Centre, which wishes to pursue an independent socialist policy, neither capitulating to the Communists nor being drawn into Right Wing oppositional groupings. It is men of these ideas who at present on the whole control the Czech, Polish and Hungarian parties. Some are to be found also in the official Rumanian party, but very few in the Bulgarian. In other words, independent Socialists are still a force in Central Europe, but hardly in the South-East.

The Socialist Dilemma

But the Socialist leaders are faced with a cruel dilemma. If they took a frankly anti-Communist attitude they would not only have the majority of the workers (except in Czechoslovakia), but would attract many supporters from the peasantry and urban middle class. They would form the nucleus of a powerful democratic movement, combining political liberty with social progress. But to do this they would have to sacrifice the Marxist principles which have been their creed for fifty years. Moreover, it is certain that the Communists, backed by the threat, or the actual use, of Soviet military power, would suppress them by the well-worn tricks of packed "congresses," expulsion and, if necessary, arrest of independent-minded leaders, and substitution of subservient stooges nominated by themselves. On the other hand, if the Socialists co-operate with the Communists, they lose the sympathy of all who are not Marxists and of all classes but the workers. All who fear or hate the Communists come to regard the Socialists, too, as their enemies. Opposition to the Communists is then increasingly monopolised by those who, under a thin varnish of "western liberalism," remain chauvinists, clericals, anti-Semites and Fascists and fundamentally hate any form of democracy.

In this tragic situation the East European Socialists, desperately searching for a "third way," follow with passionate interest the policy of the British Labour Government. On the one hand they are pleased when Bevin "stands up to" Molotov, on the other hand they are peevishly annoyed when a deterioration of Anglo-Soviet relations makes their personal position more delicate. They are certainly sincere in their desire to maintain comradely relations with Britain, but it should not be forgotten that this contact is two-sided. The Socialists seek moral support from Britain in their resistance to Communist pressure for party fusion, which they oppose, despite their fundamental belief in working-class unity, because they know that it would mean nothing but conquest of their party machine by the Communist power clique. Yet at the same time the Communists seek to exploit for their own purposes the contact between East European and British Socialists.

The fate of East European Socialism depends on the fate of Europe. Today Europe does not exist, because its most numerous and centrally placed nation, the German nation, does not exist. The treason of Germany destroyed Europe, hence the tragedy of Hungary, Poland and the other eastern countries. The practical execution in Eastern Europe of a socialist programme is at present monopolised by the Communist parties, which are instruments of Russian imperialism. The result is that the programmes are brutally and clumsily bungled, and that the ideas of democracy and socialism are being discredited. This process can only be reversed if a centre of attraction is created in the West, and this is only possible if side by side with Labour Britain and democratic France, a democratic Germany is created. These thoughts are in the minds of most East European Socialists today, but they cannot be spoken.

Scarce Currencies and Scarce Houses in Hongkong

[FROM OUR HONGKONG CORRESPONDENT]

THE Colony's need of a new air-port to cope with increasing traffic is becoming more urgent every day. The present field at Kai Tak, although enlarged by the Japanese, is hemmed in by hills, and does not come up to the requirements of a modern air-port. Ever since the liberation alternative sites have been considered and rejected, but a decision is still awaited on a plan which was gone into by a visiting mission of experts and has since been under discussion at home. In the meantime the number of passengers arriving and departing from Kai Tak monthly has risen to nearly 6,000, and there are now at least ten commercial lines using the

air-port on regular schedule. The quantity of freight handled during June was 24,500 kilos inward and 31,800 outward. Much of the traffic is for short trips to Shanghai, Manila, Saigon, Bangkok and Singapore, the passengers being mainly Chinese financiers and business men.

A good deal of treasure and bank-notes is brought in by air to be realised on the local exchange market. There is no ban on the importation of notes, but gold can only be admitted under licence. Although the number of passengers discovered contravening the law grows, it is probable that a considerable volume of treasure gets through undetected. A Chinese merchant who was recently charged was found to be in possession of the following:

1 lb. 10½ oz. in gold bars and leaves.
£821 in sterling notes.
US \$9,500 in notes.
Rupees, 6,600 in notes.
Straits, \$930 in notes.
Piastres, 140 in notes.
Ticals, 118 in notes.
HK \$1.70 in notes.

This is a comprehensive range of currencies for which there is an active market in Hongkong, and there is every reason to believe that exchange dealers derive much of their supply from air travellers. A different type of offence was that of a Chinese farmer who on arrival by train from Canton was found to be carrying a pot of bean curd at the bottom of which were two gold bars. His excuse was ignorance of the law, and he explained that he had recently sold his farm and having converted the proceeds into gold decided to take up residence in Hongkong. This explanation was found to be true, and the defendant was let off with a caution. His gold was not confiscated, but purchased by the Treasury at the official rate.

There has been a very strong demand for gold during recent weeks, and early in July the local price rose to HK\$340 per tael, which is equivalent to over US\$50 per ounce. From time to time rumours of the impending devaluation of the Hongkong dollar are put into circulation and result in an active market in gold at rising prices, followed by a sharp decline when the rumours are scotched. The approach of July 15th led to the propounding of many theories, mainly based on wild guesses, as to what would happen to sterling, and the general feeling amongst Chinese exchange operators was that its value could not be maintained. This led to a scramble for gold and a sharp rise in the local rate for US\$ notes to about HK\$5 per US\$1. A Government pronouncement allaying fears of the devaluation of sterling had a prompt effect, and exchange rates have subsided to a normal level.

Complaints of Overcrowding

Like every other world centre, Hongkong has an acute housing problem. Not only were there no building operations during the years of occupation, but many of the existing houses and buildings were either destroyed during hostilities or subsequently looted—and something like 70 per cent of the European type of residences suffered in this way. A further complication has been the influx of wealthy Chinese, who, with ample funds to pay "key-money," have caused a serious displacement of population. For the first time for many years past a debate took place in the Legislative Council in which most of the speeches were delivered extempore. The unofficial members united in support of a motion attacking the Government for "lack of progress" in housing the community; but the official reply was an amendment to omit the words "lack of progress" as well as every term which implied censure, and to pass the amended resolution by the weight of the official majority. While on balance the Government got the best of the argument, because bricks cannot be made without straw, the dissatisfaction expressed by the unofficial members may have done some good. It is realised that the Government is understaffed and is unable to procure the essentials for a big housing scheme; but a lot more could have been done at an earlier date after the liberation to encourage private enterprise. The miserable conditions in which hundreds of European men, women and children are herded together in hotels and boarding houses is bad enough; but thousands of locally born Chinese and other nationalities have had to double up with relatives in over-crowded quarters or have taken up their abode in ruined premises lacking sanitation. A temporary hutment scheme might very well have been undertaken, and would have eased the situation until the time arrives when building material and equipment is available. But the Government has refused to lower its standard of housing and the community has to suffer.

THE BUSINESS WORLD

Post-Mortem on Dollars

THE factual data sprinkled in the Ministerial speeches during last week's debate on the State of the Nation provide a far better picture than has hitherto been available of Britain's accelerated expenditure of dollars. For the most part the information given, mainly by the Prime Minister and the Chancellor of the Exchequer, covers only the period up to the end of June and, therefore, misses the crucial July climax. None the less, the figures covering the first half of the year carry with them fairly confident indications of the forces that were to reach their height in July.

The basic figures were those given by Mr Attlee on the distribution of the United Kingdom's total dollar deficit of \$1,620 million in the first six months of 1947. Of this the major part was represented by the deficit of US dollars in direct trade with the United States, which amounted to \$704 million; a further \$116 million represented British dollar expenditure on German account, and a further \$472 million comprised payments made by Britain in the Western Hemisphere outside the United States. These three items, representing about four-fifths of the total, account for the direct dollar expenditure of Britain. They cannot be linked with the factor of convertibility. It is true that the British current sterling deficit with countries like Argentina was almost automatically converted into dollars; but the concession that made these operations possible was not part of the unexpected cost of convertibility; rather must it be regarded as the price paid to induce the Argentine, in the financial agreement signed last autumn, to continue to sell goods to Britain in excess of the amount purchased in this country. The Chancellor gave some fuller details of this direct British dollar expenditure on imports from countries other than the United States, but his figures were for the twelve months to June 30, 1947, and cannot, therefore, be reconciled with the six-months' figures given by the Prime Minister. The figures for the full year show that dollar expenditure in Central America, mainly on oil and sugar, amounted to \$260 million, in Canada to \$220 million, and in Argentina and the rest of South America to \$135 million, making a total of \$615 million for the full twelve months, of which \$472 million was incurred in the first half of 1947. The substantial US dollar expenditure on imports from Canada is a reflection of the fact that the Dominion has slipped into exactly the same dollar problem as Britain and most other countries in the world. Mr Dalton explained that Britain is now, in deference to Canada, paying for half its imports from Canada in US dollars.

To return to the figures given by the Prime Minister, the next items representing purchases by the rest of the sterling area in the United States and the Western Hemisphere have more direct bearing on the issue of convertibility. These amounted to \$272 million for the first half of this year. The Chancellor gave some detailed figures which bore on this particular expenditure but which again do not tally exactly with the Prime Minister's. Mr Dalton showed that Britain's dollar expenditure for other sterling area countries in the six months of 1947 amounted to \$205 million as against Mr Attlee's comparable figure of \$272 million. This and other discrepancies are a measure of the haste with which this material had to be assembled. Included in the total given by Mr Dalton was a net

receipt of \$140 million from Malaya—which has thus returned to its traditional role as a big dollar earner. This credit shows that other items make a debit total of \$345 million, of which \$60 million went to Australia, \$50 million to South Africa and \$235 million to the rest of the sterling area. In the previous six months there was an actual net receipt of \$155 million from these sterling area countries, so that the deterioration in the first half of this year has been severe. The dollar deficit of the sterling area financed through the sterling area dollar pool, represents that part of the hard currency deficit of these sterling countries which has been financed by running down their accumulated sterling balances. Some of the items in this sub-total are unexpected. It is surprising, to say the least, to find South Africa figuring among the countries which have dipped into the dollar reserve in the first half of this year. It is true that the South African balance of payments with the hard currency area has swung violently against the Union in recent months, and there is good evidence that a considerable part of that deficit has been financed out of the South African gold reserves, which amounted to £184 million on July 15th, or £70 million less than a year ago. Over the same period, however, South Africa's sterling balances had dwindled from about £31 million to £9 million, a movement which brings corroborative evidence of the extent to which the South African dollar deficit was covered by recourse to the sterling area dollar pool. The South African gold reserve is still more than three times its level at the outbreak of war and there seems to be some ground for asking whether, in the prevailing circumstances, the Union need have unloaded the weight of any part of its dollar deficit on the fast failing British reserve of dollars.

To have refused to make these dollars available out of the sterling area dollar pool would, however, have involved a departure from whole conception of the sterling area principle as it was evolved during the war. As the Chancellor explained, the essence of this principle was that Britain acted as banker for the sterling area, receiving hard currency earnings from its members and paying out whatever they reasonably needed for their own trading with hard currency countries. The sterling area countries pooled their resources and stood together during the war and it would have been highly invidious suddenly to obstruct their access to the sterling area dollar pool when their operations with that pool began to flow in the reverse direction. What can, however, be held against the British authorities is the readiness with which they released balances accumulated by these countries and the tardiness with which voluntary agreements for the partial immobilisation of these balances were negotiated.

The Chancellor of the Exchequer gave some interesting information on the amount and rough distribution of sterling balances. Of a total of £3,560 million on June 30, 1947, he specified the following items: £1,700 million was either under control or being brought under control by voluntary blocking agreements; £400 million belonged to Australia, New Zealand and South Africa, with which no formal agreements were required; £760 million belonged to the rest of the sterling area, mainly to the colonies "with whom we have our own methods of arrangement"; £500 million was sterling belonging to the rest of the world, including countries in Europe. These add up

to £3,360 million, leaving £200 million unaccounted for, and though the Chancellor made no specific reference to this residue, it may be assumed that it represents those assets which have been or are being released and made available to countries which have agreed to voluntary blocking of part of their balances. A glance at the figures will show that there is considerable material on which a flight from convertible sterling could feed, and it is no doubt on part of this sterling that the exceptional dollar expenditure in July was based.

The items of expenditure so far mentioned account for \$1,564 million out of the total of \$1,620 million given by Mr Attlee as the dollar deficit that had to be met in the first half of this year. The small balance of \$56 million represents the use of transferable sterling for purchases in the dollar area by European countries. That item can also be laid at the door of convertibility or rather of the arrangements made in anticipation of convertibility. It may be assumed that this particular drain on the British dollar reserves also increased appreciably in July. With the increase in the dollar shortage throughout the countries operating transferable sterling accounts, an increasing amount of currently earned sterling was used to meet dollar expenditure.

Explaining the exceptional jump in loan drawings in July, the Chancellor pointed out that \$150 million out of the \$700 million drawn in that month would, in the normal course, have been drawn in June but was postponed until the beginning of July at

	Drawings on U.S. Credit \$ mn.	Net Spendings from U.S. and Canadian Credits \$ mn.
1946		
3rd quarter	400	210
4th quarter	200	369
1947		
January	200	137
February	100	224
March	200	323
April	450	307
May	200	334
June	300	308
July	700	538
Total	2,750	2,750

the request of the United States Government. In addition, \$40 million—a disproportionate sum—had to be found in July for the first payments for the seasonal deliveries of North

American grain. This, however, does not seriously distort the true course of actual dollar expenditure, as may be seen from the details which the Chancellor gave of monthly drawings from the loan and relative amounts of dollars expended (see table in previous column).

To complete the picture of Britain's expenditure of dollars, the following table showing the distribution of the direct expenditure in the twelve months to June 30, 1947, has been constructed from percentage figures given by the Chancellor.

UK PURCHASES IN THE USA		
Twelve months to June 30, 1947		
	\$ mn.	Percentage
Food	385	25
Raw materials and petrol..	416	27
Machinery	216	14
Ships	108	7
Tobacco	184	12
Films	62	4
Germany	169	11
Total	1,540	100
UK dollar receipts	340	
Deficit arising from direct UK-US trade	1,200	

From this mass of information the impression clearly emerges that, while the direct dollar deficit of the United Kingdom provided the main burden on the dollar credits, the multilateral use of sterling must also bear its responsibility. Symptoms must not be mistaken for causes, and the severity of the pressure which convertibility placed on the dollar reserves was merely a measure of the disequilibrium in the British balance of payments and of the generous releases of accumulated sterling made to sterling area countries. This explanation, however, does not gainsay the fact that since the root cause, namely the deficit, cannot be eradicated immediately and since the credits are near exhaustion, this particular channel through which the deficit impinged on the dollar reserves must be temporarily narrowed. There can be no doubt that in the coming Washington negotiations a partial retreat from convertibility of sterling will have to be sought. That it will be granted may be taken as certain. The Americans were fully prepared to grant it many weeks ago—when they seemed to have been far more cognisant of the true sterling position than the Chancellor of the Exchequer himself.

The Films Tax and After

ON Wednesday last week, the Treasury made an Order, revising the duty on imported cinema films from 5d. a foot to three-quarters of the "anticipated net proceeds." By this step, they settled two arguments—the first that it was administratively possible to levy an *ad valorem* duty on films; the second that bacon ranks higher than Bogart. For many months the Chancellor had argued that because the filmgoer paid good money to see what he liked, the Government had no right to interfere with his choice; then, less certain of his dollars and perhaps of his doctrine, Mr Dalton took powers in the Finance Act to impose a duty by Treasury Order; and now comes the decision, announced at the height of the crisis with every sign of haste—that 25 cents is enough for Bogart, and 75 cents must be released for bacon. That, after long procrastination, is how the British Government has elected to deal with film imports costing between £17 and £18 million almost entirely in dollars. It would have been easier to believe that it is a well-thought-out policy if the reasons for it had been explained.

Hollywood's reaction has been lofty, voluble and prompt. The new tax is denounced as a violation of the Loan Agreement. But that cannot be so, for it applies without discrimination to all foreign films (including foreign language films which never enter the mass market for which the American film caters) even

though it is primarily intended as a dollar saver. It has been condemned as "a confiscatory measure directed against a great and friendly industry." It is friendly greatness, presumably, that has led the American producers to suspend forthwith the shipment of new films to Britain. In six months or so, if this embargo lasts, there will be no new American films for exhibition in British cinemas; during this period there will be no revenue from the new tax and no dollar saving, and at the end of it, if the two sides are still at odds, British cinemas will have to make do with British films and American revivals—the latter, again, yielding no revenue from the new duty though they will cost dollars. As long as the embargo lasts, there will be no saving on films already in this country, and the Treasury Order will produce no revenue; it will hit the French film industry quite gratuitously; and it will pose some very awkward problems about the future scale and methods of the British and American film industries.

It must, however, be asserted that Mr Dalton is entirely right to try to set a limit to the total amount of dollars which Britain has to find for foreign films. The American film industry has been taking \$70 million a year; it must now make do with \$17½ million. But is there not a better way of achieving the same result? The Americans have said that they would agree to the "blocking"—or more accurately, the retention in this

country under friendly agreement—of a proportion of their net sterling earnings. But they have not been at all precise about the proportion which they would like to transfer into dollars. If 25 per cent is confiscatory, what percentage is acceptable? Will the Americans accept a limitation on all remittances, not merely on new but also on old films—of which the dollar cost for the next year or so will be quite high, and unaffected by the new duty? Will the American Government (and not merely the American film industry) be prepared to tolerate such an arrangement as falling within the canon law of the Loan Agreement? And what eventual arrangements about transferring the postponed funds are to be made? Are they to be invested here in film production or other channels? If, after study of these questions, all parties agree that “blocking” is better than the new duty, then the Chancellor should agree, but only with the most explicit assurances on each one of them.

On both sides of the Atlantic, the industry is well versed in the arts of publicity, and the shrieks and lamentations which have gone up during the past week easily qualify for an “H” certificate. But it is doubtful if the industry regards the situation with utter despair. The American producers will certainly calculate that the dearth of new films will be too much for the patience of the British public, who have come to expect a double-feature programme changed twice weekly almost as if it had been handed down as of right at Runnymede. They will wonder how the British cinema industry will remain solvent—a point on which British exhibitors have themselves expressed great concern to the Government this week. If takings suffer severely, as they will, how can a regular flow of funds from the box-office be kept up to sustain the expansion of the British film-producing industry? Is it not obvious that the Government will have second thoughts, and will settle for blocking, say, 50 cents in the \$?

In pursuing this line of thought, the great and friendly industry shows itself also to be a very anxious industry. To Britain, the total dollar expenditure on films is only 4 per cent of the whole; eliminate it, and there is a modest saving for more essential things. To Hollywood, on the other hand, Britain's expenditure on American films constitutes virtually the entire net profit of the industry, which does little more than cover its overheads and production costs in the American market—where, incidentally, the hold of the producers over the cinemas is far less developed than here. On the best view, the American industry has to face the prospect of a painful deflation, because its net income from Britain available to meet dollar expenses in America will be reduced, if not by 75 per cent, at least by some significant percentage. It is too realistic to deprive itself permanently of the British market.

Last week's trans-Atlantic gestures, therefore, will not be the last word; before very long, they will give way to more serious negotiation between the two Governments. A period for reflection will be no bad thing, for the Government has both to save dollars and to provide a new long-term framework for the British film industry, because the Cinematograph Films Act of 1938 expires in March next year.

The present Act contemplated a gradual rise in the exhibitors' quota from 12½ per cent to 25 per cent (that is, one-quarter of the total footage projected in British cinemas must be provided by British films) and in the renters' quota from 15 per cent to 30 per cent (that is, film renters were to acquire or make for distribution in the British market that proportion of British films to the total). Because of the war, the 1938 quota provisions have never been enforced; despite the fact that the Board of Trade has reduced the exhibitors' quota to the lowest permitted level of 15 per cent, a thousand or more exhibitors have failed to fulfil their quota obligations each year, simply because there were wholly insufficient British long films made. In 1941-42, only 46 of these were registered, and even last year, when the industry had recovered sufficiently to produce 107

long films, their number—apart from their average quality—was no higher than in 1939-40. The following table illustrates the dependence of the British cinema on foreign films:—

Year Ending March 31	Long Films				Short Films			
	Total	Foreign	British	Renters' Quota Per-centage British	Total	Foreign	British	Renters' Quota Per-centage British
1939	638	535	103	21.3	1,051	776	275	27.3
1940	507	399	108	25.78	715	506	209	34.6
1941	465	400	65	15.38	603	373	230	36.74
1942	503	457	46	14.83	647	456	191	23.29
1943	516	454	62	18.03	648	459	189	25.11
1944	446	376	70	24.19	467	339	128	27.1
1945	446	379	67	22.37	511	354	157	32.57
1946	447	364	83	21.56	476	301	175	36.98
1947	474	367	107	26.94	581	386	195	34.62

Nor should it be supposed that the British film-producing industry has reached a point where it can supply practically a quarter of the feature films shown in British cinemas. Any film over 3,000 feet counts as a “long” film, and well over half of the British output has consisted of such films, which rank for renters' quota, but play for less than an hour and are merely “second features.” The average quality of full-length British films has made a great advance, but in number they average not more than one a week.

It is hardly surprising that cries of alarm have gone up from the exhibitors. There are about 4,750 cinemas in the United Kingdom, of which perhaps 2,000 are reasonably modern and well equipped. Of the latter, there is a great concentration in the hands of Associated British Cinemas (nearly 450), Odeon Theatres (about 300) and Gaumont-British (about 250). Only one other circuit at the end of last year had more than 50 cinemas. In many large towns, the circuits are represented with closely competing houses. The Odeon and Gaumont groups constitute the exhibiting branch of the Rank Organisation; and they, too, control the majority of the West End cinemas. The Committee which reported on tendencies to monopoly in the film industry in 1944 found that the three circuits controlled 204 cinemas in the London release area, out of 300-360 “first-run” houses there, from which they would normally expect to derive 25 per cent of the gross takings of their whole circuits.

These figures show how closely the scale and prosperity of the British film industry is geared to the exhibiting side of the business; they also illustrate the shock which would result from any prolonged suspension of American film imports, because the industry is integrated on the foundation of large cinema circuits. The Monopoly Report pointed out that “save in exceptional circumstances, a booking by one of the three major circuits is indispensable for successful exploitation of a British feature film in the United Kingdom,” though it might with equal truth have added that circuit bookings were no less essential for the success of American films. In this passage, the Committee were examining the position of independent producers in this country, and the “gravity” of their situation in being dependent upon distribution of their product through one of the three main circuits. But because the circuits have been built on a foundation of a free supply of American films, it is their own position which now becomes “grave.” There are important minority American interests in Odeon and Gaumont-British (United Artists and 20th Century-Fox respectively) while Associated British is jointly controlled by the American Warner Brothers group and by the family of the late Mr John Maxwell; the weight of these American interests is clearly important in the present situation.

In two other respects, the power of the main circuits has been greatly extended. The first is the growing importance of their renting organisations, which apart from their own ready-made

market, distribute films widely to other cinemas. The two distributing companies in the Rank Organisation, Eagle Lion and General Film Distributors, now claim to handle more films between them than any one American distributor in this country. It is the certainty of circuit distribution in this country which makes distribution through the Rank Organisation attractive—if not indeed indispensable—to independent producers. But to a very considerable degree, they must attach themselves to that organisation at an earlier stage, owing to the shortage of studio space. Reckoned in terms of square feet, the Rank Organisation controls 32 per cent, and ABC 21 per cent of the total studio space, and few important British films have in fact been produced during the last year or two except by companies whose output is distributed through the Rank Organisation. To be fair, Mr Rank has treated producers reasonably and sometimes even generously; he has usually left them with a real measure of artistic freedom, but the independent producers are freemen who at the same time have been much beholden to the Lord of the Manorfield, often for their finance and largely for their market. And it is access to the market which can make or break the independent producer.

These are questions, however, which must at the moment be deferred, for until the dust of controversy has settled, the outline of the future shape of the British film industry which Parliament has to provide during the next six months cannot be drawn. These matters, like the future machinery of the quota, must be deferred for later discussion, which will be more profitable than it can be today. Meanwhile, there are two more urgent points for study. The first is the crucial question of dollar saving. The second is the minimum requirement of film product to keep the cinema industry going, and the public appeased instead of sated with films. That a dollar saving must be made is axiomatic; the question is whether imposing a 75 per cent tax on the net proceeds of foreign films hereafter imported is the best way of doing it. An informal arrangement with the American industry, by which it undertook to devote a proportion—say 50 per cent or perhaps even more—of its

net earnings in the British market—not merely of its earnings on new films—to film production here would not be the best recipe for the growth of a native film industry; for one thing, it would add to the great pressure on studio space which already exists. But it would be a means of saving dollars, if it could be squared with the doctrine of the Loan Agreement. As for the minimum product required to provide a modest diet of films—single feature programmes, and a reduction of cinema playing time by, say, one-half—a reasonable guess might be 175 long films a year. There is no reason why at least half should not be produced in British studios, provided that past production methods are radically revised, that the new budgets are arranged to produce films more quickly and more cheaply, and that the more pretentious ambitions of the British film industry in the American market are, for the time being, modified.

For years past, the cinema patron has been given a lush diet, and the exhibiting industry has prospered as the purchasing-power in the hands of the public grew. But a more austere future lies before the industry. Naturally, the process is distasteful. But every industry that is not absolutely vital will have to accustom itself to existing on a small fraction of its normal requirements of raw material. The press has had to do that for years past; the film industry is not the only one that will have to do so now. It can make great economies in its exhibiting expenditure; the “conspicuous extravagance” which appears to have become an accepted characteristic of the trade,” to quote the Monopoly Report again, belongs to the past. It is not for nothing that the yields on cinema shares are now as high as 8 per cent, for the day of high earnings is closing. There is no reason why, eventually, the British film industry should not restore itself to prosperity by accepting more modest ambitions, and cultivating its own garden. It may, in the end, be no bad thing that the industry should discover the virtue of producing ten modest and good films, instead of one costing ten times as much, and occupying scarce studio space ten times as long.

Business Notes

Three per cent or Higher?

Especially from the City point of view the Chancellor's speech in the House last week was notable for its omission of the customary reaffirmations of faith in cheap money and determination to pursue it. The gilt-edged market has responded accordingly. Its performance this week has outclassed even last week's. The fall accelerated again, culminating on Wednesday in losses ranging up to 2 points and carrying the undated 2½ per cent Consols down to 81—their lowest for nearly two years—and showing a capital loss of nearly 20 per cent for those “patriots” who subscribed through the tap for the 2½ per cent “Daltons” issued last autumn. It was significant of the present bear market that Thursday's recovery to 82½ restored only part of the previous day's loss. Inevitably, the latest issues of second-line gilt-edged stocks are in sorry shape. Of the £1½ million of Leicester 2½ per cent stock, 1965-70, offered at par, all but 8 per cent had to be taken up by the National Debt Commissioners. It is surprising, indeed, that they were relieved even to this extent, for the scrip is now quoted at around 11 points discount. The Kenya issue, though offered at a point under par but with the same redemption dates, fared similarly; of the £5 million of the existing stock only £282,500 was tendered for conversion.

For a movement which, according to the Chancellor's advisers, is “largely due to sentiment, rather than technical reasons,” this is a demoralising performance. But it certainly is not true that technical factors have not played any important part, and, to make sense of the Chancellor's explanation, “sentiment” needs to be construed as “fundamental causes.” Obviously, a considerable proportion of the recent selling derives from the sheer uncertainties of the ominous economic situation. For example, not all of the liquidation by industrial companies can conceivably be for the purpose of financing immediate outlays

upon plant and materials for essential services. To this extent the fall is “sentimental.” But the real demand for capital for essential purposes is now so acute (it may be noted, in this context, that exports, no less than industrial re-equipment, are “investment”), and the deficiency of spontaneous savings is so evident that the natural equilibrium rate of interest is obviously high and will remain so for some time. Underlying the sentimental reactions, this is a fundamental factor, which has begun to show itself now that artificial management of the market has been withdrawn. If the solvent of credit creation is not again to be used as a means of promoting the liquidity of the market, maintenance of a yield basis substantially below the equilibrium level must depend principally upon the strength of physical controls of real resources rather than upon purely financial devices such as regulation by the CIC. But it is all too probable that increasing shortages and bottlenecks in key materials and components, as distinct from specific licensing of the items in short supply, will come to the Chancellor's aid in the efforts which he presumably will make to mitigate the pressure on interest rates.

* * *

Short and Long Disparities

In addition, while the technical factors have contributed significantly to the extent of the fall, a point could shortly be reached at which some of them, at least, might exert a steadying influence. Mr Dalton himself, after declaring that the ½ per cent rate on Treasury bills and the ¾ per cent on Treasury deposit receipts would be maintained, argued that:

It may be only a question of time before other prices for medium and longer-term stocks adjust themselves to the persistently-held level of the Treasury bills and the TDRs.

It would be foolish to suppose, however, that this factor alone is likely to work at all rapidly. Indeed, this week's experience has been remarkable for the further substantial weakness of the shortest dated bonds. While the medium and medium-long dated Savings Bonds have already left the 3 per cent basis behind them—yields to redemption are now in the vicinity of 3½ per cent—the 2½ year Exchequer Bonds now offer fully 1½ per cent, while 2½ per cent can be obtained on stocks with a maximum life just beyond the money market's five-year span.

In present circumstances, with the cushion which the discount houses provide in the short bond structure already fully burdened, the abnormal disparity between short money rates and short bond yields is of little account. Whether the yields on these Bonds are 2½ or 3 or 3½ per cent, the prices in such conditions are settled not, as normally, by the professional operators whose special tax position enables them to accept a fine yield, but by the ordinary body of investors, institutional or otherwise. Only when a demand springs up to relieve the market of part of its burden will the normal resilience begin to be restored. It remains true, however, that, given the present passive role of the discount market, the gilt-edged jobbers are playing safe, so that relatively small offerings have a wholly disproportionate effect upon prices. Quite a modest off-take, therefore, might once more bring the price structure within the range of determination by the professional dealers. There is no sign of this yet, but if and when it happens, the effects, on a technical plane, might be rather dramatic. And a recovery thus induced would certainly provoke rapid covering of the quite substantial bear position which is now believed to exist in gilt-edged generally.

On the other hand, it would be wrong to suppose that the technical factors can work only one way. The further the fall proceeds, the greater is the danger that selling may be provoked because positions carried on borrowed money are becoming uncovered. So far as the inner circle of professional operators is concerned, the market could certainly fall a good deal further before that danger-point was reached; and, in such a contingency, there is little doubt that the authorities would come to the aid of those who have acted by the accepted standards of prudence. It is too soon yet to guess which way the market will turn. But, if the position can be held for a time, there is at least the prospect that the war damage value payments, if not also the Argentine Rail repayments, will bring some relief—but only, of course, at the cost of a further officially-induced creation of credit.

* * *

Equities Now

Calculations that the Government's failure to come to grips with the economic crisis would be "good for equities" because failure would mean a further increase in inflationary pressure, has completely misjudged the course of the industrial share market this week. Many investors have undoubtedly been alarmed by the noise which developed over the Supplies and Services Bill over the week-end, without pausing for much reflection whether it is the taking of power or the frank admission that the Government do not know how it will be used which is the more alarming. The strengthened position of the Government's left-wing supporters is, perhaps, a more tangible feature for distrust, for their recipes of more Socialism to meet the crisis—already evident in the whittled-down reprieve for steel—clearly bode no favour for ordinary shares.

But the key factor in the market situation is the failure of gilt-edged to preserve a defence line at 3 per cent. It was no accident that the worst day for gilt-edged on Wednesday was also the worst for equities—which reached a new low level, measured by the *Financial Times* index of industrial ordinary shares, of 118.0, compared with this year's high of 140.6. And the fall is not part of a calculated adjustment of comparative yields; it arises rather from a sharp break in market confidence regarding the future course of interest rates and also of industrial profits. There are, moreover, some signs of technical strain, though not of real trouble, in certain sectors of the market.

In contrast, the Kaffir market has shown a massive stability. This can in part be rationalised, because the South African gold mining industry is immune from fuel crises and a falling price for its product—which is more than many British industries can claim in this declining phase of the seller's market. But in part, it is also largely irrational—a sentimental flight into gold shares, to escape the threat to sterling, and even more high-flown hopes of a revision of the American gold price which has been officially repudiated in Washington this week. Even in markets like these, it takes an investor of strong mind to remain disinvested, and

many less determined ones have obviously concluded that, whatever their intrinsic merits may be, and whatever arguments exist in present fact for a rise in the price of gold, mining shares at any rate provide one of the few remaining avenues of escape from the worst. Perhaps this policy of mild despair will give way to something more rational—even, perhaps, the appearance of a partial recovery now that Parliament is no longer sitting. But many brokers who are not dissuading their clients to sell now would, in that event, certainly urge them to do so.

* * *

The Course of Profits

Although Mr Attlee appealed to companies not to pay "high dividends" there was no suggestion in last week's debate that the Government have decided on any policy of restricting the earning of profits (apart from the general measures which they propose to divert output from the home to export markets in the national interest) or their distribution. But this may only mean that, in the hasty preparation of the general heads of a crisis policy, the details of action have been left for later consideration. If, as the result of the crisis, the left-wing group of the Government's supporters have gained in influence, they will certainly reinforce their demand that any interference with wages must be compensated by similar restrictive action upon profits. The possibility of an autumn Budget "to limit any further rise in inflationary pressure" must obviously be coupled in the investor's mind with the ready-made weapon of a simple increase in the profits tax, which lies to the Chancellor's hand, accompanied by a stiff increase in the differential tax on distributed profits. It would certainly constitute a popular political move in some quarters.

Its popularity would, moreover, be enhanced by the fact that published industrial profits are now rising rapidly. In this week's *Records and Statistics* Supplement, the profits of 428 companies whose reports were published during the first quarter of this year are analysed in the usual series of tables. They show that these companies increased their profits from £83,623,000 to £102,531,000—before income tax, but after meeting the reduced EPT of 60 per cent. A sharp increase in ordinary dividends occurred; their cash value was increased from £49,896,000 gross profits (62.6 per cent against 59.6 per cent); and the average rate rose from 15.1 per cent for first quarter companies in 1946 to 22.9 per cent for the corresponding sample of companies in 1947.

Much has already been made of these increases, but there are some points about the figures which must be stressed. Firstly, they relate to companies whose reports appeared during the first quarter of this year, and whose financial years, therefore, ended well before the interruptions to production caused by power shut-downs and the winter fuel crisis. Secondly, they register the benefit of the reduction of EPT, but do not reflect the increased tax on distributed profits which is now in force. Company reports in the second and later quarters are likely to show a further increase in profits and dividends, but the full effect of fuel and raw materials shortages will become increasingly prominent towards the end of this year. Mr Dalton illustrated the time lag in the disclosure of industrial profits in his reference to the prospective fall in income-tax receipts in 1948-49. The latest profits figures will make useful political capital in some quarters; but they are indeed an out-of-date historical record, and an uncertain guide to the future—particularly if that future should include any economic or fiscal measures specifically aimed at their restriction.

Control of Labour

A draft version of the proposed Control of Engagements Order which becomes effective on October 1st was discussed on Wednesday by the Joint Consultative Committee, which consists of representatives from the British Employers' Confederation and the Trades Union Congress, and meets under the chairmanship of the Minister of Labour. The new Order apparently follows closely the lines of its wartime precedent. It will apply to men 18 and 40 except women with children under 15. Exceptions from the Order include ex-service men and women on demobilisation leave who will still be free to choose their employment, professional, administrative and managerial workers, dock workers, the merchant navy and part-time workers. The present Essential Work Orders covering coal mining, agriculture, building and civil engineering will remain.

This is control of labour in a very emasculated form. For it can only mean that employers will have to fill all vacancies for full time wage-earners through the labour exchanges—some-what invidious distinction between control of wage earners and non-control of salary earners. Two important sources of wage-earning labour are still outside the direct control of the Order—ex-servicemen and part-time workers. The Order will be quite powerless to bring the benefit of a reduction in the armed forces immediately to the undermanned industries. And what hope does it hold for those textile mills in Lancashire and Yorkshire which could make good use of part-time female labour which is still free to accept employment with the football pools? The whole scheme of labour direction as it stands is still dependent for even limited success on the cumbersome and slow procedure of discouraging expansion of the overmanned industries by fuel and material cuts, and a transfer of their surplus labour to the undermanned industries through the labour exchange machinery, if the labour seeks new jobs.

The Joint Consultative Council meeting also considered the progress made so far with staggered hours. There was a note of ominous doubt in their hope that staggering schemes could be started by October 1st. Progress has been made over the last fortnight in preparing schemes for staggered hours in Lancashire, but there is almost a touch of desperation in the proposal from Birmingham this week that certain Midland areas should have a day without power for those firms which cannot transfer one third of their load to night work. It may be possible to compromise a little longer on the deployment of labour, but there will be no compromise with a power shortage early in the winter when domestic loads and industrial space-heating will become an increasing burden on electricity supplies.

* * *

India's Sterling Balances

An interim financial agreement was signed this week between the British Government and the Government of India which defines the treatment of India's sterling balances until the end of this year. These are taken at the figure of £1,160 million, which represents the sterling assets of the Reserve Bank of India. There are in addition private balances, estimated at about £30 million, for which no provision is made in the agreement. The arrangements ensure effective control over the greater part of these large sterling assets. The mechanism that is being applied is the now familiar pattern of No. 1 and No. 2 accounts. The resources which are immobilised are placed in the No. 2 account, from which agreed releases are credited to the No. 1 account, which is also fed by India's current sterling earnings. The sterling in this No. 1 account is freely expendable in any currency area. The releases out of India's accumulated balances amount to £35 million to cover the period up to the end of the year, together with £30 million to serve as a working balance. In addition, there are minor releases, such, for example, as that to meet pensions paid outside India by the Government of India or any provincial authorities. The agreement provides that such capital transactions as sales of assets in India by persons in the UK will be paid for out of the Indian balances in the No. 2 account. India remains a member of the sterling area.

The releases appear magnanimous. They certainly represent a heavy burden on the British economy, especially as an appreciable part of the £35 million current release—perhaps one-half of the total—will ultimately find its way into dollar expenditure. Harsher treatment of India would seem required by the extremity in which Britain now finds herself. But "extremity" is a relative term. Large areas in India are on the verge of real famine (not what passes for under-nourishment in Britain), and the Indian Government can plead that the dollars she earned during the war have been dissipated in keeping British stomachs full, and that a small part of the unspent balance should now be made available to avert starvation in India. The situation crystallises all the conflicting views and arguments that bear on the vexed question of accumulated sterling balances. Impressive as can be advanced on both sides—but no brief will withstand the impact of harsh and inescapable economic realities, such as the imminent exhaustion of the dollar resources with which the threat of famine in India is now being held off.

The negotiations with the Indian representatives have been conducted in a thoroughly satisfactory and constructive spirit. India is clearly doing the utmost by import and exchange control to reach equilibrium in her balance of payments. The arrangements have been made with the Government of India, but are being taken over by the two separate dominions. To have achieved this unitary, albeit interim, solution of the problem of

the balances may help to preserve the unity of monetary and exchange policy for India as a whole; if so, it will safeguard one of the most valuable assets which might have been placed in jeopardy by partition.

The Coal Programme

A final decision has still to be taken whether the miners are to work an extra half-hour each day or on alternative Saturdays. A hitch has occurred in the negotiations between the National Coal Board and the Executive Committee of the National Union of Mineworkers on the merits of Saturday working. Against the probability of a higher output from a Saturday shift it is argued that there is a danger of increased absenteeism and the Coal Board evidently feel that with the miners already at the pit and on the surface the chances of increased output from an extra half hour's work are better than the chances of sufficient men turning up, at overtime rates, for Saturday work. Both sides have agreed to resume discussions on Wednesday next week. Time is running short, and unless an agreed scheme can be worked out then it will be too late to place it before the miners' delegate conference at the end of the week as a preparatory measure to introducing longer hours on September 1st.

It is not surprising, in view of the uncertainty of securing an increased output of deep-mined coal that the Government has decided to extend the opencast coal mining programme from the end of 1949 until 1951. Even then, it will not be possible to shut down opencast working suddenly, and operations will be gradually decelerated over the following few years. Only on such terms could contractors possibly extend their commitments. The Government considers that by extending the programme by two years, contractors will be able to plan extended operations so that output can be raised from the present weekly output of 210,000 tons to 250,000 tons weekly, taking full advantage of new excavating machinery now on order—of which \$20 million has been ordered by the Government from the United States.

Given time, the new target ought to be achieved. Available capacity is expected to increase by 50 per cent in the next two years and output per wage-earner is high—about four times that in the deep mines. On the other hand, an extension of capacity may not lead to a proportionate increase in output since the easier sites are rightly being worked first. Every possible ton of coal must be raised to keep industry going during the next few years, even without undue regard for costs, but it is unfortunate that the opencast programme cannot make its maximum contribution when it will most be needed—that is, over the critical period January to March, 1948, when many opencast sites may be flooded or unworkable. The benefit of the \$20 million worth of new equipment seems unlikely to be felt much before the end of next year, and the whole programme will be working up to a crescendo when—it is profoundly to be hoped—deep-mined coal output ought to be showing the first benefits of improved methods and increased mechanisation.

These marginal, surface supplies will probably leave behind them a monument of their cost to the community. Some 32,000 acres of land have been requisitioned and though as much as £15 an acre is to be spent on restoring their fertility, in some districts an ugly scar of clay sub-soil will remain to disfigure the surface while the once fertile overburden lies buried well beyond the reach of fertilisers.

* * *

Britain's Gold Reserve

Two figures of the British gold reserve were announced last week. One appears in the latest *Digest of Statistics* and shows that on March 31st the gold and US dollar reserves amounted to £582 million. This compares with a figure of £642 million for the end of 1946. In the course of his speech last week the Prime Minister announced that the present gold and dollar reserve amounted to nearly £600 million sterling. The substantial drop of £60 million over the first quarter of the year is almost wholly explained by the payment of the British gold subscription to the International Monetary Fund and the International Bank. These two items alone amounted to £57,650,000. This gold has not left London, but it is earmarked for the two international institutions and cannot, therefore, be included in the British reserve—though in a very definite sense it is still part of Britain's external assets.

In the course of his speech the Chancellor went out of his way to deny suggestions that the accelerated rate of drawing on the

US line of credit might be linked with attempts to build up the gold reserve. Such, he said, had not been the case, adding that the figure of the reserve at about £600 million "has stood substantially stable with only minor fluctuations for a little over 12 months." The Chancellor added: "These reserves are not the reserves only of the United Kingdom, but are the reserves of the whole sterling area including our friends of the sterling dominions."

* * *

The Fund and the Crisis

The first hint of a serious item in the agenda for the second annual meeting of Governors of the Fund and Bank in London next month was thrown out by the Chancellor of the Exchequer in his speech during the State of the Nation debate last week. Among the various lines of defence that would remain to Britain after the exhaustion of the dollar credits, Mr Dalton listed the possibility of drawing on the International Monetary Fund. But he mentioned this item only to reject it almost out of hand. The Fund, he argued was never intended to make long term loans or to correct anything so fundamental as the dollar famine from which the world is now suffering. Britain's right of access to the Fund is limited to the equivalent of £80 million a year for four years, but such recourse would be expensive, as the rate of interest rises as the period of the advance extends.

For the time being, therefore, the Chancellor stated that he had thought it right to abstain from applying to the Fund and to hold the facilities available at that institution in reserve. But he added that he intended "to take up with the other national representatives on the governing body of the International Monetary Fund next month . . . the question of whether we should not extend and modify, so far as the constitution permits, the purposes for which the Fund may be used." A debate on this subject is certainly overdue. It is true that the Fund was never conceived to meet a situation such as exists today. But had that situation been foreseen by the optimists who gathered at Bretton Woods it is reasonable to assume that some provision would have been made—whether by tightening up the scarce currency provisions, or by some altogether new articles—to meet it.

To see the IMF—the chosen instrument for "promoting exchange stability"—playing an almost entirely passive role in the international exchange crisis that is now engulfing the world is hardly conducive to creating the necessary goodwill and confidence which the new institution will need if it is to satisfy the great purposes for which it was founded—and for which, after all, such heavy hard currency expenditure has been incurred.

* * *

Report on Lace

The Lace Working Party, whose report has been published this week, have investigated an almost undocumented industry and have produced a detailed and meticulous account of all its aspects. Quite obviously the Working Party have asked the right questions and if some of them have not been completely answered, that is no fault of theirs. The lace industry, though small, is exceedingly diverse, and correspondingly difficult to describe—and to prescribe for. It consists of at least six different sections; each employs at the most a few thousand workers and each has its own problems. It is hardly surprising, therefore, that the Working Party's 67 recommendations do not constitute a comprehensive scheme for the post-war development of the industry.

A summary of the recommendations and a selection of the statistics in the report will be found in this week's issue of the *Records and Statistics* supplement. The "standard" working party recommendation for a development council with a tripartite constitution (which has now been written into the Industrial Organisation Bill) is missing from the report. The several branches of the lace industry are too specialised for such a general supervisory body. Instead, the report recommends that a review of the industry's progress in five years' time should be undertaken by a body similar in composition to the working party. They consider that a compulsory levy should be raised, partly on each of the sections and partly on the industry as a whole, to finance a co-operative market research, to establish a Design and Fashion Centre and for scientific and technical research. The labour problem should be attacked by improving the conditions in the mills, by fixing standards for the spacing of machinery and by juvenile and adult training schemes. There is also undoubted scope for improvement in the inadequate statistics which the working party found. The consumer's interest should be protected by a trade mark certifying that standard specifications have been satisfied in the product; this should apply to the Plain

Net section, but similar arrangements for other sections ought to be encouraged.

Recommendations for improving production fall under two headings. First, the working party have been impressed by the small extent of investment in new machinery since the 'twenties. Owing to the limited technical development of lace machinery over the last 25 years there is no call for an immediate scheme for large-scale re-equipment. But greater attention to the maintenance of lace machines and to the installation of up-to-date auxiliary machinery is necessary. A list of the industry's machinery requirements should be drawn up and machine-builders should reserve sufficient capacity to meet these requirements before catering for export markets. Second, recommendations have been made to stimulate output. The suggestions here include the setting-up of spinning mills in development areas, where labour may be obtainable, to provide cotton yarn, the imminent shortage of which the working party views with great disquiet, and the adoption of the Scottish method of labour deployment throughout the Lace Furnishings section. This method, which has already been accepted in principle by both sides, has given the Scottish lace industry a notably higher output per head than the Midlands industry.

* * *

The Problem of Productivity

The lace industry is small, and by many standards some of its sections are backward. Employment in 1935 was 17,600. It fell to 14,310 in 1939, and was as low as 6,630 in 1945 following the wartime concentration scheme. Falling employment has brought with it an ageing labour force and, in the Midlands at least, acute competition for labour from other industries. Firms are small, often employing two or three machines and only a score or so of workers. But the working party have not discovered any conclusive evidence that the larger firms are more efficient than the smaller ones. They have been able to show, however, that in the Scottish Lace Furnishings section, with its better arrangement of the labour force and its more forward policy of renewal and replacement of machinery, Scottish lace workers have achieved an output 20 to 25 per cent higher than Nottingham workers. Such disparities illustrate the scope which may be found in other sections of the industry for increasing output by the better use of labour, by investing in up-to-date ancillary equipment—and perhaps even by re-grouping mills both horizontally and vertically, which might stir up the managements, eliminate redundant capacity and strengthen their financial resources. The report, however, has little to say on such sterner measures.

The Working Party estimate, very tentatively, that in the temporary absence of Germany from world markets, an increase of 10 to 40 per cent in the volume of exports compared with 1938 may be expected in the next five years, and thereafter an increase of 10 to 20 per cent. Allowing for a 20 per cent increase in the home trade, total demand may be between 15 and 30 per cent higher than the average volume of 1933-38 in the short period obviously wide, but the trend of future exports is particularly difficult to infer from pre-war data because France, the main competitor in world markets, was able before the war to gain a temporary advantage whenever the franc was devalued, while post-war trends have to be based on the assumption, precarious though it may be, that there will be some degree of exchange stability over the next few years.

Over the whole industry the report estimates that no more than 75 per cent of the average labour force of 1936-38 will be available to meet this potential increase in demand. To close the gap, an increase in productivity per worker of about 30 per cent will be necessary, which must mean about 50 per cent for many firms—a phenomenal target. In Scotland the industry is comparatively well placed for its labour supply, but in the Midlands, where the higher productivity is urgently required, labour can only be won in competition with the engineering industry and the undermanned hosiery and boot and shoe industries. It is difficult to see how the labour force can be restored and a large increase in productivity achieved without a radical change in the industry's traditional methods, and solutions which involve a profound overhaul of long-established production arrangements are sometimes even more difficult than those which involve the introduction of new technique.

* * *

The Encircling Gloom

Surely never before was there a Chancellor with such a capacity as Mr Dalton for mistaking honest criticism and objective analysis for obstinate and doctrinaire opposition. *The Economist*,

ne declares, "will have their gloom. They live on it"—gloom which foresaw, many months ago, the troubles which now beset both Government and people. Mr Dalton, happy man, dwells in that same gloom but does not perceive it. Nowadays, the much-abused financial scribes are less fortunate, for their constitutions support neither songsters in the heart, nor the habits of the ostrich. But even they sometimes catch a glimpse of summer sunshine—why does it always shine brightest in years of crisis? A fortnight ago, amid its encircling gloom, *The Economist* so far forgot itself as to find one shaft of light—in the figurative surpluses of the Exchequer Return—and the Chancellor's fledgling swooped of the truth is that the little bird must still look elsewhere for its mate. Even that bright shaft pointed back towards gloom, for surpluses are more deceptive even than the sunshine amid Mr Morrison's "summer showers"—thus he described the dollar crisis only four weeks ago.

It is hardly necessary any longer to explain that fully nine-tenths of Mr Dalton's vaunted surplus is either derived from purely inconsequential internal accounting or, if not strictly internal, is none the less devoid of anti-inflationary significance. The Chancellor himself now always describes his surpluses both in their nominal and their adjusted form. His own adjustment last week reduced the "record" figure (for the first four months of the financial year) from £266 million to £21 million—before taking account of the large outgoings "below-the-line." And even *The Economist's* fleeting songster pointed out that the surpluses were making no impression upon the Treasury's effective borrowings and floating debt. The disparity between the ostensible receipts and genuine repayment of debt is, indeed, quite remarkable. In the financial year to date the total floating debt has been nominally reduced by no less than £598 million, but the reduction in the outstanding totals of tender Treasury bills and Treasury deposit receipts—which measure the really significant portion of the debt, the portion which is financed mainly (but not exclusively) through the banking system—has amounted to a mere £61 million. Yet in the same period, assuming the dollars to have been wholly spent, the Exchequer secured (in addition to its revenue surplus, if any) no less than £437 million of below-line receipts in sterling through drafts on the dollar credits—excluding the draft of £37½

million announced this week. Given these inexplicable discrepancies, it is small wonder that no headway is being made in the reduction of the huge total of bank deposits.

Just to make sure that the circle of gloom is really complete, let it be said that this is not the full song of the siren surpluses, or even its most significant part. Suppose it could be argued that, after all adjustments, there was a genuine surplus in the sense of an excess of moneys extracted from the pockets of the people over the expenditure of moneys which are likely to be spent by their recipients. Even then it would unhappily be true that a part—admittedly an imponderable part—of the relative buoyancy of Exchequer receipts would reflect simply the inflationary course of the whole national economy in these past twelve months or so—including the inflationary profits derived from the stock market boom engineered by a Socialist Chancellor who even now strives to contend that domestic financial policy has no relationship to the country's external plight. There is a lot to be said for gloom. We shall evidently need more of it before we encircle this songster's world of make-believe.

* * *

World Bank Loans

Two more loans have been announced by the International Bank for Reconstruction and Development in the past few days. The first is a loan of \$195 million to the Netherlands and the second a loan of \$50 million to Denmark. The Dutch loan falls considerably short of the \$535 million which was applied for, but as in the case of the recent French loan, which was cut to 50 per cent of the amount applied for, the way has been left open for further instalments later this year and in 1948. The terms on which the loan is being granted correspond closely to those on which the French loan was made.

In the case of the Danish loan, the rate of interest will be 4½ per cent, including 1 per cent commission, which is to be devoted to a guarantee fund, and the capital will be repayable over a period of 33 years after an initial five years during which no amortisation will be made. The Danish loan is earmarked for the purchase of agricultural and industrial raw

materials, fuel, feeding stuffs and ships. The next important operation of the Bank will probably be the second instalment of the French loan, namely another \$250 million, the proceeds of which have largely been earmarked for purchases of US coal. In fact, it might be said that the proceeds have already been spent by dipping into the French gold reserve far more deeply than would have been done had there not been some assurance that the draft would be in part reconstituted out of borrowing.

* * *

Cable and Wireless

Attention has naturally centred on the financial features of the first report submitted by the Government-appointed board of Cable and Wireless (which is examined in detail in this week's *Records and Statistics* supplement), but an equally significant factor from the compensation aspect is the stress laid on restoration and development of cables in the group's communication system. In addition to reopening the Java service, restoring the direct routes from India to the Far East, and the cable chains from Singapore to Hongkong and London-Rio de Janeiro-Buenos Aires, much work has been done on further restoration and modernisation. Nine ships are already engaged on this work, two more are to join the fleet and another is under construction. The application of multi-channel cable technique and the design of equipment to facilitate inter-linking of cable and wireless circuits is being developed "as an essential feature of the system as a whole."

The importance to shareholders in the company of this emphasis on cable development (not, of course, to the exclusion of wireless development) lies in the fact that a large proportion—about four-fifths—of the book value of the physical assets is represented by the cables system. The gross figure, in fact, amounts to £25.7 million, based on the 1928 valuation, and this includes certain cables (e.g. the West Indies route) which have been abandoned. Against this must be set specific reserves of about £4,000,000 for renewal of cable assets. In weighing up compensation possibilities the position is, broadly, that the £30 million capital of the company is represented by a net worth (after deducting specific reserves) of £35,875,431, of which £13,436,951, say 9s. per £1 share, is represented by net current assets. To assess the net worth at no more than 20s. per share would, therefore, amount to taking the communication assets, having a gross book value of £27.6 million, at only £16.5 million.

Although the Tribunal has to address itself to assessing "net maintainable revenue" it is interesting to note that analysis on these lines supports the view generally held, on the basis of the 1946 earnings, that the arbitration award might exceed par. On the other hand, hopes should not be pitched too high, because though 5½ per cent was paid for 1946 the operation of the 4 per cent standard dividend provisions naturally tends to pull excess earnings back to the level necessary to sustain the standard rate. In gross terms the 4 per cent rate would take only £1,200,000, against earnings before tax of £3,448,887 last year. The increase in receipts from messages and wayleaves of almost 10 per cent in 1946 compared with the previous year is another useful factor.

* * *

Compensation Possibilities

Assuming that the anticipation of something above par for the shares of the operating company is, on such grounds, reasonable, the shareholders—that is to say, principally, Eastern Telegraph and Cable and Wireless (Holding)—will between them hold upwards of £27.4 million of compensation stock plus other net assets, after deducting outside liabilities and outside shareholdings of some £15 million, mostly represented by general investments and other liquid items. Evidently, therefore, whatever the arguments may be against winding up the group, difficulty of liquidating the assets is assuredly not among them, for a more straightforward proposition for a liquidator could hardly be imagined.

It is difficult to see how the Eastern Telegraph and the Associated Telegraph companies can carry on under their tightly drawn memoranda there is nothing they can do outside the telegraph business, and from this they are, for practical purposes, excluded by the 1928 agreement with the operating company. Acting in a purely fiduciary capacity, as trustee for Cable and Wireless, with the object of avoiding the possibility of prejudicing some of the foreign concessions is not regarded as being sufficient to give the company a legal basis for existence, once the compensation has been settled. Winding up, or schemes of arrangement which will leave the telegraph companies in being while distributing the bulk of their assets, looks probable in the circumstances. The judgment

on the abortive winding-up petition strongly implied such an outcome.

In that event the question arises how far the equitable interest of the holding company (which holds virtually all the Eastern Telegraph ordinary capital) would be diluted by the assumed right of the preference capital to participate *pari passu* on a winding-up. Enquirers at the company's office have been warned that, according to legal advice, the company would be within its rights in distributing its surplus to the Ordinary shareholders prior to liquidation. Other interested parties have found that leading opinion is not unanimous, and as no one would willingly embark on litigation it is thought in market circles that a compromise solution is likely. At its maximum, the holding company would lose about £2,000,000 to the Eastern Telegraph Preference shareholders.

The position of the holding company is also under active consideration. Here also the big battalions are massing. This company's memorandum is drawn much more widely than that of Eastern Telegraph, and the chances of a successful petition for a compulsory winding-up order are not rated very highly. However, nearly £17 million of 5½ per cent Preference capital would be an embarrassing burden whatever the future structure of the concern. The Ordinary shareholders are also in a strong negotiating position because of the distribution of voting rights. A scheme of arrangement embodying a reduction of the amount and dividend rate on the preference capital, sweetened by an allocation to holders of a share in the equity, and combined with a substantial capital return to the Ordinary stockholders is said to have been informally discussed: but further moves must permit no award.

Role of the FCI

Even the untutored in astrology needed but one glance at the constellation beneath which the Finance Corporation of Industry came to birth to know that the company was destined to face delicate questions in its relationships both with the Government and with the City. So it has proved. It has been accused—on a superficial view, not without some justification—of competing for business with existing financial institutions instead of confining itself to the role of financier of last resort—the provider of facilities which others would not or could not furnish. On the other hand, precisely because this was its appointed role, many have supposed that its duty was to provide finance for propositions which could be justified only by extra commercial considerations, and that by acting thus it would become a channel for Government subsidisation in the field of finance.

At the second annual meeting last Wednesday the new chairman, Lord Bruce, had something to say on both these issues. Obviously, to refer to specific cases would have been both invidious and unprofessional, so that it was not to be expected that Lord Bruce would drive his points home by particular illustration. But it is good to have his assurance that neither of these common assumptions is justified. On the first point, the "impression that the Corporation was competitive with existing sources for the provision of capital . . . is completely erroneous. . . . Our mandate is quite clear in this respect and is carefully observed." It is worth noting, however, that the fact that in some cases the Corporation has told applicants that they will surely be able to find finance elsewhere, and has been right in its judgment, is not in itself a complete rebuttal of the charge of competitive activity; for it is in the business of issuing, which may arise as a sequel to finance provided rightly and non-competitively by the Corporation, that the danger of overlap with traditional mechanisms is greatest. It is here that the fine boundary-lines will have to be most delicately drawn.

On the second point, Lord Bruce emphatically denied that the Corporation was a "philanthropic institution" with "an obligation to finance projects irrespective of the ultimate financial result." Obviously, it is intended to work on commercial lines, but, as Lord Bruce pointed out, it "was not formed to make extravagant profits." That ought to mean, however—though the chairman did not expressly say so—that if it secures sufficient business to enable it to build up adequate initial reserves, the high gearing of its capitalisation, combined with the low rates at which it can borrow should enable it eventually to lend quite economically on rather more favourable terms than could with equal safety be offered by existing agencies. Therein might lie a long-term justification for the Corporation's existence, but the element of rate-cutting which might be implied would raise issues of even greater delicacy than those which concern it now. As

yet, however, even Lord Bruce is undecided whether the FCI can find a permanent place in the machinery of the City. In the meantime, it finds its justification—and it is a sufficient one—the financing and financial sponsorship of the massive programme for the Welsh tinplate industry, quite apart from the other unspectacular and anonymous transactions in which it is engaged. As for the unfortunate case in which it was obliged to appoint a receiver because a borrower suffered from the cancellation of a Government contract, it is much to be hoped that, if the issue is settled by an *ex gratia* payment by the Government, it will be made quite plain that the Corporation is being treated simply as any other *bona fide* lender might be if its case in equity was sound. Unless precautions are taken to disclose all the facts, a settlement on these lines might simply foster the false impression that the Corporation is a vehicle of Government policy and subvention.

* * *

War Damage Value Payments

Owners of war-damaged properties which rank for "value" payments as distinct from "cost-of-works" payments have long been restive at the delays in the settlements of their claims. No blame for that attaches to the War Damage Commission, for the release of these monies, like the payment for damaged chattels, was deliberately deferred by the Government with the object of mitigating inflationary pressures. The Commission, for its part, has been striving to ensure that all formalities would be completed so that it would be able to pay out rapidly as soon as the Chancellor sounded the all clear. This he has now done, and the opening date for payments under Part I of the War Damage Act has been fixed for November 10th next.

Yet, owing simply to the dilatoriness of property-owners, a substantial proportion of the claims will not now rank for payment in the first batch. The cases in suspense are those in which the properties are subject to more than one proprietary interest. Despite repeated requests, in only one-fifth of such cases have the several owners agreed upon and notified the Commission of their respective shares, yet without such notification no further action upon the cases can be taken. This hold-up is the more regrettable because the Commission, to accelerate the handling of the whole bulk of claims, has arranged for the computations and accounting to be undertaken under contract by special machine methods. The contractors will be able to deal, for payment in the first batch, with most of the single-owner cases, and, if the volume of completed cases justifies it, the Commission is prepared to arrange a second bulk payment in mid-December. To rank for that payment, owners who have not yet properly documented their claims will need to do so by October 1st at latest (they have already missed their chance of the first payment). If they delay beyond that date, when machine methods will no longer be available, the time-lag after submission of details will be at least eight weeks. The penalty in such a case will be well-deserved, for it really is the deplorable that, in these days of outcry against the size of the Government service, public money should be wasted by the negligence of property-owners in safeguarding their own interests.

* * *

Railway Safety and Efficiency

A run of exceptional accidents early last year promoted widespread questioning about the safety and efficiency of the British

railway system after its exhausting wartime efforts. Sir Alan Mount's report on railway accidents in 1946 shows that these accidents could not be ascribed to any general and remediable cause, but there followed later in the year a number of derailments which showed only too clearly that arrears of permanent way maintenance had become so serious that speed restrictions over many sections of track had become necessary in the interests of safety. Similar deficiencies of track maintenance were revealed last month at the enquiry into the Grendon derailment on the L.M.S. Trent Valley line. Last winter's severe weather and shortages of all kinds of track materials and equipment have increased the time lag in overtaking these arrears of maintenance—which required at the end of last year 400,000 tons of rails and 10 million sleepers. Railway operating standards have been seriously run down, speed restrictions have been widely applied and the increased occupancy of the track has reduced its operating capacity.

It seems highly probable that in the revised capital investment programme to which Mr Attlee and Mr Dalton referred without detailed explanation last week, the railway system will be a residuary claimant for the materials it needs. If top priority for materials is to be restricted to cases where immediate output can be obtained for export the railway service will stand very low in the queue, and will be forced to continue its policy of make do and mend to keep services going, leaving the arrears to pile up. Mr Morrison recently uttered a warning about the shortage of goods wagons and the probable delays to the movement of coal and other essential supplies during the coming winter unless more wagons were manufactured and repaired and their rate of turn-round improved. But even if some increase in the total carrying capacity of goods wagons is realised, its more efficient and speedy handling will depend on a great improvement in the state of tracks and locomotive power, and this cannot be achieved for many years to come.

Travel on British railways is still among the safest in the world, for even last year's increased fatalities among passengers amounted to only 1 in nearly 1 billion miles of travel. But safety is being achieved at the expense of speed and comfort. Last year 34 passengers were killed in train accidents and 61 seriously injured, a higher number than the average of the six war and black-out years 1940-45, when 30 passengers were killed and 42 seriously injured annually. The total number of deaths to passengers, railway servants and other persons last year was 466, compared with 355 for the average of the years 1930-34. Of last year's total no fewer than 151 fatalities occurred to railway servants working, walking or standing on the permanent way. There was considerable turnover of permanent-way staff last year—the Essential Work Order was withdrawn from railway undertakings last summer—but inexperience is not the only cause, for a number of casualties occurred among men of long experience.

Competition in Radio

The application of electronics to industry made rapid progress during the war, particularly in the field of radio and television. In that expansion, the British radio industry and the various British official and academic research institutions played an important part, which will be in evidence at the radio exhibition at Olympia in October. The exhibition should be a timely display for foreign buyers, for the radio industry has expanded considerably over the last eight years—the value of its

This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

FINDLATER MACKIE TODD & CO. LTD.
Wine & Spirit Merchants to H.M. the King

exports increased from £1,800,000 in 1938 to £7,400,000 in 1946—and much has been expected from its contribution to the export drive.

But the opportunity is fleeting. As the accompanying table shows, the United States radio industry's exports have also expanded during the war and during the first four months of 1947 they have increased at a phenomenal pace. Between January and April, exports of radio equipment totalled \$31.2 million, or say £7,800,000, compared with British exports totalling £2,200,000. By far the largest increase in American exports has been to South American republics—from \$7,800,000 to \$23,600,000 between 1939 and 1946. Britain's exports are about evenly divided between the Empire and foreign countries. Evidence is accumulating that many countries are now classing radio equipment for domestic uses as a luxury and are cutting down import licences to conserve their dollar resources—a development of small comfort to the British export trade, since convertible sterling now also ranks as a scarce currency.

In these circumstances, the British industry will have to display every advantage of price and technical excellence to win and hold its export markets. This point gives topicality to the recent report on British radio research by a committee of the Institution of Electrical Engineers. The report covers radio research in its widest sense, including fundamental research, and the application of research to the entire field of electronics and telecommunications equipment. The committee propose that radio research should be strengthened by three measures: first, by putting more money and equipment at the disposal of academic radio research; second, by increasing the inducements to research workers and laboratory mechanics to specialise in radio; and third, by closer co-operation between research at the universities, in Government departments and in industry.

BRITISH AND UNITED STATES RADIO EXPORTS.

	United Kingdom (£'000s)			U.S.A. (\$'000s)		
	1939	1946	1947 (4 mths)	1939	1946	1947 (4 mths)
Receiving sets, etc.	356	3,312	1,443	10,449	23,233	18,725
Valves, etc.	349	1,777	448	3,001	4,592	4,295
Miscellaneous	627	2,114	385	6,031	11,812	8,145
Total	1,332	7,400	2,276	19,481	39,637	31,175

The manufacture of radio equipment makes comparatively small demands upon materials and manufacturing labour, but it is crucially dependent on a highly skilled cadre of technicians and workers. These are conditions in which British competitive power ought to be seen to best advantage. In many fields of radio manufacture, especially in the field of navigational aids and television, Britain has been pre-eminent; but the technical fight

is becoming tougher and the hope of a geometric increase in British radio exports is rapidly fading.

Larger American Cotton Crop

Last week the United States Department of Agriculture announced an estimated cotton crop for this year of 11,844,000 bales. Spot cotton promptly fell in New York from 36.19 cents to 34.45 cents a lb. This estimate compares with a crop of 8,640,000 bales last year and about 9 million bales in 1945, and is round about the average of the war years' crops. The increased crop was bound to cause an automatic reaction in the market, which is not a little nervous about the ability of the world's textile industries to absorb larger quantities of American cotton when dollars are rapidly running out. The Deep South, as well as Europe, has a direct interest in the success of the Marshall offer.

