoscope of democracy in Singapore can leave out of the reckoning the possibility of malpractice. It is likely that there will be a considerable group entering the game of politics in a predatory state of mind, and ready to take advantage of the gullible and exploit the illiterate. The Bill bristles with checks against them, but how far they will be effective it is impossible to foretell.

A Problem For Raffles

A prominent item in the agenda of Legislative Council meetings will be demands for retrenchment and reform. Many new departments have been added to the Government since liberation. Office staffs have multiplied exceedingly, while higher executives have not greatly increased and suffer an almost impossible burden of responsibility. New importations from home are trade union advisers, price controllers, exchange controllers, currency controllers, social welfare workers, public relations officers, food controllers, economic advisers—their name is legion. The sole official on the overdue list is an efficiency expert; and he would be the most welcome, for he might be able to reorganise an office routine that was antiquated thirty years ago, to prune redundant staff and to cut down that government expenditure which is the cause of inflation. In our present perplexities, the only visit more gladdening would be the return of Stamford Raffles.

THE BUSINESS WORLD

The Cost of Convertibility

THE coincidence of July 15th, the date by which arrangements for the convertibility of current sterling were due to be completed, and the latest and most ominous spurt in the accelerating withdrawals of dollars from the US line of credit has inevitably caused the two phenomena to be linked. In much of the general discussion on the dollar problem, convertibility is beginning to emerge as the chief miscreant and, in the process, to serve as a convenient scapegoat for sins of omission and commission, for which the guilt often lies much nearer home. This prominence of convertibility among defendants in the dock is, it must be added, partly due to the assurances which official spokesmen have never tired of giving, that the convertibility situation was "well in hand," that everything had been "neatly tied up" in anticipation of July 15th, and that no excessive strain on sterling need be expected as a result of the new arrangements. These optimistic forecasts may still be justified; but if they are, some new and as yet quite unexplained factor has entered into the situation to cause the strain. But it is difficult to discover one.

This article was going through the press at the moment when Mr. Dalton was giving a fuller explanation of the dollar problem. But Mr. Atlee, in the course of his speech, gave an analysis of the distribution of the dollar deficit which Britain had to meet in the first half of this year, which is reproduced in Table I below. The impact of sterling area expenditure in the Western Hemisphere provides an indication of the extent to which accumulated sterling balances have been used in order to finance the dollar expenditure of the sterling creditors. The current trade balances, of which the geographical distribution for the first five months of this year is given in the second table suggest no combination of deficits and surpluses that could account for the actual rate at which the dollars were withdrawn last month, namely \$700 million. These five months have no direct bearing, of course, on the current dollar cost of the external deficit; they merely show that, on the basis of the first five months of this year, it is inconceivable that the external deficit alone could have accounted for more than a fraction of the dollar drain in July.

Any attempt to explain the latest drawings on the dollar credit in terms of normal commercial transactions, however, must take into account two important points. First, actual

drawings from the loan are not made in respect of past expenditure but in anticipation of bills that will have to be met in the ensuing weeks. The second point is that Britain is now approaching the time of the year when seasonal pressure on dollar resources is at its greatest. This seasonal rhythm in the demand for dollars, which used to be such a familiar phenomenon of the exchange markets thirty and forty years ago, lost much of its force when the United States ceased to be a large exporter of cereals. Now that the United States is again the world's biggest exporter of wheat, the seasonal pendulum is swinging again as strongly as ever. Apart from these points, it would be astonishing, on general grounds alone, if the current rate of dollar expenditure on external trade account coincided with the total sterling presented for conversion into dollars. But now that the use of sterling in international trade has become more multilateral through the extension of the transferable account system, it is impossible to trace the origins of current sterling which is offered in exchange for dollars.

It is evident, however, that current transactions alone, even allowing for the seasonal factor, cannot account for more than a fraction of the recent rate of withdrawals. Unless some gigantic "leak" has been opened, through which capital transactions are now pouring (an improbable contingency, since the authorities restrict the grant of transferable account facilities to those countries in whose exchange controls they have reason to trust) it is evident that the grant of convertibility to recently released sterling balances under the series of payments agreements negotiated during the past year, and the less formal understanding about the accumulated balances which are not yet subject to precise agreements, must bear a good deal of the responsibility for the dollar drain. The actual distribution of responsibility on this score is also a task which presents formidable difficulties, at least for those to whom the operations of the Exchange Equalisation Account and the sterling balances of overseas countries are not an open book. The third table showing the published data on releases of sterling from accumulated balances does, however, suggest that much of the explanation lies in this particular direction. These releases were in each case agreed upon after hard and protracted negotiations, in the course of which the creditors brought all possible influence

* Including transfer of £10 million to Brazil which has not been made to date.

† £8 million straight release, £12 million for working capital, £14 million estimated confirmed credits in London against which accumulated balances were released.

‡ £11 million in private hands, £22 million in Government accounts, of which £10 million agreed to be maintained as minimum working balance and £8 million in purchase of surpluses.

§ Norway agreed to hold minimum balance of £5 million and was allowed to draw freely on balance of her accumulated £20 million.

Note.—Bombay reports that an interim agreement has been signed, under which £60 million of India's accumulated balance of £1,178,000,000 had been released as working capital have been officially described in London as "premature."

to bear to obtain the maximum of releases. Viewed by itself, the argument presented by each may have seemed essentially reasonable. The case pleaded by these countries was, moreover, backed by the argument that sterling had again become an international currency and provided the basis for most of the trade of large areas of the world.

The concessions made to these individual demands, which seemed so modest when viewed in the context of each particular agreement have, in their sum total, assumed formidable dimensions. Table III suggests that close on £100 million may already have become available for conversion into dollars this year as a result of agreed releases from accumulated balances—and with more to follow before the end of 1947. This was an unduly high and generous figure in the light of the resources available to Britain and of the other pressures to which they were subjected. It may well have been argued that since sterling was becoming a convertible currency this fact would sufficiently strengthen confidence in it to encourage most of the released balances to remain here. This should surely be particularly true of the balances released for “working capital.” But a crisis feeds on itself, and as the accelerated depletion of dollar resources became apparent for all to see, it seems more than probable that many holders of convertible sterling who would normally have been prepared to leave it here have made sure of using it, as indeed is their right, before the dollars run out.

Such a flight from convertible sterling would, moreover, be extremely difficult to confine within the bounds of agreed release arrangements. A large part of the accumulated balances held

here on overseas account has been left for use at the discretion of the holders: that is true, in particular, of the balances held on behalf of the dominions and colonies. These informal gentlemen's agreements work admirably when conditions are normal and their character, moreover, is best suited to the traditional mechanism of the sterling area. But conditions are far from normal, and it is conceivable that some of the gentlemanly holders of sterling, realising that by standing back and behaving as gentlemen they were merely holding the door open to less reticent holders of convertible sterling, must have met considerable temptation to forget their good manners.

It is impossible to say how far these doubts and questions are justified without a day-to-day knowledge both of the balances maintained here by the countries concerned and of their current earnings of sterling. But the evidence of the recent rate of dollar exhaustion is too strong to clear the convertibility of sterling of all blame and responsibility. This is not to say that convertibility was the only factor in bringing about the unexpectedly rapid expenditure of the US line of credit. Yet it does suggest that in this, as in so many other aspects of British economic policy, integral parts of the same mechanism were treated separately and independently and that the condition of making convertibility effective and successful—namely the setting of a clear course towards a reasonable equilibrium in the balance of payments—was not satisfied before that step had to be taken. The loan agreement gave too little time for this tricky feat of navigation, and the Government has spent that little time studying the charts instead of setting sail.

Lancashire Looks Up

MUCH is expected of Lancashire—it may be too much—towards the optimistic export targets set by the Prime Minister on Wednesday. The cotton industry was one of the worst hit by war, and it has been one of the slowest to recover. In the spinning and weaving sections, mills containing nearly 40 per cent of the total productive capacity were closed down under the concentration scheme during the war. Employment in the industry (spinning and doubling, and cotton and rayon weaving and finishing) fell from 458,700 in 1937 and 387,100 in October, 1939, to 242,200 in October, 1943, though by last May it had recovered to 295,800. Production has fallen in even greater proportion than labour. Cotton yarn output, which averaged 23.7 million lb. a week in 1937, has in recent months (omitting February) averaged barely 13 million lb. Woven fabrics, similarly, have averaged just over 30 million yards against 70 million yards in 1937 and 59 million yards in 1935, the only two recent pre-war years for which figures are available. In other words, production as a whole has been not much better than half the pre-war level, and production per worker has fallen by perhaps one-third—mainly owing to shorter working hours, greater absenteeism and greater turnover of labour. Exports have fallen in even greater proportion than production. Yarn sales abroad, owing largely to the collapse of Germany, are barely one-sixth of the pre-war level and cloth shipments are about 40 per cent.

Such is the background against which the present hopes which are now reposed in the industry must be regarded. It would be absurd to look for a quick recovery to the pre-war level of output, let alone the higher levels recorded at previous dates back to 1913 when the export of piece goods was running at more than ten times its present rate. Nevertheless, cotton ranks fourth amongst British exporting industries, with only vehicles, iron and steel and machinery in front of it. Even a relatively modest increase upon its present rate of production would be of great value.

Is this “relatively modest increase” of output within the

sphere of practical politics? There is no reason why it should not be and there are, indeed, some fair grounds for hoping that it will be achieved in the early future. Improvement in output depends upon three factors: an increased supply of labour; re-equipment of the industry with more up-to-date and efficient machinery; and better utilisation of labour. The figures above show how heavily the number of workers in the industry fell in the war (they had been falling persistently long before) and though the labour force has recovered since, it is not within sight of regaining the 1939 figure. The Cotton Working Party hung many of its recommendations on the cardinal assumption that employment in the spinning and doubling and weaving sections, which had fallen from 330,000 in October, 1939, to 205,000 in October, 1943, could not be raised above 250,000.

Nothing that has happened since the Working Party reported eighteen months ago can be regarded as having seriously disturbed the validity of this assumption. Nevertheless the fact remains that the labour force of these two sections has in the past year risen slightly above the Cotton Working Party's postulated total. Since the Cotton Board initiated its recruitment campaign in 1943 the labour force has risen by 53,000, despite heavy wastage of married women and elderly workers. It is now 256,000, or 6,000 above the “Schuster maximum.” For that achievement great credit is due to the Recruitment and Training Department of the Cotton Board, which has employed all the resources of propaganda both to persuade employers to make employment in the cotton textile industry more attractive to workers and to persuade workers that employment in cotton was indeed more attractive.

The amount of work which has been done in making the cotton mills more agreeable places to work in has hardly received full recognition outside the industry. Some £7,000,000 has been spent on providing improved working conditions—on installing canteens, rest rooms, crèches and air conditioning and on painting mill walls and even machinery. This work has been

carried out in the face of all the obstacles raised by building restrictions and shortage of building labour and materials. Together with improvements in pay and the reduction in working hours under the five-day week, it has gone far towards overcoming the prejudice against cotton mill employment which had developed in Lancashire between the wars.

That is strikingly demonstrated by the astonishing success which has been achieved in juvenile recruitment. In 1944, the first year for which full returns were collected, only about 9 per cent of the boys and girls leaving school in the North-West Region went into cotton spinning, doubling and weaving. The percentages for subsequent years are 11 in 1945 and 15.7 in 1946, whilst in the first five months of this year 23.6 per cent of school-leavers entered the cotton mills. These percentages include towns like Manchester, in which there are few or no cotton mills. In the purely textile towns much higher percentages are recorded—60 per cent in Bolton, 62 per cent in Nelson and Colne, 65 per cent in Rochdale and 80 per cent in Burnley. It may be, and no doubt is, socially undesirable that such large proportions of the youth of Lancashire should seek employment in a single industry, but the figures at any rate suggest that the cotton industry is now holding its own in competition with the “newer industries.”

In the coming twelve months there will be no school-leavers in Lancashire or anywhere else. That fact will deprive the cotton industry of some 4,000 juvenile recruits. The industry hopes to make the hiatus good by recruiting European Volunteer Workers (*ci-devant* “displaced persons”) mainly refugees from the Baltic countries, but also some Austrians. A few hundred, all women and girls, are already employed, but it is hoped shortly to receive much bigger numbers. Suitable living accommodation is, of course, the limiting factor, and a vigorous campaign is now going on to provide this. Mills are buying large houses and converting them into hostels, but most of the volunteer workers will have to be accommodated as lodgers in private houses; and active canvassing for billets is now proceeding. It was not thought likely that more than 2,000 or 3,000 could be accommodated, but the Ministry of Labour is now offering up to 10,000, and naturally the industry will do all it can to increase its intake.

Thus the general recruitment campaign goes on, but, however far it succeeds, it cannot hope to make good any very considerable part of the present shortage of 90,000 workers compared with the pre-war labour force. This shortage can only be made good by installing more efficient machinery or by making more efficient use of present machinery—in either case by increasing production per man-hour. The majority report of the Working Party laid main stress on the former method—re-equipment—and recommended a levy on the industry for the purchase of new machinery. By force of circumstances, however, attention is rather being focused on the latter method, which is simply improved “labour utilisation,” or in the current jargon “re-deployment.” Re-equipment, though it is, of course, proceeding continuously, is going to take a long time, at the present rate of supply of machinery, before it greatly affects the output of the industry. Moreover, the deep-seated divergence of opinion, evident in the Working Party's report, on the merits of wholesale scrapping of existing machinery still persists. Whatever opinions may be held about that problem, it is clear that, from the now all-important short-term point of view, it is only by the more effective use of the existing labour force working with the existing machinery that any significant increase in output can be achieved.

There is no room for doubt that, by better use of labour, by the elimination of the wasteful and obstructive practices on which the trade unions insist and by more scientific methods of assessing “work loads,” coupled with minor improvements to machinery, a large increase in output could be obtained. One

firm of industrial consultants claims that the mills it has advised have achieved an average increase in output exceeding 50 per cent without imposing increased strain on the workers. It is not necessary to subscribe to that or any other exact figure of possible economies, nor to accept at their face value all the claims of the industrial consultants, to be convinced that “re-deployment” could save the Lancashire cotton industry and that, at this moment, nothing else can. There is reason to believe that the British Cotton Industry Research Association (Shirley Institute), which has done some work on the problem, and also the Cotton Board both hold that conviction. The Cotton Board is about to switch the proved proselytising power of its Recruitment and Training Department to “selling” the policy of “re-deployment” to the industry, and particularly to the trade unions. The department will organise exhibitions and experimental mills and apply other methods of propaganda in an attempt to overcome the resistance which still exists, notably among some of the older trade union leaders, to reforms which would benefit employees at least as much as employers. An essential element in the whole problem is the adjustment of the obsolete wage lists to modern conditions.

The final attempt to do that must await the report of the Moelwyn Hughes Committee on weavers' wages. When that report has been received it ought at last to be possible, with the spur of the national emergency to supplement common sense, to overcome the barriers of prejudice, outworn suspicion and sheer inertia, and produce a system for working the Lancashire mills and paying the workers which will liberate the industry's full productive capacity. There is surely ground for hope in the very fact that present output is so considerably below that which could be obtained under more rational conditions.

There is also scope for hopefulness on another score. An old industry like cotton cannot be expected to accomplish sensational advances either in its technique or in its products. The Lancashire industry, however, is not standing still. It can claim noteworthy technical progress in certain directions. It is producing cotton cloths in advance of anything previously achieved in design and finish, including women's dress fabrics possessing all the appearance and dignity of pure silk. The most notable of the new fabrics are perhaps the so-called “ventile fabrics,” which were developed out of wartime experience; these have the waterproof qualities of impregnated materials (though they are not “proofed”) without the defect of being impervious to air as well. There ought to be a bright future for ventile fabrics. But at present production of these fabrics is small, for it amounted to about 600,000 yards last year.

Yet it has proceeded far enough to warrant the formation of a “Ventile Fabrics Association of Great Britain” with the object of maintaining quality and registering trade marks throughout the world. The membership of the Association includes such well-known public companies as Amalgamated Cotton Mills, Combined Egyptian Mills, Crosses and Heaton, Fine Spinners, Horrockses, Crewdson, Joshua Hoyle, Bradford Dyers and Bleachers' Association. Ventile fabrics are made of very fine counts of cotton in which Lancashire still leads the world, and the belief is held that few, if any, other countries are as yet in a position to compete with her in their production. So many obituaries have been written about Lancashire cotton that it is encouraging to have this reminder that the industry can still play a part in pioneer industrial development. Lancashire might be in thriving health if its blood-stream of labour had not been so ruthlessly tapped during the war. But at least there are signs of convalescence. Each month brings a few more red corpuscles into work. The doctors are busy with every device of occupational therapy. And the most encouraging sign of all is that the patient itself seems to be looking up.

August

August is the popular holiday month—it opens with Bank Holiday weekend, and a Bank Holiday means a holiday for all. Yet as we journey to escape the prosaic world of affairs the services which a great bank affords are ready to meet the leisure mood. Money can be available wherever we may go; our instructions for regular payments must be met even in absence, and it is reassuring to know that precious smaller possessions can be left with the bank for safe custody. Before going on holiday, it is wise to consider whether you are making the fullest use of all the services which this modern bank affords.

MIDLAND BANK LIMITED

The Acid Test

Every schoolboy remembers that acids turn blue litmus paper red, while alkalis turn red litmus blue. But 'acid' and 'alkali' are not precise words like 'circular' and 'square'. Of two liquids, one may be much more acid than the other. It is often important to know exactly how acid or alkaline a given liquid is, particularly in canning, brewing, paper-making, sewage-disposal and leather manufacture. Indeed, in all branches of pure and applied chemistry one of the commonest methods of test and control is the estimation of what is known as hydrogen-ion concentration. Litmus still has its uses, but the modern chemist is able to get far more precise information by means of a whole range of dyes, which change colour dramatically at different hydrogen-ion concentrations. When liquids are too intense in colour, however, or have other properties which interfere with the colour changes, a pH-meter is used (pH is the symbol for hydrogen-ion concentration). This apparatus is illustrated above. It measures the electromotive force between the solution under test and a standard glass electrode, and gives results of great accuracy. The pH-meter is another of the tools which enable the research chemist and the British chemical industry to place the resources of Nature at the disposal of the Nation.

Business Notes

Crisis Reactions

The Stock Exchange on Thursday was in two minds about Mr Attlee's speech of the previous day. Evidently, its first impressions were that the Government's proposals to meet the economic crisis would be insufficient to stem the inflationary trend—that a cut here and a new target there made a small difference to the basic problems of the British economy. But, having marked industrials slightly higher at the opening, the market reminded itself that Mr Dalton and Sir Stafford Cripps had still to speak, and relapsed into caution. In advance of Mr Dalton's speech, the gilt-edged market was almost frozen into impassivity, and made no attempt at further adjustment between long and short dated issues.

In the equity market, the recovery at the end of last week became distinctly selective, and was mainly concentrated upon steel and textile shares—the former being assisted by the thought that the Government would be less willing to risk any interruption of supplies during the next year or two by pursuing its campaign of nationalisation. Apart from these minor changes—and their slight extent compared with the last week or two is well illustrated in the table of security prices and yields on page 258, there has been no decisive response to the debate as yet. Perhaps on further consideration of the food cuts from hard currency areas (which, as a later note shows, are indeed important) and of the restrictions to be imposed on public and private investment programmes the decision whether the programme represents merely another instalment of austerity and exhortation, or whether it will provide the much-needed corrective shock for an over-inflated economy, will be clearer. On these points, Mr Dalton's speech, with its indication of the possibility of an Autumn Budget (which might be needed in the "wider sense") and the reconsideration and rephrasing of the capital programme, suggest that the lesson of inflationary evil is being learned, slowly and painfully. And his explanation of the fall in gilt-edged ("for sentimental and not technical reasons") suggests that the song in the Chancellor's heart has now turned to whistling to keep up his courage.

At the moment, however, the equity market is not unduly impressed by the Government's measures—which means, on balance, that the chances of a partial recovery on the prospect of further inflation are probably higher than those of a further fall in prices which would be entailed by a more conscious anti-inflation policy. Cuts in film remittances to one-quarter, a £4 million saving in petrol, and the reduction in the foreign travel allowance from £75 a year to £35 for 14 months—these steps may be in the right direction. But they look only a degree more serious than those announced at the beginning of July, and on those, it may be remembered, equities staged a useful though only temporary rally.

* * *

The Government's Manpower Plans

Both employers and trade union representatives have given their general support to the Government's plans for dealing with the labour and industrial situation. A series of hurriedly summoned special conferences culminated in the acceptance by the Ministry of Labour's National Joint Advisory Council on Wednesday of the principle of the proposals, although the details have yet to be worked out by the smaller, more compact Joint Consultative Committee. The procedure is very reminiscent of the hectic days of May 1940, when the plans for the total mobilisation of manpower were hastily formulated with the approval of the representatives of the two sides of industry. It remains for the workers to show the same sense of urgency as they did at the time of Dunkirk.

The chief points which have yet to be settled are the lengthening of working hours and the scope and application of the Control of Engagement Order. It seems likely that by the autumn, overtime working will become the rule rather than the exception, throughout industry, although its introduction will be on a "staggered" basis. Thus, in the first instance the longer working week will apply to the obvious cases of coal and cotton spinning, and to the industries producing power and power equipment, mining and agricultural machinery and transport equipment. As and when they are assured of sufficient supplies of power and materials, manufacturing industries should follow suit. Arrangements for overtime, which is the most direct and obvious method

of increasing production, will have to be negotiated quickly if the new production drive is to get a good start before the winter.

The effect of the Control of Engagement Order in achieving the required redistribution of manpower is more dubious. This Order differs from the Essential Work Order in that it does not freeze a worker in his job, but ties him to a particular industry by creating a ring fence round it. Since the offer or acceptance of industrial vacancies will have to be put through an Employment Exchange, the Ministry of Labour should—in theory at any rate—have power to steer into the desired channels, workers who are unemployed or who are made "redundant" by the reduction in supplies of materials and supplies to less-essential industries. With the sanction of direction of labour in the background, the Order may be effective in maintaining the labour force of vital industries. It is more doubtful how far unwilling and unwanted workers will benefit production. The sanction of direction is preferred to what is perhaps the more straightforward one of withholding unemployment benefit.

If the situation were not so serious, some light relief might be derived from the fact that the TUC, whose pressure was mainly responsible for what is now generally admitted to have been a premature relaxation of labour controls, is now outvying the Government in supporting a policy of direction, should the proposed methods under the extension of the Control of Engagement Order prove ineffective or insufficient. It will be interesting to see whether, equally late in the day, the unions respond to the Prime Minister's appeal to refrain from pressing for increased wages. A similar appeal in the White Paper made singularly little difference to the presentation of claims for more wages and shorter hours. It is not yet clear whether the policy, adopted at Margate, of wage improvements and special incentives for the undermanned industries will be continued side by side with the labour controls. At first sight it would seem that the viewpoint of Mr Arthur Deakin, in favour of direction and against incentives, has won the day. At the same time, it is surely significant that the policy of differential rationing, so long and so bitterly resisted by the TUC, is now contemplated if a reduction in basic rations becomes inevitable.

* * *

New Targets for Coal and Steel

"Our aim," said Mr Attlee, speaking of coal production in the economic debate on Wednesday, "is an average weekly output from September 1, 1947, to April 30, 1948, of at least four million tons of deep-mined coal" and "as much opencast coal as we can get." This target for deep-mined coal plus a slight increase in the rate of production of open-cast coal would give a weekly output of between 4.2 million and 4.3 million tons a week—an annual rate of, say, 210 million or 215 million tons. This revised target thus gives a margin of 10 million to 15 million tons a year over the 200 million tons target which was written into the *Economic Survey* last February.

But if an annual rate of production of say, 210 million tons is to be achieved over the winter period, in the face of transport difficulties both for the miners and for the coal they raise, production will have to be stepped up quickly. The best prospect that is suggested by current production trends is a rate of between 195 million and 200 million tons by the closing months of this year, and this cannot be transformed into an annual rate of 210 million tons for the six months period ending in April without an almost superhuman effort. The means available for calling forth that effort, apart from a suddenly intensified sense of responsibility to the community by the miners, are not convincing. On paper, an additional half-an-hour a day down the mines, which is the only practical concession the Prime Minister has so far obtained from the miners, could raise the annual rate of output by 12 million to 14 million tons. But the problem is wider than a simple proportion sum, for before full advantage can be taken of an extra half-hour, major changes would have to be made in the miners' task work at the collieries, which will take time to arrange. Although it did not lie in the Government's mouth to suggest it, perhaps the miners may prefer to work a Saturday morning shift, rather than an extra half-hour a day, in order to avoid such an arrangement of task work. Some 250,000 tons

could be produced by a Saturday shift, which would give the same target increase of 12½ million tons annually. Apart from the longer working day (if not a longer working week) increased output must depend on reduced absenteeism and increased recruitment.