Taking the world cotton situation as a whole, there is little reason to anticipate a sudden break in cotton prices. During 1945-46 world cotton consumption amounted to 24 million bales, some 3,000,000 bales in excess of production and world stocks on July 31, 1946, totalled 23.7 million bales—only slightly higher than the pre-war stock of 22 million bales. Since last year, world cotton textile production has made further strides in the United States, India, in neutral countries which stimulated cotton textile production during the war because they were unable to import from long-established sources of supply, but also in ex-occupied countries in Europe. An increasing world output must have drawn further on stocks, for last year's American crop of 8,600,000 bales was the lowest for many years and reduced crops were taken in Argentina, Brazil, Egypt and India.

But should a recovery in crop yields be forthcoming this year from South America and the East, there will be a strong likelihood that countries short of dollars will try to obtain cotton from those sources taking American cotton only when other sources of supply have been exhausted. There are, of course, obvious limitations to this policy, within the post-war framework of non-discriminatory trade, and the savings in dollars are not likely to be large. But a gradual switch-over from American to Brazilian cotton has been noticeable for some time, for instance, in the case of this country where Brazilian cotton had taken the place of American cotton as the main constituent in stocks by the end of June, 1946.

Sugar Prospects

In the present world food shortage, it is encouraging to discover at least one commodity where output is expanding to meet demand. The world production of sugar is expected to cover consumption requirements next season, although the potential consumption of countries hitherto self-sufficient and also of importing countries will not, of course, be met for some time. The

following summary of sugar production and consumption has been issued by C. Czarnikow Ltd.

WORLD SUGAR SUPPLIES
('000 tons raw value)

	1937-38		1946-47		1947-48		Potential Consumption
	Pro-duction	Con-sump-tion	Pro-duction	Con-sump-tion	Pro-duction	Con-sump-tion	
Exporting countries	14,337	3,570	13,430	4,163	13,348	4,179	4,501
Self-sufficient countries	9,959	9,480	7,885	7,987	8,281	8,590	11,227
Importing countries	4,792	15,247	4,581	12,679	4,857	13,585	17,233
Total	29,088	28,297	25,894	24,829	26,486	26,354	32,961

There is, of course, some overlap between the seasons; in particular the apparent million-ton gap between production and consumption in 1946-47 does not denote a surplus, as some part of this quantity will not enter into consumption until the following season. World consumption is still at a low level owing to rationing in many importing countries; this is partially due to the inadequate world supplies, although more generally the lack of foreign exchange, and particularly of dollars, has forced many countries to limit their requirements to the level of their indigenous production. Exporting countries have increased their sugar consumption to 600,000 tons above the pre-war average while Mexico and Argentina, which were formerly self-sufficient, have also expanded their requirements. Taking these factors into consideration, it has been estimated that consumption in rationed countries has been reduced by 5,000,000 tons, including 3,500,000 tons for Europe and 1,000,000 tons for Japan. The potential consumption of 33 million tons of sugar makes allowance for the increase in world population since 1937 and for expanding consumption per head.

To satisfy these requirements, world production must increase and consuming countries must also have access to sufficient foreign exchange. Cuba was the chief cane producer in 1946-47 with 5,300,000 tons, India second with 3,300,000 tons, followed by the United States (2,200,000 tons) and Brazil (1,200,000 tons), out of a total world cane crop of 17.2 million tons. Supplies from Java and Formosa are on a very restricted scale compared with pre-war and the present troubles in Indonesia make it doubtful if the

200,000-ton stock said to be available there, will in fact be disposable.

The United Kingdom's sugar allocation for 1947 totalled 2,273,000 tons, of which 1,432,000 tons were allotted from Cuba, St. Domingo and Haiti and the remaining 841,000 tons from the British West Indies and domestic production. Recently, the Ministry of Food has purchased 230,000 tons of the Cuban 1948 crop for delivery in the early months of next year, as well as the 1947-48 Haitian and St. Domingo crops, although 50,000 tons of the latter are reserved for "free" exports. The price in each case is given as 27s. 10d. per cwt. f.o.b. But for the stringent dollar position of the United Kingdom, there would be reason to expect a further increase in the domestic sugar ration during the coming year. In present circumstances, however, this must await an expansion in available supplies from "softer" currency areas.

Shorter Notes

Those who wonder what the export targets mean and how they are to be achieved will study with no little interest Sir Stafford Cripps's explanation in the course of his speech in the economic debate last Thursday.

Let me deal with exports, assuming for a moment that we can get the necessary production. The right hon. gentleman said that, taking our figure of 140 per cent., it will mean, including coal, 200 per cent. Figures that have so far been published are over-all over 1938. When we reach a figure of 110 per cent it means over all, including the fact that we used to export coal, but do not do so now. Say it is a figure of 140 per cent, then we must not multiply that figure up and say it ought to be 200 per cent or we shall get out of relation with the statistical figures which there are. What we are aiming at is 140 per cent.

The new economic metaphysics of targets and forecasts are becoming very difficult for ordinary comprehension.

An application by all companies taken over under the Argentine rail purchase to sanction the scheme of arrangement to compensate the holders of the 56 classes of debentures, notes and shares will be heard in the Vacation Court on August 21st. Compensation funds will be available 30 days after the sanctioning of the scheme, to which only one shareholder has apparently entered an objection.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement; Cable and Wireless, Ltd.; Guest, Keen and Nettlefold; Textile Machinery Makers.

Abridged Particulars

P. B. COW & COMPANY, LIMITED.

(Incorporated under the Companies Act, 1929.)

Business Established 1836.

Rubber and Plastic Manufacturers—Makers of "LI-LO" Products.

Authorised:
£500,000

in £410,000 Ordinary Stock and 450,000 Ordinary Shares of 4/- each ... Issued all in Stock:
£410,000

(Neither the Company nor its Subsidiary Companies have any Debentures, Mortgages, or Loan Capital.)

The List of Applications will open and close on Wednesday, 20th August, for an

OFFER FOR SALE

250,000 Ordinary Stock Units of 4/- each at 19s. 3d. per Stock Unit.

The Offer for Sale shows (inter alia):

- The original business of P. B. Cow & Company was established 111 years ago and is one of the oldest rubber manufacturing businesses in the world. Its more important products include diving dresses, submarine escape apparatus, mining personnel equipment, surgical utensils, hot water bottles, etc., and the well-known "LI-LO" air bed. In 1944 the directors, anticipating the coming world shortage of fabrics, devoted as much of the laboratory staff's time as could then be spared to the study of thermo-plastics and as a result of their successful research the Company is to-day one of the largest producers of plastic sheeting in the country.
- Profits for the seven years ended 31st December, 1946, averaged £148,469 per annum (before charging E.P.T. and N.D.C., interest on borrowed money, deferred repairs and Income Tax, but after deducting directors' fees and remuneration at the rates now payable) and the Directors are of opinion that annual profits should in future average not less than this amount.
- Interim accounts (subject to audit) show a net profit (on the above basis) in excess of £100,000 for the six months ended 30th June, 1947.
- Provided that their profit expectations are realised, the Directors intend to recommend an Interim of 12½% and a Final Dividend of 15%, making 27½% (which would absorb £112,750 gross) for the financial period ending 31st December, 1947. This would represent a dividend return of approximately 5.7% at the offered price.

Copies of the full Offer for Sale, on the terms of which alone applications will be considered, and forms of application are now obtainable from:—
BANKERS: NATIONAL PROVINCIAL BANK LIMITED, New Issue Department, 15, Bishopsgate, London, E.C.2, and Branches.
BROKERS: SPURLING, SKINNER, TUDOR & CO., 115, Old Broad Street, London, E.C.2, and The Stock Exchange.
REGISTRARS AND TRANSFER OFFICE: M. SAMUEL & CO., LIMITED, Shell House, 55, Bishopsgate, London, E.C.2, and from

Registered Office of the Company: 12 HAY HILL, BERKELEY SQUARE, LONDON, W.1.

COMPANY MEETINGS

GERRARD INDUSTRIES, LIMITED

TENSIONAL STEEL STRAPPING
INCREASING HOME AND EXPORT DEMANDS

MR KAY HARRISON ON THE OUTLOOK

The twenty-third annual general meeting of Gerrard Industries, Limited, was held on the 12th instant at Winchester House, Old Broad Street, London, E.C.2, Mr Kay Harrison, the chairman, presiding.

The secretary (Mr H. C. Miller, A.C.I.S.) having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—I am sorry that it is not possible for us to day to have the pleasure of the presence of Major Curling. He recently and most unfortunately met with an accident and I have been asked by him to convey to you his regrets and keen disappointment at not being able to be present. I am sure you will join with me and his co-directors in sending to him our warm and very best wishes for a speedy and complete recovery to normal health. (Hear, hear.)

The directors' report and accounts having been duly circulated, I will, with your permission, take them as read; and in dealing with the accounts I propose in the customary way not to comment upon all the individual items and to limit my remarks to those which are of particular significance.

BALANCE SHEET ITEMS

Referring to the balance sheet and the liabilities side, the general and dividend equalisation reserve is unchanged at £35,000, a sum which is, I think you will agree, substantial in relation to the issued capital. I might with advantage point out that this reserve has been built up within only the last seven years, and I submit it well reflects the wisdom of the conservative financial policy of your board.

The provision for National Defence Contribution and profits tax at £3,000 is made up of £1,500 in respect of profits tax calculated on the profits now under review and a like sum representing the previous year's provision for National Defence Contribution in respect of which the assessment of liability was still pending with the authorities at the date of closing the present accounts.

Similarly, the item provision for income tax of £20,500 is made up of £8,500, being estimate of liability calculated on the profits shown in the present accounts and £12,000 representing the previous year's provision in respect of which the tax computation has not been agreed with the authorities.

Turning to the assets side of the balance sheet the item shareholding in subsidiary company £28,000 is unchanged. This refers to Gerrard Safe Seal (Overseas), Limited. You will observe that the annual accounts now include for the first time a consolidated balance sheet and on this I will make some comments later.

TECHNICOLOR, LIMITED

Investment in Technicolor, Limited, at £29,087 is the same as last year and represents the cost of our holding of 45,320 "B" shares of £1 each fully paid, that is, a par value of £45,320. In each of the two immediately preceding years we have received a dividend on this investment and you will be gratified to know that these have been followed by the payment of a further dividend at the rate of 7 per cent., the gross amount of which—namely, £3,172—is included in the present accounts.

It gives me pleasure in saying that the Technicolor organisation, the owners of that well known and now very extensively used technicolor process, has made very notable progress, particularly in the last few years,

and the trading results arising therefrom have been eminently satisfactory, and to this I would like to add that the Technicolor Company is embarking upon a programme providing for a substantial increase in output.

RESULT OF YEAR'S OPERATIONS

Adverting now to the profit and loss account, embodied in the directors' report, it will be observed that the trading profit is £24,918, as against £25,394, showing a small decrease of £476. Inquiries and demands of customers compared favourably with the previous year but deliveries by suppliers of raw material were not up to our sales requirements, due to short supply conditions of steel, our staple raw material. During the year, in common with other industries, our material costs and running expenses were higher than in the preceding year, and in the light of such circumstances you will, I hope, regard it as satisfactory that the trading results are approximately equal to those of last year.

The net profit for the year after provision for income tax is £14,903, compared with £14,787 last year, and after including the balance brought forward there is a total sum of £17,863, of which £4,034 has already been distributed as an interim dividend thus leaving the sum of £13,829 for appropriation. As the next item of business at this meeting I am submitting a resolution authorising the payment of a final dividend of 10 per cent., and a bonus of 5 per cent., both less income tax, which will absorb £6,051, and leave a balance of £7,778 to be carried forward to the current year as against £2,960 brought in.

As previously mentioned, a consolidated balance sheet is now before you and your directors took the opportunity of making this arrangement which is in accordance with modern accounting practice and anticipates one of the amendments of Company Law made by the new Companies Act which received the Royal Assent last week. I do not think there is any need for me to say anything in amplification of this consolidated statement beyond making the observation that, after allowing for proposed appropriations, the net floating assets of the group amount to £66,152, while reserves and surplus amount to £46,686.

SELLING PRICE POLICY

Having now dealt with the accounts it is fitting that I should refer on this annual occasion to our main activities as manufacturers and distributors of tensional steel strapping products which are of a specialised nature and supplied for the purposes of reinforcement and security in transit and safe delivery at destination of all types of packages and containers. The inward raw material supply position, generally speaking, was somewhat easier than last year but, although more favourable, it did not permit us to satisfy all the requirements of our customers.

The year has been unfortunately marked, still by, as I have previously mentioned, still further increases in costs of steel, which we have been reluctantly compelled to pass on, in part, to our customers. On the subject of rising costs, it is our policy to maintain selling prices unchanged wherever possible and, if this is found to be not practicable, to restrict any increase in selling prices to the lowest workable proportion; a condition of

inflation is unsound and harmful to the nation's economic well-being, and I submit that buyers and sellers should jointly combine in an effort to combat inflationary tendencies.

Our business during the year was gratifyingly on a much larger and progressive scale in comparison with preceding years, and such business is now conducted exclusively by the subsidiary Gerrard Safe Seal (Overseas), Limited, as indicated at the last annual meeting. Much has already been done in re-establishing our overseas connections after the dislocation during the war. We have been inundated with export orders and inquiries, but it has not been possible to cater for all these requirements on account of the nation-wide steel shortage. In such circumstances we hope there will be an improvement in the supply position to permit us to take full advantage of the prevailing overseas demands for our products.

DISADVANTAGES OF STATE OWNERSHIP

Last year my colleague, Major Curling, when presiding, made some comments on the subject of nationalisation, and in view of its extreme importance I tender no apology in making this further reference and wish to confirm the views he then expressed. State ownership in itself cannot solve our industrial problems, the principal being the achievement of a substantially higher output per man-hour or man-year, call it what you will, which is a prerequisite for immediate and sustained national recovery. Management by the State, judged from modern business standards, is costly and its degree of efficiency, if any, is below that attained or attainable under conditions of private enterprise.

State ownership in the most simple terms denotes a supreme monopoly from which no appeal will be possible and in my opinion negatives requisite fundamental elements in business such as sound economy, incentive, enterprise and alacrity in administrative action and decisions; without these and other factors in play it is difficult, if not impossible, to envisage any satisfactory condition of industrial economy which will permit traders to compete successfully in world markets, and this the more so having regard to the years ahead when a sellers' market has changed to that of a buyers', a process of which there are already first signs in some trades.

IMPORTANCE OF COAL

I am sure you will understand it is not possible for me to make any worth-while forecast of trading results for the current financial year, having regard to the difficult supply position. Being manufacturers we are naturally dependent upon a constant inflow of raw materials, particularly steel, to enable us at all times to maintain and extend the "Gerrard" service to customers of all categories, including, in large measure, manufacturers and distributors of foodstuffs and ancillary materials.

It is therefore our earnest hope that the Government appeal for increased production will be successful in the first instance in the now nationalised sphere of coal; here is the key to recovery, for the non-availability of coal in sufficient quantities will result in large and small producers not being able fully to operate their plants according to capacity, and thus being faced with limitations in their productive ability to cater for the pressing and almost insatiable demands of this postwar era. Given a permanent and progressive improvement in the fuel position supplemented by an easement in taxation burdens, indirect as well as direct, and a halt in the implementation of any further nationalisation projects and industry restored by stages to a position of freedom from Government controls, then, and only then, in my opinion, will there be any solid foundation for an enduring national industrial recovery.

The report and accounts were unanimously adopted.

PARKER'S BURSLEM BREWERY, LIMITED

FACTORS AFFECTING OUTPUT

CAPTAIN DOBSON'S REVIEW

The annual meeting of Parker's Burslem Brewery, Limited, was held at the George Hotel, Burslem, on the 8th instant.

Captain G. W. Dobson, O.B.E. (chairman and managing director), in his speech, said: You will recollect that I told you last year that we had had a 15 per cent. cut in our output—made in May, 1946—which is still in being, so it has operated during the whole year. Moreover, in August, a 10 per cent. reduction of gravity was imposed and was not, until May last, restored. These two cuts have had the effect of causing a further shortage of supplies and making a weak beer still weaker neither of these effects are to the advantage or satisfaction of our customers, and although the gravity reduction has now been restored, the amount of malt available has not been increased and, therefore, if we make the beer stronger we shall have to reduce the quantity brewed. This would be a serious matter when supplies are already so curtailed as to close our houses for so many days a week.

FUEL CRISIS

To crown these blows, we had a fuel crisis in February and were informed by the Government that we could only have about a quarter of the coal we needed. The deliveries of this meagre amount were often delayed and/or not delivered, and, with our stock very soon exhausted, we had to do the best we could with what fuel we could obtain from anywhere.

To add to our troubles, as you will remember, the electricity was cut off during the greater part of the day, and since we are dependent on electric power for our brewing and bottling, it was impossible for us to carry on our activities. To obviate any such recurrence, we have installed our own electric generating plant, which will carry half the load that is required on the brewery. This, I hope, will prevent us from being put out of action again. It is an expensive proposition, but it is a safeguard which I think we are bound to take.

LOWER OUTPUT

All these factors have contributed to cause the bulk output of our beer to be considerably less than last year, through no fault of our own, and I am bound to say that I feel that the Government have handled the beer question very badly. In my opinion—and I notice that Mr. Walter Scott, at Ansell's annual general meeting, held the same view—in some ways we brewers are in a position to judge these matters as well as, if not better than, Whitehall. If there was an adequate supply of beer in the country, we should have far less labour troubles and we should get better output in coal mines, in steel works, and in every form of our industrial activities.

Two years after VJ-Day we are having less beer, less tobacco, less whisky, less everything, in spite of the promises made at the General Election.

LOSS OF LICENCES

I regret to report that the renewals of three licences have been referred, and the compensation authorities have decided to close three houses. This is a severe loss, considering that we had three houses closed the year before. It seems to me unfair—since we have no opportunity, because the Government refuse to grant us building licences to put some of our older houses in good order, which we admit require alterations to bring them up to date—that they are being taken from us. The loss of these houses means that we have fewer to move

to development areas when the time comes. Moreover, as the shortage of supplies is so evident, I fail to see how any house can be called really redundant.

Continuing our policy of establishing our selves in the areas which are being developed, and not properly served with licensed facilities, we have been successful in obtaining two new licences and two removal orders.

TRADING PROFIT

The profit on trading of £313,182 is only £12,694 less than last year. This year, however, the charge for all taxation, which is the estimated liability in respect of all taxes on the profits of the year to date, is some £40,286 less than it was last year, due chiefly to the cessation of excess profits tax last December. Consequently, the net profit for the year shows an increase of some £29,000.

I think that, under the circumstances, this is a very gratifying result, particularly as during the year we have spent some £24,000 more on repairs to the brewery and plant, whilst we have also paid much the same as last year in annuities to our old employees. The large amount spent on repairs is one which, I am afraid, it is impossible to cut down, unless we are prepared to see our property deteriorate.

TAXATION PROVISION

I now turn to the profit and loss appropriation account, from which you will see that we have brought in a transfer of £50,000, the whole of the contingencies reserve, and transferred the majority of it to future taxation reserve. If you remember, I said two years ago that this reserve had then been brought up to cover our liability for the current fiscal year. I am now advised that, in conformity with the recommendations of the Institute of Chartered Accountants, it is considered good finance to cover our liability up to and including the year 1948-49, i.e., to cover our liability for taxation on all the profits we have earned up to the date of these accounts. To do this, it is necessary to bring the reserve for future taxation up to some £164,140.

The question of the appropriation of the profits has caused your directors much consideration and, as a result, we have decided that the stockholders are entitled to a share of the greater profits, and we therefore recommend that the final dividend on the ordinary stock shall be 25 per cent., making 30 per cent. for the year.

THE OUTLOOK

The current year shows no diminution in the demand for our goods, and since we have been able to brew more beer in the last three months, by using the malt that we were unable to use during the winter stoppages, we have shown a creditable increase, both in draught and bottled beers. This does not mean that I am very optimistic over the prospects. The fuel situation for the winter is, I am credibly informed, worse than it was this time last year. The supplies of barley may or may not be further rationed: it is impossible to say even from month to month what the position of our grain supplies is in this country, whilst it is too early to make a forecast of what hops there will be.

Already there are signs that money is not so plentiful and if, when winter comes, factories and industry in general have to go on short time, the money available for beer will not be there and we shall be bound to suffer a loss of trade.

The report was adopted.

ZINC CORPORATION, LIMITED

EXPANSION POLICY

The thirty-sixth ordinary general meeting of the Zinc Corporation, Limited, was held, in London, on the 7th instant, Mr. John R. Govett, the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts for the year 1946:—

In the statements I have made during the past few years the lack of manpower at Broken Hill has been a topic which has largely set the background to my remarks. This time last year I was able to tell you that since the termination of hostilities men had been returning steadily. This has continued throughout 1946, and we have been able to increase very substantially the number of men employed in and about the surface and underground workings of our property.

RESUMPTION OF DEVELOPMENT

With the easing in the manpower situation we have been able to resume on a full scale our plans for the development of the ore body. A comprehensive campaign has been carried out and encouraging results obtained. Cost of production shows an increase due to the increases in wages which follow the higher prices for lead, plus the increased costs of all supplies and services essential for the working of the mines, but in all the circumstances your directors consider the figures reasonable.

The prices realised for the company's products have been: For six months in 1947, £61 18s. 6d. per ton lead; 3s. 9.4d. per fine ounce silver and 98s. 5d. per ton zinc concentrates, as compared with £37 1s. 3d., 4s. and 87s. 7d. in 1946 and £25 4s. 3d., 2s. 7.5d. and 60s. 6d. in 1945 respectively.

THE BROKEN HILL CORPORATION, LIMITED

The Corporation has recently formed a subsidiary company, The Broken Hill Corporation, Limited, the objectives of which have already been announced.

Last year I advised you of the programme of exploration which we were undertaking. The highest priority is being accorded to the Broken Hill district. The evidence to date entitles us to consider that our enterprise will be well rewarded, and the Corporation has already joined forces with the D'Arcy Exploration Company, Limited, and with the Vacuum Oil Company Pty., Limited, in the search for both natural gas and oil.

The higher range of metal prices so far experienced this year justifies us in expecting the profits for the current twelve months to be in advance of those realised for 1946, notwithstanding the considerable increase in the royalty charge and overall taxation which our gross profits will attract. While we believe we are entitled to expect a continuance of reasonable prosperity for our industry, we desire to emphasize that the directors' policy and programme of operations are definitely not built upon the full maintenance of the current or recent level of metal prices.

Quite outside the conditions of supply and demand which normally govern prices, there are other major factors affecting or soon likely to affect commodity markets which may have a not unappreciable influence on metal values in the not distant future.

We are confident in a world level of prices which will fully justify the expansion programme we have undertaken. We have a great mine, a fine body of employees and an excellent management, and if reasonable market conditions are experienced all concerned—the State, employees and members—should be well satisfied with our results.

The report was adopted.

GOVERNMENT RETURNS

For the week ended August 9, 1947, total ordinary revenue was £55,773,087, against ordinary expenditure of £34,544,604 and issues to sinking funds £340,000. Thus, including sinking fund allocations of £3,871,384, the surplus accrued since April 1st is £283,112,658, against a deficit of £304,851,411 for the corresponding period a year ago.

MARKETS for you in AUSTRALIA

Obtain a copy of this booklet from your bankers or direct from the Bank of New South Wales, London.

Australia and New Zealand are rich markets to develop because of the relatively high purchasing power of their people. For trade, investment and travel information, ask your bankers to consult

BANK OF NEW SOUTH WALES

(Incorporated in New South Wales with limited liability)
FIRST AND LARGEST COMMERCIAL BANK IN THE SOUTH-WEST PACIFIC
London Offices: 29 Threadneedle Street, E.C.2., and 47 Berkeley Square, W.1.

REFUGEE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000
ASSETS EXCEED £97,000,000
CLAIMS PAID EXCEED £181,000,000
(1946 Accounts)

THE London School of Economics and Political Science (University of London) may award to men and women graduates one or more Leverhulme Research Studentships (each of the value of £50 a year, supplemented in the case of full-time students by a maintenance grant of £200) for full or part-time research at the school. A limited number of BURSARIES to assist postgraduate students to proceed with research may also be awarded on proof of financial need. Application forms, which must be returned by September 6, 1947, may be obtained from the Secretary, London School of Economics, Houghton Street, Aldwych, W.C.2.

AN important vacancy for a General Sales Manager exists in a large and well-established company engaged in the manufacture of primary and of fabricated materials used in the fields of insulation and of plastics. Many other applications are under development. The product sells mainly in technical applications, and therefore a high standard of technical education, such as a University Degree in Science, or the equivalent of the Higher National Certificate in Engineering, or similar qualification, is very desirable.

The General Sales Manager will be responsible for leading the sales effort of the company. A man between the ages of 35 and 45 is preferred. Applicants must show thorough and successful experience in general sales organisation.

The post covers heavy responsibilities and the work will be arduous. The post is progressive and carries a substantial initial salary, subject to obligatory superannuation scheme. Residence near the headquarters of the company at St. Helens, Lancashire, will be essential.

A rigorous selection will be made, and those with inadequate qualifications are asked not to apply.

Address applications, with an outline of career, to M.D., c/o Fibreglass, Ltd., St. Helens, Lancashire.

PRIVATE Secretary required for Managing Director merchant business. Must be highly intelligent, well educated, efficient in shorthand and typing, thoroughly experienced and qualified in all other secretarial duties. Consideration given only to candidates with outstanding qualifications and experience. Preference to applicants willing to do a spell of duty in Malaya.—Write, giving age and all particulars, to Box 766, Dorland, 18, Regent Street, S.W.1.

WANTED, a Secretary for well-known group of rubber companies, who must have had at least five years' experience of secretarial practice, age about 35.—Write, giving full particulars of experience and salary required, to Box 790, Dorland, 18, Regent Street, S.W.1.

REQUIRED by Statistical section of large manufacturing Company with world-wide interests, an Assistant experienced in dealing with overseas trade and market statistics, or with University training in economics and statistics. Knowledge of one or more European languages an advantage. The Statistical Department is of comparatively recent formation and offers considerable scope to a man with initiative.—Write Box 851 at 191, Gresham House, E.C.2.

MARKET Research Manager required by progressive expanding company at Slough. Must be a qualified statistician and capable of directing a department. Comprehensive experience of consumer research essential. Good prospects for young man or woman with initiative. Age 28-35, starting salary up to £900 per annum according to qualifications and experience.—Write to Box 538.

FREE-LANCE JOURNALIST, 28, recently returned from semi-diplomatic appointment in the Middle East, seeks post where experience of leader and feature writing on scientific, social and political subjects can be employed.—Box 533.

EXECUTIVE Position with scope for imagination and creative ability required by Information Officer with wide knowledge of Chemical Trade and present trends. Good organiser, 20 years' sound experience in Publicity and Sales Administration.—Box 532.

NATIONAL BANK OF INDIA LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the Bank will be closed from August 20 to September 2, both days inclusive.

By Order of the Board,

N. W. CHISHOLM, London Manager,
26, Bishopsgate, London, E.C.2. August 12, 1947.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong.)

CAPITAL ISSUED AND FULLY PAID UP £20,000,000
RESERVE FUNDS STERLING £6,000,000
RESERVE LIABILITY OF MEMBERS £20,000,000

Head Office: HONGKONG.

Chief Manager: THE HONOURABLE MR. A. MORSE, C.B.E.

BRANCHES:
Amoy, Bangkok, Batavia, Bombay, Calcutta, Canton, Chefoo, Chungking, Colombo, Haiphong, Hongkong, Kobe, Kowloon, London, Lyons, Malacca, Manila, Mouat (Johore), Mukden, Nanking, New York, Peking, Penang, Rangoon, Saigon, Sandakan, San Francisco, Shanghai, Singapore, Sourabaya, Suihei Fataai, Swatow, Tientsin, Teluk Anson, (Perak), Yokohama.

London Office: 9, GRACECHURCH STREET, E.C.3.

HONGKONG & SHANGHAI BANK (TRUSTEE) LIMITED,
9, Gracechurch Street, E.C.3, a company incorporated in England, and an affiliate of The Hongkong and Shanghai Banking Corporation, is prepared to act as Executor and Trustee in approved cases. Trustee Companies, also affiliated to the Corporation, are established in Hongkong and Singapore.

Full particulars may be had on application.

PIONEER MENTAL HEALTH SOCIAL WORK

Applications are invited from trained or experienced social worker interested in Mental Health work to undertake, under the guidance of Psychiatric Social Workers, casework connected with the rehabilitation of the community of men and women suffering from nervous or mental disorders. Candidates will receive three months' theoretical and practical training, partly in London and partly in the provinces. Salary during preparation at the rate of £250 p.a., thereafter from £300-£370 p.a., according to experience.—Applications, with copies of two recent testimonials, to be sent to the General Secretary, National Association for Mental Health, 39, Queen Anne Street, W.1.

PROGRESSIVE post for young statistician in London Market Research office of large food concern. Good honours degree in mathematics with ambition to apply specialised knowledge to business problems. Initial salary will depend on qualifications; progress on demonstrated ability in technical and business aspects.—Write Box 529.

ECONOMIC Research. A vacancy exists for a young graduate to initiate an economic research unit in the Market Research Department of a large business organisation. The ideal applicant will be under 30, and will have taken an honours degree in economics followed by at least a year's practical experience either in post-graduate research or in an economic research unit elsewhere. The starting salary will be entirely on the unit's progress and its contribution to the business. The person appointed will be required to live in the North of England.—Please write fully to Box 537.

EXPERIENCED Business man, retired, but fed up, would like pos executive or managerial; interesting work, not salary, main importance.—Write Box 876, c/o Whites, Ltd., 72, Fleet Street, E.C.4.

FOREIGN CORRESPONDENT.—Fluent French, German, German shorthand, moderate Italian, seeks post.—Leach, 52, Colburn Ave Hatch End, Middx.

EASTERN WORLD. Informative journal on Indian, Far Eastern and Pacific affairs. Monthly 1s. 6d., yearly 19s., post free.—141, Wellesley Court, W.9.

LUXURY MOTORING TOURS! Switzerland, Dolomites, Italy, and especially leisure. Ask for illustrated booklet.—Lammin Tour Ltd., 67, Blenheim Terrace, London, N.W.8. Tel.: Maids Vale 4321.

UNIVERSITY DEGREES. QUIETLY, in your own home, by studying our carefully prepared and tested courses, you can secure an external Degree of London University (B.Com., B.A., B.Sc., B.Sc.(Econ.), LL.B.). Expert and inexpensive tuition also given for Accountancy and Secretarial Diplomas, Matriculation, Civil Service posts, etc. Write now, specifying interest for the new 100-page FREE book "YOUR CAREER" to The Principal, The Rapid Results College (Est'd 1928), F.101, Tuition House, London, S.W.19 (or call 235, Grand Buildings, Trafalgar Square).

Inconvertible Again

SO the convertibility of the pound sterling has lasted only five weeks. Some relaxation of the strain had been hoped for in August, but it has not occurred; in the past fortnight, dollars have had to be provided for other countries' requirements in ever-mounting volume; and on Wednesday the Government took what had become the inevitable decision to suspend the obligation to make current sterling available for spending anywhere in the world—an obligation formally assumed as recently as July 15th.

There is a strong resemblance between the events of the last five weeks and the story of the restored gold standard after the last war. What was then spread over six years has this time been compressed into a smaller number of weeks. But there is the same over-hasty decision to restore one of the cardinal features of the pre-war financial system; there is the same realisation, as soon as the deed is done, that the cost of doing it is far higher than was expected; there is the same struggle to meet the obligation; and there is the same final, sudden and unilateral abandonment of the task. There are, of course, differences. The return to the gold standard in 1925 was an act of purely British pride; the return to convertibility on July 15th last was an enforced condition of the American loan. In 1925, the great majority of opinion was confident that all would be well; this time, most people had grave doubts—graver perhaps when the loan was negotiated in 1945 than they were as the fatal date of July 15, 1947, approached; for one of the unexplained aspects of the whole affair is how the British Government, in concert with their official advisers, managed to work themselves into such a state of confidence during the first six and a half months of this year. It was necessary, of course, for the purposes of the negotiations with the holders of sterling balances, to put a bold face on the affair. But the confidence was repeated as strongly in private as it was expressed in public. The private observer might have his doubts, but they were melted away by the optimism of those who had access to all the detailed information.

This is, indeed, one of the morals to be drawn from the affair—that it is possible even for expert technicians, who have all the available data at their disposal, to be very badly wrong in their estimate of probabilities. Another moral, familiar and almost equally trite, apparently needs constant re-learning—a major war is a very serious shock to a nation's financial and economic organism and too quick a return to the normal habits is likely to delay recovery.

The figures that the Chancellor of the Exchequer gave in his broadcast on Wednesday evening (as will be seen from a later article on page 331, which discusses some of the consequences of the Government's action) are enough to show why it was necessary for the British Government to act at once and why the discussions with Sir Wilfrid Eady was conducting with the American Government in Washington turned out to be merely the occasion for informing the American authorities that the obligation of convertibility had become insupportable. The Americans seem to have shown belated under-

standing of this inevitable action, taken unilaterally by the British side, but that does not mean that they accept it with any cordiality. It would be wrong to say that American opinion as a whole is uninformed about the plight of Europe or insensitive to it. The State Department, some Congressmen, and the more responsible newspapers, are anxious, sympathetic and eager to discover some method by which the inconvenient logicalities of the American Constitution can be circumvented and aid made available in time. It is a situation very similar to that of 1940-41. But, as at that time, it is the rest of American opinion that has to be reckoned with, and though there is less active hostility to Britain than at many times in the past (except among the Zionists, who probably do the British cause more good, on balance, than harm), there is equally less willingness to understand why any effort should be made to help.

Sir Wilfrid Eady has come up against a typical representative of this attitude in Mr Snyder, the Missouri banker who found himself with some suddenness projected into the office of Secretary of the Treasury. Mr Snyder has declared himself to be sympathetic to the British case, but it has also been made clear that the sympathy is of the brand that a Missouri banker is accustomed to show to a borrower who has run through one loan and now requires both to be released from some of the conditions of that loan and granted a new one. The banker will sit and listen, but the onus of proof is on the borrower and the proof had better be a good one.

It would be a waste of time to try to explain to people with this psychological approach that the fault for the present crisis—if fault there must be—is far more America's than Britain's. The loan was far too small when it was made, as the British pointed out at the time. The conditions attached to it were unworkable, as was also pointed out at the time. The sharp reduction in the real value of the loan was due to the rise in American prices, following upon the abandonment of price control in America. The world-wide dollar crisis, which hurled the convertibility provision into a disaster, is due to the fact that the American balance of payments has got out of control. Nothing could have been done about any of these things by any British action or inaction. Contributory negligence there has certainly been from the British side, but it has been of smaller importance.

But if Sir Wilfrid Eady introduced these arguments he was wasting his breath. Congress would not be impressed by them. Indeed, it sometimes seems to the Englishman that, so far from admitting any share of the blame for what has happened, the average American is determined to prove the British wrong, whatever they do. One set of voices asks why they have left matters so late, when Mr Snyder has been expecting an approach for months past. And another set of voices says that even now, it is far too early to do anything, since the British have not yet scraped the bottom of the barrel of their own ultimate reserves. Why do they not bring precise proposals of what they want? And if they did, they would be told that it is not for the debtor to do the dictation. Why do they come alone, ahead of the European queue? And if they did not, they would be told that they were sheltering behind others weaker than themselves. Why do they ask for dollars, when what they want is goods? And why do they not realise that it is useless to talk about goods until Congress has made a dollar appropriation? If they are short of dollars, why do they not live within their means? And if they stop buying American films, why does the American Government not force them to start again?

American opinion should be warned that over here, in Great Britain, one has the feeling of being driven into a corner by a complex of American actions and insidencies which, in combination, are quite intolerable. Not many people in this country believe the Communist thesis that it is the deliberate and con-

scious aim of American policy to ruin Britain and everything that Britain stands for in the world. But the evidence can certainly be read that way. And if every time that aid is extended conditions are attached which make it impossible for Britain ever to escape the necessity of going back for still more aid, obtained with still more self-abasement and on still more crippling terms, then the result will certainly be what the Communists predict, whether or not it is what the Americans intend. The crippling of the British export trades that was one of the conditions of Lend-Lease increased the dimensions of the aid that was required in 1945. And the famous Article Seven to Ten of the Loan Agreement, with their obligations of convertibility and non-discrimination, have brought the British back to Washington earlier and in worse plight than was necessary.

*

Is it really the Americans' wish that this process should continue? They should be warned that, every time it is repeated, something more is subtracted from the British willingness to offer genuine co-operation in building the sort of world that Americans want. Do they really prefer a resentful dependency to a self-supporting and self-respecting friend? They should realise that the British Government has made very great efforts, and has been willing to run great risks, in agreeing with American conceptions of international economic policy. The risks of convertibility have proved all too real. Non-discrimination, if it is applied in the months to come, will be the means of starving the British people. Yet even now at Geneva the British representatives are in process of committing this country, in the proposed Charter of the International Trade Organisation, to sweeping general principles which, however excellent they may be in theory, are likely to prove in practice to be equally dangerous. No government could have put more of its own interests in pawn to pledge its good will; no other government has even tried to make a similar effort. Yet those who would search in Washington for the credit that Britain has earned thereby would need the patience of Diogenes.

For the present, the Americans still retain the power to make the British Government jump through any hoop they choose. For it is the ultimate calamity, that, for all the brave talk of standing on our own feet, the misfortunes that would fall upon the British people if there were no dollars at all are such that no British Government could face them. But this dependence will not last for ever. A time will come when, by a combination of external events and internal efforts, Britain will be able to do without dollars at a cost that will be bearable. Do the Americans, when that time comes, want the British to regard the cutting loose from America, the erection of barriers against America, as a boon so great that the highest bearable price will be cheerfully paid for it at the earliest possible moment? They can be assured that there are very many Englishmen who would regard anything of the sort as an unparalleled disaster, as the final and irreparable losing of the peace that so much common blood and treasure were spent to win. But they can also be assured that that is the way things are drifting at present.

Mr Marshall, in his great speech at Harvard in June, called on the European nations for a great imaginative effort. They are responding and, as the following article suggests, in a more far-reaching way than might have been expected. In return, Europeans have the right to ask the Americans to make an equally great effort of imagination. Let them forget, for the moment, their own conviction that their present wealth and strength are the result of superior virtue and remember the Europeans' conviction that they are merely due to better luck. Let them worry less about what they can afford to give and more about what they cannot afford not to give. Let them above all try to realise what it feels like to be in other men's shoes.

Western Customs Union?

THE proposal of a customs union embracing some or all of the Western European states has now been officially placed on the agenda of the Paris Conference. That it has arrived there at all is itself of some significance, for it was clear from the whole tenor of the statesmen's speeches when the Conference was opened early in July that nothing so far-reaching was contemplated. The task of the Conference was then seen as short-term, "practical" and specific. But two pressures have been pushing the Conference steadily along the road to wider visions. One is the fact, to which attention was called here and elsewhere at the start, that the Marshall Plan has no chance whatever of acceptance by Congress unless it can be presented as the means to the attainment of some grandiose project of a kind to catch the American imagination. The other is the discovery that some of the participating nations take very seriously the opportunity that the Conference presents for a wider integration of the economies of Western Europe—including notably the French, who are not normally the least nationalistic of people, especially in economic affairs.

The official British view was defined by Sir Oliver Franks in a public statement on August 15th. Apart from the normal difficulties that would stand in the way of any country that contemplated joining a customs union, the United Kingdom would also have to examine the whole complex of questions arising out of its special relations with the other members of the Commonwealth. The United Kingdom, in fact, would have to find out whether it could be a member of both clubs at once. There could, therefore, be no question of the United Kingdom entering into hard-and-fast commitments in the next few weeks. But if study groups were to be set up to examine the whole question, the United Kingdom would associate itself with them and would also arrange early consultations with the Dominions.

It would be a mistake to regard this as a negative statement. It is indeed far less negative than it would have been had Sir Oliver not returned to London to consult the Cabinet. The official British view has always been that a customs union in Western Europe is so obviously idealistic that it is not worth the attention of practical men, and it is something of an achievement to have brought the Foreign Office to consent to examine it. If the pressure is kept up, they may yet be pushed into finding that it is not as difficult as they had supposed.

It is important to observe that no immediate decisions are proposed. The Americans want the Marshall Plan and the idea of a customs union to be linked. But nobody is so unrealistic as to suppose that a fully-fledged customs union can be set up before the dollars begin to flow. The negotiation of such a union, as Sir Oliver Franks said, would take a long time, perhaps five, seven or ten years. But on the other hand, there is equally to be no question of uttering a few fine phrases, for confessing a few fine intentions and promising nothing, for Mr Clayton has made it clear that the creation of preferential tariff groups in Europe (without which, as a minimum, all talk of economic integration is vain) will not be attained unless there is "a definite undertaking to form an eventual customs union." What the European countries are being asked to examine and decide upon in the next few months is whether they can now enter into a commitment—what Sir Oliver calls "a commitment entered into with faith"—to form a customs union at the end of a stated number of years. We cannot forbear from pointing out that this is exactly the suggestion that was made in *The Economist* of June 14th.

There is perhaps one overriding question that needs to be asked. If a Western European Customs Union should become

a practical possibility, is it desirable—apart from all question of its technical possibility—that the United Kingdom should seek membership in it? Would it not perhaps be the wiser course for Britain to wish the project well, but to stay out of it? There should be an unequivocal answer to this. If there is to be a customs union of the countries immediately across the narrow seas, then Britain should strain every nerve to be a member of it. Politics and economics point to the same conclusion. The risk cannot be taken of the creation of a gigantic aggregation of power in Western Europe which might in the future turn against British interests. If there is to be such unification, Britain must be in a position to influence its development. Indeed, it is unlikely that it would come about at all without British participation, for the Low Countries would certainly not enter into a union alone with France, since their traditional suspicions of French expansion are not wholly dead. Moreover, by one of the accidents of history, British abstention would also presumably exclude the Ruhr, in which case the Union would lose a large part of its *raison d'être*.

Sir Oliver Franks's statement emphasised the obvious and specific difficulty that is created for Britain by the existence of the Commonwealth. It would be unrealistic to expect the Dominions themselves to enter the proposed customs union. Canada is, in economic matters, much more closely tied to the United States than to Europe. Australia, and to a lesser degree the other Southern Dominions, is evidently determined to protect home industries against all comers. The new Indian Dominions are of a wholly different economic substance from the European countries. It would therefore be a question of arranging means by which the European Customs Union could be set up without breaking the existing commercial ties between the British countries. That task ought not to prove insuperably difficult. Is it not possible to arrange for, say Australian goods to enjoy a preference on entering Great Britain, but to pay the full tariff of the Union on entering France or Holland, and for supplementary duties to be payable on re-export from England? The other members of the Union might well wish to make similar arrangements for their own colonial imports.

*

But this, of course, would not really be an answer. What the Dominions would fear in the project of a customs union would not be so much that their goods would get worse treatment in the British market as that their competitors' goods would get better treatment. Before the war, for example, the principle was established that the order of preference in the British market for foodstuffs was the home farmer first, the Empire producer second and the foreign producer third. A customs union would mean that some foreigners would move up from their third place to a new place somewhere between first and second. But it would surely be possible to reassure these Dominion fears by some form of long-period bulk-purchase policy by which the Dominions were guaranteed a market for certain quantities of their produce at prices acceptable to them; though whether this could be squared with the rules for bulk-purchase contracts now being incorporated, at American instance, into the Charter of the International Trade Organisation is another question.

In general, however, it would be a sad mistake to over-emphasise these difficulties, which are peculiar to Britain, since it is likely that by far the greatest difficulties are of the kind that affect every nation alike. The existence of the British Commonwealth must not become the scapegoat for something

far more intractable—the unwillingness of sovereign nations to surrender any part of their sovereignty. In the interests of realism, it is as well not to lose sight of the fact that no customs union can exist without some sovereignty, political as well as economic, being surrendered, and also of the fact that the further gone a country is in conscious planning of its economic policy, the harder the surrender may be.

It should not, for example, be passed over in silence that any customs union involves some equalisation of standards among its members. Perhaps among the countries of Western Europe that difficulty is not insuperable, since the differences in standards of living and of output are not so very great. But if Italy is to be included, to say nothing of Eastern Europe, the question will immediately arise.

Secondly, the existence of a customs union would unquestionably set limits to purely national economic planning. If an expansion of purchasing power in one country, for example, led to a very rapid increase of imports from the other members of the union, the original policy would be at best diluted and at worst frustrated. There was a certain tendency in last Friday's discussions in Paris to assume that a customs union would apply only to customs tariffs and that import quotas would be left untouched. But if this were so for more than a transitional period, the customs union would be an empty farce. If it is entered into, it must mean a willingness to permit movements of goods between the members of the union almost as freely as within each member. And that, in its turn, must lead to some arrangements between the members, at the most to concert and conduct a common economic policy, at the least to control the repercussions of one member's policy on another. In either event, the freedom of politicians in each country to do as they wished would have to be limited. The project to establish inter-convertibility among the currencies of the group, which is also being studied in Paris, and which would be an almost essential counterpart of a customs union, raises the same question. None of the other countries will be willing to establish convertibility between their currencies and the French franc or the Italian lira until some stability has been brought into the domestic finances of France and Italy.

Thus, thirdly, it would be idle to suppose that a customs

union could ever be established within a purely economic framework. A political structure would have to be built alongside, not necessarily anything nearly as far-reaching as a federation, but solid enough to provide reliable anchorage for some of the economic arrangements. Would countries, for example, be willing to see their wartime self-sufficiency melt away under the influence of a customs union without the most binding assurance that they would never find themselves at war without the other members? It may even be found that it is, after all, a waste of time to tackle the whole complex of questions wrapped up in Western European interdependence as exclusively from the economic angle as the present prominence of the idea of a customs union would suggest. It may be that, in the end, the political arrangements will have to come first.

★

There is thus no point in denying that there are formidable difficulties to be surmounted before a customs union could be created even for such a naturally homogeneous area as Western Europe. The British Government are right to ask for time to study the matter—except, of course, that they should have studied it minutely long ago. But what is needed is that it should be studied with real determination to find a way through the difficulties. Very many of them, after all, relate to the adjustments, some of them painful, that would have to be made in the transition to a new state of affairs; very few of them relate to the new state of affairs once it was established. The final answer to timidities should be to contemplate the alternatives: either that Western Europe shall remain in its fragments, slowly declining to Balkan standards, efficient only in the output of political obstinacy; or else that Western Europe saves itself without Great Britain, which would thereby be as surely excluded from the possibility of economic expansion as from that of political influence. The opportunity to advance the unity of Western Europe was not taken during the war, when all the Governments concerned were in London, for a number of reasons, of which American opposition was one. The American pressure has now moved into the opposite corner of the compass and so the opportunity recurs. It will not come a third time.

Pan-Americans at Petropolis

THE conference of 20 American nations which opened at Petropolis in Brazil on August 15th is officially limited to the preparation of a Pan-American treaty of defence, for which various drafts have already been submitted by different Governments. But, however strictly confined the agenda, the actual discussions are likely to be deflected into other channels by all the accustomed pressures and counter pressures of Latin-American politics. The most familiar is the traditional rivalry between the United States and Argentina. The Argentine Government refused American leadership during the war and abandoned its neutrality only just in time to attend the Pan-American Conference at Mexico City in 1945. At this Conference, the Act of Chapultepec was drawn up as a preliminary to the act of joint defence which is now, two years later, to be elaborated. Argentina signed the Act, but to appease its own nationalists and to rebut any criticism of outside interference in its internal affairs the Government thereafter refused to put into effect certain provisions of the Act relating to the ending of Axis activities in Latin America. Against this recalcitrance, the United States decided to try direct pressure. The Farrell regime in Argentina, based at that time on Colonel Perón and his military group, was not noticeably constitutional and the State Department permitted its Ambassador, Mr Braden,

to lead the attack upon the dictatorial government in Buenos Aires. His local action was reinforced by a decision taken in Washington to postpone the discussion of the military treaty forecast in the Act of Chapultepec until "a new Argentine Government has had reasonable time to comply with the promises made at Mexico City." Since the military treaty contained the hint of free armaments for Latin America, its withholding was a strong bargaining point.

Neither Mr Braden nor the State Department made any secret of their hope that the new Argentine Government would be "democratic," in other words, that it would not be dominated by Colonel Perón. By the time the elections, early in 1946, had given Perón his sweeping majority, Mr. Braden's neck had been stuck out so far that, short of a complete loss of dignity, it could only be very slowly withdrawn. The summer of 1946 passed therefore in a species of stalemate. The United States realised that the Perón regime had come to stay. Moreover, as the question of Communism grew more and more pressing, Perón's robust anti-Communism began to outweigh his dictatorial tendencies. Braden and his policy were laid aside. Perón, realising that he had won the Braden bout in his long battle with the United States, made conciliatory gestures. When President Truman in May 1946 laid before Congress his

proposals for an "inter-American Act of Military Co-operation," President Perón welcomed them. During the summer he announced his Five Year Plan for the industrialisation of Argentina. The needed goods and machines could only be obtained in the United States and early in 1947, he invited a private group of American experts under General Royal Lord to advise Argentina. At the same time, the Argentine Government at last took the measures against Nazi firms and agents which had been outstanding ever since the Act of Chapultepec had been signed. The way was now clear, to take up the work of pan-American co-operation at the point at which the hostility between the United States and Argentina had interrupted it. Mr Braden resigned from the State Department after going on record with his view that Communism was a greater danger than any Fascist tendencies left over from the Nazis, and President Truman presented a new version of his Act of Military Co-operation to Congress in which he proposed that the arms and defences of the hemisphere should be standardised and supplied from the United States; it was then announced that the long postponed conference to discuss this and other proposals would be held in Brazil in the course of the present summer.

★

From this bald summary of the last two years, it can be seen that President Perón has scored a considerable political victory in his determined fight to assert Argentina's independence of foreign influence and to reinforce its claim to a special and leading place in pan-American politics. It is the United States rather than Argentina that has "retreated to prepared positions" by reducing the uncomfortable Braden salient. There is no doubt that President Perón will seek to maintain his advantage at the present conference and to see that no agreements are reached which could be interpreted as an infringement of Argentine Sovereignty. Typically, he has proposed that any collective action to counter aggression against the Western hemisphere must be unanimously agreed. This he maintains would give each Power "a proper sense of responsibility." Other American republics merely think it would give him a veto. The United States, backed by a number of states, including Chile and Mexico, propose rather that action approved by a two-thirds majority should be binding on the approving majority. Yet another draft proposes a two-thirds majority binding on all. Argentina seems likely to take an equally independent line on the question of standardised equipment. The Argentine Minister for War recently announced that his Government might consider the production of standardised equipment in Argentina arms factories, but did not intend to buy arms abroad or give up the policy of building its own defence industries outlined in the Five Year Plan. It is thus clear that the struggle for leadership in Latin American affairs will continue as usual under the surface of the latest pan-American conference.

Argentina's great asset in asserting its independence of United States influence and laying claim to separate leadership in Latin America is the fact that its sister republics also relish sovereign independence and are almost as jealous of it as Argentina itself. This year, this traditional asset is somewhat reinforced by a general Latin American determination to keep out of war at all costs. President Truman's offer to supply standardised weapons and to work out with Latin America a common policy of defence against aggression has made a number of governments wonder uneasily where the line will be drawn and whether they may not find themselves committed to one side in a world struggle between the United States and Russia. President Perón is shrewd enough to sense this mood and he attempted—probably not without success—to exploit it in the extraordinary broadcast he made, with every pomp and circumstance, at the beginning of July. His declaration seemed to amount to no more than a general offer on the part of Argentina to be very good provided

everybody else was very good, too; but the passage most interesting to Latin American ears was no doubt the President's offer to create and reinforce a "third possibility" between the extremes of Communism and Capitalism—in other words to form a bloc with those states that are not prepared to commit themselves to either side. The Latin American republics which have come to Petropolis wondering uneasily whether behind the American offer of standardised equipment lurks the Truman Doctrine will not be discouraged from that view by the Argentine delegation.

The weakness in the Argentine position is that the United States stands not only for a Truman Doctrine but also for a Marshall Plan. Economic questions are strictly excluded from the agenda of the Conference but they are on the tip of every delegate's tongue. The economic position of Latin America has changed radically since the last pan-American Conference in 1945 and preoccupation with the continent's immediate economic future is so urgent and so grave that the two questions—military co-operation and economic aid—will not be kept apart, however much the North Americans may wish them to be so. At the end of the war the Central and South American countries between them had between \$4 and \$5 billion in reserves of gold and foreign currencies accumulated as a result of the Allies' heavy buying in Latin America and their inability to ship goods in return. Of this about one billion, it is true, represented sterling balances or inconvertible currencies, but the free reserves were nevertheless important and remained high throughout 1946, since the world still needed Latin American products but could not yet provide goods in return. The largest reserves were held by Argentina with a figure of nearly \$2 billion. In 1947, however, the picture has started to change rapidly. The various countries have been spending their reserves freely and these have declined at the rate of over \$100 million a month. The drop is particularly marked in the case of Argentina, which has lost over half a billion dollars in the nine months ending on June 15th. The country's current deficit in trade with the United States is running at about \$400 million a year and only two-thirds of the remaining reserves are in gold and freely convertible currencies. Mexican reserves have fallen this year from \$380 million to \$180 million. Brazil's annual trade deficit with the United States is \$280 million and only \$636 million is left in reserves. Chile's reserves have been halved. The reserves of all the republics are without exception diminishing and only Cuba, Guatemala and Salvador have tiny favourable trade balances with the United States.

The governments have taken steps to limit this drain. In Brazil, importers must surrender 30 per cent of their foreign exchange to the Central Bank. In Mexico a law has been passed virtually banning the import of non-essential goods. Argentina is introducing quotas. Peru, Bolivia and Chile are each trying to make import licences available only against foreign currency earned by current exports. All the republics realise that the United States cannot go on indefinitely exporting to Latin America to the extent of over \$4 billion a year while receiving only half that figure back in imports. In short the Latin American states face, though in a less acute form, the dilemma before Europe. How can they prevent a disastrous economic collapse at home—with all the social and political unrest it might entail—when in a foreseeable time their dollar reserves will have been exhausted? Inevitably they turn to the idea of a "Marshall Plan" and Chile and Colombia are even pressing to bring the matter up officially at the Petropolis Conference.

It is this aspect of the Latin American dilemma that suggests that the Argentine Government, in spite of all its political manoeuvring, may be hard put to it to maintain a position of leadership in the next year. In spite of its great wealth, Argentina is not in a position to act as an economic makeweight to the United States. President Perón has introduced an ambitious

Five Year Plan for industrialisation which calls for the expenditure of a billion and a half dollars in the next five years on transport, ports, drainage, reservoirs, oil fields and electricity. The President has also attempted to draw Chile (with its mineral reserves) into the Plan by proposing a Customs Union offering Argentine credits for mineral development (the Chileans, scenting Argentine domination, have so far failed to ratify the agreement). Argentine credits have gone to other European and Latin American countries to the total of \$580 million. But all these efforts do not make Argentina the great source of machinery, industrial and consumer goods which all the Latin American republics so urgently need. If it became known at Petropolis that the possibility of a Marshall Plan lay behind the American plan for unified hemisphere defence, Argentina might be left in lonely eminence in its opposition to anything more binding than the unanimity rule.

Mr Marshall has made it clear that he is not offering another

The Balance of Payments—1

What Went Wrong?

THE balance of payments was invented less than forty years ago by a young official of the Board of Trade who is still very much alive. It was in those days an obscure inhabitant of the statistical menagerie. Indeed it was not until several years after the end of the first war, when Keynes took the subject up in a number of articles in the *Economic Journal*, that the balance of payments began to be familiar even to the academic fraternity. And even then it was regarded as no more than an interesting and illuminating manner of setting out, after the event, a record of what had happened in a country's international transactions, about as harmless and non-controversial as a rainfall table. It would have been difficult to imagine then that a day would come when the balance of payments would dominate the political scene, when its component items would be wrangled over in the House of Commons and when defects in the balance of payments would undermine the stability of Governments.

The ordinary newspaper reader has learned in the past few years what the balance of payments is. But he is still a little bewildered, in all the argument, over what exactly has gone wrong with it, over what governs the chances of putting it right, and over what moral to draw for the future economic policy of the country. It is proposed in a short series of articles to attempt to elucidate some of these mysteries.

The obvious starting point for any such discussion must be the balance of payments for the year 1938. In a simplified form of the version given in the latest National Income White Paper (Cmd. 7099),* the figures are as follows (in millions of pounds):

Imports of goods.....	835	Exports of goods.....	533
Govt. expenditure overseas..	16	Receipts of interest, etc....	205
Payments of interest, etc....	30	Other "invisible" exports..	200
Other "invisible" imports....	127	Deficit.....	70
	1,008		1,008

The position revealed by these figures was not particularly creditable; it is not a healthy sign for a mature country to show a deficit in its annual accounts. But the deficit (if there was one at all—there is some reason to suspect the figures of undue pessimism) was small; it was less than 10 per cent of the gross turnover and less than 2 per cent of the total overseas capital of the country. In fact, it probably did not greatly exceed the sinking fund payments and other returns of capital that were

* This version differs slightly from the Board of Trade estimates, in that imports are included at their f.o.b. values and the element of shipping, insurance, etc., that enters into the c.i.f. prices at which they are declared to the Customs is here reckoned (insofar as it is paid to foreigners) as an "invisible" import.

plan and that the discussion of economic issues must wait for the general conference at Bogota next year. The general view in the State Department is, however, that the rapid exhaustion of the Latin American reserves is due in large measure to the incompetence of the governments—to their failure to concentrate on essential goods, to keep a reasonable price level, to institute proper systems of taxation. There is also a widespread conviction that more aid should await some settlement of Latin America's large and various foreign debts. At the same time, it can be argued that the restoration of Europe—which is still Latin America's chief export market—would indirectly assist economic stabilisation in Latin America. The offer of a Marshall Plan at this Conference or in any immediate future is therefore out of the question and the response of the Latin American republics to sweeping commitments in the military field will be correspondingly cautious. Their caution is Argentina's opportunity and it will be exploited to the full.

made to the United Kingdom in the course of the year. It was certainly no cause for alarm, and if a return could now be made to a deficit of only £70 million a year, loud hosannas would be uttered on every side.

Actually, the deficit in 1946 was estimated at £400 million, as follows:—

Imports of goods.....	1,110	Exports of goods.....	890
Govt. expenditure overseas..	300	Receipts of interest, etc....	150
Payments of interest, etc....	70	Other "invisible" exports..	222
Other "invisible" imports....	182	Deficit.....	400
	1,662		1,662

How had these changes come about? It is possible, in an illustrative and not over-accurate way, to isolate each of the causes that has combined to produce the result.

The first is the change that has taken place in the volume of trade in goods, as distinct from the values placed upon the goods. In 1946, the volume of imports was only about two-thirds of the 1938 level; the missing one-third was plainly felt in the general shortage of all foods and raw materials. The volume of exports, on the other hand (including re-exports of imported merchandise) was only about 10 per cent lower last year than in 1938. If these had been the only changes that had taken place they would have improved the position by some £220 million and turned the pre-war deficit of £70 million into a surplus of £150 million. Those who, in this or other countries, feel the temptation to place the blame for Britain's balance-of-payments difficulties on some sudden improvidence of the British people might reflect on this numerical measure of what would have happened if austerity and abstinence had been left alone to show their effect.

But of course they were not left alone. The prices both of imports and of exports rose very sharply. The difference in the degree of their rise was not very great; according to the Board of Trade's estimates (referring to categories defined somewhat differently from those used in the tables above) import prices in 1946 were 210 per cent, while export prices were 196 per cent of 1938. But a point that is not always appreciated is that any rise in prices, even if it bears equally on imports and exports, works to the disadvantage of Britain, which is much more of a buyer than of a seller. Thus if import and export prices had impartially doubled between 1938 and 1946 and nothing else had altered, that alone would have been enough to add £300 million to the deficit. Of course, if the "invisible" items were also affected to the same extent, some of this loss would be

recovered. But though some of these invisible items are swollen by generally rising prices, few of them respond at once or in full degree, and some do not respond at all. In rough numerical terms, it can be said that, of the national saving of £220 million made by the great cut in imports, about £70 million was lost by the fact that prices rose and a further £70 million by the fact that they rose unequally.

The other items making up the post-war deficit can be read off the tables. Government expenditure overseas was £284 million higher than in 1938. Net receipts from interest and dividends were £95 million lower and net receipts from "other invisibles" (shipping, insurance, banking, film remittances, tourist expenditures and the like) were £33 million lower.

The full reconciliation is thus as follows:—

1938 deficit.....	70
Effect of reduction of volume of imports and exports..	-220
Effect of fact that prices rose.....	70
Effect of fact that they rose unequally.....	70
Increase in Govt. expenditure.....	284
Reduction in interest receipts.....	95
Reduction in other invisible income.....	33
	400

1946 deficit..... It should be added that in the first half of 1947, the volume of imports increased more rapidly than the volume of exports, which added to the deficit at the annual rate of about £40

Australia and the Japanese Treaty

IN order that Australia should play an influential role in international affairs two things were necessary: that Australians should be aware of the existence of the world and that the world should be aware of the existence of Australia. The first of these conditions has been fulfilled as a result of the Pacific war and the great southward drive of Japan in 1942 to Timor, New Guinea, the Solomons and the very fringe of Australia itself. Before this, Australia and New Zealand had indeed taken part in the wars of the Empire or Commonwealth, once in South Africa and twice in Europe and the Middle East; to that extent their citizens could not but know that events beyond their encircling seas might involve them at any time in military expeditions and sacrifices. But such participation in world affairs remained on the whole indirect, even after the Statute of Westminster; there was no sense of immediate danger to Australia or of need for an independent foreign policy. Australia and New Zealand had no land frontiers and no sea-power seemed to be within striking distance; between the Pacific Dominions and remoter dangers the British Navy interposed its shield, and Anzac aid in an emergency was requital for this abiding protection. That was as far as either Dominion need really be involved; world politics were for London to worry about.

But in 1942 this conception—or, rather, this instinctive attitude—was violently upset. Neither the British nor the American Navy was able to provide protection; Australians suddenly found themselves alone facing possible invasion by a swarming and cruel Asiatic enemy. The shock was greater than has perhaps ever been fully understood in Great Britain. Without any wish to sever the ties of the Commonwealth, Australia was forced by circumstances to a new independence and self-reliance, to a new consciousness of political and strategic interests in a world wherein distances which had seemed infinite had been so drastically contracted. Japan's mushroom empire has crashed in ruin, but Asia remains, a vast enigma looming on the horizon of the Near North, full of incalculable possibilities. In the island of Java alone there are six times as many people as in the whole of Australia; in the two Indias, South-

million. Moreover, prices shot up still further and still more unequally. If both had risen only as much as export prices, that would have cost the country about £35 million a year. The additional rise of import prices added a further £100 million on an annual basis. These additions would have raised the annual rate of deficit to about £575 million. Of the "invisible" items, the "Economic Survey for 1947" anticipated a reduction of £125 million in Government expenditure overseas and some slight improvement in other invisibles.

It should also be explained, parenthetically for the purposes of this series of articles, that the "deficit" as used here is by no means synonymous with the amount of dollars that the British Government requires. For one thing, the general deficit may cover a surplus in trading with one group of countries and an even larger deficit with another group. As is notorious, this has been the case. Secondly, Britain has had to find the dollars needed by the other members of the sterling area and by the British zone of Germany. These dollars provided for others amounted, in the first half of 1947, before the crucial date of July 15th, when the convertibility obligation came into effect, to £111 million. Since July 15th, as everybody now knows, Great Britain has been providing dollars for all the world.

A following article will discuss some of the factors that will determine the future course of the British balance of payments.

East Asia, China and Japan together there are about 130 times as many. There can be no return to the old Antipodean seclusion, nor yet to the old willingness to leave world affairs to Britain. With the best will in the world, John Bull, living on the western fringe of Europe, cannot see things in the same perspective as they appear from down under in the longitudes of Tokyo, Vladivostok and Shanghai. And even if he did, he might not be able in the future, as he was not able in 1942, to do very much about it.

Australia, therefore, is irrevocably concerned about the world, and especially that part of it which borders on the Pacific Ocean. But Australia's concern is not by itself enough to make Australia's voice heard. A country, or even a continent, with a population of 7,000,000 (which may be reinforced with one and a half million New Zealanders) requires to assert itself rather emphatically in the international arena if it is to make larger nations take notice of its policies and opinions. Thus to put Australia on the map in international politics has been the purpose of Dr Evatt, and he has been aided in his task by the traditional Australian lack of reverence for the hierarchies of rank and status. In the last two years Australia has become famous (or, from some people's point of view, notorious) for the public baiting of Great Powers. At the San Francisco Conference there was an excited tremor of anticipation whenever Dr Evatt's initial words, "Speaking for Australia . . ." were heard in the hall, for everyone knew then that Mr Molotov was about to get what was coming to him. At the Paris Conference, too, the delegates of the smaller European Allies listened with envious admiration to audacities of speech which they deemed it unwise to permit themselves in controversy with Great Powers.

Moreover, it was not only towards the Soviet Union, so jealous for the rights of the strong against the weak, that Australia showed this boldness—which the cynics could explain by reference to Australia's remoteness from any Soviet frontier; even for a Power on whose goodwill Australia might seem much more dependent the lash of public criticism was not spared. In Tokyo, when it proved diplomatically impossible to add Australia as a fifth to the Big Four represented on the

The Alliance undertakes the duties of Executor and Trustee and of Trustee for Debenture Issues.

proving itself to be in the main a responsible and level-headed body and its majority report may well make specific and workable recommendations to the Assembly in September, when the Report will be submitted.

The Assembly will not be unduly handicapped by procedure in dealing with the issue. Unanimity is not required for a recommendation of the Assembly, which on a major question of this kind, however, must get two-thirds of the votes. Such a majority might be secured for some positive recommendation on Palestine. And it is worth remembering that, in framing such a recommendation, the Assembly is not in any way restricted to the trusteeship provisions of the Charter. That procedure would have required the mandatory to submit its trusteeship proposals, and until that initiative had been taken, the United Nations could not act. Britain at present administers Palestine in accordance with the resolution of the Assembly of the League of Nations at its 21st and final session in April, 1946, which took note of the expressed intention of mandatory powers to continue administering these territories "for the well-being and development of the peoples concerned" under the terms of their mandates until "other arrangements had been agreed between the United Nations and the respective power." Here again there is no mention of trusteeship, and in fact there is no reason to expect that the Assembly will favour that method of dealing with Palestine, now that the whole question has reached it in such unrestricted form.

A recommendation of the Assembly will, however, in the first instance be directed to Britain. It may be supposed that, other things being equal, there would be a strong moral obligation on the British Government to give effect to such a recommendation. But other things may not be equal. If Britain were required to take the relatively simple, though no doubt momentous, course of handing over authority in Palestine on a specified date to some newly to be constituted authority—an independent Palestinian Government, for example, or separate Arab and Jewish Governments, or an international body—well and good. But if the recommendation involved some new policy under continued British administration, it would have to be very carefully examined. If it were found to involve the British Government in commitments which went against its conscience or were beyond its resources, the Assembly would have to be asked to think again. The Government would then have the choice between maintain-

ing the *status quo* pending a new decision, and firmly announcing an early date for its own relinquishment of sovereignty. The former course might be more internationally correct, but the latter is the only one which would do justice to the realities of the situation.

Turkey Woos the Arab World

The Turks, in their efforts to improve and strengthen their relations with the Arab States, have little to show for two years' hard work. They have achieved a pact of friendship with Transjordan, whose King Abdullah paid a courtesy visit to Ankara last January. And they have a similar pact with Iraq which, even though it was only a harmless affair with annexes covering frontier control, customs, extradition, port facilities, communications and water control, including a Mixed Commission for the Tigris and Euphrates, nevertheless had to wait fourteen months for ratification. The delay in its ratification by the Iraq Parliament was not directed against its text, but was a demonstration on the one hand against its negotiators, the Regent, Prince Abdullilah and General Nuri Es-Said and on the other against a presumed British plot to line up the Arabs with Turkey in an "eastern bloc" against Russia.

The reasons for the Turkish failure are complex. Of the main obstacles only one was foreseen. It was realised that the Syrians had by no means reconciled themselves to the loss of the Sanjak of Alexandretta (Hatay), the port with its hinterland handed over to Turkey by the French in the summer of 1939. But the Turks undoubtedly under-estimated the strength of Syrian feeling on this issue, and the Syrian left wing, whose attitude to Turkey is conditioned by doctrinaire friendliness for Russia, has been able publicly to suggest that the issue of the Hatay should be brought before the United Nations. Consequently Turkey's gesture in being one of the earliest powers to recognise the independence of Syria and the Lebanon earned only half-hearted appreciation. Turkey would probably be ready to make economic concessions to mitigate the damage done to Aleppo which, by the transfer of the Hatay, lost its natural seaport, but such concessions could not form part of any new treaty as long as the frontier itself is in dispute.

In these circumstances it was unfortunate for Turkey, though perhaps inevitable, that its first successes should be with the two Hashemite countries. The result was that its good intentions became entangled in the "Greater Syria" project sponsored by King Abdullah, and its new links with Iraq and Transjordan were represented by the over-sensitive Syrian Republicans as an "encirclement" of Syria. Egypt, official opponent of "Greater Syria," is also extremely jealous of its hegemony in the Arab League and will resist any move which looks like putting Turkish leadership in its place.

The New Realist

Slowly, but relentlessly, the icy wind from off the Atlantic is restoring Mr Bevan's consciousness of current realities. Steps have now been announced to concentrate resources on finishing houses at present under construction, and on additional building for workers in farming, mining, and other key industries. New licences to private builders are no longer to be issued, except for the replacement of war-damaged houses or with the specific consent of the Ministry of Health's regional officers: consent will usually be given only in the case of housing for key workers. The Minister's special appeal, a fortnight ago, to local authorities in the mining area has been reinforced with a circular to the chairmen of housing committees in rural districts and county towns. And a long overdue streamlining of the building controls has been announced. The futile attempt to maintain detailed over-licence of 67 out of the ninety items at present controlled is to be abandoned, while at the same time the control of the remaining 23 is to be tightened up. These are the right lines of advance, and Mr Bevan's example deserves to be imitated in far wider fields.

But the question remains whether these measures, sound as they are, will produce results either quickly enough or on a big enough scale; for there are still two unpleasant facts to be faced. The need to curtail public investment means that the size of the housing programme as a whole must be reduced still further; and, secondly, new homes for workers in key industries will not go up fast enough to make much difference in the crucial period of the next year or two unless far more building labour can be diverted from work in non-priority areas. From both points of view, there is an overwhelming case for cutting local programmes of new building, and even for postponing many of those schemes which are already under way. And the need for more building labour in key areas should imply either direction on a scale which will certainly not be accepted or a policy of substantial cash inducements. There could be few less popular subjects among Ministers than even so small a segment of a wages policy; but may it not be dawning today even on the Labour party that a capacity for dealing firmly with unpleasant issues is the surest way to win public respect and confidence?

Green Thoughts from East Grinstead

Last winter greengrocers caused some indignation by charging up to 3s. 6d. apiece for dubious cabbages. Actually, they were doing nothing abnormal or immoral; greenstuffs were genuinely short for obvious reasons, rationing was impracticable, there was plenty of money about, and demand and supply did their usual job. Control might have cut profits for the consumers' benefit; it might also have driven greengrocers off the market altogether. Today the picture is different, an infuriating one of scarcity in plenty; cucumbers, lettuces and cabbages ploughed back, loads of peas and apples returned from Covent Garden to the farmer, of farmers blaming wholesalers, wholesalers blaming retailers, and retailers blaming the public.

This week, in consequence, the market gardeners of East Grinstead have taken matters into their own hands. Their Direct Supply Association has been selling produce like the hottest of hot cakes at open stalls in a Croydon arcade and reports of similar action are coming in from all sides. There is, of course, a great deal that is artificial about the whole scheme. Its novelty and the publicity it has won have doubtless attracted many of the customers. Moreover, as the retailers' spokesman has been quick to point out, the achievements of unpaid labour on rent-free stalls give no fair measure of what can be done by concerns with premises and assistance to pay for. Nor are the prices paid by the customers to the direct suppliers in every instance very much below the prices asked by the shops. But the growers have

obtained a better price, and they have not had the disheartening spectacle of their produce being turned back from the market.

Clearly, all farmers cannot turn retailer without detriment to their farming, nor will free stalls be permanently available in Kennard's Arcade or elsewhere. There is no sign that the Direct Supply Association can or will supersede the normal marketing methods. But it has put the wholesale and retail trade on notice to try to make profits by low prices and higher turnover. And if produce cannot in fact be sold at a margin of less than six times the grower's price by the normal wholesaler-retailer system then that system should be reformed, supplemented—or superseded. The provision of emergency outlets in time of glut, and the revival of the old-fashioned open markets, which in so many towns have been discouraged by councils overweighted with retailer interests, would make a world of difference. The proper long-term remedies for glut, the development of canning, bottling and quick-freezing, will take time; but no priorities, happily, are needed for East Grinstead's rebellion against wholesale and retail restrictionism.

Efficiency in Westminster and Whitehall

Last week's article in *The Economist* on "The Efficiency of the State" was given two illustrations before the paper appeared. On Friday, it was announced that Mr Morrison had tabled a series of amendments to the Standing Orders of the House of Commons, and on the previous day the publication of the third report of the Public Accounts Committee revealed that at the end of 1945 there were large arrears of taxes in the Inland Revenue Department, amounting to nearly £780 million.

These arrears are attributed to the difficulty of recruiting and training the necessary staff, and a similar staffing difficulty at the Ministry of Supply led to a delay in revising the selling prices of timber with a resulting loss of £9,000,000 a year. These are merely two specific instances of the main theme of last week's article—that Whitehall has more to do than it can cope with effectively. But is its burden to be lessened? So far from there being any sign that any of its present load is to be shed, Mr Morrison's amendments to the Standing Orders would seem to imply a further pressure of legislation, which would add to it.

These amendments have a history going back two years. On August 24, 1945, the Government appointed a Select Committee to consider parliamentary procedure and to report what alterations were necessary for the more efficient despatch of business. The Committee had before it a scheme drafted by a committee of Ministers of the Coalition Government, but not endorsed by the War Cabinet, which was designed to meet the special circumstances of the transition from war to peace, when there was bound to be a heavy legislative programme. Notwithstanding the experimental nature of the proposals, the Select Committee turned down a number of the Government's proposals, in particular those which would curtail debates on the Budget and further curtail debates in committee by giving the chairman power to disallow debate on the question that "The clause stand part . . ." Notwithstanding the Select Committee's objections and notwithstanding the fact that the original scheme was intended for the first session or two after the end of the war, the Government is now pushing on with these proposals along with others to which the Committee agreed. Yet most of its reconstruction legislation is now on the statute book. The only conclusion that can be drawn from its decision is that it still has a great deal of legislation in mind—and therefore more work for Whitehall—and is determined to push it through with the minimum of parliamentary control and criticism.

INDEXES TO VOLUME CLII OF "THE ECONOMIST" AND TO VOLUME I OF "RECORDS AND STATISTICS" (January to June, 1947)

These will shortly be available at the following rates, post free:—

American Oil Concession in Italy

Were it not for the fact that the Italian Communists are baiting their political campaign with bitter attacks on "dollar diplomacy" and "American capitalist infiltration," the news that the Standard Oil Company of Texas are negotiating with the Italian Government an oil concession in Northern Italy would probably not have aroused so much perturbed and hostile comment. In itself, the proposition is very reasonable. The presence of large quantities of methane gas near the mouth of the Po is a reliable indication of some oil reserves lying below, but the process of discovering the amount, the location and the depth of these reserves is long and very costly. Under the Fascist regime, many wells were drilled to an average depth of 3,000 to 4,000 feet, and a dribble of oil—between 15,000 and 20,000 tons annually—was extracted. But even this figure dwindled as the autarkic years went by. The reason for this relatively small return was quite simply that the Fascist Government had neither the capital nor the equipment to bore over a sufficiently wide area or to drive the borings down to the depth of 15,000 feet or more which is customary in the United States. Thus the question of the nature and extent of the oil reserves remained in doubt.

The great American oil companies are not hindered by any such material obstacles. They have the capital and the equipment, and the Standard Oil Company considers the risk of finding or not finding oil worth the \$6 million it proposes to invest. It seeks a wide enough area to justify its researches, and has asked for three years in which to conduct the explorations. If at the end of that time oil has been discovered, the Italian Government will be free to negotiate the terms of a long-term exploitation of Italian oil.

In spite of the complete reasonableness of the agreement, it may nevertheless have unfortunate political repercussions. Were it an isolated incident in a balanced foreign policy, Communist criticism would fall on less susceptible ears. But it is the extent of American influence and infiltration that causes alarm. American interests have acquired holdings in such key firms as Fiat's and (it is believed) Montecatini's. Italy's dependence upon dollar loans is underlined by the almost permanent session of an Italian Negotiating Commission in Washington, and each month brings rumours of new American purchases and concessions. The effect of these reports would be less disturbing if they were combined with more vigorous Government measures to combat the black market, profiteering, tax evasion and the blatantly luxurious living of the privileged few. Since they are not, it is not surprising that not only the Communists see de Gasperi's policy as one of "making Italy safe for American capital."

* * *

The Assistance Board's Task

The first two instalments of the social security programme—family allowances and higher old-age pensions—which came into force last year are reflected in the report of the Assistance Board for 1946 [Cmd. 7184]. When family allowances were first introduced, the effect on the income of families on assistance was merely that their assistance payments were docked by an amount corresponding to their family allowances, but this hardship was partly mitigated later when the Assistance Board increased its scale rates for dependent children by 1s. 6d. a week, except for children aged 5, 6 and 7, for whom the increase was 3s. The number of children in respect of whom the Assistance Board was making payments was 132,000.

The increase in old-age pensions had a much greater effect on the Assistance Board's work. In October, after the new basic pensions had been introduced, 935,000 of its 1,470,000 pensioners ceased to need supplementary payments. Of these, about 100,000 were no better off—that is, they lost in the supplement exactly the same amount as they gained on the basic pension. The remainder gained an amount averaging 3s. 10d. a week; but there were wide variations ranging from as little as 6d. to as much as 21s. or even more.

But the fall in the Assistance Board's work, caused by the increase in basic pensions, is likely to be only temporary. Indeed, in the non-monetary sphere it is spreading out in new directions doing agency work for other Departments—finding out whether pensioners satisfy the retirement conditions, investigating needs for the welfare foods scheme, and so on. It is also continuing, where wanted, its welfare work among old-age pensioners whether receiving supplementary payments or not. From next July, too, it will take over from the local authorities the supplementation of benefits in respect of the sick and disabled and those pensioners who now fall outside its scope, and the payment of assistance

to those who fail to qualify for benefit in any form. There is also a possibility that if the cost of living rises further, the Assistance Board's scale rates will have to be revised upwards, which will mean not only that its supplementary payments in general will be larger than expected, but also that in particular many of its lost pensioners will return to its fold. The Assistance Board certainly has a future, and each succeeding report shows that its machinery is flexible enough for its new tasks. The great unsettled question is whether, in inheriting the ragtag and bobtail of the poor law, it will also inherit its stigma and unpopularity.

Shorter Notes

The chart below compares the weekly new notifications of infantile paralysis this year with notifications in 1938 and 1926—the only previous years, since notification became compulsory in 1912, when there has been a sizeable epidemic. This year's epidemic has been taken as starting in the twenty-second week of the year, that is, May 24th to 31st. It will be seen that in 1938

the first peak was reached in the thirty-second week (ending August 13) when 80 cases were notified. The final peak was not reached until the third week of October, when 85 cases were notified. In this year's epidemic, notifications in the week ended August 9th showed an increase of only 27 per cent over the previous week, whereas in each of the preceding four weeks the increase was about 50 per cent. It is thus possible that this year's peak is beginning to flatten out. It is worth pointing out in any year when the disease is more than usually prevalent, many mild cases are diagnosed which in normal years escape notice.

Certain changes in Whitehall have been made necessary by the creation of the two new Dominions of India and Pakistan. The appointment of Mr Arthur Henderson, formerly Parliamentary Under-Secretary of State for India, to be Minister of State in the newly established Commonwealth Relations Office, which is to take the place of the Dominions Office, was announced last Friday. The staff of the India Office will also be transferred to the Commonwealth Relations Office, which may well have to face some more difficult problems than did its predecessor.

Since the Soviet delegate has vetoed all action on Greece in the Security Council, the United States has asked the Secretary-General of the United Nations to place "Threats to the political independence and territorial integrity of Greece" on the agenda for the General Assembly.

As a result of the recommendations in the interim report of the Curtis committee, the Home Office has appointed a Central Training Council in Child Care. This council, the membership of which was announced last Saturday, is to arrange with some universities and local education authorities for facilities to train suitable women for work with children who have been deprived of a normal home life. There will be two courses of training, one for boarding-out officers, who should have high educational qualifications, to supervise children placed in foster homes, and one for house mothers in children's homes. Training is all very well, and a certain amount is probably necessary. But it is to be hoped that the course for house mothers in particular will be flexible enough and wide enough not to exclude women obviously suitable by temperament and inclination for looking after children, but who cannot master technicalities or pass examinations.

Letters to the Editor

The Economic Crisis

SIR,—I do not wish to engage in barren controversy, but I must insist that much of your comment to my letter in your issue of August 16th seems to be beside the point. I also had intended to refer to aggregate output, and not simply to that of manufacturing industry; I had not imagined that an economist would be accused of making so egregious a blunder as to confuse the two. Though some of my statements could be taken as referring solely to manufacturing industry, they are also applicable to the provision of services, where hours are also less than pre-war and productivity almost certainly lower. I can but repeat the implications of my essential statement; with employment in the aggregate (and not merely in manufacturing) only about 6 per cent above pre-war, shorter hours almost everywhere, and lower productivity in many major fields, where does an increase in aggregate output of from 10 to 20 per cent come from?

May I make three points on the details? First, I suggest that your argument based on an assumed rise in prices of more than 70 per cent is vitiated by the inadequacy of the national income at factor cost as a measure of output (there is, in fact, an element of circular reasoning in your statement), particularly in that it cannot allow for changes in quality, a matter of primary importance in circumstances in which services bulk so largely.

Secondly, you refer to the higher level of personal expenditure on consumers' goods and services (at 1938 market prices) in 1946 as compared with 1938. But the relevant figure is that for the National Cost of Personal Consumption; this is not given for 1946, but from the series (including that to which you refer) which are available in the National Income White Paper, it seems that it was still below that for 1938, and this was the basis of my (conservative) statement that we had in 1946 barely reached the standards of 1938, without making any allowance for deterioration in quality of goods and services.

Thirdly, though you "would not deny that standards of quality have deteriorated" you seem reluctant to recognise the effect of this. Thus, even the small excess of personal expenditure in 1946 over 1938 to which you refer more than disappears if a single correction is made for the additional water bought in the form of beer. Or, again, another item on which personal expenditure (at 1938 prices) has increased is "books, newspapers and magazines"—which must be only one example of a "higher output" obtained with fewer workers, engaged for shorter hours, and using smaller quantities of materials.

I leave on one side the ambiguities involved in the fact that the "too many services" which we are alleged to be producing are concentrated in the Armed Forces and Government Service. These points (which could be elaborated and extended) simply emphasise my contention that the figures of National Income and Expenditure are now poor guides either to output or to welfare. I maintain my original suggestion that output in the aggregate (if, indeed, any valid meaning can now be attached to this) is not in so healthy a state as you imply. As a regular reader of *The Economist*, I certainly would not accuse you of believing that the British economy is in a healthy condition; it is precisely because of this that I deplore what I believe to be the error which I have endeavoured to point out.—Yours faithfully,

S. R. DENNISON

Gonville and Caius College, Cambridge

SIR,—Surely Mr Dennison is right, and even ultra-cautious, in doubting your contention that there is nothing much wrong with "the aggregate output of the community." If statistical calculations, based on national income data, really suggest that our aggregate output is from 10 to 20 per cent higher than in 1938, that adds another to the many good reasons for distrusting the reliability of global calculations of this sort.

First, the figures on which they are based are inevitably of date. In this case they relate to 1946, when our productivity was less unsatisfactory than it has since become, though the conclusion which you draw is expressed in the present tense. Second, they entail a number of artificial assumptions, as, for example, that the incomes of a clerk in Whitehall engaged in administering controls and of another clerk employed in private business to wrestle with these controls are a fair measure of the contribution which they make to our "aggregate output." This may be what you have in mind in saying that our production is badly distributed, and that we have "too many services and too

few goods." But, as such services are not ends in themselves, it seems more to the point to say that the contention which you endorse is a statistical illusion.

Again, the deterioration in the quality of many of our goods and services is surely not to be dismissed as a trifle or treated as irrelevant to the question of the volume of output. The poorer average quality of our coal is equivalent to a decline in volume, and I would entreat you to remember this when you urge us to export 30 million tons out of an available 200 million tons of coal. In terms of tonnage that would no doubt "leave for home requirements 170 million tons against the pre-war inland consumption of about 180 million tons." But what would be the reduction in calorific value?—Yours faithfully,

5 South Parks Road, Oxford

HUBERT D. HENDERSON

SIR,—In commenting on Mr J. R. Hicks' letter in *The Economist* of August 16th you suggest that the "natural" level of the pound would be lower in terms of dollars, and that the time for devaluing it "may be approaching very fast."

Is not this a misreading of the circumstances? The pressure to buy dollars in the exchange markets of the world is due to an immediate need of resources, which only the United States can meet. It is possible to meet this pressure by raising the price of dollars. If the resulting high prices are a sufficient deterrent on imports and stimulus of exports, equilibrium may be attained. But high prices may be a very inadequate deterrent on imports, and the stimulus to exports is likely to result in sales below world prices. As Mr Hicks says, "devaluation would turn the terms of trade against us"; if the greater volume of exports yields reduced prices in terms of foreign money units, the total proceeds may actually be diminished. Even at the present dollar value of the pound, that has already occurred, as Mr Hill-Smith pointed out. The index of British imports has reached 265, that of exports only 221, of wages 167. There are limits to the disparity of wages and prices. Devaluation would be only too likely to defeat its purpose by accelerating the rise of the wage level.

We are not relying either on the high prices of imports or on the high profits of exports to secure equilibrium. We are restricting consumption by measures of austerity, and the limit on our exports is the amount of productive resources thereby released. That process is consistent with any rate of exchange which allows an adequate profit on exports.

The price level and wage level in the United States are rising, and have not reached their limit, and, so long as the pound is linked to the dollar, even at the existing rate, we shall participate in the progress of inflation there. What is needed is not a devaluation but an up-valuation of the pound. A time will come when the rise in the American price level is reversed, and the link of the pound with the dollar will mean participating in deflation. Then will come the clamour for devaluation, but devaluation will then mean the continuance of inflation and a further degradation of the pound.—Yours faithfully,

29 Argyll Road, W.8

R. G. HAWTREY.

"Keep Left"—But How?

SIR,—If the writer of the Notes of the Week looks again at *Hansard*, he will see that I used the word "rationalisation" and not "nationalisation," as he quotes me as saying. Subsequently, in the speech, I tried to make two suggestions: first, that the Government should take effective steps to rationalise British industry, and second, that it should give a lead in Paris for at least a European Customs Union with a common currency. The application of Socialist ideas referred to the first point, by which I meant that industry should be judged, not by the dividends it yields, but by the service it renders. We accept the nationalisation of 20 per cent of industry, provided steel is included; but we do want the remaining 80 per cent to be efficient and socially useful. (See "Keep Left," pages 22-26.) This means standardisation, mass production, and concentration of industry. Mr Kaldor has shown that the price of a wide range of consumers' goods were four times as high as they need be, if full advantage had been taken of the potentialities of standardised mass production. A foundry making ordinary cast-iron cisterns has twenty-three different patterns when one would do. Each local authority in the country requires a different type of bus, whereas if they were standardised the manufacturers could reduce their costs

considerably. The same argument applies to housing fixtures and in many types of engineering. In the building industry there are nearly 100,000 firms employing less than twenty people. The latest census of production shows that there were 30,000 firms having between them ten and a hundred workers covering about one-fifth of all factory workers and that, in addition, there were 130,000 firms in the factory trades who employed normally ten workers each. In agriculture the need is just as great. If a comparison is made with New Zealand, the production per man-hour there is probably five times greater than it is here. Over 80 per cent of the herds in New Zealand are machine milked, as against approximately 20 per cent in this country. We average about twenty cows per milker, as against fifty in New Zealand. One could go on indefinitely with examples of this kind, but perhaps the best over-all picture is that since 1938 the expenditure on capital equipment in American industry was £4,000 million, against Britain's £650 million.

The job of the Government is to take steps to reorganise the 80 per cent of British industry which is not being nationalised. This means the introduction of mass production, standardisation and much greater mechanisation. It means the Government making available capital, plant and equipment in order to increase production, and the placing of bulk orders so as to ensure continuity. It means, too, the reduction of the number of firms in each industry by concentration and amalgamations, and even the elimination of some industries which are not socially justified. Steps taken on these lines vigorously would probably indicate that we are not short of manpower, and would release over a period production sufficient for the home market and for the export trade as well. This is what we mean by a Socialist approach.—Yours faithfully,

R. W. G. MACKAY

House of Commons

[Nationalisation was a misprint, for which we apologise. Our comment was based on the assumption that Mr Mackay had said rationalisation.—EDITOR.]

What is Wrong with the Press?

SIR,—I have just seen your two articles on the Press on my return from abroad. As a journalist who held responsible positions during 24 years in Fleet Street, I feel that *The Economist* has not been as judiciously perceptive as usual on two points.

(1) You state in your own summary of your argument that much that is complained of in daily newspapers "arises from bad traditions, inadequate education and false values" (I entirely agree), but you add the words "among journalists," suggesting to me that this employed section of specialists in each producing unit in the industry imposes its personal crudities on a heart-broken and impotent management which has failed in its triple task of raising their bad traditions to its own good ones, of rewarding only the more educated of its employees, and of directing their energies to the pure values for which it is renowned. The unfair impression caused by your sweeping remark, which I cannot think represents your considered view, is not removed by your later true statement that "it is grossly unfair to assume that the only culprits are the proprietors or the shareholders."

(2) For these admitted evils you say "the remedy lies largely in their [the journalists'] hands." Any practical journalist would ask what precise remedy you think should begin to be applied tomorrow morning by the staff of the *Daily So-and-So*. Should the rank and file of its members hold a private meeting behind the backs of their proprietor and editor (who do not normally consult them on policy) and decide that as from sunset the bad traditions and false values for which the *Daily So-and-So* was distinguished would no longer be acceptable and must be abolished? And should the staff then notify the proprietor and editor of their decision? And what would the proprietor and editor do? Would they cry "Splendid! We have long wished for this day"?

My experience is that the consistent tone which distinguishes each newspaper represents the policy of its management to a close degree, and that managements are sensitive and resentful of employees attempting to discuss with them the "tone" of a paper's content and of its presentation. Unless, therefore, *The Economist* advocates the raising of newspaper standards by the action of revolutionary cells on the proprietors' premises, I fail to see what direct action journalists as a whole can take except to ventilate, at the annual national meeting of their trade union, their collective embarrassment at any false values which they think beset their calling. The individual rank-and-file journalist cannot influence the policy of his paper to any degree. He can merely, within the framework of its tone and policy, try to be an upright craftsman. I believe the great majority do so. The individual journalist who is a senior executive can do something to encourage personal standards of conduct, but it is often beyond his power to alter

the sillier traditions of a newspaper, and few men with children to educate can convince themselves that a one-man strike would achieve anything.

I deplore the misrepresentation which underlies your patriarchal picture of "the proprietors . . . dining of an evening" while, in their absence, the news is being mishandled in their offices by specialists who exemplify "the ignorance of the journalist." That picture is as naïve as your assurance that the National Union of Journalists has the right, the power or the organisation to interpose in offices to check policies of sensationalism and irresponsibility. Have you forgotten the *Daily Mail* machine-room unionists' attempt to influence policy the night before the General Strike? In practice the tone and policy in most big papers represent the collective prejudices of a group of perhaps a dozen people (directors, departmental heads and their deputies), including only one professional journalist the editor. The criticisms, comments and *obiter dicta* of this group form the determining pattern of policy. While your proprietor is dining your ignorant journalist makes up the front page, knowing what this group has commended and disliked in front-page headlines, pictures and treatment of news every day for the past year. If he does not closely read the minds of his masters he is rapidly displaced.

I am anxious not to make the proprietor or anyone else an easy scapegoat. Press responsibility is so complex that it can be explored only with tolerance, patience and insight. That is why I complain that your two generalisations about journalists are very unfair.—Yours faithfully,

ROBERT SINCLAIR

Garway, Quill Hall Lane, Amersham, Bucks

Conservatives in the Garden

SIR,—On behalf of the group of Conservative Members of Parliament responsible for the production of the pamphlet "Policy for British Horticulture," may we thank you for the generous mention you made of it in your "Notes of the Week," of August 9th, and at the same time comment upon a criticism you make of it. You chide us for not having dealt with the problems of Covent Garden, of distribution generally, and of the gap between growers' and retailers' prices. We refrained from doing so deliberately. As is made clear in the pamphlet, it is a survey of horticultural production. The group is now engaged upon an investigation of the whole problem of distribution and prices, which will be the subject of a separate and subsequent report. You state that the gap between growers' and retailers' prices is "not even mentioned," but may we draw your attention to lines 3 to 16 of page 16. You express disapproval of the Group's advocacy of greater

From *The Economist* of 1847

August 21, 1847.

THE great alterations made in our laws within a few years, which were by one party proclaimed to be in opposition to the Coronation Oath—the continual demands now made on Ministers for measures that are supposed to be beneficial, without any question of their being according to the Constitution—the continual promises made by them to introduce laws or carry out measures that were never heard of before, convince us that the general practices of Ministers are very much in conformity with Lord Palmerston's language. Instead of finding the rules for their conduct in the narrow principles of the Constitution or what our forefathers laid down as law, they really seek for truth and aim at doing justice. They have become philosophers, and philosophy is fast taking the place of the Constitution. To seek for truth and to do justice is to set aside or reform the law. Ministers, like other men, fail very often, and do not find what they seek, which is not surprising, considering how their time is occupied with official business . . . but, in the main, no longer confining themselves to old practices, they do what Lord Palmerston says they ought to do. The difference between former and present principles is very plain . . . it requires only a slight recollection of the past and an almost cursory observation of the present to acquire an immediate conviction that a most important change, amounting to a revolution, has taken place in the character of the Government. . . . Founded in conquest, maintained by constraint and coercion, relying on sharp laws and sharper swords to preserve obedience, it has gradually been changed, till it has become, unknowingly and unintentionally, an instrument for discovering truth, by "rubbing one man's opinions against another's," and doing abstract and perfect justice.

control over imports of fruit and vegetables, but we ask you to consider the practical results of the Ministry of Food's present policy. In the first ten days of the main Kent cherry season 2,800 tons of Italian cherries were dumped on to the London market, transport being diverted from Kent to Tilbury to carry them. The market for British plums has been spoilt by heavy importations of Italian plums. In the last fortnight of July very heavy arrivals of Dutch and Canary tomatoes left British growers without a market for their produce.

At the present time British cucumber growers are being told not to send their produce to market owing to its being glutted with heavy importations of Dutch produce. With a record crop of British apples cooking varieties are almost unsaleable, but Italian apple imports are permitted. This is the practical result of the alternative policy of not safeguarding the interests of the home-grower.

The disappearance of soft fruit from the shops the day after the imposition of price control was due to the Ministry of Food pre-empting supplies to the jam factories. It was the fault neither of the grower nor the retailer. Nearly a year ago our Group urged upon the Minister of Food the abandonment of pre-empting. This he has agreed to do as from the end of the present season. Incidentally he has also announced, yesterday, the restoration of a free market in fruit and vegetable retailing. Now anyone can become a greengrocer without a licence. This welcome recognition of the virtues and value of free competition is very relevant to our Group's present inquiry into marketing and retailing.

Yours faithfully,

ALAN LENNOX-BOYD
JOHN BAKER WHITE

The Security Council and Dependent Peoples

SIR,—A very significant, and from the point of view of colonial peoples, a very vital precedent was established by the Security Council on Tuesday, August 12th, when it decided to hear delegates of the Indonesian Republic in the present deadlock with Holland. I call this vital, because hitherto every effort had been made by the interested parties to put the machinery of Uno and the Security Council out of the reach of the Colonies and depen-

Books and Publications

The Value of Victorian Virtues

"La Répartition de la Population sur le Territoire Belge." By C. Mertens, S.J. Louvain. (Price not stated). 302 pages.

THE happy combination of Samuel Smiles and the Rochdale Pioneers which has put Belgium in the front rank of European reconstruction shows to advantage in Fr. Mertens. Taking the by no means inspiring subject—at least at first sight—of the geographical distribution of the population of Belgium, he has succeeded in fashioning from it an absorbing study of the economic, demographic and social anatomy of his country, rising at times to real eloquence. "Fascinated by progress, enterprising without rashness, wary without timidity, endowed with astonishing adaptability, but above all hard-working and tenacious"—ing Thucydides himself have done better as a panegyric on his fellow-countrymen? Inevitably there are weak patches. There would have been room for more statistical analysis; and on the policy side, in particular, Fr. Mertens might reasonably have gone a little further than his close knowledge of the Barlow Report has taken him. It is possible that his later visits to England may have provided him with ideas for a second edition. But, even on the side of policy, what he has to say is interesting and suggestive. Town planners should be specially interested in his justification of the "urban" pattern of Belgium as against the doctrine of the city wall and the clear division between town and country normally accepted here.

In a way, perhaps, the most interesting feature of his work is the outlook from which it is written. When faced with the horns of a dilemma, the tendency is for Protestants to ride off on one while Catholics seat themselves firmly on both. Fr. Mertens' outlook is Catholic enough, in every sense of the word, to include equal enthusiasm for the pioneers of Belgian big industry and the founders of the *Bœrenbond* and the *Jeunesse Agricole Chrétienne*. Perhaps he is sometimes a little biased on the bour-

dencies, and until Tuesday, this interpretation of the Charter had been tacitly accepted by all.

I may point out that when the suggestion to hear the Indonesians was made, Britain, France and Belgium, the only "colony" owners apart from Holland, voted against it, and in Britain very little publicity and discussion was given to the Security Council's decision either by the BBC or by the daily newspapers.

Nevertheless, the suggestion, which was carried, put a definitely new interpretation on the Charter, and marks a definite approach to the international status of colonies and dependencies. It is now established that in case of a clash, armed or unarmed, between a dependent people and their imperial power, the dependent peoples have a right to a hearing, by the Security Council—a change which I hope will engage the close scrutiny and attention of international students and colonial politicians.—Yours sincerely,

Hugh Stewart Hall, Nottingham

VICTOR OWUSU

Italy's Former Colonies

SIR,—Professor Bentwich has challenged a suggestion regarding the future of Italy's former Colonies, feeling that "some of the statements" (in Mr Cora's letter) "should be corrected in the interests of truth and justice." In doing so he has himself made statements that need correcting in the same interests.

He claims that "all the people of Eritrea are agreed that the Italian rule should not return in any form" and that "the Somalis had a positive hatred of their ex-masters." It must be emphasised that neither Professor Bentwich nor anybody else has any means of knowing what all the people of Eritrea desire. Nor can he utter on behalf of the Somalis. There is no means of knowing what these peoples want.

It seems that wide truths have been assumed from individual opinions. Some, but not all, Somalis evince dislike of Italians. Experienced observers on the spot maintain that the ruling antipathy of the Somali people is towards Ethiopia, to which, Professor Bentwich claims, they are "historically, ethnically and economically attached." On all counts this statement, at any rate as far as the Somalis are concerned, is grossly untrue.—Yours faithfully,

Political Invective

"Our New Masters." By Colm Brogan. Hollis and Carter. 223 pages. 8s. 6d.

"Most political invective derives not from personal emotion but from tactical necessities" wrote Hugh Kingsmill in the introduction to his anthology, "Invective and Abuse." To this rule Mr Brogan provides an exception. To write over 200 quarto pages of unremitting onslaught on the members of the present Government must require a degree of personal emotion; and from the tactical viewpoint it would surely have more effect if this mass

of material were sliced into small articles suitable for the pages of "Tory Challenge."

Mr Brogan works his way systematically through the Parliamentary Labour Party ("a feeble and querulous thing . . . corrupted by Continental Socialism and shallow internationalism"), from Mr Attlee, whose main crime, curiously enough, seems to have been his support of collective security, through Sir Stafford Cripps ("Sir Stafford is not right in the head"), Mr Shinwell ("really a very thoughtless man") and other Ministers, down to the back-benchers, "whose blank, uncomprehending faces speak of the emptiness of their souls." The more prominent features of the Labour landscape are carefully pointed out: the contraposition of Intellectuals and Trade-Unionists, of Mr Morrison and Mr Bevin, of class war and appeals for national unity. And, turning to the wider world, Mr Brogan finds time to explain the real significance of the division of Europe. "On the one side are solidifying the forces which accept Christian principles and profess faith in human responsibility and freedom. (These forces are known to the *News-Chronicle* as Reaction, for short.)" Is one to infer that the atheistic, totalitarian, malicious and irresponsible Labour Party depicted by Mr Brogan has its real habitat in Eastern Europe and not in Transport House?

The publisher's blurb quotes James Bridie in support of the claim that Mr Brogan is a satirist unrivalled for "urbane derision." That may well be; but this latest of his books makes no attempt at either satire or urbanity. It is humorous, but the humour springs from Thomas Carlyle, not from Voltaire. It is a vigorous, bludgeoning humour strongly reminiscent of Carlyle's judgments on his contemporaries. And, like Carlyle's unceasing condemnations, it is highly amusing at first; but it becomes intolerably tedious. If Mr Brogan really wants to damage our new masters, he would do well to study the technique of Mr Lytton Strachey.

A Marxist Prognosis

"The Coming Crisis." By Fritz Sternberg. Gollancz. 214 pages. 7s. 6d.

Year by year, in pious patience, vengeful Mrs Boffkin sits

Waiting for the Sleary babies to develop Sleary's fits. . . .

READERS of Kipling will remember that Sleary's fits were the product of Pears' shaving soap and of an understandable desire

to end his engagement to Minnie Boffkin. The crisis of 1929, for whose successor Mr Stalin and his supporters in all lands are waiting with equally pious patience, was unfortunately the genuine article. "The Coming Crisis" is quite the best full-length analysis which has yet appeared of the grounds on which Communist hopes, thinly disguised as disinterested fears, are based. The 1929 crisis was unlike all others in that it broke upon a world whose hitherto adequate safety valves—imperialist economic expansion, emigration to new countries, exploitation of an internal "frontier"—were no longer functioning and had, indeed, been permanently sealed down; and the difference was plainly shown in that there was no real recovery until war again temporarily resolved the capitalist dilemma. Nothing in that dilemma has changed; the safety valves have not been restored; ergo, the crisis must return. It will begin, as it began before, in America, whose productive capacity has been enormously increased, whose internal market is bound to be inadequate, and which cannot hope to find in the widest imaginable expansion of exports a means of disposing of its surplus. The likeliest American solution is a *Wehrwirtschaft* on the German model, diverting the surplus of productive power into warlike preparations; different in externals, since America is incurably civilian-minded and will glorify neither uniform nor war, but perfectly possible in essentials, in the guise of a multiplication of secret Oak Ridges and the like. The ensuing explosion of a would-be American *Blitzkrieg* against Russia would end civilisation.

The remedy lies in an American drive against native monopoly capitalism, beginning with a full employment policy which will shift the balance of class power; in a conviction among the American people that their technical and productive superiority does not carry with it any possibility of lightning victory, and/or of escape from the full horrors of any Third World War; in the end of American support for "foreign reactionaries" whose own policy spreads and intensifies crisis; in fact, in American acceptance of Socialism at home and abroad.

If allowance is made for that propensity to tactical oversimplification, *suppressio veri*, deliberate ambiguity, and slanderous imputation of motive, which is the moral occupational disease of most Marxist writers, this is a recognisable account of the past. If for the word "inevitable" one reads throughout "possible," it can even be taken seriously as a forecast of the future. But the proviso is important.

AMERICAN SURVEY

Marshalling Facts

(From Our US Editorial Staff)

WHEN, on June 22, President Truman simultaneously designated three separate committees to advise him on the domestic implications of the foreign aid programme, there were some who recalled the wartime adage that an executive order to do a job was nothing more than a licence to get into the fight to decide who was to do it. But in this case there are indications that an overall strategy lay behind the designations, and that care is being taken to avoid more than a minimum of duplication. Under the allocation of responsibility that has been worked out, the committee on national resources, headed by Mr Krug, the Secretary of the Interior, is making a series of industry studies: on steel, transportation equipment, metals other than steel, textiles and fibres, leather and leather goods, agricultural products, machinery and equipment, coal, petroleum, farm machinery, chemicals, wood and paper, rubber and its manufactures, metals and their manufactures exclusive of machinery and vehicles. These product analyses will serve as the basis of an overall report to be drafted by the Department of the Interior, with editorial help from representatives of a number of other Government agencies. In this summary, the manpower transportation and electric power resources of the United States will also be reviewed. The Council of Economic Advisers' report (prepared under Mr Paul Homan, chairman of its Foreign Aid Committee) will deal with the impact of foreign aid programmes on American resources and the domestic economy generally.

These two documents will be internal jobs by government agencies. The Committee of Nineteen under Mr Harriman, the Secretary of Commerce, will have its staff-work done in his Department, but its members are a cross-section of private citizens, ranging in origins from Massachusetts to California and in economic position over an area equally wide. The names of members of its main subcommittee, on economic and financial analysis, are illustrative: Mr Owen Young, chairman; Dr Harold Moulton, of Brookings Institution; Mr W. Randolph Burgess, of the National City Bank; Mr Paul G. Hoffman, of the Studebaker Corporation and of the Committee on Economic Development; Professors Calvin Hoover, of Duke, and Edward Mason, of Harvard. The industry reports of the Krug Committee will serve as documentation for the Nineteen's other subcommittees, on capital and durable goods, consumer goods, food resources, manpower, mineral resources and transportation. Mr Robert M. La Follette, former Progressive Senator from Wisconsin, is chairman of the Harriman drafting committee. It is anticipated that his report, in addition to estimating the range of assistance possible, will be a policy proposal, saying what, in the Committee's view, would be a wise programme of foreign aid, in view of the political situation in the United States as well as of its economic capacities, of the political and economic situations elsewhere, and of prospective results of the aid programme beyond the immediate period of rehabilitation.

At first sight, this structure exhibits some of the massive fumbling of a glacier. But it has direction. At the technical level, the staffs of the various agencies concerned—and the staff were in Washington in war agencies and knew each other then. The same is true of many of the members of the Committee of Nineteen. Beneath the external proliferation there is considerable unity.

The glacier's untidy landscape, moreover, has great political advantage. There is strength in the demonstrable Republican-

ism of some of the Nineteen, and in the demonstrable relation of many of them to the pressure groups likely to be potent when the aid programme is voted on. Provision is even being made for getting the views of some groups—the farm organisations, for instance—that are not directly represented. The United States is a big country; support has to be accumulated in many places.

And if there is positive strength in assembling ideas from many sources, there is also negative strength in not providing a single target for attack, particularly in view of what the target would have been. The Departments of Commerce and the Interior are logical places to get advice on a matter which after all is of great concern to the domestic economy; the State Department's striped trousers are a standing temptation to an irreverent people. The attitude of the State Department towards the present arrangements indicates foresight rather than slight.

In the schedule of the glacier, September is the critical month. October 1st is the present deadline for the Committee of Nineteen's report. But there are two other glaciers in the neighbourhood whose grindings must also be considered. One of these is centred in Paris; a statement of American capacities would come more appropriately after a statement of requirements.

The other is the bipartisan Select Committee on Foreign Aid, also of nineteen members, appointed by the Speaker of the House of Representatives in the last days of the Congressional session. A resolution for such a committee was submitted by Congressman Herter of Massachusetts last April, and while Mr Eaton of the Foreign Affairs Committee is the nominal chairman, Mr Herter will act as executive. This committee sails for Europe in a body on August 27th; after consultation on board it will divide into subcommittees for investigations to last some five weeks, with return reservations on October 4th. Three general consultants have been appointed, comparable to the Harriman Committee members: Messrs Allen Dulles, John Hancock, and Julius Klein. An unsettled question is whether the Harriman Committee shall withhold its report until after conversations with the returning Congressmen, or greet them with the document as they dock.

Among the political-economic factors on the agenda of the various groups, the most potent is likely to be the direction that the curve of foreign trade is taking in October. In June, US exports showed a decline to \$1,242 million, or 13 per cent below the post-war high of \$1,422 million in May. Commercial exports accounted for \$1,201.6 million of the June total, and were down 12 per cent from the previous month. While June exports included no shipments under post-Unrra relief and only \$20,000 of Greek-Turkish aid, these figures draw attention to the fact stressed in the mid-year report of the Council of Economic Advisers, but not yet absorbed by the country, that overseas requirements, the Marshall plan included, are very

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. likely to be less in the immediate future than they have been lately. The Krug subcommittees' instructions include the assumption of continued high-level production, but other possibilities may be included in the agenda somewhere along the line.

A slackening of economic pace might make a real difference in the availability even of some of the tightest items—turbo-electric generating equipment, for instance—for which contracts now cover all American capacity for several years ahead. Under such circumstances, allocations might be worked out quietly on a voluntary basis: in the machinery category the number of companies concerned is not very large—three each in mining equipment, electric equipment, and locomotives, though to find a freight car to attach to the locomotive is a different matter.

When it comes to agricultural products, indeed, the shoe is on the other foot. The line from the Southern folksong, "By an' by hard times comes a-knockin' at the door" is already in the minds of the tobacco farmers of Virginia and North Carolina; there is even speculation on the merits of a 10-year bilateral agreement with Britain which would assure supplies free for two years in return for a guaranteed market, at a given percentage of "parity," for the next eight. The course of this trial balloon shows which way the wind is blowing in quarters hitherto strong in support of free trade. Officials of the State Department, hearing these rumours, now must remember rather bleakly the testimony they gave to Congress last winter in favour of the International Trade Organisation and the full rigours of multilateralism.

American Notes

Moral Suasion Fails

Faced with a more or less general disposition to ignore Presidential warnings on price dangers, and with new price increases in farm products, foodstuffs, coal, steel and automobiles, the Administration last week decided that moral suasion is no longer quite enough. The gentle urgency of Presidential denunciations has been replaced by a declaration from the Department of Justice that a nation-wide investigation will shortly cover food, clothing and housing costs, and that "where criminal conspiracies are found to blame for high prices, prosecutions will be started." Determination of guilt, declared Mr Tom Clark, the Attorney-General, must now be followed by gaol sentences for "all individual profiteers, and top fines for all corporations."

At a subsequent conference, Mr Truman admitted somewhat ruefully that he did not expect the investigation to "force down prices," but that it would expose those who were charging prices higher than is warranted. In fact, the investigation, which represents little more than an extension of recent endeavours by the Federal Trade Commission to check "price maintenance" in the retail field, is in itself a confession of the impotence of government, and is probably intended to provide a reasonable answer by the executive branch to any charges which may follow from the Congressional price investigations to begin this autumn, with Senator Taft in control, as chairman of the Congressional Economic Committee.

The new drive opened this week with a fanfare of publicity, and the first specific charge in the new anti-trust campaign. The Federal Trade Commission has given notice that almost the entire steel industry must answer the accusation that twenty-six corporations have for many years "collectively composed, published, and announced prices in a wrongful and unlawful manner." The FTC has extremely wide power of investigation and can issue "cease and desist orders" whenever it decides that company procedure violates the Anti-trust Laws. It can also avoid protracted court procedure and thus quicken the pace of anti-trust action. But its record does not suggest an efficient administrative

body (largely for reasons beyond its own control) and it has certainly proved in the past to be incapable of continuing control over those industries which have been judged to be offenders under the Sherman and related Acts.

Meanwhile, wholesale prices touched a new peak this month, with the Bureau of Labour Index (1926) at 151, against 141 in December, and with the cost-of-living index (1935-39) at a new high point of 157 in June, against 153 in December. The collapse so frequently and so long forecast will certainly not arrive in time to ease dollar shortages abroad, and will certainly not be hastened by the investigations now under way.

Wage Rate Peaks

Against this background wage rates are still rising to new peaks wherever organised labour can find a clause in a wage contract sufficiently broad to allow "re-negotiation." And on the latest evidence President Truman is still backing the claims of the unions to enjoy fresh wage advances without price disturbances. Spokesmen for the American Federation of Labour declared recently that a general process of wage revision must come about unless industry agreed to voluntary price reductions, and this cry has been taken up by representatives of the Congress of Industrial Organisations. Some of the CIO unions are going as far as to suggest that Congress should be brought back in special session for the reimposition of price controls.

The movement of wage rates and weekly earnings since 1939 makes very interesting reading. Those tabulated below refer only to selected manufacturing industries. Farm workers have secured even greater gains, the July average of daily rates (without board) being \$5.17, an increase of more than 300 per cent from 1940:

	INDUSTRIAL HOURLY EARNINGS		
	Durable Goods Industries	Non-Durable Goods Industries	Average
1939.....	\$ 0.698	\$ 0.582	\$ 0.633
1946.....	1.156	1.012	1.084
1946, December.....	1.216	1.077	1.148
1947, June.....	1.294	1.138	1.220

For all manufacturing industry in 1939, the gross weekly wage was \$23.86. By 1944, the weekly average had risen to just beyond \$46, declining to below \$44 over 1946, and rising to the new peak of just below \$49 in June last. In fact, of course, organised labour, generally, has held no more than a very modest share, in terms of real wages of this nominal increase. The Department of Labour estimated recently that May earnings of \$48.46 were equivalent, after tax deductions, to no more than \$26.46 in terms of 1939 prices to a single worker and to less than \$30 for a worker married and with two children. These figures, moreover, do not reveal the extent to which the highly organised and aggressive unions have been able to secure advantages at the expense of those less favourably placed. Since the collapse of price control last autumn the purchasing power of many millions of lower-grade workers must have suffered severely.

President Truman's mid-year report to Congress repeated his earlier request, made last January, for a revision of social security benefits and for an increase in the minimum wage level of 40 cents an hour for industrial workers engaged in interstate commerce. The President then declared that the existing minimum (authorised by the Fair Labour Standards Act) was equivalent to no more than 25 cents an hour in terms of pre-war prices. Many attempts were made during the past session of Congress to revise this minimum to at least 60 cents; one group of New Deal Democrats attempted to secure a minimum level of 75 cents by 1949, but the move was finally blocked by the majority party largely because, if there is to be a revision, it had clearly better be done in election year.

Inquisition by Committee

The notoriety which attended, and the collapse which has followed, the Ferguson-Brewster investigation into the wartime airplane contracts awarded to Mr Howard Hughes and Mr Henry Kaiser has provided a healthy warning to other probing legislators. Not even the midget dumped in Mr J. P. Morgan's lap during an investigation into investment banking in 1933 exceeded the irrelevance of most of the testimony in this inquiry. What might have been a serious investigation into contract awards degenerated rapidly into the public laundezing of highly dubious expense

accounts. But what chiefly contributed to the discomfiture of the investigators, and the speedy adjournment of the hearings, was the fact that the Senators who went fishing for minnows found they had caught two fish with much more fight in them, Mr Hughes and Mr Elliot Roosevelt. Congress, in search of the raw material of legislation, enjoys virtually unlimited powers of investigation. Committee hearings suffer no hindrance from the safeguards which characterise judicial procedure, and this guerilla warfare has usually been at the expense of the witnesses. But this time it was the investigators who fled before Mr Hughes' aggressive countercharge that Senator Brewster had offered to call off the hearings in return for the acquiescence of Transcontinental and Western Airlines in the formation of a proposed monopoly for overseas operations.

The short-term effect of the extravaganza was to divert public attention from the mounting crisis in Europe and to spread a non-partisan smear over witnesses and investigators alike, as well as a number of government officials. Over a longer period, however, a useful purpose may be served if it induces, either by changes in the law, or purely by the force of horrid example, more self-discipline on the part of investigating committees. The committee probe is, by its very nature, a focus of controversy, and many observers doubt whether the compulsory powers enjoyed by Congressional committees can be curtailed without impairing their usefulness. But one reform very widely supported is that the power to investigate should be limited to those standing committees which also write the laws; that muck-raking for its own sweet sake should end. The Legislative Reorganisation Act passed last year originally contained a prohibition of special committees like the War Investigating Committee under whose auspices the Hughes inquiry took place. This was sacrificed to secure the agreement of the House, and has been disregarded in fact; but a limitation of inquisitorial powers to permanent committees might raise the standards of hearings.

Newsprint Prospect

The newsprint "famine" in the United States has in the last few months produced a special survey by the Tariff Commission, an independent inquiry by a Congressional committee, and another investigation by a Federal grand jury on behalf of the Anti-trust division of the Department of Justice. The judicial investigation, designed to sift the evidence supporting recent charges of collusion between large publishing groups and mill-owners, at the expense of smaller units in the trade, will presumably continue for some time. The Tariff Commission and a House Committee have meanwhile established the fact that a very determined effort will be needed to expand newsprint supplies in North America, although domestic output of all grades of paper and paper-board has recently established a record annual rate of 21 million tons—very nearly double the 1929 boom rate.

The Tariff Commission survey gives the following picture:—

	Newsprint output, consumption and imports.		
	Consumption	Domestic output	Imports
1929	3.8	1.4	2.4
1939	3.5	0.9	2.6
1944	3.1	0.7	2.4
1946	4.3	0.8	3.5

Canadian newsprint capacity is now about 4,300,000 tons. Capacity in the United States in 1947 is estimated at 850,000 tons, with consumption still expanding slowly at 4,400,000. The Commission takes a sober view of the possibilities of any expansion in US production because domestic costs are relatively high and are still rising; suitable pulpwood supplies are fast diminishing, and other grades of paper offer more attractive price margins for the mills (largely because of protective duties). In the South, where raw materials are in fairly good supply, it is held that "the limits of expansion" are probably within the range of 150,000 to 200,000 tons yearly.

As for so many other materials, the United States is thus now turning to Alaska for an expansion in supply. Here, possible output, on an entirely economic basis, is put as high as 1,000,000 tons yearly, but in order to secure this, it will be necessary to develop power sites, logging equipment and mills, a task that will probably take two years and cost more than \$100 million. Development has been complicated by Indian tribal claims which were recently shelved by Congress. So far, American industry has not shown any great enthusiasm for development in this region, while expansion in Canada has been delayed by memories

of the drastic slump in newsprint prices which followed from the 1920 boom. The survey by the House Committee, only summarised versions of which are available on this side of the Atlantic, seems to have followed from a far less detailed investigation. It declares, for example, that the South could support a newsprint industry with an annual capacity of 1,500,000 to 2,000,000 tons "with proper reforestation," but it does not, apparently, outline such a programme, which would certainly entail a considerable amount of Federal support.

Newspaper publishers here can only sigh for a sight of the "stringency" that afflicts their American colleagues. In 1946, US daily newspapers had a combined daily circulation of fifty million copies, averaging 22 pages, although postwar stress found its reflection in a fall of 20 pages in the average size of Sunday editions, which are now a mere 70 pages.

Westward Ho!

The westward stream of migration, which dropped to a trickle with the closing of the frontier and the end of free land in 1890, reappeared during the war years. Census figures just published show that between 1940 and 1946 California, Oregon and Washington, on the Pacific Coast, gained 3,481,000 inhabitants an increase of 33.9 per cent. The rate of increase for the other 45 states was only 3 per cent. In spite of a natural net increase in the nation between 1940 and 1946 of over 9,000,000, 17 states showed absolute drops in population, and 12 other states kept their total constant only by very narrow margins.

In these 29 states there was a net outward movement of 4.5 million. There was a call from both coasts; it was the inland states—the Dakotas, the mountain states, the South—which suffered the heaviest losses. The eastern seaboard managed to do a little better than hold its own. A century after the Gold Rush of 1848, California is once more the new frontier; that state led the list with a population increase of 2,485,000, an increase of 36.2 per cent. The lure of gold was replaced by that of the war industries and the golden climate of California. How permanent this movement may prove to be is another matter, but as yet there is no pronounced exodus.

The figures for California lend a peculiar interest to the reported determination of the Democratic National Committee to stage next year's Presidential Convention in Los Angeles or San Francisco. California, already third in population after New York and Pennsylvania, has 25 electoral votes. It will have more in 1950 when there is a new distribution of votes. California played a critical role in the Wilson election in 1916 and in nominating President Roosevelt in 1932. All the omens are that its influence will continue to grow. What the influence will be, in national politics, of a state in which the party boundaries are so lightly treated, and nonsense of all kinds so highly esteemed as they are in California, is incalculable. It explains, however, the desperate efforts that have been made to quench the Wallace boom in California and bring the Democratic Party into line in that state.

Shorter Notes

A crushing blow was dealt last week to hopes of an effective third party led by Mr Wallace, when Senator Pepper—"Red" Pepper to his enemies—came out loud and strong in favour of another term for President Truman. Senator Pepper is the staunchest New Dealer and the most congenial ally Mr Wallace possesses in the Senate. His intention to remain loyal to his party will strengthen the Democrats' appeal to labour as much as it weakens Mr Wallace's proposed bolt.

President Truman has appointed three new members to the National Labour Relations Board which, under the new Labour Act, has specific authority to regulate "unfair labour practices." The new members are: Mr. Robert Denham, a conservative-Democrat lawyer, who will be general counsel to the Board; Mr Abe Murdock, a former Utah Senator and New Deal advocate, and Mr J. Copeland Gray, who has gained an extensive experience of labour problems on the Wage Stabilisation Board and the Regional War Labour Board. Mr Gray's political colour has been determined as "liberal-Republican." The Senate gave a somewhat grudging approval to these appointments before adjournment, but through pressure of time, neglected to give formal confirmation. The three nominees will serve by interim appointment until January next. A more widely welcomed appointment is that of Mr Cyrus Ching as head of the now autonomous Federal Mediation and Conciliation Service.

THE WORLD OVERSEAS

M. Ramadier's Cleft Stick

(From Our Paris Correspondent)

A GREAT deal of criticism has been levelled, some of it with excellent reason, at the integrity and wisdom of certain important sections of the French Socialist Party. Nevertheless, in fairness it must be admitted that at their thirty-ninth annual congress, which took place at Lyons last week-end, they were certainly caught between the devil and the deep blue sea.

The fundamental issue lay between the "participationists" and the "anti-participationists." If the Socialists leave the Government today the two surviving partners of the coalition—the Radicals and the MRP—will cease to command a majority, the parliamentary machine will be paralysed, the new constitution further discredited, and "*La république en danger*" will become something more than a melodramatic party slogan. French instability and political confusion, already all too apparent to the fifteen other partners at the Marshall talks and to the "observers" from the International Bank (who are over here looking into France's claims for another emergency \$250 million loan) will be blared out in headlines from Washington to Moscow. In the ensuing confusion the Communists may well manoeuvre themselves back into office and eliminate France as an effective partner in the Marshall planning. These arguments are telling enough even in the mouths of Socialist leaders who have jobs, and not unnaturally want to keep them.

The second alternative is scarcely more appealing: it means conciliating the two partners on the Right. In practice this involves the abandonment of the Socialist policy for tighter economic controls and more severe rationing and food collecting, for a new fiscal policy and for colonial reforms which imply a greater degree of autonomy for the native populations and less protection for the European minorities than the other two parties could be induced to sanction. "What is the sense of our party staying in office to carry out a policy exactly the reverse of its own?" is a question which is being asked by a great many Socialists who are neither "cryptos" nor fools, nor necessarily vote cadgers.

The Congress Evades the Issue

The Socialist dilemma is plainly one of expediency rather than principle. They must weigh up the disadvantages of two displeasing but inevitable alternatives. The one thing they cannot do is to elaborate a policy and impose it on the country, since that would need more than the backing of a quarter of the electorate and a diminishing voting strength.

The Socialist Annual Congress characteristically evaded this choice between evils. It contented itself with dragging out the crisis which keeps on, almost—but not quite—demolishing the coalition, and has already quite demolished public respect for the Government's authority. Before the Congress dispersed, it had voted resolutions, firstly, to authorise M. Ramadier to stay in office; secondly, to command him to follow a policy which would make this impossible. In his few months of office M. Ramadier has earned a reputation for conciliation and reconciliation which has sometimes approached the miraculous, and this time he will certainly need all his talents. The immediate issue will be the Statute of Algeria, which comes back before the Assembly this week and the Socialist bill for strengthening governmental authority to tighten food distribution. Tempers are frayed, and this interminable session is not made less exasperating by the tropical heat. Moods, especially of French politicians, are unpredictable and much will depend on moods.

If the Socialist deputies follow party orders to the letter and refuse to conform to the well-developed precedents for political haggling in the lobbies of the Chamber, it is quite possible that they may find the Prime Minister, M. Ramadier, has once again left the fold. M. Ramadier has a long experience of recalcitrance to party orders, and he is reported not only to have passed many years outside the party, but, when in, to have been brought before the Party's disciplinary council no less than 29 times. He is con-

vinced that it is his duty and privilege to show that France can be governed in defiance of the Communists, and would be very adverse to a forced retirement.

Danger of a Split

A split in the French Socialist party would be deplorable from the European point of view, and would very gravely prejudice what chances France still has of achieving stable government within what the West understands by a democratic framework. It is to be hoped that the French Socialists will profit from the sad examples of division and downfall of their comrades in Italy and Eastern Europe. Three forces may keep the party and Government from disintegrating: the great personal influence of Paul Ramadier's principal adviser, chief of the "participationists" and still by far the best beloved of the party leaders, Léon Blum; secondly, a joint desire to make the best of the Marshall offer, which may keep both the coalition and the Socialists from disintegrating, at least while the Paris conference continues; finally—strongest of all cohesive forces—the hostility inspired by jealousy, suspicion, fear or plain exasperation, felt by almost the whole Socialist party towards the Communists. This was the dominant characteristic of the Lyons Congress. It was evident not only in the outspoken words of the Prime Minister, but in the general tone of the debates. The Socialists have certainly moved a very long way since their last year's Congress, when a substantial section of the party was still advocating "*l'unité d'action ouvrier*."

Whatever the Socialists should and could do in their unhappy predicament, one thing is certain: their Congress did nothing either to enhance their own prestige or to strengthen France's wavering faith in the value of the party system and parliamentary government in general. After prolonged debates only a week ago the theoretically sovereign Assembly twice voted confidence in the Government. The party Congress, which represents about 1 per cent of the electorate (party membership is about 300,000), was then able to decide whether or not it chose to overrule and reverse the decision of parliament. Thus it did no good either to the Government, or to the Assembly or to itself.

Economics of Franco's Spain—II

The Poverty of the People

By A SPECIAL CORRESPONDENT

THE disparity between the standards of rich and poor, always a striking feature of Spain, is on the increase. Ever since the civil war there has been a steady tendency to inflation. During 1946 it got well out of hand, causing a great stock-exchange boom and heavy sacrifices by the fixed-income classes, in which under a dictatorship the workers are included. Largely, as the Bank of Spain's report for the year shows, this can be attributed to heavy calls on the capital market and especially to government borrowing. But the rise in prices caused by the disastrous 1945 harvest and the subsequent growth of the black market are other factors, while much of the boom in variable-interest securities was due to a rush to convert money into the apparently safer form of industrial and real estate shares.

At first the government found it convenient to take the line of justifying the inflation; "Hispanicus," the economic journalist who is popularly supposed to be Franco himself, quoted the standard arguments about inflation's stimulating effects. More recently, however, the tendency has been to pretend that it is not taking place, to censor the evidence and to avoid the use of the word itself. The government is trying to restore control, increasing taxation and cutting down borrowing. With various transitory factors to help it—the temporary exhaustion of the demand for

capital after the spate of new capital issues in December, the withdrawal by the syndicates of large deposits in order to pay for the first instalment of Argentine imports, and its own selling of 400 million pesetas' worth of shares in the Telephone Company—it was able at the beginning of this year to check the rise both in food prices and in the note circulation. Nevertheless, there is no sign of any reduction in government expenditure; industrial and raw-material prices were still rising at the beginning of the year; the note circulation is rising again, and it will not be possible to say whether the inflation has really been mastered until after the usual heavy autumn demands for agricultural credit have taken effect. The government is nervous about the psychological repercussions of raising the fiduciary issue—at present limited to 23 billion pesetas—but it seems unlikely that it can avoid this step.

The Cost of Franco's Bodyguard

The Ministry of Finance is not above practising a certain amount of deception. Instead of a cut of 144 million pesetas in the army estimates, as announced by the Minister, who added last year's extraordinary expenditure to the actual budget figure in making this calculation, there has been an increase this year of 775 million pesetas, or over a third. An ingenious trick, too, was used two years back in order to conceal the increase in expenditure: the prizes awarded in the State lottery were removed from the expenditure side and transferred to Revenue as a deduction from lottery receipts. And the Falangist party, which seemed to drop out of the budget after 1945, just as it seemed to drop out of politics, has in fact been smuggled in under the (largely clerical) skirts of the Ministry of Education, which now pays for the greater part of its activities—198 million pesetas this year against an official budget for the Falange of only 36 million. It is not surprising therefore that the full budget, in which alone these deceptions are apparent, is not available to the public. With it one can discover other interesting facts; for example, the annual expenditure for Franco's bodyguard is 16 million pesetas this year—which is equivalent to fifty times the grant to the Prado or over a sixth of the annual budget of the Ministry of Agriculture, and is some measure of the value placed by the Spanish government on the superficialities as opposed to the realities of prosperity. This can be further confirmed by anyone who saw the show put on for Señora Perón or who visits the newer government offices.

Paying for Protection

Though many of Spain's problems are inevitable, the great proportion of the state's expenditure (48 per cent of the 1947 budget), devoted to armed forces, civil guard, *Seguridad* and *Falange*, is a specific feature of the present regime. Hitherto it has been able to finance such heavy unproductive expenditure by large-scale borrowing and the introduction of extraordinary estimates, almost entirely devoted to the armed forces, to supplement the main budget, compelling the banks to subscribe to its loans. But besides its contribution to the inflation all this waste of money is beginning to have another effect: the banks are returning their government stocks to the Bank of Spain (especially the 2½ per cent Treasury bonds) as security for loans, so that to an increasing extent it is the latter from whom the government is really borrowing. Yet it cannot easily cut down. Whether or no the government is really frightened by the foreign bogies which it conjures up for the benefit of the public, it must for consistency's sake keep up the appearance of facing an outside threat. Moreover, it would be politically disastrous for it to harm the interests of the 25,000 regular army officers whose pay in 1946 cost the taxpayer more than did either housing or social insurance. Nor could it possibly cut down on the 92,000 police unless it were in a stronger position than at present.

The food shortage and the lack of raw materials have severely affected the living conditions of the middle and working-class Spaniard in the towns, and the landless labourer. Though the situation is in some ways much better than last summer, when the effects of the 1945 drought were still being felt, there is no sign of permanent improvement. Wages, tightly controlled, have been unable to follow prices upward, with the result that even in 1945, before the inflation had taken effect, the official index showed real wages for men as 30-50 per cent below the 1936 level (allowing for Sunday pay). Nor does the Spanish insurance system pay large enough benefits to affect this greatly. Payment for holidays and Sundays brings a worker's basic wage up by roughly a quarter, and then the Insurance Institute pays a fixed scale, irrespective of the basic wage-rate, for children under 14, which may be supplemented by pooling schemes run within the individual firm. But the rates are low. The average insured worker with a family in 1946 was drawing 2.16 pesetas a day under

the various provisions of the family allowance scheme, and although women's pay has increased more than men's it seems unlikely that there is to-day any working-class family in Spain which is better off in terms of real wages than it would have been in 1936.

Rations in Town and Country

During 1946 the official cost of living index rose by a third and the food index by over 40 per cent, with the wholesale black-market food index, as calculated by the LAFICO economic newsletter (Madrid), rising by 56 per cent. And though the rations have improved since last summer they are still startlingly low. There are endless local variations and no consistent policy other than for bread, so that only random examples can be given: e.g., a month's rations in Seville this spring comprised a litre of oil, 500 grammes of sugar, 300 each of rice and dried cod, 700 of beans, 200 of soap and 50 of coffee; and in Jerez a litre of oil, 500 grammes of beans, 300 each of sugar and cod, 200 of rice and 100 each of soap and vermicelli, all at controlled prices, which, though low, are not low enough to prevent some people from being unable to buy their whole ration. In villages the situation is worse. Whether through inefficiency or on the assumption that the peasants have their own source of supply, rations are announced which are not in fact available in the shops, and even the bread ration is not always honoured. All Spaniards are driven to the black market, whether as buyers, or sellers, or both, and the outward evidence of misery is obvious enough.

It is not only the workers who are driven to dishonesty by the need to use the black market. One of the chief causes of the petty racketeering by minor officials and of the deals in army rations is the low pay of junior officers and the bottom grades of the civil service. The evils of the situation are cumulative, and the black market, whose chief stimulus was the unusually bad harvest of 1945, is now so firmly rooted that even the record olive crop of last year could not shake it. Allowing for exports, 37 per cent more oil than the 1931-35 average was produced for home consumption. But it is still rationed, and sold on the black market in Seville, the centre of the olive area, at two and a half to three times the controlled price. Average exports in 1939-43 were less than half those of 1931-35, and they have since dropped even further. Moreover, all exports through the port of Seville in 1946 were compensated by imports of soya oil, and as this is not available in the shops as such it is fair to assume that it is mixed in with the ordinary oil ration. With neither agricultural difficulties nor foreign trade restricting the quantity available for consumption the shortage is a great tribute to the power of the black market. Such conditions exaggerate the effects of the fundamental difficulties and keep the cost of living artificially high.