Without sufficient coal, the steel target of 14 million tons set by the Prime Minister is meaningless. Given the coal, an output of 14 million tons in 1948 is practicable. But everything hangs on coal. Four months ago steel workers accepted in principle a 48-hour week in the melting furnaces, but owing to the coal shortage it has not always been possible to provide 48 hours' work for them. Increased resort to oil firing will assist the industry to aim at this target. More important, however, is the urgent necessity to increase iron production at the blast furnaces, for pig iron stocks have been seriously depleted, and supplies of coking coal are still insufficient and spasmodic.

* * *

Dollar Food Cuts

Cuts in food purchases from hard currency areas had been widely expected, particularly as the rapid rise in food prices in these countries, coupled with a fringe of luxury purchases, has contributed to the increasing cost of British imports and the evaporation of the American loan. Mr Attlee put the hard currency saving on food at £144 million a year, but gave no details of the cuts which are contemplated. A large part of the British basic ration has to be met by supplies from the United States, Canada and Argentina, but during the past 18 months quite appreciable quantities of less essential foodstuffs have also been purchased from these sources. In the table below an attempt has been made to compute the possible hard currency savings by cutting the less-essential food imports. Pigmeat, eggs in shell and dried, processed milk, fresh fruit and vegetables, canned fish, luxury meats and various other items such as preserved fruit and vegetables, have been classed as dispensable. In addition, cheese from the United States has been included in the list on the ground that the 70,000 tons imported into Britain last year could be replaced by increased supplies from Australia and New Zealand.

BRITISH FOOD IMPORTS FROM HARD CURRENCY COUNTRIES—1946
(excluding items in the basic ration, apart from bacon)

	U.S.A.	Canada	Argentina
Pigmeat	£mn. 4.8	£mn. 16.8	£mn. 3.6
Cheese	8.8	5.3	1.7
Eggs (shell and dried)	25.4	1.0	...
Milk, processed	7.6	2.7	...
Fruit and vegetables	0.9	4.4	...
Fish	2.7	2.6	3.9
Other foods(a)	7.5	...	...
Total Saving	57.7	32.8	9.2

(a) Includes tongues, extracts and essences, bladders, preserved fruit and vegetables, beverages, cakes and food preparations.

The total dollar saving, on this severe import programme, measured by the cost of such imports in 1946, would be some £100 million a year—or allowing for a 20 per cent increase in prices, £120 million. Strictly speaking a further £5,000,000 should be added to this total for possible food cuts from South Africa, which although not by definition a hard currency country, should in practical effect be included among their number. Thus there is still a gap of £19.24 million before the official target of £144 million is reached, which will have to be covered by a reduction in basic rations from these sources. Grain supplies could not be reduced without drastically affecting the bread ration and feeding stuffs to livestock; the remaining dairy imports from these three hard currency countries totalled only £8,500,000 in 1946. Hence the reduction must fall largely on meat supplies which last year totalled £45½ million from the three leading hard currency suppliers. These would have to be cut by 50 per cent—equivalent to more than a 20 per cent reduction in Britain's total annual imports of meat. British meat stocks at the end of June were estimated to be 100,000 tons or a little over three weeks' supply. The prospects of replacing these cuts in dollar supplies by increased purchases from soft currency areas must be regarded as small.

* * *

Is the Export Target Possible?

It requires the eye of faith to discern any chance of reaching the already postponed export target of 140 per cent of the 1938 volume by the end of next June, and only blind optimism can

Total	84	98	104	111	83.2	101	88.5	102

afford belief that the new end-year target for 1948 of 160 per cent has any realistic basis. Indeed, Sir Stafford Cripps recently used words which almost suggested that the sellers' market had ended. But already conditions in overseas markets are much more difficult than they were a year ago. The accompanying table clearly shows how radical the new measures must be, if the export targets are to be attained. The volume of exports expanded from 84 per cent of the 1938 level in the first quarter of 1946 to 111 per cent in the fourth quarter. Four industrial groups have borne the burden of the export drive—machinery, vehicles, electrical goods, cutlery and hardware—supported to a smaller extent by pottery, apparel, footwear and rubber manufactures. Shipments of iron and steel, non-ferrous metals, rayon and their manufactures, although well above their pre-war level, did not maintain their initial expansion in the second half of the year. Exports of cottons and woollens declined during the first two quarters but recovered in the subsequent period, although by the end of the year their volume was below that for 1938, cottons being only 43 per cent and woollens 89 per cent.

Exports in 1947 have, of course, been seriously affected by the winter fuel crisis, and by raw material shortages. The volume index at the end of June stood at 102, and judging from last year's experience, a rise appreciably above 115 by the end of 1947 would on general grounds seem quite improbable. But an analysis of individual groups during the second quarter of the current year is frankly alarming. Not one single group—with perhaps the unreal exception of machinery whose exports are only now showing its effects—has recovered from last winter's fuel shortage and only iron and steel exports have reached the volume attained in the last quarter of 1946, when they were already affected by a lack of coal. Only two industries expanded their exports, and then only slightly, during the first three months of 1947—machinery and rayon; machinery has since declined slightly and rayon quite perceptibly. The volume of cotton exports during the second quarter remained stationary below their end-1946 level; they are still well under half of the 1938 figure. Iron and steel, non-ferrous metal manufacturers, cutlery and vehicles have all expanded their physical exports compared with the first quarter, but have not yet made up the leeway lost during the February shut-down. Electrical goods showed no significant change, while chemicals, woollens, apparel, pottery, footwear and rubber manufactures—in order of export importance—have all declined considerably.

If the new export targets are to be achieved, a mere diversion of supplies from home to overseas markets will not suffice. Output of all the major exporting industries will have to expand appreciably—and that means increased supplies of fuel, raw materials and labour.

* * *

Survey of Imports

Since the beginning of 1946 total imports have been rising steadily by value, except for a minor set-back in the first quarter of 1947. In both the last quarter of 1946 and the second quarter

of 1947, import values have jumped upwards quite disproportionately to volume. Retained imports during the last quarter reached 77 per cent of the 1938 volume. Food, drink, and tobacco have consistently accounted for half of the total value, and the uninterrupted rise of this group throughout the past 18 months reflects more the rise in world, and particularly in dollar, food prices rather than any substantial increase in quantities.

BRITISH IMPORTS
(monthly averages)

	1938 monthly average	1946				1947	
		I	II	III	IV	I	II
<i>Food, Drink & Tobacco</i>	£ mn. 35.8	£ mn. 46.9	£ mn. 53.5	£ mn. 53.8	£ mn. 58.8	£ mn. 61.9	£ mn. 72.4

Seeds & nuts	2.5	5.1	5.5	4.1	6.1	6.1	11.6
Hides & skins	1.5	2.4	2.1	1.6	3.0	3.6	3.2
Paper-mak'g material ..	1.3	1.2	1.6	1.7	1.6	1.4	2.3
Rubber	1.0	1.1	3.9	4.0	5.0	3.6	2.3
<i>Manufactures</i>	19.5	17.0	18.7	21.9	25.9	23.2	31.6
Others	0.6	2.7	2.3	2.3	0.9	2.0	1.7
Total	76.6	93.1	105.8	109.4	122.9	121.3	151.3
Volume of retained imports	100	63.2	68.7	70.1	72.2	66.7	77.0

The increase in raw material imports has been quite modest until recently. As import prices for raw materials are on average 170 per cent above their 1938 level, it is evident that arrivals are far from commensurate with pre-war imports—except perhaps for rubber and more recently whale oil.

Substantial cuts in imports cannot be made without jeopardising industrial output; hence the balancing of the external trade accounts must depend on an expansion of exports. A movement of the terms of trade in favour of the United Kingdom would bring considerable relief, but there are no reliable indications of it. Indeed, there are signs they are moving in the opposite direction, for costs of imports have been rising more rapidly than the average price of British exports.

* * *

Deteriorating Terms of Trade

Under the pressure of rising import prices, the British terms of trade have become progressively worse. In June, prices for imported goods rose by 1½ per cent compared with a 1 per cent increase in export prices. In both cases the rise was less than in the previous month, but it is significant that import prices are still rising more rapidly than export prices. Among the imported goods, the biggest rise (2 per cent) occurred in the prices of manufactured articles, which play a comparatively small part in the British import programme, but food, drink and tobacco increased by 1½ per cent—the same as in May—and raw materials by 1 per cent—though this was much smaller than in either of the two previous months.

The main rise in export prices occurred in raw materials, which were 2 per cent higher; but they, unfortunately, are the least

important, owing to the cessation of coal exports. Manufactured goods, on which the export drive depends, showed only a small rise; textiles remained stationary at 301 (1938=100), while the prices of metal goods increased by 1½ per cent. The following table shows the trend in import and export prices over the last four months:

INDICES OF IMPORT AND EXPORT PRICES (1938=100)

Index	March	April	May	June
<i>Imports prices:—</i>				
Food, drink and tobacco	226	229	232	236
Raw materials and articles mainly unmanufactured	246	254	268	271
Articles wholly or mainly manufactured	216	223	232	237
Total	229	234	241	245
<i>U.K. Exports prices:—</i>				
Food, drink and tobacco	217	216	217	219
Raw materials and articles mainly unmanufactured	218	218	222	227
Articles wholly or mainly manufactured	220	221	226	227
Metal goods	199	200	204	207
Textiles	294	297	301	301
Other manufactures	210	214	218	220
Total	220	221	225	227

The development of relative import and export prices over the past 15 months, indeed, shows a dangerous trend. When calculated on the basis of a three months' moving average to even out fluctuations, import prices show an increasingly upward tendency since the beginning of 1947, and raw materials import prices have risen even more steeply. Export prices have been rising slowly, but at a fairly constant rate throughout the period, though there has recently been some tendency for the curve to flatten out. One of Britain's major hopes in bringing the balance of payments into equilibrium has been for an improvement in the terms of trade—that is, the ability to export a smaller quantum of manufactures to secure a given quantum of imported foodstuffs and raw materials. But even if the prices of both imported foodstuffs and raw materials tend first to be stabilised and then to fall, the relief will be illusory if by then the world seller's market has already swung in favour of buyers. And even on the most optimistic assumptions, a substantial increase in the physical volume of British exports will still be required to bring the external account into balance. The recent trend of export prices suggests that we may make the worst of both worlds—by selling exports too cheaply relatively to imports during the period of post-war scarcity and by trying to sell them too dearly after the exuberance of the seller's market is over.

The Scarce Currency Clause

Messages from Washington have suggested that a way out of the gathering dollar crisis would be an invocation of Article 7 of the International Monetary Fund agreement. Under this article a currency in which the Fund finds that "a general scarcity is developing," can be declared "scarce," thus opening the door to any discriminatory treatment against the country in question. The idea would be to declare the dollar scarce at this moment, a step which would nullify the non-discrimination clause of the Anglo-American loan agreement and which furthermore would allow restrictions in current payments to the United States

—in particular, a suspension of convertibility of other currencies into dollars. The suggestion holds the vision of an attractive short cut to all kinds of remedial measures for present difficulties.

It must, however, be admitted that it could only be taken by virtue of an extremely elastic interpretation of the articles of agreement of the Fund. Whatever may be happening to the supply of dollars in the world outside the United States, it is all too evident that the dollars in the hands of the Fund have scarcely been touched. The whole gist of Article 7 of the IMF agreement and of the measures by which it proposes to restore the Fund's holding of a scarce currency carries the clear indication that "scarcity" in the context of this agreement means scarcity of dollars in the hands of the Fund. These dollars amount to some \$2,750 million, while in addition the Fund holds gold which could be offered for sale to the US Treasury in order to replenish the Fund's supply of dollars.

Even if every other member drew its full permissible quota in terms of dollars the supply of these, allowing for their replenishment by sales of gold, would last rather more than two years. On the strict interpretation of the Fund agreement, therefore, this particular remedy does not carry the promise of sufficiently rapid operation. Meanwhile, there remains the surprising contrast between the growing shortage of dollars in the world and the absence of purchases from the Fund. It is clear that that institution is conceiving itself more and more as a fair weather mechanism and that member countries have been left in no doubt by the management that if they do not wish to court rebuff they had better not approach the Fund for assistance at the present juncture. This was hardly the policy for which Lord Keynes laboured.

Cotton Purchasing Policy

Stocks of raw cotton in the United Kingdom have been built up over recent months from 389,000 tons at the end of 1946 to a peak of 446,000 tons at the end of last April. These figures are substantially above the wartime and even the prewar levels; stocks at the end of 1938 were only 311,000 tons. In May, stocks declined slightly to 443,000 tons, and it is thought that this downward trend has been continued during June at an approximately similar rate. Average weekly consumption for all purposes in 1946 was 7,250 tons; in the current year, the fuel crisis has reduced this figure to between 6,500 and 6,750 tons. There is thus some 14-16 months' stock in this country, which includes all raw cotton held by the Cotton Control, cotton spinners and other consumers and an estimated weight for quantities of raw cotton unloading at the ports and in transit.

The Government is therefore well able to contemplate the postponement of further purchases for at least six months. It will be an interesting test case to see what effect Britain's abstention from the world cotton market will have on prices. But the saving of dollars will not be very large as the Cotton Control has for some months been buying larger quantities of cotton from non-American sources—including Brazilian and even some Russian supplies. Nevertheless over any long period, Britain would have to become once more a customer of the United States, unless other producers of American type cotton can be encouraged to expand their output substantially. If postponement of purchases should, in fact, lead to a fall in American prices, will this mean that British spinners a few months hence will be paying more for raw cotton than their overseas competitors? And if the recovery of cotton exports, from which so much is expected, encourages an expanding rate of production in Lancashire, care will have to be exercised lest raw cotton stocks, like those of many industrial raw materials, are run down below the safety margin.

Increased Railway Charges

The announcement by the Minister of Transport in the House of Commons last Tuesday—one day before the Transport Act was placed on the Statute Book—that rail charges are to be increased from October 1st next from an average of 28 per cent over prewar to 55 per cent was no surprise. Indeed, it has been apparent since last winter that unless there was to be a substantial deficit on the control net revenue account this year, which would have to be met by the Exchequer, an early increase was essential. The true position was originally confused by the Charges Consultative Committee, who reported on November 15, 1946, that they estimated the deficiency in 1947 at about £9 million, whereas the evidence they had from the railways put it at rather more than twice that amount. However, Mr Nicholas

Kaldor, giving evidence "solely as an economist" on behalf of the National Coal Board, then estimated that the gross receipts from passengers and freight would not be less than £322,512,000 and might reach £339,023,000, compared with the railway estimate of £306,240,000. Mr Robert Shone, the economic director of the British Iron and Steel Federation, confirmed Mr Kaldor's view, and Mr A. W. White, "a chartered accountant with long experience in railway accounts," thought the figure would be £330,000,000.

By March of this year, however, it became evident that these optimistic forecasts were very wide of the mark, and the net deficiency was then put at £32 million, due in part to the fuel crisis. Now the Minister has disclosed that the deficiency will be £37 million, to which must be added £22 million for the higher wages and shorter hours recently conceded. Even when charges are raised to 55 per cent above pre-war from October next, there will be a deficiency of £43½ million this year to be met by the Exchequer. The main reason for such a large shortage is that the increased charges will only operate for three months of 1947. It is thus a case of bad estimating in the first instance and belated action since; at least one-third of this deficiency which the taxpayers will have to meet could have been avoided.

The Minister's decision to remove the existing differential on the different types of traffic—broadly speaking, passenger fares are 33½ per cent above prewar and freight rates 25 per cent above—and to equalise the increase of 55 per cent above prewar is clearly sound in principle, and although there might be some doubt about its appropriateness in the present economic crisis, on the whole it is not open to criticism. As a general principle, transport charges should be based on transport considerations, and there should be no subsidy of one type of traffic by another for other reasons. The prospect for 1948 shows an estimated deficiency of £65 million, compared with the annual rental payments—which, of course, ceases at the end of this year—and the yield from the increased charges will produce roughly this sum. Thus the Transport Commission will take over on January 1st next with a healthier prospect of earning a net revenue of £40 million or so from its railway operations than seemed possible before these increases were announced. There are, however, many special intangibles about next year, and it is unlikely that even the most expert forecasting will anticipate them.

A European Exchange Plan?

It has not taken long for the European Economic Conference in Paris to stumble on one of the main obstacles to European recovery, to which no recognition was given in the initial phase of the discussions. This is the problem of the wide disparities in price and cost structures in Europe. Expressed in another way it is the artificiality of the present rates of exchange of many participating countries. The question was first acknowledged and approached by the decision to include among the questionnaires to the participating countries one dealing with the balance of payments. In framing answers to this, it would be difficult in the extreme to avoid reference to obvious discrepancies in the external valuation of various European currencies, for these discrepancies must play a very prominent part in perpetuating the prevailing balance of payments difficulties.

The subject has now been brought more clearly into the limelight by a proposal sponsored by the "Benelux" delegation, which suggests partial inter-convertibility of the currencies of the 16 participating nations. Needless to say, the scheme clearly recognises that one of the conditions of its introduction and successful operation must be that each country should take the necessary measures to stabilise its domestic financial conditions and to adjust the value of its currency in the exchange markets to a figure bearing a realistic relationship to its purchasing power parity. One country, Italy, has done something in this direction, by devaluing the lira. But this is only one half, and the easier half, of the task. The financial rehabilitation has yet to come.

A scheme for European inter-convertibility would have much to commend it. It would extend the principle on which the increasing multilateral availability of sterling has been developed through the operation of transferable sterling accounts. The scheme would be fully compatible with the Bretton Woods agreements and could, at the appropriate moment, be dovetailed into the wider convertibility propounded in those agreements. Before convertibility could be made complete and effective in terms of US dollars, additional dollar resources would, of course, have to be made available from the United States—either collectively or individually to each participating country. But the most important condition for the establishment of such a scheme must

be the framing of the relatively stable financial setting, in which alone it could operate. This would imply a reversal of the inflationary policies that are now being pursued in a number of participating countries, and the abandonment of the artificial pegging of the currencies concerned. This would help to close those yawning holes through which gold and foreign currency reserves are now pouring. For this reason the "Benelux" scheme would, in the first instance, be intended only to cover the countries which are in reasonably stable financial conditions, namely Britain the "Benelux" group itself and the Scandinavian block. If Britain should be forced to abandon full convertibility of sterling, inter-European convertibility with due safeguards, might provide a useful hedge.

* * *

Bank Investments in July

The London clearing bank figures for July show virtually no net change in the total volume of banking credit outstanding. Deposits have risen by £14,334,000, but since cheques in course of collection and transit items have fallen by £16,289,000 the total of true deposits is substantially unchanged over the month. This stability is the product of a number of divergent movements. The most important of these is a fall of over £47 million in Treasury deposit receipts and a rise of £27,776,000 in bills discounted. Money at call and short notice has fallen by £8,677,000.

At first sight it may appear a surprising movement, given the extent to which the discount market is believed to have bought short bonds in recent weeks. In this connection, however, it should be realised that the greater part of the market's bond money comes from lenders other than the clearing banks. The most interesting move in the July returns is their revelation of a rise of £9,231,000 in investments, a movement which confirms the widespread belief that the banks have offered moderate support to the gilt-edged market in the recent decline. Advances continued their steady expansion, and at £1,129,103,000 they are about £9,713,000 higher on the month and more than £250 million higher than a year ago.

New Companies Act Timetable

Section 119 provides that the Companies' Act which received the Royal Assent on Wednesday, is to come into force on such day as the Board of Trade may appoint, and that different days may be appointed for different parts of the Act. The Lord Chancellor on Tuesday gave some indication of the Government's intended timetable for introducing the changes. It is intended first to bring into force without delay the concessions and alleviations—such, for example, as that relating to the disclosure by directors of their previous nationality or previous names. Secondly, the Government will bring into force as soon as possible the provisions which place duties on the Board of Trade rather than upon the business community; obvious examples of such provisions are the new powers governing investigations into the affairs of companies and share ownership.

On the question of accounts, on which the governing provisions are largely self-contained in the Act, the Government rightly stresses the great importance of making them operative as soon as possible. On the other hand, they cannot be put into operation without giving due notice to the business community and the Lord Chancellor has suggested that not less than six months would be given. There remains finally the enforcement of detailed provisions in the Act which will if possible be deferred until the new Act is consolidated with the old, a step which the Government hopes to take during the next Session. But consideration will be given to any requests to bring into operation at an earlier date any provisions which are likely to be helpful to the business community and the Government has reserved the right to bring into force any particular provisions that appear to be necessary in the national interest.

Difficulties for British Car Exports

The production of both motor cars and commercial vehicles achieved record post-war levels in June. Private car production reached 29,268 units and commercial vehicles 14,826. As the accompanying table shows, these results are above the pre-war monthly average production of 28,417 and 8,667 respectively—indeed commercial vehicles continue to forge ahead towards a 100 per cent increase on the pre-war rate of output. These comparisons, however, are in terms of averages; if instead the pre-war

record output of 46,000 cars a month is used as a datum, the part played by shortage of materials in severely limiting production becomes much more evident.

Manufacture for export in June touched record levels both for private cars and for commercial vehicles. Private car production for export reached 13,750 units, about twice the 1938 level of production for export while commercial vehicles produced for export were about four times as high. Actual exports of all vehicles by value over the six months January to June this year were about equally divided between the Empire and foreign countries.

MONTHLY PRODUCTION OF PRIVATE CARS AND COMMERCIAL VEHICLES

	Private Cars			Commercial Vehicles

* Estimated. § Including vehicles for the Services. † Actual exports.
Source: Monthly Digest of Statistics and The Society of Motor Manufacturers and Traders.

The halcyon days in the export market, however, seem to be drawing to a close, and there are serious portents of sterner days ahead. Sweden, for instance, which took no less than 19 per cent of all car exports to foreign countries last June has recently placed a temporary embargo on all vehicle imports from this country. But Sweden is only one example from a rapidly growing list. Currency restrictions have now placed a barrier of temporary embargoes, licence restrictions or reduced quotas for exports of British cars to the following countries:—

Argentina, Belgium, Chile, China, Czechoslovakia, Denmark, France, Greece, Holland, India, Norway, Peru, Spain, Syria, Lebanon, Turkey, Uruguay, Brazil, Ecuador and Mexico.

Many of these restrictions have come into force since free convertibility of sterling became operative on July 15th and the list of countries, it must be feared, will lengthen further.

These restrictions though they may be intended as temporary only, deal a severe blow at the car export trade. The Nuffield organisation has already announced that £1,000,000 worth of export orders have been cancelled because importers were short of sterling. But there are other complications—the British motor vehicle industry will now find it more difficult to build up its goodwill and trade connections in foreign markets in preparation for the day when new British export models become available and each week that passes brings the threat of acute American competition nearer to reality.

* * *

Slow Recovery in Wool Textiles

Production of wool tops was slightly affected by holidays in June, but the general trend of wool textile output since the first effects of the fuel crisis were surmounted has been one of steady, if unspectacular expansion. The trend, at least, is encouraging, for every yard of cloth or pound of yarn won this summer in the face of shortages of coal and labour is of real importance for the export drive.

Employment in the industry in the first week in June was 181,200, compared with 179,500 in April and 166,400 last September. These figures include clerical and part time workers, so that the full extent of the gap between the current labour force and the national target of 200,000 suggested by the Wool Working Party is not revealed by them. The increase, such as it is, seems to be fairly evenly spread over all sections of the industry, but after allowances for part time and clerical workers, there was a net increase between April and June of only 400 worsted spinning employees and 300 woollen spinning employees. This is scarcely a satisfactory rate of recruitment of spinning operatives.

The accompanying table shows deliveries of wool yarn, fabrics and blankets for 1942, the first year for which figures are available, for 1946, for the fuel crisis month and for the latest month. Output in May in each case compares quite favourably with the production levels attained in the last quarter of 1946, but the fall in the production of tops in June to 4.43 million lb. compared with 4.74 million lb. in May, suggests that there may have been a slight setback in woollen and worsted deliveries over the same period. The lion's share of the recovery in production during the spring months has gone, as the table shows, to the home market, which

**British Films
deserve
a fair show on
British Screens**

British films have earned their place at the top of the bill at British cinemas by sheer merit. As more and more British first feature films come along they should be assured of a fair show. The Film Quota Act, without which British films could not have reached their present strength, is due to expire in a few months. It should be replaced by an improved Act which will not only give British films a fair show, but ensure that our big pictures do not have to play second fiddle to anyone.

**AN IMPROVED FILM QUOTA ACT. WILL
GIVE THEM THE PLACE THEY DESERVE**

British Film Producers Association

COMPANY MEETINGS

CARTER AND COMPANY,
LIMITED

A YEAR OF PROGRESS

The thirty-ninth ordinary general meeting of Carter & Company, Limited, was held, on the 31st ultimo, in London.

Mr C. Cyril Carter, the chairman, in the course of his speech, said: It has been for us a year of progress in many directions. All your companies have been working for the full twelve months and all of them have made profits. The export trade of your company before the war was not large; we had developed and become very prominent in certain rather specialised activities in the building trade in this country. When the war put an end to those activities for a time, a substantial export trade was developed by those of your companies engaged in the making of tiles, and it is our hope to maintain that, and in fact increase it. Only one thing prevents us increasing it still more now, and that is the shortage of labour.

I want you to know that we are giving a lot of attention to these things, with a view to equipping our factories for maximum output, but it is at times slow work, as you will appreciate, because deliveries of necessary machinery and equipment are inevitably slow. Reference was made last year to the need for considerable expenditure at our Stoke-on-Trent factory. We have made a start there, but have met with one or two setbacks which have held us up, in spite of which the factory has got going again and increasing its output. I have referred already to the Poole Pottery works. The distinguished wares of fine quality for which the company had made a name for itself are now being produced again, for export.

(Continued from page 258)

of gold bars, thus putting legal sanction behind the recent request of the Federal Reserve Bank of New York that no dealings in gold should take place at more than the official price of \$35 per ounce. The Philippine Government has also taken steps to prohibit gold operations at more than the authorised price and to prevent the renewal of gold export licences. The Philippine move is of considerable importance, as these islands have provided one of the main channels through which gold has been reaching the Far Eastern markets, whose appetite for the metal has proved almost insatiable.

* * *

Higher Cement Output and Prices

Cement production made a good recovery from the fuel crisis, but costs are rising and acute shortages are reported in some areas. Output in the average week of February was only 48,000 tons, compared with 110,000 tons in the average week in January which was by no means a month of high production. Since February, production has gradually recovered and by the last week in July it had reached almost 163,000 tons—that is, 10,000 tons above the previous post-war peak of 153,000 tons recorded in October, 1946.

By last November the scale of cement production had expanded sufficiently for the industry to reduce its prices by 2s. a ton. But the low output between January and June and rising coal and transport costs have together provided the justification for the Ministry of Works' recent decision to raise Portland cement by 1s. a ton to 56s., with the same increase for rapid-hardening cement.

Under the summer coal scheme, the building materials industries were expected to receive about 85 per cent of their requirements, and cement perhaps slightly more. In the event, coal deliveries have not always proved to be the same as allocations and some cement works are still suffering from a coal shortage. In some regions the scale of production is below the optimum level and in areas like the West Country and South Wales, which

Although in common with other tile makers we have very much restricted the range of our products, with a view to getting the greatest possible output, demands for the special work for which we are so well known are gradually increasing and we are equipping ourselves by training the necessary craftsmen to carry out such work when it can be undertaken, and we have had sympathetic help from the Government departments concerned, in this matter.

SUBSIDIARY COMPANIES' CONTRIBUTION

You will note the substantial contribution the subsidiary companies have made to the profits of the year. The turnover has increased as labour has been available, and that must account for the improved position presented to you, but costs of fuel and raw material have risen against us to detract from what would otherwise have been still better results.

We have the satisfaction of knowing that the things we make are the best of their kind. In design and quality our name stands very high. Everything we make is a solid contribution to building (to housing or to the rehabilitation of industry) the only exception being that of the Poole Pottery, which is, to an unfortunately limited extent, meeting domestic needs and, to a still more restricted extent, ministering to the æsthetic satisfaction of householders.

I wish our general contribution could be greater, and I feel that it could be if some of the valuable labour and raw material used in the making of the trashy rubbish made and sold in this country to-day could be diverted to more useful channels. We feel that the sound financial position of the company, which has often been referred to, will be even sounder if we make wise use of our resources to that end.

The report was adopted.

NEW BROKEN HILL
CONSOLIDATED, LIMITED

A YEAR OF PROGRESS

The eleventh annual general meeting of New Broken Hill Consolidated, Limited, was held, in London, on the 7th instant, Mr John R. Govett, the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts for the year 1946:—

The year under review has been one of progress. In the year 1946 ore production from our own leases totalled 41,723 tons, of which 29,459 tons came from the zinc lode and 12,264 tons from the lead lode.

In order to determine the position of the footwall shear in the area of the proposed upcast airway and to obtain any information about possible ore bodies, a series of bore holes have been planned.

While it is too early yet for us to attempt an assessment of ore reserves in the usual terms, we have no doubt that the programme on which we have embarked is well within the limits of the ore that will be developed in the area extending to a point 3,000 ft. south of our Northern boundary. It will be appreciated, of course, that in adhering to our time-table we are dependent not only on obtaining the necessary manpower—which we believe will be available—but on maintenance of delivery dates by manufacturers of plant and equipment in Australia and the United Kingdom. I look forward to being able to give you next year a report of further satisfactory progress, and with the higher range of metal prices so far experienced this year I believe I am entitled to say that you may expect your company to reach the dividend-paying stage.

The report was adopted.

are some distance from the main centres of production, an acute shortage of cement has developed.

There are better arguments for giving cement its full coal allocation than for any other building material industry. Indeed, it is impossible at present to have too much cement. The Ministry scheme to be spread over the next two years which will consume big tonnages of cement. Houses and new factories will need large quantities and the export market has been starved since the export quota was cut just before the fuel crisis, when the industry ran short of kraft paper bags. Stocks in the pipeline are low and must be replenished if the building programme is to run smoothly during the autumn.

Shorter Notes

In continuation of the Treasury's policy of anticipating maturities of Defence Bonds by offering conversion terms well in advance, holders of 3 per cent Defence Bonds maturing between November 1, 1947, and April 30, 1948, are invited to continue their bonds until the next interest date, May 1, 1948 (when a payment of six months' interest and a maturity premium of £1 per cent will be made), and to convert into the same amount of 2½ per cent Defence Bonds repayable at £101 for each £100 nominal value on May 1, 1958.

*

The Trustees of the Houblon-Norman Fund, on the recommendation of the Advisory Committee, have made the following awards for 1947-48:—*Fellowships (renewed for a second year)*: P. J. Watkin, B.A.—Financial Facilities for Industry in South Wales. *Research Grants*: D. R. Marsh, B.A.—Rise and Growth of Corporate Executors and Trustees; *Renewed for a second year*: P. S. Sumner, M.Sc., B.A.—The Economics of Investment Trusts.

An offer of awards for 1948-49 will be made early in 1948. Further information may be obtained from the Secretary, Houblon-Norman Fund, c/o Bank of England, E.C.2.

GENERAL ELECTRIC
COMPANY, LIMITED

DEMAND EXCEEDS SUPPLY

The annual general meeting of the General Electric Company, Limited, was held, on the 31st ultimo, in London.

Sir Harry Railing, the chairman, said that the profit, after providing for E.P.T. and profits tax, amounted to £2,270,965, compared with £2,300,554 a year ago, a slight decrease of £29,589. The result had been achieved in spite of the setback suffered on account of the fuel crisis. The net profit was £905,201, against £956,413, and they recommended a dividend of 10 per cent. per annum and a bonus of 7½ per cent. on the ordinary stock.

He had explained last year the tasks ahead of them, namely, to increase their productive capacity in all fields for capital and consumer goods for home and export. They were valiantly struggling to overcome, within the limits set to them, the difficulties which confronted them in regard to adequate buildings, new tools, labour supply and raw materials. They had successfully changed over from production of war materials to normal peace production, but were handicapped by the necessity of changing their plans with the ever-changing picture dictated by national requirements.

They were doing their utmost to play their part in the call for increased production in all fields. They had increased, and intended to increase still further, their output for capital goods in connection with generating plant, in connection with transmission and distribution plant and traction work. They had replaced the manufacturing capacity in telephone and radio transmission plant which had been destroyed during the war and had extended it by additional works. They were doing their best to start factories in districts where labour was available.

TASKS IN MANY FIELDS

The urgent need for the country to extend the power supply to mechanise the mines and increase coal output, to increase the production of steel, to re-equip transport and shipping, to increase means of communication and to improve exports could only be satisfied with the help of this company.

All those demands on them had involved them, and would still further involve them, in heavy capital commitments. In each of those fields during the reconstruction period, as during the period of the war, they had to play a prominent part.

The demand for most of their goods at home and abroad was in excess of their output. He was of the opinion that that would continue for some time, anyhow as far as capital goods were concerned. In regard to some of the consumer goods, the outlook was becoming somewhat less promising. Their output and means of expansion for the coming year were both entirely dependent, first of all, on the supply of coal and then of power, steel and other raw materials. It was impossible to make sufficient progress in any direction until those barriers were removed. One could not be optimistic about the immediate industrial outlook. They might have further setbacks and disappointments in regard to coal and the quick amelioration of the shortages from which they suffered. But it was surely impossible to imagine that any responsible party, management or section of workers would knowingly persist in any measures which, at the present critical juncture, tended to increase the difficulties in any way and thereby deliberately prevent us from maintaining our standard of living. The clear task was an immediate increase in production. Past history showed that whenever they had been given a task, which was understood by all, they had jointly solved it.

The report was adopted.

GEORGE NEWNES, LIMITED

INCREASED DIVIDEND AND FIVE PER CENT. JUBILEE BONUS

The fiftieth annual general meeting was held on the 31st ultimo at the company's head office.

The following statement by the chairman, Sir Frank Newnes, Bt., was circulated with the report and accounts:—

This year the company presents its fiftieth balance sheet and profit and loss account. It happens also that its Jubilee coincides with the largest net profit in the history of the company.

In such happy circumstances the directors propose that the company's Jubilee year should be celebrated by payment of a special bonus of 5 per cent. This is in addition to the proposed increase in the dividend on the ordinary shares from 12½ per cent. to 15 per cent.

For the five years preceding the outbreak of war the average dividend paid on the Ordinary shares was 13 per cent. per annum. The average paid since 1940 has fallen to 9 per cent. per annum. The directors thus feel that, in view of the enhanced profits and the powerful financial position of the company and its subsidiaries, the Ordinary shareholders are fully entitled to the increased payments recommended.

THE ACCOUNTS

The net profits, after making all charges and providing for taxation, amount to £191,604. This compares with £151,893 for the previous year.

With the amount of £61,923 brought forward from last year, and after deducting dividends on Preference shares, there is an available balance of £212,254. The proposed dividend on the Ordinary shares requires £75,000, and the special Jubilee bonus £25,000, and after transferring £5,000 to staff sick and pension fund, £25,000 to general reserve and £20,000 to development and reconstruction fund, there remains a balance of £62,254 to be carried forward to next year's accounts.

The items in the Newnes balance sheet show few marked changes. "Freehold and Leasehold Premises" at £229,762, has risen by £88,097 as a result of further acquisitions to meet the growing needs of the business. "Investments" at £874,732, showing an increase of £77,473, represents new enterprises in which the company has become engaged. Stocks at £170,963 are higher by £42,129. These additional outlays are reflected in a reduction in our holding of British Government Securities, which at £87,738 shows a fall of £74,222; and cash at £302,762 is lower by £31,797.

The consolidated statement sets out the financial affairs of the Newnes group of companies as a whole. With George Newnes Limited as the parent company, the other companies are: C. Arthur Pearson Limited, Country Life Limited, W. H. and L. Collingridge Limited, National Trade Press Limited, Leach's Publications Limited, London Opinion Limited, British Aviation Publications Limited and Newnes Educational Publishing Company Limited.

The latter company, recently formed, is planning to enter the educational book market, and the services of Sir Frederick Mander, who holds an eminent position in the educational field, have been secured. He has become a Director of the new company and is now actively engaged in its affairs. Mr Charles Pearce, the popular and well-known general secretary of the London Teachers' Association, has also joined the board.

STRONG GROUP FINANCES

The figures of the consolidated statement disclose a strong financial position. Reserves

total £817,576, in addition to which a sum of £379,992 has been set aside for development and new enterprises as and when suitable opportunities arise. Balances on profit and loss accounts amount to £233,389. Stocks at £259,322 have risen by £66,820. Government securities at £114,797 are £149,222 lower. Cash has increased by £66,128 to a total of £679,973, in addition to which we have tax reserve certificates of £445,350 to meet our obligations in that connection. "Freeholds and leaseholds" at £326,044 have increased by a net amount of £35,462.

Trade investments at £339,094 are £183,094 higher. Plant at £28,746 is £62,545 lower. These changes reflect the arrangements which were completed in the current financial year whereby the printing interests of the Newnes & Pearson Printing Company, together with the factory and the bulk of the machinery were acquired by W. Speaight & Sons. As was stated last year, we retain a substantial interest in Speaight & Sons, which is conducted by a joint board appointed by Financial Times Limited, our partners in this enterprise, and ourselves. The new arrangements are working smoothly and well, but the increasing benefits expected from the merger are being retarded by the difficult paper supplies which threatens to become even more difficult rather than easier.

The various companies have paid substantial amounts as excess profits tax during the period the tax has been in force, and it is now computed that a net amount in excess of £150,000 will fall due to be repaid to the company.

PAPER SUPPLY PROBLEMS

The publications, while fully maintaining their sales to the extent the very limited paper rations permit, have been able to make little progress in the direction of additional pages and higher quality of production, both of which steps we consider to be essential at the earliest moment in studying the long-term interests of the business. Furthermore, advertisement space is still very strictly limited, although every possible care is taken to ensure that the allocation is fairly spread among the many advertisers using our journals.

It has come as a shock to the periodical publishing industry to find that after waiting patiently for a long time for a very moderate improvement in paper rations, it has recently had to move backwards rather than forward. The paper supply position has deteriorated in a manner to cause us deep anxiety. Arising out of the fuel crisis in the spring, paper supplies were reduced from 40 per cent. of pre-war to 35 per cent. Whilst causing a severe and costly setback, we regarded this as a temporary misfortune, but unhappily we have already been notified that the lower figure is to continue up to November. After that, the possibility of an improved position is by no means reassuring judging by present indications. In addition, paper prices have just been sharply increased. The result of all this is to create new and embarrassing problems, to which we are now applying ourselves.

No one would wish to minimise the serious economic problems with which the Government is confronted, nor to put forward claims on behalf of any section of industry not consistent with those problems. At the same time one cannot but feel that the highly important services the periodicals are able to render to the country are being restricted more than they should be, even in the present difficult conditions. A moderate increase in paper supplies would enable the periodicals to perform additional services to the public, to the business community, and to the considerable personnel engaged upon their production, out of all proportion to the comparatively small extra tonnage involved.

Early this year Mr H. Tingay, managing

director, and another director, Mr. H. Patchett, carried out a round-the-world tour by air, visiting Australia, New Zealand, Canada and the United States of America. It was mainly a goodwill visit to re-establish personal contacts with a wide circle of business interests which it had not been possible to maintain under the prevailing conditions of recent years. For the same reasons other directors and executives have visited the United States and Canada during the year.

"COUNTRY LIFE" FIFTIETH BIRTHDAY

"Country Life," as well as George Newnes Limited, attained its jubilee during the year, having first been published on January 8, 1897. To mark the occasion a dinner was held at the Dorchester Hotel, at which impressive testimony was paid to the high prestige this journal enjoys. Messages were read from His Majesty the King and Her Majesty Queen Mary, and among the 400

BRITISH PLASTER BOARD, LIMITED

PROFIT MAINTAINED DESPITE DIFFICULTIES

LORD BELPER ON THE OUTLOOK

The thirtieth ordinary general meeting of the British Plaster Board, Limited, was held on the 31st ultimo at 20 St. James's Square, London, S.W., the Rt. Hon. LORD BELPER, the chairman, presiding.

The chairman, in the course of his speech, said: Before charging tax, the profits for the year are approximately the same as for the previous year, but an additional amount is now required for the dividend on the increase in the issued capital, and there has had to be found a sum to meet the new profits tax which accrues as from January 1, 1947. There is, however, sufficient profit to maintain the dividend on the ordinary shares at the same rate as that paid for some years past, and still leave a small sum to be added to the balance carried forward.

As you will have observed, the balance-sheet reflects the considerable extensions in mine and plant capacities, some of which have now been completed. The increase in the amount of shares in subsidiary companies from £1,208,551 to £1,240,633 is accounted for by the acquisition of the Raynal Manufacturing Company, Limited, to which I referred last year, less an adjustment occasioned by the writing down of the holding in Peter Ford and Sons, Limited, to a figure commensurate with the net assets remaining in that company. A settlement has been reached with the Air Ministry in connection with the explosion at the Fault Mine and works of Peter Ford and Sons, Limited, and the difference between the amount of the settlement and the net assets remaining in that subsidiary, accounts for the increase in the capital reserve of £59,310. There is a new item in the balance-sheet representing shares in an associated company, which cost £125,000. This refers to your 40 per cent. holding in Gypsum Industries, Limited, of South Africa, now taken up, following the announcement made in the Press during May, 1946.

SURPLUS OF ASSETS

In my statement to you last year, I remarked upon the surplus of £920,630 of current assets in excess of current liabilities. This year, you will see that the current assets amount to £1,450,144 and the current liabilities, including the provision for dividends now recommended, amount to £291,646, leaving a surplus of £1,158,498. The current assets as shown in the consolidated balance-sheet amount to £2,942,558 and the current liabilities, including dividends now recommended, amount to £718,719, leaving a surplus of £2,223,839; the corresponding surplus disclosed by the previous year's consolidated balance-sheet

guests were distinguished representatives of the Church, the Arts, Agriculture, Sport, and many leading advertisers and executives of kindred interests, and the various national causes with which "Country Life" has identified itself during the past fifty years.

Commencing this year the Company proposes, in response to requests from a number of shareholders, to revert to the pre-war practice of paying interim dividends in respect of the Ordinary Shares. We have a considerable number of small shareholders, and feel that the course proposed will be welcomed. It should be made clear, however, that the resumption of interim payments does not imply any increase in the total dividend for the year.

Again I have to pay high tribute to the loyal and devoted work of the staffs of the various companies, and to express to all concerned the thanks and appreciation not only of the directors, but I am sure, of the shareholders, too.

The report and accounts were adopted.

being £1,791,156. Your company is, therefore, well placed to finance the completion of the various extensions in progress.

The balance-sheet has been strengthened by useful additions to the reserves. Share premiums on the recent issue of new ordinary shares yielded £851,686, and the capital reserve account has been increased by the £59,310, to which I have already referred. Your directors had these facts in mind, in making their recommendation to maintain the dividend.

IMMENSE DIFFICULTIES

Reviewing the year which lies behind us, there is still, I fear, all too little understanding in this country as a whole of the immense difficulties under which those of us responsible for the production of goods or services are labouring; difficulties, that is, which are the inevitable result of superimposing upon industry an ever-increasing number of self-contained bureaucratic machines, too vast and too independent of each other for practical co-ordination.

In the "Economic Survey for 1947" presented a few months ago by the Prime Minister, there was encouraging evidence of the Government's realisation of the need for co-ordination, and Government Departments, employers and labour were urged to consult together, thus expediting the solving of the many problems.

NOTEWORTHY ACHIEVEMENTS

I want you to know that the figure of profit, before taxation, of £592,910 has been earned in the face of a large measure of such troubles as have beset industry as a whole. However, there are a number of achievements to record. The prices of our considerable outputs of plaster boards have been reduced and in the main, the prices of the rest of our numerous products have been held steady. Our workers have received increases in their wages and a pension scheme for our staffs has been agreed upon by your board, subject to consideration, in due course, of the relative clauses in the latest Finance Bill.

Whilst I hasten to disclaim it as an achievement, I make mention here of the benefit which the Chancellor of the Exchequer has gained by way of the new profits tax as from January 1st. Your company, although essential to the war effort, was never permitted to make profits as large as those earned in world-wide competition before 1939, and so never attained the payment of excess profits tax. This latest form of tax is, therefore, for us, not an alternative but an entirely new and additional burden.

The consequences upon your company's

affairs of the fuel crisis were considerable and, as has been pointed out on behalf of other industrial concerns, succeeded in doing that which all the efforts of our enemies failed to do. It closed down almost all our mines, mills and factories for a number of weeks.

Whilst, therefore, the personnel of your company have received benefits, the full brunt of the fuel crisis in the latter part of our financial year, followed by the new profits tax, has fallen on the shoulders of the company's 14,000 shareholders, who must look to the future for some alleviation of the loss in purchasing power of their dividends, the rate of which has not been increased for a number of years.

NATIONAL INTEREST SERVED

The national interest has been well served by your company. Apart from the stability of the sales prices, there has been a substantial increase in the production of all the main products, as compared with the previous year. I single out for special mention the production of gypsum from the mines. In spite of the loss of output during the fuel crisis, the total production for the year was 6 per cent. greater than the best achieved in pre-war years and the rate of extraction is still increasing. This position is due, principally, to the mechanisation of our mines now proceeding, and there is expectation of reaching our gypsum rock production targets before the end of 1947, thus enabling the full potential demand of this country to be met.

The rest of your company's expansion schemes, principally in the gypsum plaster and plaster board fields, are making progress, although slow in some cases, because of delays in delivery of plant.

In these difficult times, you doubtless look to me to submit a view, however tentative, of the future prospects of your company. I feel I shall best serve this purpose by stating the simple facts as I see them.

Your company depends for its prosperity mainly upon the building industry. This country has need of building activity to a degree beyond anything previously experienced. It is surely to be assumed that we shall eventually achieve a rate of building in excess of that prevailing in pre-war days. Your company, together with its competitors, will presently be in a position readily to supply the full requirements of their products, if we can also assume availability of fuel and other raw materials. The long-term future appears, therefore, to be assured.

PRESENT POSITION

In the meantime, the rate of new building operations is a fraction only of pre-war rates. The effect of this lamentable position is, at present, offset so far as your company is concerned, by a demand for materials for repairs and for construction of pre-fabricated houses, to a point where there continues to be a demand in excess of supply. I trust the building industry can be enabled to get into its full stride before the requirements for repairs and pre-fabricated houses have been largely filled. To avoid any such gap, the building industry will certainly need, and need quickly, a great deal more freedom from restriction and, in certain sections of the industry, both workmen and employers will have to find ways of achieving far more effective production for each hour of their labours.

So far as concerns your group of companies, you will no doubt have appreciated from my remarks that production in relation to manpower has shown satisfactory progress. I know you will wish to join with me in thanking the personnel of all sections for their efforts during a difficult year. I am confident we have an organisation upon which we can rely in meeting whatever lies ahead.

The report and accounts were unanimously adopted.

At a subsequent extra-ordinary general meeting a resolution was passed approving the conversion of the ordinary shares into stock.

GOVERNMENT RETURNS

For the week ended August 2, 1947, total ordinary revenue was £80,196,792, against ordinary expenditure of £98,511,523 and there were no issues to sinking funds. Thus, including sinking fund allocations of £3,531,384, the surplus accrued since April 1st is £262,224,175, against a deficit of £303,225,239 for the corresponding period a year ago.

UNIVERSITY COLLEGE OF HULL

DEPARTMENT OF ECONOMICS AND COMMERCE

Applications are invited for a Lecturer in Applied Economics and Economic Statistics. Salary range £525 x £25-£800.—Particulars from the Registrar, to whom applications (six copies) should be sent not later than 22nd August.

UNIVERSITY OF THE WITWATERSRAND

JOHANNESBURG

Applications are invited for the CHAIR OF ECONOMICS. Salary £1,100 x £50-£1,400 per annum, plus a temporary cost-of-living allowance which at present is £75 per annum for a member of staff with a wife or other dependants and £46 15s. for others. Membership of the University Teachers' Provident Fund is compulsory. Allowance is made for travelling expenses. Further particulars may be obtained from the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. Closing date for the receipt of applications is October 14th, 1947.

UNIVERSITY OF THE WITWATERSRAND

JOHANNESBURG

Applications are invited for a LECTURER IN ECONOMIC HISTORY. Salary £550 x £25 per annum, plus a temporary cost-of-living allowance, which at present is £75 per annum for a member of staff with a wife or other dependants, and £46 15s. for others. Membership of the University Teachers' Provident Fund is compulsory. Allowance is made for travelling expenses. Further particulars may be obtained from the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. Closing date for the receipt of applications is October 14th, 1947.

CANTERBURY UNIVERSITY COLLEGE

CHRISTCHURCH, NEW ZEALAND

Applications are invited for the CHAIR OF HISTORY AND POLITICAL SCIENCE.

Salary £1,200 per annum (New Zealand currency). Allowance for travelling expenses for appointee and wife. Further particulars may be obtained from The Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. Closing date for the receipt of applications is October 6th, 1947.