Need for New Houses

The housing situation, too, is extremely unfavourable. The great shortage of building materials, in which there is, of course, an active black market, the growth of speculative building and the lack of any firm central policy has meant that the number of new dwellings offered at reasonable rents is very low indeed. The Banco Urquijo in its report for 1946, calculates that there was a shortage of 500,000 dwellings in January, 1946. To keep pace with the growth of the population 62,500 additional dwellings a year are needed, quite apart from the replacement of the 30 per cent of existing dwellings which are officially condemned. But the building actually undertaken bears no relation to the needs. Only 24,000 new dwellings were authorised by the *Fiscalia Superior de la Vivienda* in 1945, and, though probably about 10 per cent more were authorised last year, too many builders apply for licences without ever intending to carry them out in order to get the materials to make it likely that anything like those numbers were built—roughly one-third of the dwellings authorised in 1945 were completed during the year. All this means that overcrowding continues—even the casual visitor can find in Madrid a family of eight living in one room, or in Seville eighteen families in a small tenement sharing a single kitchen and a blocked-up lavatory. Unless the state is able to introduce a drastic and undoubtedly very expensive plan conditions will get worse rather than better.

Yet complacency seems to be the order of the day. "Such is the extent," says the "Spanish Newsreel," the official propaganda sheet in English, "of the work done by the National Housing Institute and other similar institutions, that it is impossible to do it justice. It may well stand as an example to those who wish to judge our regime by the work which has been accomplished during its term of existence." In Spain, one must realise, there are depths of silliness as well as of misery, which are difficult to imagine from this side of the Pyrenean Iron Curtain.

West Indian Conflicts

[BY A CORRESPONDENT]

THE Report of West Indies Development and Welfare for 1945-46, prepared by Sir John Macpherson (who succeeded Sir Frank Stockdale as Comptroller in 1945), contains little that is new. Most of the facts and arguments about the West Indies which it sets out are already familiar to those who have attempted a critical appreciation of Sir Frank Stockdale's two preceding Reports, and the distressing picture of the future prospects of the West Indian Colonies which has already been drawn will hardly be dispelled by the plain and unvarnished story of two more years of administrative work which Sir John Macpherson tells.

In some ways, however, the present Report may be thought to mark the end of an epoch in West Indian affairs. The "development and welfare" approach to economic, social, and political problems has failed so obviously that even the most reluctant will be driven to think a little about the way things are drifting, and of the direction that long-term trends are taking. Hitherto, for instance, the classic example of the clash between economic realities and starry-eyed idealism has been in the field of education. The application of this argument is greatly widened in the present Report; several other examples of the operation of the limiting economic factors are now presented to the public for the first time. The most striking of these is given in the section of the Report dealing with Town Planning and Housing Schemes, from which it appears that it has only been possible to allocate the trifling sum of £42,000 for housing in the draft development plan proposed by the Government of the Leeward Islands. It is nevertheless pointed out that the cost of carrying out a single scheme involving the moving of 187 families from one of the worst slum areas in the capital town of one of the three Presidencies of the Colony would absorb nearly half this sum, which is all that will be available during the next ten years for all housing schemes, rural as well as urban. The general conclusion is that "the housing problem in the West Indies cannot be solved by subsidies under the Colonial Development and Welfare Acts of 1940 and 1945."

This may be taken as a pretty fair random sample, as well as a useful illustration of the situation which confronts the administrator in one way or another over and over again in the daily run of the official mill, and the obvious conclusions can be shirked no longer. Although the intellectual discomforts which this process has created have not hitherto led to direct changes in official policy, there has nevertheless been a tendency for "welfare" to be allowed to recede into the background, and for "development" to become the primary aim and objective of public administration. This becomes explicit in the Housing section of the report, where Development and Welfare policy is defined anew as aiming at "concentration of capital expenditure on development projects calculated to raise the general standard of living." The emphasis lies on "welfare through development."

No New Policy

This being so, it might therefore be expected that the beginnings might be seen in the present Report of a new policy and a new programme. But this is not the case; all that there is of fresh argument may be described as a simple reaction from the present situation. The truth is that the politician still calls for "welfare," whilst the official planner is beginning to call for "development." The outcome of this clash is a dangerous state of drift that will continue until a constructive policy is adopted in which "welfare" is utilised as the force energising the "development" programme. That there is little chance that anything like this will emerge from the administrative machine as now constituted, however, is obvious from the fact that the grants under the Act of 1945 are administered on an "overall" basis; that is to say, certain total sums have been made available to each Colony to finance development schemes gathered together in so-called "Sketch Plans" applicable to a period of ten years. This has had the consequence in the first place of intensifying inter-departmental rivalries. Secondly, and still more important, as the allocation of the sums between services has been left to the individual Colonies preparing the Sketch Plans the initiative in matters of development and welfare has passed from West Indies Development and Welfare to the Colonial Governments, and the effectiveness of that body as a planning agency has been sadly undermined.

The result is an unhappy collision in which the services with the least political influence have gone to the wall, and as a matter

of fact rather than of theory "welfare" has triumphed at the expense of "development." Barbados, for instance, has been allocated £800,000 under the Act of 1945; this is included in the total estimated expenditure of £2,611,726 provided for under the Barbados "Sketch Plan" for 1946-56 which allocates £727,570 to public health, £534,000 for Housing and Town Planning, £446,806 to Education, and £200,000 to Social Welfare. In contrast, £533,000 is allocated to Water, £486,806 to Agriculture and £50,000 to "Industrial Development." So far as Barbados is concerned therefore, the 1945 Act will be "dead" if and when the Sketch Plan is approved; nothing more could then be achieved under it towards securing a new objective such as "welfare through development."

Too Timid Measures

So far as economic organisation is concerned, we are only just beginning (in the present Report) to emerge from a state of intellectual sloth in which all the shortcomings of the region are attributed directly to "laziness" and indirectly to the unchangeable influence of the climate. This greater awareness of the complexities of human behaviour is certainly welcome, but it is disappointing that the diagnosis of the economic ills of the West Indies is so negative. The importance of the rapidity of the growth of population in the West Indies is emphasised; quite rightly so, for it is pointed out that recent censuses estimate it at 2,848,947 in 1946, as compared with 2,028,412 in 1921. The increased cost of living is regarded as a serious burden and a considerable source of embarrassment to Governments; the low productivity of labour, and delays in increasing basic productivity generally is stated to be a cause of "deep disappointment." Considerable gains have been recorded since the Royal Commission went to work in the depressed years, but the present economic position is unstable:

It is by no means certain that these gains can be consolidated, or that there has been any fundamental progress towards a solution of the basic economic problems of the area.

Indeed,

the restrained optimism with which this measure of progress should be greeted must be tempered by a recognition of the largely artificial character of the war-time gains.

There may be some doubt as to whether the facts thus presented justify even the measure of "restrained optimism" accorded to them. Even if the prices of West Indian exports have risen, the adverse balance of trade of Jamaica has increased from £2,400,000 in 1936 to £4,800,000 in 1945 (imports being exactly double exports) whilst Trinidad converted a favourable balance of one million West Indian dollars in 1939 into an adverse balance of \$17,800,000 in 1946. The instability of the economies of the West Indian Colonies may be appreciated from the fact that Jamaica had the benefit of substantial "invisible exports" in the shape of the earnings of agricultural labourers in the United States, which amounted to approximately £3,800,000. This source of revenue cannot be counted on in the future.

We therefore find ourselves compelled to this conclusion: West Indies Development and Welfare has mainly restricted itself in the past to surveying the overall social and economic problems of the region, but has not addressed itself to finding solutions for them which will lead to lasting improvements; it lost most of its potentialities as an energising influence in the affairs of the West Indies when the system of "overall" grants was adopted. The initiative has now passed to the Colonial Governments, busy with the preparation and discussion of Sketch Plans. Sir John Macpherson expresses the hope that "all the Colonies will then be able to embark on the orderly execution of large-scale programmes of development that will be based on sound financial planning." But this is a very slender hope, to say the least of it. He recognises that "in the enlarged conception of development planning it is essential that high priority be given to projects that will increase the national income in a more immediate and definite sense" than would result from the extension of the social services; he expresses the belief that "responsible opinion today is much more optimistic than was the Royal Commission about the prospects of increased industrial development in the area." But all still remains to be done in the way of preparing detailed plans for the development of specific industrial and other projects to utilise the resources of the West Indies, particularly manpower. There is little hope that this can be achieved until West Indies Development and Welfare is reconstituted as a regional planning body, possessing sufficient political authority to overcome vested interests, ignorance, and inertia. Whether or not this will be possible will depend on the outcome of the negotiations now proceeding towards the establishment of a West Indian Federation.

WARNES OF WORTHING

BALKAN SOBRANIE CIGARETTES & TOBACCO

THIS ENGLAND . . . Number Nine

OUR civilization is divided into at least two parts—the North and the South. The North is hard but hard-working, canny but hospitable; the South is soft but generous, mannered but gentle-hearted. Yet there are connoisseurs who wear tweeds as well as morning coats, there is taste in the Dales as well as on the Downs, and there are smokers who demand the best whether they spin yarn in Manchester or yarns at Westminster. *Balkan Sobranie* has no accent—it translates perfectly into all dialects and every tongue.

SOBRANIE LTD. LONDON E.C.1.

"In times of scarcity, for the simple reason that everybody wants it, the best becomes scarcest of all."

If your White Horse Whisky seems rarer than ever, it is partly because so many people prefer it.

MAXIMUM PRICES:—Bot. 25/9, 1-Bot. 13/6 as fixed by the Scotch Whisky Association

One of these days you may be saying good-bye to your son as he goes away for Army Service or to live and work among strangers. Then he must find his own friends. His moral and spiritual quality will be tested under new conditions, and especially by loneliness—the loneliness of a barrack room, a strange town, or perhaps a foreign country.

One of the tasks of the Y.M.C.A. is to serve young men in these circumstances. It offers friendship and encouragement, as well as recreative activities for body, mind and spirit. Your son may be one of the many thousands who look to the Y.M.C.A. for help and guidance. By supporting this great undertaking now, you can do something to ensure that he does not look in vain. Please send a contribution to-day.

Donations may be sent to the Rt. Hon. The Earl of Athlone, K.G., G.C.B., President of the Y.M.C.A. War and National Service Fund, 112 Great Russell St., London, W.C.1

(Registered under the War Charities Act, 1940)

**"I was against it—
but experience of
this man has
proved me wrong..."**

"I'll admit I was rather against taking on anyone over 40 for an executive job. You know—old dogs, new tricks, and all the rest of it."

"But this man I mentioned is older—and he's proved me wrong. What an asset experience can be! He got the hang of our business in no time; and he has a grasp and judgement you couldn't expect from a youngster. To watch him tackle a problem is fine training for the young chaps in his department who will one day succeed him."

"Yes, the Appointments Office suggested him—added him to their 'short list' because of his impressive record. I'm glad they did. It's an instance of the intelligent way they help you in finding the best available man. The Appointments Offices are linked by teleprinter, so you get the pick of all their regional registers. And they've already done the preliminary interviewing and sifting before they suggest a few candidates. All 'probables.' I'd recommend any

employer wanting a really good man to see what his nearest Appointments Office can do."

Hundreds of employers have commended the service of the Regional Appointments Offices—to-day's logical starting-point in the recruitment of high-grade staff, whether the need is for men and women already experienced and qualified, or for younger candidates to train.

Your nearest Appointments Office "matches men with jobs" in the executive, managerial and administrative field. Any local office of the Ministry of Labour will put you in touch. For highly qualified technical and scientific personnel—engineers, scientists, architects, etc.—appointments are dealt with centrally, in London, by the specialist staff of the Technical and Scientific Register, York House, Kingsway, W.C.2.

Since VE-day, the Appointments Department has successfully filled over 50,000 responsible posts.

14 Appointments Offices cover the Nation's potential executive manpower

Issued by the Ministry of Labour and National Service, Appointments Dept., 1-6 Tavistock Sq. London, W.C.1

THE BUSINESS WORLD

Sterling's Future Role

THIS is indeed a year of abandoned targets. On July 15th Britain announced its punctual fulfilment, almost to the letter, of the onerous convertibility obligations of the Washington Loan Agreement and confidently proclaimed that the new facilities for turning sterling into dollars would involve no undue additional strain upon its shrinking dollar reserves—but might, in due course, even help to relieve the pressure. Now, only five weeks later, the new system embodied in a complex network of laboriously negotiated international agreements has been utterly engulfed in a torrent of overseas demands for dollars.

In a broadcast on Wednesday evening, the Chancellor announced that the new facilities for overseas holders of using sterling freely for dollar purchases would be "temporarily suspended" forthwith—except from persons residing in the dollar area—the area known technically as the American Account countries—and Canada. This departure from an obligation in the Loan Agreement by which the United States has always set great store has of course been made in consultation with the Washington authorities, whose attitude is said to have been one of sympathetic understanding, but it has not resulted from any formal negotiation of a waiver of the convertibility provisions. In form, Mr. Dalton's letter to the Secretary of the US Treasury is a unilateral notification that the obligation is at present insupportable, and Mr. Snyder's reply expresses no acceptance of the proposition but simply that the British Government's decision and proposed action have been "noted." Moreover, the suspension applies not only to what might be called the "July 15th" series of agreements with other countries—the agreements concluded just before or just after the convertibility zero hour determined by the Loan Agreement—but extends also to the special arrangements for convertibility negotiated much earlier, such as the Argentine agreement of last autumn.

Blow to British Prestige

This is undeniably a bitter pill for such countries to swallow, though it has a little sugar-coating—of very costly sugar, let them observe, in terms of Britain's dollars. The new restraint upon convertibility will not operate for releases already agreed from accumulated sterling balances: the only category of sterling which is affected is that accruing as a result of new current transactions. Even more important, on any sober reckoning, is the fact that, though dollar convertibility ceases, free and the multilateral convertibility of sterling remains elsewhere in the world, through the sterling area and the now far-flung transferable accounts area, with convertibility by administrative arrangement in many other countries. But, despite these important easements, and despite the evidently compelling circumstances which explain and justify Britain's decision, it seems idle to hope that this retreat from contractual obligations so soon after their assumption will not impair the British Government's prestige, and the prestige of sterling, in many quarters abroad. If the full circumstances and difficulties could be seen through British eyes, if the technical advantages which yet remain for foreigners—including, eventually, even some consequential new advantages—could at the outset be dispassionately surveyed, the

response might perhaps be the most favourable. But on Mr. Dalton's own admission, the result will inevitably be a disturbance of trade over wide areas and, for some countries, there will be real embarrassment. At this stage, even the short-term repercussions cannot be fully foreseen, if only because much will depend upon the attitude of foreigners at the very outset, before they have had time to ponder the wider and secondary effects in this world of dollar famine. Britain will be fortunate if the initial response does not embrace resentment and even anger, emotions which are all too likely to be excited by an assumption that the British Government is itself largely to blame for the sorry mess in which it finds itself.

"July 15" Miscalculations

Yet, in truth, of the many retreats from planned objectives which the Government has had to make, this is the case in which it is the least blameworthy. This particular objective—to restore convertibility unilaterally by July 15th last—was not a chosen objective nor was it a party objective. It was an inescapable part of the price for a loan which most people were agreed Britain had to have, a price which Britain honestly tried to pay, but which was so high that it was all too likely to break the bank. It would certainly have done so within a very few days had Britain decided that even in the present extremity it had to stand by the letter of the bond. During the month of July, the sand in the dollar hour-glass was running out at the frightening rate of \$17½ million per day. In the seven working days before the new decision was taken the daily loss was at just twice that rate—\$176 million was lost in the five days to August 15th and \$66 million in the first two days of this week. At such a rate, the US dollar credit would have run out early next month. Would the situation have been different had Government domestic policy followed a different course in these past twelve months or so—if party legislation had been soft-pedalled, if planning had been more efficient, if budgetary policy had been more realistic, if there had been no extravagant cheap money drive? Obviously, the answer is, yes. But, given the weight of the external pressures and the growing shortage of dollars throughout the world, the life of the dollar credits would not have been substantially longer, great though the eventual benefits of such statesmanship would have been.

If the Government is culpable on this particular issue, it is not primarily for the deficiencies of its domestic policy but for its utter failure to foresee what the consequences of the last steps in convertibility would be. Its lack of foresight was by no means confined to the events of the past fortnight. The crisis debate early this month, and the hastily-improvised programme which the Government then presented (in language which often contradicted that of only a month before) resulted almost entirely from its shock at the size of the dollar drain in July. Yet its own figures of the special payments known to be falling due in that month explain the whole of the increase. And if the \$150 million which it had wanted to draw in June had in fact been then drawn and paid away, the June drain would have surpassed that of July.

Mr. Dalton, looking ever for a scape-goat, actually lays part of the blame on the press for the fact that the dollar drain from early

August was so much greater than the Government expected in mid-July. Certainly it is true that the acceleration reflected lack of confidence among overseas holders of sterling, but this was the obvious reaction to the patent inadequacy of Government policy in face of a critical situation the approach of which it had for so long ignored. Moreover, if the financial press had been aware that, despite the many new agreements, large blocks of sterling were so free to move into dollars as they have since shown themselves to be, it would never have endorsed the confidence about July 15th which the Government exuded at the time and supported by rational arguments which the press disseminated in all sincerity. Only the expert negotiators of the many agreements and those in touch with the overseas authorities could gauge the latitude which they afforded, the danger of losses from the area with which no formal plans had been made, and the extent to which some parties might not play the game. Obviously, the Government could not have been surprised by the strain imposed by the funds agreed for immediate release, for the Treasury excels at simple arithmetic. This being so, it is surely obvious that much of the pressure must have arisen from action outside the spirit of the agreements. In most cases, the sterling was to be "convertible" when required for current payments elsewhere. That it was suddenly withdrawn in large blocks as soon as the opportunity arose is surely proof that this vital condition has by no means been generally observed by the overseas authorities which British officials had deemed sufficiently competent and trustworthy to work the new system. If these risks were present, it is the business of officials to foresee them, instead of covering them in a smokescreen of wishful thinking. Foreigners will blame the Government for suspending convertibility; many misunderstandings seem inevitable; and much damage will be done which may take years to repair. But in these circumstances, the real blame upon the Government is not for suspending convertibility but for restoring it. Can it really be said that this retreat from many recently negotiated agreements with countries covering almost the whole commercial world does less damage to British prestige and trade than would have been done if the Government had told the Americans a few months or even weeks ago what it had to tell them this week? Is one default, upon an obligation which even the most sanguine could not honestly be sure was supportable, but the impracticability of which had not been tested in practice, more damaging than a whole string of defaults which had to be risked to provide such a test?

Effects on Britain's Imports

What of the consequences? Because Britain has had to act in contravention of the Washington Agreement, without the prior consultation provided for in Section 8 (ii) (b), it was necessary to inform the US Government that no further drawings on the loan beyond those already notified would be made except by agreement after such consultation. Allowing for drawings already notified but not yet made, the immobile portion of the credit is expected to be about £100 million. Unless and until this amount again becomes available, or other dollar aid is forthcoming, Britain will have to dip into its ultimate reserves of gold, totalling some £600 million, plus the unexpended portions of the final dollar drafts. The funds in the till, however, will no longer be drained for the purpose of meeting, as Mr Dalton put it, other peoples' burdens. They will be used only for Britain's own needs and those of others for whom Britain acts specifically as banker—the countries of the sterling area, most of which can be relied upon to exercise an appropriate measure of restraint in their demands. Apart from the moral obligation upon them to join with Britain in the belt tightening process, the technical position of these countries will not be directly affected—so long as the central reserve of cash lasts. It is not very likely, therefore, that Britain's ability to secure supplies from such countries will be suddenly and significantly impaired.

With certain other countries, however, the trading relationships are fundamentally changed. The increasing shortages which Mr Dalton foresees in supplies from overseas are plainly inevitable. Given the immediate immobilisation of perhaps one-seventh of the exchange reserves which remained, Britain in any case will have no choice but to cut down even more drastically than was contemplated a fortnight ago the purchases from the dollar area and Canada which must still be paid for in dollars. But this is far from being the whole story. In principle, other countries which are desperately short of dollars will not readily sell to Britain now that they can no longer get dollars (or convertible sterling) in exchange, and the flow to Britain of many vital supplies may therefore be arbitrarily interrupted. Yet the extent of the additional shortages will turn very largely upon whether the countries concerned now act rationally and dispassionately or partly out of resentment, misunderstanding or distrust. Britain's suppliers cannot in fact gain anything from cutting down their shipments if they are already receiving full payment for them in exports from Britain of the goods and services they most need—in other words, if their accounts with Britain (indeed, with the sterling area and even, perhaps, with the whole wide area within which sterling remains convertible) are in equilibrium or in deficit, they can benefit from cutting down their sales only if the supplies they are getting from Britain are less imperative for them than those they can get in the dollar area.

Argentina—and the Meat Ration

Fortunately, an important proportion of Britain's supplies from beyond the dollar and sterling areas come from countries whose accounts with Britain (or in some instance with the sterling area) are already in deficit. If the reactions now could be strictly sober and rational, the real immediate danger would therefore come only from those other countries which already have surpluses on their sterling trading—surpluses which are now virtually frozen, unless and until sterling countries, and especially Britain, can provide the particular goods which the accumulators of balances need. In recent months many countries—including some which have been "hard" currency countries from Britain's point of view—have been adopting drastic import restrictions in order to save dollars. Against this background, it would be unrealistic to suppose that non-sterling countries will not take prompt steps, by cutting down their exports to Britain, to avoid fresh accumulations of sterling.

The principal suppliers outside the sterling and dollar areas which are in this position are Argentina, Switzerland, Spain and Uruguay. With Switzerland and Spain, Britain already has monetary agreements which provide for the sterling financing of Britain's current deficit, and there is reason to hope that, despite the altered circumstances, these facilities will be continued, at least by Spain. It is with Argentina and Uruguay that the really critical problem inevitably arises, for neither country is likely to feel able to afford to accumulate sterling, and both are important suppliers of essential foods. Argentina had a favourable balance with Britain of £46 million in 1946 and one of £22 million in the first quarter of this year, primarily on account of sales of meat, but also from oilseeds, hides and skins. This disquieting situation is complicated, moreover, by the fact that New Zealand, the other primary source of meat supply, has a very large surplus in trading with Britain and, despite its proven readiness to do everything in its power to assist, will be severely embarrassed by Britain's dollar extremity. Plainly, it is from this particular problem that the probability of cuts in basic rations arises. The only hope of easement at this point lies in the possibility that Argentina, despite the infringement of the vital convertibility clause in last year's agreement, will yet abide by the consequential rail purchase

agreement—in which case it will still need for some time to secure surpluses from current trading in order to provide sufficient sterling to complete the purchase.

A "Temporary" Suspension?

On the somewhat longer view, the prospect may be less bleak. Mr Dalton's claim that the Government has acted in order "to keep sterling a strong currency" is not simply window-dressing. When people abroad recover from the first shock, they may realise the significance of the maintenance both of the sterling-dollar rate and of the whole system of transferable accounts, except for the withdrawal of transferability to the dollar area. It may gradually be realised, too, that the more intractable the world dollar problem becomes, the more clearly does this wide availability of sterling for international payments provide the only hope, at least for some time to come, of flexible trading relationships and exchange stability over a wide area. When the panic pressures and seepages are over, it will be true, too, that the technical position of sterling will be much stronger than it was a few months ago; the recent agreements, though their dollar convertibility provisions are abrogated, yet ensure the immobilisation of vast accumulated balances the free availability of which has in the past involved much wasteful use of Britain's export potential. And, in the wider field of commercial policy, Britain will have restored to her the bargaining weapon with which she was deprived in 1945—the right to withhold or grant, at her own discretion and in her own time, convertibility facilities. Finally, to mention one other of many possible repercussions, it is conceivable that this acceleration of world dollar

pressure will, by intensifying dollar economies everywhere, shortly have important repercussions upon American prices, thus tending to reverse at last the adverse movement of the terms of trade.

Even in this preliminary survey one further point needs to be made. The Government has described this step as a temporary suspension and an emergency measure. It reaffirms its faith in multilateral convertibility and its intention to strive towards it. Is it too cynical to recall that the gold standard was "suspended" and not "abandoned" in 1931? The Government may sincerely believe in the eventual desirability of a system of multilateral convertibility and in the principle of non-discrimination as long-term objectives. Indeed it would be an act of despair if they thought otherwise. Yet it would be the height of folly to attempt to reverse this week's decision unless and until the whole fundamental problem of disequilibrium between the Eastern and Western Hemispheres has been solved. And that means finding a solution to the problem of financing or extinguishing America's colossal export surplus. There is no reason for thinking that any permanent solution will be quickly found.

Meanwhile, this exchange crisis—which in truth is only the most spectacular, not the most significant, facet of Britain's problem—will be turned to good account if it drives home one other parallel with 1931. Then a policy of vigorous budgetary retrenchment was conjured up to save sterling—a fallacious prescription in the then conditions of large-scale unemployment. Now, in conditions of full employment, that same prescription is valid and indispensable. It is, moreover, virtually the only means left of bringing the realities home to the British public.

Business Notes

No Worse News?

Thursday's reaction on the Stock Exchange to the withdrawal of convertibility must have produced a minor echo of the song in the Chancellor's heart. The market opened lower; then the bears, calculating that there was no worse news to come, at least for the time being, promptly covered their positions. And by the end of the afternoon Old Consols and Treasury 2½'s had recovered 1½ points to 85 and 85½ respectively. It is, emphatically, a technical recovery, somewhat sharp in its contrast with the nervous drift of the previous days this week, but symptomatic of the need for bears to withdraw from the market and not of the willingness of the bulls to return. Indeed, to have produced such a comparatively small recovery in the present "one-way market" conditions is not a very auspicious performance. Whatever the professionals may have felt it discreet to do, the public did not follow their lead.

For most of this week the industrial market has been in poor fettle. On Wednesday the *Financial Times* industrial ordinary share index was no better than 114.3—a new "low" for the year—and it became impossible to sell even moderate lines of the best equities except at the cost of a disproportionate fall in prices. Perhaps there was a hint of selective recovery during the course of Thursday—a little interest in textile shares, for example—but the general conviction that share prices as a whole have not seen the end of their fall remains unshaken. The sheer prudence of this view shows a degree of realism which has not always been evident on the Stock Exchange.

Realism, however, has never been characteristic of all sections of the gold share market. The end of convertibility has pricked the boom in Kafirs which had been proceeding merrily for a fortnight past, and was fed by every kind of rumour about rising gold prices, sterling devaluation, falling costs and the like. The end of easy profits in gilt-edged and equity shares attracted a great speculative following to the gold share market as soon as prices began to move upwards. The speculators—or at any rate some of the slower ones—will be hard put to explain why gold shares should go up now. For whatever might have been said about the possibility of sterling devaluation a week ago (and obviously even then the arguments were against any such policy) it is now ruled out at least for a considerable period.

Coal Stocking for the Winter

Coal production is now feeling the full effects of the summer holidays. But weekly figures so far available for July and August show a rather erratic trend and it is too soon to hazard a guess as to how much coal will go unmined this summer owing to miners' holidays. It is noteworthy, however, that weekly average production in July at 3,332,000 tons was actually below the weekly average of 3,492,000 tons for July, 1946. Output for the first two weeks in August was 2,307,000 tons and 3,668,000 tons respectively. From these figures it might be inferred that regular holidays for the miners had concentrated the fall in production on July and early August instead of prolonging it throughout the second month. There would be more confidence for such a view if the voluntary absenteeism figures for July at 5.44 per cent were lower and not higher than the June figure of 4.60 per cent. Meanwhile, the deadlock between the Coal Board and the miners' representatives on the relative merits of an extra half-hour a day and an

June	10,544	5,869	482	2,992	847	354
July	11,985	6,534	450	3,465	1,178	358
August* ..	11,858	..	..	..	..	..

* As at August 9th. † Merchants' stocks.

extra shift on alternative Saturdays is unresolved after another day's discussion on Wednesday and also after reference of the question to the Government on Thursday. This is only one case of an apparent lack of a sense of urgency. Reluctance to admit Polish recruits into the mines is another, though net recruitment for the mines on which so much depends, slumped from 2,400 in June to 800 in July. These recruitment figures should be compared with the loss this week of 100 trained miners

at Whitehaven in the Cumberland coalfield—one of the least efficient coalfields with a bad accident record.

Much has been made recently by official spokesmen on the progress achieved in stock-building for the winter. It is true that considerable progress has been made towards the target of 15 million tons by the end of October, which may be compared with stocks of 10.9 million tons in October, 1945. Starting with only 6 million tons in April this year (the end of the winter period), stocks had reached 11.86 million tons by August 9th. Comparing the number of winter weeks' supply held in stock at the end of July with July and October, 1946, the picture is as follows:—

	End July, 1946	End Oct., 1946	End July, 1947
Gas.....	2.7	3.2	4.3
Electricity.....	2.7	3.7	5.0
Railways.....	2.0	1.5	1.9
Iron and steel.....	2.4	2.1	2.2
Engineering.....	3.7	3.8	5.0
Other industries.....	2.8	3.0	3.3

Viewed in this way there is clearly room for improvement in the stock position of key industries, even if the total is speeding towards its target—and there are wide discrepancies between the stock position of industries as a whole and the stocks of their constituent firms. But a glance at the accompanying table will show that part of industry's gain is reflected in the fall of merchants' stocks for domestic consumers. Mr Shinwell will have difficulty in delivering his target figure of 16 million tons to domestic consumers this winter unless stocks rapidly improve. But they rank, quite rightly, for the lowest priority.

The Course of Production

The six weeks period of special effort for which Mr Morrison asked at the end of June to lift industrial production clear of the immediate effects of the fuel crisis and to produce a spurt in output before the holidays began, has now passed. On Wednesday, the Lord President was able to give a provisional report on the effects of his appeal.

The report was good—in parts. Brick production in July at 407 million was running at the highest rate since the war. Cement output at 787,000 tons was above the monthly average for 1938. The unemployment rate, at 1½ per cent, was the lowest ever achieved in peacetime since unofficial records began in 1894. But there were also debit items. By the end of July holidays had already begun to take their toll on production of the two key industries—coal and steel. And while unemployment was low, its distribution was still far from satisfactory. The textile industries which are now cast for an increasingly important role in the export drive, were still severely undermanned.

Public attention, however, is now riveted on the external trade figures, and those for July this year have particular significance. This is not only because the publication of the provisional trade figures for July have coincided with the decision to suspend dollar convertibility, but also because July's figures should show the acceleration in this year's export drive begun in June as the fuel crisis was left behind and the beginning of the seasonal expansion of imports as grain and commodities move into this country.

The July figures do show the anticipated expansion. Exports by value were £110.3 million, an increase of 18 per cent above the £93.1 million recorded in June and the highest since November, 1920. The volume index is put, provisionally, about 120, taking 1938 as 100. There were, however, 27 working days in July and the increase in value over June on a daily basis was only 5 per cent. Imports in July were valued at £179.2 million compared with £153.8 million in June—an increase of 16 per cent. So the gap between imports and exports has been held—but only just.

One of the most welcome features of the Lord President's remarks on Wednesday was his emphasis on the priority for export targets. There was a stern, if belated, note of austerity in his hint that private car production might have to give way to commercial vehicles and tractors, and that textile export targets would have to be met irrespective of the requirements of the home market. But the sting was in the tail of his remarks on exports. "It would be a mistake to assume," he said, "that we will be unable to resume export of coal to Europe as early as next year." This was much further than Mr Shinwell was prepared to go in the coal debate a few weeks ago. Was this eleventh hour optimism on the trend of coal production or a hint that Europe's need for coal and Britain's need for exports might take priority over some classes of coal consumers in this country?

Check to Steel Production

A seasonal decline in pig-iron and steel output is customary during July. But this year, the fall has been particularly severe owing to the concentration of holidays in July and the introduction of the new scheme for six days' additional holiday with pay. The situation has been aggravated by a continued shortage of coal supplies in some areas.

Figures computed by the British Iron and Steel Federation for July, as set out in the accompanying table, show that ingots and castings production amounted to 211,700 tons per week compared with 254,000 tons a week in June and 226,000 tons a week in July last year. Thus the annual rate of output last month was no more than 11 million tons compared with 13.2 million tons in June. If the target of 12½ million tons for 1947, set in the *Economic Survey* (and also the target of 14 million tons for 1948, set by the Prime Minister) is to be achieved, production will have to be stepped up to an annual rate of 13½ million tons during the rest of this year.

PIG IRON AND STEEL PRODUCTION
('000 Tons)

	Pig Iron		Steel Ingots and Castings	
	Weekly Average	Annual Rate	Weekly Average	Annual Rate
July, 1946.....	147.0	7,645	226.0	11,759
June, 1947.....	144.3	7,501	254.0	13,206
July, 1947.....	143.5	7,460	211.7	11,007

There would be greater hope for anticipating a recovery to such a level of output if there were signs of improvement in pig-iron production. Output in July, however, averaged only 143,500 tons a week compared with 144,300 tons in June and 147,000 tons a year ago. Relief from the pig iron shortage is on the way, but it is an open question whether it will arrive in time to assist the expansion of autumn steel production. Two additional blast furnaces came into operation early this month and six more are due to be blown in before the end of September. Two of these, one at Consett and one at Colvilles, are new furnaces installed under the modernisation programme. But before advantage can be taken of increased pig-iron capacity, an improvement in coke supplies will be needed. And beyond the autumn there looms the uncertainty of the winter coal allocations.

Argentine Rails Now

As this week's edition of *The Economist* goes to press the legal fate of the Argentine Rail Purchase Scheme is being decided in the Vacation Court. Now that Mr Kavanah has withdrawn his objection, the approval of the court will probably not be long delayed, and after the stipulated thirty days have elapsed, the purchase money is due to be made available for distribution. But on Wednesday, disquieting rumours of the possibility of a revision of the agreement upset the market, and by the same night it was clear that, on certain assumptions, the withdrawal of convertibility of sterling might change the situation considerably. One of the unexpected features of the dollar shortage is the rate at which Argentina's dollar supply has fallen during the last twelve months. Undoubtedly, the arrangement by which Argentina could, until Wednesday, convert sterling arising from current transactions into dollars was a timely alleviation of her dollar troubles. Now, failing this facility, if Argentina continues to export goods to this country and if Britain cannot supply goods which Argentina has hitherto been able to buy in the United States, Argentina will accumulate further sterling balances. This situation may be regarded from several viewpoints. Argentina may reduce exports to Britain at a time when this country has great need of meat and produce; or accumulated sterling might be used for such purposes as meeting the consideration for the rail purchase; or the sterling balance might be left to increase in the hope of later conversion or financing the purchase of the goods she wants in this country when they become available. There is nothing in this line of reasoning to suggest that Argentina will fail to ratify the scheme except the original fact that the payment will involve the payment from current sterling balances of some £30-£35 million to make up the full purchase price of £150 million.

But it might be argued by Argentina that it would now be expedient to scale down the purchase price to a figure nearer the £115 million of blocked sterling which remains on Argentina's account, and it is on these fears that weakness persisted in Argen-

The florin, though Italian in origin and deriving its name from the small flower or 'fiore' in Italian, whose image it bore, has been the monetary unit of Holland since 1798.

Florin

For many years Barclays Bank have fostered the growth of Anglo-Dutch trade by providing a comprehensive foreign banking service, strengthened by close links with the principal banks of the Netherlands. Today, when our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

TANDEMS FOR TIENTSIN

British goods are 'in the window' when British films are shown to the world. That's how Mr. Chang of China comes to want his British bicycle. A demand is created, and trade is born.

This is what happens when producers and manufacturers grasp the importance of this indirect form of salesmanship. For films cannot help showing your goods. Every time a film star changes her costume she models British fashions. The arc lights play on the love scene and with equal clarity on the furnishings. How vital it is that the best of Britain should go on the screen! Other countries have been very alive to the sales appeal of this most 'visible' export, and we in Britain are now equally aware of it. When important films go into production nowadays, manufacturers and the Board of Trade and the Council of Industrial Design all co-operate. In this way (with no loss at all in entertainment value) films are at the same time groomed as travelling salesmen for many British industries.

J. ARTHUR RANK ORGANISATION LIMITED

Treasure Trove

Hidden amid a mass of other matter may be a substance that the chemist particularly desires. In bygone days such a product was usually called a "quintessence", and the problem of extracting it is as old as chemistry itself. Modern equivalents of the quintessence are such things as perfumes of flowers, drugs in seeds and resins, vitamins, and hormones. Their isolation is a difficult problem. One way is to find a liquid which will dissolve the required substance, but not those which accompany it. A solution is thus obtained, run off and boiled away, the residue being the substance desired. All sorts of liquids are used for 'extraction'—water, alcohol, ether, acetone, chloroform, benzene, and scores of others. Sometimes the substance will dissolve at ordinary temperatures, but heat is usually needed. Very often the best available solvent will only act slowly and with difficulty. When this happens, the chemist uses an extraction apparatus such as is shown above. The raw material is placed in a thimble of porous paper suspended in a tube above a flask containing the solvent. The solvent is boiled and its vapour passes into the condenser at the top. Here it is reconverted into liquid, drips into the thimble, and seeps through, carrying some of the substance to be extracted down into the flask. This cycle is allowed to continue until extraction is complete, and another quintessence has been extracted by the British chemist for the well-being of the nation.

tine Rail issues on Thursday. Both Senor Miranda and Sir Montague Eddy must be considerably exercised by the new situation.

Iraq's Sterling

Details of the financial agreement reached with Iraq last week, but released for publication only on the morrow of the Chancellor's announcement of suspension of sterling convertibility into dollars, look somewhat incongruous in the light of that decision. The terms conceded to Iraq are certainly favourable by comparison with those afforded by some of the other sterling agreements. It needs to be remembered that this arrangement—unlike, for example, those recently concluded with India and Egypt—is not merely an interim plan but operates over a five-year period; and Iraq, unlike Egypt, remains a member of the sterling area. A firm and amicable arrangement with Iraq is perhaps particularly welcome, the more so by reason of its position in a strategically vital region.

The mechanism of the agreement takes the familiar form of No. 1 and No. 2 Accounts, the first of which is made the repository of freely available convertible sterling (but now no longer automatically available for payments to the dollar area or Canada), and the second of which carries the portions which are blocked. Private balances are not affected, so that the sterling assets involved—including those of the Iraq Government, the Iraq Currency Board and banks in Iraq. They total some £60 million, the whole of which is in the first instance transferred to No. 2 Accounts. Releases are then provided for to the "free" sterling category on No. 1 Accounts. The sum of £5,000,000 is released forthwith as a "special provision" to facilitate for the Iraq Government the transition to the new exchange regime—this, it should be noted, is a "once for all" payment—and a further £2,000,000 is provided as a working balance which may be drawn upon from time to time to meet any temporary exchange shortage. Apart from these special arrangements, the main releases will be £15 million over the 5-year period, provided that not more than £4,000,000 is withdrawn in each of the first two years, the balance being released in equal annual instalments during the remaining life of the agreement. There will also be releases equivalent to the £4,000,000 to £5,000,000 to be provided by Iraq to meet outstanding confirmed credits opened by UK banks and a sum of up to £4,240,000 to cover repayments, as and when they are made, of advances made to the Iraq Government by the Iraq Petroleum Company and other oil companies.

Obviously, some of these releases, and certain other less important ones for which provision is made, will necessarily be purely sterling transactions, but the others will be in the form of fully convertible sterling. As sterling accruing from current trade will not, despite the agreement, be convertible into dollars, presumably some new mechanism will need to be devised—for this and all other similar agreements—to distinguish the two varieties of sterling which will be merged in No. 1 Accounts.

Unilever and World Trade—

To do full justice to the report of Lever Brothers and Unilever would require many pages of *The Economist*. A company note in this week's issue of the *Records and Statistics* Supplement gives some of the salient figures from the profit and loss account and

balance sheet of the Unilever group, though it perforce excludes much interesting information which is presented in the report, and conveys a quite inadequate impression of its accounting elegance. It has been said that an investor should not buy Unilever shares if he wishes to have a holding simple to understand; and these accounts are, for all their detail and immense range, hardly child's play. Yet there is nothing in the report which is excessive to a full and adequate understanding of this immense business. Any stockholder who may complain that he is given too much is criticising, not Unilever, but defects in his own intellectual apparatus for wise and prudent investment.

In this wealth of riches, a few points only can be spotlighted. One of the features is the rapid recovery in the profits of NV (the Dutch limb) which the report attributes in great measure to the business in the United States. It would seem that NV began to prosper on the grand scale with the elimination of price control in the United States during the last months of 1946; prices have since fallen in what the directors describe as a "healthy" fashion to more normal levels, but the expanding volume of American business this year is taxing the group's manufacturing capacity. American experience, however, is in distinct contrast to that in

most of the group's other markets, where recovery has been impeded by the familiar tale of shortages, controls, and reconstruction. Yet even here, the story is by no means uniform. In Britain, supplies of oil seeds were lower last year, but in several European countries they improved. The expansion of the group's basic products like soap and edible fats is hampered by the world shortage of oil seeds and nuts, and even though several of the European countries in which Unilever is interested have managed to restore the pre-war volume of output—Belgium and Norway are two

The Treasury's huge spendings of dollars in July and the Chancellor's vaunted Budget surplus had virtually no effect upon the volume of bank credit outstanding during the month. As a Note in *The Economist* on August 9th (page 257) recorded, at the July make-up date "net" deposits of the clearing banks—that is, after allowing for items in course of collection—showed virtually no change by comparison with end-June. Gross deposits, however, fell by £14.3-million, whereas in that Note it was inadvertently stated that they had risen by this amount.

HUNGARIAN COMMERCIAL BANK OF PEST

ANNUAL GENERAL MEETINGS

The Hungarian Commercial Bank of Pest held its annual general meetings (numbers 103, 104 and 105) on the 29th ultimo, as none had been held since 1944.

Ex-Foreign Minister Louis Walko, in the chair, presented the forint-balance of the bank.

GUEST, KEEN AND NETTLEFOLDS, LIMITED

A HEALTHY STATE OF AFFAIRS

The annual general meeting of Guest, Keen & Nettlefolds, Limited, was held, on the 20th instant, at Birmingham, Sir Samuel R. Beale, K.B.E., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:—

When I had the privilege of circulating a statement to you last year, I told you that your board unanimously associated themselves with statements made by the President of the Iron & Steel Federation that nationalisation of the iron and steel industry would result in a less efficient industry and thus be contrary to the interests of the country. Since then the Steel Board has been formed and the co-operation of the industry in the Board's general supervision of its activities was assured by the omission of questions of nationalisation from the Board's terms of reference. The position of our own group of companies is a good example of the desirability of proceeding to such further supervision of the industry as may be found necessary in the national interest by way of evolutionary development of the functions of the Steel Board.

THE FINISHED ARTICLE

Our chief interest lies in the finishing ends of the industry, such as bolts and nuts, wood screws, steel stampings, railway fittings and the like. We are only interested in steel manufactured through certain of our allied companies, such as Guest, Keen, Baldwins and John Lysaght, Limited, chiefly so that we may ensure suitable supplies for our finishing works. Similar relationships exist elsewhere, developed out of practical need and supported by continued scientific research controlling manufacturing processes from the raw material to the finished article. It is this finished article that commands the most remunerative price to the country in the export markets of the world, and it would be disastrous to hamper improvement and development in any way.

The policy of your board has been to go steadily on providing equipment of greater capacity and most modern design in our finishing departments whenever it can be justified. The results are steadily justifying our policy by our increased and increasing ability to meet apparently ever-growing demands both in quantity and quality, only limited by our ability to get sufficient steel. I sincerely hope this increased capacity may accrue to your benefit as, in equity, it most certainly should.

CONSERVATION OF RESOURCES

After referring in detail to their various interests, he went on to say: The profits of the year under review, without relation to other factors, would in themselves permit the distribution of a higher rate of dividend than is proposed on the ordinary stock. We felt, however, that we could not disregard other matters such as the conservation of resources for the considerable programme of development expenditure proceeding and envisaged within the group, and the uncertainty surrounding economic conditions throughout the world. I am sure no apology is needed for our consistent policy of development expenditure, and it must be remembered that there has been a six or seven year period during which great technical progress has been made and during which all new plant was of necessity selected entirely from its suitability for war rather than normal peace purposes. The recent rises in the costs of everything will need no emphasis.

Taken as a whole, the board consider that the balance sheet shows a healthy state of affairs. You will notice the satisfactory surplus, amounting to £9,192,925 of current assets over current liabilities.

The report was adopted.

ARISTON GOLD MINES (1929), LIMITED

YEAR OF SATISFACTORY PROGRESS

The seventeenth ordinary general meeting of Ariston Gold Mines (1929), Limited, was held, on the 20th instant, in London.

Sir Joseph Ball K.B.E., deputy chairman, presided.

The following is an extract from his statement which was circulated with the report and accounts for the year ended September 30, 1946:—

Members will note that the net proceeds from the sale of gold are up by £7,702, which, in a year by no means free from difficulties, may be considered satisfactory. Then, on the debit side of the profit and loss account will be observed what was our final contribution to the concentration scheme, namely £27,731.

With regard to dividends, we have already distributed 15 per cent., less tax, in respect of the year under review, and we are now recommending a final distribution of 5 per cent., less tax, thus maintaining the year's total dividend at 20 per cent., less tax. We have also declared a first interim dividend of 5 per cent., less tax, on account of the current year ending September 30th next.

INCREASED PRODUCTION

Passing now to the work in the field, I am pleased to report a year of satisfactory progress. Production was increased from 240,000 tons of ore to 253,500 tons, while working costs at 33s. 1.27d. per ton, including development, showed a reduction of 1s. 2d. per ton as compared with those of the previous year. This reflects the greatest credit on our management, since costs of mining supplies, etc., continued to rise, as also did the wages of the African employees, while at the same time the general standard of efficiency of native labour has shown a tendency to deteriorate.

With regard to our projected programme for increasing the current rate of production and milling from 23,000 tons to 40,000 tons of ore per month, I have to report that during the current year orders have been placed for the new winders required in connection with the additional sinking and increased haulage capacity of the central shaft.

Arrangements are in hand for the provision of the additional electric power supply that we shall require as our production expands, and provided that we can secure a part, at least, of our power requirements during the next twelve months, we have every prospect of attaining the first stage of the increased production programme, that is, 40,000 tons per month, within that period.

I am pleased to report good progress in the Broomassie tunnel, which, members will recollect, we are driving from the 17th level of the north shaft to a point under the downward extension of the old Broomassie workings, and in the eventual examination and development of which we are joined in agreement with the Gold Coast Selection Trust, Limited, and the Marlu Gold Mining Areas, Limited.

PROJECTED CAPITAL ISSUE

We are now compiling details of the capital expenditure ahead of the company during the next five years, covering the purchase of new plant and machinery, development work, building, and general welfare of both European and African employees, including the provision, jointly with our neighbours—Gold Coast Main Reef, Limited,—of new hospitals for both Europeans and Africans. It will undoubtedly be necessary, in due course, to increase the company's capital for these purposes, and, subject to the consent of H.M. Treasury, the Board proposes to do so by making an issue of stock to existing members.

The report and accounts were adopted and the proposed dividend was approved.

GOVERNMENT RETURNS

For the week ended August 16, 1947, total ordinary revenue was £58,229,022, against ordinary expenditure of £69,955,147 and issues to sinking funds £540,000. Thus, including sinking fund allocations of £4,411,384 the surplus accrued since April 1st is £270,846,533, against a deficit of £355,094,685 for the corresponding period a year ago.

(1946 Accounts)

UNIVERSITY OF LONDON invites applications for post of an additional Assistant Secretary for Tutorial Classes. Salary, £500-£20-£580, plus Family Allowance where appropriate. Superannuation Scheme. Preference given to graduates about 30. Experience of adult education essential. Applications should reach the Director, Department of Extra-Mural Studies, University of London, Senate House, W.C.1 (from whom further particulars and application forms can be obtained), by October 15th.

UNIVERSITY OF OXFORD

The Institute for Research in Agricultural Economics invites applications for the appointment of SENIOR ECONOMIST for a two-year period. Wide previous research experience is essential. Preference may be given to candidates with a knowledge of agricultural and industrial economics overseas and of international trade. Salary £300 to £1,000 per annum, according to qualifications. Particulars from The Secretary, Agricultural Economics Research Institute, Parks Road, Oxford, who will receive applications up to September 15, 1947.

THE UNIVERSITY OF TASMANIA

Applications addressed to the Registrar are invited for appointment to the following positions:—

1. Lecturer in Mathematics.
2. Lecturer in Statistics and Economics.

Salary for both positions according to qualifications and experience within the salary range £500-£700. Conditions and other details of appointment may be obtained from the Agent General for Tasmania, Golden Cross House, Charing Cross, London, W.C.2, and Universities in Great Britain. The closing date for receipt of applications for the Lectureship in Mathematics is September 30, 1947, and the Lectureship in Statistics and Economics October 31, 1947.

M.A. (Cantab), 28, linguist with world-wide technical and commercial field experience in market research, organization, sales and intelligence work, seeks change offering scope for developing executive ability more fully. Present salary £750. Highest references.—Reply, Box 498.

PROGRESSIVE post for young statistician in London Market Research office of large food concern. Good honours degree in mathematics with ambition to apply specialised knowledge to business problems. Initial salary will depend on qualifications; progress on demonstrated ability in technical and business aspects.—Write Box 529.

EXPORT MANAGER for Chemicals wanted by old-established firm. Must be well versed in all aspects of the trade, such as suppliers, markets, etc. Good salary and share of profits.—Box 531.

EXECUTIVE cum technical post required by University Graduate, 29, with wide knowledge of technical and economic industrial problems. Sales (Home and Overseas) and production experience of textiles, dyes and organics and knowledge of consuming industries.—Box 534.

M.A. (Cantab), Classics and Economics, 27, seeks experience in Market Research or allied work. Proved organising ability, interested advertising technique.—Box 535.

ASSISTANT SECRETARY, 28, Cambridge M.A., passed Finals C.I.S. fully experienced in legal and company secretarial work, patents, trade marks, relations with Government departments, etc., seeks responsible position with progressive public company, London or provinces, which will give adequate scope for advancement.—Apply Box 543.

GOVERNMENT OF SOUTHERN RHODESIA

FOUR AND A HALF PER CENT INSCRIBED STOCK, 1958-68.

CITY OF JOHANNESBURG

FIVE PER CENT INSCRIBED STOCK, 1950-60.

NOTICE IS HEREBY GIVEN that in order to prepare the Warrants for Interest due October 1st next, the BALANCES of the Several Accounts in the above-mentioned Stocks will be STRUCK on the night of September 1st, and that on and after September 2nd the Stocks will be transferable ex-dividend.

For Barclays Bank (Dominion, Colonial and Overseas).
(London Registrars of the above Stocks.)

BANK OF NOVA SCOTIA

(Incorporated in Canada with Limited Liability.)

Established 1832.

General Office: Toronto, Canada.

Paid-up Capital ... **\$12,000,000**
Reserve Fund ... **\$24,000,000**
Total Assets over ... **\$650,000,000**

Special facilities are available to the public through the Branches of this Bank for the transaction of business with Canada, Newfoundland, Cuba, Puerto Rico, Dominican Republic, Jamaica and the United States at New York.

Address enquiries to London Branch:
108, OLD BROAD STREET, E.C.2.

C. G. WEBSTER, Manager.

IMPERIAL CHEMICAL INDUSTRIES, Paints Division invite applications from men, preferably aged 28-40 years, with at least three years' advertising experience, with knowledge of (a) Press Advertising routine; (b) Technical copywriting (not necessarily paint); (c) Printing types and printing and blockmaking processes. Please write for application form to Central Staff Department, I.C.I., Ltd., 2, Grosvenor Place London, S.W.1.

AN important vacancy for a General Sales Manager exists in a large and well-established company engaged in the manufacture of primary and of fabricated materials used in the fields of insulation and of plastics. Many other applications are under development. The product sells mainly in technical applications, and therefore a high standard of technical education, such as a University Degree in Science, or the equivalent of the Higher National Certificate in Engineering, or similar qualification, is very desirable.

The General Sales Manager will be responsible for leading the sale effort of the company. A man between the ages of 35 and 45 is preferred. Applicants must show thorough and successful experience in general sales organisation.

The post covers heavy responsibilities and the work will be arduous. The post is progressive and carries a substantial initial salary, subject to obligatory superannuation scheme. Residence near the headquarter of the company at St. Helens, Lancashire, will be essential.

A rigorous selection will be made, and those with inadequate qualifications are asked not to apply.

Address applications, with an outline of career, to M.D., c/o Fibre glass, Ltd., St. Helens, Lancashire.

ORGANISING Accountant, wide industrial and commercial experience, desires assignments. Advanced systems, with labour-saving methods. In Financial, Cost, Budgetary Control and Group Accounting.—Box 536.

YOUNG LADY required to act as Secretary/Personal Assistant to Principal of large firm of General Merchants with offices established in Aden. A sound knowledge of French is essential. Shorthand typing desirable, but the ability to act on own initiative is more important. Applicants must be willing to reside in Aden after preliminary period at London office. Excellent prospects for right person. Write, stating age, education, experience, etc., to Box 539.

ABLE, energetic man, analytic mind, experienced negotiator, solicits offers. Economics, legal training. Knowledge psychology, industrial relations. Executive, organising experience, committees, staff control, research, précis, reports, journalism, public relations. Ex-Parliamentary candidate. Personable, adaptable, ideas, initiative.—Box 540.

LADY (22), inter accountancy R.S.A. studying C.I.S. costing, wages and some book-keeping experience, seeks position as assistant in secretary's or accountant's office.—Box 541.

ECONOMIC research appointment required by young woman, B.Sc. (Hons.) (Econ.), London. Seven years' confidential Government work. Administrative and research experience. Fluent French and German. Secretarial training.—Box 542.

ASHRIDGE-BERKHAMSTED, HERTS. (Principal: General Sir Bernard Paget, G.C.B., D.S.O., M.C.) Ashridge is a residential college for education in Citizenship and provides an open forum for discussion. Course 36, Week-end September 19-22, 1947. LOCAL GOVERNMENT. Subjects: The Machinery of Local Government, The Housing Problem, The Work of the Local Education Authority Voluntary Services. Speakers will include The Dowager Marchioness of Reading, G.B.E.; H. Symon, Esq., Ministry of Health; L. Missen, Esq., Chief Education Officer, East Suffolk. The Course assembles Friday evening and disperses early Monday morning. Inclusive fee, £3. 3s. Application for enrolment should be made to the Bursar, Ashridge, Berkhamsted, Herts. Telephone: Little Gaddesden 3191.

WANTED—Copies of *The Economist*, dated July 19 and August 2 and 9, 1947.—Reply, Box 545.

MONOMARKS—Permanent London Address. Letters redirected, 5s. p.a.—Write, Monomark BCM/MON04N, W.C.1.

"THE Public Corporation in British Experience." A paper read before the Institute of Public Administration. Now obtainable from the office of the Institute, 18, Ashley Place, S.W.1. Price 2s. 6d. (2s. 8d. including postage) or from principal booksellers.

AVELING-BARFORD LIMITED

At a Meeting of the Board of Directors, held on Tuesday, August 19, 1947, the following Resolution was passed:—

It was Resolved that a Second Interim Dividend be paid on October 1, 1947, on the £375,000 Ordinary Stock at the rate of 4 per cent (actual), less tax, and that the Ordinary Stock Transfer Books of the Company be closed from September 8 to September 22, 1947, inclusive.

By Order of the Board,
Grantham, August 19, 1947.

H. C. RYAN, Secretary.

A Curse on the Tinker

ANOTHER mouse of restrictions has been brought forth from the Labour mountain. Once again, the public had been led to expect very much more than was imposed on them by Wednesday night's announcement. Once again, the inevitable public reaction will be to conclude that the crisis cannot, after all, be as bad as the Government says it is. For the great mass of the people, the only impact of the economic crisis is to be the loss of twopennyworth of meat a week, and elaborate care is taken to see that there is no reduction in the supplies available to the canteens and restaurants where they eat. The rest of the restrictions are chosen to fall almost exclusively on those who are not wage-earners. So far as the workers are concerned, the Government are still tinkering with the crisis; it is the middle classes who get the tinker's curse.

This simply will not do. A revolution in the country's economic position happened last week. Until Wednesday, August 20th, the British people were living on Lend-Lease and policy was governed by the hope, which was still officially entertained, that it would be possible gradually to restore the pre-war pattern of trade among the nations. Last week, all that changed. For one thing, the dollars have now run out. What Mr Morrison called the twelfth hour has struck, and it would be the height of foolish optimism to base any calculations on the assumption that more dollars will be forthcoming either through the Marshall Plan or in any other way. For these new circumstances, a new policy is clearly required. Yet the Government announcement is at some pains to argue that these new cuts are merely a further instalment of the policy decided upon before the fateful day of August 20th. Moreover, something else of the greatest importance happened on that day. The two crippling conditions attached to the American Loan vanished—the obligation to make sterling convertible was explicitly suspended and the non-discrimination provision, for all Mr Snyder's protestations of the sanctity of Article Nine, was tacitly abandoned. Not only is there the most urgent need for a new policy, but there is a new freedom to devise it in the way best calculated to serve Britain's needs and interests. But of a new policy there is not the faintest vestige of a shadow of a sign. All that the Government can think of is the old policy, and not very much of that. Since they came into office two years ago, Ministers have contributed only one new idea to economic policy and that one, the nationalisation of basic industries, is of precisely no relevance at all to the present crisis. For the rest, all they can think of to do is to turn a bit further the screws of the old war-economy policy of the Coalition. All the old expedients are being trotted out again, with the rations somewhat smaller and the targets somewhat higher. Even their boldest step, the policy for the expansion of agriculture, carries with it, as the following article explains, not a single new idea about how it is to be done. The present course of economic policy having been demonstrated to be inadequate for the nation's needs, their only recourse is to intensify it.

Naturally, the old screws are getting harder to tighten any further. Naturally, some of them will break under the Government's hand. And

naturally a policy so conceived will fail to achieve what is required of it. The first test of a sound policy for today is very simple. Does it reproduce in every family budget and in every business profit-and-loss account a microcosm of the nation's desperate straits, so that individual efforts and initiatives will pull in the same direction as the Government's policy? So far from trying to do that, the Government seems to be desperately anxious to insulate the great mass of the people—who, after all, have nearly three-quarters of the total of net personal incomes—from feeling any impact of the crisis. The feather bed is still their economic symbol. And as a result, for all their protestations to the contrary, the country will be lucky if it does not find itself living on the last vestiges of its stock-in-trade, and if the destocking crisis which occurred in coal last February is not repeated before very long throughout the length and breadth of the economy.

It is difficult to feel very optimistic about the prospect of a really new course of policy emerging, either to recapture the control of the domestic economy that has been lost or to take such advantage as can be gained from the new state of affairs in international trade. For one thing the senior civil servants, who are the real initiators of policy, are all very tired and overpressed men who simply could not face the mental and physical effort of starting again from first principles. And it is by now clear that the Socialist Ministers never had but one idea. They have been so obsessed with getting hold of the controls of the national economy, with "seizing power," that they have never stopped to think what they are going to do with it. In the one industry that is already nationalised, coal, there is an obvious policy to pursue; but there are no signs of its being pursued, and meanwhile the coal industry goes on much as it did before. In the other industries that are about to be nationalised, the appointments made demonstrate a determination that very little, if anything, shall be changed. So far the

An Expanded Agriculture

OF the making of targets, there is no end. When the Prime Minister announced earlier this month that the Government had decided on a programme designed to increase the net output of British agriculture by £100 million, or 20 per cent., by 1951-52, few people recognised this step as the most positive, and also the most far-reaching, item in the Government's hastily assembled ragbag of policy and expedient to meet the economic crisis. It might have been just another exhibit to add to the gallery of rounded millions—like the coal target—but, in fact, it represents a fundamental decision by the Government about the future of the British economy. The Government have said, in effect, that there is no hope of solving the problem of the British balance of payments before 1952, and probably not then. Britain must grow more food regardless of costs, and regardless of the British standard of living, because, within the range of practical forecast, it will be unable to export manufactured goods on a sufficient scale to ensure adequate food imports. Implicit in the Government's view lies the assumption that no conceivable change of economic fortune will turn the terms of trade sufficiently in Britain's favour so that an adequate volume of imported food and raw materials can be obtained in return for British exports.

To say that this is a doctrine of despair is not necessarily to prove it wrong. It may be that in a world dominated by American productive capacity, there is no possibility of increasing the efficiency of British industry so that it can meet American output on the world's markets on competitive terms. It may be that Britain cannot afford to gamble on the chance that the terms of trade will one day begin to turn in our favour. Perhaps the export surpluses of primary producers,

Labour Party has made a negative contribution to economic policy. Nationalisation adds nothing, and the elaborate deference to trade union selfishness and recalcitrance subtracts a great deal.

There is no case, at least in the crisis of the moment, for a return to the methods of individualist *laissez faire*. What the nation urgently needs, and would respond to, is some real economic planning, some purposive direction of its affairs instead of the present hortatory, sloganised drifting. Planning has no terrors for the British people, provided it achieves results. Socialism would be accepted by an overwhelming majority of the people if it could only be given some meaning. Mr Mackay, in his letter to this journal last week, defined "Socialist measures" as meaning almost anything other than public ownership of industry. This is, to say the least, a novel definition, worthy of Humpty Dumpty. But if it is accepted by the Labour Party and the Government it at least means something. What is infuriating is the Government's propensity for nationalising first and then looking round for a policy, of taking sweeping powers without the will to use them, of controlling for the sake of controlling and not for the sake of doing anything. If they would reverse the process, if they would first realistically face the facts about the country's position, then work out the possibilities of altering the facts, then set targets that can be achieved and are consistent with each other, and only as a last stage evolve the controls and take the powers that are necessary to achieve the targets—if they would do that, then they would not need to worry about frightening the people by being too drastic or too extreme. Nothing that would emerge from such a process would be half as frightening as the present demonstration that, having failed in one line, they have nothing to put in its place, and that, with a hurricane blowing up, the committee on the bridge cannot agree either to alter course or to take in sail or even to batten down the hatches.

when at last they become sufficient, will be able to find a better market than Britain. Again, political stress may postpone for several years the restoration of the rice economy in Asia—leaving the growing millions of those regions to be saved from starvation only by the shipment of cereals from the Western Hemisphere. All these things may happen; the Government's decision may, in the end, prove to be the right one. But no such far-reaching decision ought to be reached without full exposure and examination of the reasoning that leads up to it. And it is not only the justification for the policy that should be debated in public. Even if there is no escape from the forced growth of British agriculture to save foreign exchange, it is high time that the British consumer began to count the cost.

To read the Government's announcements one might be forgiven for believing that there will be no cost at all—that £100 million of imported food will simply be replaced by £100 million of additional home-produced food. In terms of present prices, the net output of British agriculture (that is, the value of the produce sold off farms after allowance for the cost of imported feeding stuffs), which was about £400 million before the war and is, say, £525 million this year, is to be increased to something over £600 million in five years' time. Since the emphasis of the new programme is on dollar saving, and not on the saving of cargo space as in the war, the greatest stress is rightly laid on increases in the output of pig-meat, eggs, beef, mutton, cereals and linseed, while root crops like potatoes and sugar beet are expected to fall—the former by more than a third from the present level of output. But before the over-simplified picture of a simple replacement of imported food by home-

grown is accepted, some estimate of the future trend of prices must be made. It may be true that the cost of growing the additional 20 per cent of food at home, at the level of costs prevailing hitherto, is not very different from the cost of importing it, at the prices now prevailing. But it is as good as certain that world prices of food will fall, and fall heavily, before long. And, as the new price list announced last week demonstrates, it is quite certain that the cost of British food will rise. It may be a case at the moment of a simple exchange of £100 million of British food for £100 million of imported food. But it is likely to be a case, before long, of paying £150 million for British food to replace foreign food that could be bought—if the foreign exchange were forthcoming—for £75 million. The difference will be paid by the British consumer, either as consumer or as taxpayer.

It is painfully obvious that the Ministry of Agriculture has no policy for securing the required 20 per cent increase in food production other than the hope that it can be attracted out of the earth by the pull of ever higher prices. Experience during the war showed that to secure a given increase in output, a far greater increase in direct costs and inducements was required. Between 1937-38 and 1946-47, the quantum of British agricultural output increased by rather more than a quarter, but the increase in total farming costs during this period was of the order of 90 per cent—wages, of course, were more than doubled during the period. It has been calculated, on the basis of pre-war prices and wages, that it cost £136 million to secure an increase in annual net output of £62 million between 1938 and 1943-44. The Ministry's announcement is relatively hopeful about costs in future, for it counts on an improvement in farming efficiency of 2 per cent per annum during the next five years—which would provide half the expected addition to output. Fairly rapid improvement in the efficiency of agriculture has been achieved by increased mechanisation, upgrading of dairy herds and improved grassland, and if the ability and resources of the average farmer could be raised, the improvement would be more marked. But it is doubtful whether any great reduction in money costs can be expected from improved technical efficiency—indeed, higher prices seem to be needed as a spur to greater efficiency. Certainly, the increase in farm wages during and since the war has outstripped the improvement in the efficiency of farm labour, yet farm workers will remain in a strong position to secure a further increase in real wages.

It is, therefore, fairly certain that merely to offer higher prices and to pump extra capital into the land will not be the most economical method of procuring additional food supplies. Increased food prices will mean increased export costs; overseas markets will have less to spend on British exports; and any improvement in the efficiency of British agriculture may well be

matched by overseas producers, thus preventing any reduction of the gap between the costs of British and imported food. There is no means of telling whether these points were studied when the programme was being prepared. But if they were, they have apparently been waved aside. The Government, in this instance, are strangely careless about the standard of living of the people. They are at least prepared to condemn it to a sharp reduction without even explaining the reasons why it is unavoidable. Their reliance on home food production would make any pre-war Tory administration gasp with astonishment. Mr Morrison, in his broadcast last Saturday, declared that much of the talk about incentives was "bunk." But one has only to look at the new schedules of prices to see how open-handedly the Government, on behalf of the British consumer, is extending incentives to the farmer. There is no mention of sanctions to ensure good farming, and no fundamental changes are proposed in farming technique or lay out. A farmer need do no more than his reasonable best, and he can rest assured that he will be perfectly safe under the new Agriculture Act. He can grow linseed at £55 a ton, wheat at 23s. a hundredweight, and produce pigs at 36s. a score. Linseed is a fairly new crop, for which the price has been pitched at the scarcity level contrived by Argentina; wheat averaged 9s. 8d. before the war, and pork pigs 13s. 5d. Now that prices are settled between the Government and the National Farmers' Union on the basis that the least efficient marginal producer can pay his way, such prices as these are more than generous to a farmer of moderate ability and efficiency. The only remaining boon to be granted by the Government—and some farmers have been forward enough to suggest it—is to revert to the old system of taxation under Schedule B.

It may be said that nearly half of the extra profits from farming will in due course be gathered in by the income tax collector. But there is an important qualification to this notion, for under the Income Tax Act of 1945 it is highly advantageous to invest in new machinery, and to recoup the generous allowances on new plant. The present backlog of orders for new farm machinery (and the black market premiums of £100 or so for new combine harvesters) show that the spurs to the reinvestment of profits in new equipment are real enough for the farmer of any size and substance. But this is not always true of the smaller farmer—and nearly 90 per cent of all the holdings in England and Wales are less than 150 acres. The new scheme offers no guarantee that the small man will re-equip on an adequate scale; he may prefer to pay off debt or put his profits by for retirement. It is he who is steeped in tradition and inefficiency; he whose output would gain most from the application of new methods; and he who is usually least ready to accept help and advice. If the County Committees, on whom the task of putting the Government's broad programme into detailed

The Chairman said

"... the Society's With Profit policies will stand comparison with those of any other office. This is particularly true when the strength of the Society as disclosed by the triennial investigation is borne in mind."

Extract from Chairman's speech, 27th March, 1947

EQUITY & LAW
Established 1844
LIFE ASSURANCE SOCIETY
20, LINCOLN'S INN FIELDS, LONDON, W.C.2.

effect will rest, are to succeed in their task, they will need strength as well as tact in getting the best from the small farmers.

The same reticence is evident in the statement about the landlord's role. It is quite obvious that improved milk-yields, expanded beef herds and an increased pig population will require much outlay for farm-buildings, water supply and grass drying plant. A Government scheme for financial assistance to encourage grass conservation is promised later. But how quickly can new farm buildings be provided—and who is to pay for them? Only 37 per cent of agricultural holdings in England and Wales have piped water supply to farm buildings, and a mere 16 per cent to fields. When a landlord borrows at 3½ per cent and charges his tenant 4 or perhaps 5 per cent for such improvements, he is helping the farmer at quite small cost to make an appreciable increase in his profit. The past seven years have weighted the scale increasingly against the landlord and in favour of the tenant—a familiar consequence, indeed, of inflation and fixed money contracts. Can the average landlord be expected to give the Government scheme his full support without a better return? How far will he succeed, under the new Act, in taking cases for increased rents to arbitration? Will he not require a freer hand for reconditioning old buildings as well as the construction of new ones?

*

In the search for dollar-saving and increased self-sufficiency in home food production, the Government are embarking on an untried, and maybe perilous, experiment. It is, unfortunately, impossible to assert with confidence that its gloomy assumptions about the future course of British export trade are wrong. But it is certain beyond doubt that the consequences of the new agricultural programme (whether it is justified by future events or not) will mean a further, and permanent, reduction in the British standard of living. For all its sensible emphasis on an increase in livestock and poultry, it still contemplates a wheat output half way between the pre-war level and the wartime peak, and increases of 180 per cent in the output of barley and between 50 and 60 per cent for oats, compared with the pre-war levels. At one and the same time, an attempt is being made to produce more high-class protein for human consump-

tion, and more high-class feedingstuffs for livestock. When the Minister of Agriculture was asked last week who would pay for this programme of agrarian nationalism, he referred the question to Mr Dalton. The Chancellor has, on several occasions, referred with satisfaction to agriculture as "a great dollar saver." It will be a great pound waster under the new policy; perhaps that is the best ground for hoping that the increased costs will be passed direct to the consumer, where they rightly belong and will be fully visible, and not forced on the taxpayer as increased subsidies.

It may be that the British industrial consumer, by his failure to produce efficiently for export, has deserved to reap this bitter harvest. But he has at least the right, before he agrees to this new policy, to demand the fullest and most convincing answers to three sets of fundamental questions.

First, what are the Government's reasons for believing that British exports will never again be sufficient to pay for the pre-war volume of imports? Do they agree with FAO that it will not be long before there will again be a surplus of food in the world market? And if they do, why do they think that Great Britain will be unable to offer goods in exchange? Or is the new programme not intended to continue after 1952? Will they give a pledge not to keep out imported food, if it is available cheaply and can be paid for?

Secondly, what methods do they propose for ensuring that the targets of production are in fact attained? Do they propose to rely entirely on the offer of higher prices?

Thirdly, what estimate can they form of the cost of this programme to the British nation? That is to say, how much higher fraction of his income will the average Englishman have to pay out for food in, say, five or ten years' time, than he would have to if, at that time, the country were still free to buy its food where it could be had most cheaply?

There may be convincing answers to all these questions. But before the country, in a moment of panic, throws overboard the system of economy upon which its wealth and greatness were built, they should at least receive the most searching public examination.

Nationalism in South-east Asia

THREE European nations have since the war been confronted with intense native independence movements in Far Eastern territories which were under their sovereignty in 1941. Britain in Burma, Malaya and North Borneo, France in Indo-China and Holland in Indonesia have had to face post-war situations which, in spite of local variations, have been broadly similar. Japanese invasion, spreading out to the Bay of Bengal in the west and to Java in the south, eliminated the European administrations—the British and Dutch in 1942, the French in 1945—destroyed their prestige, set up formally independent states and spread far and wide the doctrine of "Asia for the Asiatics." The Japanese gained little for themselves in the long run, for their arrogance and exactions soon made them unpopular with the peoples they "liberated," and the news of their military defeats quickly destroyed their temporary reputation for invincibility. But the impetus given to nationalist movements continued to operate after the downfall of Japan and brought together in new formations of leadership those who had throughout the war sided with the Japanese, others who had always resisted the Japanese and others again who had changed

sides and at least begun to work a passage to the camp of the United Nations.

In each area there were in 1945 native armed forces, which had either been trained and equipped by the Japanese or else supported and supplied with arms by Allied agents for guerilla warfare against them. In returning to their former territories in the last stage of the war, or after the Japanese surrender, the European Allies had to decide in each case whether to recognise the new political and military organisations as *de facto* authorities and negotiate with them, or whether to stand firmly on their juridical rights and treat any local power not authorised from the metropolitan country as a merely private and unofficial body.

The conditions of re-entry into South-east Asia were, however, very different for the British on the one hand and the French and Dutch on the other. The British fought their way back into Burma while the war was still going on and were able to land in force in Malaya immediately after Japan's surrender; thus they not only returned with the prestige of victors, but with sufficient strength to prevent usurpations of

governmental power. In Burma, the Japanese-sponsored Republic under Ba Maw had been involved in the collapse of Japanese power, and Aung San's forces, who had crossed over to the British side, transforming themselves overnight in British military terminology from the BTA (Burmese Traitor Army) into the BPF (Burmese Patriotic Forces), were not strong enough to make an open challenge to the juridical sovereign. In Malaya, key points were taken over directly from the Japanese, and the Chinese Communist guerillas, who represented "resistance" in Malaya, had no chance to seize power; in Malaya, in any case, the division between the Chinese and Malay communities had prevented any real national movement from emerging, and the Japanese, anxious to keep so valuable a territory entirely in their own hands, had not tried to set up an independent state. Thus, both in Burma and Malaya, the British had a firm grip before the end of 1945. They had the power to protect their own nationals and properties until agreement could be reached with native leaders and were nowhere at the mercy of mobs acting in the name of "governments" which could not, or would not, control them.

For the French and Dutch the position was quite different. Owing to the conditions in their homelands they could only make their initial return to their Far Eastern territories through token detachments in the train of British forces marching in to take the Japanese surrender. Further, it had been agreed between Britain and the United States that northern Indo-China should be a Chinese strategic sphere; southern Indo-China, including Saigon, had long been allocated to South-east Asia Command. Java, however, had originally been in the sphere of General MacArthur's command—as it had been assumed that a landing there would be made either from Australia or the Philippines—and was only transferred to South-east Asia Command just before Japan's surrender.

These war-time dispositions, made for strategic convenience, determined the political issue. In northern Indo-China the Chinese protected the Vietnam Republic set up by the Viet Minh party. In southern Indo-China, British forces did not recognise the authority of this Republic and co-operated with the French in re-establishing their control. In Indonesia, the British expedition to take over from the Japanese had to be improvised and was carried out with an inadequate force; at the outset, conscious of inability to defend themselves, the British, in spite of Dutch protests, accorded *de facto* recognition to the Indonesian Republic which had been prepared with Japanese support and proclaimed just after the surrender.

There was no consistency of principle in the British dealings at this time with the French and Dutch respectively. Morally, the French case was far weaker than the Dutch, for the "Vichy" administration in Indo-China had been collaborating with Japan up to March, 1945, and the Viet Minh had been a resistance party supported by the Chinese and American authorities in Kunming. In Indonesia, on the contrary, there had never been any Dutch collaboration and Soekarno's movement had been thoroughly pro-Japanese—though it was subsequently joined by other nationalists who had opposed the Japanese. Yet the British gave more support in the critical days to the French than to the Dutch, the overriding consideration being one of momentary expediency. In the sequel, both the French and Dutch were able to land some troops, but found themselves confronted with "republics" in being, claiming sovereign independence and denouncing any return of European soldiers and officials as "aggression."

In international law, neither the Vietnam nor Indonesian Republics have attained any juridical existence, as no nation has given them formal diplomatic recognition; the French and Dutch are, therefore, within their legal rights in crushing them as rebels, if they can. Nevertheless, these new régimes have had time to establish themselves to a degree of strength at

which they can only be overcome by regular military operations. Such warfare, when undertaken by the Dutch, has led to the intervention of the Security Council. The French had previously been carrying on similar warfare in Indo-China for half a year without attracting the attention of the Security Council, but the drift of events has made it clear to them that the procedure applied to the Dutch would be applicable, sooner or later, to them also, and France has therefore used the veto to stop a Russian proposal for direct Council supervision of the truce agreement in Java.

In Burma, by contrast, the British have managed to avoid any armed clash with the main nationalist leadership, have admitted it to power, and have raised no objection to the Constituent Assembly's decision to proceed to sovereign independence in the immediate future. After the assassinations a month ago, all the dead Ministers were at once replaced from the same party formation with the concurrence of the Governor, Sir Hubert Rance. There was no disposition to use the crisis as an occasion for the Governor to resume emergency powers

or to postpone the constitutional development already planned to take place. The British people are certainly entitled to congratulate themselves that their policy in Burma has been successful in avoiding violent collision with Burmese nationalism and that they have not a costly and devastating colonial war on their hands in the Far East, as both France and Holland now have. On the other hand, they should endeavour not to indulge in an excessive self-righteousness in relation to their French and Dutch neighbours, but try fairly to understand, not only the initial disadvantages from which they have suffered in the post-war period, but also how their conceptions of the solution to the colonial problem differ from the British.

The French approach to the problem of colonial nationalism—and the Dutch in general share the French outlook—differs from the British fundamentally in its idea of the new relation to be established with colonial territories as a federal one. The British approach the question of India or Burma with a habit of thinking derived from the experience of constitutional adjustment with the Dominions over a long period of time. The British have never been strong on the theory of the state or the making of written constitutions, and they have never spent their time worrying whether the Empire was breaking up or not when self-government was given to territories which had been governed from London. The personal union provided by the monarchy,

was, of course, the element which gave continuity and averted any formal break; even so, the British mind has now become so accustomed to parts of the Empire setting up house on their own that, even if they want independent republics, it is no longer thought impossible for them somehow to belong to the Commonwealth. The British economic or strategic interests affected by these evolutions of self-government are by no means ignored and underrated, but it is a cardinal principle—or perhaps it would be better called an instinct—of British statesmanship that the important thing is to preserve goodwill into the new era as the only sure means of obtaining satisfactory settlements.

France and Holland, on the other hand, see the solution in their Eastern territories in terms of imperial federation—or rather of two-storey federations, for in each case there is to be a regional, as well as a general, federation; the Vietnam Republic is to be combined with Cambodia, Laos and, perhaps, Cochinchina in an Indo-China Federation, which will in turn be part of the French Union, and similarly the Indonesian

Republic, comprising Java and Sumatra, is to be combined with East Indonesia in a United States of Indonesia, which will be combined in a federal union with the Kingdom of the Netherlands. In these schemes, real power will be held by the federal authority at each stage and, if the federation were entirely voluntary, great value might be claimed for such elaborate political systems. But the nationalists of Vietnam and Java see them as devices for maintaining French and Dutch rule in disguise. After all, it is the Vietnam and Java-Sumatra Republics which established a *de facto* independence, and the other territories with which they are to be federated are those over which the former European rulers have regained control. It is, indeed, very questionable whether there is any future for projects of federation between widely separated European and Asiatic peoples. The British way of liquidating colonial rule has its dangers, but it holds out better hopes of lasting co-operation than an artificial and complicated federal structure.

The Balance of Payments—II

The Terms of Trade

THE first article of this series analysed the relative importance of the different causes of the critical deficit in the British balance of payments. If the total deficit in the first half of 1947 (ignoring capital items, of course) can be guessed at the annual rate of £525 millions, then the responsibility for it can be very roughly distributed as follows (in £ millions):—

Pre-existing deficit (1938)	70
Effect of changes in volume of exports and imports	-180
Effect of fact that prices have risen	105
Effect of fact that import prices have risen more than export prices	170
Increase in Government overseas expenditure ...	234(?)
Reduction in interest receipts	100(?)
Reduction in other invisible income	26(?)

Clearly the largest single item is the great increase in the Government's overseas expenditure. In 1946, the total of £300 million was made up of £225 million for military expenditure (net), £97 million for relief and rehabilitation, £38 million for "Cost of Germany (net)" (not including the cost of the Army of Occupation), and an unexplained credit item of "Other (net)" amounting to £60 million. The total will certainly fall. Relief and rehabilitation expenditures are already ended and military commitments, it must be hoped, will fall very rapidly. Germany is to be self-supporting in five years' time, and might even conceivably be able to bear the costs of occupation. On the other hand, Government overseas expenditure will not disappear. It was £16 million in 1938 and the fall in the value of money by itself would make some increase necessary. Moreover there has been a regrettable tendency to locate the new international institutions in expensive places like New York. Perhaps the best guess that can be made is that Government overseas expenditure in the 1950s—the period with which these articles are concerned—is unlikely to be less than £30 million or more than £50 million a year. That would mean a relief, as compared with the above table, of between £200 and £220 million.

The future net receipts of interest and dividends are another puzzling item to estimate. It is often said that Great Britain is now a debtor country. That may be true so far as capital values are concerned. But it so happens that many of the remaining assets are invested in directly owned trading concerns where the average return on capital, taking good years with bad, is reasonably high, while the great mass of Britain's debts are—at least for the present—in the form of bank balances

on which little interest is paid. It is therefore not unreasonable to suppose that Britain can be a debtor on principal account and a creditor on income account. On the other hand, the net receipt of £80 million in 1946 is bound to be diminished. Some of the sterling balances will be funded, or used to purchase British investments that are now income-earning; and in the 1950s there will be interest to pay on the American loan, against which can only be set the hope of revived dividends from some British properties, in Malaya and elsewhere, that are now paying nothing. On balance, the country will be lucky if, in the 1950s, it has net receipts in interest and dividends sufficient to pay for the Government's overseas expenditure.

Other "invisible" income (chiefly shipping, insurance and banking earnings less film royalties) brought in £73 million in 1938 and £40 million in 1946. Shipping earnings can be expected to recover; indeed, they may be quite high unless and until the German and Japanese merchant fleets are restored. Insurance earnings have held up well and should have some scope for further increase. Banking and general merchanting earnings are more doubtful. Moreover, all these items are influenced, sometimes with some delay, by changes in the general value of money. It would be foolish to attempt to make a definite estimate of what they will amount to in the 1950s; but the upper limit cannot be much above £100 million a year.

What all this amounts to is that the net total of Government expenditure, investment income and other invisibles, which brought in £232 million in 1938 and led to a net debit of £180 million in 1946, cannot be relied upon to bring in more than £100 million a year at most in the 1950s. On the other hand, the net total ought not, at the worst, to be less than, say, £40 million on the right side. This, it should be repeated, is not an estimate, but a mere setting of limits. The purpose that the calculation serves in the present context is to demonstrate that the net total of all the "invisible" items is likely to be very small—probably not more than about 5 per cent of the "visible" items—and that variations in the items of which it is composed are not likely greatly to affect the main issue. Any contribution that the invisibles can make to the balance of payments will be very welcome; but the shape of the balance will be almost entirely determined by imports and exports of goods.

The entries that are made in the international accounts in respect of imports and exports are a function, first, of their

volume and, secondly, of their price, and of the two, it is the price factor that, in many ways, is the more important. The relationship between the prices of imports and the prices of exports is the famous Terms of Trade of which so much is heard in current discussion. It is, indeed, one of the most fundamental of all economic phenomena, especially for a country situated as this one is. But it is also one of the easiest of economic terms to misunderstand and mishandle.

Crudely, what is known as "the Terms of Trade" is an index number derived by dividing an index of export prices by an index of import prices. This is what is graphed in the first of the accompanying diagrams. A rise in this index indicates that a representative unit of British exports can be exchanged for a larger quantum of imports than before; it is therefore said to be a move in Britain's favour. It will be seen that, over the generation that has elapsed since 1913, the terms of trade have, on the whole, moved strongly in Britain's favour. This was not so in the first war, but in the 1920s (except in the boom years at the end of the decade) the index stood at 120 or higher and in the early 1930s it moved up to 140 or higher. In 1938 it stood at 138 and over the war period as a whole there was not much change. It was only in 1946, and particularly in the first half of 1947, that it moved sharply against Britain; the June figure was 127.

Basically, there can be no doubt at all that the "favourable" trend of the terms of trade in the 1920s and 1930s was in fact, as well as in economic jargon, very favourable to the British community. It meant that the necessary supplies of food and raw materials could be obtained, throughout those decades, with the expenditure of many fewer man-hours of British labour (in the early 1930s with about one-third fewer man-hours) than would have been necessary if prices had retained their 1913 relationship. This meant that a very large total of man-hours was available for raising the national standards either of leisure or of consumption. Unquestionably, this was a great benefit to the country. Directly, living was cheap. Indirectly, new industries grew up on the purchasing power that might have had to be devoted to food and raw materials. It was, for example, demonstrated in *The Economist* at the time that the chief cause of the housing boom of the 1930s lay in the favourable shift of the terms of trade.

But the "favourable" nature of this shift requires some qualification. For one thing, some part of the man-hours set free by it were compulsorily devoted to unwanted leisure. A country that enjoys a "favourable" shift in the terms of trade can either import more for the same expenditure of effort in the export trades, or it can import the same volume and have unemployment in the export trades. Britain did the latter; and it would have taken some clever explaining to convince the cotton and steel industries in 1933 that anything "favourable" had happened to them. The standard of living of the community as a whole benefited, but part of the benefit was wasted and the gain in real income and leisure was unevenly distributed.

Secondly, the long-continued favourable shift in the terms of trade has very largely concealed a major change in the economic structure of the country. As the second chart shows, the volume of imports into Great Britain has shown a generally rising tendency, while the volume of exports has no less consistently fallen. If both are taken as 100 in 1913, then the average volume of imports in the five years before the second war was 125 and of exports 65. In short, the volume of exports, relatively to that of imports, had been halved. The British community was habituating itself to a volume of imports that rose almost parallel with the national income while it was steadily losing the habit of exporting. In the late 1930s, the average inhabitant of Great Britain was importing nearly 20 per cent more than in 1913 but exporting nearly 40 per cent less. If the favourable shift in the terms of trade can be regarded as permanently assured—or, still better, if it can be relied upon to continue—then these persistent tendencies can be looked upon with the complacency with which they were in fact regarded. But a country which becomes increasingly dependent on imports while it is losing the habit of export is in a very vulnerable position if the terms of trade should happen to swing the other way—as the British people are now experiencing.

The words "favourable" and "unfavourable" should therefore not be applied to shifts in the terms of trade without considerable qualification. Moreover, there is also danger of false conclusions being reached when the attempt is made to base future policy on the terms of trade. If the single object of policy is to move the terms of trade in Britain's "favour," then by far the simplest way of doing so is to double the prices of all British exports. But the immediate effect would be a sharp fall in the volume of British exports. Such trade as was done would be on very "favourable" terms; but the gap in the balance of payments would be larger than ever and the country would starve. The example is not too fanciful, for it is quite possible that there will be a sharp fall in the world prices of primary products at some time in the next two years. If there is no fall in the prices quoted by British exporters from their present astronomical levels, then there will be a sharp "favourable" shift in the terms of trade, but there will be no British exports. It may be to a country's advantage to seek less "favourable" terms of trade.

The pure statistical conception, in fact, comparing prices without regard to the volume of trade done at those prices, is a barren and misleading one as a guide to policy. It is not nearly enough to say that British policy must hope for a favourable shift, and work for it. The definition of the object of policy is a much more complex formula, bringing in volume as well as price. For the next few years, the object of policy may be defined as such a relationship between import prices and export prices that the necessary volume of imports can be bought and paid for with the lowest possible expenditure of man-hours in the export industries. In the next article an attempt will be made to reduce this abstract conception to figures.

But to what extent such a conference can be of value at the moment is rather dubious. Not only is it costly, but it imposes a considerable strain on the already overworked government officials, particularly of European countries, who have to devote a considerable amount of energy to the Paris talks. In any case, can the decisions of the FAO conference, whatever they may be, be considered in isolation from the Marshall Plan, particularly as the world food shortage is aggravated by an equally ubiquitous dollar shortage? Surely it would have been better to agree on the Marshall Plan first and then attempt to fit that scheme into the world programme. It would be even better if producing countries such as the United States and Argentina were to make a realistic effort to restrict or even reduce home consumption and thus make available larger supplies to their necessitous neighbours.

* * *

Better News of the Ruhr

A cynic might feel inclined to draw all manner of conclusions about the British administration of Germany from the fact that while the Commander-in-Chief and his technical advisers were absent in London, the principal Foreign Office representative and the chief industrial and economic advisers in Washington and the remaining experts in Paris, coal production in Germany rose from new record to new record week by week and has now nearly reached the level of a quarter of a million tons a day. The Anglo-American coal talks in Washington have been greatly simplified—from the British standpoint—by this background of steadily increasing coal output. In the teeth of ill-informed and often malevolent criticism from a stream of American visitors to the Ruhr this summer, the British have consistently maintained that only more food and better conditions would increase output and that the actual management and organisation of the mines were as good as was humanly possible under the conditions. To confirm the British point, the last weeks' spurt in output has followed the issue of new rations and inducements to the miners, and at the same time the British experts (chief among them Mr H. E. Collins, until recently Deputy Director of the North German Coal Control) were able to convince the Americans that technically Britain had little to learn on questions of management and production and that, on the contrary, a remarkably efficient organisation had been built up. There should now be little difficulty in creating a harmonious Anglo-American control group for the mines which will very largely continue British policy with the addition of bigger material inducements to the German workers. The question of supplying the dollars for these inducements, however, has yet to be discussed.

* * *

The Education of Our Masters

The education of members of the Government continues. Last Saturday's broadcast by Mr Morrison again emphasised the need for all to work harder—how uninspiring it sounded on this, at least the twentieth occasion—and there was a welcome warning that "the government can't do the whole job"—it can only plan "the strategy of peace-time prosperity." There was some recognition that Great Britain is trying to do too much—but there was a significant absence of any reference to housing.

But, as was only to be expected from an official broadcast, the most important questions were ignored. Is it possible to increase production without first reducing the inflationary pressure? And how long can the Government afford to gibe, as Mr Morrison did, at the price mechanism? All agree that, as this country is now living beyond its income, production must be increased. And at last, it is pretty generally realised that neither rationalisation nor the direction of labour can do this. But how can the labour force be revitalised? Mr Morrison dismissed incentives as "bunk." He may be right. Perhaps people cannot be "spoon-fed and bribed" to give Britain all the effort it needs. On the other hand, it is quite clear that nobody is going to leave a job at £15 per week, "making and selling things that Britain can do without," for one at £5 per week making things that Britain needs, on the strength of a broadcast appeal. During the war a change of job was always eased by an increase of pay. But now the conflict between official policy and the pull of the market, particularly in the underpaid and undermanned cotton and woollen industries, the foundries, the brickworks (to borrow the Lord President's examples), is obvious. It is the Government's failure to introduce a wages policy in the early days of peace that has now forced it to the direction of labour. This divergence between what the Government wants and the beckoning of the market results from the pressure of

inflation, perpetuated by the structure of controls which actually encourage the spending of money on the uncontrolled and less essential products. The Government is here in a dilemma of its own making, which it cannot solve in the best way, that is by reducing Government expenditure and increasing the sphere of the market, so long as it adheres strictly to its Socialist programme.

A restoration of a price system to its normal function in the economy, and an enlargement of the area of competition in industry—these measures will not be palatable to most Socialists. But until the pressure of inflation and of over-full employment is decreased, it is useless to look for other means of increasing output per head. For only then will the carrot seem worth working for, and only then will it be reinforced by the stick, in the form of a fear of losing one's job. It is on these lines that the way to a "transformed and strengthened Britain in which everyone can work to a purpose" should be planned. The next step "to put stuffing into our dreams" as well as songs in the nation's heart lies with the Chancellor of the Exchequer.

* * *

Transport and Electricity Chiefs

During the last week announcements have been made of further appointments to the authorities which will control the nationalised transport and electricity undertakings. Sir Eustace Missenden is to be the chairman of the Railway Executive and Lord Latham chairman of the London Transport Executive. It is believed that the salary attaching to the first office is £7,000 a year, to the second £5,000. In electricity, the chairman of the new British Electricity Authority will be Lord Citrine and the deputy chairmen Sir Henry Self and Mr J. Hacking. The names of the full-time members of the British Transport Commission were announced earlier in the month (and discussed in *The Economist* of August 16th, page 272), while the announcements from the Ministry of Fuel and Power included the names of some of the chairmen of the Area Electricity Boards.

The announcements follow a familiar pattern; one might be reading a list of members of some new Royal Commission to inquire into, say, the shortage of French chalk. There are the familiar semi-political, semi-industrial names at the top, the same distinguished civil servants, inevitably a trade union secretary and, equally inevitably, a sprinkling of prominent but non-industrialised public figures, no doubt representing, in some way, the interest of the consumers. One may be prompted to ask, what would we do without Lord Latham and Lord Citrine, and why should the higher ranks of the civil service complain about their pay when they need no longer retire on pension? But such questions could be considered uncharitable.

But there is a more serious criticism. So far, if one were judging the appointments from the angle of a capitalist undertaking one would say that care has been taken to look after the interests of the debenture-holders and preference shareholders. Here are sound and reputable people, all with sober reputations. But where does the enterprise come in? Is that to be left to the lower ranks of anonymous executives or has it been left out altogether? Mr Silkin took his courage in both hands and gave the original responsibility for Stevenage to someone like Mr Clough Williams-Ellis. Mr Shinwell and Mr Barnes have certainly been more cautious. Perhaps they do believe that no industry should be nationalised until all possibility of improvement in it has gone.

* * *

Exodus Returned

Did the Government really think of the consequences to this country's international reputation and prestige when the decision was taken to send the "Exodus" Jews to the British Zone of Germany? Few orders could have been such a gift to Zionist anti-British propaganda or so damaging to Britain before a world opinion which Irgun outrages had recently inclined towards sympathy. In a pathetic attempt to undo the mischief which has been done, it has been officially explained that the camps would not in fact be in "the Belsen area" (as was at first reported) and that the soldiers going aboard at Hamburg to "persuade" the Jews to land would not be armed with rifles but only with staves for self-protection. But all Germany is a Belsen for Jewish memory; there is no part of it where Jews have not in the last decade been murdered, tortured or swept in by the Gestapo net for concentration camps and the gas chambers. What kind of obtuseness is it which cannot see the emotional effect on Jews all over the world, on opinion sympathetic to their cause and

indeed on anyone with a sense of human decency, of sending intercepted Palestine immigrants to Germany?

But the "Exodus" Jews have declared that they will not land voluntarily except on the soil of Palestine; either therefore British troops must put them ashore in Germany by force or they will remain indefinitely in the ships in the Hamburg docks making Britain contemptible in the eyes of the world. The same dilemma might confront the authorities if they were brought to a British port, but the moral effect would be entirely different from that involved in having such scenes on a German waterfront. It is no use reasoning that these Jews would be no worse off materially in the one country than in the other; emotional associations are facts not only for psychologists but for any politician who knows his business. Perhaps it is even now not too late to divert the ships to a British port; it only needs a glimmer of sense in the responsible quarter and a radio message to the transports.

* * *

Egyptian Uncertainties

The Egyptian press and public are already taking it for granted that the Security Council's decision on Egypt's case will be unfavourable. An instruction to the two parties to resume negotiations, as proposed by Brazil, would be equivalent to awarding the verdict to Britain. There will be no comfort in this for Britain, whose concern in the matter goes further than being formally in the right. The immediate security problem which may arise from a continuance of Egyptian unrest is serious, but not so serious as the impact on Anglo-Arab relations generally. Egypt, the least Arab of the Arab League states, with an Egyptian nationalism of its own, is yet the unquestioned leader and pace-setter of the Arab world. Despite the appalling poverty and degradation in which the mass of its people live, the doubtful value of its armed forces, and its internal disunion, it is still the most powerful Arab state. All that is new or vital or interesting or progressive, as well as all that is old and corrupt and obscurantist and reactionary, in Arab politics, culture and thinking has its headquarters in Egypt. The only Arabic newspapers that count in the Arab world, the only books of importance are published in Cairo. Egypt is the home of the leading educational institutions. The American University of Beirut has prestige, but the Arab world, particularly in its moods of isolation, is a Muslim world, and the University of Islam is Al-Azhar.

But Britain cannot really come to terms with Egypt until Egypt comes to terms with itself. What is happening in Egypt today is a revolution. This revolution may be postponed or sidetracked or boil over, or it may be canalised by one strong hand, but it must work itself out somehow. A return to power of the Wafd under Nahas Pasha would in itself be merely a postponement. He is as much a part of the old order of landowners, merchants and personal parties as the Palace politicians. But it might not stop there. The younger Wafd members have been getting increasingly impatient with Nahas's old-fashioned idea of party as a game of follow-my-leader without programme or principle. The news that they have joined with the youth sections of the Kotla, the Socialist Labour Party, and others to oppose any resumption of negotiations with Britain is an omen as much for the present regime in Egypt as for Britain. The proportion of University students to the rest of the population is eleven times as great in Egypt as in the United Kingdom. There are not careers for them all, so they turn to political extremism; they are also prominent in the near Fascist groups, the Nationalist Party, the Muslim Brotherhood, the Young Egypt Party, all of which may claim some mass support.

As for a strong man to take charge of Egypt's revolution, in the Atatürk tradition, there is only one whose authority is at present great enough to make him a possible candidate. That is King Farouk himself. But he would have to look very much further than he has yet done, beyond the constitutional façade, to beyond the small circle of upholders of the existing system, to appear, in sharp opposition to them, as the champion of the Egyptian masses.

* * *

No Reprieve for Petkov?

The British and American efforts to obtain a review of the trial of Nikola Petkov have so far met with no success nor at the time of writing does there seem to be any ground for hoping that the death sentence will not be carried out (though in Yugoslavia Professor Furlan, whose condemnation was no less scandalous, has had his death sentence commuted to twenty years' imprisonment). The Soviet member of the Allied Control

Commission in Sofia, who previously obstructed British and American requests for an official observer to be allowed to attend the trial, has rejected the demand for a review of the evidence by the Commission on the ground that the trial was purely an internal affair of Bulgaria, and this attitude has been maintained by the Soviet Government in reply to representations in Moscow. Meanwhile, in the inevitable sequence of events, the Communist majority in the Bulgarian Parliament has ordered the dissolution of Petkov's party, the Agrarians (which between the wars was the main Left party in Bulgaria and the principal opponent of all reactionary and pro-Nazi Governments) and has cancelled the mandates of its members who were returned in the last election. Bulgaria has thus come nearer than any other country except Yugoslavia to the Communist ideal of party dictatorship on the Soviet model. Such a consolidation of Communist control would hardly be possible while a politician of such outstanding democratic record and personal courage as Petkov remained alive.

One important point arises with regard to this country's diplomacy in such cases. In view of the obligations undertaken by Bulgaria as an ex-enemy country there can be no doubt that Britain and the United States have been within their rights in demanding a review of the trial. But in the last resort they have no power of enforcement if the Bulgarian Government is supported by Russia. The only real check on the kind of political proscription of which the Petkov case is typical—and which may be widely repeated in Eastern Europe in the coming months—lies in maximum authoritative publicity. This cannot be afforded merely by the press, partly because of lack of space and partly because coverage of a trial by a few specially licensed correspondents without legal training in a little-known language is not a satisfactory method of providing reports on which the public can form its own opinion. It is incumbent on the British and American Governments which have protested on the diplomatic level, to place at the disposal of public opinion all the information they have about the trial and the background of it. The British Government should publish a White Paper without delay. It may be too late to help Petkov, but the spotlight turned into dark places may still be some deterrent to similar trials which may be planned elsewhere.

* * *

Will the French Rally?

General de Gaulle has announced that his super-party "the Rally of the French People" will participate in the October municipal elections. In doing so he has definitely re-entered the political arena after a retirement which lasted some twenty months.

When he resigned office, declaring with some reason that the country could now get along without him, the situation was characterised by administrative chaos and rocketing inflation. The General has recently admitted to an eminent Belgian, an ex-Minister of Finance, that he missed the psychological moment when these evils could have been most effectively cured. Yet now that the General has returned to politics, it would be quite impossible to describe the political aims of his "People's Rally" beyond those of rallying the people and continuing M. Ramadier's present policy of excluding the Communists from government. The General offers no answer to the question of how he proposes to enforce French authority on recalcitrant colonies, or the state's authority on recalcitrant trade unions. There is no self-evident reason to expect that the General would succeed better either in remedying inflation, or suppressing the Black Market than he was able to do while he was in office. Humdrum problems of this kind have, in the opinion of his close associates, always appeared beneath his military dignity.

But the lack of a programme does not necessarily indicate that the General's campaign will be unsuccessful, for, in France, in

times of stress, a big name is often a greater asset than a coherent policy. The General knows that the colonial situation is tense, that a financial collapse threatens, that the food crisis may precipitate political trouble. In short, it can be confidently expected that everything will get much worse before it is likely to get any better. If, spurred on by hunger, misery and insecurity, the nation should seek not a policy but a saviour, the General is certainly the likeliest candidate.

Admittedly the RFP clashes with the French republican tradition in its adherence to the cult of the "Führerprinzip" and in its emotional rather than rational appeal, but the French republican tradition has been of late under a very severe strain thanks to a succession of impotent coalition governments, an ineffective and largely corrupt administration and endless speeches on the principles of equality at a time when privilege and immunities for the rich have never been so patent. These are the facts which make the "systematic denigration of parliamentary democracy," which Maurice Schumann complained of this week in regard to Communists and Gaullists alike, such a rewarding enterprise.

London Roads

The Ministries of Transport and of Town and Country Planning have now published jointly a revised plan for the future road system in and around London, and their plan departs considerably from the original proposals made in conjunction with the Greater London plan. The two main features of the original plan were, first, the creation of ten radial arterial roads out of London, plus three ring roads around London, and, second, the reservation of these roads for motor traffic only. Highways, mainly existing, for all-purpose traffic were to be called sub-arterial roads.

The new proposals involve the abandonment of six of the ten new arterial roads and of one of the three ring roads around London. This latter is to be constructed in part, to form an intermediate half circle lying between the existing inner and outer rings. The details are shown on the accompanying map.

In the present need to curtail public investment, the Ministries' caution may be justifiable. But since there is apparently no question of undertaking work on the new roads now, the engineers' criticism is understandable. There is no fresh evidence produced with the revised plans sufficient to convince a road engineer that the original estimates were extravagant. Likewise, experience of the past all shows that earlier cuts in plans for new roads have only tended to aggravate the subsequent problem, both in complexity and expense. If either of the present plans had been imposed

upon the Greater London area twenty-five years ago London's traffic would not be involved in the confusion that now exists.

Yet there are arguments on the other side, of which the principal one is that new roads not only attract traffic; they create the conditions that multiply traffic. At least, such, again, is the experience of the past. The final answer can only be given by the Ministry of Town and Country Planning. For the first time they have in the new Act an implement by which they can control all the conditions that increase traffic, new houses, factories and amenities generally. If the Ministry is determined to ensure that London shall not grow any further, that Stevenage and the other new towns around London are to be self-contained, and will not become breeding points of fresh traffic to and from London, then the modified version of the roads plan may suffice. If their control is not to be as rigid as that, then once again the two Ministries are pushing off on to posterity a great many of the problems that courage and imagination could solve to-day.

Enterprise Scotland

Scotland has achieved the distinction of organising three major events in the same week, the Edinburgh Festival, "Enterprise Scotland," an exhibition of consumer goods at the Royal Scottish Museum, also in Edinburgh, and the first post-war meeting of the British Association which opened this week at Dundee. "Enterprise Scotland" is a smaller but in some ways more attractive edition of "Britain Can Make It." Primarily, it is a spectacle, designed not so much to sell goods directly as to stimulate Scottish interest in what is being made and sold in their own country. Inevitably the exhibition directs attention on the Scottish trading estates, whence the major stimulus in the manufacture of consumer goods comes. In 1939, some 5,000 people were employed on the then four Scottish Trading Estates. During the war the figure rose to over 20,000. Last year, with the ending of the three-shift regime, the number fell to 14,500. By June last, however, it had climbed back to 17,500. The Board of Trade, in 1945, estimated that Scotland needed 150,000 new jobs to maintain full employment. It is clear that Scotland's light industries, of the kind now displayed at Edinburgh, can and should play a considerable part in reaching towards that target, even though they may not reach their own target of some 37,000 additional jobs by the end of 1949.

The extension of Scottish interest in light industries is a healthy sign, if only because Scotland did not display sufficient interest in them between the wars. Scottish heavy industry was, and must be, the backbone of its industrial activity, but heavy industries are continually throwing off opportunities for establishing successful light industries, almost as by-products. There were, in the past, too many examples of opportunities lost, and, with respect to the Scots, the faults there lie with themselves rather than with the "alien dictators" in London.

Shorter Notes

The first figures for the interim index of retail prices, which succeeds the old cost-of-living index, were published this week. With June 17th taken as 100, the figure for July 15th was 101. This rise was chiefly due to increased prices for foodstuffs, clothing and some household goods. So far no wage agreements have been negotiated which tie wage rates to the new index. On the other hand, although the unions will not be able to claim an automatic and full rise in wages in response to an increase in the new index, they are certain to use it as an argument in wage claims, just as they used increases in the old index whether their wage rates were tied to it or not.

The Colonial Development Corporation has at present two heads and no body. Last Saturday it was announced that Lord Trefgarne (formerly Mr Garro-Jones, MP) and Sir Frank Stockdale (the first Comptroller for Development and Welfare in the West Indies) would be chairman and deputy chairman respectively of the Corporation, which now awaits legislation before it can become formally constituted. What one anxiously awaits is some indication of how it will actually work. Will it be hamstrung by advisory committees of anthropologists and sociologists; will all its projects have to be filtered through a mesh of governmental control, locally and in Whitehall? The ultimate sovereignty of the Colonial Office is necessary. But within broad limits it is essential that the new Corporation should have as free a hand, and as unbounded a vision, as possible.

Letters to the Editor

The Economic Crisis

SIR,—The bewilderment of the neo-"liberal" school, when faced by the difficulties of the post-war international economic settlement, is well illustrated by the sequence of panaceas recently presented by Mr Hicks, who is undoubtedly one of the most subtle and least extreme of its representatives.

First he recommended a sharp deflation by a capital levy or some similar method (*Lloyds Bank Review*). While an increase in the rate of investment, relatively to consumption, is much to be desired, this would be the most mechanical and therefore the clumsiest way of attacking this problem. It could have little if any immediate effect on our balance of payments.

Then (in a letter to *The Times*) we were told that world demand for our exports was so unstable and slight that our international problem could only be solved by exporting coal. But even if we exported 80 million tons and prices did not fall (which is highly unlikely, since the demand for coal is very inelastic) that would not close the gap. And industrial competition with our high-grade exports—detrimental to our efforts to close the gap—would immediately increase. Some sacrifice in sparing coal for European reconstruction, as you rightly argue, will be needed. But no one should pretend that an increase in coal exports will cure our position, unless we use it to induce others to join us in common planning of our international exchanges.

Now Mr Hicks, writing to *The Economist*, wishes us to devalue sterling. Nothing would be more futile if not positively mischievous. Our exports are not now limited by relative prices nor the volume of our imports determined by them. Thus we could gain nothing by devaluation (unless it were of vast proportions) that cannot be much more effectively accomplished by direct control. We should lose heavily because our export prices are in the main not determined by perfect competition and would not rise proportionately to devaluation. If Canada cannot accept our goods she will have to cease exporting. Both the Canadians and ourselves will suffer from the peculiar multilateralism which has been recommended to us as a means of expanding world trade. Once multilateralism is limited to equal partners our problem will be reduced to our own internal production problem. Devaluation would render any further borrowing in sterling impossible.

The British problem is not amenable to solution by "liberal" methods (which might play some part, at some later date, in a new comprehensive plan). It can only be solved by restoring the balance between the Eastern and Western Hemispheres and that between agriculture and manufacture—both destroyed by the two wars. This demands planned agricultural and industrial development and integration in Europe and the British Commonwealth.

Fortunately, important sections of the US Government are beginning to realise that international "free market" economics based on non-discrimination and unconditional convertibility can in the present unbalanced state of the world only perpetuate bankruptcy—especially for Britain. The intellectual crisis, however, has not yet been overcome in Britain—as our floundering tactics in the Paris and Geneva Conference clearly demonstrate. Perhaps the loss of a score more millions of our reserves and of a few more months spent in searching for haphazard stopgaps will be sufficient to overcome this last and most dangerous obstacle in the way of true and stable reconstruction.—Yours faithfully,

Balliol College, Oxford

T. BALOGH

SIR,—At the conclusion of your interesting and suggestive article on "The Planners' Last Chance," you envisage the possibility of "the effort to assert man's control of his economic environment" breaking down, "unless the planners make haste to plan for realism."

Greater emphasis needs, I submit, to be placed on one vital respect in which, in a democracy, realism in planning must consist: sight must never be lost of the nature of the "planned"—that vast mass of persons whom the French conveniently call "*les administrés*" in distinction to "*les dirigeants*." Is not an objective *dirigisme* bound to go down sooner or later, in a country ruled as ours is, before the tide of passions and interests which flow in continuously along such channels as the press, the lobby, the constituency and the ballot box? And will not the wise *dirigeant* humble his pride accordingly, knowing that he will never get those who ask endlessly for jam to accept from him the necessary powder? The story of Babel is now repeating itself in the economic sphere, and I am myself being driven to the uncon-

able conclusion that there are only two effective stimuli to production in any country, either the play of economic forces, however mitigated by social reforms, or the police. Wherever our preferences lie—and I know where mine do—we are bound to come to grief if we halt between two opinions much longer. I commend to all planners this of Burke:—"Our plans are made for men. We cannot make men and bind nature to our designs." It looks as though "democratic planning" were a contradiction in terms and a directed economy not effectively compatible with a liberal system of law and government.—Yours faithfully,

ERNEST MARPLES

House of Commons

The Housing Programme

SIR,—Mr Devons raises an important point when he suggests that the housing programme should be reduced to "what it is really expected will be achieved." Such a reduction must, however, be accompanied by other measures.

A "cut" in the paper target figures will not necessarily result in less houses being built than are, in any case, likely to be achieved. Instead of 120,000 houses in the first six months of 1947 (i.e., half the year's programme) 51,000 were finished. At the outside, 60,000 would have been a sensible target.

The Government's unsound programming has created the illusion that housing is outrunning the supply of materials. The present running down of stocks of materials is causing housing delays especially over plaster, but this is not due to over-house-building, but more to over-licensing of other work. For housing itself, labour still remains the chief bottleneck, both the supply of labour and its poor output. The latter is now demonstrable, output having stayed somewhere about the level of 3,000-4,000 man-hours per house (instead of the pre-war 1,600-1,900) for such a long time that the issue must be faced.

Exhortations to "work harder" are probably a rather futile remedy. A radical overhaul is needed (a) of the Government's planning and programming technique, and (b) of the building industry's organisation. There is no space to enlarge on these themes; with regard to (b), the main point is to secure larger organisations with adequate capital resources in the industry, and better supervision of gangs on the sites. At present, both discipline and incentives seem to be excessively low, and a multitude of small master-builders provide competition but not efficiency.—Yours faithfully,

109 Westbourne Avenue, Hull

IAN BOWEN

The Greengrocery Trade

SIR,—Whatever the particular reasons for the present scandalous price level of fruit and vegetables might be, complaints about excessive fruit and vegetable prices are of long standing; they relate to the distributive side and not to the prices charged by producers. In 1923 the Interim Report on Fruit and Vegetables published by the Ministry of Food (Linlithgow Report) said that

were retailers to be satisfied with a smaller rate of gross profits when prices are lower than they at present appear to obtain, the total volume of trade would be appreciably increased with advantage to themselves and with corresponding benefit to both producers and consumers. Instead the chief complaint against the retailer appears to be that he prefers to operate upon a small turnover and a relatively large margin of profit rather than, by reducing prices, to secure an equal, or possibly greater, financial return from a large turnover.

The position had, however, not changed before this war; one could read in 1939 in one of the leading trade journals of the fruit and vegetable trades:

Very few retailers are making anything like an attempt to interest the public in buying larger quantities of home-grown plums and apples by offering them at prices commensurate with wholesale rates.

It is also for this reason that, unfortunately, trade associations have opposed the extension of municipal and other retail markets, although these markets, in the words of the expert agriculturist, the late Sir Daniel Hall, "serve their purpose of keeping the retail price not too far away from the wholesale price."

It seems doubtful to me whether Mr Lennox Boyd and Mr

Baker White in their suggestive letter in your issue of last week are right in saying that markets are "glutted" with some fruit and that our record crop of apples is "unsaleable" when we do not in the least know what the consumption and the turnover would be if prices in the shops were lower. Retailers simply argue that their requirements are sufficiently met and that they do not want larger supplies; they never consider what their requirements might be were prices more elastic and the absorbing power of the people thereby greater. It is high time that the Ministry of Food published a cost build-up of fruit and vegetable prices comprising all the stages from the grower to the final consumer. Nobody will deny that through transport charges, depot-charges, packing expenses and ordinary retail costs the total cost of distribution of fruit and vegetables must unavoidably be heavy. But this plain truth does not remove our anxiety that prices and margins are at present arbitrary and excessive. The chaotic state of them is reflected, among others, by the sometimes blatant difference in prices between one urban, or suburban, district and another and between districts where markets exist and where this is not the case. That the elaboration of a detailed cost build-up does not provide insuperable difficulties was shown by the Linlithgow Report, which gave a detailed account of all the various cost items entering the wholesale price of tomatoes. The public has a right to ask for more information about the prices of fruit and vegetables and should have this information before, as must unhappily be expected with the coming winter, prices are still further enhanced.—Yours faithfully,

149 Lichfield Court, Richmond

HERMANN LEVY

A Labour Asset?

SIR,—In criticising Mr Churchill's recent broadcast speech you say that some of the Government's most important controversial measures have been vital even in the short run. With the exception of the nationalisation of the mines, to the principle of which little opposition was offered by the Conservatives, your generalisation seems of doubtful validity and one wonders what examples you have in mind.

Drawing on my memory as a regular reader of *The Economist*, it seems to me that most of these controversial measures have met a heavy barrage of criticism in your columns at one time or another. Can it be that your lack of logic on this issue is due to some vendetta against Mr Churchill which must be pursued at all costs?—Yours faithfully,

14 Leadenhall Street, E.C.3

K. M. PARRY

[No, it cannot be.—EDITOR]

Indonesia—The Real Issues

SIR,—As a British officer who served in Java in 1945 and 1946, I would like to comment on some of Mr H. A. Lunshof's statements in your number of August 16th.

What struck us most vividly in Java was the evident prosperity which the Europeans enjoyed and the poverty of the Javanese. A study of Dutch statistics has shown me that while in 1936 64,000 Europeans had an income of over 900 guilders, only 30,000 of the 60-odd million Indonesians could aspire to such an income.

One feels that Dutch rule can hardly be called successful when

94 per cent of the population is illiterate, when the death rate is 20 per thousand, or double that of the Netherlands, and where the expectation of life is 25 years, or about half that of the Netherlands.

Nor was democracy far advanced. Of the 61 members of the *Volksraad* only 20 were elected by the Indonesians, on a very limited and indirect suffrage. The Dutch, on the other hand, who comprise 0.5 of the population, elected 15 members. The remainder were nominated by the Governor-General.

I found among Indonesians not so much a hatred as a contempt of the Dutch colonials; a feeling which was not slow to spread among the British, Indian and Australian troops who came in contact with them.

One feels that if the Dutch Government had followed the example set by Britain in India, then the lives of many innocent people would have been saved and the world spared another terrible war.—Yours faithfully,

6 Cheyne Row, S.W.3

NEIL STEWART

"Keep Left"—But How?

SIR,—Please do not forget the other side to rationalisation.

I took my car to its world-famous maker and asked for the self-starter to be repaired. "We cannot do it now. We have only so many electricians and must not interrupt what they are doing or ask them to do extra jobs. We will give you a date to send it in, about three weeks hence."

Next day, at 8.45 a.m., I took it to my local garage, where a man of 40, brought up amongst cars since he was 13, proud of his skill and knowledge, took off the starter, re-set it and re-fixed it in twenty-five minutes. I complimented him. He said: "I was in charge of an army repair shop for seven years. I've seen inside some big factories. If a mistake is made you can never fasten it on the man who did it. If you do anything extra well or extra quickly you are looked at twice, but you get no promotion, especially if you are a youngster. And you make no friends of customers."

That is the problem of the civil service, the forces, the large firm. The youth who wants to be paid by results, for hard, more and more skilful work, and to see the result of his work, has another view of the division of labour, which is an older name for rationalisation. It has caused more "don't care," more sense of frustration, than even the ugliness of Victorian factories and streets. I think the work-a-day happiness and satisfaction of the masses depends on the opportunities for the small firm. We need it in thousands. On the question of efficiency—there is nothing to choose between small and large. I have worked for both, and in the civil service.—Yours faithfully,

Brewdon, Guiseley, Leeds

J. A. HARRISON

"Premium Days" in Engineering

SIR,—The new export targets for 1948 make increased output of the engineering and allied industries of vital importance. It is to be hoped therefore that the Government and trade unions will agree on the abolition of certain practices in these industries.

I refer in particular to the so-called "premium days" which follow every bank holiday. Men working on "premium days"

AMERICAN SURVEY

The Entr'acte Begins

(From Our US Editorial Staff)

THE talks on the Loan Agreement have finished in a flurry of emergency expedients and tacit understandings. With the balance of the loan reduced to \$400 million there was little point in anything more. It was worth nobody's while to prod a sleeping Congress with doubtful interpretations. The solution—a moratorium on both convertibility and drawing—could offend nobody (and has already had the approval of Representative Jesse Wolcott, Chairman of the House Banking Committee); nor could the unofficial conclusion that it will not be considered discrimination for Britain to spend money she has, rather than money she has not. Nobody, however, thinks that Britain's problems have been solved and nobody knows what happens next. The British Government's action is called "emergency and temporary" and Sir Wilfrid Eady made it plain that Britain wants to re-establish the convertibility of sterling as soon as possible. This may be, it is thought in Washington, about ten years from now.

Whether Britain ever sees the last \$400 million or not (and it seems doubtful whether any way can be found of releasing it without involving Congress) the first effort at post-war recovery has gone wrong. The attempt by the United States to reconstruct the pre-war world economy by lending Britain a shoestring, on the understanding that anyone else who wants to go for a walk can borrow it, has failed. The over-optimism which caused it to fail was not only an American fault. When the President said, in his Economic Report recently, that the dislocations of the war had been under-estimated, he did not speak only for the United States. The British assumptions of financial burdens—contributions to Unrra and expenditures in Germany and Greece—are symptoms of the same misunderstanding in London.

It had been taken for granted that Mr Snyder would be tough with the British delegation and that the State Department and the Department of Commerce would try to stretch interpretations to their limits. What would have happened if the Secretary of State had not been in Rio it is impossible to say. Mr Lovett, the Under-Secretary of State, new to his job and lacking full confidence, was not inclined to take risks. And he had behind him a department to whose planners the loan was an irrelevant anachronism. They are at work on the Marshall Plan and they could not advise their Acting Secretary of State to do anything which might divert Congressional attention from the great objective. When the negotiations started, it was Mr Snyder who was sympathetic and helpful and Mr Lovett who delayed action. It was no lack of sympathy on Mr Lovett's part—only fear of criticism—and in the end he appeared as happy at the solution as anybody.

This somewhat unexpected reversal of roles is not out of character in the present situation. The Treasury was prepared to cure a financial crisis, which it could understand, by a remedy that had been effective before; a run on a bank must be followed by a moratorium. It is significant that it was the Treasury spokesman who explained the situation by using the parallel of the American Bank Holiday in 1933. The State Department, with its eyes on a future of customs unions, an integrated Western Europe and planned distribution of surpluses, was not interested in old-fashioned remedies for traditional diseases. The Marshall Plan is to be a cure-all, so there was no reason for wasting energy on curing a part. All energy must be concentrated on explaining The Plan, and only The

Plan, to Congress and the public. Nothing else is relevant.

The Chancellor's letter to Mr Snyder shows that the present retreat from multilateralism is considered a temporary and undesirable expedient. Whether or not it is undesirable, there is little disposition in Washington to consider it temporary. An American businessman, who said "If only we were still a debtor nation" recently, was speaking from the heart for many who still regret the pre-1914 pattern. That was a cosy and comprehensible world. But multilateralism seems an impossible ideal when one side of the figure is greater than the sum of all the other sides. The State Department's planners, though their ideas may have no firm shape yet, have recognised as much.

★

Mr Clayton, in Geneva and out of Washington circulation for some months, seems on the other hand still to be peddling his spring models, though with a few summer trimmings. That some inkling of what has been happening in Washington has reached him is suggested by reports from Geneva that he is advocating a Western European customs union. But the correspondent of the *New York Times* at the ITO conference says that "United States economic policy officials are convinced that the much-talked-of 'integration' of the European economy is a will-of-the-wisp affair if conscious planning is relied upon to bring it about. . . . In the United States' view one tried and tested way of 'integrating' the economy of a large and diverse area is to let the most efficient producers expand and force the less efficient ones to contract or convert to other activities." This paean of praise for chaos comes from Geneva at a time when officials in Washington, afraid that the "other activities" might include Communism, are consciously planning and calling on others for more and more plans.

"While Mr Clayton has been away Clause 9 of the Loan Agreement has been relaxed, officially, to allow discriminatory trade with the colonies and, unofficially, it is believed, with the Dominions as well." But "the United States will regard this conference as a real success only if the imperial preference system is thoroughly wrecked beyond hope of repair," reports this same Geneva correspondent, adding that the similar system of lowering tariffs within the Benelux area meets with the unqualified approval of these American officials.

All Mr Clayton's efforts, in fact, are still being concentrated on arrangements for ensuring a steady market for American goods. While busily digging a channel in which United States trade can run, he has not even paused to look behind him. If he did he might notice that restrictions on currency and imports are filling the channel as fast as he digs it. Until a method can be found of allowing other countries to earn dollars—and nobody has thought of one yet—American exports, except under some scheme of subsidies such as the Marshall Plan is to be, are impossible. The British crisis has taught that lesson because it was the first to hit Washington. Others will not be far behind. For the first time there is a suspicion that it may not be possible to rearrange the pieces into the pre-war pattern. A new pattern may be called for.

The first act of the post-war drama—set in "Cloud-Clayton-Land"—is over. After a respectable interval, which some of the performers may not have the wherewithal to survive, the curtain will go up on act two. The scene will be "Somewhere in Marshallania." The great question now confronting the United States is whether, when the third act begins, in perhaps ten years time, the programme can read "Same as Act One."

Hollywood on the Ropes

(From a Correspondent in Hollywood)

THE Hollywood Producer is by legend a man of violent and individual temperament, and while legend may have over-drawn the type, there is a sufficient basis of truth for it in the characters who wield an almost absolute despotism in their own studios in a calling in which gastric ulcers have long been recognised as the occupational disease.

The lack of violent and individual response to the news of the proposed British import duty on American films is a real gauge of the serious nature of the threat; firstly, because discipline among so many individualists has rarely before been achieved and, secondly, because a violent reaction in the shape of drastic lay-offs of studio man-power has hitherto been the immediate response to any breath of a threat that box-office takings are on the way down—and the news from England contains more than the breath of a threat.

This unaccustomed discipline and restraint has clearly been enforced by the Motion Picture Association—the major arm of the Johnston Office. Recent telephone calls to the public relations offices at three of the major studios were answered with a degree of caution which was a remarkable contrast to the cheerful barrage of information about current and future production that such a call usually elicits.

The general directive seems to be that a rigid (and unnatural) abstention from comment on the proposed British measure is necessary to preserve the friendly atmosphere in which it is believed that the negotiations will proceed between the Johnston Office on the one hand and the British delegation in Washington on the other. Everywhere there is a feeling of certainty not only that these negotiations will take place but also that they will result in some relaxation of the proposed duty. This optimism, which has been much heartened by the meetings and petitions of the British Exhibitors and Producers groups in London, is typical of the lack of realism which affects Hollywood production and which is due to the fact that the primary impact of any crisis is always on the main offices in New York, which are still the treasuries and policy-makers for the subsidiary production companies on the Coast.

But if this enforced restraint and the optimism which its enforcement engenders—as if, indeed, the restraint was some sort of penance which must earn its reward—is a symptom of a lack of realism, a much more vivid and vituperative lack of realism is exhibited in the local and trade press, which is under no sort of enforced discipline. Here the proposed measure has been described as “confiscatory,” “retaliatory” and “recriminatory.” It is said that the tax is aimed alternatively at the State Department or the American public as a threat of what will happen if a further loan is not granted. (The fact that no loan has been solicited has been disregarded). It is claimed that it is a protective measure designed to foster the growth of British production at the expense of American, and, at the other end of the scale, there has been registered a faint reproach that this injury should be inflicted on an industry which ran so pro-British a lobby at the time of the debates on the original loan.

Nowhere has the simple reason been either discussed or entertained: that the British Isles can no longer afford the dollar luxury of American entertainment; and perhaps here the British

“AMERICAN SURVEY” is drawn from three sources. Articles described as “From Our US Editorial Staff” are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as “From an Industrial Correspondent” or “From A Correspondent in Ohio” are from outside contributors. Everything printed without attribution is prepared in London.

Government was at fault in not having accompanied its proposals with a simple explanation. There can be no question that neither the trade press nor the American public are in any way convinced that this is the sole and compelling motive for the proposed legislation.

Yet another reason for the lack of realism in regard to the duty is because the effect of it on the industry is, from the point of view of the production companies, too bad to be true. The number of feature motion pictures produced in Hollywood and registered with the Johnston Office in 1946 was 397, and it is estimated that their total cost was about \$410 million. The total sum recovered from the British Isles was some \$72 million, which represent a yield of 17.5 per cent on the total investment. This percentage is not, however, a fair reflection of the position, since of the 397 films probably some 90 were designed entirely for the American market and were at no time intended for exhibition overseas. Though it is true that these films produced for the domestic market alone are low-budget films, they nevertheless carry their full appropriation of the studio overhead—in many cases as much as 50 per cent of their production cost.

A truer reflection of the gravity of the position is to be found in the profit statements of the production companies. The total profits from motion picture production activities last year have been estimated at \$125 million and, if the import duty of 75 per cent is applied to the rentals from the British Isles, the yield from that territory will be reduced from \$72 million to \$18 million and the profits, on last year's basis, from \$125 million to \$71 million, which represents a much lower yield in the highly speculative field of entertainment than the financial houses are prepared to entertain. It must be remembered, further, that these figures comprise the industry as a whole, and do not reflect the position of the individual production companies, whose position may vary from profit to loss by reason of such imponderables as production programmes, star values, stories acquired and even exploitation policy.

In face of these facts, it would seem that the resolution of the Motion Pictures Export Association to ban the export of all American films to England is perhaps little more than a bargaining approach, since an individual producer's share of the \$18 million thereby renounced might well represent the difference between profit and loss in his balance sheet; and there is reason to believe that the Society of Independent Motion Picture Producers, headed by Mr. Donald Nelson and representing producers of such calibre and independence as Mr Sam Goldwyn and Mr David Selznick, was more than reluctant to commit itself to such a self-denying ordinance.

The production companies have always been quick to adjust themselves to trends in box-office returns and since April of this year there have been unmistakable signs that the lush war years are over, when the quality of a picture seemed to bear only a remote relation to its earning capacity. But the gearing down of the industry to meet the uncertainty in its domestic market is something very different from the slashing that will have to take place if seventy-five per cent. of the British profit is going to disappear; and the apprehension felt through every branch of the industry, from crowd player to production executive, is a very real symptom of the fact that Hollywood has some serious problems to overcome.

It is understood that Mr Rank's group of producers anticipate earning some \$12 million in the American market in the next 12 months. Allowing, perhaps optimistically, another \$6,000,000 of American revenue for other independent British production, the figure of dollar earnings approximates to the amount that the American production companies will be able to gain from

the British Isles, under the full incidence of the proposed duty. A possible solution of the present difficulties might be to permit sterling earnings to be converted to dollars on a *pari passu* basis with all British dollar earnings in excess of \$18 million. This would stimulate the American distributors to efforts which they have never previously undertaken on behalf of British films.

American Notes

Prosperity Now

A growing industrial concern over foreign trade prospects in the light of the British crisis finds no reflection in the latest official business forecast by the Bureau of Labour Statistics. After revealing that a new burst of construction activity had brought “the biggest summer housing boom in history,” Mr Ewan Clague, director of the Bureau, declared a few days ago: “There is not a thing in sight to show that a depression is coming,” while he also took the opportunity to assure a national audience that current high prices were not of “an economy-wrecking, explosive nature.” On a more factual basis, the Department of Commerce a few days earlier confirmed the preliminary estimates of national income revealed in the President's mid-year report to Congress, while significantly stressing that current income levels follow, not from increasing production at this stage, but from “price distortion.”

From this point onwards, industry will wait eagerly for further signs of an ebbing export tide. As already noted, a sharp fall in the export surplus, which has been running recently at an annual rate of \$10 billion, would not in itself necessarily be sufficient to bring about a general deflationary spiral, though it would mark an important phase in the current business boom, and remove an important prop from the present price structure. But the effects of such a fall in exports would not, of course, be confined to a simple subtraction from present national income figures. An export deflation would have some cumulative effect on business as a whole. Moreover, if it occurs simultaneously with a reduction in the present inflated level of expenditures for capital equipment, and with a reduction in “buy-at-any-cost” consumer expenditures (as prices outmatch wage rates, and as durable goods become steadily more plentiful) it could then reinforce a very wholesome and salutary process of deflation. Unfortunately, crop reports are now giving a new twist to the inflationary spiral, and industry altogether is still more generally concerned with rising prices for basic commodities—cement is the latest example—than with the prospect of price recession later this year.

Budget Revision

A sharp revision of Budget estimates for 1947-48 does give some promise that Treasury operations within the near future will exercise a deflationary effect. It has taken a week or two to disentangle the controversy surrounding the net yield from the Republican Party's economy drive, but it is now quite apparent that Congress has found no more than very modest savings to be possible. Against January estimates of \$37.7 billion for revenues, and \$37.5 billion for expenditures, the Budget Bureau now lists a revenue estimate of \$41.7 billion, with expenditures at a revenue estimate of \$41.7 billion, giving an estimated surplus of \$4.7 billion against \$37 billion, giving an estimated surplus of \$4.7 billion against \$37 billion figure in the first Presidential report. Mr Truman has credited the Republican Party with savings of \$1.5 billion, against earlier claims of anything up to \$4.4 billion, and a broad-cast “target” of \$6 billion.

These political arguments, however, are now less important than the revised estimate of the Budgetary surplus. The figures now given, do not, of course, include any future commitments under the moves now taking place for European aid. On the other hand, they do include authorisations for expenditures which are not expected to accrue during the fiscal year 1947-48 and which might, conceivably, amount to \$3 billion. The Treasury will also be able to enforce some marketable debt reduction from sales of special savings bonds.

Monetary policy continues to be hesitant and timid in the face of an unprecedented price boom. But events are forcing the Treasury gradually to retreat from the rigid pattern of cheap money rates established through the war years. Following the break-away from the $\frac{1}{4}$ per cent rate for Treasury Bills a few weeks ago, it has now broken the $\frac{1}{2}$ per cent rate structure for one-year Treasury Certificates in a refunding operation that offers 1 per cent for 12½ months. While this process of revision is still

in the early stages, the immediate effect of the refunding operation has been renewed strength in the general list of Treasury Bonds as the commercial banks seek to offset reduction in income by an extension of maturities. The process of “debt monetisation” is thus continuing, and Treasury policy is sharply criticised in commercial quarters where it is held that autumn operations must work much more firmly for higher short-term rates.

Corn Crop Damage

The sharp decline in farm prices, until recently predicted by so many official and unofficial observers, is still beyond the horizon. After several years in which the wheat crop has been sustained at far higher than average levels for the past decade or so, US farmers are again harvesting a bumper crop of more than 1.4 billion bushels, against the previous peak of 1.1 billion last year. Reports from the corn (or maize) belt, however, have become steadily less pleasant, and Washington is plainly concerned by the dual threat to prices and supplies in 1947-48. The cash market in corn is relatively small in most years, since most of the crop is reserved by farmers for feeding animal stock, with a modest balance for industrial consumers. In volume, however, it ranks as the most important grain crop, and the 1946 output of nearly 3.3 billion bushels exceeded the combined supply of wheat, oats, barley, rye and rice.

The Department of Agriculture this year urged farmers to make every effort to secure bumper crops and until quite recently the corn crop estimate was about 3 billion bushels, a level which would have provided a very comfortable margin above home and foreign demand. The late spring floods in the corn belt, however, have been succeeded by drought conditions in which crop estimates have dwindled steadily, the latest figures suggesting a final crop of no more than 2.4 billion bushels—the smallest for eleven years. Rains may still assist a crop which is late enough to be threatened almost as much by early frost as by present drought, but more favourable weather from now on cannot restore earlier damage. Recent unofficial reports, indeed, point definitely to fresh deterioration. The result has been a tremendous growth in speculative activity in the Chicago market, with corn for September delivery at nearly \$2.50 a bushel. Not for many years has corn outpaced wheat (now \$2.50, Chicago) and present price levels have not been approached since the peak of the 1919 crop boom. The corn price in 1947 is higher than it has been in a century.

The prospect for other feed crops is still described as favourable, and grain speculators may overplay their hand in the Chicago futures market. But the world crop position and the abnormal level of domestic demand still suggest that every ton of available grain will be needed, and the Department of Agriculture has again abandoned hopes of acreage reduction despite insistent warnings that the present peak area for arable farming is well above the safety level and must, if sustained, bring a longer-term problem of soil erosion, or sub-normal crops.

Adverse weather conditions threaten crop quality no less than volume, and there is the further threat that farmers will be forced to use more than a normal proportion of the corn crop for autumn feeding, bringing a heavy increase in near-term supplies of pork, beef and poultry products—at the expense of 1948. In this event, overseas shipments would certainly not keep pace with livestock slaughter, while the American farmer would dip heavily into wheat stocks on the farm for his surviving hogs and cattle.