NATAL UNIVERSITY COLLEGE

Applications are invited for the post of LECTURER IN COMMERCE AND ADMINISTRATION (in Durban).

Applicants should have a degree in Commerce or Economics, and should be qualified to lecture on industrial management and business administration.

The salary will be on the scale:
Men: £550 x 25-£725
Women: £425 x 25-£600

Compulsory cost-of-living allowance of £46 15s. per annum is paid in addition. The initial salary will be determined in accordance with the qualifications and experience of the successful applicant.

Membership of the University Teachers' Provident Fund is compulsory. The appointment will be in the first instance for a probationary period of one year. Further particulars may be obtained from the Secretary, Universities Bureau of the British Empire, 8, Park Street, London, W.1. Closing date for the receipt of applications is 1st September, 1947.

FIRST-CLASS Produce Marketing Assistant required for Marketing Companies being formed in London to handle cocoa purchased by West African Boards. Applicants should have experience of marketing and shipping produce and should not be more than 45 years old. Salary according to qualifications and experience.—Write full particulars to Box 808, c/o White's, Ltd., 72, Fleet Street, E.C.4.**BANK OF SCOTLAND**

HIS MAJESTY'S COLONIAL SERVICE

A European (Commercial) Master is required for the Education Department, Singapore, to teach day and evening classes up to standard required for such examinations as those of the London Chamber of Commerce. Candidates should preferably be under 35 years of age and possess a degree in Commerce or Economics. Salary according to qualifications and experience at a point in the scale £400-£800 per mensem (£560-£1,120 per annum).

Pension position of contributors under Teachers (Superannuation) Act can be safeguarded and secondment terms can, in certain cases, be arranged with Local Education Authorities.

Further particulars of post and forms of application may be obtained from the Director of Recruitment (Colonial Service), 15, Victoria Street, London, S.W.1.

VACANCY exists for ASSISTANT EDITOR (Male or Female) for a Government Department in Moscow.

Candidates must be British born of British-born parents. Good education essential and, if possible, with qualifications in Economics and Political Theory. Knowledge of Russian, Russian history and affairs is essential. Journalistic experience desirable.

Salary: married man from £600 p.a.; single person £550 p.a. tax free, according to qualifications. Free accommodation and outfit allowance.

Applications, giving date of birth, full details of education, qualifications and posts held (including dates) should be addressed to London Appointments Office, Ministry of Labour and National Service, 1-6 Tavistock Square, London, W.C.1, quoting Reference F.A. 372. Original testimonials should not be forwarded.

ONLY CANDIDATES SELECTED FOR INTERVIEW WILL BE ADVISED.

AMERICAN MAGAZINES available. *Magazine of Wall Street*, 67s. 6d.; *Saturday Evening Post*, 50s.; *Fortune*, 67s. 7d. Incl. one year. For list of other magazines send s.a.e. to Willen, Ltd. (Dept. 53), 120, St. Georges Road, London, E.10.

PROGRESSIVE post for young statistician in London Market Research office of large food concern. Good honours degree in mathematics with ambition to apply specialised knowledge to business problems. Initial salary will depend on qualifications; progress on demonstrated ability in technical and business aspects.—Write Box 529.

C. AND J. CLARK, LTD., Shoe Manufacturers, Street, Somerset, require Woman Secretary for the Chairman of the Company. Previous experience of similar work is essential. This post will appeal to those who like living in the country. Further information will be given on application.—Full particulars of age, education and experience should be given on application, which should be marked "Personal" and addressed to the Personnel Officer.

DENMARK.—FABIAN SCHOOL. Hindsgravl Castle, Middlefart-on-Funen. Sailing dates: September 5th, returning September 21st; and September 6th, returning September 23rd. Cost £34, including tickets, meals, tips, lectures, with two days in Copenhagen. Five Continental lecturers included in programme. A few vacancies. Details: General Secretary, Fabian Society, 11, Dartmouth Street, S.W.1.

EXPORT MANAGER for Chemicals wanted by old-established firm. Must be well versed in all aspects of the trade, such as suppliers, markets, etc. Good salary and share of profits.—Box 531.

RUSSIAN lady gives Russian lessons.—Box 495.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894); moderate fees, payable by instalments, if desired.

Moral Crisis in Downing Street

SECOND thoughts about the Government's handling of the latest phase of the economic crisis are no more cheerful, after the lapse of a week, than those provoked by the Prime Minister's speech in the House of Commons. Indeed, in one important respect, the crisis has changed in its character and become more ominous in the process. Last week, it was still an economic crisis, a matter of needs and resources. Now, it has become a political crisis, a matter of confidence. Then, the chief anxiety was whether the Government had a policy. Now, there is growing anxiety whether the country has a Government.

The Labour Government and the Labour Party now find it impossible any longer to conceal from the world the fact that they are so unsure of themselves and so riven with differences that their power of decision, never very large outside those Elysian realms where nationalisation schemes are drawn up, has almost totally disappeared. The whole course they have pursued this year long ago pointed to the conclusion that the Cabinet could not make up their mind—but those who wished the Government well resisted the conclusion, since it implied such a monstrous dereliction of duty. But last week's performance prohibits any other verdict. The press is eloquent testimony to the shock. With the exception of the duty-bound *Daily Herald*, not a single paper has had anything good to say of the Government. Those organs which, like *The Times*, the *Manchester Guardian* and the *News Chronicle*, have hitherto been most friendly to the Government and to Mr Attlee personally have been the most outspoken in condemnation of them and of him. According to those reports that have run the gauntlet of the new definition of Parliamentary privilege, the Parliamentary Labour Party itself now recognises that its leaders do not know where to lead. The astonishing contrast between the forecasts of downright, drastic, ruthless action and the pitiable performance—the contrast that has so much angered the back benchers—is apparently to be explained, not by any lack of the intention to be forthright, but by the fact that, when it came to the point, the Cabinet could not agree on anything to be forthright about. So those unlucky Ministers who were compelled to speak took refuge, each according to his character, Mr Attlee in banalities, Mr Dalton in verbal rotundity, and Sir Stafford Cripps in eloquent moralities.

Subsequent events have underlined the nervelessness of Ministers. The whole episode of the Supplies and Services Bill has revealed them in an attitude of vacant indecision. The shilly-shallying over the nationalisation of the steel industry contributes to the same impression. Most of the members of the Government are by now heartily sorry that the word "steel" ever crept into the pages of "Let Us Face the Future." They dare not back out completely. On the other hand, they have no illusions about the administrative, Parliamentary and public consequences of going ahead and, for all their obstinate party rancour, they know that this is not the time to split the country wide open. They would gladly find a compromise that would enable them to tell their followers that they had done something, without in fact doing anything very much. Mr Morrison had worked such a plan

out. But the representatives of the left wing in the party and in the Cabinet, led by Mr Aneurin Bevan, will not hear of compromise. They are a small minority, but Mr Bevan is one of the few Ministers with the moral courage to resign on what seems to him to be a matter of principle and that, in this Cabinet, gives him great power. He is using it, today to insist on the nationalisation of steel, tomorrow probably to protect his housing programme against any more cuts; in either case to make mischief.

★

In difficult times, the British people will always respond to strong leadership. By so much more are they likely to be dismayed by the discovery that there is no hand at all at the helm. The Government have, in the last few weeks, thrown away a priceless asset. They allowed, they even encouraged, the public to be keyed up to a pitch of rueful, but nevertheless resolute, expectation of sacrifice and effort. For the first time in this economic Battle of Britain, they were getting ready for tears and toil. When the Prime Minister rose to speak last Wednesday, there was an atmosphere of emotional tension; the nation was waiting for the word of command. The mood was punctured and deflated, and it will be very difficult ever to re-create it. The public will be very hard henceforward to convince of the reality of a crisis. If Ministers have hitherto enjoyed from the public the benefit of the doubt, they will henceforward have to fight against a tide of distrust.

A fortnight ago the view was expressed here that the present crisis was the planners' last chance. It is now unfortunately clear that it has not been taken—through no fault of the central group of permanent and temporary civil servants, who have doubtless done their best to keep their masters' noses to the grindstone of reality. But planning as practised by the present Government is now clearly bankrupt. It is true that Ministers and their advisers are busy working out a new set of estimates, targets and programmes. But these are about as pointless as the plans of the General Staff in an army where the troops no longer obey their officers. The real issue is not whether the

programme is the right one but whether, and how, it will be achieved. The Government have lost control of the situation; how can they regain it? To these essential questions it is clear that Ministers have no idea of the answers.

Something was said last week about the extent to which the nation's crisis is an economic one or a moral one and the way in which what looks like bad morale may merely be bad economics. But there is one place where the crisis is wholly moral, and that is in Downing Street. No one but a fool would pretend that he knows how to solve the nation's problems. But it is not very difficult to suggest quite a number of things that could be done and would certainly both exercise the right influence at home and give the necessary evidence to foreign observers (whose verdict will be final) that the ability and the will to recover still exist. One, which is argued in the following article, would be to start the immediate export of coal, if possible from increased production, but if necessary at the cost of domestic consumption. Another would be to make it quite clear that food imports will be cut before essential industry is allowed to stop for lack of raw material. A third would be to postpone the bulk of the housing programme to clear the way for productive capital projects—those, that is to say, that will directly result in increased production, especially of food, power and exports, within three years. A fourth would be to face the fact that these large capital projects can only be accomplished at the cost of consumption and that they can only be prevented from causing inflation by deliberately cutting the national consumption until they are wholly financed by current savings—which involves creating a real budget surplus, either by economies in expenditure or by increases in taxation, of some £400 million or more.

These things are terribly difficult for politicians to attempt. But until somebody in Downing Street acquires the moral courage to demand that they be done, and to endanger his place and his popularity to get them done, the nation will continue to slither rudderless from weak expedient to unworkable compromise.

Coal Must Come First

DURING the next few weeks developments in western Europe will offer a rare opportunity for British statesmanship. The economic conference of sixteen governments in Paris, having completed their stocktaking, will be drawing up the final reply to Mr Marshall. They will sometimes pause nervously and wonder if they are building castles in Spain. They will be tempted to conduct disputes on the side and to frame vaguely-worded compromises. They will be using a number of impressive phrases, ranging from "pooling of resources" and "co-ordination of plans" to "customs union" and even to "united states of Europe." The test will be whether they can put any reality behind the phrases. Such arrangements and engagements between governments look easy in eastern Europe, where the Russian matchmaker brings couples together in record time; in western Europe they look difficult, with the British, and the French, and the Scandinavians, and the Swiss behaving rather like stubborn bachelors and suspicious spinsters, while the American matchmaker stands aloof and inscrutable.

In such a situation bold and purposive leadership by one delegation becomes essential. Leadership in this case means not pre-eminence in stating general principles but initiative in setting practical examples. What sort of examples? Agreement to use scarce materials like coal and steel for mining equipment instead of for luxury cars; agreement to concentrate manufacturing programmes on countries where plant and labour are available; agreement to pool available timber supplies at the

cost of national building programmes. None of these, perhaps, is a very striking example of one government giving up plans and advantages to help others, but the principle of sacrifice involved in each one is very striking. And it is by offering a striking contribution to western Europe's recovery so as to bring the principle to life that leadership in Paris will be seized and held.

How could Britain make this contribution? Alone among the sixteen, it has in comparative abundance the raw material from lack of coal: every one has incurred criticism from its people, or changed the pattern of its foreign trade to buy it in new markets, or spent dollars to buy it from the United States, or intrigued politically to get it from Germany. The vicious economic circle caused by lack of coal is everywhere known in western Europe. German recovery has been critically delayed by the demands of neighbouring countries for Ruhr coal and coke which might have gone to the making of German steel or mining equipment. French recovery has been delayed—with momentous political consequences—because the coal requirements of the national plan could not be met. Timber for wood-pulp, newsprint and British houses has been burnt in Swedish homes because no British coal came. Italy has had to exchange men for French coal because it could buy no British coal. The revival of Europe's fields and farms has been held back because

there has not been the coal to produce the fertilisers. And so the woeful tale can be spun out, until it builds up into an unanswerable indictment of British failure.

The British are inclined to ask what on earth it has to do with the foreigner if they cannot export coal; forgetting that the foreigner takes it for granted that the coal could be produced. Only thirty-five years ago, before the war of 1914-18, British mines produced 23 per cent of world coal output and shipped abroad 55 per cent of world shipments. And as recently as 1938 they were still producing 18 per cent of world production and exporting 37 per cent of world shipments. Now those exports have virtually ceased, and a trickle towards the end of next year is the most that Mr Shinwell will hope for.

Nothing that Mr Shinwell has said since he left the front Opposition bench—and there is much to choose from—shows that he is aware of the momentous consequences of such a statement. There has been no authoritative voice deploring the arrival of American ships in the Bristol Channel ports—not to fetch coal but to bring it. Mr Bevin's thrice repeated public demand for thirty million tons of exportable coal with which to bargain his way in European diplomacy has never been answered by a colleague. And Mr Horner, stout advocate of doing without the dollar, has positively shied away from the suggestion that Britain could cut some of those dollar ties, simply by exporting coal to take the place of American coal now reaching France and Italy and Denmark. The foreigner, of course, concludes that British Ministers are afraid of the miners, that they cannot command their good will or loyalty.

Nor indeed has much attention been paid to the cost to Europe of Britain's failure to export coal. Only rough and round calculations are possible, even for the dollars spent on American coal; and it is still impossible to calculate what the failure has meant to such countries as Sweden, Spain, Italy and Denmark. But, in the year ending June 30, Europe received from the United States 25½ million tons of coal and coke at a cost of over \$500 million. The conclusion is inescapable: that British miners could have saved Europe \$500 million by working one hour a day more than they worked in May and June.

★

What may be called the foreign political argument—Mr Bevin's argument—for coal exports of 30 million tons a year is overwhelming. But so is the currency argument. Of hardly any other British export than coal can it be said with certainty that it will be indispensable and saleable for years to come. Countries may refuse, or reduce their demand for, textiles, motor cars, machinery and other key British exports; they will not refuse coal. In 1938 (not a particularly good year), when 31 million tons of coal were exported to Empire and foreign countries, over £37 million was earned. At present prices the same amount of coal would earn vastly more. Even on the narrowest

grounds of British self-interest, the export of coal should be regarded as priority number one. If there is any truth at all in the slogan "export or expire," coal should be exported before any other use is made of it. Ideally, of course, the rate of production should be increased until it covered both exports and home requirements—and there are very few foreigners who can understand why this is not possible. But even if it is impossible, even if 200 million tons is the very most that can be hoped for, exports should still have the first call. If 30 million tons were exported out of a production of 200 million tons, that would leave for home requirements 170 million tons, against the pre-war inland consumption of about 180 million tons. There is not another country in Europe that would not count itself lucky to be able to burn 94½ per cent of its pre-war supplies of coal. Mr Bevin, by taking up Mr Marshall's challenge, has committed the country to a Western European policy as the one means of obtaining American aid and support. The essence of the operation is that there should be at least a rough equality of effort, at least a rough pooling of resources. The Continental nations will certainly say that what the British can and should contribute is coal. The Americans will agree. There is no British answer that will hold water for a moment. British coal exports will probably be, and certainly should be, an essential condition of receiving any assistance under the Marshall plan. Whether those exports are provided out of increased production or by cutting the supply of coal for warming British houses is not the concern of the Americans or of the Europeans; it is a matter that will lie between Mr Arthur Horner and the people of Britain.

Ever since the fuel crisis six months ago, British conduct of economic policy has been watched in Europe and the United States with very critical eyes. Some of the remarks made have been unreasonable; the mood and hopes of the voters who brought Labour to power have not been understood. But the main criticism has been shrewd and fair. It has taken the form of a question: why cannot the British put first, above all things, the extraction and export of their national treasure—coal?

An answer to this question must be found if the opportunity now offering itself in Paris is to be seized and held. Nothing would kill the Marshall idea quicker than persistence of the feeling that Britain, in any economic association of Western Europe, might prove a liability instead of an asset. That feeling will persist so long as the British Government shows no signs of making its basic industry perform the vital function of fueling Europe. Doubtless Congress and the American public will welcome round phrases and the general principles which the Marshall offer suggests—a declaration of interdependence, a pledge to work for economic integration and a provisional plan for self-help. But these will all ring hollow if the French will not produce food, if the Germans are not allowed to produce steel, and above all if the British refuse to export coal.

The Chairman said —

"... the Society's With Profit policies will stand comparison with those of any other office. This is particularly true when the strength of the Society as disclosed by the triennial investigation is borne in mind."

Extract from Chairman's speech, 27th March, 1947

EQUITY & LAW
Established 1844
LIFE ASSURANCE SOCIETY
20, LINCOLN'S INN FIELDS, LONDON, W.C.2.

The Efficiency of the State

LABOUR'S second year of office has ended in the same flurry of far-flung legislation in which it has run its course. Future generations, contemplating the serried ranks of statutes on agriculture, transport, electricity, planning and a host of minor matters, may perhaps find for Mr Attlee some small niche by the side of, say, Campbell-Bannerman. This generation, paying the price in unresolved crisis, and saddled with slapdash laws crying out to be patched and tinkered into a more passable shape, might well have preferred more action and fewer Acts. Part of the blame for this contrast between grandiose schemes and poor practical performance must, of course, be laid directly on the Labour Party's ideology. But not all of it, for it has been a growing tendency of British government, under any party, to bite off more than it can chew. That the administrative machine is overloaded, in spite of the myth of excessive staffs, is today common ground between Right* and Left†. The Board of Trade, the most glaring example of overload, is blessed with no fewer than 256 senior administrative officers, from Principals upwards, concerned with a Pooh-Bah conglomeration of functions ranging from films and tourists to clothes rationing and commercial treaties. To the outsider these numbers seem formidable. And yet most of these officers are individually overworked; and from each and every one of them—at least as serious a matter—a chain of responsibility reaches upwards to the twin bottlenecks of the Permanent Secretary and the President. Is it surprising that, with the best will and highest competence in the world on the part of its officials, the Board sometimes appears to industry as bloated bureaucracy *in excelsis*? And closely bound up with this chronic overload is the fact that the Governmental machinery at both the Ministerial and official level has failed to provide for coherent and long-sighted forethought, except for the special purposes of war.

*

For these defects in the administrative machine several remedies can be suggested. The first, though the least important, would be to devolve on to other agencies a certain amount of the work which now takes the time and clutters the desks of Ministers and their subordinates. A great deal of the present national control of the location of industry can be gradually demobilised as the new machinery of the Town and Country Planning Act comes into operation. The prospective Development Councils under the Industrial Organisation Act, if properly manned and given real responsibility, should be able to relieve the economic departments of a noticeable burden of work. The reform of local government might make it possible to return some of the powers of initiative and decision to the Town Halls. The Scots and the Welsh, again, are often a public nuisance at Westminster; year by year, the case for leaving them to settle many of their own affairs for themselves in Cardiff and Edinburgh grows stronger.

A more important need is to find some way in which the administrative machine can have time to think ahead. It is a favourite dogma of the "scientific" students of administration that planning and administration are separate functions to be kept apart. They would have "planning sections" in each department and a central planning staff, all as aloof from the processes of day-to-day decision as the colonels of the

Prussian General Staff were from the actual command of men. But this is a very academic concept; there is no such divorce, in civilian politics, between planning and administration, and if a divorce is insisted upon, the usual result is that nobody pays any attention to the planners. The only effective way in which forethought can be effectively brought into British civil administration is by giving the top administrators time to think. And that involves finding some way by which the burden on the Permanent Secretaries can be reduced. So long as the Minister is responsible to Parliament, and is liable to have Parliamentary questions directed at him, he must be given the opportunity of deciding upon, or at least informing himself about, many matters of detail that in a private business would be left to subordinates. And if everything must go to the Minister, everything must likewise pass through his chief adviser. But it should still be possible, by increasing the number of Departments and reducing their average size, to allow Permanent Secretaries to keep in touch with everything and still pause to think. This would, of course, involve some grouping of Departments on Haldane lines, and the various joint staffs that now constitute the Cabinet office would naturally fall into place as the staffs of the co-ordinating Ministers.

In these and similar ways, the machinery of Government could be streamlined. But it would still be overloaded; and one or other of two further remedies must be faced. The first alternative is a very substantial increase in the number of Civil Servants in the administrative grade. But though that could perhaps be done, it very emphatically ought not to be; for the supply of first-class knowledge and administrative talent is strictly limited, and a fair share must be left for other spheres of national life. It is the best men whom the Civil Service needs, and it is the best men, notably from University teaching, whom it ought not to be allowed to have to the exclusion of other claimants.

The other alternative is to cut commitments to the point where they can be handled efficiently by the existing staff, and it is highly significant that the Fabian Society's Committee should have been driven to conclude that precisely this should be done. "We recommend," they comment, speaking of non-nationalised industry,

that serious consideration should be given to abandoning any attempt to control the whole field in detail, and to concentrating on the effective control of the few things which in reality control everything else. The keynote should be guidance rather than control.

Coming from the source they do, these words deserve to be inscribed above every Minister's desk in letters of gold.

*

To cut commitments is indeed necessary, but cuts, as the Fabians very reasonably point out, require a tough Minister and a sharp axe. The psychological difficulties are great. Memories of 1921 and 1931 dovetail with the general left-wing preference for state control. The Fabians themselves—and the Fabian is as reasonable a Socialist as the species permits—having logically concluded that cuts must come, add with supreme inconsequence in their Introduction that no reduction in State activity will be acceptable. Who is to force Ministers to face these obstacles? And in what fiery furnace is, say, Mr Wilmot to be hardened to the semblance of real steel?

In principle, the answer lies in Parliamentary pressure, and it is here that the question of cuts merges into the wider issue of the relations between Parliament and the Government. The

ordinary back bench MP neither has nor should have much initiative—even in more normal times—in legislation, and he has no direct control at all over administration. If democracy means control of the initiative of this kind, then Britain, as Mr Amery points out, has never been, is not, and never ought to be, a democracy. Nor does the private member make and unmake Governments, except perhaps at very rare moments of acute national crisis. That function belongs normally to Party leaders and the electorate. What he does possess is the right and duty to ask awkward questions. Parliament, in John Stuart Mill's phrase, is the nation's Committee of Grievances and Congress of Opinions, and the basic duty of an MP is to know what is going on in the Government, and to guide, focus and express public opinion and criticism at the salient points. In theory, Parliament controls the Government through the power of the purse, which in fact is not exercised. In practice, so far as it controls it at all, it does so through informed criticism and the pressure of public opinion.

But just how far does it control it? That is the crux of the matter, and to anyone who considers the progress of public policy and the legislative conveyor belt in the last session the answer is only too plain. On individual personal grievances—Mrs Jones's pension or Sergeant Jones's demobilisation—control by MPs is valuable and effective, for in these cases the member has the possibility of getting at most of the facts of the matter and, by custom, real freedom to press his point. But on policy, or in the detailed criticism of legislation, his position is quite different. In public, if not always at Party meetings, MPs on the Government's side are only too often reduced by Party directive to an uneasy dumbness. And back benchers of all parties alike are cramped within a rigid time-schedule imposed from above and, except for members of one or two special committees, are denied regular official access to a very large fraction of the information needed to do their work. In the circumstances, is it surprising that Parliament has made so poor a show of criticism and control, or that, in what should be the balanced tableau of Parliament and Government, Ministers regularly and completely steal the limelight?

The way out lies in two main directions. The first and least obvious is to develop the use of Parliamentary committees. Recent reports of the Select Committee on Estimates have shown the value of investigations of this kind alike to the administrator, to the MP anxious to use his brain and acquire real competence in particular fields, and to the public seeking for balanced judgments and up-to-date facts. The present

generation of students of politics has been brought up to regard a Parliamentary Committee system as something slightly disreputable, like the Continental Sabbath or a Reno divorce, and the idea, though old and familiar, has never made progress in this country. But that is not because it is a bad idea, but because all Ministers and all Government Departments hate it. It is the strength of the Government that has prevented the growth of the Committee system, just as it is the weakness of the Executive in France and America which has given the legislative Committees in those countries a degree of power which seems to the Englishman to be dangerous. It is natural that governments should resist the Committee idea. But it would nevertheless do a great deal to revive Parliament and to attract into politics a type of man who wants to use his time in serving the country rather than waste it in pursuit of personal ambition.

The other reform required is more time and freedom for the back bench MP to criticise and suggest. The inducement for an ordinary member to prepare carefully for a debate has been whittled away almost to nothing by the steady squeezing of the Parliamentary timetable, and it is vital that, except in genuine emergencies, enough time should be allowed to enable every member with a real contribution to offer to have his say, and alike on the floor of the House and in Committee. A convention is needed that members are not only free but expected to argue, comment and amend as their individual wisdom suggests. And just as time for the administrator to think would inevitably cut down the number of administrative tasks that can be undertaken, so time for the legislator to talk would inevitably cut down the volume of legislation.

The conclusion that the volume of the state's activities must be cut down—that is, the volume of its detailed activities—not necessarily the range of its influence—will be unwelcome to very many people. Yet it is really inescapable; the present strains and inefficiencies cannot continue. In the course of a generation or two, after a great expansion of the Universities, it may be possible to achieve a great increase in the number of trained administrators without starving every other profession in the country. Parliament may be able to work out techniques by which it can do several things at once, and yet turn the searchlight of supreme publicity anywhere it wishes. But until these things have been done, there is really no option: the state—meaning by the term Parliament and Government together—must seek for means whereby it can cut down the volume of its activities to what it can handle effectively.

NOTES OF THE WEEK

"Keep Left"—But How?

The severity of the problems that face the country is such that the great majority of people would endorse any policy that offered a real prospect of emerging from them. This does not exclude even the extreme forms of Socialism, enforced by dictatorial methods, that are advocated by the "Keep Left" school. But it becomes more and more difficult to understand exactly what it is that they are proposing. For a group of "intellectuals," their reasoning has a strangely large number of yawning logical gaps. Mr Crossman's latest speech, delivered last Friday in support of the Supplies and Services Bill, is an almost comical example of this. Mr Crossman welcomed the Bill as of "immense symbolic significance," because it meant that the Government had decided not to go "back to a pool of unemployed" but "forward to full Socialist planning." How he derived this interpretation either from the Bill itself or from Ministers' speeches in support of it was a mystery to everyone, his own front bench not least. But in any event, Mr Crossman threw away his whole argument in an aside—

This Bill gives the Government power to carry out Socialist planning, but that does not mean the planning will be carried out.

Exactly. Does Mr Crossman not realise that that is the whole point? The Government have plenty of powers to carry out Socialist planning, Capitalist planning or any other brand of planning. The question is what they are to do with their powers. The "Keep Lefters" will not convince anybody until they stop talking about the perfection they aspire to in the sweet by and by and begin saying what plans they would make now, how they would ensure that they were carried out, and how they differ from anybody else's proposals.

Mr R. W. G. Mackay is another member of the same school. He made a thoughtful speech two days earlier, in which he tackled the very real problem of how the British economy was to be adjusted, not merely at present but in the long run, to a reduced ability to import. Exports of 175 per cent of the pre-war level, he said (rightly), were impossible.

We must face the fact that we are now in a world in which we cannot rely upon the export of manufactures to the extent that we did before.

Up to this point, Mr Mackay's speech was easily the most penetrating made in the whole two-day debate on the crisis. But what is his remedy?

We must nationalise our industry, and apply Socialist methods in

* L. S. Amery; Thoughts on the Constitution. (A full review appears on page 278.)

† The Reform of the Higher Civil Service, by a Committee of the Fabian Society. Fabian Publications and Gollancz, 2s. 6d.

the doing of it, in order to see that we obtain ten times greater efficiency in our industry than we have had before.

But this, all of a sudden, is a complete flight of fancy. Why does Mr Mackay think that the application of Socialist methods would lead to any increase in efficiency? The country now knows what a nationalised industry looks like, and what sort of persons are appointed to it, and the sort of way it goes about its business. There is no apparent reason whatever for supposing that the "application of Socialist methods" automatically leads to an increase in efficiency. Why does Mr Mackay take it for granted that it does? Why does he not offer at least a little evidence in support of the point without which his whole argument collapses? Why will he not come out of the clouds where slogans have importance and come down to hard facts?

*

There is still another paradox in the "Keep Lefters'" position. They, above all others, are the people who say that we ought to get rid of our dependence on dollars and stand on our own feet. That ought, in logic, to mean super-austerity. But it so happens that the two leaders of the group are Minister of Health and Minister of Food, whose reputations would suffer if there were any cuts in houses or food supplies. So the "Keep Left" position has to be that the country can be independent of dollars without austerity (except, of course, for the rich). They can square the circle only by two gigantic pieces of wishful thinking. One is the belief that "Socialist planning" can vastly increase the output of British industry in a very short time. The other is that a gigantic trade can be built up with Soviet Russia. Once again it is Mr Crossman whose wishful thinking soars furthest into the empyrean—

The market where the people will take and need our goods and sell us the food and the timber we require . . . is not America, but Russia and East Europe predominantly.

Anyone who really believes that ought to have his head examined.

It would be very refreshing to have some proposals from the Left for getting the country out of its mess that were based on facts and proceeded logically.

* * *

Storm in Parliament

It is difficult to decide who has been silliest during the stormy debates over the (renamed) Supplies and Services (Extended Purposes) Bill that have brought this Parliamentary session to a close—the Government for introducing the measure at all, the Opposition for reading into it a sinister plot to set up a totalitarian state, or those Labour back-benchers who gave some substance to the Opposition's fears by placing their own ultra-Socialist interpretation on it. What, amid all the mutual recriminations and contradictions that characterised Friday's and Monday's—and Monday night's—debates, may be taken as certain is that Mr Morrison was quite right when he said that the Government has "no preconceived notions as to precisely how we propose to utilise" the Bill. A possible explanation of why it was ever introduced in the form it was is as follows. There was some legal doubt—the Attorney-General and the Lord Chancellor differing on this—whether the purposes defined in the 1945 Act for which wartime defence regulations can be used could be stretched to cover the purposes required by the present crisis, in particular whether they would cover measures to redress the balance of trade. It therefore became necessary to remove this doubt by extending the purposes for which defence regulations—existing ones—can be used.

If the Bill had been so drafted to make it quite clear that this was all there was to it, the storm might well have not arisen. But the Government threw in, as one of the extended purposes for which defence regulations may be used, the sub-section

generally for ensuring that the whole resources of the community are available for use, and are used, in a manner best calculated to serve the interests of the community.

It may be, as the Lord Chancellor argued in the Lords in a lucid, reasonable speech, that these words were only intended to give Ministers some discretion in marginal cases which might not be quite within the scope of the more closely defined purposes. It may be that they were intended to echo a famous sub-section of the Emergency Powers Act of May, 1940, in an attempt to revive the Dunkirk-cum-Battle-of-Britain spirit on which Mr Attlee has put so much stress. It may be that they were intended to placate the Keep Lefters inside and outside the Government. It may be that they were intended to kill these three birds with one stone—and at the same time conceal the Government's complete lack of

policy in the present emergency. All that the words have in fact done is to irritate instead of to inspire, to increase dissension instead of fostering unity. But to read into them a plot to give this Government, which has barely used the powers it has under the 1945 Act, vast new powers to set up a totalitarian state is just absurd.

* * *

Parliamentary Privilege

A minor issue of the Allighan case was decided this week, after the editor and lobby correspondent of the *Evening News* had been summoned to the Bar of the House and had apologised for refusing to tell the Select Committee of Privileges the name of the Member of Parliament who had supplied them with information in return for payment. Through the form of the questions put to them by the Committee, the two journalists were able to use in defence of their refusal their ignorance of the fact that it amounted to a contempt of the House. That refusal to answer questions put by any Select Committee is contempt of the House has now been established beyond doubt by the House's acceptance of Mr Morrison's motion to this effect, but it was also made clear from some members' speeches, in which they raised the question of professional confidence in cases other than journalism, such as that of doctors, lawyers or priests, that the House would probably take a lenient view in a particular case if it deserved it on ethical grounds.

The major issue raised by the whole affair, the personal conduct of Mr Allighan, who supplied the *Evening Standard* with information, and Mr Evelyn Walkden, who supplied the *Evening News*, will not now be judged by the House until next session, and ought not therefore to be commented upon meanwhile. But it is perhaps permissible to say, since the Select Committee was itself divided on this, that many people are unhappy about the opinion of the majority of its members that proceedings of private party meetings are subject to the same rules of privilege as proceedings of the House itself. Surely the minority view, held by Lord Winter-ton and Mr Reid, that leakages of information on what occurs at such meetings are a matter for ordinary party discipline, is much more tenable. The evidence of the expert witness—in the person of Sir Gilbert Campion—to the Select Committee on this point certainly cannot be held to support entirely the majority view. What, in brief, one wonders is whether—the conduct of Mr Allighan and Mr Walkden again being left aside—the question of parliamentary privilege would have arisen at all in this case if it had concerned the minority party instead of, as it does, a party with a large majority, which happens to hold its meetings within the precincts of the Palace of Westminster and which happens at this particular moment to be increasingly sensitive about the dissensions within its ranks.

* * *

Coal Talks in Washington

In recent weeks it has become more and more widely realised that the only reasonable context in which to consider Germany is that of the Marshall offer. In any assessment of the possibilities of European self help, coal is the first consideration and it is in the Ruhr that the biggest increase can almost certainly be made soonest. At the same time, unless the reconstruction of Germany is subordinated to European interests, the political objections of Germany's neighbours would quickly outweigh the economic advantage gained. Logically, therefore, the conference on increasing coal production in the Ruhr should be taking place in Paris, not Washington, but no doubt the European Powers will be prepared to waive logic if they are offered some hope of more coal.

The British and American deliberations in Washington are likely to establish one fact very rapidly. Coal production depends above all upon the restoration of the Ruhr as a functioning industrial community. Criticism of British management in Washington has abated recently. More sober—and more expert—American investigators have reported that in the despair and hardship prevailing, the miracle is that any coal has been produced at all. The talks will therefore tend to concentrate upon incentives in the broadest sense—more food, more clothing, more housing—and the British are convinced that it is now useless to confine these advantages simply to the miners and their families. Work depends to a great extent on the general morale of the community and general measures must be taken to restore it.

But if more of the world's scarce supplies are to be pumped into the Ruhr, they can only be paid for in dollars. The financial

arrangements of the fused zones, which were not due for reconsideration until December, will inevitably come up now, for the British are in no position, strictly speaking, to bear the existing burden and will certainly be unable to increase it. This fact strengthens the American position in any changes they may wish to make on the side of organisation and management in the Ruhr. They are known to dislike the British insistence on the need to socialise heavy industry, and are also anxious to bring back some of the old German managers in order to increase efficiency. What the Americans appear to forget is the political outlook of the miners themselves and the extent to which political discontent can lower production, quite apart from economic factors.

* * *

Ruhr Miners Take Heart

Once again, for the first time in four months, coal production in the Ruhr is rising above 230,000 tons a day. Last Saturday's output was 234,836 tons against 226,700 tons on the previous Monday. Clearly the miners had decided to work harder, stimulated by the prospect of the food parcels and full rations promised in the new scheme of group inducements. There is no question of food already received having increased their capacity to work; it is the attitude that has begun to change. How important the attitude is, and how big a part political and other considerations may play in determining output, was shown again last week in admissions by the miners' own leaders.

Six hundred delegates representing 90 per cent of the mine-workers in the British Zone met in Essen to appeal against any proposals to transfer the Ruhr mines from German hands. Their principal resolution was that the Land North-Rhine Westphalia should become trustee of the Ruhr mines for a future German state, and it included the threat—it can be called nothing else—that increased coal production was unthinkable if mineworkers were not represented on democratic administrative boards for their management. It is as important to realise that such threats and claims are made and can play their part in keeping production low as it is to press the miners' claims for better food. American plans for the future management of the Ruhr often seem to overlook this psychological factor, partly because genuine concern for and sympathy with the miners' living conditions and state of health has overlaid understanding that they are Germans first and Europeans second. The leaders of the Ruhr miners occupy a key position in the events of the next few months in western Europe. To persuade them that there may now be a loyalty wider than that which they showed towards Germany during the war is a task that will tax British and American statesmanship.

It is persistently reported that Mr Bevin has already agreed to postpone for five years the public ownership of the mines. American opinion has been understandably ready to argue that American opinion has been understandably ready to argue that neither French nor British output since mines were nationalised shows that public ownership increases production. German democrats argue in return that there must be some guarantee that the Ruhr will not fall back into the control of its old masters, and that if such guarantees are not given there will be many Ruhr converts to Communism. It would be unseemly for British statesmen to turn a German threat against American statesmen; but the Strang Mission now in Washington might well seek some formula of trusteeship which would satisfy both Americans and Germans.

* * *

Steel for Germany—Coal for France?

One point on the agenda of the coal talks in Washington raises the central controversy in any plan for European reconstruction. A general recovery in the Ruhr is impossible without an increase in steel production. So much is generally admitted, but in abandoning the restrictive clauses of Potsdam the British and American administrations in Germany have swung in the other direction and suggested a figure of 12 million tons of steel as the target for German industry. The reason for their doing so seems to be that in abandoning the Potsdam figure they have not lost the Potsdam approach, which was to restrict German industry, branch by branch, on the basis of a steel production of 5.8 million tons a year. The revival of the different sectors of German industry thus appeared—rather artificially—to depend upon fixing a much higher figure for steel and working out, on that basis, a new general level of industry.

Military Government, conferring in isolation in Berlin, did not, however, realise the international repercussions of announcing its new plan. The French instantly took alarm, for to them the figure of 12 million tons of German steel a year prejudged the

issue which chiefly engages them—the expansion of French steel by the export of German coal to France rather than the expansion of German steel by the export of French ore to Germany. They do not deny the need for a German steel industry, but they argue that France's industry must be larger and must be revived first. At present they claim that only 65 per cent of their steel-making capacity and 55 per cent of their potential output of iron ore are being utilised for want of coke, and that 9 million tons of iron ore have already accumulated at the iron mines. They therefore argue that any increase in German coal must be used only partially to revive German steel. Its main task—inside or outside the Marshall Plan—must be to increase the output of steel in France.

Ever since the figure of 12 million tons for German steel reached the press, the French have been in a watchful and resentful mood. Their anxiety increased when last week the answers on Western Germany's resources and requirements returned to the technical committees in Paris by the British Commander-in-Chief were all found to be based on a steel figure of 12 million tons. Mr Marshall has promised that a conference shall be held in the near future—probably in London—to enable Britain, France and the United States to explore the difficulty. The best hope is that for the moment the fixing of the final figure can be postponed, but in the last analysis the decision between enlarging French or German steel capacity will have to be faced.

* * *

Balkan Storm Centre

All over Europe hangs an atmosphere of tension and uneasiness. Nobody believes that there will be a war, but nobody believes that there will be peace either, and so the Continent in general is suspended in a state of unhappy truce. But in one corner of Europe the situation has drifted beyond the state of uneasy equilibrium. In the Balkans—needless to say it is in the Balkans—a situation is developing which looks perilously like war. The attacks of the guerillas across Greece's northern frontier continue unchecked and the strategic plan is disturbing, with first a thrust into Greek Macedonia, then an attempt to reach the port of Dedegatch and cut off Greece from Turkey. At the same time the Russians have started to throw out hints that they may break off diplomatic relations with Greece and the Bulgarians and the Yugoslavs have agreed in their latest treaty to concert measures against "Greek provocation." Thus there are present in the Greek situation many elements which in the past, in comparable situations, have meant a drift to war.

The Americans are aware of this danger and have been attempting to use the Security Council as a means of countering it. Last week, they proposed that a United Nations Commission should be set up in Northern Greece to check the incursions of the guerillas. This very sensible suggestion was immediately vetoed by Mr Gromyko, although nine of the eleven members of the Security Council voted in its favour. But if the Russians expected the Americans to follow the melancholy pattern of the last two years by simply accepting the veto, they were quickly disillusioned. The Americans have now made the most strongly worded statement on policy in Greece that they have yet put forward. Mr Herschel Johnson told the Security Council that the Americans feel that the time has passed when they have "to appease the threat of the veto." They are prepared to put the issue before the Assembly and to invite like-minded nations to join with the United States in concerting action to safeguard Greece's security.

* * *

America Blows Hot and Cold

This new statement of policy probably means that the United States will propose to the Assembly the setting up of a Border Commission in northern Greece, and will invite other nations—in particular Britain and France—to co-operate in its working. This policy, although perfectly sound in itself, is probably insufficient to restore order in northern Greece. Will the Americans go further and see that the new Commission's authority is not flouted as were the earlier efforts of the United Nations Commission of Inquiry?

Mr Herschel Johnson's statement rather suggested that the United States might be ready, in an emergency, to send troops to Greece. In fact, so widespread were the rumours that this was the case that, with one of those bewildering *volte faces* to which American diplomacy seems so prone, Mr Royall, the Secretary of War, was put up to announce that there was no intention of sending American forces to Greece.

This statement is all the more unfortunate in that there is clearly an element of sheer opportunism in Russia's Balkan policy—of kicking at the Greek door to see if it is open. There is not much likelihood that the Russians would take the risk of battering a closed door down, but uncertainties such as those which have been expressed in American policy this week must convince them that the Greek door is not closed after all.

* * *

The Transport Commission

Hard on the heels of the signification of the royal assent to the Transport Act came Mr Barnes's announcement of the names of the five full-time members of the British Transport Commission. The Chairman is to be Sir Cyril Hurcomb, until now Permanent Secretary of the Ministry of Transport. The other members are Lord Ashfield, Chairman of the London Passenger Transport Board, Mr. John Benstead, General Secretary of the National Union of Railwaymen, Lord Rusholme, General Secretary of the Co-operative Union, and Sir William Wood, President of the Executive of the LMS Railway. The names of three part-time members are to be announced later, and it is promised that one of them will be a representative of Scotland. One of the others must surely be some one with experience of the road transport industry, which is at present unrepresented—except by Lord Ashfield's rather specialised experience of metropolitan road passenger traffic. And it would be strange if the eighth seat were not filled by a financial expert.

If these forecasts prove to be correct, they will give one negative cause for satisfaction, since they will leave no room for the Chairmen of any of the subsidiary executives. There was a risk at one time that the Chairman of the Railway Executive would also be given a seat on the Commission. This, it need hardly be said, would have been a disastrous mistake. It is already the outstanding defect of the structure that the Act sets up that the Executives are far too independent of the Commission, and if the Chairman of the Railway Executive were himself to be a member of the body that purported to instruct him, he could be certain that he would never be instructed against his will.

It is no disrespect to the other members to say that the main burden of the Commission will fall on Sir Cyril Hurcomb and Sir William Wood. No better example of the virtues of the British Civil Servant could be found than Sir Cyril, who is one of the very select few who excite the admiration of all who see them at work. Sir William Wood has risen to the top of the largest railway company in the country; he is a man of great energy, quickness and determination.

But the supreme importance to the new structure of transport of the personnel of the Commission requires something more to be said. Both Sir Cyril and Sir William are consummate administrators, tireless in the pursuit of detail and assiduous in attendance at committees. But the Commission's job is not to administer anything; it is to think out what is meant by the co-ordination of transport, to determine how the nation can get a better transport service at lower real cost, and to impose the results of this reflection on the Executives. Or again, the whole *rationale* of the Transport Act is that there is something new to be done to transport, something that is not being done now. But Sir Cyril represents Things As They Are on one side of the fence that separates government from industry, and Sir William represents Things As They Are on the other side of the fence. All in all, Mr Barnes's appointments are so "safe," they reflect such an obvious determination not to upset anything, that one wonders more than ever what the Government thought it was accomplishing by its Act.

* * *

Telescopes to Blind Eyes

The depressing subject of Mr Isaacs grows no less gloomy with time; and the best that can be said for his Department's policy is that it may perhaps be less disastrous to productivity than the habits of Mr Shinwell, Mr Bevan, or the Chancellor of the Exchequer. Tinkering with odd half-hours and Saturday morning work is all very well in its way, and may even end by producing results of real value. But the basic reasons for low labour productivity lie elsewhere. The fact that the remedies for the neglected causes might prove embarrassing to the Government is an explanation, but not an excuse. First, there is the astonishing failure of Mr Dalton (or is it a failure?) to realise the close connection between low PMH, declining stocks, and inflation. It is no use expecting workers to work all out, or managements to push production to the limit, when stores are emptying and lack of materials or components causes work in

progress to accumulate on the floor. And it is no use expecting stocks to accumulate or the flow of components to be adequate until the demand for finished products has been brought into closer relation with the materials available; until, that is, the Treasury begins to take inflation seriously.

Secondly, there is the Government's decision to neglect the most obvious means of finding workers for the bottlenecks. The National Coal Board is merrily occupied in finding billets for ex-company secretaries. Would it not be as well to inquire when, if ever, it proposes to pass on, with Mr Bevan's help, to the more useful if less congenial task of concentrating its labour force in the more productive pits? And does even Mr Isaacs genuinely believe that the direction of labour will today produce the results which might have been expected from an effective wages policy? Direction more drastic than under the new Control of Engagements Order, which is discussed in a note on p. 292, was certainly more or less accepted during the war—more for men, less for women. But that was because the emergency was of a special kind—and, logical or not, the distinction between the popular view of war and peace emergencies is a hard fact to be faced—because it was strictly limited in time, and because it was, in practice, almost universal in the age-groups concerned. None of these conditions applies today; and on the other hand, the fact that the Order does not apply to managerial, executive, and professional workers maintains a glaring form of class distinction. In the circumstances nothing is less probable than that the attitude of directed labour will resemble that of the typical munition worker. It is far more likely to resemble that of the Bevin Boys, whose method of conscription was universally and rightly regarded as too haphazard by all except the vested interests which forced it on the Government. The Government has sold the worker's birthright of freedom for a mess of pottage; and its bargain would at least be more satisfactory if it were as likely to take delivery of the pottage as of the mess.

* * *

The New Era in India

British rule in India came to an end at midnight on Thursday. The decree is *nisi* and not absolute, for one or other or both of the new Dominions may decide to remain within the Commonwealth beyond the transitional period during which the Governors-General will have special powers for effecting the transfer. But from August 15th executive power in India will definitely belong to Indian Governments with no control any longer from London. The decisive step has been taken and there is no going back on it. Britain has formally divested itself of the remainder of its former sovereign or paramount authority over approximately 400 million people—one of the two most populous territorial units of the world—and has done so while there was still time to choose freely and before any violent upheaval has presented the dilemma between surrender to force and sanguinary suppression. It is an honourable and dignified conclusion to a chapter of history which began with the East India Company's first trading settlements and reached its climax of magnificence with the great Delhi Durbar of 1911.

Just as sometimes, looking back to the perilous autumn of 1940, we may suddenly feel astonished at realising that we are still alive and that there is no swastika over Westminster, so also, looking back a couple of years, it is a cause for congratulatory surprise that we have come through the final crisis of the British Raj in India without the breakdown, confusion and general hostilities which seemed to be impending. There has, indeed, been bloodshed in local communal strife, and massacres which have been terrible for those directly concerned. But the great catastrophe has been avoided; the ship has been navigated into the open sea. The credit for this on the British side goes specially to Mr. Attlee and Lord Mountbatten. Mr Attlee's service on the Royal Commission which went to India in 1927 has been invaluable to him as Prime Minister, for he brought to his consideration of the problem of policy a comprehensive knowledge of the Indian background. The Cabinet has also had the benefit of Sir Stafford Cripps's long study of Indian questions, though his approach to them has sometimes been unduly doctrinaire. Mr Attlee's policy has been fully in accordance with the principles of his own party, but it has been adjusted to facts with the skill which makes the difference between success and failure in politics. Yet success could not have been achieved from London without the right man in New Delhi. It was the most fortunate wisdom which appointed Lord Mountbatten, with the experience of South-East Asia Command behind him, to the office of Viceroy. He has deserved well of both Britain and India.

Politics and Food in India

All the governors of provinces in India have placed their resignations in the hands of the Viceroy with effect from August 15th. Three—two British and one Indian—have been retained in the provinces in which they were already serving, and in other provinces—the total number now being raised from eleven to thirteen by the partition of Bengal and the Punjab—new appointments have been made. In all, there are to be five British governors during the transition period; they will be in Bombay, Madras, West Punjab, the North-West Frontier Province and East Bengal. These appointments are, of course, by consent of the Indian and Pakistan Governments in their respective territories and it is worthy of note that the three of them in Pakistan are in provinces where trouble threatens; Sind, on the other hand, where Pakistan is most consolidated and has its capital, will have an Indian governor. The fact that any British governors at all have been retained in the provinces is in itself remarkable, and is a tribute to the good reputation which the individuals concerned have achieved for themselves in India.

All active politicians in both Dominions are now busy getting ready for the strenuous days ahead. The outstanding absentee from the political scene is now, nominally at least, to be Mr Gandhi, who has announced his retirement from politics and his intention of spending the rest of his days in Pakistan trying to restore Indian unity. To Mr Jinnah, unfortunately, this may also appear to be a form of politics, and it is hard to believe that Mr Gandhi desires altogether to disappear from the news; he may shun the conference rooms of New Delhi, but he has not lost his capacity for fasting.