Power Shortage Ahead

The transient vision of an atomic age for industry has been replaced by far more sober considerations. It is now realised that whatever benefits may accrue from atomic energy in terms of flexibility and economy, there is bound to be a considerable period of development during which industry must grapple with the problems of capital costs, processing hazards, and danger to personnel. Moreover, it is plain now that the first impact

of atomic energy upon industry would be the displacement of earlier sources of fuel for heating systems rather than a radical change in the generation and transmission of power. In the meantime, the United States is faced with the very definite prospect of a power shortage throughout the main industrial centres this winter, and a return to the "brown-out" which represented North America's pattern of war austerities.

Spokesmen for industry sometimes assert that the prospective power shortage follows from the political interference of recent years, the Acts under discussion being, of course, the Federal Power Act, and the Public Utility Holding Company Act of 1935. The latter has only begun within the last two years to effect the integration of utility systems, and is now generally regarded as a reasonable measure which has performed very useful work under the operative control of the Securities and Exchange Commission. The Federal Power Act, through a supervision of regulatory bodies by the Federal Power Commission has also helped the industry to strengthen a financial structure weakened in the boom years by improvident finance.

Politics may have played a minor part in the relatively slow expansion of the electric power industry in pre-war years. But, until 1939, the industry had very considerable reserve capacity. By last year, however, with installed capacity of 50 million kw. reserve capacity fell to below 10 per cent, a figure much below normal and much below the safety line.

The trouble has arisen since 1942 when all but emergency orders for switchgear, pumps, boilers and turbines were shifted to meet clamorous war demands, especially from synthetic rubber plants, and merchant and service shipping. The heavy manufacturing industry too, was crippled by strikes in 1946, and has since been delayed by shortages in steel, coal, and copper. Now, expansion is going ahead again, and the power industry is demanding ten million kw. in generating capacity over the next few years. It is precisely in such directions, of course, that Washington must face sternly competitive demands for domestic expansion and foreign rehabilitation.

Near-term expansion, in any event, will not save some regions from a fairly tight position through the winter months—if industrial activity and individual consumption hold near recent levels. The mid-western industrial area, east of the Mississippi, and north of the Ohio, is expected to face sharp regional shortages; partial relief may follow from the development of "grid" networks—although this, too, is expensive in terms of time and equipment. A sustained economy drive by American consumers, however, would no doubt relieve existing capacity by an amount sufficient to avoid any serious industrial dislocation.

Taft-Hartley in Action

The Taft-Hartley labour law, the Republicans' only major success in domestic legislation during the past session, became fully effective on August 22, except for provisions allowing certain contracts to run on. In the months since it was passed over the President's veto, the larger labour unions have been energetically devising detours around the new road-block. Either, like Mr Lewis, they have demanded "able and willing to work" clauses, or they have refused to continue the "no strike" provisions in existing contracts, as a means of protecting union treasuries from suits. In some cases, unions have determined to sign no contracts at all, relying on union discipline and management's amenability to perpetuate the closed-shop in fact, if not in law. The decision of the Congress of Industrial Organisations to boycott the National Labour Relations Board is one which will appeal to the stronger unions, for it relieves them of the necessity of filing anti-Communist affidavits and information on union finances. Sentiment in favour of this course will be strengthened by evidence that Mr Denham, the new counsel for the Labour Board, intends to interpret the act with enthusiastic strictness. The Board itself, despite its new members, is thought still to be sympathetic to labour, but Mr Denham, whom the new law has made the most powerful single figure in labour relations, has already been reproved by Mr Truman for his anxiety to co-operate with Senator Ball's "watch-dog" committee, rather than to pursue an independent course. The new regulations governing the filing of anti-Communist affidavits provide, for example, that the failure to file of a single national officer of the Congress of Industrial Organisations, or the American Federation of Labour, would deprive every member union of its right to use the machinery of the Labour Board.

Of direct challenge of the Act on economic grounds, there has been surprisingly little, even on the issue of the closed shop, the prohibition of which is a heavy blow to many unions. On the political side, however, there is no slackening in the effort to wipe the Taft-Hartley Act off the statute books. Defiances of the ban on political expenditure are daily occurrences. The ban on direct political contributions to candidates, on the other hand, is not likely to be contested. In the case of the CIO, these, as well as much political expenditure, are handled by the Political Action Committee, which is believed to be immune from the Act, and local unions are urged to keep their PAC bank accounts separate from union funds. The AFL is endeavouring to increase political contributions, and the CIO is waging a campaign for a \$1 a head contribution to the PAC from every CIO member.

THE WORLD OVERSEAS

Sweden and the German Vacuum

(From Our Stockholm Correspondent)

FOR both geographical and historical reasons the Swedish economy has traditionally depended to a large extent on trade with Germany. During the first world war Swedish foreign trade was inevitably directed mainly towards the German market. Although the inter-war years partly restored the pre-war balance, Germany secured its position as Sweden's leading source of imports—responsible for 22 per cent of total imports, and its second best customer—taking 18 per cent of its exports. In 1940 the occupation of Norway and Denmark cut off Sweden from its western markets and almost overnight made Germany the dominant trade partner. Germany's share in Swedish imports rose to no less than 48 per cent, while 42 per cent of Sweden's exports were sent to that country. Incidentally it is remarkable that Sweden could in these circumstances so balance its trade with Germany that it got through the war period without having granted Germany any credit whatsoever. On the contrary, Germany ended up with a clearing balance, besides which the Swedes managed to get paid the interest on Germany's considerable pre-war debts to them and substantial amortisation payments as well.

For the time being the paralysis of Swedish-German trade has had by far the most serious repercussions on the import side.

During 1946, total imports from Germany were worth no more than about 50 million kronor, as against a total import value of 454 million kronor in 1938. Because of the sharp increase in prices during the same period the decline in volume is even greater than appears in this comparison. The range of Sweden's imports from Germany was very diverse, the principal items being machinery, electrical equipment, iron and steel products—mainly commercial and constructional iron—textiles, chemical products, coal and coke. In many lines German imports ranked very high. Almost half of Sweden's imports of machinery and electrical equipment and more than one third of its imports of chemicals came from Germany.

Gambling on the Future

The loss of these imports has severely strained Sweden's supply situation. It has been found possible to replace this loss in some measure by imports from other countries and by increasing domestic production, but this compensation has been achieved only at some cost. Firstly, the prices paid to other countries have often been considerably higher than would have been demanded by a highly efficient Germany; secondly, the expansion of domestic

capacity has meant diverting scarce labour and building materials to capital investment, which in the long run might turn out uneconomic. Even with these measures Sweden has not been able to replace certain important products, for instance textile machinery, commercial iron, coal and coke, and chemicals. Another direction in which the impossibility of getting substitutes has made itself seriously felt is in spare parts for industrial machinery, originally imported from Germany.

As a receiver of exports the German market was also important in Sweden's international relationships. In 1938 Sweden exported goods to Germany worth no less than 335 million kronor, representing 18 per cent of total exports. These exports were concentrated on a few bigger items, principally iron ore, iron and steel products, and paper and pulp. The first item especially was very important; in 1938 the value of the iron ore exports to Germany was 160 million kronor, or 70 per cent of Sweden's total iron ore exports in that same year. With the disappearance of German demand this industry has met serious difficulties in finding new outlets for its products. The export figure for 1946 was only 5 million tons—far below the 1938 level of 12 million tons. As for the other types of export which formerly would have gone to Germany, the problem of finding new markets for these is relatively easy so long as present world shortages prevail.

When speaking of the immediate effects of the German vacuum, it is also necessary to point out its indirect effects on Sweden's foreign trade. The industrial systems of a number of other countries, especially of the Netherlands, Belgium and Switzerland, with which Sweden has intimate commercial relations, have also been adversely affected by the collapse of Germany's foreign trade. As a result, not only has their capacity to export certain important commodities to Sweden—for instance coke, iron and steel and machinery—seriously suffered because of the lack of German imports, but their ability to buy goods from Sweden has also been curtailed. This last factor is, however, obviously not so important in the short run.

Turning to the long term aspects of the problem, it is only possible to make rather vague conjectures. First, as regards the necessary redistribution of our imports, it seems not unlikely that countries like Switzerland and Belgium will permanently take over Germany's role as suppliers of certain machinery and iron and steel products. The trouble is that productive efficiency in these countries, because of the more limited scale of production, compares unfavourably with that of pre-war Germany, thus implying higher import prices for the Swedish economy. In this respect the United States and Great Britain would be preferable as sources of import, but here the very limited export capacity has up to now been the main obstacle.

Outlook for Iron Ore

There is also small doubt that the current tendency of Sweden's production structure towards more autarkic ideas will be hard to stop. Already during the war, Sweden increased its iron and steel capacity, especially for commercial and constructional iron. This expansion was made necessary not only by insufficient German imports and by heavy building activity and military requirements, but also by lower productivity in the domestic iron and steel industry, which was mainly a result of substituting wood fuel for coal. The total disappearance of German imports has accelerated this development and the Swedish iron and steel industry has very extensive investment programmes for the next few years. The advisability of this expansion has been questioned by some economists. If the possibility of a freer flow of imported iron and steel products later on is borne in mind, as well as the necessity to concentrate on regaining the pre-war markets for Swedish quality steel, part of this new capacity might seem uneconomic. The fact that even now the iron and steel industry is finding it very hard to get sufficient labour has also been advanced in support of this theory.

Another sector of the Swedish economy where the impact of war has stimulated increased capacity is the engineering and machinery industry. But it is to be doubted whether the disappearance of German imports in this field will be a sufficient guarantee that this new capacity will be long and fully used. Swedish producers might find it hard to shut out British and American imports of many kinds of machinery, especially as the Swedish cost structure is rather unfavourable in many lines. There is, however, one exception to be made in this connection, and that is for the electrical equipment industry. Not only are Swedish prices for this type of commodity highly competitive, but the export outlook seems very promising. The requirements of the Russian trade agreement alone will take care of any excess

capacity. It should be added that the war and the German collapse have caused other industries, too, to expand their output and new firms to be set up, the future of which seems rather uncertain. The danger on a long view is, of course, that these investments, made in a sort of "hothouse atmosphere," will in the end become vested interests, hampering Sweden in its endeavours to re-establish its trade on a free, multilateral basis.

The loss of Germany as a customer is a major difficulty mainly for the iron ore industry. Sweden will have to face the fact that, whatever happens, German heavy industries will not be rebuilt to such an extent that Swedish exports of iron ore can attain anything like pre-war figures. Yet a sharp decline in the mining of the ore would create serious social problems, as this industry dominates the economic life of the traditionally undeveloped and relatively poor northern region of the country. There are, however, some hopes that Sweden will be able to expand iron ore exports to the United States and thus make up, at least partly, for the loss of the German markets. As regards the other commodities which used to rank high among Sweden's exports to Germany, the long-term problems seem relatively small. Exports of forest products will have to be curtailed anyway, in order to adjust production to the current yield of the forests. And no doubt the Russian trade treaty is to be regarded as offering a possible solution to the problem of finding new markets for Swedish exports formerly bought by Germany.

Labour and Politics in Latin America

[FROM A CORRESPONDENT IN LATIN AMERICA]

THE first impression of an observer in Latin America is that there is a great wave of unrest surging up throughout the whole continent. This takes different forms in different countries, and for the most part is a blind sort of thing—an awakening of largely uneducated and culturally backward masses, who only know that they are no longer satisfied to live under the oppression and exceedingly bad economic conditions which have hitherto been their lot, and who, in the main, are willing to follow any leader who will offer them a better existence. In Brazil, for example, this revolt is centred in the Communist Party and the *Partido Trabalhista* of ex-President Vargas, a group not unlike the *Partido Peronista* in Argentina. In Argentina, the whole of this movement has been canalised into the *Peronista* movement, which whatever its defects—and they are many—is without doubt a "popular" movement. In Chile, the unrest has largely followed the Communist Party; while in Bolivia the fascist *Movimiento Nacionalista Revolucionario* has crystallised this spirit of revolt among the tin miners, and the left wing *Partido Obrero Revolucionario* and *Partido de la Izquierda Revolucionaria* have also increased. In Peru, without doubt, the *Aprista* Movement is the real popular force, and as yet there has not been organised any really effective opposition to the *Partido del Pueblo*, as the APRA is now called. On the other hand, in Ecuador, the Socialists who won a considerable victory, particularly in the region of the capital of Quito, and who now have nearly a third of the members of Parliament as a result of recent elections, seem to have been the chief gainers from this spirit of unrest.

The diversity of this movement of revolt indicates its lack of cohesion. It is not a conscious movement with a well-thought-out programme, but rather a blind attempt to strike out against the wrongs and fancied wrongs from which the poorer classes and the oppressed racial groups have so long suffered. The spirit of rebellion no doubt arises in part from the general world situation, in part from the promises made by all concerned during the two World Wars, and from the slow seeping of a minimum of education and the beginnings of industrialisation into these countries, expanding the horizons and bringing new desires and wants to these people. And although the movement is one for liberation, it is not always channelled into organisations which are democratic. Thus, for instance, in Brazil there is a great need for some popular democratic socialist or similar grouping to rival the two totalitarian organisations which are the Brazilian Communist Party and the *Partido Trabalhista*, the PCB and the PTB. In Argentina the *Peronista* movement has indicated that the masses of that country are willing to sacrifice liberty and freedom in return for a promise of a better economic and social future.

This tendency of the Revolt of the Masses in Latin America

not to concern itself unduly with the ideas of democracy and liberty indeed represents a great challenge to those who hold these ideas dear. There is a great necessity to orient this spirit of rebellion in a direction which can bring not only an end to the age old caste system which has dominated so many of the Latin American countries, but which can also bring these countries a democracy and a liberty which but few of them have ever known. There are some elements in all of these countries which are trying to meet this challenge. For instance, there are Socialist parties in Uruguay, Argentina, Chile, and Ecuador which are of some importance. In Uruguay there is the *Baillista* Party which is a lower middle class and working class group which has a long history of working for social reforms in that country, and which is largely responsible for the very genuine and very advanced democracy which exists in Uruguay. In Brazil the situation is still very chaotic politically, since that country suffered under fifteen years of severe dictatorship from which it is only now partially recovering. During those fifteen years there was no chance for younger and more progressive political elements to emerge, and the development of such groups needs time. There are small left-wing groups, such as the *Esquerda Democratica*, around which in time perhaps a really democratic movement can be built. Finally, in Peru, although there are those who disagree, it is probable that the *Apristas* will in the next few years bring about a profound social revolution which not only will attack the age-old problems of the land, education and health, but will bring real democracy as well to that country which has so far known little more than its sham.

The second important observation which one can make about the labour and political situation in Latin America is that during the last decade the trade union movements of all these countries have grown swiftly. For instance the labour movement of Argentina has during the last four years more than doubled, and has reached into areas such as the packing houses and the sugar plantations where there had never before been effective trade union organisation. In Chile, since 1936 when the *Confederacion de Trabajadores de Chile* was formed, the trade union movement membership has jumped from less than 100,000 workers to some 300,000 or 350,000 and practically all the industries of any size are organised. Even in Bolivia, one of the continent's most backward countries economically, the trade union movement has grown in the last few years. Since 1942 the miners have been firmly organised, and in the city of La Paz, the principal industrial centre, the 18,000 factory workers have almost all become members. In Peru during the last two years of democratic government, the labour movement has more than doubled its strength and even in Ecuador where it is really only beginning, it already comprises practically all of the "organisable" workers.

Highly Political Trade Unions

In connection with the trade union movement it is very important to note that the labour movements of all the countries of the continent are highly political. In Chile, for instance, the labour movement is split between the Socialists and Communists. In Peru the same thing is in process, with the Communist-influenced unions breaking away from the pro-*Aprista* *Confederacion de Trabajadores del Peru*. In Argentina, the vast majority of the trade unions are dominated by the *Peronista* Party. In Brazil, the Communists have succeeded in gaining control of a large number of the unions, in spite of the exceedingly close control which the government has over them, and many of the others are dominated by the *Partido Trabalhista*. In many, if not most, of the countries, the political parties which have a mass following work actively within the unions, forming cells of their affiliates in as many of the organisations as possible. Of course, all this does not prevent the trade union leaders of all these countries being all but unanimous in affirming that they themselves do not take political considerations into account in administering their unions—though almost always these same leaders affirm that those of the opposite political group do give weight to such considerations.

Almost all the countries of this continent have a special body of labour legislation, which in a number of countries is dignified with the name of a Labour Code. The purpose of these codes seems to be twofold—on the one hand to provide certain rights to social security, freedom of organisation, and so on, to the workers, and, on the other, to give the governments of the respective countries some kind of legal control over the workers' organisations. This aspect of control of labour organisations goes farthest in Brazil, which is still operating under the corporate system inaugurated by President Vargas on the fascist model. In Brazil there is for all practical purposes no collective

bargaining and contracts between the workers' organisations and the employers are almost never signed. Instead, all problems between the workers and the employers are referred to the Labour Courts, and the activity of the unions insofar as relations with the employers go is restricted to providing a lawyer for those of its members who desire to institute proceedings in one of the Labour Tribunals.

At the other extreme is Uruguay, where government intervention in the unions is kept at a minimum and government recognition of trade unions is not necessary. In between these two extremes are ranged most of the other countries. In Chile, for instance, the government seldom intervenes in the internal affairs of the unions, though the possibility of doing so is provided for in the Labour Code. In Argentina, on the other hand, through the payment of labour leaders by the government and through the legal regulations of the unions, the government intervenes to a very great extent. Yet, for all this variety, it is safe to say that in the years just ahead the "Revolt of the Masses," and the trade unions as one expression of this revolt, will play an increasingly important part in the politics of the Latin American countries.

British Miner in the Ruhr

[These impressions of technical and working conditions in the Ruhr have been contributed by a miner from one of the best equipped of British mines. The author was one of the party of British miners who recently visited the Ruhr at the invitation of the National Coal Board.]

ONE of the first things that impressed me during my visit was the wonderful efficiency of the haulage system. The main roads are all driven at pre-determined levels, which means that they are all straight and level, and not undulating as they are in this country. Locomotives are in general use (diesel, electric and compressed air), and in the pits I visited I noticed a complete absence of ropes (endless, main and tail or direct). This system of haulage eliminates a considerable amount of labour and is very much safer; haulage accidents are reduced to a minimum. In the shaft bottom, after the full tubs are detached from the locomotives, they gravitate slowly to the shaft side. From my own personal experience I can testify that there is only one-tenth of the personnel employed in handling tubs at the pit bottom or pit top in the Ruhr compared with the British pits.

At the coal face also the Germans are far in advance of us; wherever possible a machine is used to lighten laborious tasks. On the surface the dirt, when it is extracted from the coal, is sent back down the pit and not littered all over the countryside in huge ugly dumps. The dirt is crushed small and is blown into the wastes through six-inch pipes, packing the wastes solid. This in turn maintains better roof conditions at the coal face. We saw the now famous coal plough. I would say that conditions have to be almost perfect for this machine to be effective; but it certainly was very effective where I saw it, and it was filling a tremendous amount of coal.

The living conditions of the German miners are, generally speaking, terrible. This is mainly due, of course, to war damage. They are erecting for the miners Nissen huts, which, with their internal fittings, compare very favourably with our own temporary pre-fabs. But they are not being put on prepared sites, and no roadways are being laid.

Output is very low in the Ruhr, particularly when one remembers the higher proportion of men actually engaged on coal filling and machine mining, which is so much more highly developed than in this country. The low output, in my opinion, is due entirely to the rations the German miner receives. As a heavy worker he is entitled to a much higher ration than the ordinary consumer, but he never gets it. He does get every day a bowl of soup (vegetable, not meat) at the colliery canteen and two slices of nearly black bread with some kind of sausage meat between them. But we saw hundreds of children going to the pits with their fathers, who gave the children the sandwiches to take home. The food is really atrocious, and I am certain it would be difficult to find one British miner who would eat it, let alone work on it.

The two main conclusions I have drawn from my visit are: firstly, I think it is hopeless to try to improve the output per man-shift until the rations are improved; secondly, in Germany far more money was put back into the collieries to improve them and instal new machines than there ever was in this country. If we had progressed in the last 25 years on the same scale as the Germans, there would be no British coal crisis to-day.

THE PARKER PEN COMPANY have pleasure in announcing that the incomparable Parker "51" will be on sale in the Autumn. If you wish to possess this, the most coveted pen in the world, tell your Parker retailer.

ITS UNIQUE NIB OF TUBULAR GOLD, hooded against dirt and damage, gives years of jewel-smooth writing.

SHOPPING THROUGH THE AGES

"Come, buy of me, come buy!"

How welcome he was in those days, the itinerant pedlar from the great cities to the outlying villages and hamlets of Elizabethan England! With what excitement the people gathered round to examine his enticing wares!

Today, the fun has not been entirely eliminated from the mundane business of shopping. There are always plenty of attractive articles to catch your eye when you wander round the display counters at any W. H. Smith & Son bookshop. That is why so many people have grown accustomed to this easy-going method of doing their shopping.

THE BUSINESS WORLD

Britain's Trade Pattern

LAST Saturday, at the closing session of the International Trade Conference at Geneva, Mr Harold Wilson, Secretary for Overseas Trade, gave a realistic estimate of the future trend of British trade policy now that all hope of proceeding rapidly towards full convertibility of sterling and non-discriminating multilateral trade has been shattered. The British Government will find it "necessary and desirable" to have even closer co-operation with the other countries of the Commonwealth, and it will have to use methods "in the intervening months and years" which might appear opposed to the principles of the draft Charter of the International Trade Organisation. A Britain destitute of dollars has no option but to proceed by non-convertibility and discriminating trade in the immediate future and to secure such supplies as are available in, and will be willingly supplied by, countries in the new sterling orbit.

At this moment, countries of the Commonwealth and also the South American republics (technically outside the sterling area, but bound nevertheless by long-standing trade relationships with Britain) are revising their trade strategy. It is not the purpose of this article to forecast what they are likely to

do, but rather to indicate the trading framework within which their decisions, and Britain's, have to be taken. For this purpose, a series of tables has been prepared showing the value and sources of Britain's imports (Table I), a similar table for exports from the United Kingdom (Table II), a statement of the balances of visible trade between Britain and the principal countries of the dollar, sterling and other currency areas for the first six months of this year (Table III), the pattern of imports to the countries with which Britain has a trading deficit (Table IV) and a parallel table showing the pattern of exports of Britain's principal suppliers (Table V). This is a formidable statistical exercise, but it is no more than is needed for making a realistic estimate of Britain's future trade.

Table I shows in detail the all too familiar story of Britain's recent dependence upon the hard currency area (which has included Argentina during the first six and a half months of this year) for foodstuffs, raw materials and manufactures. The great bulk of the cereals, over half of the meat, and one-third of the dairy produce imported into Britain came from the United States, Canada and Argentina during the first six months of

this year; among raw materials, nearly half of the cotton, a third of the non-ferrous metals, over a third of the petroleum, three-fifths of the timber, and four-fifths of the tobacco, though scarcely any of the wool; and three-quarters of the machinery and vehicles came from the same group. It is true that the general degree of British dependence on the dollar area for food, raw materials and manufactures is less marked. But, for the critical supplies of food and raw materials of which detailed figures are given, the degree of dependence upon the dollar area during the first six months of this year was very high indeed. Any appreciable cut in these supplies on grounds of dollar shortage would have a serious reaction on rations and on supplies of essential raw materials to industry—save perhaps in a few special cases like tobacco and cotton, where stocks are sufficient to tide over the country for perhaps a year or so.

The selection of principal British exports shown in Table II reveals the failure of British exports to make any adequate progress towards filling the dollar gap. There is not one item among Britain's leading manufactures for which American demand is predominant. This is no new discovery, but if British trade is in future to be redirected along the channels where British exports are acceptable, the consequences both for dollar exports and for British imports of essential foodstuffs and raw materials from the dollar countries should be obvious; relief for Britain depends largely upon the decisions of other countries—upon the outcome of the Marshall proposals, and upon the limits within which Britain's suppliers can force their trade into a strict sterling pattern.

Before these possibilities are discussed in greater detail, attention must be drawn to Table III, which sets out the deficits and surpluses of Britain's direct visible trade during the first six months of this year with the dollar and other hard currency countries, the principal sterling area countries and the rest of the world. Of the total visible deficit of £269 million for this period, more than half (£139 million) was represented by the dollar area deficit, and a slightly smaller total (£131 million) by the deficits with Canada and Argentina. This again is a familiar and unhappy position. Britain's deficit arises almost wholly in the Western Hemisphere, while trade with the sterling area is in rough balance (though even this is not entirely satisfactory if account is also taken of South Africa's sales of gold bullion to this country). Table IV shows that the British dollar deficit in American trade cannot be rectified by a major change in the sources of the United States imports, the great bulk of which come from South America, Canada and—to a much smaller extent—from India. Those who suggest that the dollar account can be squared by higher prices for rubber and tin delude themselves. Canada's position in the dollar crisis is scarcely less difficult than Britain's, for Canada is the textbook example of triangular trade—a heavy export surplus to Britain

is, in normal times, offset against a heavy import surplus of American manufactured goods, the third side of the triangle consisting of the sale of goods and services by the sterling area to the United States. Argentina's dependence upon imports from the United States is less exclusive—her imports are generalised more widely over several South American and European suppliers—but last year the value of imports of United States goods was more than twice that of imports of British goods. Even in the case of Australia, the latest available figures show that imports from the United Kingdom were not far ahead of those from the United States and Canada.

The primary demand for British exports, therefore, comes from countries in the Commonwealth, like New Zealand and Australia, whose export surpluses are normally sold in large part to this country. But as Table V shows, there are two special cases which will have a great influence on the future pattern of British trade. The first is Canada, to which this country is attached by long trade ties, and by the four-year wheat agreement. Canada will not wish to cut these ties; nor, certainly, will Britain. But the dollar dilemma will remain for Canada so long as Britain cannot earn sufficient dollars to pay for the balance of Canada's imports from the United States. It may be possible for Canada to reduce the level of imports from the United States but the balance of the Canadian economy rests on adequate imports from the United States, much of which Britain is in no position to replace.

The second special case is that of Argentina. Here the picture is different, for Britain is the largest single importer of Argentine produce, and if Argentina were to attempt to divert these shipments into the American market, it would be faced by the necessity to make a great sacrifice in prices. It may be that Argentina will preserve the present export outlets to Britain at prices already agreed, rather than face the risk of a permanent rupture of trade relations with Britain and the hazards of finding new markets for the bulk of its produce.

These, at any rate, are some of the calculations which the suspension of convertibility last week entails. Time will be needed before the answers are clear, but it is perhaps significant that so far no supplier to Britain has suggested the possibility of suspending shipments. The impression is gaining ground that Argentina, short both of dollars and sterling, will maintain the agreed meat exports to Britain, though it is well to remember that economic policy in Argentina is capable of almost overnight changes. Some solution has yet to be found to meet the peculiar difficulties of Canada—for in this case rigid bilateralism clearly will not work. As for the other countries, the figures here presented indicate future trading possibilities rather than solutions. Perhaps the one consoling thought, in examining them, is that trade relationships are often based on something wider than statistical necessity.

World Rayon Outlook

RAYON is an outstanding example of the *ersatz* become staple. A decade or so ago, it was still compelled to masquerade under the misnomer "artificial silk." Now it is a synthetic textile fibre in its own right. Its position has been consolidated during the war, when old uses were extended and new ones developed. But the war also brought some important changes in the leading producers and consumers of rayon, the importance of which can be measured from figures given in the annual review of the industry by the American publication *Rayon Organon*, from which the data in the tables below are drawn. Table I shows the expansion in rayon production by all processes from 1930 to 1946. World output jumped from 458 million lb. in 1930 to 2,254 million lb. in 1939. Production then went on to achieve an all-time peak of 2,825 million lb. in 1941, but fell to 1,416 million lb. in 1945 and recovered part of the way by 1946 to 1,672 million lb. The fall in the middle years of the war was mainly due to reduced production in Europe and in Japan. Table II shows the effect of the war on the output of individual countries. As would be expected, ex-enemy states have suffered a drastic cut in their production. But the outstanding feature of the war years has been the astonishing and uninterrupted expansion in the rayon output of the United States from 287 million lb. in 1938 to 854 million lb. in 1946. Last year the United States produced over 50 per cent. of the world's total output.

The fall in world production between 1942 and 1945 was particularly severe in the case of staple fibre, because Germany, Japan and Italy, each of which had built up a large rayon industry before the war, were forced to reduce production in the later war years. This gap has not been filled by other producers, though the United States emerged in 1946 as the world's largest staple fibre producer with an output of 176 million lb., representing one-fifth of its rayon production. The United States is followed a long way behind by Germany with 89 million lb. and by this country with 71 million lb. It is not generally realised that, despite the major contraction in staple fibre production by 1946, Germany dropped only from first to second place among the world's producers. Figures for small rayon producing countries are given in Table III.

Although world production of rayon in 1946 was well below the 1941 level, this is likely to be only a temporary setback and output had already recovered noticeably by the end of last year from the low point of 1945. The level of production achieved over the next few years must depend on three factors: the level of world consumption; the adjustment of capacity to meet demand; and the availability of labour and raw materials.

Consumption of rayon per head of population for a selection of countries is shown in Table IV. Prewar figures for ex-enemy states are much higher than those of other countries, but they are an uncertain guide to possible levels of demand, since the rayon industry was artificially stimulated in those countries to reduce their dependence upon imported natural fibres. Similarly, their levels of consumption in 1946 were also probably affected by the special consideration that the natural fibres, like cotton and wool, were unobtainable. The gains which rayon has scored in ex-enemy states since the end of hostilities may prove temporary and will be lost during the next year or two, if the world's wool and cotton industries (including those of Germany, Italy and Japan themselves) can increase their production. The longer term prospect that rayon may continue to gain at the expense of wool, cotton and silk

is more difficult to assess, but three factors at least are working in favour of rayon. First, the world price of staple fibre is below cotton and wool—a vital consideration in markets where cheapness is of paramount importance. Secondly, rayon is offering increasing competition to cotton, in industrial uses, on its own technical merits. The coarser deniers of filament rayon, for example, are now competing successfully with cotton in tyre manufacture; it follows that the demand for rayon is so much the less dependent than it was before the war on the whims of fashion in consumer goods. The high level of consumption per head in the United States, where filament rayon has made most progress as a component in tyre manufacture, suggests that there should be scope enough for expanded consumption in other countries. Thirdly, assuming that there is no fall in post-war incomes, consumers will look to rayon piece-goods, soft-goods and suitings for the long-promised, and long-deferred, gaiety and freshness in dress; indeed, the figures of American consumption in Table IV suggest that an expansion in rayon output well beyond the peak wartime level may ultimately be required. Staple fibre is, of course, interwoven extensively with cotton and wool into mixed fabrics. To some extent, therefore, the demand for rayon is complementary to, as well as competitive with, the demand for natural fibres.

World capacity is now expanding to take advantage of the anticipated increase in world demand. In 1939, there were 26 countries producing rayon. When current plans are put into operation, this number will have increased to 37. But among the large-scale producers, a key position is held by the United States, where capacity is expected to expand to an annual rate of 1,120 million lb. by 1948, of which 300 million lb. will be for staple fibre. Already, the United States is producing sufficient staple fibre for its present needs. Such indications suggest that the American staple fibre market is now virtually lost to exporters, chief among which before the war was Britain.

World capacity is destined to expand beyond the levels of 1938, but will sufficient labour and raw materials be available to use it to the full? Labour presents no great problem, at least for countries which have some degree of industrialisation. Capital investment per operative employed is high in the rayon industry and it requires mainly semi-skilled and some unskilled labour—a fact which the Japanese were able to turn to advantage before the war. As for raw materials, rayon is made from cellulose which is obtained from wood pulp and refined cotton linters. In America, about 78 per cent. of the total cellulose used in the viscose process is derived from wood pulp, but only 63 per cent in the acetate process. Price relationships, however, favour the increased use of pulp. Regular tenacity viscose pulp (which is the kind used in ordinary rayon manufacture as opposed to the high tenacity qualities needed in rayon for tyre yarn) costs about 7 cents a lb. in the United States at present, compared with about 4 cents a lb. before the war. On the other hand, refined cotton linter pulp now costs as much as 21 cents compared with 6 cents a lb. before the war. On the evidence of existing prices, therefore, a continued effort to expand world rayon output is likely to exert pressure on world wood pulp supplies at a time when increased demands may also be expected from the plastics industry.

A series of good cotton crops in America would increase the supply of cotton linters, but the price is unlikely to fall far

enough, nor would linters be available in sufficient quantities from other cotton growing areas, to encourage a transfer from wood pulp to linters as the main source of cellulose in the event of a wood pulp shortage. Rayon can, of course, bid for pulp against the newsprint and paper industries, but the price which would have to be paid would react most unfavourably on rayon production costs—especially in the case of staple fibre.

In 1937, about one million tons of wood pulp were consumed by the rayon industry when world production was 1,831 million lb. In 1946, rayon production had recovered only to 1,672 million lb., so that, even allowing for a growing proportion of wood pulp being used, world demand is probably less than the one million tons level. Before the war, the main pulp producers were the United States, Sweden, Germany, Canada and Finland. Between 1937 and 1946, production of dissolving wood pulp (which is the variety of wood pulp used in rayon manufacture) in the United States dropped slightly, but the industry's capacity is adequate to achieve prewar levels of production if prices are favourable. The same is true of Canada. Capacity in Sweden was three times as high in 1946 as in 1937, but production was lagging behind capacity over the years 1937 to 1942—the latest years for which figures are available—owing to the need to use timber for fuel instead of imported coal. German sources of cellulose, such as hardwood on which considerable research work was done during the war, will probably be required for housing rather than for cellulose manufacture, and should Germany be allowed to expand its rayon industry to near prewar levels it would probably even become a net importer of raw materials for cellulose. Subject to a most important qualification, there seems no likelihood of a critical world shortage in rayon material supplies at least until the present expansion programme in the United States is completed and the future level of operation of the rayon industries in ex-enemy territories is known with greater certainty. The qualification is briefly stated: those countries which are mainly dependent on imports of raw materials—such as Britain and France—will have to pay for their cellulose supplies either with scarce dollars or, in the case of Scandinavian supplies, by exporting coal or capital equipment at a time when there are many other claimants for the limited amounts available.

This country is among the world's important rayon producers, and imports of material for cellulose and rayon exports are an important factor in British overseas trade. Rayon production has recovered strikingly from the concentration period during the war, and it rode out the fuel crisis with more success than any other textile industry. Production in June was 16.8 million lb.—the second highest monthly figure ever achieved. The industry has laid its plans for an expansion programme costing some £50 million. Production, however, has been hampered by a shortage of labour, raw materials and fuel. The industry has to be given full credit for its production record and its bold expansion plans and its well earned reputation for technical efficiency. The rayon industry has an important role to play in the British export drive, but increased competition must obviously be expected from other countries as soon as their capacity has been expanded or, in some cases, brought back into production. So far, British rayon prices have been lower than those of most of the competitors, but it has not been possible to take full export advantage of this creditable fact owing to the limitations upon production arising from coal and raw material shortages, and also owing to the needs of the home market. Those export markets which have expanded noticeably in filament rayon, have been mainly in Empire countries, rather than in the hard currency areas. The real test of British competition in world markets has still to come. Italy has already become once more an important filament rayon

producer. It is not known yet how much capacity Germany and Japan will be allowed to restore to production. But their return to the world market can only be a question of time. The United States market will offer little scope for competitive imports in a few years, when the projected expansion pro-

grammes are complete. By the 'fifties, much of the world will still be poorly clad, and rayon will play a full part in satisfying this demand. But it will be a highly competitive market, keenly contested by the various large producers, and also by the reviving strength of the other textile fibres.

Business Notes

Investing in the Closed Economy

Alone in the market, gilt-edged stocks have put a good face on this week's instalment of crisis news. The two "irredeemables," Old Consols and 2½ per cent Treasury Stock, have recovered further to 86½, and have thus progressed well clear of the 3 per cent yield datum to which—indeed, below which—they were beaten down as recently as a fortnight ago. The coincidence of the break in gilt-edged prices and the recovery of the last ten days with the beginning of formal convertibility of sterling on July 15th, and its suspension on August 21st, has attracted much attention. Some observers have inferred that the break was due less to "sentiment," as Mr Dalton would have it, than to foreign selling. It was, of course, invariably the foreign seller who was responsible for depressing gilt-edged prices in the days of free exchanges—and, of course, the patriotic British purchaser who put them up again. So, at least, market gossip usually had it before the war. But something more than gossip is needed to justify the view that foreign selling accounted for the major part of the recent reaction in prices. Whatever may have happened in the short bonds (where special factors prevailed, which are discussed in a later Note), the long-dated issues can hardly have been affected.

Meanwhile, the delay which buyers are now experiencing in getting delivery of gilt-edged stocks suggests that the size of the professional bear account was bigger than was at first thought. Now that recovery is in train, the closed economy argument is again being aired to justify the rise in gilt-edged prices. Inflationary surpluses are bound, so it runs, to find their way eventually into the gilt-edged market, because there is no other avenue of useful escape. The argument assumes that inflationary pressure will continue to increase; some of its supporters even contemplate a further bout of active credit creation on the lines of twelve months ago. But at this stage when the need for a disinflationary policy is universally conceded (except perhaps by the Chancellor himself), both assumptions look even more dubious than they did, say, three months ago. In any event, the effect of inflationary pressures ought to be seen more directly in the industrial market. But there a general atmosphere of deflationary gloom prevails, with the *Financial Times* industrial share index touching new low levels almost daily—it reached 112.6 on Wednesday.

Investors are now convinced that the coming winter will provide plenty of examples of specific deflation at particular points of industry, no matter what may happen to industrial prospects generally, or to the favoured priority groups, like steel and textiles. It needed the suspension of the basic petrol ration to have a significant effect on motor share prices, although their prospects, looking a year ahead, were already rather unsettled. The rot in shipping shares, on the other hand, seems to be based on the idea that international trade is likely to come to a virtual standstill, despite the evidence of current demand for freight space. Among the "money stocks," home rails are trying to recover in line with gilt-edged; Argentine issues (discussed in detail in a later Note) are trying, at the moment, to take a more hopeful view of the completion of the purchase agreement; but coal shares, which are "money shares" at second remove, until the compensation is finally allocated to individual companies, remain depressed. Few market observers would say that equities as a whole have fallen too far, having regard to the bleak economic outlook. But it seems likely that particular groups have suffered more than their due in the reaction.

The New Exchange Structure

So far as can be judged—and there is only scanty evidence from which to draw conclusions—the reactions abroad to Britain's withdrawal of dollar-convertibility from sterling have been more restrained than there seemed reason to fear. The situation is so complex that it would be unrealistic to suppose that overseas authorities already fully grasp the implications, but the absence of any explosive reaction at the outset holds fair promise that the problems will now be deliberately studied on their merits; and Britain could ask no more than that. Meanwhile, in London, a situation which the authorities describe as "fluid" is in the City regarded as highly confused. Perhaps there is not much distinction between the two definitions, but in construing the effects of the bewildering Payments Order (S.R. & O. 1947 No. 1785)

the policy-makers and their draftsmen presumably have an advantage over private financial circles and journalists who have been left without guidance.

Some of the broader technical consequences are, however, becoming apparent. From statements made at the outset last week (when the formal documents were not available to provide a crosscheck) it appeared that the range of restraint upon convertibility of non-resident holdings of sterling into dollars was narrower than is the fact. Except for the sterling on American and Canadian Accounts, all non-resident sterling which formerly was fully convertible is treated similarly, regardless of its origin or ownership, and is deprived of its automatic right of transferability to the US dollar area or Canada. This restriction applies equally to such sterling accumulated before the Chancellor's announcement as to new accumulations. There is, therefore, no distinction (such as was drawn in *The Economist* last week) between transferable sterling accruing from releases of old balances specifically conceded under the recent bilateral agreements and transferable sterling accruing from either old or new current transactions.

To this extent, last week's comment on the technical strength of sterling was rather more cautious than it need have been. In principle, the effect of the arrangements is to ensure that no part of the sterling balances accumulated by non-resident holders (i.e., countries outside the sterling area), and already subject to blocking agreements, can impose a direct strain upon Britain's remaining dollar resources. Provided that the system works as intended, the blocked portions are not available for transfer at all, and the "released" portions (in common with newly-accumulating "current" sterling) cannot be used for payments to the US dollar area or Canada or (with certain exceptions) to non-sterling countries with which no specific transferability arrangements had been made. In the absence of leakage or abuse, the only strain which such releases can now impose arises from the possibility that the funds may be used to buy sterling area goods which might otherwise have earned dollars or discharged adverse balances elsewhere. The drain from "unrequited" exports has not been wholly stopped. But there is some reason to believe that a high proportion of the non-resident funds arising from agreed releases has already disappeared, through the final rush to secure dollars before the door was closed.

Sterling Area Now

It therefore seems that the principal source of danger to the residual reserve—apart, of course, from Britain's own yawning gap—now arises from the sterling area, for here there are no such formal safeguards as have been introduced against withdrawals by non-sterling countries. Technically, the position of the sterling area is unaffected by the changes announced last week. The overseas monetary authorities retain the same degree of autonomy as they have enjoyed all along; the central reserve is regarded as the reserve of the whole system; and if they think fit to sanction payments to the dollar area, the Exchange Control and its agents here are bound to see that they are duly honoured. In the technical sense, the only basic distinction, compared with the position existing a few weeks ago, is that most of the accumulated balances have been blocked, either by specific arrangement (as with India) or informally; but specifically agreed releases are technically still available.

In practice, however, the British authorities are not so dependent upon the good husbandry of the overseas authorities as this informal arrangement might seem to imply. All members of the sterling area have been told plainly that they must exercise the greatest possible restraint, and it would be surprising if those which have lately been granted specific releases have not also been warned that these cannot be treated as automatically available. Britain, quite apart from its own desperate needs, has a duty to ensure that no member of the group secures more than a fair share of the exiguous reserve which must suffice for all. This week's omens seem to promise a high degree of very willing co-operation, but if any member shows signs of abusing the trust which the arrangement demands, the British authorities can be relied upon to bring strong pressure to bear, with the threat of excluding the member from the sterling area. In most instances, that would mean the freezing of virtually the whole external reserves of the country concerned, subject to such a ration of exchange as the authorities here deemed it appropriate to provide.

The potency of this drastic sanction does little, however, to

relieve the acute difficulty of the whole situation. In some cases, the possibility of undue strain may arise from the sheer administrative complexity of the problem which confronts the exchange authorities overseas, some of whom have little experience in sifting applications. Leakages arising from such considerations would certainly justify London in taking matters into its own hands. But dollar demands arising from import requirements upon the essentiality of which there is room for honest differences of opinion pose an entirely different problem. In principle, this is a case for fair shares between all members of the group, but the test when the resources are so slender is not how much more each should get but how large a cut each can stand. On what principles should, say, India's standard of living be compared with that in Australia or Britain? It is a forbidding problem—even assuming that all parties are equally determined in their drive for economy.

* * *

No Agreement on Miners' Hours

Protracted negotiations on Thursday of last week between the Government, the Coal Board and the National Union of Mineworkers on extra work in the mines to increase coal output, met with a complete *impasse*. The Coal Board have not felt justified in accepting the miners' proposal for Saturday work at overtime rates at a time when the conditions on which the five-day week was granted, especially the undertaking to reduce voluntary absenteeism, have still to be implemented. On the other hand, the miners consider that working an extra half-hour a day represents the abandonment of the principle of the five-day week, since it would extract from them more work a day, at normal rates, than was contemplated when the five-day week was conceded, and that in any case extra Saturday working would produce more coal than could be won by re-organising stints to take advantage of the extra half-hour a day.

The key to this problem, as indeed to most aspects of coal production, is the reduction of voluntary absenteeism. If that could be achieved, the miners' claim for a sacrosanct five-day week would have more justification and the Coal Board's arguments against Saturday working would carry less force. Absenteeism can be reduced only by a shrewd mixture of incentives,

cajolery and discipline. There is more to be gained from isolating mining communities by a prescription on those lines—despite anything that Mr Morrison has said—than by mere exhortations to public duty. Of cajolery, there is a liberal supply from the NUM itself. Incentives, too, have been provided in abundance by minimum wages, bonus systems and preferential treatment in the supply of rationed and pointed goods, but is it quite impossible to link the preferential allotment of food with the completion of five full shifts, say by the issue of emergency cards with the weekly pay packet, rather than by making extra rations automatically available to all miners and many other consumers in mining districts?

The abortive negotiations on extra hours have at least produced signs of a firmer line on discipline. The possibility of withholding the minimum wage from absentees and unofficial strikers was aired last week at a Lancashire area meeting of the NUM, and on Wednesday it was announced that the Coal Board would not take back 2,682 unofficial strikers (of whom many had been picking fruit at £1 a day) at Grimethorpe, near Barnsley, until they undertook new contracts of service, which include the working of a longer coal face—a step which received the immediate approval of Mr Will Lawther but was received with disapproval by a group of Doncaster miners, who have struck in sympathy with the Grimethorpe men. Meanwhile, trouble has flared up again between the National Union of Mineworkers and the Clerical and Administrative Workers' Union. It now seems likely that the clerks' union will raise the question whether it is to be eligible to negotiate terms of employment for its members with the Coal Board, independently of the NUM, at the Trades Union Congress which opened at Southport this week. Meanwhile, the country's urgent coal requirements will go unmet while the Coal Board and the NUM once more take up their bargaining positions and until the mineworkers show greater resolution in putting their domestic affairs in order.

* * *

Higher Coal Prices

With the consent of the Minister of Fuel and Power, the National Coal Board has decided to increase the pithead price of deep-mined coal by 4s. a ton from September 1st. Corresponding

THE BANK IS INTERESTED

It is interested in its customers, in their affairs and in their business ventures; it is ready, by direct assistance and friendly counsel, to help those affairs forward, for it recognises that the prosperity of the Bank is to be found in the prosperity of its customers. It is, therefore, good business to keep in touch with your Bank. The Manager at any branch of the Westminster Bank will be glad to discuss with you any problem in which the services of the Bank can usefully be employed.

WESTMINSTER BANK
LIMITED

Palm kernels, palm oil and ground nuts supply the raw material for many products with a fat content, and these commodities rank high among the exports of Nigeria. Tin mining is also a major industry, while cotton and rubber growing are steadily increasing in importance. In comparison, recent trade returns for cocoa, hides and skins show some decline on pre-war figures.

The gradual change-over to a peace-time economy with its varied demands may well bring about further changes in the commercial activities of Nigeria. Modern commercial development calls for careful and continuous study of local market conditions. Full and up-to-date information, backed by an intimate knowledge of the Colony, is available to merchants and manufacturers interested in trade with Nigeria.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

increases in manufactured fuel, and in open-cast coal produced by the Ministry of Fuel and Power, will also be made. And further increases in prices will be necessary a month later, when the increase in railway freight rates, which involves an increase in the average rate for coal class traffic of 1s. 9d. per ton, takes effect. Mr Shinwell might well observe, as he did a fortnight ago, that "profit making in the mining industry has disappeared."

The Board is currently operating at a loss of 3s. 3d. per ton; including the cost of coal imports from the United States and Poland, this loss is increased to 3s. 9d. per ton. The chief item contributing to increased costs is, of course, the rise in wages following the introduction of the five-day week. The Board's financial statement puts the increased cost resulting from the five-day week, "after taking credit for improvements in output per manshift," at 2s. 6d. per ton. The gross cost cannot be "accurately assessed," but it is substantially more than the net cost of 2s. 6d. per ton, and the latter will only be further reduced when restrictions on output are eliminated and new recruits to the industry become fully productive. But the statement immediately adds that the price increase of 4s. includes no allowance for "the increasing effect of adverse factors not fully reflected in present results," or for any allocation to reserve, or for losses carried forward from the period May to August, which were only partially offset by profits for the period January to April.

A statement of the Board's profit and loss for the first quarter of this year will be published during the next few weeks. Meanwhile, it is instructive to compare the Board's present position with that of the coal industry under private ownership last year, when profits prepared for wages ascertained amounted to 2s. 9d. per ton. The Board has to provide for depreciation (8d. per ton) and for interim income to colliery owners until compensation is paid (1s. 5d.), and it is obtaining profits equivalent to 4d. a ton from ancillary undertakings. These items make a net adjustment of 1s. 9d. to be deducted from the ascertained profit, leaving a net surplus of 1s., on a comparable basis between the two periods. Wages now cost 2s. 6d. per ton more; other payments like holidays and welfare, 7d.; staff superannuation, 4d.; scientific research, education and training, 2d.; other additional costs, including national insurance, staff compensation, etc., 3d.; new staff, 1d.; timber stores, etc., 4d. These increases total 4s. 3d. per ton, leaving a current loss, before including the cost of imported coal, of 3s. 3d. per ton.

*

Clearly, this is not the end of the increases in coal prices, which have raised the pit-head price by 23s. 5d. a ton since 1939. The effect on the level of British industrial costs needs no emphasis. In conjunction with the rise in freight rates, it is likely to lead to an increase in steel prices in the relatively near future; gas and electricity will cost more; and industry generally will suffer by higher prices for fuel and intermediate products. And consumers will note that the National Coal Board in its references to the future has no single note of encouragement to offer.

* * *

See-Saw in Argentine Rails

Argentine rail stocks remain a tender market. Last week-end hopes were buoyed up by the report that General Perón had stated categorically that the purchase would go through—it had been approved by the High Court in London on August 21st—but a more careful reading of his words showed that he was referring only incidentally, and then in the past tense, to the agreement. The truth is that the market this week has been operating in the dark—which is no new situation for the few jobbers who now remain in it. In form, the Argentine authorities should now, within thirty days of the Court's sanction, proceed to complete the transaction. But in their anxiety to safeguard their dollar requirements for the rest of this year, they seem to have lost sight of the fact that they would be short of sterling. If, as is suggested, Argentina's accruing sterling has been promptly converted, its problem is to find the balance of £35 million to supplement the sterling balances of £115 million, so that the purchase price of £150 million can be met in full.

Even after the slight recovery in prices which is shown in the accompanying table, it is obvious that holders are taking a cautious view about the implementing of the agreement. Discounts ranging between 10 per cent on the senior stocks to 20 per cent on the juniors suggest that investors are not counting on the immediate completion of the agreement—and are not even certain that it is proof against revision. The presence of Sir Montague Eddy in Buenos Aires for discussions with the Argentine authorities may clear up these doubts. They turn partly on internal Argentine poli-

tics, and perhaps also on the legal construction of the purchase agreement. Is this an integral part of the monetary agreement which Britain has now abrogated in the all-important matter of convertibility? Or is it a totally different settlement to the joint

company proposals for the railways which that agreement contemplated, and therefore unaffected by changes in the agreement itself? Will the lapse of convertibility provide an argument for the Argentine Government to try to secure a reduction in the purchase price? Will the current shortage of sterling from which Argentina now suffers mean a delay in completion of the contract until balances have been built up? Will the desirability of taking over the railways for political reasons be coupled with strong economic compulsions to retain the British market for Argentine meat, even though satisfaction of the agreement will mean exporting four months' supplies "for nothing" in order to find the balance of the money?

There are questions enough, and few answers. But the fact that no official denunciation of Britain's action last week has come from Buenos Aires is, in its negative way, a pointer of a sort. Present indications, such as they are, suggest that the general framework of the agreement is secure. There might be delay in completion, though it should not be difficult for Argentina to secure temporary finance in London for this purpose, granted the present pattern of her trade with Britain. But any attempt to reopen the bargain with the idea of getting the railways at a cheaper price would certainly have more serious consequences, particularly for the junior stockholders. That possibility may be remote, but at least the market has recognised it.

* * *

Short Bond Problems

Among the technical consequences of the convertibility crisis and its antecedents, one that has been overlooked is the impact upon the short bond and money markets, in which an interesting position has arisen. Upon the former, the direct effects are difficult to trace and may not, indeed, have been particularly large. The theory that overseas selling, for "convertibility" purposes, was largely to blame for the crack in the gilt-edged market may conceivably be valid, but is certainly hard to substantiate. There is fairly general agreement that the weakness originated in the shortest bonds and that at times even of major movements the reactions in the longer dated stocks were mainly sympathetic. As for experience in the shorts, all that is definitely known is that on several days in July there was substantial but rather localised selling, which may or may not have reflected overseas operations at one or more remove. These sales were particularly concentrated upon the 2½ per cent National War Bonds, 1949-51, but extended also to the 1951-53 and 1952-54 issues. During the final stages of the weakness, in mid-August, the volume of selling was both smaller and less concentrated, but came upon a market which was almost devoid of support.

In the short loan market, however, the effects of the movement of overseas balances are more readily discernible, and may have had some secondary repercussions on the bond position. For some months before the convertibility crisis, the discount market had been experiencing a particularly large turnover of money, attributable especially to large movements of funds from the "outside" circle of banks to the inner ring of clearing banks and also, at times, to the authorities. There were, of course, also reverse movements, but over the period the net result was to reduce the volume of money available to the market from "outside" banks—the funds of many of which reflect accumu-

lations of overseas sterling balances—and to increase the volume of call money obtained from the clearing banks.

It would be wrong, however, to attribute these changes wholly, or perhaps even mainly, to convertibility. Certain sterling balances were being depleted by sterling payments for exports—the "unrequited" exports—and in other cases reductions were attributable to purely special operations, such as the gifts from Australia and New Zealand to the Imperial Exchequer. In the latest stages, however, the reduction became more noticeable and certainly was attributable to the withdrawal of funds from the market for the purpose of conversion into dollars. In parenthesis, it may be noted that the immediate effect of such transfers is to reduce the supply of outside money without increasing the supply of clearing bank money, since the funds are paid away to the authorities, who would naturally employ them for the reduction of borrowings from the banking system on Treasury deposit receipts or bills.

* * *

"Bill" and "Bond" Money

The technical consequences of these changes has been a disturbance in the equilibrium between the discount market's "bill" money and "bond" money. In the past, the habit of the discount houses has been to finance a high proportion of its bill portfolio by money borrowed from the clearing banks, and almost the whole of its bond portfolio by money borrowed "outside." This situation arose from the fact that "outside" money is normally the marginal supply, and is always treated as such. In consequence, the outside lenders traditionally could not in general command a rate as high as the stereotyped rate charged by the clearing banks, and had less freedom in deciding whether to lend against bills or bonds. Since the Daltonian reduction in short money rates in October, 1945, the clearing banks' rates have been ½ per cent for loans against bills and ¾ per cent against bonds, whereas the outside bond money rate has normally been ¾ per cent.

Recent events have disturbed this position in two distinct ways. On the one hand, the discount market, until its position became fully extended, absorbed the offerings of short bonds, so that its requirements for bond money were increased. On the other hand, the shiftings of foreign funds reduced the normal supply

of such money—the "outside" money. In recent weeks, the clearing banks have therefore been called upon to provide substantial loans to the discount market against bond collateral. This is almost a novel situation; ever since 1934 the clearing banks have quoted a differential rate for loans against bonds, but the facility had never been substantially utilised.

The possibility that this situation might arise had long been foreseen, however, for it had never been supposed that the huge wartime accumulations of overseas balances would become a permanent feature of the London market; while it was evident that the discount houses would be likely to remain large operators in bonds for so long as any substantial proportion of the national debt is held in short-dated form. But the shifting of the balance of forces in the short loan market occurred not only suddenly but in circumstances which, from the banks' point of view, were unpropitious. They were called upon to lend more largely against bonds at the very time of pronounced weakness in gilt-edged, and especially in the "shorts."

* * *

New Problem for Banks

It is perhaps not surprising, therefore, that this situation produced minor friction. A fortnight ago it was suggested in certain press comment that the discount market's capacity to support gilt-edged—that is to perform its proper role as a shock-absorber for short bonds—was being circumscribed by inability to secure all the "bond" money it needed. It is doubtful whether money limitations of this particular kind restricted the activities even of individual houses, but there certainly was no perceptible constraint upon the operations of the market as a whole. It is true, of course, that the discount market as a whole is no longer in a position to increase its bond portfolio, but this is because the ratio of its bonds to its capital resources had already reached—and, in some cases, may even have surpassed—the conventional limits.

There remains, however, a technical problem to be solved if the market is to function with maximum flexibility. The clearing banks in general have not yet hammered out the principles upon which they should lend upon bonds. Some of them, realising the

AUSTRALIAN
TRADE

This Bank is equipped to provide essential information to business houses planning to enter the Australian markets or develop existing connections. Over 400 branches and agencies at leading trade centres furnish regular advices of current business trends, which data is promptly available to British Exporters and Importers.

Address enquiries to Information Department of:—

**THE NATIONAL BANK
OF AUSTRALASIA LIMITED**

7 Lothbury, London, E.C.2

and at Australia House, Strand, London, W.C.2

Established 1858

Incorporated with Limited Liability in Victoria

Since 1910 the escudo has been the monetary unit of Portugal. The name is derived from the Latin "scutum," a shield, and the coin bears this device.

Escudo

For many years Barclays Bank have assisted the growth of Anglo-Portuguese trade through their comprehensive foreign banking service, strengthened by close links with the leading Portuguese banking houses. Today, when the expansion of our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

BARCLAYS BANK

LIMITED

54, LOMBARD STREET, LONDON, E.C.3.

Is Australia your market?

Do the people of Australia buy your products? Or do you buy theirs? Whichever is the case, the Commonwealth Bank of Australia is able to give you considerable assistance. Guaranteed by the Commonwealth Government, the Bank has 330 branches throughout Australia and New Guinea; it has an unrivalled first-hand knowledge of Australian produce and Australian requirements; it is, therefore, unusually well equipped to facilitate trade between this country and the Commonwealth. The Managers of the London branches welcome enquiries from those whose interests lie in the Australian market.

COMMONWEALTH BANK OF AUSTRALIA

8 Old Jewry, London, E.C.2. Australia House, Strand, London, W.C.2.

A WORD FOR IMPORTS

At the moment exports take precedence, but exports encourage imports and the latter will in time resume their rightful place in the Nation's trading. Firms which hope to be associated with the coming expansion may call upon The Three Banks for advice. The Members of this Banking Group, whose combined resources rank them sixth among the Banks of Great Britain, have extensive facilities and the benefit of long and valuable experience to offer to their customers.

novelty of the situation, are thinking on rational and liberal lines. But there is some reason to believe that others have been trying to legislate by past experience, and have been looking backwards to the days before the discount houses had a clear and acknowledged role in the short bond market and when almost surreptitious business in bonds was made possible only by the expedient of "mixing" them in parcels of bill collateral. But in those days there was no sort of assurance that the authorities would approve such operations if the question arose, whereas now, provided it has operated within prudent limits and has confined itself to bonds with less than five years' life to final maturity, the discount market has the assurance that the authorities will stand behind it. From this point of view, therefore, bank loans against bonds are almost on all fours with those against bills. There is, of course, the greater risk of depreciation, but the banks naturally safeguard themselves by exacting a fairly substantial margin of collateral. It would be useful, incidentally, if margin practice could be standardised.

"Staggering" the Power Load

This week's warnings of possible power cuts—in the middle of an August heat wave and the holiday season—were due to generators being taken out of service for summer overhaul. But they lent particular point to last week's announcements of the complicated arrangements which have been made to avoid the dislocation of industry by a repetition of last winter's widespread power cuts.

Even with "staggered" hours of work in the factories and the installation of diesel generators by firms to lessen their dependence on the "grid," there is no hope of closing the gap between the potential maximum demand of 11 million kilowatts and total generating capacity of 9 million kilowatts. Efforts are now being concentrated to ensure that the cuts, when they are made, should be orderly and predictable. The arrangements made by the Ministry of Fuel and Power give each electricity undertaking a "quota" of maximum demand to which its load must be reduced on the instructions of the Central Electricity Board—thus providing some measure of central surveillance over the regional allocation of the grid's total supplies. Within each area, those firms which cannot transfer a third of their demand for power from the morning peak periods to evening shifts, will be expected to submit to a rota of power cuts, which may take the form of the division of an area into five zones, each of which will be liable to have its power cut on a specified day each week. Should these cuts still be insufficient to reduce consumption, the rota system may be extended to all industries in the area, power being cut—on giving, say, twelve hours notice—for industries which had already transferred a third of their load to off-peak periods. Schemes on these lines have already been approved by the Ministry. Restrictions on space heating will not be imposed

this winter and, according to the Ministry of Fuel and Power, no compulsory restrictions are likely for domestic consumers.

The authorities now have a formidable array of chosen instruments for imposing power cuts; they include a statutory Order to enforce staggered hours, supply targets for electricity undertakings and a multiplicity of schemes and plans throughout industry for spreading the power load over a longer working day and ironing out the peaks. The complexity of this machinery is certainly a tribute to the intricacies of the problem. Each area has its industries which are unable to transfer a third of their power consumption owing to technical difficulties or perhaps even to labour resistance in some cases. The success of economy measures accepted by industry may still be jeopardised by the thoughtlessness of domestic users linked to the same circuits.

Golden Harvest

After an astonishingly short growing season followed by the easiest harvest for a generation, the general verdict on British corn crops is favourable. Yields are much better than was at first feared and the quality is good. But the European grain position generally looks far from healthy and the harvests promise to be even lighter, than earlier estimates suggested. The wheat yield in the Danube Basin has been poor, but to some extent this will be mitigated by the good maize crop. In Scandinavia and parts of Germany, the hot dry summer has caused some deterioration, whilst in Czechoslovakia the wheat harvest is expected to be only two-thirds of last year's, and rye 80 per cent; deficits of bread-grains and fodder have been estimated at 300,000 tons and 800,000 tons respectively. In Greece the production of all grains is reported to be 30 per cent below last year's harvest and 40 per cent below the pre-war level; the wheat crop is expected to yield 18.4 million bushels—a decline of 35 per cent on 1946. According to the latest FAO report, Europe, North Africa and Asia will require an import of 34-38 million tons of grain to cover basic needs in the coming season.

Even in the major grain producing areas there are unpleasant indications. The Australian crops are growing well on a larger acreage, but the wheat area in Argentina has been reduced. The first official estimates from Canada give the current season's wheat out-turn at 358.8 million bushels compared with 420.7 million bushels a year ago. Oats will be a small crop, and barley is also expected to yield less than in 1946. The latest forecast from the United States puts the wheat harvest at 1.4 billion bushels—another and even better bumper crop; last year's record out-turn was 1.156 billion bushels. This quantity would be sufficient to furnish 500 million bushels for export, which it is understood has been set for the coming season. But there are indications that even if action is taken by the US Government the target is likely to be unfulfilled. The American maize crop is expected to yield only 2.3 billion bushels compared with 3.3 billion bushels

SECURITY PRICES AND YIELDS

in 1946, and since there is a smaller oats crop, the feed situation begins to look precarious. Domestic consumption of food is likely to continue at a high level while prosperity is maintained in the United States, and a large diversion of wheat supplies from the export market to feeding livestock is likely to follow the maize failure. It is too early even to guess how much wheat may be used in this way, but the earlier estimate of a deficit of 4 million tons between world grain requirements and the world exportable surplus will probably turn out to be over 10 million tons.

For the first time in the history of the Chicago market, maize stands at a premium over wheat. Even if the Marshall Plan provides European countries with sufficient dollars to buy bread-grains, American farmers are unlikely to market sufficient quantities, except at high cost. Only a miracle can prevent an acute grain shortage in Europe during the next twelve months—and Europe is tired of waiting for miracles.

Baltic's Air Freight Section

It may be too early to say that civil aviation has started on the wrong foot. But it is a symptom of the times that states should have displayed almost universal eagerness to set up monopolies, and that not only in Great Britain, but also in the United States and elsewhere, they should have rejected the claim that air transport is a modern extension of sea transport. Private enterprise, operating in the limited field of charter and freight air transport, left open since the war, finds that the affinity of commercial air transport to shipping grows from day to day; hence the opening of an Air Freight Section of the Baltic Mercantile and Shipping Exchange must be regarded as a logical development. Numerous companies which now operate charter aircraft have been seeking for some time to establish a sound commercial basis for integrating their growing industry, and the experience and success of the Baltic Exchange in chartering ships for world commerce during 200 years suggests the way towards a solution. The shortage of air liner transport has tended to overstress the "air taxi" side of the business, but in the long run it is the carriage of goods by air which is likely to prove the main standby of commercial (as distinct from state-controlled) civil aviation. There are good cargoes to be carried, usually of a specialised nature, which can stand the extra cost of speedy transit; these include medical supplies, machinery and spare parts, luxury perishables, bullion, documents and commercial samples of every kind, including bulk commodities.

The main difficulty at the moment, from the charter aircraft

operators' viewpoint, is to find the cargoes at the right time, and, from the prospective shipper's point of view, to get the right aircraft at the right time and place to make its use profitable. Membership of the Baltic has now been thrown open to the air transport industry and as a result brokers should be able to "marry" cargoes and aircraft, as they have been doing with ships for so long. This step should go some way to obviate the common diseconomy that one-way cargoes have to bear the cost of the return flight without pay-load. Further advantages may be anticipated from the quotation of freight rates and the long overdue framing of satisfactory "time," "voyage" or "bareboat" charter-parties, similar to those which have long been universally accepted for carriage of goods by sea.

Air freight agents and operators overseas are watching the new development closely and there is a chance that the London air freight market may become the international centre of air chartering as it has been for so long of ship chartering. Some operators, however, still visualise a system which might be described as a cross between Keith Prowse and a supreme commander's "operations control room"; in particular they maintain that a mechanism suitable for shipping is too "slow" for arranging air transactions. They possibly do not realise that although the floor of the Baltic is open only from 10 to 4, it is the broker's job to provide a 24-hour service for his clients. There is welcome evidence of strong support for the new project from the more experienced aircraft operators. But a successful and internationally recognised market will not develop without the support of the principal users of air transport, and their participation, or that of their chartering agents, must be assured.

Trade in Tea

An initial step in the re-opening of Mincing Lane has been taken by the Government in sanctioning tea imports by merchants on condition that the tea is re-exported after blending. This move will be of some help in re-establishing the once pre-eminent position of London in the world tea trade, and it has come none too soon. Free auctions have been operating for some months in both Calcutta and Colombo, though since the United Kingdom has, in effect, boycotted them, dealings have been restricted. Nevertheless they are something of a threat, for either or both of these centres are trying to fill the lack of a central market in the world tea trade which has become evident since tea was freed from international allocation.

Mincing Lane possesses many advantages which do not exist in either India or Ceylon, and of these perhaps the most important is its expertise in blending. A number of large pre-war buyers of tea, including South Africa, Australia and America, are still buying their supplies direct from the growing countries, so that the volume of re-export trade in tea from this country is unlikely to assume its pre-war proportions for a long time, and even then could do so only with difficulty. Nevertheless, with its experience in blending teas to suit particular palates, London may well regain a useful proportion of this trade.