For many millions of Mr Gandhi's fellow-countrymen, however, fasting to-day is involuntary, and is likely in the near future to overshadow all other problems of India. The prospects of the food supply have become very serious, and have been made more so by partition; for one of Pakistan's first acts has been to withhold food exports from Sind to the Indian Union. The latter is becoming more and more dependent on food imports, which are difficult to obtain, and use up India's foreign exchange resources to the exclusion of the purchases for capital development planned by Indian economic leaders. These conditions inevitably increase bitterness of feeling about the freezing of the sterling balances and diversions of Burmese rice under international food supply regulation. India is setting out on the road of independence with very formidable economic difficulties looming ahead, and it is to be hoped that, as the more acute political and constitutional problems are disposed of, the energy of the new Governments will be concentrated without delay on the fundamental question of increasing agricultural production.

* * *

Housing on the Block

With the axe—whether Mr Bevan's or another's—poised in the air above the housing programme, the latest published returns are of mainly historical interest. They show, for the period to the end of June, the steady persistence of the familiar features of the previous monthly figures. About as many houses were finished in June as in May; houses were still being started all over the country; and the number started was still slightly greater than the number completed, so that the total under construction rose once more to a new high level. Certain features of the returns are commented on in a letter to the Editor on page 277.

The question today, however, is not of the continuance of these trends. Mr Bevan has made a good beginning in a new direction with his decision to concentrate in the mining areas the majority of the aluminium houses now coming out of the factories. Before the economic crisis is over it will certainly be necessary to go much further along the same lines. The farming areas and steel towns will need much higher allocations than in the past; and even within the priority areas, much more care will be needed to ensure that houses go to the districts where they will do most good. It is a little disturbing to find, from the June returns, that nearly three times as many temporary houses have been allotted to the South Wales mining districts as to the entire Nottinghamshire coalfield, where PMH is nearly twice as high and aggregate output is already three-quarters of the Welsh figure. The North Midlands as a whole produce nearly 70 per cent more coal with 13 per cent fewer workers than South Wales; and not even the powerful political pull of the Labour Party's Solid West should prevent the appropriate housing moral from being drawn. The problem of redistributing the building labour force will have to be met, with or without the advice and consent of the TUC, by heavy bonuses for transfer to the priority districts; and it is

quite probable that, to release enough men and materials for priority work, it will be necessary to suspend construction on a good deal of work elsewhere. It will hardly be logical for Labour Members, continually harking back to wartime methods of planning, to complain if in the present emergency many housing schemes suffer the fate of their predecessors in 1939. But logic

is not everything, and least of all since many of the severest cuts would fall on Labour strongholds such as Birmingham or London; and the present battle within the Cabinet is an uncomfortable reminder that housing will be hard to keep in its rightful place near the head of the posteriority queue. Mr Bevan, to judge by his statement on Wednesday, is still undefeated on the issue of whether housing is to be cut at all.

The Boys in the Back Room

The report of the Select Committee on Expenditure, dealing with the £69 million allocated during the current financial year to scientific research, gives a wide survey, but one which necessarily leaves much unilluminated. The reason for the dark spots is obvious when it is realised that over £60 million of that total is spent by or on behalf of the Services, including a substantial sum on atomic research. It is true that a further £11 million, in the shape of Government grants to the universities, is at least partly devoted to research purposes; but the disproportion, were the world even comparatively sane, would be striking enough nevertheless.

Disproportion apart, the scientists' relation to the Government is by no means satisfactory. First-rate work requires freedom; not only that freedom to publish and discuss results and methods which may for reasons of security be denied to the awkwardly placed workers on atomic fission or—one surmises—certain aspects of bacteriology, but freedom to work in directions apparently unpromising, to follow up "hunches" without having to justify them in triplicate, to come and go between laboratory and conference, and to do, in short, a lot of things which by usual departmental standards look suspiciously like waste of time. This is a point raised several times in the Committee's report; it takes little imagination to read, between the lines, what the scientists actually said about it.

The problem of harnessing natural-born anarchists—who may certainly do their best work as part of a freely co-operating team, but not as regimented units under traditional Civil Service discipline—is matched by the problem of financing them. The Committee notes that pure research may yield enormous dividends economically justifying heavy expenditure; but there must always be the temptation to concentrate spending on the type of project whose results can be foreseen in the fairly near future—a temptation translating itself for the individual scientist into a choice between monastic austerity in the pursuit of knowledge and comparative affluence in less exalted fields. If this temptation has not hitherto proved overwhelming, it is less because of any positive wisdom than because British industry, with some honourable exceptions, has been willing to muddle through its technical problems without scientific help in a way which fills Americans and others with astonishment and pity. The Barlow Report pointed out the need both for a larger crop of scientists and for a

closer liaison between science and industry. If the day ever comes when scientific qualifications are valued in Great Britain as they are in the United States, the dilemma of Governments and universities will grow more rather than less acute.

Progress at Geneva

There is irony in the fact that, just as world trade is withering under the paralysing influence of the dollar shortage, encouraging news should be coming from the Geneva tariff negotiations. The deadlock over wool between the United States and Australia has been broken. After the enactment of the new wool legislation in the United States, the American delegates in Geneva offered the Australians a 25 per cent reduction in the import tariff on wool. This is exactly half the extent of America's maximum permissible concession, and is not as much as the Australians had hoped for. But the offer is expected to provide the basis for an agreement on this crucial issue. When it does so it will open the way for completing a number of other negotiations which had been held up by this particular deadlock.

Most important of all, the offer should allow the negotiations between the United States and the United Kingdom to be completed without much difficulty, since the only important points which remain at issue in these negotiations are American demands for concessions on preferences, which could only be granted with the consent of the Pacific Dominions and South Africa. It can now be claimed for Geneva that the conference will have achieved a greater reduction in tariff obstacles to international trade than has been effected in any comparable period in the past. It is doubly unfortunate that this achievement should, in the existing circumstances, be so empty a victory.

The other part of the Geneva negotiations, namely the debate on the proposed International Trade Organisation Charter, has felt the impact of the dollar crisis far more directly. The all-important fifth chapter of the Charter, that dealing with commercial policy, and in particular the crucial Articles 26, 27 and 28, which deal with quantitative import restrictions and the circumstances in which discrimination can be applied to restrictions of this kind, are now in the centre of the battle. The efforts of the British delegation are bent on giving this section of the Charter the greatest possible elasticity for the immediate future, postponing for at least five years the application of the doctrine of non-discrimination. There will be plenary sessions of the preparatory committee on the 18th and 19th of this month, and it is possible that any remaining differences on these fundamental issues may then come into the open. The present timetable is to get the Charter discussions finished within the next week or so, to end the tariff negotiations on September 10th and to ring the final curtain down on the meeting on October 1st. Most of the delegates will then barely have time to pack their bags before they are off to the World Conference at Havana, where the ITO is to be finally launched.

Twilight of the Gods?

In November, a conference of the Governors of the African Colonies will be held in London to exchange ideas on colonial problems, and in the first half of next year a conference of unofficial members from the Legislative Councils of those territories will meet here for the same purpose. The idea of colonial Governors conferring in London, or anywhere else, on matters of common interest is a recent one. In the bad old days, when colonial rule in Africa was mainly concerned with maintaining law and order, the Colonies were isolated, not only from the Colonial Office, but also from one another. A strong-minded Governor, as the King's personal representative and commander-in-chief of the local armed forces, was encouraged to formulate the details of policy as broadly delineated at Westminster and to carry them out. Assisted by a small executive council, he was at the same time First Minister in the Cabinet and head of the local Civil Service. Except in times of emergency, Governors were generally too jealous of their powers to wish to discuss common problems. Today, the growth of democratic institutions has somewhat mellowed their attitude to co-operation. Improved sea and air communications have reduced the feeling of isolation, and the advantages of co-operation between Colonies are beginning to emerge. But it is now recognised, as it has for the last few years been recognised in the West Indies, that the African peoples themselves should have the opportunity of discussing mutual problems through their unofficial representatives, without a Governor as chairman, and it is the recognition of this fact that

makes next year's officially-sponsored conference of unofficial representatives so significant.

The powers of colonial Governors are considerably less than they were twenty years ago in most Colonies; but except in those Colonies on the verge of dominion status, the Governor, through his personality, ability and general attitude, still largely moulds and directs the pace of progress. The announcement last week of the appointment of Governors-designate for Nigeria, Northern Rhodesia, the Gold Coast, and Sierra Leone is thus of major importance. Men have now been chosen who will direct, with the assistance of the local Legislative Councils, the destinies of four African Colonies in the next five years. Plans for the political and economic progress of these Colonies should have considerably matured by the end of their period of office. Governors will no doubt be by then even more constitutional monarchs than they are at present.

Fifteen Russian Wives

The Foreign Secretary has stated in answer to a parliamentary question that he no longer has any hope of obtaining the Soviet Government's consent to the departure of the fifteen Russian wives who were to join the British husbands to whom they were married under Russian law during the war. No episode in Anglo-Soviet relations has been so extraordinary as this or has done so much to convince the average Englishman that there is indeed something essentially cruel and inhuman about the regime which, for no easily comprehensible reason, can thus deliberately wreck the lives of innocent people and victimise men of whom some risked their lives bringing war supplies to Russia on the Arctic convoys. This has been no affair of red tape, of a blind adherence to regulations by officials who dare not disregard them; an application has been made to the very highest quarters and its rejection has been a political act of the utmost deliberation. Moreover, since the matter was first raised, the Soviet Union has forbidden by law any marriage between a Soviet citizen and a foreigner. The Soviet Union has thus, alone among modern nations, adopted national endogamy as a legal principle; henceforth there will be not only a Soviet people, but a Soviet race.

It may seem, however, that the law prohibiting foreign marriages should at least have made it easier for the Soviet Government to have been lenient over the small number of marriages legally contracted before the prohibition, for it must have removed any fear that exit permits for the fifteen might serve as a precedent for a mass emigration of women unaccountably misled by Cupid to forsake the "happy life" of Stalin's empire. But not even the fifteen can be permitted to go. Why not? Neither the Soviet Government nor its professional apologists in this country have succeeded in producing any reason which is both respectable and convincing. The only explanation, indeed, appears to be the obvious one—that the Soviet Government will not allow any of its citizens ever to go abroad for good and escape finally from its power and control, so that they are free to talk as they please. All Soviet citizens who do go abroad are very carefully tested and selected and perpetually watched; even so, there are Krivitskys and Kravchenkos. The fifteen wives were selected neither by the Party nor by the NKVD, but by love; so much the worse for them.

Shorter Notes

Among the distractions of crisis this week's long step back towards normal is in danger of being overlooked. As from August 11th the Minister of Food has revoked the order empowering local authorities to direct caterers to supply meals to the public in emergencies created by enemy action, and enabling the sale of food in air raid shelters. This is good hearing only two years and a few months after VE Day. Perhaps the railway companies may now be spurred to remove from their carriage advertisement frames those placards urging observance of blackout regulations or exhorting passengers not to leave the train when halted between stations during an air raid.

*

In the week ended August 2nd, 448 cases of infantile paralysis were notified, bringing the total for the year to about the same level as was reached in 1938 when 1,489 cases were notified in the whole year—the highest total previously recorded. Figures given in *Hansard* for August 7th show the distribution of notifications by counties and associated county boroughs during the period March 30th-July 26th of this year. The West Riding of Yorkshire had the highest total, with 153 notifications, followed by London with 113, Lancashire 85, Buckinghamshire 77, Durham and Warwickshire 55 each, Surrey 47, Middlesex 42, Kent 33 and Essex 31.

Letters to the Editor

The Economic Crisis

SIR,—In your article of August 2nd, you state that "there is really very little room for doubt that the aggregate output of the British community today is from 10 to 20 per cent higher in volume than it was in 1938." I suggest that the evidence for this view is at least ambiguous.

The total employed labour force (men and women of insurable ages) is now about 6 per cent above pre-war. The fact that the increases in the armed forces and in national and local government administration together more than absorb the increase in total employment has obvious implications. Weekly hours are shorter (and holidays longer) than in 1938. According to the Ministry of Labour Enquiries, which cover most industrial employment, the average weekly hours actually worked in October, 1946, were slightly less than in October, 1938. This was just before the movement for shorter standard hours resulted in new agreements now affecting most of our major industries; since the autumn of 1946 there has almost certainly been an appreciable reduction in actual hours worked, both for this and other (e.g., shortage of fuel and materials) reasons. Productivity per worker in many important industries, comprising an appreciable proportion of total employment, is well below pre-war. Even when allowance is made for any factors on the other side (such as the improved capital equipment in parts of the engineering industries), this general evidence strongly suggests that aggregate output cannot be from 10 to 20 per cent above 1938.

More detailed study of the available data confirms this general conclusion. The data for coal mining and building (together employing 11 per cent of the total civil labour force) need not be reiterated. The volume of exports in 1946 and the first quarter of 1947 just reached that of 1938; no more than "a normal pre-war year's work" of industrial equipment and maintenance was done in 1946. On personal consumption (about which you state that the standard in 1946 was "in the aggregate and on the average . . . already as high as in 1938"), the "National Income White Paper" for 1945 shows that "consumers' expenditure in

real terms" (measured by the National Cost of Personal Consumption at 1938 prices) was 14 per cent less in 1945 than in 1938. The "White Paper on National Income" for 1946 does not give the corresponding calculation, but the data which are given suggest that, at best, in 1946 we still barely reached the standards of 1938; the "Economic Survey for 1947" confirms that "the amount of goods sold (in 1946) is probably not more than 10-15 per cent below [my italics] pre-war." As we had also an increased population, the average standard would show a still bigger decrease. These calculations necessarily omit any allowance for deterioration in quality, a matter of considerable significance, neglect of which can vitiate the whole picture. It is well known that the statistics of output of coal and of consumption of beer are appreciably inflated, as compared with pre-war, by the inclusion of material which formerly would have been excluded; the reduced durability of various consumers' goods represents a considerable loss in the real value of output; while the deterioration in the quality of services hardly needs comment—although increased expenditure on services accounts for a substantial part of the increase in personal expenditure between 1945 and 1946, which is usually taken as representing a rise in real standards. Nor, to quote the 1945 "National Income White Paper," do any "of the figures make allowance for the loss of satisfaction caused by restrictions on consumers' freedom of choice." Production for the consumer reflects the maldistribution of resources (particularly of manpower), and is, in fact, heavily weighted in favour of those things he does not want and against those which he does.

It is, of course, true that the national income is in a healthy condition. But any simple deductions about national prosperity or economic welfare from this fact are misleading. The warnings of Marshall and Professor Pigou on this point were probably never more apposite than to-day; for many reasons, it is no longer possible to believe (what was never more than a rough first approximation) that "the two concepts, economic welfare and the national dividend, are thus co-ordinate, in such wise that any description of the content of one of them implies a corresponding description of the content of the other."

TI

and the boy in the boiler suit

Hundreds of boys, many of them fresh from school, earn their first real wages from one of the TI Group of Companies. From that moment, regardless of background, they enjoy equality of opportunity, for TI have decided that the only limit to their advancement shall be the capacity of the individual.

Opportunity is there from the beginning. Youngsters in TI are helped to continue their broad education for one day a week on full pay. Older boys, after an apprenticeship agreement with their Company, embark on a course of training in engineering or commerce which will lead the right lads as far as a university degree. At every stage they and their parents are advised by their Company Training Officer.

TI hold this policy to be at once a duty and an interest—for upon such opportunity depends the future, not just of TI, but of the whole nation.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paint—the whole is TI.

Tube Investments Ltd., 3 Grosvenor Square, London, W.1

More than 2,250,000,000 effective telephone calls are made in Britain every year. G.P.O. telephones are used thousands of millions of times in a year; and all those receivers are plastics. One of the basic materials used in the making of plastic telephones is phenol. Monsanto are the largest manufacturers of phenol in Great Britain.

SERVING INDUSTRY WHICH SERVES MANKIND

While it is possible to agree that part of our present difficulties arise from over-ambitious programmes (particularly of capital construction), and inflationary demand generally, it is surely a false diagnosis to state that "It is not the output of the British economy that is mainly wrong. . . . It is not the supply side of the equation that is at fault, but the demand side." Not only is this dichotomy too sharp, but I suggest that it is manifestly untrue that all is well with output either in the aggregate or in the particular pattern. Granted that "greater abstinence" can play its part in reducing inflationary pressure and thereby also help to put the supply side right, and that specific measures to increase output are likely to be frustrated if inflationary pressure is not reduced, to accept your diagnosis means not only acceptance in the main of the present low output, but also acquiescence in measures (from the refusal to allow entry of new apprentices into the building trades to the adoption of a still shorter working week) which can only exacerbate our problems.—Yours faithfully,
Gonville and Caius College, Cambridge S. R. DENNISON

[Part of Mr Dennison's letter is taken up with denying what we never asserted. For example, we never said that the production of manufacturing industry was higher than in 1938; we carefully said "the aggregate output of the community." That the community is producing too many services and too few goods may well be true. Or again, we would not deny that standards of quality have deteriorated. And we should be very surprised indeed if any regular reader of *The Economist* could read into any of our recent articles any belief in the "healthy condition" of "national prosperity or economic welfare." What we were trying to assert was that the volume or quantity of the national income is not deficient, that it is not the volume of production that is at fault but its distribution. The country is producing in large volume, but the wrong things. Some of the evidence in support of this is as follows:—

1. The net national income at factor cost in 1938 was £4,671 million and in 1946 £7,974 million. For the real magnitude in 1946 to be lower than in 1938 would involve assuming a rise in the general price level of more than 70 per cent, which is difficult to reconcile with known facts, especially when it is borne in mind that it is the whole of output that is in question.
2. According to the National Income White Paper, personal expenditure on consumers' goods and services valued at 1938 (market) prices was slightly higher in 1946 than in 1938, and personal consumption was almost certainly a smaller proportion of total output than in 1938, in view of the increase in Government expenditure.
3. *The Economist* Index of Business Activity provided before the war a fairly close measure of the movements of the real national income. Of the 14 weighted components, five, with total weights of 16 out of 42, would probably now be found to be more than 15 per cent higher than in 1938, and a further two, with weights of 12, between 5 and 15 per cent higher. One, weighted 4, would be at about the pre-war level, and only two, weighted 3, definitely lower. For three components, weighted 7 (Postal Activity, Shipping Movements and Building Activity) the data do not furnish, on a hurried inspection, a fair comparison. EDITOR.]

SIR,—Others will doubtless be commenting on your leader, "Articles Seven to Ten," from the standpoint of principle; may I make just one point, on the plainest ground of practicability?

What do you do about Canada? This country could doubtless survive economically, if the worst came to the worst, and we suspended altogether our trade with the United States. It would be extremely unpleasant, but it could be done. But the imports we get from Canada are absolutely essential; we have got to have some means of paying for them, and at present we are only doing so to quite a slight extent. Is it really thinkable that we should bring pressure to bear on Canada to compel her to take measures restricting her imports from America in order to take our goods? Surely it is most doubtful if we could do it, even if we tried; and the mere attempt to do it would poison relations between every pair of the "North Atlantic triangle" on whose willing and unforced co-operation most of the hopes of the world depend.

And yet we have got to find a way of paying Canada. It is hardly conceivable that we can possibly pay her unless some substantial part of the payment is made directly. We have got to get our prices low enough to compete with the Americans on the Canadian market. At present US exports to North America have risen in an even greater proportion above the pre-war level than US exports to Europe; we ought to be able to displace some of those exports, and if we do so by the normal channels of trade Canada (and even the more sober minds in the United States) would have no cause to do anything but bless us. But consider the cut in prices which we shall need in order to displace US goods in Toronto or in Winnipeg! It cannot be done without a devaluation of the pound.

Sir, we have learned to expect from your paper an open-mindedness which is one of the best things left in the public life of this country. Surely you cannot go on shutting your mind to this issue much longer. It cannot be denied that the pound is overvalued, not perhaps in relation to price-levels, but relatively to the work which (now that we have lost our foreign assets) it has to do. And now, of the two arguments which have universally been advanced to still the voices of the devaluationists, both

are losing their force. Devaluation would stimulate internal inflation; we know that, but at last it has been agreed among sensible people that strong steps against internal inflation must be taken in any case. Devaluation would turn the terms of trade against us; but what turns the terms of trade against us is not devaluation as such, but the stoppage of the gap in our balance of payments—if the gap is to be filled (as we all want it to be filled) by increasing exports. The more exports we push on the world, the less favourable will our terms of trade be, as compared with what they might have been otherwise. We do not now want to reduce imports in order to turn the terms of trade in our favour—the old (and admittedly defensible) protectionist argument. We want all the imports we are likely to get, even if we have to get them on unfavourable terms.

I would admit that devaluation is not the only remedy in the field of commercial policy which we need to consider. When we have devalued (of course, we can only devalue by agreement with the Americans), then would be the time to seek some alleviation for the commercial provisions of the loan agreement. It would, incidentally, be much more sensible for the Americans to make such alleviations if they saw that we were not proposing to rest the whole weight of our trade recovery upon them—a weight which they, most certainly, cannot bear.—Yours faithfully,
Nuffield College, Oxford J. R. HICKS

[What have we done to deserve the accusation of a closed mind on the subject of devaluation? In our opinion, it is all a matter of timing. A point will come when the advantages of letting the pound find its "natural" level will begin to outweigh those of keeping its value up. That time may be approaching very fast. But we doubt whether Mr Hicks is right in thinking that it has yet arrived.—EDITOR.]

SIR,—I was greatly interested to read in your issue of August 2nd a letter by Mr Derek E. Hill-Smith suggesting an alteration in the \$-£ exchange rate as a remedy for the worsening of the terms of trade to this country. What Mr Smith seems to advocate is an appreciation of the pound in terms of dollars to cheapen the essential imports from the United States.

The "escape clauses" of Bretton Woods were mainly, if not exclusively, intended to deal with the opposite case: a country wishing to devalue its currency. In short, Mr Hill-Smith's proposal would amount to Britain asking the United States to devalue the dollar.

This suggestion does not appear to be very realistic. According to the theory of purchasing power parity, which Mr Hill-Smith seems to follow, the country whose price-level has relatively

From *The Economist* of 1847

August 14, 1847.

WE had the gratification last week of recording the unopposed return of Mr Villiers for South Lancashire; and this week we have the additional gratification of announcing the similar return of Mr Cobden for the West Riding of Yorkshire. . . . Their election . . . fixes the throne of free trade over the prostrate monopoly of the landowners. . . .

The real opponents to free trade are the persons who by office are bound to maintain old institutions. Nestled in every crook and cranny of the Treasury, and every other public office, there are found persons who adhere pertinaciously to old forms and old practices—whose life is one mill-horse routine—and who, on habit and principle, oppose almost every change. Sometimes they are called the Tadpoles and Tapirs of the Government, sometimes the bureaucracy; but they are always distinguished by preferring dead forms to living interests. The progress of free trade is, in a great variety of modes, destructive to their power. It wounds their self-love. They are the organised host who oppose the onward march of the people. Now, free trade, having some of its own followers filling the high office of statesmen, has an advantage over them; and fortunate will those statesmen be, assured of power and popularity, who shall disregard the advice and the pretensions of the subordinates of all the public offices, and shall resolve to do things and have them done on the principles of free trade. . . . Far more . . . for the tranquillity of the country will depend on the course of the Ministers than on the character of the Parliament. The country has spoken out in favour of free trade, and though some men in office may for a time thwart it, causing much confusion and injury, no one can finally arrest it, and, therefore, their highest duty and pleasure should be, to give, as speedily as is consistent with safety, effect to the wishes of the people and the necessity of the age.

risen should devalue, provided that the existing exchange rate corresponded to the true position before the rise in prices occurred.

It seems, however, obvious that the present rate of \$4.03 to £1 would never be maintained in a free exchange market, and there is ample suggestion that a "realistic" after-war rate would be rather in the region of some \$2.50-\$3.00 to £1. A country with less goods to export than to import cannot afford a high rate of exchange. In spite of the rise in American prices the £ seems to be still overvalued at the present rate.

If there are any British exports to the United States the demand for which is inelastic, is not the best way out to raise their price, instead of affecting all British exports to America by altering the rate of exchange?—Yours faithfully,
H. TYSZYNSKI

33 Wetherby Mansions, S.W.5

SIR,—You are surely in error in your article when you claim that the convertibility Articles (7 and 8) of the American Loan Agreement are relatively unimportant compared with the non-discrimination Articles (9 and 10).

The convertibility Articles seriously increase the draining away of our dollar resources in two ways. They cause us to lose dollars at a rate exceeding that of the total deficit in our balance of payments (we have to supply dollars to the full extent of the sum of the deficits with individual countries—which is larger than the net adverse balance with all countries). Secondly, they increase the total deficit in our balance of payments by providing other countries with an incentive to cut down their imports of British goods, because their favourable balances with us can be turned into dollars.