The Indian tea trade in the coming months, granted the difficulties of partition, will be somewhat insecure, and this may provide an opportunity for Mincing Lane to expand its operations. Most of the tea imported for blending will be destined for the Continent and certain colonies; this trade is quantitatively small, and its main value will be to enable the market to re-establish its trade connections and to prepare for the eventual day when the Ministry of Food ceases to be the sole purchaser of supplies for home consumption.

The Indian Government has granted permission to the Ministry of Food to purchase 268 million lb. of tea; this increase over the original 200 million lb. limit is to cover the additional contract offers. Provided that there is no hold-up in delivery, these supplies would cover a 2½ oz. weekly tea ration, but the Government has stated this week that the ration will not be increased beyond the present level of 2 oz. This decision, presumably, has been taken in order to increase stocks, which have been heavily run down during the past year.

Growth of the Trade Gap

Recent events have left only an academic interest for the July trade figures. Yet they deserve serious attention in their own right. Both imports and exports last month reached new peaks, but the adverse gap widened further to a new post-war record of £65 million. In 1946 the monthly adverse balance remained at about £27 million, for the expansion in exports during the year kept pace with the rising volume and value of imports.

The shortage of fuel and the severe weather last winter brought about a marked reduction in exports, and as the import programme was not readjusted, the adverse balance rose to £32 million a month in the first quarter of 1947 and jumped sharply to £57 million a month in the second quarter, when the secondary effects of the winter crisis synchronised with the full impact of rising import prices. Over the past six months, import prices have risen by 15 per cent, while export prices have risen by only half that extent.

Exports in July are usually high, for the month contains the maximum number of working days, and shippers are eager to clear documents before the holidays. On the basis of a national month of 26 working days, July shipments were 5 per cent higher than in June and thus continued the improvement from the coal crisis, an improvement which began last April. Owing to holidays this is likely to be interrupted in August and September. The following table gives exports for the past 8 months, recalculated on the basis of 26 working days a month:

	£ mn.		£ mn.
December, 1946	90	April, 1947	89½
January, 1947	88	May, 1947	89½
February, 1947	82½	June, 1947	101
March, 1947	82½	July, 1947	106

The volume of exports in July has been provisionally estimated at 125 per cent of the 1938 figure, which compares with 102 per cent in the second quarter of 1947, 101 per cent in the first quarter and 111 per cent in the last quarter of 1946. The July volume figure is the highest recorded since the war, the previous best being a year ago (July, 1946), when the export volume reached 121 per cent of 1938. The increase in exports compared with June was almost entirely represented by larger shipments of manufactured goods, with machinery (£17.3 million) and vehicles (£16.7 million) accounting, for the second month in succession, for over 30 per cent of total exports. The number of

VISIBLE TRADE BALANCE
(£ Million)

	Imports			Exports and Re-exports		
	I/1947 (Monthly av.)	II/1947 (Monthly av.)	July, 1947	I/1947 (Monthly av.)	II/1947 (Monthly av.)	July, 1947
Food, drink and tobacco	61.9	72.4	82.0	5.1	5.7	6.8
Raw materials	34.2	45.6	56.4	7.9	7.4	5.8
Manufactures	23.2	31.6	39.1	73.5	78.4	97.8
Others	2.0	1.7	1.7	2.8	2.9	4.2
Total	121.3	151.3	179.2	89.3	94.4	114.6
Visible Deficit				32.0	56.9	64.6

new cars exported totalled 12,156, which exceeded the May record by 1,486. The expansion was general throughout all categories with the notable exceptions of cotton and rayon goods, exports of which were both smaller than in June and in July last year.

Imports in July, totalling £179.2 million, were £25.4 million above the previous peak recorded in June—on a daily average basis the increase was 3½ per cent—and were the highest ever recorded with the exception of January, 1920. Food, drink and tobacco imports rose by £11.8 million on the month owing to increased arrivals of meat and dairy produce. Meat imports were 50 per cent heavier than in June, and about half the increased

quantity came from New Zealand; these arrivals were indeed timely, for meat stocks in the United Kingdom were estimated to represent less than a month's supply at the end of June. Retained imports of raw materials were £12.4 million, or nearly a third above the average for the two previous months. Imports of machinery were also higher.

Dollars from Tin

Although world tin production is improving, supplies available during the second half of 1947 are estimated by the Combined Tin Committee to be sufficient to meet only half the requirements of the importing countries. The additional allocation recently announced totals 15,710 tons, which together with the interim allocation of 11,331 tons made some seven weeks ago, gives a total for the second six months this year of 27,041 tons. The United States is to get 14,657 tons, France 4,115 tons, India 3,263 tons and Canada 1,000 tons. The Committee has emphasised that the present allocations must cover the major needs of the consuming countries for the period, although small additional quantities may be allocated towards the end of the year. A small reserve has been set aside to cover requests for minimum additional allocations to improve working stocks of those countries whose needs the Committee think are urgent. By this method it is hoped to mitigate the difficulties caused by the long distances between producing and consuming areas and the generally low level of stocks.

In Malaya, tin output is at long last expanding at a satisfactory rate. Rehabilitated dredges and open cast mines have been restarted; in June, 370 mines were in operation as against 252 in January. There has also been a steady increase in coal production, which in the first quarter of the current year totalled 23,760 tons and in the second 57,489 tons. These factors have resulted in an increase in tin output to 8,217 tons for the April-June quarter, compared with 4,614 tons in the first quarter of the year. Production in 1947 is expected to reach the target of 46,150 tons and to rise to 72,800 tons in 1948.

With the American demand still firm, tin is one of a handful of commodities which enjoy a certain dollar-earning capacity. But tin is subject to international allocation and controlled prices, so that its contribution towards redressing the dollar deficit has been limited. It may not be possible, for political reasons, for sterling producers to break free from an international marketing scheme so long as the shortage of supply exists. But it ought to be known, particularly in the United States, that despite Britain's dire need of dollars, it is not capitalising the world shortage of tin.

Shorter Notes

Agreement on staggered hours in the printing industry has been reached between the British Federation of Master Printers, the Newspaper Society and the Printing and Kindred Trades Federation. A shift system to ease the electricity load next winter has also been agreed by both sides of the cotton textile industry in the Bolton area of Lancashire.

The sharp increases in the maximum prices of home trade tops made from merino and fine crossbred wools will allow Bradford to purchase such wools at prices ruling at last season's auctions. First sale of the new season opens next Monday at Sydney and it will be interesting to see if prices continue their upward trend.

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

COMPANY MEETINGS

JAMES HOWDEN AND
COMPANY

RECORD ORDER BOOK

MR C. W. HUME ON THE OUTLOOK

The forty-first ordinary general meeting of James Howden and Company, Limited, was held, on the 27th instant, at 195 Scotland Street, Glasgow, Mr Crawford W. Hume, M.I.N.A., the chairman, presiding.

The secretary, Mr James S. Niven, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to April 30, 1947:—

For the convenience of the shareholders, it has been thought advisable to revert to the practice of publishing the chairman's statement along with the directors' report and the accounts.

Since the last meeting, Mr James B. McGillivray, who has been associated with the company for 54 years and who has been a director since 1922, has tendered his resignation, which has been accepted with regret by the board. Having been with the company for so long, Mr McGillivray had accumulated a store of experience which was of great value in the work of the board and his counsel will be missed in the affairs of the company. On his retirement, the Board co-opted Mr James S. Niven and Mr Henry L. Paul, who have both served the company faithfully and well for a number of years, Mr Niven as secretary and Mr Paul as a senior executive. It is my confident belief that their services as directors will be of great value to the company.

The usual practice has been followed in setting out the appropriations in the directors' report. You will note that £30,000 has been transferred to the general reserve account, increasing this reserve to £185,000. A provision for taxation of £185,000 has been made, and it should be noted that last year we followed the practice of previous years and provided in the accounts to April 30, 1946, for income-tax due on or before January 1, 1947, whereas this year in the accounts now presented to April 30, 1947, we have provided for income-tax due on January 1, 1948, and January 1, 1949. This is a substantial additional provision.

DIVIDEND 30 PER CENT

You will also note that in addition to the interim dividend of 9d. per share, or 7½ per cent., less income-tax, which was paid on April 30, 1947, the directors recommend that a final dividend be paid at the rate of 2s. 3d. per share, or 22½ per cent., less income-tax, thus making a total of 30 per cent. for the year. This dividend, if approved, will be paid on the 476,000 ordinary shares of 10s. each, Nos. 1 to 476,000 inclusive. The 70,000 new ordinary shares of 10s. each, No. 476,001 to 546,000 inclusive, which were issued in April, 1947, by the conditions of the issue, do not rank for dividend at this time.

The issue of these shares increased the issued capital from £238,000 to £273,000. The premium, less expenses, has been added to capital reserve account, which you will note on reference to the consolidated balance-sheet has been increased by £85,852 to £100,385.

Reserves and undistributed profits now amount to a total of £371,513.

ADDITIONS TO FIXED ASSETS

On the other side of the balance-sheet it will be noted that considerable additions have been made to the fixed assets of the company to meet expanding activities. These additions, amounting to £95,397, include the purchase of a valuable site adjoining our main works, the erection of buildings and the purchase of plant, machinery and equipment. The excess profits tax post-war refund of £48,675, as shown in the balance-sheet, has been used towards this development expenditure. The further refund of excess profits tax, which last year was stated to be approximately £6,000, has not yet been received. It is now expected that the figure will amount to about £11,000, and this also will be applied in the same way.

Last year I stated that the company's factories were fully employed on peacetime products. The fuel and power crisis had not then arisen, and while this to some extent affected the output and employment in the factories during the early months of 1947, it also had the effect of bringing a very large proportion of the company's production into a position of the highest priority, for, as you know, our products are used extensively in the equipment of power stations. In spite of the difficulties, the output from our main works at Scotland Street constituted the highest in the history of the company. In the MacLellan Street factory a high level of production has also been achieved, but much ingenuity and improvisation have been necessary to overcome shortages of materials and bottlenecks. The demand for the products of this factory is extensive, and I believe we shall find it possible during the present year to maintain or increase its output.

FULL EMPLOYMENT ASSURED

Our order book, which reflects the demand for power station and marine equipment, continues to increase, and the orders we have on hand exceed all previous records. Given supplies of steel, fuel and power, and in this we are receiving the support and help of the Government Departments concerned, and provided there is no serious setback in the industrial activity of the country, full employment is assured for a long time to come.

The loyal co-operation of the administrative and executive staff and of the workpeople has again been evident, and I should like on your behalf to thank all the employees of the company for their faithful service.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Mr I. J. Craik Henderson, Mr Norman Burke, M.I.Mech.E., M.I.Mar.E., A.S.M.E., Mr James S. Niven and Mr Henry L. Paul, M.B.E., were re-elected, and the auditors, Messrs William Hart, Jnr., and Wilson, were reappointed.

WATNEY COMBE REID AND
COMPANY, LIMITED

RESTRICTION OF OUTPUT

The ordinary general meeting of Watney Combe Reid and Company, Limited, was held, on the 28th instant, in London, Major Arthur C. Bonsor (the chairman) presiding.

The following is an extract from his circulated statement: Our output and profits have suffered from the 15 per cent. cut in our standard barrelage of 1945 imposed in May, 1946, to save materials. In August last a 10 per cent. cut in average gravity was also imposed. The change, while enabling us to make available more beer for the public, at the same time depreciated the quality. I am glad to say that this latter restriction has now been removed, and we have taken advantage of the relaxation to improve the quality of our existing beers, and we hope to be able

to brew a small quantity of stronger beers in the coming winter.

It has been a very difficult year, as we have had to face rising costs in both labour and material in conjunction with a lesser output. This limitation of output will, I fear, remain until the cereal position all over the world improves, but it is unfortunate, as we are precluded from producing enough beer to meet the legitimate requirements of the public. We are producing up to the maximum quantity allowed under existing restrictions.

With regard to the replanning of London, many schemes have now been prepared by the London County Council and local authorities which affect the future of our properties, and there are many more to come. Our policy is to watch your interests while at the same time co-operating with these authorities and with other brewery companies in the spirit of the Licensing Planning Act, 1945. One point I would like to make refers to the Greater London plan which has now emerged in what looks to be its final shape at the hands of the Ministry of Town and Country Planning. This plan envisages a great decentralisation of population—about 1,000,000 people—from London to the suburbs and outer areas, and the new residential areas will need an adequate number of licensed premises to serve them.

In some of the reception areas there is at present an unfortunate tendency among the local authorities concerned in preparing their plans to allocate too few sites for both "On" and "Off" licensed premises.

Having regard to the very difficult conditions with which we have had to contend during the year, the revenue from trading at £1,434,142 is not unsatisfactory.

The report and accounts were adopted and a final dividend of 9 per cent., making 15 per cent., and a bonus dividend of 5 per cent. on the deferred ordinary stock were declared.

DUFAY-CHROMEX, LIMITED

SIR HERBERT MORGAN'S SPEECH

At the meeting of Dufay-Chromex, Limited, held at Chartered Insurance Institute, 20 Aldermanbury, E.C.2, the chairman, Sir Herbert Morgan, said:

The consolidated revenue account shows that during the year to September 30, 1946, a net profit of £58,107 was earned after making provision for taxation and contingencies.

New subsidiaries, Coronet, Limited, and Standard Cameras, Limited, have made an encouraging start towards recapturing pre-war markets for cameras, and a "Cub" camera and "Cameo" camera are meeting with enthusiastic reception from all over the world. Cellulose acetate sheeting products are in great demand.

"Dufaylite Honeycomb," to which I made reference last year, now used in important airplane construction and for many other purposes. We are negotiating licences for manufacture of "Dufaylite Honeycomb" abroad, which we hope will provide us with steady source of revenue.

Our wholly-owned subsidiary, Polyfoto, maintains its position as largest individual photographic business of its kind in the country, serving some 1,000,000 customers a year.

We have ample capital for programme before us; practically unlimited demand with orders in hand capable of producing substantial profits in future years. As result of past research we have several products ready for market which should add to revenue.

Discussions are taking place between company and I.C.I., which, if they mature, should prove of lasting benefit to the development of the company.

I cannot conclude my remarks without acknowledging great debt owed to your managing director, Mr Demetre Daponte.

Sir P. Malcolm Stewart moved vote of thanks, which was carried by acclamation.

GOVERNMENT RETURNS

For the week ended August 23, 1947, total ordinary revenue was £45,403,325, against ordinary expenditure of £64,719,631 and issues to sinking funds Nil. Thus, including sinking fund allocations of £4,411,384 the surplus accrued since April 1st is £251,530,227, against a deficit of £395,199,373 for the corresponding period a year ago.

Elbow Room for Essentials

THERE is a lull this week in the storm. It is, of course, not yet over, and next week Sir Stafford Cripps, the original inventor of austerity, is to disclose his plan for exports, which will certainly not be pleasant reading for the domestic consumer. But this week it has been the turn of soothing syrup à la Strachey, and ringing protestations of faithfulness to destiny at Southport.

The interval will be welcome if it is used for some clearing of minds. The Government have been buffeted in the last few weeks by criticism, the range and strength of which must be almost without precedent. No doubt they have deserved it. But criticism alone is not enough, and not all of the critics would have an answer ready if they were challenged to say what they would do now. When the crisis of 1947 first came over the horizon there was no alternative policy in being, either in the ranks of the official opposition or elsewhere. Gradually, an alternative is crystallising as public discussion continues. But it is neither clear nor definite yet and the best service that the Government's critics can render, when their anger is spent, is to give what help they can in clarifying the issues and in distinguishing sense from nonsense. There has been a great growth of humility among the members and supporters of the Government in recent months, and if an alternative policy were clearly and cogently formulated, they might even adopt it as their own. And such a turn of events is certainly a far more practicable, and to very many people would seem a far more desirable, issue from our present afflictions than a change, before the General Election, in the party complexion of the Government.

Diagnosis is an essential preliminary to prescription, and it is necessary first to agree on what is chiefly wrong with the British domestic economy—except of course for those who still hold that nothing is wrong in these islands and that all our troubles come from abroad. The official doctrine is that what is chiefly wrong is low output due to insufficient effort—We Work or Want is the slogan. An attempt was made here some weeks ago, not indeed to suggest that this diagnosis is wrong, but to show that it is very incomplete and that it omits the major piece of the puzzle. The general level of output of the community, it was suggested, is not low, but high; what is wrong is partly that it is distorted and mainly that it is overwhelmed by the wholly unreasonable demands that the community is putting upon it, that lack of supply may be a difficulty, but that excess of demand is a much greater.

This thesis led to some protest in our correspondence columns from Mr S. R. Dennison and Sir Hubert Henderson, and the resulting statistical argument, as often happens, tended to obscure the wide measure of agreement on the main issue. No one would contend that production is so high that it might not well be higher; and, equally, few economists would argue that there is no danger from the present bloated and inflated state of demand.

No one would argue against the necessity for harder work and greater effort. But indiscriminate higher effort all round is not the remedy. For one thing, there are millions of men and women who cannot work any

BROADSTAIRS GRAND HOTEL.

A modern, well-appointed hotel in an unrivalled position. 100 comfortable bedrooms (many with private bathrooms), central heating, hot and cold water and telephone in every room. Delightfully furnished lounges and restaurant. Varied high-class cuisine. Excellent and well-stocked cellar. Everything to ensure a perfect holiday.

A NICHOLSON HOTEL

THE ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

The half-yearly PRELIMINARY, INTERMEDIATE and FINAL EXAMINATIONS for candidates will be held on Tuesday, Wednesday and Thursday, December 2nd, 3rd and 4th next, in Aberdeen, Belfast, Birmingham, Bournemouth, Bristol, Cardiff, Cork, Dublin, Edinburgh, Glasgow, Hull, Leeds, Liverpool, London, Manchester, Newcastle-on-Tyne, Nottingham, Plymouth and Sheffield, and at such other Centres, if any, as circumstances may warrant.

Entries must be received on or before October 1, 1947, at the offices of the Association, 22, Bedford Square, London, W.C.1.

ASHRIDGE-BERKHAMSTED, HERTS. (Principal-General Sir A. Bernard Paget, G.C.B., D.S.O., M.C.). Ashridge is a residential College for education in Citizenship and provides an open forum for discussion. Course 37 Weekend September 26-29, 1947. INTERNATIONAL AFFAIRS: THE NEAR AND FAR EAST. Subjects: Reconstruction in China. His Excellency the Chinese Ambassador; The Future of Japan, John Morris, Esq., M.A., M.Sc.; The American Outlook, Professor T. Walter Wallbank, University of Southern California; The Near East in World Politics, Professor H. S. Deighton, M.A., B.Litt.; The Pacific Campaigns, William Courtenay, Esq., War Correspondent. The Course assemblies Friday evening and disperses early Monday morning. Inclusive Fee £3 3s. Application for enrolment should be made to the Bursar, Ashridge, Berkhamsted, Herts. Telephone: Little Gaddesden 3191.

VACANCY occurs for accurate shorthand-typist as Assistant to Secretary of Comptroller. Interesting post with good prospects. Would suit girl with some experience seeking to improve position, but a really capable beginner might be considered (standard of work must be high). 5-day week, pension scheme, good working conditions.—Box 549.

SECRETARY shorthand-typist required for Secretary of Group of Companies. Interesting post requiring accuracy, commonsense and discretion. 5-day week, pension scheme.—Box 548.

THE WHITEHALL LETTER. An intimate weekly study of politics, diplomacy and economics. By private subscription.—Mitre House, 44, Fleet St., E.C.4.

STATISTICIAN required for media analysis and research by leading London Advertising Agency. Must be educated in and capable of developing the use of statistics in this field and be research-minded. Age under 30. Salary and prospects excellent.—Box 550.

COAL SHORTAGE—Install NU-WAY OIL BURNER EQUIPMENT for your central heating boiler and enjoy automatically controlled warmth.—Booklet No. 15, from NU-WAY HEATING PLANTS LTD., Birmingham, 17.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

HONGKONG & SHANGHAI BANK (TRUSTEES) LIMITED.
9, Gracechurch Street, E.C.3, a company incorporated in England, and an affiliate of The Hongkong and Shanghai Banking Corporation, is prepared to act as Executor and Trustee in approved cases. Trustee Companies, also affiliated to the Corporation, are established in Hongkong and Singapore.
Full particulars may be had on application.

Trade with Canada

We provide a complete and informed banking service for foreign traders through branches from coast to coast. Correspondents the world over.

London Offices—6 Lothbury, E.C.2. E. B. McInerney, Mgr.

2-4 Cockspur St., S.W.1. L. R. Newman, Mgr.

THE ROYAL BANK OF CANADA

Over 600 branches in Canada, Newfoundland, the West Indies, Central and South America.

Incorporated in Canada in 1869 with Limited Liability.

MARKET RESEARCH. A leading manufacturing and trading firm in process of expanding its already extensive research department offers positions of responsibility to adequately qualified men. In addition to the comprehensive background and experience necessary for planning and carrying through important consumer research jobs, qualifications should include an understanding of the marketing significance and application of research results. Letters of application should be as detailed as necessary and should state age and salary expected. Address Box 552.

ONE of the largest nationally advertised makers of branded women's wear require well-educated woman as Stylist and Merchandise Manager. Fashion flair and balanced business judgment essential. Retail experience, social and press contacts, sketching ability desirable. Age preferred, 26-36.—Give full particulars in confidence to the Managing Director, Box 551.

ADMINISTRATIVE or executive position required. Advertiser (39) has wide commercial and industrial experience, now Company Secretary at about £700. Salary not first consideration, but congenial post with scope and prospects. Used to full responsibility for entire business. Glasgow, Kilmarlock, Ayr district preferred.—Box 547.

SCOTSWOMAN (23), Dipl. Com. now studying C.I.S., desires position as assistant secretary in industrial organisation, country district preferred. Possesses tact, capacity for work, and sense of responsibility.—Box 546.

YOUNG lady (20), B.Com. (First Class Honours), seeks post connected with statistical research into market or financial problems preferably with private firm.—Write Box 6595, Williams's Advertisement Offices, Bradford.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees, payable by instalments, if desired.

Prospectus from Dept. P17, WOLSEY HALL, OXFORD

harder because they are limited by shortages of materials. And for another, the nation does not need more of everything. If everybody, throughout the nation, were to work an extra hour a day, the main effect would be to concentrate a still greater weight of purchasing power, derived from the payment for the extra work, on the few crucial shortages. It can even be argued that the nation would benefit if less work were done in those industries which, less essential themselves, compete for manpower, for materials and for resources of all kinds with the crucial bottleneck industries, those producing coal and power, those producing exports, and those producing food. Just as the 1940 slogan of "Go To It" would have been more accurate if it had been "Munition Workers, Go to It; the Rest, Keep out of the Way," so now the rugged simplicity of "Work or Want" is misleading. The difference is that while the oversimplification of 1940 did no harm, that of 1947 may do plenty, because it distracts the public's attention from the crucial necessity of giving the essential industries room to breathe, of providing for them a labour supply ample to their needs, of allowing them to build up the stocks of materials and products that are essential to non-stop running, of giving them prompt and efficient transport service—all of them things that are incompatible with an all-round intensification of activity. The most essential thing for the nation to do at present is not to put an equal pressure for increased output on all its activities indiscriminately, but to do what is almost the opposite, to restrain some of its projects so that others may go forward, not to try to advance all along the line, but to withdraw units of resources for regrouping.

★

Another example of the need for clear thinking can be found in the country's programme of capital expenditure. It is probably true that the greatest single cause of the present inflationary state of affairs can be found in the fact that the community is attempting to carry out more capital expenditure of all kinds—in building, re-equipment and restoring working capital—than there are resources to implement. It is therefore tempting to say that one of the first things to be done should be to cut down the capital programme drastically. The Federation of British Industries, in the memorandum they published last week, suggested a reduction of £450 million, which would be about one-third of the total.

It is perfectly true that the present capital programme could and should be pruned. But it is supremely important that the process should be a discriminating one. Some capital expenditure can be postponed—new Government offices and some of the housing projects are in this category—but other forms of capital expenditure are the most vitally necessary things that the country is now attempting to do, since they offer by far the best prospect of raising its productive efficiency and increasing its exporting power. The way to tackle the capital programme is to draw two clear distinctions. The first is between "productive" and "non-productive" capital, defining "productive," for once, in the narrow sense of those forms of capital which will contribute directly and indispensably to higher output within a period of two or three years. A dwelling-house may be indirectly productive in the long run, but it is "productive" in this sense only if it is strictly necessary to get an additional coal-miner, farm-worker or export-producer on to the job. The second distinction is within the productive category, between capital projects that will earn or save dollars and those that will not. The order of priority should be dollar-saving productive capital first; other productive capital second; non-productive capital third. The first category should not be cut at all; indeed, one of the objects of the whole policy should be to give it elbow room to go ahead more rapidly. This should be, as in Russia, the super-priority of all priorities. The second category should not be cut very much. The third category should be

left to take its chance with the rest of the community's expenditure.

This procedure might very well result in a capital programme that was still larger than the savings available to finance it. This is the more likely because the flow of funds available for capital creation has hitherto been swollen by the Government's overseas borrowings. These have now ceased, and if the capital programme has to be cut down to the total of gross savings being done by the British people and by business firms, then it will indeed have to be cut by at least one-third. If this can be done by sacrificing only "non-productive" projects (in the narrow sense used above), then well and good. But nothing could be more akin to national suicide than to sacrifice any dollar-saving productive projects, or any large proportion of other productive projects, to a shortage of savings. If there is a shortage of savings, the Government must fill the gap by a true budget surplus of the required amount.

The task, therefore, is not one of indiscriminate pressing for greater effort but of re-sorting and re-aligning, of re-adjustment of the economic machine to new circumstances. By what methods is the re-adjustment to be carried out? The crucial difficulty, as all the world now knows, is not that of making plans but of carrying them out. How is it to be done? *The Economist* has been much attacked in recent weeks for suggesting that a moderate degree of unemployment would help in the process. Mr Shinwell described this as "an amazing doctrine."

The Labour Party (he said) believes that we cannot rely upon the fear of unemployment and poverty in order to induce the workers to respond to the Government's appeal for higher production.

No one can feel very happy about the conclusion that unemployment—even the moderate amount that *The Economist* contemplated—is a necessary element in keeping the economy under control and responsive to the helm. So far as this journal is concerned, it was made clear that the conclusion was reached with reluctance. But what is the alternative? How little Mr Shinwell has found it possible to abolish the fear of unemployment and poverty was illustrated, almost as he spoke, by the National Coal Board's action in dismissing the striking coalminers of Grimethorpe. And how little Mr Shinwell has discovered anything to take the place of these sanctions was shown by the failure of the appeal he made, in person, to the same striking miners.

Why is there so much unwillingness to face the facts? There must be, in every economy, some mechanism for adjusting individual desires to collective reality. What alternative mechanism have the Socialists to suggest in place of the carrot of material rewards and the stick of fear of insecurity—something that will work, not in the sweet by and by, but here and now? Can they point to an effective working economy where these methods have been successfully replaced by something else? Of course they are unpleasant. Of course they are unpopular. Two resolutions that would be passed by acclamation at any Congress of Donkeys, held at Southport or elsewhere, would be that the distribution of carrots should not depend on the amount of work done and that sticks should be wholly abolished. But where then would be the motive power of the Donkey Economy?

The stakes are high. For ourselves, we believe that keeping the British economy alive is, for the moment, far more important than anybody's dreams of better worlds to come. Somehow, reinforcements must be rushed to the danger points and until some reason is produced for believing that some other method will do the trick, we shall stick to our belief that a moderate degree of elasticity in the labour market is an indispensable prerequisite for the de-congestion and lubrication of the British economy. It is well worth while postponing the millennium to avoid starvation.

Uno's Plan for Palestine

THE report of the United Nations Special Committee on Palestine contains eleven unanimous recommendations, a twelfth agreed with two dissentients, and two plans, of which one received seven votes, and the other three, Australia abstaining in both cases. Of the recommendations, by far the most important are the first two, calling for the earliest possible termination of the Mandate in Palestine and for the establishment of an independent state. Noteworthy, too, is the sixth, insisting on the extreme urgency of an international arrangement to deal with the "250,000 distressed European Jews" now in assembly camps; the seventh, which makes a "basically democratic" political structure a prior condition to the grant of independence; and the ninth, demanding that the "economic unity of Palestine" be accepted as a cardinal principle.

Of the two plans for giving effect to these recommendations the majority's is a scheme of partition, the minority's of federation. The majority plan would divide Palestine into seven zones, of which one, the city of Jerusalem and the immediately surrounding villages and towns, would be an autonomous zone administered directly by the United Nations through a non-Palestinian Governor. The Arab and the Jewish State would each consist of three non-contiguous zones. The Arab zones would be western Galilee, the hill country of Samaria and Judea, and the coastal plain from Isdud to the Egyptian frontier. The Jewish zones would be eastern Galilee, the Plain of Esdraelon and most of the coastal plain, and the whole of the Beersheba sub-district containing the triangular southern part of Palestine known as the Negeb. Figures of the exact size of these two "states" have not yet been received, but a rough estimate is that of some 10,000 square miles of Palestine, about 6,400 square miles would be in the Jewish State. The populations would be approximately: Arab State, 620,000 Arabs, 15,000 Jews; Jewish State, 550,000 Jews, 500,000 Arabs.

The plan provides for a transition period of two years during which the United Kingdom would carry on the administration under the auspices of the United Nations, with the assistance of one or more nations if desired. During this period 150,000 Jewish immigrants would be admitted into the proposed Jewish State at a uniform rate of 6,250 a month (the present rate is 1,500 a month) and the Land Transfer Regulations, which limit the sale of Arab land to Jews, would not apply within its borders. It is further ruled that if the transitional period should continue for more than two years, Jewish immigration should be allowed at the rate of 60,000 a year.

The minority plan (supported by Yugoslavia, Persia and India) provides for a federal state comprising an Arab state and a Jewish state, with Jerusalem as its capital, to be created after a

transition period not exceeding three years. The boundaries of the Arab and Jewish federated states in this plan are a good deal less favourable to the Jews than in the majority plan. In particular Jaffa, and the western portion of the Beersheba sub-district, including Beersheba town and a strip along the whole length of the Egyptian frontier, are assigned to the Arab State. There would be full local self-government for the Arab and Jewish States, but immigration would be one of the subjects reserved for the federal government. The form of the latter would depend on the Constituent Assembly, which would be elected "by popular vote" during the transition period, and therefore presumably have an Arab majority. Immigration during the transitional period would be determined by economic absorptive capacity as estimated by an international commission of three Arabs, three Jews, and three United Nations nominees. An administering authority for the transitional period would be appointed by the United Nations Assembly.

Of these two proposed solutions, the minority plan concedes so much both in form and substance of the Arabs' own demands that it is curious to find it bracketed with the majority plan by the Mufti's office in Cairo in one sweeping rejection. The majority plan, on the other hand, goes further in appeasing the Zionists than any previous plan for partition. Even the Jewish Agency plan discussed by the Woodhead Commission in 1938 was less drastic. The Jewish State is given some two-thirds of Palestine's total area, both its ports, most of its vital water supplies, most of the Arab as well as the Jewish citrus plantations, 45 per cent of its Arab and 91 per cent of its Jewish population. With the important exception of the Dead Sea potash works, nearly all Palestine's industry, including most of the more important Arab industries as well as those set up by foreign enterprise (neither Arab nor Jewish) would be in the Jewish State, although this result would be mitigated by the provision of economic union, including a customs union and joint operation of the ports and railways.

It is thus broadly true to say that although structurally the two plans—with their separate governments and their central agencies—somewhat resemble each other, they nevertheless differ profoundly in that the majority plan favours the Zionists (who have already given it cautious approval) while the minority plan favours the Arabs. This is obvious not only in the very striking difference in the territorial arrangements but in two points which have always been at the heart of Arab-Jewish controversy. The first is taxation. It seems that in the majority plan each state will be responsible for its own taxation and thus it will not be possible for the very poor Arab community to gain any share in the benefits derived from taxing the wealthier

Jewish communities and enterprises and it is difficult to see how the two states could co-operate for joint economic development schemes if the Arab community had as little to offer as would be the case under the majority plan. In the minority plan on the other hand, the Federal Government would have power to tax for federal purposes and thus the disparity between the two communities would be evened out. By far the more important point is, however, that of immigration. Under the majority plan, each state would decide the matter for itself. In the minority plan, a double check is placed on any increase. During the transitional period, a body with a non-Jewish majority would determine the Jewish state absorptive capacity (which would be the objective test). Afterwards, immigration would be reserved to the Federal Government which, if it were based on strict parity, would permit the Arabs to produce a permanent stalemate, and if on democratic principle, would give the Arabs a majority.

What should the attitude of the British Government be to this Report in whose discussion and application they are bound to be a prime mover? Generally speaking, the twelve recommendations—the principles on which the Report is based—can reasonably be accepted, with perhaps a few minor reservations. But the plans for partition—the specific applications of the principles—are on a very different footing. With partition itself there can now be no quarrel, even though it is anything but a pleasant and effortless solution and, whatever form it takes, will arouse opposition, even violent opposition. But the particular plan of partition put forward by the United Nations Committee is both unjust and unworkable. It is unjust because far too much of Palestine's wealth and territory has been conceded to the Zionists and some little equality of sacrifice there must be at the start if the two communities are ever to live side by side. It is unworkable because of the distribution of population between the two states, each of which would consist of three non-contiguous areas. A Jewish State, in which half the population would be Arabs, will contain, in view of the great difference in the respective birth-rates, an Arab majority at an early date. The Jewish numbers would, therefore, have to be steadily and massively increased by immigration. The departure of Arabs from the Jewish State might be looked for, were it not for the magnets of the oil refineries

and the port installations and industries of Haifa and Jaffa, which indeed are likely to attract still more Arabs from the parched hills of the Arab State. How, then, can a democratic state in such boundaries remain Jewish, or a Jewish State remain democratic? And if the Arabs are to be driven out by various disabilities—insistence on speaking Hebrew, for instance—how can there be any talk of either political pacification or economic union?

The fact of this internal unworkability makes it all the more impossible for Britain to accept any responsibility in administering the proposed plan during the proposed period of transition. Not only is the period of two years far too long in itself, but during it the country is to be prepared for partition by the injection of Jews at a rate of 6,250 per month, or over four times the present rate, a figure which the need to outstrip the Arabs might push upward still further. But what under such conditions would be the cost to Britain of securing an orderly transition? Keeping order in Palestine has already cost over £35 million a year. The rate would certainly rise during such a period of forcible adjustment, and the total cost for the two years might be not less than £100 million. Worse still, it is not certain that two years would be enough, and the ultimate duration of the transition is left open. But far more important to Britain than the money cost are its relations with the Arab world, which during such a period would inevitably deteriorate to something like open warfare. Britain is not required to obstruct the United Nations in carrying out such measures, but must resolutely decline to be associated with any power or group of powers which is prepared to accept responsibility for enforcing them.

It is important that this should be made clear. The British Government should say of Justice Sandström what Andrew Jackson said of another Chief Justice: "John Marshall has given his judgment, now let him enforce it." The General Assembly of the United Nations will be working in an unreal atmosphere unless it is put upon notice that its decisions must be accompanied by some consideration of how, and by whom, they are to be carried into effect.

What then is the upshot of the United Nations investigation? It has established beyond doubt the need both of ending the Mandate and of achieving partition. But it has not offered means of relieving Great Britain of an intolerable burden nor has it evolved a workable scheme for partition. Great Britain is, however, in a reasonably strong position since clearly no other Power is willing to accept the responsibility instead, yet the fulfilment of the plan turns on some outside authority being ready to act for the United Nations. Such a situation can, of course, be used to recreate the miserable deadlock of this year, and Mr Bevin would be very ill advised if he permitted his Middle Eastern officials to persuade him to avoid or postpone once again the decision on partition which must be made. But the situation can surely be developed towards an honourable solution if the British were now to do what they should have done last Christmas—produce a scheme for partition which they would be ready to execute—and present it to the United Nations as the only alternative to a British withdrawal this year. Such a scheme would inevitably be less acceptable to the Zionists but an equality of discontent is preferable to the furious hostility of one or the other side, and if the alternative were a British withdrawal and the opening wide of the whole strategic situation in the Middle East, the American Government might be prepared both to moderate its own Zionists and to co-operate in the execution of the plan. One of the most unsatisfactory features of recent developments over Palestine has been the total inability of the American and British Governments to work together. The United Nations report provides a new opportunity for better understanding. Given reasonableness and flexibility on both sides, co-operation can perhaps be achieved.

Away from Potsdam

EVER since the Allies accepted full responsibility for the German people, they have faced two alternatives—either to let them rot in the ruin and dislocation the Nazis had caused or to restore them to a self-supporting existence, whatever the implications. The Americans and the British, being what they are, could never fully accept the former alternative, but neither did they unequivocally accept the latter. The result has been two years in which Western Germany has not finally and irrevocably collapsed—Allied doles were just sufficient for that—but has done no more than cling to the rim of chaos.

The new Anglo-American plan for the level of industry in Western Germany is clearly a step away from the present policy of subsidised ruin. It revises in an upward sense almost every figure fixed at Potsdam in March, 1946*. The increase in heavy industry (which formerly accounted for about 65 per cent of Germany's export trade), in machine tools and in the production of chemicals is particularly marked. The new figures, it is calculated, would permit Germany to have the level of industry prevailing in 1936; but the increased population in Western Germany, which has already increased by about 6,000,000 and may grow by another 2,000,000 by 1952, means that production per head of the population would be 25 per cent lower than in 1936. This figure is, however, so great an improvement on the statutory stagnation imposed at Potsdam that it does seem as though a decisive break has been made with the old restrictive mentality and a genuine step taken in restoring a Germany that can pay its way.

But is the break really decisive? Or rather, is it certain that all the beneficent consequences that might flow from the new plan will, in fact, be worked out—and worked out in time? Nobody should be deceived by the fact that the new plan is called a plan for the level of industry. In fact, it does nothing to determine what the level of German industry shall, in fact, be; it is not a production programme. Its purpose is simply to determine how much German plant and equipment is redundant and can be removed as reparations. The real relevance of the fact that the permitted ceiling of production in this industry or that is now raised to 85 or 90 per cent of the old prewar level is only that the plant to be dismantled is reduced to 15 or 10 per cent. And while the 85 or 90 per cent is permissive and remote, the 15 or 10 per cent is meant to be compulsory and immediate. It is not a Level of Industry Plan so much as a Level of Reparations Plan. Moreover, there is as yet very little evidence to suggest that the statesmen, the soldiers and the administrators responsible for Germany have yet worked out how to get from the present desperate situation to the happier picture portrayed in the new plan. The full implications of restoring Germany as a viable partner in Western Europe have certainly not been squarely faced. On each of these scores trouble may lie ahead for the Allies.

Sir Sholto Douglas and General Clay made it reasonably clear on their return to Germany from the London talks with France that a vigorous attempt would be made immediately to "complete the programme of dismantlement." They said that a final list of factories would be ready in another three weeks. Then, presumably, it is hoped that a lightning operation will clear the matter up once and for all. A moment's reflection must show that such a policy is very unwise. Not only is Western Germany so crippled by its labour shortage that the diversion of the necessary thirty-odd thousand workers to demolitions might upset the very modest achievements in industrial revival

already recorded. Not only is the transport system so undermined that it probably cannot carry extra coal even if it is brought out of the ground. But the Germans themselves are no longer in the mood of 1945. Two years have passed in increasingly bitter uncertainty and a mass removal of plant now, on the eve of winter, would be the signal of a move of political resistance which it would be difficult to abate. The German trade unions are already reported to have passed secret resolutions frankly refusing to co-operate. The authorities in the states and municipalities may well follow suit. War plants proper and possibly some steel plants could be permanently closed and scheduled for removal when conditions make it practicable, but a "blitz" operation of dismantling now would place the seal of certainty on disaster for this winter.

★

The difficulties inherent in carrying through a policy of dismantlement are simply one aspect of the generally low and stagnant conditions in the zone, and it must be emphasised that the new plan for the level of industry can have no possible effect on Germany's immediate problem—which is quite simply to survive the coming winter. The Germans in the towns have now lived for two years on rations that have never really reached 1,550 calories and for some periods have fallen to 800. Their physical reserves are used up. And what has happened to the people has happened to their industrial system. Here, too, the reserves are used up, the small hoards of raw materials and spare parts, the unused capital, the workable equipment. This process has reached its climax in the transport system, which is expected to break down almost completely when, in November and December, the distribution of the local harvest is added to the carrying of imported food and the despatch of exported coal.

The financial situation is admitted by all to be chaotic, the official price schedules meaningless. And these economic evils are reflected in the paralysis among the Germans at Frankfurt, where the Christian Socialists, by drawing on the most conservative elements among them, have driven the Social Democrats into virtual opposition and produced a stalemate. Yet Western Germany needs government almost as much as it needs food.

If this concentration of evils is not to lead to collapse in the critical months of March and April next year, measures must be taken now which have, frankly, very little to do with long term levels of industry. What is needed is not a "blitz" operation of dismantling, but an equally violent, rapid and determined effort to build up certain sectors—an immediate repair and replacement plan for the railways, the importing now of stocks of key raw materials, especially of steel, above all, a frontal attack on the food problem, both by much more ruthless requisitioning of local food which the farmers are hiding in increasing quantities and by the securing of a steady pipeline of imported grain with six to eight weeks' reserve stored in the zones. In the last two years, food supplies have failed with the utmost punctuality in March and a catastrophic fall in coal production has followed. It will be almost wholly attributable to administrative inefficiency and lack of foresight if the same disaster occurs for the third time next March.

The one element which is not a question of sensible planning is the problem of payment. The increased supplies of food and raw materials cannot be met by increasing British expenditure in Germany still further. It is also true that these supplies are, to some extent, competitors with the Marshall offer, with which Germany is to be associated. But, whatever the fate of the Marshall offer, relief for Germany cannot wait until January or March. It is as responsible occupying authorities rather

* Details of the new plan are given in this week's issue of the "Record and Statistics" supplement to *The Economist*.

than as Marshall planners that the Americans must brace themselves to find means of providing the necessary dollars for Germany, not in six months' time but now.

The problems generally raised by the new plan for the level of industry do not properly belong to the next twelve months. They may cast their shadows before, particularly in France, but their impact will not be felt until some future year—1950, say, or 1951—by which time the effect of greater production in Western Germany will have begun to impinge on the European economy. The essence of the problem is that by then Germany will appear as a competitor to the two principal countries within the Marshall plan, France and Great Britain, and this economic fact is aggravated in the case of France by the old haunting desire for military security. If Western Germany continues to be cut off from its old eastern agricultural hinterland, its position will very much resemble that of Great Britain. It will need to export its manufactures to food-producing areas in order to feed its people. Potentially, therefore, there is a direct conflict of interest between them. France is likely to be more self-supporting in food, but the form in which it fears German competition is in an industrial revival based on steel, which both absorbs the coking coal which might have expanded France's steel production and recreates military strength.

But, while it is possible to state in general terms the likely conflict of interest in Western Europe, it is much more difficult to guess how acute it may become. Will the industrial areas of Western Germany in fact be cut off from their old food supply? The issue of German economic unity is not lost yet and should be made the principal point at the Four Power Meeting in November. Even if, like Arab and Jew, "Russian Germans" and "Western Germans" cannot live politically under the same roof, they could at least, perhaps, be given the economic unity which Uno is devising for Palestine. Nor will all German links with Eastern Europe be broken. Even today,

Czechoslovakia is "Bizonia's" best trading partner. The splitting of the estates in Eastern Germany and the development of industrialism by the Poles and other countries of Eastern Europe may reduce the old agricultural surpluses, but this is not inevitable if farming technique improves. And, if trade between East and West continues, it is not certain that German competition will be any fiercer than it was, say, in 1936. Nor are France's fears of a shortage of coking coal likely to be justified. The experts working in Paris on the Marshall plan estimate that, in 1951, European production will be sufficient to justify a level of steel output in France of 12 million tons and in Germany of ten. France's preoccupation with the angle of security is understandable and should be met, but not by the restrictionism which produced Potsdam and has placed a brake on European revival, from which all are suffering.

Germany's need to export to live admittedly creates problems for other countries. But they are not insoluble problems. There are ways and means of avoiding them, provided the opportunity existing now—perhaps fleetingly—is seized. If, as a result of the Marshall offer, Western Europe could move towards the kind of economic unity enjoyed in the United States, there is no reason why such a highly developed and well populated area should not achieve similar standards of production and demand. America today consumes some 90 million tons of steel a year. In a comparable area in Europe, there could hardly be damaging competition between the Ruhr, Lorraine, Luxemburg and the Black Country, which on the most optimistic assumption will not together be producing much more than 40 million tons of steel in the 1950s. It is only if the dominant policy is negative and fearful that the potential conflict of interest raised by the new German level of industry becomes a danger to stability and peace. Widen the framework, raise the sights, achieve the unity, and within it there is room for everything the Germans can produce.

The Balance of Payments—III

Achieving a Balance

THE preceding article in this series was devoted to a discussion of the statistical ratio that has become known as "the terms of trade." In its crude form it is a simple comparison between an index of import prices and an index of export prices. When export prices are high in relation to import prices, the terms of trade are said to be "favourable." But the article went on to give reasons for approaching this concept with caution. In particular, it would be wrong to suppose that a "favourable" shift in the terms of trade is all that is needed to solve the problem of the balance of payments. Policy has to take account not only of the relative prices at which trade is done but also of the volume of trade that can be done at those prices. The aim should be not merely to shift the terms of trade in Britain's favour, but to achieve such a relationship between import and export prices that Britain can sell enough goods to pay for the necessary volume of imports.

It follows that any attempt to calculate the probable shape of the British balance of payments in a "standard" year of the 1950s must take account of several variables and will return alternative answers varying with the assumptions on which they are based; anything as simple as the official figure of a 75 per cent increase in volume is almost certainly wrong.

There are, in fact, four main sets of variables. The first concerns the definition of "the necessary volume of imports." The calculations are usually done on the imports of 1938, when the volume was the second highest on record, some 9 per cent above the average of the five pre-tariff years 1925-29. This

would suggest that some reduction below the 1938 level could be borne without causing such scarcities that rationing or allocation schemes would be permanently necessary. But on the other hand, in this country imports and the popular standard of living are very closely related; 1938 was certainly not a year of full employment and even modest assumptions about higher employment and better standards of living would require more imports to carry them out. For the purposes of calculation, it is assumed in this article that 100 per cent of the 1938 volume of imports would be no more than reasonable and that 85 per cent of that volume is about the lowest that can be contemplated without severe dislocation. This may be called Variable A.

Variable B is the level at which the value of money in general, and export costs in particular, settle down in this country. The basic—though not quite the decisive—factor in this is the cost of labour. The official index of standard weekly rates of wages now stands at about 166½ of the pre-war level. Costs, at the moment, are doubtless higher, because the employer gets less out of a week's work, because he has to pay overtime, because delays in production are universal, because profit margins are swollen at every stage, and for many other reasons. It may be assumed that there will be very little reduction in wage rates, but the rise in total costs may be somewhat higher or somewhat lower. It is here assumed that the level of British export prices, when things settle down, will be somewhere between 150 per cent and 175 per cent of the 1938 level.

Variable C is the Terms of Trade properly so called—that

is the ratio in which the price of imports stands to these export prices. At present, the terms of trade are about 10 per cent less favourable to Britain than in 1938. One extreme assumption is that this relationship continues—which is to say that if British export prices are 150, the prices of imports will be 165, or if British export prices are 175, import prices will be 192½. The other limiting assumption is that the price level of imports settles down at 10 per cent below British exports—that is, at 135 or 157½ respectively. And in between is the assumption that the ratio of prices is exactly the same as it was in 1938.

Variable D is the volume of exports that Britain contrives to sell at these price relationships. There is, of course, a strong reciprocal connection between Variables C and D. If the terms of trade are strongly "favourable" to Britain, that is likely to mean either that Britain's customers are impoverished by the low prices they can get for their produce in the world market, or alternatively that British goods are relatively dear. In either case, it would be foolish to expect a large volume of exports. Conversely, if the terms of trade are "unfavourable," if foreign countries are prosperous or British goods are cheap, then large sales may be possible. It has long been clear that the Government's figure of 175 per cent of 1938, by volume, is an impossibility. For the present purpose, it has been assumed that the volume of exports is unlikely to exceed 150 per cent and will not fall below 100 per cent of the 1938 level.

Strictly speaking, there ought to be a Variable E, the net total of the "invisible" items, including interest and dividend payments and receipts, Government overseas expenditure, insurance and shipping earnings, etc. But, as was argued in the previous article, this net item will in future be too small to have much influence on the final result and it has seemed more convenient to make the rigid assumption that there is, in all circumstances, a net receipt of £70 million a year (as against £232 million in 1938) from this source.

These four sets of variables can be combined in a great number of different ways. For example, a fairly optimistic combination would be as follows (Assumption I):—

Variable A—85 per cent of 1938 imports is enough.
Variable B—British export prices are 150 per cent of 1938.
Variable C—Import prices are also 150 per cent—i.e. the terms of trade return to the 1938 ratio.
Variable D—The volume of British exports is 150 per cent of 1938.

A less optimistic combination (Assumption II) would be:—

Variable A—100 per cent of 1938 imports.
Variable B—British export prices 175 per cent.
Variable C—Import prices 192½ per cent—i.e. terms of trade 10 per cent less favourable.
Variable D—Volume of exports 135 per cent.

The results are as follows (in £ millions):—

	Assumption I	Assumption II
Imports	1065	1607
Exports	1200	1268
Invisibles (net)	70	70
Surplus (+) or Deficit (–) ...	+205	–269

It would be wearisome to work all through the permutations and combinations, particularly since the results can be fairly simply summarised:—

If the necessary volume of imports is 100 per cent of 1938—
With the terms of trade— The account would be balanced with exports of—

10% more favourable 135% of 1938
same as in 1938 150% " "
10% less favourable much more than 150%

If the necessary volume of imports is 85 per cent of 1938—
10% more favourable 120% of 1938
same as in 1938 135% " "
10% less favourable 150% " "

These are the targets for the balancing of the British accounts. But to set out the targets is not the same thing as establishing that they are attainable. Are any of these combinations possible? With the terms of trade as set out in the first column, are any of the export targets in the second column reasonably possible?

These questions could only finally be answered by experience, and it would be unwise to be dogmatic. But it does not require very much insight to see that it will be difficult to the verge of impossibility to pay for the full 1938 volume of imports. An export programme of 135 per cent of 1938 would not by itself be impossible; but it would have to be combined with terms of trade 10 per cent more favourable than in 1938—that is, 20 per cent more favourable than today. Such a large shift could only come about by a very sharp fall in the prices of all primary products combined with great rigidity of British export costs. High prices in a deflated market are hardly a formula calculated to produce an increase in the volume of sales of as much as one-third.

An important preliminary conclusion would therefore seem to be that policy should be based on the assumption that it will not be possible for Great Britain, even in the medium-long period, to pay for imports of the same volume as in 1938. If there is a great expansion in world trade and British exports increase beyond what it now seems reasonable to expect, this conclusion will be proved too pessimistic and the country will be able to choose between expanding its imports and building up new overseas investments. But it would be foolish to lay any plans on the assumption that this will happen; it seems obviously wiser to base economic policy on the assumption that the volume of imports, in the next dozen years or so, will have to be kept down to something like 85 per cent of the 1938 volume.

*

This would have some consequences for the domestic economy, which will be discussed in a later article. But it is first necessary to establish that even this reduced volume of imports could be paid for. Even with the terms of trade 10 per cent more favourable, it would require a 20 per cent increase in exports; and if the terms of trade remain as they are now, the increase would have to be 50 per cent. Which, if either, of these combinations is likely to be the more practicable?

The volume of exports that Britain can expect to sell at a given relationship of prices is dependent on the elasticity of demand for them in the consuming countries. By how much can the purchasing countries be expected to increase their demand for British goods? There is a crucially important distinction to be made here. It is difficult to believe that there are many countries in the world which will readily increase the total volume of their imports. This is particularly true of the countries to which British exports have in the past been mainly directed. All of them are feeling the urge to economic nationalism and economic self-sufficiency; all of them are in greater or lesser degree dependent, for their earnings of foreign exchange, on the British and West European market, which is obviously going to be limited for some time to come. It takes a great deal of optimism to believe that the elasticity of the world's demand for imports-in-general will be very large. It follows that Britain's chance of securing an increase in exports depends almost entirely on doing better than other exporters, and by far the best way of doing that is to offer goods at attractive prices. The world market is still a highly competitive place, and if British goods were, quality for quality, cheaper than the competitive goods, the elasticity of the world's demand for them might prove to be very large. "Favourable" terms of trade mean that British goods are dear in foreign countries. Competitive prices mean relatively "unfavourable" terms of,

trade. It might well be much easier to balance the books with terms of trade no more favourable than in 1938, even though that would require exports of 135 per cent or thereabouts, than to sell 20 per cent more exports with "favourable" terms of trade. It might be still easier to get 150 per cent exports if Britain could undersell the world by 10 per cent.

The argument thus leads inexorably to the paradoxical conclusion that, although the unfavourable shift in the terms of trade is responsible for a great deal of the present troubles, a simple reversal of what has happened may not be the best way out. Britain should certainly hope to get its imports cheap; but greater hope lies in selling its exports still cheaper. The surest avenue of escape from the present dilemma lies in exploiting the only elasticity of demand that is certainly large—

NOTES OF THE WEEK

On the Eve of a Paris Plan

The last stage of the Paris Conference has been reached. Last week-end Mr Kennan and Mr Bonesteel, joined by the two Ambassadors, Mr Douglas and Mr Caffery, went over the proposals and figures so far brought together and gave the leaders of the conference their views on the best way of drafting and presenting them. Two points above all appear to have been emphasised by the American experts. The first is that the European nations should guarantee to be self-supporting by 1951. In other words, they should by that time be able to dispense with dollar subsidies. Otherwise Congress may see the help they are asked to give simply as "good money going down the drain." The second point is that the plan should be something more than a statement of need, a shopping list, and should show some effort on the part of the European nations to achieve the "more perfect union" always lurking at the back of the American imagination.

What are the prospects of the European nations meeting these American conditions? Equilibrium by 1951 depends upon so many completely hypothetical points that it can hardly be more than a hope—a determined hope, perhaps, but not a certainty. What will be the world terms of trade by then? How successful will internal stabilisation have proved? Will production, as opposed to targets for production, really have reached the proposed levels? The nations could guarantee to balance their collective budget by drastic cuts in their imports. But this, sensibly enough, is not what the Americans are looking for. They insist that equilibrium must be achieved by expanding production and exports—which raises another unanswered question: America's future willingness to buy.

Sir Oliver Franks is quite emphatic in his insistence that the conference will produce more than a list of needs. The committees have already assembled a variety of methods of co-ordination and integration which genuinely go beyond the purely national approach. By a joint planning of assets and needs, some bottlenecks in the European economy have been eliminated. For instance, the hope of securing sufficient coking coal for the needs of the next four years has replaced an estimated deficit of 12 million tons, thanks to the various countries' readiness to increase output and to use substitutes. Again, the agreed hydro-electric scheme is expected to be on a dramatically large scale. Certain industries whose plans for development might have proved competitive—for instance, the steel industry—have agreed on some degree of sensible co-ordination and division of labour. There has also been a measure of agreement on achieving the utmost utilisation of European surpluses; for instance, Dutch vegetables and Scandinavian fish. Above all, competent groups of experts are discussing the possibilities of a West European Customs Union and of the stabilisation of currencies. All these ventures are far from negative, and taken together the European delegates feel that they represent something more organic and constructive than the shopping list to which many critics—Mr Molotov not least—have referred.

Mr Bevin at Southport

Mr Bevin's speech to the Trades Union Congress at Southport, for all its formlessness, had the accents of leadership. There is no loss of confidence, no timidity there. It will inevitably strengthen the movement, already strong, for an exchange of offices between Mr Bevin and Mr Attlee. Whether such an exchange will actually take place must remain uncertain. It is

that is, the elasticity of the world's demand, not for imports-in-general, but for British-goods-in-competition.

The argument of this article has been abstract and hypothetical, but it has arrived at an important practical conclusion. The spotlight has been fixed on the level of costs in the British export industries. The task is not simply to push the terms of trade back in our favour; it is almost the opposite, to see that British export prices are not left high and dry by the receding tide of world prices for primary products. In the next article, an attempt will be made to forecast what the tendencies of the world market will be, and what British policy can do to attain the objects here sketched. In a final article, something will be said about the internal consequences of importing less and exporting more.

unlikely that anybody in the Labour Party is willing—or is yet willing—to force Mr Attlee's hand. But personal modesty is one of the Prime Minister's most attractive characteristics and he is quite capable of stepping down voluntarily. The decision probably depends on an estimate of the size of the Left Wing which would be irreparably estranged by Mr Bevin's promotion, and if he can prove that it would be insignificantly small, his chances should be good.

In politics, personality and psychological impressions are three-quarters of the battle, and in these respects Mr Bevin is well endowed. But a statesman must also have a policy, and for that his speech can be searched almost in vain—that is, for a policy to meet the immediate needs of the nation. Indeed, the speech, with its candour about the mistakes of the past, its warm idealism for the projects of the safely remote future, and its vagueness about what is to be done here and now, was very reminiscent, in a rough-hewn way, of Lord Baldwin.

Out of the many *obiter dicta* in the speech, two have attracted particular attention. One was the suggestion that the United States should have redistributed the gold at Fort Knox. This seems to show an attachment to the *mystique* of gold that it is strange to find in a member of the Macmillan Committee. Does Mr Bevin not know that the accumulation of gold at Fort Knox is a consequence, not a cause, of the disequilibrium in the United States' balance of payments, and that so long as that disequilibrium is uncorrected, any gold that was "redistributed" would infallibly be turned into dollars and sent back to Fort Knox? What exactly did he mean?

The second was the personal proposal for a customs union for "the Commonwealth and certainly the Empire." No one, nowadays, will dispute the necessity for a thorough-going policy of developing the resources of the Commonwealth and Empire. But at the same time it is difficult not to have doubts about a Customs Union as a necessary, or even as a helpful, first step. Mr Bevin seemed to put it forward as something that would be easier to achieve than a Western European Customs Union. It is true that it is not likely to be any more difficult. But one of the salient differences between the two projects is that whereas the Western European countries are likely all to be in favour, in principle, of a Customs Union, the countries of the Commonwealth and Empire are likely to be all against it. The Dominions, with the possible exception of New Zealand, would not touch it: Canada is too closely attached to the United States and all the Dominions are determined to protect their industries against external (i.e. United Kingdom) competition. As for the Colonies, most Colonial Governments are largely dependent on customs revenue. Possibly the Imperial Exchequer could reimburse them, though it would itself be losing a tidy sum. But the Colonies have often made it clear that they want to be masters of their own finances.

And even if these difficulties could be overcome, would a Customs Union make all that difference? What needs to be done in "the Commonwealth and certainly the Empire" is surely not the liberation of trade, which is already fairly free, but the development of productive resources. The economic integration of the Empire needs to be pursued by much subtler techniques than a Customs Union and it would be a great pity if an Empire Customs Union became, in the public mind, either a preferable alternative to a Western European Customs Union, or, as Mr Bevin said of the latter, "a panacea for our difficulties."

The Issue at Grimethorpe

The real issue which is being fought out at Grimethorpe, where the miners have now been on strike for more than three weeks, can be summed up as a struggle between rationalisation and syndicalism. The argument over the extra working at the coal face appears to be merely the pretext for a show-down on whether control is to be exercised by an all-powerful Board or whether the workers are to be given a measure of influence in the management of their own pits. Many miners expected nationalisation to result in workers' control; instead it has resulted in a large bureaucratic machine leaving the individual miner face to face with the same managers with whom he has been wrangling over the past twenty years.

This is an issue on which the National Coal Board cannot be defeated, for management and responsibility cannot be divorced. Managers must manage, and there is no reserve of experienced colliery managers on whom the Board can draw to replace those who are already there. Only time can solve this problem—time to educate existing staff and to train new men in modern mining techniques and in staff management; time to convince the miners that the past is really done away with. But, as Mr Morrison said, it is time that is the greatest shortage. In the Grimethorpe case all the official negotiations were conducted correctly: full agreement was reached between the local officials of the Board and the union; the extra stint was considered feasible. But the men have rebelled; they refuse to use the conciliation machinery or to accept the offices of the more remote union representatives. There appears to be no other explanation than that they wish to decide the issue themselves; hence the spread of sympathetic strikes around them.

This division of purpose is critical: the Board cannot yield, but neither can the nation forgo its coal. It is clear that a greater measure of decentralisation is required. The improvements in labour relations which the nationalisation of the industry has, in spite of such setbacks, already achieved cannot be maintained unless divisional and area boards have greater powers delegated to them and the individual colliery manager is given every possible freedom from control compatible with greater output. It will may be that the present deadlock in the method of extending the five-day week could have been avoided if area boards had been instructed to arrange locally whatever extension of hours suited local conditions. As it is the Board and the National Union of Mineworkers appear to be locked in struggle over Saturday working, while the Government skirmishes on the flanks about an extra half-hour's work a day. Meanwhile the chances of getting through the winter without a major coal crisis fall lower and lower.

No Reshuffle in Greece

In spite of a vigorous summer campaign conducted by the Greek regular army, no term has been set to the activities of the guerillas. In the mountainous districts, from the Peloponnese to the North, armed bands are at work among the farms and villages and the country carries on its life against a perpetual background of violence and unrest. Were the movement entirely the work of Greece's northern neighbours, it would be easier to contain, but it is rooted in Greece itself and there are no short cuts to its elimination.

But it is clearly nourished by the reactionary inefficiency of the Greek Government, and the creation of a more able and representative Cabinet is one of the essential preliminaries to domestic pacification. The Americans hoped, when their Mission arrived, that it would be unnecessary "to intervene in Greece's internal affairs," but non-intervention is helping them as little as it used to help the British. It simply commits them to supporting the Government's repressive and negative policies and to watching the disappearance of American economic assistance with little solid work of reconstruction to show for it. Thus the American Mission has been led—as were the British—to attempt an intervention. They are tied by the fact that the Populists and the extreme Right still have a majority in the Greek Chamber but no longer command the respect even of the other deputies let alone of the ordinary public. The Americans feel they can hardly get rid of Mr Tsaldaris or Mr Maximos, yet the terms upon which other more moderate parties will serve with the Populists are so stiff that the majority party will not accept them. The Cabinet crisis has thus trailed on for over a week and has ended, momentarily, in the return of Mr Tsaldaris with a Populist Ministry. But it is not thought that this "solution" will last many days.

This atmosphere of complete Governmental instability helps to explain the American Government's unwillingness to see the

The Economist's New Premises

From Tuesday, September 23rd, the offices of THE ECONOMIST will be established in new permanent quarters at 22, Ryder Street, St. James's, London, S.W.1. Ever since our pre-war offices were destroyed by enemy action in May, 1941, we have been working under great difficulty in cramped and separated temporary quarters. We have now acquired a building in which all departments can be comfortably housed for, we hope, many years to come.

Will all readers and friends of THE ECONOMIST therefore please note that from Tuesday, September 23rd, the address for all purposes will be—

The Economist,

22, Ryder Street, St. James's, London, S.W.1.

Telephone: WHItEhall 1511

Telegrams: ECONOMIST NEWSPAPER, LONDON.

Cables: MISTECON, LONDON

The offices of the paper will be closed (except for publishing purposes) on Friday, Saturday and Monday, September 19th, 20th and 22nd. Some dislocation of business may continue for a week or two after the move and we apologise in advance for any inconvenience that may be caused thereby.

5,000 British soldiers still in Greece depart. The troops have taken no part in the fighting, but the Americans insist that their presence has a "steadying effect." From the British point of view, the request is obviously awkward. The purpose of the transfer of responsibility from Britain to America in Greece was to relieve the British of obligations the economic crisis had made it very difficult to carry on. Today the crisis is even more acute, the reduction of the armed forces a crucial political issue. What is Mr Bevin to say to critics who ask why American troops should not take their turn in Greece?

* * *

GI Joe Abroad

It is this possibility—that the containing of Communism may involve the United States in something more than economic assistance—that underlies the State Department's anxiety to keep British troops in Greece. At present there are about 1,000,000 men in the American Army. Half this number are overseas—two divisions in Europe (with special police units in addition), seven divisions in the Pacific—and these armies (very largely made up of untrained volunteers) are absorbed by the tasks of occupation. The only reserve is the four divisions in the United States that are responsible for home defence. The War Department has three headaches—the possibility of keeping up even the present figure without a universal military training service Act (both Mr Truman and Mr Dewey urged the American Legion—successfully—to support such a measure at their New York Convention this week); the disparity between American and Russian forces which according to American estimates amount to 102 Soviet divisions in Russia, 93 divisions in Europe and 13 in the Far East; and, lastly, the chance that the foreign situation may make more calls on America's armed forces in the near future. If the British were to withdraw completely from the Middle East, would American garrisons be needed in Greece, Turkey or, worst of all, Palestine? Would the proposed despatch of an American Military Mission to modernise the Egyptian Army be an adequate substitute for British forces on the Suez Canal?

The only relief the Americans see to offset these possibly expanding commitments is the withdrawal of some 15,000 American troops from Italy. Russia's sudden decision to ratify all the peace treaties last week permits the Americans (and the British) to withdraw their Italian armies of occupation—with the exception of the 10,000 men who will remain at Trieste. The Americans will now presumably rescind their recent decision to maintain and renew their units in Italy and have already signed an agreement with the Italian Government on the timing and methods of withdrawal. The British Foreign Office might, perhaps, point out that there is really no reason why 5,000 of the retiring forces should not return to America via Greece.

* * *

Hungary Toes the Line

During the course of this summer, the sharpening antagonism between Russia and the United States has been reflected in almost every government in Europe. The dismissal of the Communists from the French and Italian Cabinets was the constitutional and unviolent reaction of the West. In the East, the methods used have been equally in keeping with the tradition and outlook of the different countries. In Bulgaria and Rumania, the opposition has been wiped out—by the outlawing of the parties and the arrest of the leaders; in due course their judicial murder is likely to follow. In Yugoslavia, too, a number of arrests have given another screw to Marshal Tito's vice-like control. In Poland, the pattern is similar, though milder. The farcical spring elections destroyed the Opposition, but Mr Mikolajczyk and other leaders are still at large and their party has not been banned. In Czechoslovakia, most Western of the Easterners, the Coalition is still stable and representative. In Hungary, lying on the border line between two worlds, the struggle has been complex and devious and although the outcome—Communist domination—is dictated by Hungary's position in the Russian sphere, the political situation after last week's elections and the methods which led to their result lack the clear-cut brutality of recent developments in Rumania and Bulgaria.

The largest Hungarian party—the conservative Smallholders—who received nearly 60 per cent of the votes at the 1945 election, may very possibly have toyed in the spring with the idea of following Signor de Gasperi's example and dropping the Communists from the Cabinet. In Hungary, however, the Communists were too firmly entrenched throughout the Government and in the

key Ministry of the Interior. And at their elbow was the Soviet Military Commander. Their counter offensive took a dual form and has taken two or three months to accomplish. Too small and unpopular to stage a direct coup, they concentrated on splitting the unity of the Smallholders (not a difficult task since the party included a variety of elements from extreme right to moderate left) and on weakening the position of the Socialists. By pressure, by exposing real and imaginary plots, by judicious arrests, the Ministry of the Interior led the campaign which detached the right wing of the Smallholders, banished the Prime Minister to the United States, and thoroughly intimidated the left wing which was still willing to co-operate. A similar, although less violent, campaign weakened the cohesion of the Socialists. At the same time, the Communists threw themselves into the new electoral campaign and by hard work and better organisation seriously weakened the position of the more numerous easy-going Socialists.