I suggest that the convertibility and non-discrimination Articles are equally injurious to the economic recovery of Britain.—Yours faithfully,
A. J. PETTIT

The Housing Programme

SIR,—In the debate on housing in the House of Commons on July 28th, Mr Bevan made the startling revelation that "we are at the present time stacking bricks on site" and that "we are having to close down in certain brickyards because they cannot get orders." Now this surplus of bricks does not result from our great success with the brick production programme, for the average monthly output of bricks in January to May of this year was only 330 million, compared with an estimated production of 442 million per month for the whole year planned in the "Housing Programme for 1947" (Cmd. 7021). It merely results from the fact that we have been even less successful in the house building than in brick production.

In view of this apparent superfluity of bricks on an achievement of only 75 per cent of programme it is of interest to look at what has happened in other housing materials and components. It will be seen from the accompanying table, which gives such figures as are available, that in many components the percentage achievement of programme is higher than for bricks; in some indeed the programme has been exceeded by a substantial margin.

PROGRAMME AND OUTPUT OF BUILDING MATERIALS AND COMPONENTS
(Monthly Average) (Thousands)

	Unit	Programme 1947 (Cmd. 7021)	Output, Jan.-May, 1947 (Cmd. 7152)	Output as Percentage of Programme
Bricks	Number	442,000	330,000	75
Cement	Tons	135.0*	102.0*	76
Plaster gypsum	"	18.3	13.7	75
Plasterboard	Sq. yards.	923.0*	663.0*	72
Drain pipes	Tons	39.2	32.5	67
Soil pipes	"	4.6	2.6	57
Rainwater goods	"	6.7	6.2	93
Manhole covers and frames	"	3.8	3.0	79
Baths	Number	33.3	27.4	83
Lavatory basins	"	81.2	74.9	92

Sockets	"	916.7	1,055.0	115
Switches	"	541.7	682.0	126
		1,383.3	1,108.0	80

* Weekly Average.

The proportion of supplies going to new house building varies from item to item and it cannot of course be assumed that there are excess supplies in all items where production is 75 per cent—the figure for bricks—or more of programme. But there can be little doubt that stocks of some of the items are accumulating and will continue to do so at present rates of output.

Lack of balance of this sort is inevitable when component supply is planned in relation to an unrealistic target programme. The only remedy for it is to reduce the housing programme to what it is really expected will be achieved and to arrange component supply to correspond to requirements at that realistic level. It is of course always attractive in planning to pursue the policy of building up large stocks of components in order to make distribution easy, and to guard against possible lapses in production in the future, but it is seldom realised that to have components for which there are no houses is just as much of a waste as to have houses for which there are no components.—Yours faithfully,
ELY DEVONS

Economics Research Section, Manchester University

Indonesia—The Real Issues

SIR,—I will not discuss the article from your correspondent about Indonesia in *The Economist* of July 26th. I only want to point out that a number of facts are untrue.

1. The issue of the struggle in Indonesia is not between a capitalist Holland and a socialist Indonesia. With the aid of arms, which the Japanese have given for that very purpose, a number of so-called politicians tried to seize power and even to suppress the liberties of the other peoples of Java. Dutch, English, Chinese goods are taken away. If your correspondent calls this nationalisation, Goering had a right to call his robbery of European treasures of art nationalisation too.

2. The KPM shipping line has not the bulk of a huge industry in its hands. In Indonesia goods were produced to the advantage of the Indonesians and of the Dutch, who brought justice, freedom, health, security and science to the inhabitants. It is, in my opinion, not state socialism when a small minority steals these goods, sells them below the world price, puts the money in its own pocket, or threatens to burn these goods in order to levy political blackmail. It is not state socialism to destroy the rights and freedom of several peoples and to enslave them. In the Island of Madura starvation and wholesale death prevail. But, to repeat the words of your correspondent, "this sense of urgency is not shared by the republicans."

3. The Republicans did not bring freedom from fear any more than other points of the Atlantic Charter. On the contrary, the Japanese terror was mere child's play in comparison with the new one. Thousands of hostages are still in camps. Every Indonesian movement is suppressed. Those are the simple facts which can be checked by everyone. The supposition of your correspondent that at the Hague die-hards are living who want to restore an old-fashioned Colonial system is pure nonsense. The politics of the Dutch have been, for more than twenty years, aimed at co-operation with the true nationalistic spirit of the different Javanese peoples, a co-operation, now fully existing in East-Indonesia, where the inhabitants have a deadly fear of the so-called Republic.

4. The article of your correspondent is an expression of the decline in our moral standard. England became a great nation because it did not support robbery, terror, blackmail, murder; and it has the duty to maintain this high standard. Acting thus, it cannot support the Indonesian Republic, a mere creation of the Japanese, a Japanese time-bomb. Moreover, the Republic of Djokja is not the expression of the real nationalism, with which the Netherlands always will, and already do, co-operate. Before this can be fully realised in Java and in Sumatra, peace and order have to be restored.—Yours faithfully,
Haarlem, Holland H. A. LUNSHOF

Government and Governed

"Thoughts on the Constitution." By the Rt. Hon. L. S. Amery, CH, DCL Oxford. 8s. 6d.

MR AMERY'S book is an attempt, by a philosophical Conservative of immense practical experience, to express the genius of British institutions. In four chapters devoted respectively to the nature of the Constitution, the future of Parliament, the organisation of the executive and the development of the Commonwealth he presses home his thesis that the distinguishing feature of the British Constitution is the balance it preserves between the principles of government and consent. It is not, for all nineteenth century theorising, a democratic constitution, because at every point it recognises the primacy of government and assigns to the people and their elected representatives the negative function of choosing between alternative policies worked out by others. This preserves us from the dangers of the multi-party system, with its insistence on the need for a mathematically precise reflection of popular opinion; from the chaos which results from members of the legislature being allowed to interest themselves too actively in public expenditure; and from the Continental dogma that virtue resides in numbers. It also explains why British statesmen, nurtured on the Duke of Wellington's doctrine that the King's Government must at all costs be maintained, are willing to accept almost any sacrifice of principle rather than leave the country ungoverned for a week-end.

The traditional balance between the initiating and guiding element in the constitution, which Mr Amery calls the Crown, and which in practice is the Cabinet and the criticising, inquiring and choosing elements which Mr Amery calls the nation, and which is embodied in Parliament, is, in his opinion, being rapidly upset. The Cabinet, borne down by departmental duties, has little time left over in which to guide policy in any accurate meaning of the phrase. He advocates a small inner Cabinet of Ministers free from particular departmental responsibilities and concerned solely with co-ordinating and directing the activities of their colleagues. The trouble with the popular or consenting element in the constitution is that its functions are being steadily diminished. Mr Amery does not think that this is due entirely to the Commons being overworked. There is urgent need for an efficient committee system for the scrutiny of indirect legislation, but the real enemy is want of specialised knowledge. If the life of the nation is to be faithfully reflected in Parliament, Mr Amery believes that Parliament must contain more elected representatives of professional interests. At the same time, when Parliament has to delegate it should do so, wherever possible, to elected professional bodies with power of subordinate legislation, such as those granted by Statute to the Church Assembly. Professional interests are probably not left in the cold under the present system to quite the extent which Mr Amery suggests, and the Government's numerous advisory bodies, drawn from both sides in industry, occupy an important, though informal, place in the constitution. The problem is how to combine specialised knowledge with genuine representativeness. We must get away from the idea that there is anything wrong in being a vested interest, and recognise that pressure groups come into being only when legitimate interests are denied constitutional expression.

Mr Amery's last chapter is a brilliant vindication of the principle of co-operation between legally sovereign states, as against federalism. The experience gained in political and economic co-operation in the Commonwealth might profitably be remembered by the statesmen now engaged in making Europe fit for dollars. Altogether this is one of the weightiest and most penetrating essays in political theory which has appeared in this country for many years, and it should be long studied and admired by students of the constitution.

Savings Banks History

"A History of Savings Banks." By H. Oliver Horne. Oxford University Press. 18s.

It would be hard to find better instances to illustrate the curious relations that can subsist in the United Kingdom—and probably nowhere else—between the state, private commercial enterprise, and movements for social reform than are contained in the history of the Trustee Savings Banks. By origin those banks are the products of the social reforming zeal (and the manifest need) of the Napoleonic War period. From the first, legislation was

required to protect their depositors and to make them workable. In the mid-nineteenth century, when they showed signs of stagnation, the state set up what appeared to be a formidable rival to them in the Post Office Savings Bank. After their earliest decades, they were in competition in some degree with commercial banking interests, which were jealous especially of the virtual subsidy which they received from the state (in the shape of a high rate of interest on their assets lodged with the National Debt Commissioners) during the greater part of their history.

Thus, the historian of these banks has a task of some difficulty, as well as an excellent opportunity to chart some of the most interesting cross-currents of opinion and policy of the last century and a half. It was fortunate that the late Mr Horne, whose long association with the banks gave him an unrivalled knowledge of their more recent history and structure, was also a sufficiently able historian to take advantage of this opportunity, and to make his book, which was in any case bound to be a standard work for the specialist, a valuable one for the general student of economic history.

The social and economic background is well drawn wherever it is relevant; a useful amount of biographical information is given on the main personalities; and the central economic and political issues involved in each of the successive stages of development and legislation are admirably analysed. The Trustee Savings Banks Association is to be congratulated on its initiative in commissioning this work.

Feminist Stocktaking

"Women: Their Professional Status." A World Survey, Issued by the British Federation of Business and Professional Women. 78 pages. 10s.

LIKE its predecessor, World War II has had for a by-product a wide forward surge of feminine emancipation. The most obvious changes in status, the winning of the vote and the formal opening of the professions, were in most countries already accomplished fact; while more women have achieved citizenship and more professions have been opened, the greater change has been in the weakening or breaking down of the informal barriers, the conventional discriminations and habitual mistrusts. The British Federation of Business and Professional Women, by publishing this résumé of the International Labour Organisation's study, "The Law and Women's Work," provides a convenient survey of the formal and legal situation, the results, so to speak, of the essential preliminary site-clearing operations. It is an excellent little book, in which one can illuminatingly follow some particular problem—say, that of maternity provisions for married State employees—from country to country. In the pre-war Italian civil service, for instance, the full pay drawn during maternity leave was supplemented by a special allowance "for active service." Sweden, giving somewhat longer leave, paid only one-third salary. Mexico, Belgium, Brazil, Bulgaria, and France paid their women teachers at full rates for varying periods; New South Wales, Great Britain, and Greece reduced the pay by varying proportions; Tasmania and Rumania had leave provisions amounting to temporary suspension without pay—a sort of maternity fine.

A really adequate study of the professional position of women would, of course, have to go far beyond even the fullest and best-amination of such extra-legal barriers as the restriction of training facilities; beyond even the assessment of convention and prejudice. It would have to look for light on a wider question: how society should be organised in order that women should be enabled to make their full contribution, economically and civically as well as biologically. The fact that the biological function is so unevenly divided between the sexes means that women's contributions—in other fields must be unequal likewise, and the old-line feminists—so often themselves celibate or childless—might as well resign themselves to that fact. But there is no reason why that inequality should be as great as it now is, or even as it still would be were every merely negative barrier of law and convention thrown down. Nothing much can be done about the curse of Eve; but its subsidiary after-effects are another matter. It will be interesting to see whether any subsequent publications of the Federation cast any light on these positive changes, which one can envisage as ranging from the multiplication of nursery schools to the growth of a proud independence, in the masculine mind, with regard to the darning of socks.

AMERICAN SURVEY

Can Wallace Stop Stassen?

(From Our US Editorial Staff)

OF next year's Presidential candidates, two have the advantage of holding no public office at the moment and have been able to spend their time in preparations for next spring's party conventions. Both have travelled widely and spoken often within the United States; both have taken trips to Europe. The two are Harold Stassen who, contrary to the tradition of modesty, has firmly announced his candidature, and Henry Wallace, who shyly allows others to press his claims.

Often the only way of judging a candidate's capacity for the Presidency of the United States is to watch his growth after new experiences. To be a good President it is necessary to be able to learn quickly. Presidents, unlike Prime Ministers, have not had, when they take office, the long training of years on the back benches, more years in minor jobs and periods of great administrative responsibility in Cabinet posts. There is no such hard road to the Presidency. The traditional journey from log cabin to White House is not a long, long trail but is accomplished by magic carpet with few stops on the way. Most Presidents come from one of two sources, governorships of States—good, but miniature, training grounds—or the Senate, a strictly legislative body which can provide no experience in administration. A few have held Cabinet appointments but, in the United States, the whole executive responsibility rests with the President. Cabinet officers have no authority which is not delegated by him; they are his staff officers—not members of a Committee.

Mr Stassen, always a Republican, has been Governor of Minnesota, a valuable experience but not as exacting as the governorship of New York, from which Mr Roosevelt came (and Mr Dewey hopes to come). Mr Wallace, the son of a Republican Secretary of Agriculture, became a Democrat and has himself been Secretary of Agriculture, Vice-President and Secretary of Commerce. During the most trying war years he was, to some extent, in Mr Roosevelt's confidence. His career should have provided better training than Mr Stassen's and he should have been able to make better use of his European trip. It is now clear that he has not done so.

Mr Wallace seems to have learned nothing in Europe and his speeches since his return have been no different from those he made before leaving. Everything he has said in the last three months suggests that he is still obsessed with nostalgia for the 1930's rather than with plans for the 1950's. He has appointed himself Roosevelt's heir and reverently parades his "FDRdipus complex" at every meeting. "I came here in 1933 to join a team," he said in his last speech in Washington. "The man who put the team together and made it work is gone." Having established his ancestry, filial piety leads him to attack the present President on behalf of the late one. Nothing that Mr Truman does can be right for Mr Wallace. Mr Truman, after all, has the job which he might have had (if Roosevelt had died

a few weeks earlier) and which he considers to be rightfully his.

The most curious of his recent caprices has been his handling of the Secretary of State's Harvard address. He made two major speeches—one at Newark and one in Washington—in the first two weeks after the launching of the Marshall Plan. He made no reference to it in either, and even admitted that he "had not studied it in detail." By that time he must have been the only man in the world with aspirations to statesmanship who had not. Instead, he continued his attack on the Truman Doctrine as a more vulnerable example of the Administration's foreign policy and preferred to ignore the Marshall Plan in the hope that it would never reach adolescence. His eventual grudging praise for it (as a "great advance" on the Truman Doctrine—in the course of a vicious attack on Mr Bevin) did not come until he had presumably lost hope of it dying young. Since Mr Molotov left Paris he has returned to deep silence.

Henry Wallace is now a Presidential candidate before anything else. His desire to reform the Democratic Party from within, so often expressed, means his intention to do the job himself. He wants the Democratic nomination next year but he knows that he cannot get it. The only thing he can do is to defeat Mr Truman by splitting the party and letting the Republicans in. Then he hopes to collect the pieces and run in 1952. His campaign was started in California at the end of July by Mr Robert W. Kenney, himself an unsuccessful Democratic candidate for Governor of that State. A meeting of Wallace delegates from eleven western States to be held at Denver in the autumn is the next step. In his efforts to disrupt the Democrats he has the support of the Communist Party, who, if they cannot elect their own man, prefer to have a diehard Republican as an object for attack. He seems to have little support from the other members of the "team" which he joined in 1933 and has now left in the lurch. Mr Harold Ickes, who might well lay claim to a share of Mr Roosevelt's mantle, asked some weeks ago *à propos* the Marshall Plan: "Where do you stand, Mr Wallace?" There was no answer.

*

Mr Stassen has shown different qualities since his return from Europe. He has the reputation for being stolid and pedestrian. If so, his feet seem to be a sound pair. By comparison, Mr Wallace is a lark without wings. Mr Stassen made less noise in Europe because he went to learn and not to lecture, but he came back with a better idea of the problems. As soon as Mr Dean Acheson had stated the European dilemma at Cleveland, Mississippi, in May, he said, in a speech at Jefferson, Iowa, on May 21st: "I believe that for the next ten years we should devote ten per cent of our total national production of goods to building for world-wide peace." In June he told the graduating class at Swarthmore College that "there is currently more danger from mistakes and errors of American world economic policy than from any other major question in the country." Mr Stassen's approach to all problems is economic while Mr Wallace's is political. Mr Wallace suggests a dramatic meeting of Mr Truman and Mr Marshall with Mr Stalin and Mr Molotov; Mr Stassen can offer only a ten-year programme of American help.

But, while Mr Wallace can jump from branch to branch, singing the praises of free enterprise and calling Communism

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

"grand and glorious" in the same speech, Mr Stassen remains a Republican—not merely a member of the Republican Party. His distrust of Socialism is deep—and sincere. He believes nationalisation to be a political question which Britain should decide as she likes when she has the time. As he does not admit that it provides any solution of the economic crisis, to which the energies of all Ministers should be devoted for the present, he does not think she has the time now. He is not, like most of his party, opposed to all controls. He would be willing to impose them in the United States to make the Marshall Plan work. If he were President, aid to Europe might have temporary strings attached. They would not be ropes, as his dislike of dictatorships extends to himself.

From Phrases to Figures

(From Our US Editorial Staff)

MR ATTLEE'S speech outlining the steps by which Britain proposes to start meeting its dollar difficulties, has begun to bring more precision into the American concept of what the Western European situation is, and what it will require. The fact that the British loan is practically exhausted, while British recovery is hardly begun, has underlined the importance of keeping in separate compartments from now on credits designed for rehabilitation and credits designed for relief.

The British loan, on a single country basis, was designed as a dual purpose instrument to cover expenditures both for current consumption and for capital purposes; on a multiple-country basis, and with more emphasis on current relief, so was Unrra. The extent to which both sets of funds were used for current account is recognised to be in considerable part the result of miscalculation as to the real extent of war damage and disruption, the rise in the US price level which correspondingly diminished the purchasing power of the credits, and inability to get delivery of US products because of the competitive demand of the domestic market. But the difference between a gift and a productive investment remains. Americans are willing to make both. They do, however, want to know which is which.

American bankers, industrialists, economists and journalists have recently visited Europe in fair numbers. Some have seen things with their own eyes—others appear to have been led around by "Seeing Eye" dogs of one breed or another. Those who went over and saw what they had decided to see, are now sharing their conviction that the US is being led up the garden path. The basis of their conviction varies: Europe is finished anyhow; socialised economies are incapable of efficient production; European management is hide-bound; failures arising from political sources in the socialised sectors of the European economies, or from private sources in the capitalistic sectors, will stifle plans for rationalisation which have been waiting for years—decades, even—to get off the paper they were written on; no overall assessment, economic or political, has been made of what is, or what is not, possible. The balance sheet recently proposed by *The Economist* as the planners' last chance is thus rapidly becoming a first condition of any plan that will require the American industrial economy to make contributions to European recovery.

The alternative to vague charitable appeals is to present a bill of particulars. The Monnet plan, even though its speed

Harold Stassen could be elected next year if he could be nominated. He has the Republican National Committee to beat, a stiff-necked and unadulterated group, who have been caught napping once—by Wendell Willkie in 1940—and do not propose to be caught again. His chances will be bad if Mr Wallace splits the Democrats and makes it certain that any Republican, however, reactionary, will win. They will be good if Mr Truman's popularity grows and the Republican National Committee is sufficiently frightened to allow Mr Stassen to be nominated. It used to be said that everybody was against Mr Roosevelt except the voters. It may be that in 1948, everybody will be for Mr Stassen except the delegates to the nominating convention.

to date in getting off paper may be disappointing, has the merit of a precise proposal. With comparable data for Italy, the Low Countries, the Western Zones of Germany, and Britain, it ought to be possible to estimate by how much specified equipment could be expected to induce revival by, say, a year after installation. And so on for a few years ahead. Such a gauge of workability, however inevitably rough, would give a solid basis for forecast and review.

Another point on which current negotiations may soon give more precision is the essential unity of the British and the European problem. Mr. Marshall's emphasis that loan negotiations between the British and American Governments can concern only the loan, the Ruhr negotiations only coal, the level-of-industry negotiations only level-of-industry, underline the assumption that no inclusive arrangement can be undertaken with Britain by herself; Western Europe, Britain included, must work as a whole or the whole goes under.

A third point on which there is new precision is the probable volume of credits under the Marshall Plan. The present rate of US exports, \$16 billion a year, is due in any event for decline. The largest magnitude currently discussed for the Marshall Plan is an annual rate of \$5 billion. The tendency has been to think that the Marshall Plan would press further demands on US productive capacity. It now begins to be seen that while a gradual decline in exports would provide the mild relaxation of inflationary pressure for which everyone longs, a rapid fall to a level more like that of the 1920s could be very much too much of a good thing, and make the long prophesied recession a vivid fact.

The film situation is illustrative. If an axe, rather than a tax, had been applied, the economic facts would not have been surrounded by the present emotional high tension. Film revenues from Britain have been equal to about 15 to 20 per cent of the industry's receipts and the stock market took stock accordingly, with some shares falling 3 points in 2 days. Similarly bearish trends, developing elsewhere, may well become a major factor in the business community's attitude both toward the Marshall Plan and toward the entirely possible necessity of reinstating priorities and allocations machinery, on the American side, for such basic commodities as steel, if orders based on credits under the Marshall Plan are to provide deliveries of producers' goods without destructive delay.

That is the point at which some of the overall assessments and some of the political and economic initiative proposed so earnestly to Europeans by Americans become applicable on the American side. Such assessments are necessary if the Marshall Plan is to function as a method of rehabilitation. They concern the construction of an economic area workable in its own right. If they can be prepared with realism and presented with clarity they can be seen and understood for what they are, alternatives to semi-permanent handouts compounded indiscriminately of rehabilitation and relief.

American Notes

Special Session?

Predictions that a special autumn session of Congress would after all be called have been widespread in the past week, following conferences of State Department officials in Paris. The talks were held on August 5th and 6th between Mr William Clayton, Under-Secretary of State for Economic Affairs, and the three principal US Ambassadors in Europe, a fairly general view being taken that all concerned favoured such a session. It may be taken for granted, however, that no such decision has been reached in Washington where the State Department is harassed by a timetable of conferences which threatens to put a severe strain upon key officials. These talks will in the near future embrace not only the general problem of Ruhr control, and the special dollar problem attaching to control of the Western Zones, but negotiations for modification of the loan terms for Britain, the special report from European Ambassadors on possible short-term aid to Europe (which is regarded as very slight, indeed), the report from the Committee of European Economic Co-operation, as a blueprint for aid under the Marshall project, and which Washington expects to have by the close of this month, and, lastly, reports from Geneva on the International Trade Conference.

If that schedule is not enough, the State Department has also to meet demands from Rio de Janeiro where the United States and the Latin American Republics have begun their long-delayed effort to establish by treaty the "hemisphere defence" measures agreed at Chapultepec in 1945.

On the British loan terms, discussion of which has quite naturally filled a large proportion of the news and comment space in the national press, Washington still seems to be baffled by its precise powers in the absence of an immediate appeal to Congress, with Mr George Marshall, and Mr John Snyder, Secretary of the Treasury, offering divergent views. It is also generally reported that a postponement of "convertibility" was actually offered to London in July, and rejected by Mr Dalton, and there is now a disposition to assume that this British view was based on incomplete and obsolete data, and that a meticulous presentation of accounts will be necessary before Washington makes a decision.

While the burden of this preparatory work falls on the State Department, the key figure in overall policy is still Senator Vandenberg whose task will be, in effect, to pilot the Marshall project through Congress whenever it meets. The Senator is taking part in the Rio Conference, along with Mr Marshall, who is chairman of the conference. The two statesmen will have plenty of immediate problems on hand, for the Latin American countries are no less fearful than Europe of the "dollar gap"; some of them are resentful of US post-war policy on tariffs and quotas, and most of them are disappointed because Congress has so far refused to ratify President Truman's plan for standardising military equipment within the Americas, and for the provision of equipment and assistance. Additionally, the uneasy friendship between Washington and the Perón regime is very far from concealing the view that Argentina is still far more concerned with her challenge to US leadership than with more general security problems. Some skilful work may be necessary to avert an open breach.

But, however preoccupied they may be with continental problems, Washington is sure that discussions between Mr Marshall and Senator Vandenberg will, in fact, cover a world range, and that at least one formal declaration by the Secretary of State will embrace the general foreign policy of the United States. A good deal of significance is attached to a recent comment by Senator Vandenberg:—"The problem is here." He is known to be concerned by the lack of domestic response to news from Europe and is understood to have urged that the Administration must act quickly to arouse public support for the Marshall proposals. Until that has been done, Mr Vandenberg is understood to have expressed the view that no useful purpose would be served by assembling the House Foreign Affairs and the Senate Foreign Relations Committees for preliminary discussions before Congress takes over.

First Challenge

The Taft-Hartley Labour Act is meeting with a rising barrage of criticism from responsible quarters even before it has become fully operative. There is, for example, considerable ambiguity in the section which extends the legal ban on contributions by corporations for election campaigns in order to cover similar

campaigns financed by the general funds of labour unions. The new Act specifies all "expenditures" apart from "contributions," and apparently establishes a position where no union may be allowed to publish a newspaper at regular intervals, and give editorial comment, for or against particular candidates, unless it can prove that expenses are not met from general funds. Some unions are now openly inviting a contest on this issue of press freedom.

A more direct challenge has been made by the Foreman's Association of America which has now filed a complaint against the National Labour Relations Board in the Federal Court. The plea is that specific sections of the Act should be declared unconstitutional as "discriminatory and capricious," and that the whole Act should be invalidated as "a flagrant attempt to destroy political association and the freedom of the press." The Labour Board has been enjoined because, under the new Act, it has been obliged to dismiss petitions by foremen's unions for collective bargaining status. These special unions are not outlawed, and foremen may retain membership within a union organised for their own use, or as part of a rank-and-file movement. But this right of membership depends in turn upon the policy of individual employers—and the relative strength of the unions concerned. The case will almost certainly be fought up to the Supreme Court.

Unions meanwhile are scurrying to consolidate their position before August 22nd when the Labour Act becomes fully operative with a complete ban on the closed shop, and with drastic regulations necessary to enforce "union shops," and other security measures. And the unions are finding that their bargaining powers at this time are very strong indeed. Mr John L. Lewis "rode out" on the Taft-Hartley Act with a flat refusal to accept the "no-strike" clause in the contract with the mine operators. Now, a brief tussle between the Ford Motor Company and the United Automobile Workers has closed with another victory for the unions. There are some nice legal points involved in this procedure, for while the Taft-Hartley Act establishes the right of employers to sue for damages in the event of contractual failure by unions, it nowhere specifies that employers must sue for breach of contract. On the other hand, outside parties might still, presumably, make claims on unions for damages in the event of action that could be construed as an "unfair labour practice" within the specifications of the Taft-Hartley Act. These points are rather abstruse today. The whole concern of industry seems to be centred on watching and waiting, and the verdict seems to be:—give the unions a year and find out how things go. Two conclusions emerge: it is more than ever certain that this Act will bury both the Labour Board and the courts in an avalanche of petitions and litigation; secondly, the Act, even for the big and tough unions, may be very awkward when employment conditions are no longer so rosy.

* * *

Deflation in Technicolor

Latest reports from New York suggest that Hollywood is still hopeful of a "compromise arrangement" which may dull the edge of the economy blade disclosed in the House of Commons last week. The initial reaction, however, was one of "anger and bewilderment" and the protest meeting held at once in New York must have matched in excitement (though scarcely in pleasure) the annual gatherings wherein the film impresarios ladle out Academy Awards on a strictly protectionist basis.

The film—or motion picture—industry has been the first in the United States to scent the approaching dollar famine. Hollywood has never disguised the importance of the British market, which accounts for about one-half of foreign rentals, in turn accounting for something like 40 per cent of the gross revenues derived from films. Apart from the British market itself, other western European countries still contribute a fair quota to Hollywood revenues, though there are severe limits on dollar remittances. Much nearer home, a golden post-war market in Latin America is also threatened by exchange troubles.

It is not possible to get any precise breakdown of foreign revenues among the main producers. But foreign rentals altogether produced about \$70 million in 1946, a year in which gross incomes of six leading producers were nearly \$900 million, and net revenues less than \$120 million.

The blow has fallen upon the film producers at a time when they are worried also by purely domestic factors. They believe that they may well be facing a period of sharp adjustment from the present high level of consumer expenditures on entertainment. They are aware that costs have been inflated during war years, and that they operate in an industry where the heaviest costs are apt to prove very stubborn, at least in the early stages of decline.

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to:

The Publisher, *The Economist*, 15 Lancaster Place, London, W.C.2.

They are also worried by the competition of television and by the fact that it is at present quite impossible to assess the longer-term prospects of this new, and now formidable, competitor.

Beyond all this, the industry has incurred the righteous anger of the anti-trust section of the Department of Justice. Although the film industry does not figure among the industries which rank for automatic inclusion in every anti-trust report by Congressmen, it has for long resisted government efforts to separate ownership between production, distribution and exhibition. The courts have so far upheld this resistance, but have agreed with the government that producers should not enjoy the advantages of "block booking" (a system whereby independent exhibitors take a given quantity of films and possess only nominal rights of selection) or of price-fixing. This case is now before the Supreme Court.

A short period of relative adversity will scarcely bring permanent damage to Hollywood. It will deflate salary lists, and give the efficient producer a chance to prove his worth. From the long depression of the 'thirties, the industry emerged with more modest ambitions and a more defensible capital structure. And war profits have swollen cash resources.

* * *

Business Profits

The current high level of corporate profits formed the peg for a typical Presidential warning to industry in the mid-year Economic Report to Congress. "It must be recognised," said Mr Truman, "that a high volume of profits is necessary to make provision for the increased cost of buying for inventories and capital equipment, and the decreased value of existing reserves. Even after these allowances are made, it is evident that business profits are in many cases more than adequate to permit price reductions or wage increases or both." The record is certainly good:—

	CORPORATION PROFITS (\$ million)	
	Before Taxes	After Taxes
1939.....	6,467	5,005
1940.....	9,325	6,447
1942.....	21,098	9,433
1944.....	23,841	9,928
1946.....	21,140	12,539

The importance of corporate profits may be gauged by the fact that over the first half of the current year business expenditures on new plant and construction were running at an annual rate of \$25 billion—by far the greater part of which was being financed from current earnings and accumulated liquid assets. No precise data have yet been given by the Department of Commerce on earnings for the first half of 1947, but the August report of the National City Bank declares that total industrial earnings were apparently above the high level reached in the June-December period of 1946 "although about one-third of reporting companies showed lower net profits due to costs increasing faster than sales." A very modest list from the *Wall Street Journal* (less than 140 companies) showed net profits for the June quarter scarcely changed from those for January-March, but up by no less than 84 per cent on the June, 1946, quarter, a period in which industrial strife brought considerable dislocation.

The decline and fall of Wall Street from early 1946 onwards is a remarkable feature in the light of the subsequent record. The Dow Jones Industrial Average, now around 180, has made a good recovery from 1947 lows, but it is still thirty points below the peak of 1946, and still some way below the top of the 1937 rise. At a time, moreover, when Treasury Bond yields are below all earlier standards—the first few months of 1946 alone excepted—it is possible to obtain yields averaging 5 per cent on a wide range of leading industrials and to obtain more than 4 per cent on a representative list of so-called "Blue Chips." Dividend rates, moreover, represent a very cautious assessment of distributable earnings. For the US Steel Corporation, with a current annual dividend rate of \$4, the present price is no better than \$71. The investment community is certainly conscious of the fact that, in the changing world conditions of 1947, a heavy Republican majority in Congress can no longer guarantee the stability which was taken for granted by Wall Street in 1920 and again in 1924.

* * *

Federal and State Taxes

Adjustments in the tax policies of the various States may follow from a Treasury study of the degree to which Federal and State governments now secure their revenues from identical sources. The Treasury, while not concerned with immediate policy recommendations, is seeking a much closer degree of

co-ordination, and discloses that for \$39 billion revenues of the Federal government, and for nearly \$5 billion of State revenues, more than 90 per cent accrues from identical sources:—

	RECEIPTS, EXCLUDING PAY-ROLL TAXES FOR 1946 (in million dollars)	
	Federal	State
Individual taxes.....	18,705	395
Corporate taxes.....	12,462	436
Death duties, gift taxes.....	677	143
Alcohol duties.....	2,526	466
Tobacco duties.....	1,166	199
Petrol duties.....	406	900
Admission taxes.....	415	12
Stock transfers.....	30	30
Others.....	2,584	2,338
Total.....	38,971	4,919

Specifically, the Treasury study declared that 77 per cent of Federal collections and 17 per cent of those for the States were from income taxes, and that conflicts here "can be resolved only by integration based on the assumption that both Federal and State levies would continue." On tobacco duties, it is suggested that the Federal government might increase current duties, replace State collections, and redistribute income among the States. On petrol duties, however, where the Federal government draws only modest receipts, it recommends leaving a field of revenue to the State governments alone. The complicated structure of sales taxes is held to be of "secondary importance" though Congressional study is recommended.

The relationship between State and Federal taxation policies may in the future be complicated by the widespread effort on the part of many municipal authorities to broaden their revenues through income taxes. Property taxes are the main source of revenue for city governments, but very many of them face sharp legal restrictions on their taxing powers, and with generally heavier burdens, they have sought to evade tax rate limits by tapping a new source. This process, however, is resisted by many of the State governments, and legal tests are continuing, although so far the right of city governments to impose income taxes has been upheld in the courts. For State governments, a remarkable feature of the last decade or so has been the abandonment of property taxes in favour of income and sales taxes, and specific duties upon petrol, alcohol, tobacco, and entertainments. This clearly makes them more liable to fluctuating revenues in the event of a trade setback, since many of the semi-luxuries now tapped for revenue are the first to reflect the impact of unemployment and reduced earnings, while property taxes are, in the main, sustained, unless depression is very severe or unduly prolonged. Most State governments are very conscious of their vulnerability, despite the good reserves accumulated in recent years, and they will be reluctant to abandon revenue channels without special safeguards for replacement.

Shorter Notes

President Truman has vetoed the Bill for the extension of war-time subsidy payments to marginal producers of copper, lead, and zinc. In recent months, these premium payments have assisted only to a very small degree in the case of lead and copper, although nearly two-thirds of zinc producers were enjoying subsidies earlier this year. The cost since 1942 has been \$330 million, and Congress this time proposed the payment of \$35 million annually for two years.

*

Senator Taft's open bid for power in 1948 was preceded by the long-expected announcement of his colleague in the Senate from Ohio, Mr John Bricker, that he did not "anticipate being a candidate next year." The door may still be open, but Senator Bricker (vice-Presidential candidate in 1944) will need something like a political miracle now to push him through it. While the race is still entirely open, Mr Taft's supporters claim that Governor Dewey's recent tour of the west was a relative failure, and that his chances have not been improved by Mr Stassen's denunciation of his failure to take any definite stand on policy.

*

The revised Robertson Wool Bill (accepted by President Truman and now shown of the tariff-raising and import quota provisions which brought such a storm at Geneva) will enable the US Government to offer reductions of 8 cents to 10 cents a lb. in the import duty on raw wool. On dutiable wools, current levies range from 27 cents to 32 cents a lb.

THE WORLD OVERSEAS

Economics of Franco's Spain—I

Privilege Without Planning

(From a Special Correspondent)

SPAIN'S foreign trade position has never been easy. From 1900 until the civil war there were, if one excepts the abnormal 1914-1919 period, only three years in which it had a favourable trade balance. Immediately before the civil war the difficulties were already increasing. In the 1930s the world crisis and the gradual exhaustion of the mineral resources (iron and copper in particular), which had provided a major part of exports, had cut Spain's foreign trade by about a half. Now the situation has been aggravated by the civil war, by the world war—in which productive effort had to be concentrated on paying off civil war debts to Germany and Italy—and by the ensuing shortages of raw materials and hard currencies; so that although the country is still undergoing its industrial revolution, the increase in production is not enough to check the drop in exports. Its value in terms of the peseta has naturally increased, but the actual volume of foreign trade has remained at only about 40-50 per cent of its 1931-35 level; and even to maintain this a lowered standard of living and great sacrifices are necessary. This basic problem would face any Government in Spain today, and even with the outside help that has been denied to Franco, to restore the not very high pre-war standard of life would take a long time. But the case against the present regime, at any rate as more intelligent Spaniards see it, is rather that in many ways it aggravates their difficulties and has made a most unjust division of the burden between rich and poor. The bulging shop windows, shiny new American cars, smart clothes and beautifully dressed children which strike the visitor to Spanish cities are evidence, not of prosperity, but of the Government's unwillingness to face its difficulties or to apply the principles of elementary justice by spreading the hardship.

Shortage of Fertilisers

At the root of present difficulties is the decline, owing to the civil war, of Spanish agriculture. Spain traditionally produces cereals for its own consumption, and is nearly self-sufficient, while its fruit, vegetables and wine not only satisfy the internal demand, but account for two-thirds of exports. But after the civil war the volume of food exports fell by three-quarters, while that of imports had to be doubled, affecting not only home consumption, but also the industries which need raw materials and equipment from abroad. Tables in this week's *Records and Statistics* give details. An important factor is the drop in the wheat area cultivated, accompanied by a general fall in productivity due to lack of fertilisers; the cutting off of phosphate supplies by the French in March, 1946, came on top of the world nitrate shortage. There is also the reluctance of farmers to slaughter their cattle for money they distrust. Cereals, meat, sugar and potatoes are all insufficient for home needs, and even the present cereal consumption per head, one-third below the 1931-35 average, can be maintained in an average year only by at least double the pre-war imports. Nor is there any immediate likelihood of change. Fertiliser supplies are improving, thanks to an increased allotment of nitrates and to the importation of sufficient phosphate through Egypt and the United States; but the prospects for this year's wheat crop are only average, with the area sown still 750,000 hectares short of the 1931-35 figure. In spite of the safeguard represented by the Argentine agreement, imports remain difficult to pay for and the bread ration, which last winter was twice increased on the strength of the good 1946 harvest, has had to be cut.

Familiar Vicious Circle

As elsewhere in Europe, therefore, the feeding of the country has become the main consideration, and Spanish industry, still growing up, has had to furnish a higher proportion of exports and reduce its imports. There is a general tendency to increased production, with electrification proceeding fast and textiles and chemicals playing a much bigger part than before in the country's export trade. But the statistics do not reveal the raw material shortages

or the need for machinery replacement which are central to Spain's present economic difficulties and should by rights dictate its import programme. Every Spanish industry is held back for lack of raw material. An annual deficit of about 2,000,000 tons of coal, in spite of increased electrification, affects many other industries, and in particular restricts iron and steel production to some 60 per cent of capacity. Shortage of steel last year prevented urgently needed railway wagons from being constructed, and caused half the shipyards, in spite of large orders, to be idle at the end of the year. The steel and timber shortages hold back building, while the shortage of coal means shortage of cement. Shortage of cement holds up the hydroelectric schemes that are to relieve the coal shortage—and so on.

Failure to Plan

Then the lack of imported cotton means temporary stoppages in the textile industry, at present said to be working at only 60 per cent capacity. More important still in the long run than the breaking of this vicious circle is the capital replacement which could not be undertaken during the war, and the long overdue patching up of the rickety Spanish transport system. One-third of the country's railway track is said to need re-laying; the textile industry is estimated by the Banco Urquijo (the bank whose interests are most closely identified with those of industry) to need 200 million pesetas' worth of machinery from abroad; while the hydroelectric concerns have announced that, as against imports totalling 47 million pesetas during the first half of last year, they need 250 million pesetas' worth of foreign material this year and a similar amount during each of the two to come. Such, economists feel, are the basic requirements if the country's long-term interests are to be safeguarded; to fail to plan for them now is to pin too much faith in the continuance of the present sellers' market.

It is impossible to get information about Spain's hard currency holdings, but the indications are that dollars and Swiss francs are now very short—more so than a year ago. Early last year it looked as though exports to the hard currency countries were developing well. Trade with Switzerland had gone ahead during the war; deliveries to Scandinavia were being resumed, and exports of tinned fruits, wine, cork, olives and woollen blankets ensured a favourable balance with the United States. This year, however, to judge from the figures issued, not only has the monthly average of exports fallen by about 4 per cent compared with the first half of last year, but exports sold for hard currencies are dropping in relation to those sent to Britain and the Low Countries. The Americans are showing less interest in Spanish foodstuffs. Trade with Switzerland has been handicapped not only by the closing of the French frontier, but by the competition of cheaper Italian fruit and by the falling-off of demand for various goods used as *Ersatz* during wartime. Moreover, the general rise in prices—the Chamber of Commerce index shows a rise of 4 per cent in wholesale export prices during 1946 and a further rise of 5 per cent in the first two months of this year—threatens to affect the whole export trade.

No Taste for Austerity

All this makes it increasingly necessary that an austere and well-planned imports policy should be followed. It is, therefore, astonishing to see the carefree optimism with which the Spanish Government goes to work. Petrol, which a year ago accounted for some 12 per cent of Spain's total expenditure on imports, is unrationed, and consumption has doubled since the restrictions were lifted. Havana cigars fill the shops, and in the cities there is a lavish display of large, new American cars, symbol of the present Spanish "way of life." Until the regulations were changed in May, profits of up to 300 per cent were being quite legally made on cars bought with black-market dollars. Now that possession of dollars must be justified and resale

is forbidden, the granting of import permits is to be speeded up, says the Ministry of Commerce, "for the benefit of importers who are legitimately serving their own interests, identified with the general interest of the nation," a fantastic misconception by English standards, and worth quoting as an example of the regime's reluctance to touch the interests of the well-to-do, which it regards as so closely bound up with its own. Nor is this surprising when one looks down the list of import licences and sees that an Under-Secretary in the Ministry of Commerce is down for two cars and a lorry.

The fact is that the Spanish ruling class does not understand self-denial. Just as their children are grossly spoilt and always get

Socialists of Eastern Europe

(By Our Special Correspondent)

EAST European socialism can look back on more than fifty years of history. In the eighties and nineties industry grew up in Bohemia and Silesia, at Lodz and Warsaw in Russian Poland, at Budapest, Cracow and Zagreb, in the oil-fields of Wallachia and Galicia, and in the mines of the Balkans. About the same time Marxist ideas spread from Germany into Russia and Austria-Hungary. Two separate Polish socialist parties existed in the two empires by 1890, the Hungarian Social Democrat Party was founded in that year, the Czech movement was formally separated from the Austrian in 1897, and small parties had come into being by the beginning of the present century in Serbia, Bulgaria and Rumania.

Already before 1914 a difference was visible between the Central European and Eastern types, whose centres were respectively Vienna and St. Petersburg. In both types the organised cadres were provided by factory workers and the leadership by an intelligentsia which included self-educated workmen, Jews and discontented elements from the ruling class (impoverished landed gentry or new bourgeoisie). The difference between the two types lay partly in the disproportionate numerical strength and skill of the workers in the two regions and partly in the differing intellectual traditions of Germany and Russia. The main features of the Russian movement, shared—despite their many other differences—by the "Populists" (Narodniki) of the 1870's and the Bolsheviks in the first decade of the 20th Century, were on the one hand the formation of a conspiratorial elite of professional revolutionaries, and on the other hand the attempt to win for the revolutionary movement the lower strata of the peasantry, medium and smallholders and agricultural labourers. The predominant group in the German socialist movement were on the whole opposed to both conceptions. They regarded the peasantry as a hopelessly reactionary class unsuitable for partnership with the workers, and within their own party they put the emphasis not on a "vanguard" of "conscious" revolutionary leaders, but on an elemental mass movement of educated and organised workers. Local workers' initiative was encouraged rather than unqualified obedience to a rigid central control.

The Czech movement was of the German type, and so, somewhat surprisingly, was the Hungarian, which concentrated on organising the rapidly growing urban proletariat but showed little interest in the exploited peasantry, particularly after the severe repression by the Hungarian Government of the incipient Agrarian Socialist movement and harvesters' strikes of the late nineties. The Rumanian and Balkan movements in the two questions of peasantry and of revolutionary elite were influenced by Russian ideas. This was especially true of the so-called "Narrow" socialists who formed the majority in the Bulgarian movement. The Polish party had elements of each type. The conspiratorial tradition was extremely strong in the PPS in Russian Poland, and its chief exponent was Pilsudski. In Galicia, under the leadership of Daszynski, a more reformist type of socialism enjoyed some success. Both these groups were fanatically nationalist. In the end nationalism prevailed over internationalism within the Polish movement.

Communism and Socialism

The formation of the Third International in 1919 gave majorities within the workers' movements to the Communists in the whole area except Poland, where anti-Russian nationalism was an insuperable obstacle. But when the two successive waves of revolution and counter-revolution had spent themselves, and relative normality returned, the difference between Central and Eastern

THE ECONOMIST, August 16, 1947

their own way, so the Spanish Government is unwilling to deny itself and its friends the luxuries without which they think they cannot live. Friendship is a great thing in Spain, but the concessions to it which on a minor level are not so harmful—those made by one's friend in the Ministry, for example—are fatal when applied to the whole orientation of the country's foreign trade. Austerity is unknown to upper-class Spaniards, though they impose it gaily enough on the rest of the country. "The Spaniards really know how to live," says the English visitor; unfortunately for their country this is true, and their reluctance to live in any other way is at the root of the Government's failure to tackle the problems that face it.

Europe became again apparent. In Czechoslovakia the Communists remained an important legal party, but the Social Democrats recovered the majority of the workers. In Hungary and Poland only Socialists were allowed to exist, and their freedom was severely restricted. Both parties were organised on the Central European model, but both had left wings within their ranks which would have stood openly for a revolutionary policy had they been allowed. In Rumania, Bulgaria and Yugoslavia the real left movement was Communist. Communism in these three countries was during some years nominally "legal," during others formally banned, but in practice always ruthlessly repressed. Persecution only increased its prestige, and in fact even in the northern provinces of Yugoslavia, where Social Democracy of the Austrian type had had some support before 1914, the Communists gained ground. In all three countries Social Democracy was an unimportant force. The reasons are the small size of the industrial working class, the dominance of the agrarian question, and the lack of influence of German Marxism.

During the Second World War the initiative in resistance in Yugoslavia and Bulgaria was taken by the Communists, while in Rumania there was no resistance at all. In Czechoslovakia little was heard of specific Socialist activity, and at the end of the war, strengthened by Soviet prestige, the Communists emerged as the strongest workers' party in both the Czech lands and Slovakia. In Hungary the Socialists formed a more or less respectable opposition to the regime up till the German occupation of March, 1944. At the end of the war a Communist Party reappeared after 26 years. It was composed partly of left wing Socialists and partly of miscellaneous new recruits, and was led by exiles returned from Moscow. In Poland the PPS split. A right wing, the so-called WRN group, supported the Home Army and the Government in exile. It represented at that time a majority of Polish Socialists during the war years. It became increasingly anti-Soviet, and one of its leaders, Arciszewski, became Premier in London in 1945. A left wing, known as RPPS and led by Morawski, joined with the underground Communists in supporting the Soviet-sponsored "People's Army," and was then represented in the "Lublin Committee." Since the end of the war this left wing seems to have won the support of the majority of Polish socialists.

Socialist Groups Today

Today, with the exception of Yugoslavia (where only one political organisation, the People's Front, exists), all the East European governments contain socialist groups. But the socialist movements of all five countries are split into two or three sections, which can roughly be described as a right wing, a left wing and a centre.

In Poland, Rumania and Bulgaria there are right wing socialist parties which form an open opposition—the WRN and the groups of Titel Petrescu and Lulchev, of which it seems probable that the first two are now minorities and the third a majority. In Hungary there is a strongly anti-Communist group led by the old leader Peyer, which still nominally belongs to the party.

In Czechoslovakia there seems to be no socialist right wing group. At the other extreme are the left wings which, whether from conviction, ambition or fear, advocate unconditional co-operation with the Communists. Such is the policy of the governmental socialists of Nelkov in Bulgaria, and to a lesser extent of Rada-Fierlinger and Lausman in Rumania. Among the Czech socialists, the Ministers also some of the advisers of the Hungarian socialist leader Szakasits and some leading personalities of the Polish Socialist Party.

Between these two extremes is what may be called the Socialist

To-day . . . another meteor flashes through the sky

Five thousand years ago heaven-sent meteorites brought man his first knowledge of nickel-bearing ore. To-day, the spirit of enquiry and the impetus of research work has evolved new nickel alloys with extraordinary high properties. One such is a standard material in British jet aircraft. Thus another meteor now flashes across the heavens, bearing nickel—the servant tamed and controlled by research for the benefit of mankind.

SIXTY YEARS OF PROGRESS

A DECADE OF EXPANDING INTERESTS

In 1903 the BTH built their first turbo-alternator which was of the vertical type, as shown above; but within a few years they changed to the horizontal type as now universally used.

In the ensuing years BTH designed the distributed rotor winding for turbo-alternators; they developed to the utmost capacity of oil circuit breakers and built the first motor-operated breaker in Britain: they developed rotary converters. In 1909 they produced the first trolley bus and in 1911 the first drawn wire tungsten filament lamp—precursor of the now famous MAZDA lamp.

The same spirit of enterprise and endeavour is alive today. As in the past, so in the future, BTH will carry the fame of British electrical engineering to the four corners of the earth.