The elections revealed the success of the Communists' tactics and the weakness and divisions of their opponents. The Smallholders' right and centre fell away into three new opposition groups—Mr Barankovics's Democratic People's Party, Mr Pfeiffer's Hungarian Independent Party, and Dr. Balogh's Party. The Right was further weakened by the disfranchisement of some 400,000 voters who had been connected with political life in the period before liberation. At the elections themselves, the Communists made use of "flying voting squads" (the Ministry of the Interior admitted to printing half a million non-residential voting permits), and, according to the Socialists, actually falsified the instructions issued on the conduct of the elections. By these means—a mixture of energy and deception—they increased their vote from 800,257 in 1945 to 1,082,597 and emerged as the largest party.

The results (732,178 to the Socialists, 757,082 to the Governmental Smallholders, 805,450 to Mr Barankovics, 718,193 to Mr Pfeiffer, and 256,396 to Mr Balogh) do not suggest fraud or violence by genuine East European standards. The combined vote of Smallholders and Opposition is about as big as the Smallholders' vote in 1945, and the people have been free to give it. But the Communists have achieved their aims by more subtle means. They dominate the coalition. They have shown once again that it is almost impossible for them to collaborate on any genuine basis, and in the present situation lies no guarantee that domination will not, when it is convenient, be dropped in favour of total control.

Britain's Food Supplies

The Ministry of Food has this week published (Cmd. 7203) an up-to-date version of the White Paper on "Food Consumption Levels in the United Kingdom," which gives comparative figures from the average pre-war period onwards up to the middle of this year. It shows that in 1946-47 the calorie equivalent of the supplies of food available for consumption was 96 per cent of the pre-war level, a fall from 98 per cent in 1945 and 100 per cent in 1944 which is presumably due to the introduction of bread rationing. It also shows, by detailed tables of individual food-stuffs, the change in the national diet from the beginning of the war—more potatoes and vegetables, more liquid milk, more, far more, fish, but less eggs and less, far less, fats.

All the figures contained in the White Paper are based on the total food supply, imported and home-produced, moving into consumption divided by the number of civilian consumers. Some allowance is made for wastage in distribution, but no allowance is made for wastage in the home and no allowance is made for changes in retailers' stocks or for changes, which may be considerable, in the stocks of individual households. As a picture of actual consumption of food the White Paper is, therefore, very incomplete. The 3,000 calories available a head a day before the war masked, as is well known, very great differences in the standard of nutrition of different sections of the community. Similarly, the 2,880 calories available today mask similar differences—although not in the same classes of people. It is not possible to come to any conclusion about the standard of nutrition at the present time until information is given on the actual consumption of food, at home, at work, at school and in restaurants, of representative groups of people. Only then will any idea be obtained of whether differing needs are being adequately met. The promised publication of the Ministry's family food surveys will throw some light on this.

But what the public is now, rightly, anxious about is not its past and present supplies of food, but its future supplies. In this respect the Government, and particularly the Minister of Food, are showing an utter lack of responsibility in confusing people to the extent that they are doing. At Dundee last Sunday Mr

Strachey stated that Britain had for the time being stopped buying food from the United States. He also gave a very clear account of the coming struggle to pay for imports, of food from elsewhere and of raw materials, tobacco, machinery from the United States and elsewhere, out of the proceeds of exports. On the information available, it is clear that the fight can only be won by a reduction in food imports. Why, then, did Mr Strachey deliberately refuse to prepare people for further food cuts? Why did he say: "Of course, we shall come through all right"? Why did he say we can manage for some time without buying food from the United States? If his optimism is well-founded, let him produce the facts. If not, let him tell the public the truth or at least keep quiet.

Anglo-Danish Trade Talks

The trade negotiations about to open between Britain and Denmark form the latest in a series bedevilled from the first by the post-war lack of a world market and a world price for food-stuffs. The Ministry of Food, as sole importer of staple foods, drives with each of the supplying countries a separate bargain whose terms reflect partly those countries' costs and domestic political pressure, partly their desire to maintain a footing in the large and prospectively valuable British market, and partly any political or sentimental goodwill. Thus Canadian wheat costs Britain \$1.55 a bushel, American over \$2, and Argentinian an unpublicised but even higher figure, and Danish butter is considerably dearer than that from the Southern Dominions. Normally, of course, arbitrage and the pressure of economic incentives on the farmer would soon reduce these differentials to those corresponding to differences in quality, but no such norms operate in Government trading.

The Danes are in effect demanding a cost-plus basis for the deal; feeding-stuff costs have doubled in the last two years (mainly thanks to President Perón's stranglehold on Argentine exports), and it has taken a stiff government subsidy on both home-consumed and exported produce to keep the Danish farmer going. The Dane sees without enthusiasm his beer and schnapps taxed, as savagely as the Englishman's tobacco, in order to supply Britain with farm produce below cost; and as Denmark's foreign exchange position is even weaker than Britain's he does not see why he should make sacrifices to keep his customers, even his best and steadiest customers, in the style to which they are accustomed. Against this view it is argued that if one item in the Danish farmer's costs has risen, it is his responsibility to bring other costs down to a level related to the price those customers can, emergencies apart, be expected to afford; and that Danish foreign exchange difficulties are largely due to earlier Danish unwillingness to face the postwar facts of life, particularly those relating to austerity in hard-currency imports.

In the last analysis all these debates, whether between Danes and British, Argentines and British, or farm blocs everywhere and their governments, are reducible to one issue: what is the proper parity—to use the American term—between agricultural and industrial prices. Farmers everywhere remember the 30s—the 25 cent wheat, the fourpenny butter—with a horror even sharper than that of a trade union recalling a 50 per cent unemployment rate. Traditional price structures have been as thoroughly shattered as traditional frontiers; and the farmers, as wary as Mr Molotov, are also as anxious as any Russian to preserve their present advantage and to establish a strategically safe norm, from which any downward deviations will still leave them with something in hand. The economic diplomats in Copenhagen and elsewhere have their work cut out.

The TUC and Direction of Labour

It was only to be expected, after the General Council had already announced its agreement, that the Trades Unions Congress at Southport would accept the necessity for some form of direction of labour. Logic, indeed, compelled such acceptance. As Mr Lincoln Evans, the steelworkers' leader, insisted, the trade union movement could not reasonably demand planning for everything and everybody and then refuse planning for themselves. The unions' acceptance of direction, however, was unhappy and reluctant in the extreme, and was taken against every instinct and tradition of the Labour movement. They clearly wanted to be assured that direction would be applied fairly over the whole community and not merely against the workers, and that there would be adequate safeguards in its operation.

Their very natural desire for information about the Government's intention was, however, largely thwarted, and delegates came away from the debate more confused and bewildered than they had gone in. Apart from his natural history analogies and his promise that the powers of compulsory direction would be used as a last resort, mainly against "spivs and drones," and that the Government would proceed by persuasion and not compulsion, Mr Isaacs gave absolutely no indication of the scope and method by which direction will be applied. This is not altogether surprising, for the direction of labour in peacetime cannot be fully effective without the wartime machinery to operate it, without the registration of all potential workers at employment exchanges, without the machinery of enforcement and sanction, without the provision for the compulsory transference of workers who become unemployed as a result of the closing down of non-essential factories to areas in which production will be concentrated. It is most unlikely, in fact, that the powers of direction will ever be used, unless the Control of Engagement Order breaks down completely and fails to achieve its purpose of "guiding" workers into the desired channels. For the adoption of direction of labour in peacetime the Labour movement is itself largely responsible because it has consistently refused any form of re-distributing labour by Government intervention in the wage market—even the new branch of the Ministry of Labour, whose function is merely to collect information on wages and hours, was given only a grudging and guarded acceptance at Southport. But direction is a cumbersome substitute for incentives and the pull of the market, and since it is only likely to be used against a small minority of workers, it is hardly worth the ill-feeling it will cause.

The Canberra Talks

The Commonwealth Conference at Canberra closed on September 2nd after deliberations which appear to have been most valuable and constructive as a preparation for drafting of the peace treaty with Japan. The environment of the conference has been conducive to a broad view of Pacific affairs, for the problem of dealing with Japan has inevitably been seen from Canberra in the context of Australian interest in the economic development of the whole Far Eastern region, and Mr Chifley, in his concluding speech, linked together the making of peace treaties with the task of finding solutions to the economic problems arising from the war. Thus the peace settlement in the Pacific has been studied in Canberra not merely as a matter of rendering Japan incapable of renewed aggression or of collecting and sharing reparations, but in terms of Japan's future part in the economic progress of the Far East. Dr Evatt spoke of a comprehensive international effort to raise the standards of welfare throughout eastern and southern Asia, and declared that Japan's future could not be considered in isolation from this larger whole.

These principles are altogether admirable and it has been well worth while to have had a discussion on these lines between Commonwealth representatives before the wider preliminary Allied conference of the Far Eastern Commission nations which is to meet in Washington. What has been made public is naturally couched in general terms and there has been nothing in the nature of a manifesto of detailed proposals for the treaty. The attitudes of the various Commonwealth Governments on the more controversial issues likely to arise are still unknown. On one point however, the conference seems to have made assumptions which are somewhat too easy. It anticipated that after the treaty has been signed in a few months' time, Allied supervision over Japan can be confided to an Allied Control Council acting by a two-thirds majority without any veto right. But is it likely that Russia will ever agree to this and, if not, what will be the situation? The autocracy of General MacArthur may have caused irritation in

many quarters and have been contrary to the original intention of the Allied Powers, but it has kept Japan quiet and orderly to a degree which can easily deceive superficial observation. Japan may be a very different place when the lid is taken off.

General Wedemeyer Passes Judgment

General Wedemeyer, who during the war replaced General "Vinegar Joe" Stilwell as Chief of Staff of the China command under Generalissimo Chiang Kai-shek, was recently sent back to China on a "fact finding mission" as President Truman's personal representative with the rank of Ambassador. He was obviously better qualified than a civilian to estimate the military situation in China, on which Washington needs reliable information, but he was also instructed to report with the aid of his staff on the political and economic affairs of China. On his arrival his public relations officer announced that he was not empowered to make any requests or proposals to the Chinese Government. But fact finding can produce some definite ideas on what ought to be done, and after a month in China, General Wedemeyer made a statement in which the tone of admonition was strong. As might be expected, he has found that things have gone wrong in China and that almost everybody deserves a reprimand. In distributing the blame he has followed his predecessor, now Secretary of State, in a scrupulously fair alternation of kicks to the seats of both the Kuomintang and Communist pants. The government is told that instead of spending its time "blaming outside influences or seeking outside assistance," it should carry out "drastic and far-reaching political and economic reforms," while the Communists are told that if they are really patriots they should go in for "peaceful means" instead of "violence and destruction." All this is excellent advice and except for the lack of appropriate quotations from Confucius might almost have come out of an old-fashioned censor's memorial on the degeneracy of the age. But it gives no clue to the question in which Chinese are most interested: whether the United States is going to give China any more economic aid and on what conditions. The Nanking official case is that if the Truman Doctrine is applicable to Greece and Turkey, it must be applicable to China as well, and, for Americans who deplore the civil war, the Kuomintang propagandists have a nasty habit of bringing up Abraham Lincoln and pointing out that he would not allow the Confederates to secede. The recent cancellation of the seats previously reserved for Communists on the State Council and in the National Assembly does not suggest any weakening of the Government's determination to unify China by force, at any rate south of the Great Wall.

Korea, General Wedemeyer's second assignment, he will find in no less sorry a case than China, but as the antagonists here are in the first place Russia and the United States, he will hardly be able to hand out condemnation with the same equal measure. The Korean situation is about as bad as it can be short of actual hostilities, for American-Russian negotiations for setting up a Provisional Government have broken down for a second time. The United States has now declared that no purpose is to be served by going on with these negotiations and that the question must be referred to a conference of the Four Trustee Powers—the United States, Russia, Britain and China. It remains to be seen whether they will be able to do any better in solving by agreement the real issue, which is whether or not Korea is to have a Communist-controlled Government. Meanwhile the two halves of this unfortunate "liberated" nation continue to live their respective lives to north and south of the 38th parallel of latitude.

The Statute of Algeria

The Statute of Algeria is intended to satisfy moderate Arab nationalism and to soothe existing political tension, without either depriving France of the essential attribute of sovereignty or sacrificing the interests of 1,000,000 French colonists to the 9,000,000 Moslem majority. Under its provisions, Algeria becomes financially autonomous. Two equal electoral colleges, French and Arab, jointly elect the assembly which votes the budget. Certain Arabs, however, are honorary members of the first college, so that the French are slightly outnumbered. To redress the balance, it is stipulated that no decision can become law without a two-thirds majority. The appointment and leadership of the government rests with the Governor-General, nominee and representative of the French Cabinet, who conserves his present title.

The Bill, which is the outcome of many months of haggling, had a stormy and slow passage through the two Houses of the French Parliament, where over 100 amendments were tabled. The Assembly's Commission (which, unlike the Assembly itself, com-

mands a pro-Arab majority), together with Communists, Socialists and Moslems in the Assembly, systematically obstructed it, in favour of a project of their own. The Socialist party at its national congress instructed its members and ministers to vote in favour of this alternative. It was only by openly defying his own Party that the Prime Minister, M. Ramadier, prevented a Cabinet crisis and at the same time secured acceptance of the compromise plan. The reason for the collapse of Socialist opposition, the Communist decision to abstain, not oppose, and the support, however unwilling, of the Centre and Conservative groups is probably the fact that the French urgently require some answer to the burning pan-Arab propaganda campaign which is being organised from Cairo and which urges the North African Arabs to "throw the French, bag and baggage, out of North Africa."

The prospects for reconciliation have not been improved nor the French prestige among the Arabs raised by the interminable debates in the Assembly, which have been passionate and dogmatic on both sides. The Moslem deputies finally refused to participate in the discussions. Before they retired, one of them mounted the rostrum to denounce the French for their "aggression" of 1830 and to propose an appeal to Uno.

No Alternative . . . ?

It is an axiom in a constitutional democracy that there must exist an alternative government ready and willing to accept office if the government in being fails, in one way or another, to command the support of the country. Judged by this standard, it is difficult to feel convinced that the Opposition in Britain at present is discharging that duty. It may, in the secret places of its heart, be ready and willing to take over; its outward demonstrations of that over the last month have been few and, it must be confessed, lacking in conviction. True, Mr Eden spoke at Carnoustie a week ago, and to an audience of some 20,000 people, but a great deal of what he said might have been said by a left-wing Labour critic. The Government seem to have hypnotised not only themselves but their opponents. What is the cause?

Not all the blame can be laid upon the Conservative Party. It is difficult honestly to disentangle those elements in Britain's present difficulties which exist whatever the political theories of the Government and those which have been caused by the actions of the Government itself. In many cases the Government have aggravated rather than caused the troubles. In others they have found solutions which a full-blooded Conservative Government might have failed to find. In the main the complaint against this Government is that of failure to prepare, both plans and above all the people, and it is hard to found a rallying-cry now on the one slogan, "We would have told you more twelve months ago!" What the average man wants to know is what is to be done here and now.

But the Opposition cannot escape all criticism. With respect to Mr Churchill, what Britain has not got from two years of a Socialist Government is a Gestapo police state—unless the police tolerance of Fascist meetings and war-cries in London is to be treated as a symbol of that. It has not been given an iron dictatorship of the Left. It has been given a woolly compromise, typified in what Mr Shinwell said in effect on his return from Doncaster last Sunday, "We mustn't be cross with the miners at Grimethorpe. They have a grievance." If everyone with a grievance stopped work Mr Shinwell's task would indeed be over—with those of everyone else with authority or responsibility.

The Conservative Party annual conference opens at the beginning of next month at Brighton. As with the Labour Party, the time has passed when its leaders should content themselves with talking about their worst fears. As a suggestion, would it not be practicable for them to announce at the opening session what the executive of the party is agreed that it would do—the detailed administrative and legislative actions that it would take in the first three months—were it returned to power on, say, October 31, 1947?

Diagnosis Agreed

Outside the Government and the general body of the Labour movement, there is an astonishing degree of unanimity about at least one of the causes of the present economic crisis, and that is a cause for which the Chancellor of the Exchequer is responsible. Last week two more voices were added to the swelling chorus of plans to check inflation: the Design for Freedom Committee and the Federation of British Industries. In a pamphlet called "Design for Survival," Mr Peter Thorneycroft, MP (Conservative) and Lady Rhys Williams (Liberal) are quite specific in their pro-

THE WHOLESALER TAKES THE IMPACT

As "the governor" in a piece of machinery maintains a uniform speed, so the wholesaler takes the impact of fluctuating demand from the textile manufacturer and the retailer, and keeps the flow of goods at a steady level. He buys in bulk in advance of the season, and thus enables the producer to plan long runs and continuity of production. The wholesaler stores and distributes in varied quantities to large store or smaller shop as required. An essential function in efficient marketing.

Take your pick of the WORLD'S TRADE OFFERINGS

Attend the Canadian International Trade
Fair in TORONTO

May 31-June 12
1948

The finest goods from every part of the world will be on display in Canada in 1948. You can compare the goods of many makers—many nations—and order them on the spot!

Canada's first International Trade Fair—sponsored by the Canadian Government—will bring buyer and seller together on an international scale.

Plan NOW to attend the Canadian International Trade Fair in 1948 or to send a representative. Full details on exhibits, transportation, and accommodation, etc., available from:

LONDON: R. P. Bower, Commercial Secretary, Office of the High Commissioner for Canada, Canada House, Trafalgar Sq. S.W.1.

LIVERPOOL: M. J. Vechter, Canadian Trade Commissioner, Bank Building, Water Street.

GLASGOW: G. F. G. Hughes, Acting Canadian Trade Commissioner, 200 St. Vincent Street.

DEPARTMENT OF
TRADE AND COMMERCE

OTTAWA CANADA

How far away is Singapore? The answer isn't in miles. A mile can mean anything—or next to nothing. To a snail, it's 73 hours of non-stop travel; to the Pilot of a Meteor, 6 seconds. And you don't get leave from the East in miles, but in months and weeks and precious days. Days of home leave, and in this case forty-eight of them can be spent at home, instead of being expended on getting there and back. The answer to 'how far is Singapore?' is two days by landplane or five and a half by flying boat. Two days to Singapore—2½ to Australia—1 to West Africa. 36 hours to India, 22 to Canada and the States. The world that the Speedbirds cross today is a world in which none need ever feel far from home.

IT'S A SMALL WORLD BY SPEEDBIRD **B.O.A.C.**

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH Q.E.A., S.A.A., T.E.A.L.

posals. The cost of living subsidies should be reduced by £300 million, and the resulting rise of 2s. 3d. a head a week in the cost of food should be partly compensated by an increase in old-age pensions, family allowances and unemployment benefit. Stiff indirect taxation should be imposed on luxuries and semi-luxuries to bring in an additional £150 million. Government expenditure—capital expenditure at home and military expenditure overseas—should be cut drastically to save £200 million. As against these economies, the standard rate of income tax should be reduced to 6s. 8d. in order to restore incentives to enterprise and effort. The result would be a budgetary surplus of £560 million.

The FBI is less specific in its proposals. But it, too, proposes big cuts in Government expenditure, and though it does not go so far as to suggest a reduction in income tax, it states that any higher taxation that is imposed to check inflation should be indirect rather than direct. Yet even if the consultants are agreed on the diagnosis, what general practitioners could be found to carry out the treatment prescribed? There is no sign that the official leaders of the Conservative Party will take up the ideas of the authors of "Design for Survival," who, it should be emphasised, are by no means solely concerned with a prescription for immediate needs, but also with the old problem of the role of the state in economic affairs. They champion the Liberal-Conservative alternative as the only possible choice between the "two-light chaos" of the present Socialist administration and the old Capitalism. It follows, they claim, directly in the tradition of the 1944 White Paper on Employment Policy. Perhaps next month's Conservative Party conference will show whether the Conservative leaders responsible for that White Paper agree with them.

The Colonies and the Crisis

A personal message sent by the Secretary of State for the Colonies to all colonial peoples illustrates the complexities of the present economic crisis. In brief, the colonies are asked to regard themselves as part of the United Kingdom. They are asked, that is, to cut their consumption to the minimum, particularly their consumption of dollar goods but also of goods produced within the sterling area since this will release more goods for export in exchange for hard currencies. Colonial sterling balances, in consequence, should not be drawn upon; they should indeed be added to by a reduction in colonial imports below what can be paid for by current earnings.

From the point of view of the United Kingdom's balance of payments difficulties, such a request is logical and reasonable. But what will be its effect, if it is acted upon, in an individual colony? For some time, many colonial governments have been worried lest inflation should get out of hand. The higher prices received for colonial produce from the beginning of the war, the shortage of consumer goods in the same period, and the demobilisation of colonial troops with gratuities and accumulated pay to spend, have all produced an excess of purchasing power which cannot be curbed, as in more advanced countries, by controls, rationing or even direct taxation. The colonies have, therefore, been looking forward to an increased supply of imported goods to meet the higher colonial incomes. Secondly, the colonial development and welfare plans are being to a large extent financed out of colonial resources, especially from the sterling balances out of colonial production which would recoil on the United Kingdom. The problem of finding incentives for, say, the African, is even more difficult than finding them for the British worker. But it is almost certain that he will not produce more groundnuts or copra or commodities for export to hard currency areas if he receives less piecegoods in exchange. On the other hand, it is even more certain that if the United Kingdom cannot get through this crisis satisfactorily, an end is put to all plans for colonial betterment. There is clearly a conflict of interest here which cannot readily be resolved.

How Not to Do it

Spaced out over the last few weeks have come announcements that the basic petrol ration would be cut by one-third; that it would be abolished from October 1st; that there would be no carry-over of September coupons; that September coupons would

be honoured during the month of October only; and that petrol in the motorist's tank could not be used after November 30th. There the matter now rests except for the forthcoming wrangles between individual motorists and their local Petroleum offices, which may or may not have consistent and reasonable directives to work by.

This is really not good enough. The abolition of basic petrol (announced, with typical psychological ineptitude, well after the right moment had passed) probably causes more dislocation, waste of time and energy, and general frustration, per dollar saved, than any other cut which could be thought of; and it is a safe bet that it would not have been imposed on any group of good trade unionists. This is not to say that it is unnecessary; although the Government might well have tried the alternative policy of allowing motorists to keep a basic ration but putting a swingeing tax on petrol supplied under it—"supplementary" petrol granted, on much stiffer tests, for essential purposes being taxed at the ordinary rate. Nevertheless, much worse things may prove necessary soon. But for the prohibition on spinning out the few remaining gallons according to private convenience there is no justification whatever. It is, of course, easier for the police if the mere presence of a car on the road indicates lawbreaking; and the black marketers and their clients are correspondingly hampered. But are these two considerations really enough to justify preventing the ordinary car-owner from banking his coupons and running his car, while they last, as often or as rarely as he pleases? Or using his last gallon, if he so chooses, on Christmas Day rather than November 30th? On only one assumption can the answer be "yes"; that the proper regime for this country is—as has been well said—government of the people, by the police, for the bureaucrats.

But if petrol shows up the planners this week, it provides no advertisement for private enterprise either; for it is now of all times—with consumption cut to the bone, with economy in manpower and everything else imperative as never before—that there is announced the imminent return of branded petrol. For all the anticipated pleasure of seeing Shell posters on the hoardings again, it would be hard to find a sillier and more uneconomic manifestation of the competitive spirit. It is as well to have an occasional reminder that government planners have no monopoly of error.

Housing Lack of Progress

Another depressing housing return (Cmd. 7204) has made its appearance. (Details appear in the *Records and Statistics Supplement* for this week.) When are the number of houses completed in a month going to show the sharp upward movement so long awaited? As it is, the number completed by local authorities in July (8,333) showed an increase of only 5.3 per cent over June, whereas between May and June the increase was 8.3 per cent. Yet the weather this summer could hardly have been bettered; if houses are not completed in large numbers now, it is difficult to see when they ever will be. It is surely nothing less than scandalous that the rise from the low level reached in the atrocious weather of February and March should have been so relatively small. The fault is, as has so often been pointed out, partly the low output of the present, extravagantly swollen, building manpower and partly the dissipation of resources on too large a number of houses. But the number of houses under construction by local authorities still shows no signs of the big contraction that is called for. Since the return goes no farther than the end of July, it does not reflect the decisions, if any, that were taken during that month and August to curtail the housing programme—Mr Strachey's references to housing at Dundee imply, in fact, that Mr Bevan has won his battle and that for the time being housing has been reprieved. But whether there will eventually be a marked pruning of the total programme or not, the target for the rest of this year is clear: it is to finish as many as possible of the 230,000 houses at present under construction by local authorities and private enterprise and to prevent another large carry-over of unfinished houses into the new year.

Shorter Note

The High Court in London last week refused a motion for a writ of *habeas corpus* made on behalf of the 4,500 Jews deported from Palestine in July and subsequently sent on to Hamburg. The application was heard by Mr Justice Jenkins, and the main ground for his decision was that as the original deportation from Palestine was within the legal powers of the High Commissioner, the Court could not be concerned with the ultimate destination of the ship on which they were placed, the more so since those on board had had an opportunity of disembarking in France.

Letters to the Editor

The Education of Our Masters

SIR,—If the prospect of losing his job is to hold any terror for the unsatisfactory worker and induce him to improve his performance, he must be afraid that he will have great difficulty in finding employment elsewhere, or at least employment under conditions as good as those he has left behind. This fear does not exist at the moment; we have a state of "over-employment." Hence, so runs your argument, the level of employment must fall appreciably (by implication) before it is useful to show the stick. And many employers will agree with you.

It would be better to think again. Unemployment might indeed be a solution to the problem posed by the unsatisfactory worker. To suggest, however, that, even leaving general social considerations aside, this advantage is worth the cost is to paint a picture that is sadly lacking in proportions. Of the disastrous effects on output of the fear of unemployment there can be no doubt. Only one other fear, that of rate-cutting, can rival it in breeding restriction of production. As early as 1924 a report of the Industrial Health Research Board concluded that "the fear of unemployment is always an obstacle to efficiency, and unless it can be entirely removed maximum efficiency will never be attained." Good workmanship is not compatible with fear, and it is a mistake to believe that insecurity stimulates the competitive spirit. Unemployment, in fact, does nothing to remove the urgent need to find incentives for the worker; instead it reduces or eliminates such incentives as exist. It would also kill stone dead whatever contribution is expected of joint consultation and other efforts to enlist the workers' co-operation.

Far too much, not too little, fear of unemployment is still left in the minds of the workers of today. It does not affect only those who have been unemployed; it is passed on to others besides. Lately, restriction of output even in the building industry has been authoritatively attributed to this fear. In the middle of the war, the Select Committee on National Expenditure reported that "it is difficult to persuade the men that the present drive for production is likely to be a lasting one." The urge towards shorter working hours is still sometimes connected with the tendency to unemployment inherent in modern economic systems. Recruitment to several industries, even those requiring a high degree of skill and hence regarded as interesting, is bedevilled by the very same fear. Moreover, uneven production flows in post-war Britain, due to irregular supplies of raw materials and fuel, do little to convince the workers that, despite all the fine talk about full employment, they are not, after all, working themselves out of a job.

It is important to find means of spurring the unsatisfactory worker to greater efforts. But whatever the suggestions that are adopted—and little imagination has been shown so far—they must not be allowed to spread fear of unemployment among the great majority of workers. Has it ever struck your readers that some firms seem to have much less difficulty with their workers than many others?—Yours faithfully,

69 Exeter Road, N.W.2

R. P. LYNTON

[Mr Lynton should draw a distinction between the prolonged mass unemployment of the 1920s and 1930s, which no one wants to see again, and enough moderate, short-term unemployment to restore some elasticity to the labour market. To put the same point in another way, does Mr Lynton hold that the economic system will work efficiently with only the present 14 per cent of unemployment? In the past, at least 3 per cent, and more usually 5 or 6 per cent, has been taken as the minimum for efficiency.—EDITOR.]

The Economic Crisis

SIR,—Mr Marples, in his letter in your issue of August 30th, echoes independently a striking article by M. Bertrand de Jouvenel which appeared in the April-May number of *Economie Contemporaine*. Here are the three key paragraphs (the translation is mine) which contain his conclusion:

If the political direction of an economy relaxes these two springs, the rhythm of intensive work and the intensive accumulation of capital reserves, not only will it fail to hasten an improvement in the standard of life, but it will bring in its train a progressive decline. And a state subjected to simultaneous pressures from the mass of consumers and the unions of producers will have difficulty in avoiding this consequence.

A directed economy, if it is to be productivist and expansionist, presupposes an authoritarian state, which must be a stern employer and an inflexible saver.

The choice of an economic regime is, therefore, inseparable from the choice of a political regime. For power to govern an economy with efficiency, it must have conferred on it such a degree of authority as will enable it to blot out the wills which disturb its plans. The socialist mission requires fascist controls. Authoritarianism or stagnation, that is the choice which dirigisme thrusts on us. —Yours faithfully,

H.

SIR,—It would be well, in the present situation, to try to achieve a sense of historical proportion. Otherwise, like Mr Marples, we may be driven to conclusions that are not only uncomfortable but perhaps absurd. Could it not be rightly said, for instance, that the play of economic forces, in whose effectiveness he is led to believe, has in the past taken us tottering from one crisis to another—except when the prosperity of the few rested firmly on the poverty of the many—and is even now the cause of our difficulties?

It is too soon to say that the alternative, planning, is bound to fail without ruthless coercion. If its aims are right, there is surely a reasonable chance of at length obtaining, with patience and education, the intelligent co-operation of the workers, without which all is lost in any case. The fact that the planners of the new world are no more adept than their forerunners at healing the ills of the old, with which, to their apparent surprise, they find themselves encumbered, should not in itself cause us to condemn and abandon their objectives. After all, the particular surgical remedy advocated at the moment—deflation—is calculated to hurt most the working men who are their main sponsors and reluctance to operate is quite understandable. To be realistic, no Government, whatever its colour, could hope

From The Economist of 1847

September 4, 1847.

THE last report of the Relief Commissioners [for Ireland] . . . states:—

the largest amount of gratuitous relief . . . supported 2,920,792 persons per day; and the number to whom sold \$9,920.

The returns to August 1st show a gradual reduction to 2,467,989 gratuitous, and 52,387 sold; the cost of each ration, including establishment and expenses, averages 2d.

Although a reduction of one-sixth, on 3,000,000 persons gratuitously fed, leaves an enormous number still to be provided for, it must be remembered that the "period of the year that brings with it the greatest amount of distress is notoriously that which immediately preceded the gathering of the first crops, during July and the early part of August"; and we may reasonably hope, therefore, that prior to the end of September, when the country will be thrown on its own resources, that it will be able, though poorly and scantily, to provide for its own poor. A correspondent informs us:—

The out-door relief has nearly ceased, nevertheless every one has plenty of food: the harvest-work is in; provisions are cheap; and the poor have means to meet all their immediate wants. Today I changed an American order for a poor man for 10 dollars; he said, "I did not expect this, sir, as I wrote to my brother *not to send more to me*, as I had full employment, I could now do without trespassing on his bounty." . . . He added, "My sister wants clothes—I will give her the entire, as I can do without it; and, thank God, I owe nothing." These were his exact words. Oh, that our rulers could but know the Irish poor!

... These statements . . . are the most cheering we have yet had from Ireland. Nothing is wanted to insure the permanent prosperity of its people, but that they should make proper use of its advantages. There, "all, save the spirit of man, is divine." The raw materials of endless wealth and prosperity are to be found in her rivers, her mines, her fisheries, even in her turf bogs: they woo industry and skill, but industry and skill are not there to profit by them. With awakening hope and brightening prospects, after so dark and dismal, and so long a night, it is now the especial business of all to aid and cherish the willing exertions of the respective classes to escape from their unhappy condition, and prevent themselves ever again falling so low.

nowadays to get away with a policy of creating unemployment, however it were disguised, without imperilling its political future. Labour is too powerful at the polls to be openly defied, too vital industrially to be deliberately provoked, and, through its organisations, too knowledgeable to be bamboozled about its immediate interests.

The trouble with economic forces is that they seem quite incapable of attaining stable equilibrium. Various cures are suggested for reversing the trend of the moment—and, of course, reverse the trend we must—but what hope is there that once straightened out we shall be able to keep our balance any better than we did last time, or the time before that? What I should like to see is a reasoned argument, from yourself if you believe in it, demonstrating convincingly that the system of economic forces—liberal, free, capitalist or whatever you like to call it—for which the surgeons and physicians are constantly having to prescribe, is capable of prolonged periods of good health, given the acquisitive human properties required for individual economic success. Personally, I doubt it.—Yours faithfully,

5 Osborne Mansions, N.W.2

DENNIS WESIL

A Curse on the Tinker

SIR,—“Socialism” you write “would be accepted by an overwhelming majority of the people if it could only be given some meaning.” Do you really think so? When did the conversion of *The Economist* occur? And would any meaning do?—Yours faithfully,

LIBERAL

[The language was inexcusably loose—though the sentence was not, we hope, so sweeping in its original context as without it. What we meant to convey was that Socialist remedies for the present crisis would be acceptable to the great majority of the electorate—or at least would not be rejected merely because they were Socialist—if only somebody could make it clear how they differ from any other sort of remedies and why they can be expected to work better than non-Socialist common-sense.—EDITOR.]

Indonesia—The Real Issues

SIR,—I have read with interest, but not without astonishment, the letter to the Editor of Mr Lunshof, Haarlem, Holland, in your issue of August 16th. In Holland we have a saying, which can hardly be translated into English, to the effect that decency demands that dirty linen should be washed at home. I am sorry to say that Mr Lunshof has shown a complete lack of good taste in writing his letter.

There is plenty of evidence that Mr Lunshof's opinion is that of a minority in this country, of a minority holding influential

positions in The Hague and Batavia. Further, it is evident that the complete failure to come to an agreement with the Republic of Indonesia is, to a great extent, due to the activities of the friends of Mr. Lunshof and of his co-actors in the Indonesian Government, the so-called extremists. Both these groups are interested to avoid any reasonable understanding; the Dutch group in order to maintain the possibility of colonial exploitation of the Indian Archipelago, the Indonesian extremists by reasons which originate from a universal hatred for Western men and civilisation.

I wish to state clearly that it is neither the will nor the intention of the Dutch Government or the Dutch people to suppress by arms the desire for liberty and independence held so strongly by the peoples of Indonesia. Only very few Dutchmen show such a complete inability to understand what is going on in Asia.

Finally, I am fully aware of the fact that English readers are well informed about developments and events in that part of the world and do not need the personal point of view of Dutch die-hards.—Yours faithfully,

F. L. J. VAN AALST

Churchill-Laan 45, Amsterdam

Socialists of Eastern Europe

SIR,—My experience in Rumania last December bears out your Special Correspondent's opinion that the Opposition fraction of the Social Democrat Party which followed Titel Peurescu is a minority.

My experience in Bulgaria during the two months before that, however, contradicts his belief that that which followed Kosta Lulchev into opposition is a majority. The estimate which I heard, from a reliable non-Communist foreigner who had been there almost ever since the liberation, was that it had about 3,000 members, compared with about 100,000 members in the section supporting the Government. The votes cast at the general election on October 27, 1946, which were generally agreed to have been properly conducted, are unrevealing in this connection because Lulchev's Social Democrats and Petkov's Agrarians decided to ask their supporters to vote for them indiscriminately, and it is therefore impossible to say how many of the 1,205,530 votes which they collected together were votes for the Social Democrat Party. Since, however, the votes cast for the Social Democrats supporting the Government numbered only 79,511, out of a total electorate of 4,252,631, it will be realised that, unless one assumes that the supporters of Petkov's Agrarians were few, which is improbable, the combined strength of the divided Social Democrats is relatively insignificant.—Yours faithfully,

28, Gloucester Place, W. 1

EDGAR P. YOUNG

Books and Publications

pattern are of no great significance. But the Catalan language is really a survival of Provençal, the Langue d'Oc—the speech of the troubadours—and in the twelfth century the Provençal-Catalan lands formed a world which was neither French nor Spanish, but much more civilised than the hinterlands to north and west of it. After the French conquest of what is now the south of France the distinct Provençal culture gradually disappeared, but south of the Pyrenees Catalonia retained its national identity, with its own laws, customs and a parliamentary constitution in which all classes were represented, until it fell under Castilian domination in the time of Ferdinand and Isabella. For a coastal land with an enterprising seafaring population and a high development of trade and industry, the ascendancy of the backward central plateau of the Peninsula was an enduring blight, and the antagonism of the two peoples has never been resolved. The separate constitution of Catalonia was finally suppressed in 1714—with the assent of England after England had used the Catalans as allies in the War of the Spanish Succession. In 1931, with the coming of the Republic, the Catalans regained autonomy, only to lose it again to Franco's armies in 1938. But Mr Trueta maintains that those who think the Catalan problem has been settled by the Franco regime “will be proved wrong,” and it is indeed unlikely that anyone who reads his book and realises how rich is the cultural and political heritage of this people will be ready to believe that Spain can now be governed for long on any but a federal basis.

Surgeon—Historian

“The Spirit of Catalonia.” By J. Trueta. Oxford University Press. 8s. 6d.

THIS is a historical work, but with a sharp contemporary point. It is a history of his own people by one of the most eminent of the living Catalans, a surgeon who, in exile in England since the destruction of Catalan autonomy in the Spanish Civil War, has made a notable contribution to medical science in this country. Mr Trueta writes about the past of his country at a time when General Franco has imposed on Catalonia a system of ruthless denationalisation; the use of the Catalan language is prohibited for any official or serious literary purpose and Catalan books are being systematically destroyed as part of the programme for the national unification of Spain. Every effort is being made to reduce Catalan to the status of a mere local dialect.

But this in any case is what most Englishmen who have heard of it at all suppose it to be. The ignorance of the historical achievement of the Catalans, even among people with a good general knowledge of European history, is very remarkable. It is largely a matter of anachronism. French, Spanish and Italian are great recognised living languages; France, Spain and Italy have in recent times been sovereign states; so it is natural to assume that phases of history which do not conform to this

Mexican Scene

"Mexican Kaleidoscope." By Norman Wright, FRGS Heinemann. 175 pages, with 24 pages of illustrations and end-maps. 15s.

A VIVID variety would seem the quality that most impresses the observer of the Mexican scene. And it is this which characterises Mr Wright's present work. It is a book of purely personal theories, observations and reminiscences on a great variety of subjects. And it is in a minor key throughout. To the political experiment which, as the Revolution of 1910 evolves into what may be the pattern for the development of other Latin American States, captures the interest of so many foreigners there is barely a reference—nor to oil, nor to St Lombardo Toledano and his powerful Labour organisation, nor to the problems of industrial independence with insufficient capital, machines and skill: and wisely so, for the author, who was Military Attaché to the Mexican Government for three years during the war, "enjoyed," as he explains in the Foreword, "rather special facilities for getting to know the country from one end to the other." Others, he implies, may bring their particular gifts to the interpretation of specific problems, but his self-chosen function is to act as a kaleidoscope, to mirror the bright fragments of his varied experience for the enjoyment of the beholder.

The result is a pleasant travel-book, light, colourful and perceptive. Perhaps its weakest sections are the early chapters on Mexico generally and its capital and the penultimate chapter on the Arts in Mexico. These need a more co-ordinated approach than the scheme of the book permits. Yet in them may be perceived many of the qualities which give other sections of the book its charm—the author's delight in departing from the beaten track, his interest in nature, his curiosity about Mexico's many rich civilisations of former ages and his sympathetic interest in their latter-day heirs, the Indians. Indeed, an appreciable part of the book is devoted, directly or indirectly, to the Indians. The description of a visit to the 300 odd surviving Seris, a race too primitive to comprehend the technique of agriculture, even when instructed in it, is especially interesting. This and similar expeditions bring out the inadequate communications and difficult terrain which, with the advancement of the Indians, rank among the chief problems of Latin America generally. Incidentally, in the occasional references to the success with which the Mexican Government is solving these problems there appears to be a polite tendency to equate plans with performance.

Other Things are Never Equal

"La Valeur Logique des Théories Economiques." By Bertrand Nogaro. Presses Universitaires de France. 185 pages. 200 frs.

It is a pleasant and fruitful task to puncture the illogicalities of the great, and Professor Nogaro wields a very pretty pin. His theme is the vital importance, in any deductive economic analysis, of a detailed as well as a clear definition of the data, and of checking the sequence of argument stage by stage against reality. He has something to say in passing about the corresponding need, on the side of the inductive economists, to make full use of hypothesis to check an apparent sequence of facts; but his heaviest fire is reserved for the theoreticians. Though he does perhaps underestimate the importance of pure theory in providing the tools of economic thought, few British economists in these days are likely to dispute his general emphasis, and least of all since the rapidly increased recognition of the importance of applied economics which has followed from the war years. As an analysis of current fallacies, his cap in fact fits French heads distinctly better than British, for the examples of unsound logic which he quotes are hardly characteristic of British economic thought to-day. Or at any rate those of them which are genuinely unsound, since, in his long series of fallacies from Hume to Keynes, there are at least a few instances (notably his discussion of the marginal theories of value and imputation) in which his own logic is open to dispute.

The chief though not the only value of this book for British readers should be as a text for second- and third-year students—those who already have a fairly wide knowledge of theory—on how not to conduct economic analysis. The expert economist will find a good deal of enjoyment in it, and the theoretically-minded student should suffer some salutary shocks, while both alike will be pleasantly reminded of the venomous delicacy of the French language in pinning down a shade of contempt. "Should one say in this," as Professor Nogaro inquires of Professor Robbins's panegyric on Wicksteed's discovery of the reversibility of the demand curve, "yet another proof of the irresponsibility with which economic theory is too often treated, or should one not

rather detect here a discreet manifestation of traditional British humour?"

Shorter Notices

"Towards a Classless Society." H. D. Hughes, MP. Fabian Publications and Gollancz. 17 pages. 6d.

THIS competent and clearly written newcomer to the Fabian Society's series of discussion pamphlets will probably be found useful by many who are neither Socialists nor members of discussion groups. Drawing on Government statistics and reports, on such classics as Daniels and Campion's "Distribution of National Capital" and Carr-Saunders's and Caradoc Evans's "Social Structure of England and Wales," and on Parliamentary debates, it provides a neat factual foundation for any intelligent consideration of the problems of class structure, not to mention taxable capacity, incentive, and half a dozen other topics.

That is undoubtedly a full half, probably the more important half, of a discussion pamphlet's job. The other half is to be stimulating, to start profitable trains of thought, to indicate the possibly significant and, more subtly and valuably, to inculcate the habit of looking for significance and evaluating it when found; to do, in short, as much as possible of the work of a good live teacher. Here Mr Hughes, for all his practical experience, is less successful. His suggested questions for discussion are practically tests of the reader's, or discussion group's, capacity for memorising his own facts and figures. One could suggest a few better ones at half a minute's notice. Would the classless society necessarily mean the rule of mediocrity? Should future leaders be spotted young and given any special training? And do we need anything in the nature of a *Führerprinzip*, anyway? Is the monarchy compatible with a classless society? And so on. No doubt that is precisely what group discussion leaders will do.

"The Little Man Marches On." Cartoons by Strube. "Daily Express." 160 pages. 3s. 6d.

TO an eye accustomed to David Low's unerring political eye and magical economy, the pictorial comments of Strube on the events of the last two years often seem ephemeral, overcrowded and fussy. Yet how good they are, and how wrong would be the historian who neglected that aspect of the British character which they illustrate. Look at the cartoon of July 28, 1945: Coalition (Attlee and Churchill, sitting peacefully side by side, listen to an anonymous voice asking from the other side of the despatch box, "What are you going to do about it?"); Intermission (Churchill, still peaceful, is similarly apostrophised by Attlee); Opposition (it is Attlee now who benignly listens and Churchill who asks the question). How much of British political life is expressed in the temper of that? Or see the bread crisis of 1946—a somewhat bedraggled John Bull shies half-a-loaf to a raft-load of hungry fellow-castaways, shouting, "Coming over—don't forget I'm on a raft, too."

But Strube's real hero is, of course, the Little Man; skimpy, walrus-moustached, baggy-trousered (when he is not expressing Austerity by wearing a barrel), thankfully discarding his warden's helmet for a bowler, cultivating his garden and muttering objurgations against the crows (marked "Taxes"), ruminating over the atom bomb, struggling with burst pipes, lighting "just one" cigarette nine days after the Budget. He is not a heroic figure; he is short-sighted, not very very satisfactory representative of a Britain which needs thews, intelligence and the long view. But there are worse deficiencies. One retains a sneaking affection for the little fellow and a corresponding gratitude to his creator.

"Sveriges Utrikeshandel efter Kriget. Meddelanden från Konjunkturinstitutet; Serie B, Nr. 7." With a Summary in English. Isaac Marcus Boktrycker's AB, Stockholm 1947. 64pp. 1 Kronor.

THIS concise and competent review of Sweden's foreign trade since the war describing Sweden's difficulties describes also the problems of Europe's distorted economy—but most of Europe has the devastation of war to contend with as well. The "inflationary gap" stimulates luxury imports. After a speciously encouraging start as relief shipments or long-awaited imports swell the figures of foreign trade, the "German vacuum" and other effects of war make their presence felt. Trade shifts to the New World. Its terms become increasingly unfavourable, although its volume remains high. The scarcity and high cost of raw materials foster autarkic tendencies. These in their turn cramp trade. All this and more is discussed in this excellent little pamphlet, and eighteen tables and five schedules provide the necessary illustration.

"Les Transfers Internationaux de la Population." Institut National de la Statistique et des Etudes Economiques. Presses Universitaires de France. 556 pages.

THIS massive study, exhaustively documented, will constitute a standard work of reference on its subject matter. For various reasons, however, post-war movements have been omitted; the authors do not deal with the Czech or Polish expulsion of German minorities, with the Canadian expulsion of Japanese residents (including Canadian citizens) or with the general problem of the Displaced Persons.

AMERICAN SURVEY

Portrait of a Plan

(From Our US Editorial Staff)

"Who is Silvia? What is she?
That all our swains commend her?"

WHAT, indeed? The swains of the State Department find it difficult to answer. It is not, they say, a plan at all—yet. They prefer to call it the Marshall Approach. It is, they explain, an approach to a problem—not a cut-and-dried plan for solving it. But, though its father and his staff may be reticent, others have been roughing in the outline recently.

Who is the Marshall Plan? What is She? We do not know yet. Wholly fair, undoubtedly. "United States officials" were recently said by the *New York Times* to consider Britain's economic position serious. But they "pointed out that the Marshall Plan, on which the United States hopes to build its programme of European recovery, does not permit the selection of any particular country for preferential treatment." That is Silvia.

From Geneva come more lines to fill in some gaps in our knowledge. "The United States," says Mr Michael Hoffman to the *New York Times*, "has made it clear to the European countries interested in the Marshall proposal that a definite project for a Customs Union is one essential for further large-scale United States aid. . . ." That also is Silvia.

"Is she kind as she is fair?" The President thinks so. When asked whether there was any possibility of a Marshall Plan for Latin America, he replied, firmly, that there had been one for a hundred years. "But with the governments who have declared their independence and maintained it," runs the Western Hemisphere's centenary Marshall Plan, "and whose independence we have . . . acknowledged, we could not view any interposition . . . by any European power in any other light than as the manifestation of an unfriendly disposition toward the United States." That, too, appears to be Silvia.

Mr Snyder, on one occasion, said that the Marshall Plan did not envisage any American financial help to Europe. But Mr Benjamin Cohen, speaking for the State Department at Long Beach, California, said: "Those who have been studying Europe's rudimentary rehabilitation needs tell us that Europe, including Great Britain, may require as much as five or six billion dollars a year for another three or four years." Mr Dean Acheson, at Cleveland, Mississippi, speaking, it is true, before the Harvard speech which gave birth to the Marshall Plan, but speaking surely in the rôle of John the Baptist, also used figures. (There may be significance in the coincidence that the two State Department officials who were known to be resigning were chosen to mention the difficult subject of dollars.) Mr Harriman, on the other hand, explaining the task of his committee, stressed the fact that its report would be in terms of products—not of dollars.

All these things are the Marshall Plan, but they are by no means the whole of it. It has been left purposely vague, though it is very real to its progenitors. The reason why it has never

been explained is partly because it took their breath away. When they found it taking shape they realised that

"She excels each mortal thing
Upon this dull earth dwelling."

They also realised that the United States was vulnerable to remarks about "the almighty dollar" and "dollar diplomacy." Mr Roosevelt invented lend-lease to take the dollar sign out of the war. It came back to spoil the peace and this is partly an attempt to take it out once again. For that reason, the invitation to the European powers was a very general one. They were to draw the outline. With the help of the few hints given them they would provide a silhouette, which would later be filled in and given colour by enlightened American generosity and self-interest. Within certain limits they would determine the shape of the Marshall Plan—but they must not produce a portrait of Silvia unrecognisable by her parents.

★

There has recently been a certain doubt whether the portrait was going as well as had been hoped. Mr George Kennan, chief of the State Department's new Planning Division, went to Paris last week to look it over. Now is the moment for more precise definition. When the Secretary of State comes back from Rio and the American people come back from their vacations the campaign to explain and sell the Plan must begin. Its shape must then be settled—even if all the colour has not yet been put in. The report of the Paris Conference was to provide the outline on September 1st. The colour will come from the reports of the Harriman Committee on October 1st and, most important of all, the decisions of the House Select Committee on Foreign Aid, the Herter Committee, which will return to the United States with its findings in the second week of October.

Mr Kennan went to Paris to ensure that the portrait had all the features required to provide the necessary sales appeal—the bright eyes of Customs Union, the shapely features of hydro-electric schemes which take no account of national boundaries, and the red lips of an integrated transport system for Western Europe. There have been rumours in Washington that some—or all—of these were missing. If they are, it will not be an easy portrait to sell. Before the American people will "garlands bring," they must be assured that the Plan has the breadth and vision which they need to inspire them. The idea has these qualities. It has the basis of generosity which moved Herbert Hoover during the first World War. It has enough self-interest to clear the conscience of those who are always afraid that Uncle Sam is being Uncle Sap again. It takes, with exactly the right amount of innocent bewilderment, a glancing blow at Russia and the Eastern bloc—thanks to the tactlessness of Mr Molotov. It may, if properly handled, make the United States, in twenty years, the unchallenged leader of the world without any of the responsibilities previous world leaders have had to shoulder.

But it is not certain that the Plan will end by being so excellent. Congress—and, before Congress gets at it, the President's Committees—may remove an arm here and a leg there. That is the way of Congress. But the State Department will not abate their admiration whatever becomes of her. Even if Congress does its worst, they feel, they will be left with the Venus de Milo.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Radioactive Isotopes

(From an American Correspondent)

ONE of the important by-products in the discovery of nuclear fission is the production of radio-isotopes of almost any element in any desired quantity. "Isotope" is the name given to all atoms of different weight belonging to the same element. For example, oxygen is composed of three isotopes, oxygen¹⁶ and oxygen¹⁷ and oxygen¹⁸. The three kinds of oxygen are indistinguishable chemically, but can be distinguished by physical means which are dependent on slight difference in mass. These isotopes are called stable, or non-radioactive, isotopes. In 1934 the Curie-Joliot discovered that it is possible to make unstable or radioactive isotopes. These new elements are chemically identical to the stable, or non-radioactive, homologues; they differ from the stable isotopes only in that they give off radiations. They are not found in nature, with a few exceptions of little biological significance.

Three fields of usefulness can be foreseen for these materials in biology and medicine. The first, and probably least important, is their direct use in the treatment of cancer and allied diseases. As has been known for many years, the radiations from radium or X-ray machines can be used to cure certain types of cancer or to alleviate the suffering caused by this disease. The mechanism involved is fundamentally one in which the radiation produces greater damage to the cancer cells than to the normal cells. The major difficulty with external radiations, as at present used in the treatment of cancer, is the rather small margin between the dose which kills the cancer cells and the dose which kills the adjacent normal cells. Many cancers today cannot be successfully treated because the amount of radiation necessary to kill these cells also kills the normal cells in the field of treatment.

Another field of usefulness for radio-isotopes in medicine is in the diagnosis of disease. Here the tracer technique is what is used. This technique rests on two points: the above-mentioned chemical identity of a given radio-isotope with its stable isotope, and the existence of instruments which permit the detection of the presence of radio-elements in quantities far smaller than is possible by other techniques. For example, it is possible to detect a billionth (10⁻⁹) part of a millionth of an ounce of radioactive phosphorus. This means that one could mix a minute quantity of a compound containing a radioactive element with a large amount of the non-active compound and trace or detect the movement of the resulting mixture. Compounds of radioactive sodium and radioactive iodine respectively have already found use in diagnosis of diseases of the small blood vessels and of the thyroid gland. It seems certain that compounds containing other radio-elements will speedily be utilized in the diagnosis of other diseases. Among the possibilities are the use of radio-phosphorus in the evaluation of liver function and the use of radioactive carbon contained in organic compounds in the evaluation of disturbances of protein, fat, and carbohydrate metabolism.

Finally, and potentially far and away the most important, there is the application of the tracer technique to increase knowledge of life processes—to find out how the human body functions. The site and mode of action of drugs, vitamins and poisons can be investigated by "tagging" the material in question with a radioactive element, then following the movement of the injected material in the body. Perhaps the greatest value of the method will lie in the biologist's ability to investigate those normal body processes which cannot be explored by ordinary chemical methods. For example, it is now known that certain food elements are essential to life. It is not known, nor can it be found out with any other technique, how, where, or at what rate they are utilized. Only after such knowledge is available about a wide variety of metabolic processes can the

treatment of the metabolic and degenerative diseases be placed on a rational basis. At that time it is not unreasonable to predict that at last a beginning can be made in progress in the prevention and treatment of cancer, high blood pressure, heart disease and the rest of the illnesses that arise from disturbances of metabolic processes.

So it is seen that the benefits to be obtained from the use of radioactive isotopes is great. It is not too much to predict that use of radio-isotopes in medicine and biology will alter the treatment and prevention of disease as much as, or more, than the advent of the microscope altered them in the past. The effective treatment of infectious diseases necessarily was dependent upon the discovery of bacteria or germs as a causative agent for these diseases. The microscope made it possible to see small bodies. With medicine's new tool it seems certain that the answers to many questions will be found and rational treatment made possible of diseases which are now treated ineffectively.

American Notes

Limits on Dollar Aid

Despite the publication of some rather half-hearted denials in Washington, there seems to be no doubt that the State Department was shocked by recent estimates from Paris suggesting a European Aid Programme at an overall cost of nearly \$30 billion for the next four years. Less than a fortnight ago, the official line of the State Department was that "interference" in the Paris Conference by the United States would run the dual risk of stimulating Soviet charges of dictation, and of giving official support to European estimates in a manner which might easily bring a Congressional mood of overwhelming hostility to further dollar aid. The despatch of two special State Department delegates (Mr Kennan and Mr Bonesteel) to Paris reflects the later view that prior agreement between the United States and the European nations concerned, however informally expressed, will prove to be less damaging than any later rift on dollar totals. Apart from this factor, which provides a simple reflection of the State Department's phobia concerning the trend of Congressional opinion, there is genuine anxiety about the lack of progress in Paris on moves for the economic integration of Western Europe.

Circumstantial reports suggest that an initial figure given by the State Department as a "yardstick" for European Aid possibilities, covers from \$15 to \$20 billion over five years. It is also suggested that such an estimate will be well in line with initial estimates prepared by the Policy Committee of Nineteen, now working under the chairmanship of Mr Averell Harriman, Secretary of Commerce. State Department officials have been working on estimates for some time now. But the Harriman Committee itself will not issue a report before the close of this month, and its work will be dovetailed with estimates submitted by a special committee of the Council of Economic Advisers, and a further committee on national resources, headed by Mr Krug, Secretary of the Interior. These facts suggest that the State Department "yardstick" at this moment is probably no more than a fairly realistic assessment of what may be expected from Congress—given a suitable response from Europe in terms of "self-help," and of solid moves towards economic integration.

Such an interpretation is also borne out by the present shape of the Budgetary estimates for 1947-48. As noted last week, Mr Truman's latest Budget estimates provide for revenues of \$41.7 billion and expenditures of \$37 billion—a surplus of \$4.7 billion. Actual cash outlays, however, will probably fall short of the expenditure total by as much as \$2 to \$3 billion over the rest of the fiscal year, these figures being altogether dependent, of course, upon the assumption that business activity and national income remain at present high levels. It must not, however, be assumed that any balance of \$7 to \$8 billion would be scheduled almost

automatically for a European Aid programme. Political observers in Washington have noted that recent Presidential declarations have been careful to avoid any complete shattering of tax reduction hopes. And it is widely held that the approach of the 1948 elections will enforce a much more sympathetic attitude towards the Republican Party's clamour for tax relief. Such a programme need not go all the way with the \$4 billion plans vetoed this year by Mr Truman. But any worth-while plans would almost certainly put a limit of, probably, \$5 billion yearly on dollar aid.

The Economic Burden

By next January, of course, many complicating factors may sway Congressional votes. There may be a swift export decline, and there may be a swift business recession, while fresh developments on this side of the Atlantic may yet prove to be the deciding issue. A dollar aid programme, moreover, could be financed outside the normal Budgetary schedules, although such a purely bookkeeping shift would not adjust in any way the real burden of continuing assistance. What can be said with safety is that the economic burden of assistance on the scale now suggested in Paris would certainly not strain the resources of the United States; nor need it necessarily bring fresh inflationary pressure. The following table shows the pattern of inflation in terms both of foreign and domestic demands upon the US economy:—

	1939	1946	1947†
	(in billion dollars)		
Personal consumption ...	67.5	143.7	158.0
Gross domestic investment ...	9.0	24.6	29.5
Net foreign investment ...	0.9	4.8	10.0
Government purchases ...	13.1	30.7	27.5
Gross National Product ...	90.5	203.8	225.0

† Annual Rates.

So long as personal consumption and domestic investment continue at present high levels, so long will inflationary pressures persist. But a Marshall programme will certainly not mean a fresh increase of the foreign investment total, which is destined to fall sharply in the near future without such a stimulus. And the process of post-war re-equipment must by now almost certainly have reached, or nearly reached, the stage where a pause is essential for orderly progress. A decline here from \$30 billion to \$25 billion, for example, would certainly leave the economy accumulating new capital equipment on a scale beyond the pre-war average, and would leave ample scope for post-war rehabilitation. But if all the present demands on the American economy are maintained, there will be stringent limits on the Marshall Plan, since Congress will clearly be in no mood to strengthen the modest powers of allocation now held by the executive branch. The weaker the position revealed by Western Europe, the more clamorous become the voices for a strong America before any other goal. On the extreme wing, such views are presented in the *Wall Street Journal*, which now declares quite roundly that "the British loan has not done any of the things that its sponsors claimed. Other loans made under like circumstances give no promise except to have very similar results. It is time to stop." At another level, the suggestion is that only an American controlled corporation (such as a sort of Reconstruction Finance Corporation with direct US supervision) can make any loan plan roadworthy. This is only another way of repeating the *Wall Street Journal's* plea, and it is a far cry from these columns to those influential and friendly commentators, Joseph and Stewart Alsop, who jointly declare that the United States has gone through the world crisis "like a nation in a dream—an opium dream of peace, plenty, and pleasure." Between them stands Mr Lovett, the Assistant Secretary of State, declaring that "our concern is that any programme should not only be reasonable, but realistic, and involve diminishing amounts of assistance." But Mr Lovett has since made public Administration's fears that Congress cannot move fast enough to avert breakdown in Europe.

Rallying the Legion

It is an impressive reflection of the potential power of the veteran that most of the country's leaders found time this last week to address the American Legion Convention in New York. Mr Truman alone was unable to attend in person, due to an impressive press of business. History will record, no doubt, that a resolution was accepted endorsing the Marshall plan "to maintain the bulwark in Europe which at present is damming

back a rising flood of Communism"; that other resolutions were framed endorsing aid to Greece and Turkey, but prodding the Administration to move faster and further and urging the strengthening of the United Nations through modification of the veto. The agenda of the convention bears testimony to the effectiveness of a slogan of an organisation for which the Legion has nothing but scorn: the "Citizens First, Veterans Second." If there was a bonus plan somewhere in the works, it has yet to be reported. The Legion has not yet made any move to welcome to high office or into its policy discussions the politically-conscious veterans of World War II, although they make up 70 per cent of its membership of over 3,000,000. But the serious business of the convention is evidence of a desire of the executive to make the Legion something more than a lobby for veterans' interests, though how many Legionnaires knew what was in the resolutions they accepted is a matter of dispute.

The Convention also made history by providing the occasion for Governor Dewey boldly to follow the lead of President Truman, the Legion itself, and the Gallup poll, in espousing military training. Under such august auspices, the Governor has not hesitated to take an effective little jab at Senator Taft, who has steadfastly opposed military training. A modest foray in Senator Vandenberg's direction was less fortunate; support for, and criticism of, a bi-partisan foreign policy was accompanied by an aside claiming to have fathered bi-partisanship as long ago as 1944. "Me, too," is a phrase which has been used before to describe Mr Dewey's aptitude for climbing on band-wagons once they are well under way.

How great an impression the speeches and ringing resolutions made upon the happy invaders of America's largest and richest city is another matter. This was an invasion armed with water pistols and battery-charged walking canes, which in an all too real sense electrified innocent passers-by; of jovial crowds spilling over into the roadways; of interminable road blocks. It was the old Legion back again, a trifle greyer, bringing its sons of World War II with it, but determined that nothing should interfere with the traditional horse play. Progress has done away with the street cars which could be blocked by lying on the tracks, but otherwise little was changed. New York, despite its pride in its deliverers of two wars, and the millions of dollars of business a Legion Convention brings with it, has welcomed a new liberation as the legions melted away.

To File or Not to File?

The battle over the boycott of the National Labour Relations Board still rages unabated. The central issue is whether union officers should sign the anti-Communist affidavit and disclose union finances in order to enjoy such protection and privileges as the Board still offers. Fourteen unions affiliated with the Congress of Industrial Organisations (out of a total of 24) have gone on record against resorting to the NLRB, and Mr Lee Pressman, general counsel to the CIO, has urged the use of economic force as a substitute for NLRB authorisations. The AFL decision to file or not to file will be made on September 8th.

What is becoming clearer is the disposition of the labour unions, looking closer, to declare of the law "What big teeth you have, grandma!" Boycott is possible (though Mr Hartley calls it brazen effrontery), but the costs may be greater than was realised at first. It has been ruled that if a single officer of a national organisation refuses to sign, no affiliated union may be considered to have met the requirements of the law. If the right of a non-filing union to represent the workers in a given plant is contested by another organisation which has complied with the rules, the non-signing union may face an election held by the NLRB in which its name does not appear on the ballot. It would also be deprived of the right to negotiate any sort of union security agreement. No cases charging unfair labour practices could be brought by it before the Board. It may even be decided that cases pending when the Taft-Hartley Bill became fully effective on August 22nd may not be heard if the petitioning union refuses to register with the NLRB. As a consequence, it is suspected

that even the arch-recalcitrant Mr John L. Lewis will eventually decide to declare that he is not a Communist, not only for the sake of the other constituent unions of the AFL, but because his "District 50" (though not the miners' union itself) is accustomed to bringing complaints before the Board and requesting elections. One interpretation of the law has saved the CIO from a serious embarrassment. The executive board of the CIO will not, it appears, need to file anti-Communist affidavits, a step which would have been difficult for Mr Ben Gold, head of the furriers' union and long an avowed Communist. Whatever the bulk of the unions decide to do at present, it is becoming clear that in a time of falling employment, with its encouragement to sharp employer practices, the costs of not clearing themselves with the NLRB will mount.

* * *

Co-operatives Under Fire

The Republican majority has at last got round to the gadfly of the co-operative movement, which from humble origins among farmers has grown into big business. In 1944 co-operatives did a national business of \$6½ billion—6.5 per cent of total consumer expenditures. The endemic cry of private business is that co-operation has grown, not because it met a need, or because of superior efficiency, but because it enjoyed an unfair exemption from taxation. To wipe out this unfair advantage the National Tax Equality League was formed. One of its unintended by-products has been to give co-operation more free publicity than it has ever been able to secure for itself.

A sub-committee of the House of Representatives has made it a recess task to investigate "whether and to what extent tax-exempt privileges of co-operatives are harmful to free enterprise." It plans to look at 45 co-operatives, from New York to California, but the investigation has started in Washington's own backyard. The consumers' co-operative established at Greenbelt, Maryland, a government-owned community, has been branded a monopoly because the residents decided, in the beginning, to exclude private enterprise from its retail trade and to establish a Co-operative Society of which two-thirds of the inhabitants are now members. The community, created in the early days of the New Deal, and sometimes known as Tugwelltown, has a ten-year contract with

the Federal Housing Administration, an agency enjoying no popularity with a Republican Congress.

This explains, no doubt, why it was chosen at the start. Logically the committee, if it is really investigating tax-exemption, should have begun with the agricultural producers' co-operatives, which enjoy the complete remission of Federal taxes. Consumer co-operatives pay most of the taxes levied on private business, with the exception that income returned to members is not liable for Federal income tax.

The strength of the committee's convictions will be tested when it moves West to take up the question of farmers' co-operatives. Greenbelt can be tarred with the New Deal brush; but in the Middle West co-operators and Republicans are one and the same, and the committee members may be forcibly reminded that it was the Republicans who wrote the tax-exemption clause into the Internal Revenue Code in the nineteen-twenties as an aid to bankrupt farmers. As was the case when the House of Representatives, in the pursuit of economy, slashed irrigation and conservation payments for the West, the Republicans may wake up to find they are biting their own tail.

Shorter Notes

Trade experts allege that prices of British woollen goods are now "completely prohibitive," a development which is said to be due to higher prices for raw wool imports, and to the regulation of domestic prices for finished goods. According to one spokesman, a devaluation of sterling by 20 per cent would be needed to make United Kingdom prices competitive. It may be noted that present tariffs on finished woollen goods are extremely high, 1939 rates ranging from 35 per cent to 85 per cent *ad valorem*.

*

The Department of Agriculture forecasts a fall of at least 5 per cent in meat supplies next year, the 1947 total being at the record level of 23 billion lb. Prices have rather more than doubled the 1937-41 average, and the Department says that present demand has brought a heavy dip into livestock reserves. Simultaneously, mid-western reports suggest that a growing number of farmers are now convinced that gross farm income will reach a near-term peak this year, and that rigid costs and smaller feeding crops will bring lower net income over wide areas.

THE WORLD OVERSEAS

Terror in the Punjab

(From Our Special Correspondent in Lahore)

THE present slaughter in the eastern Punjab, where the Sikhs are systematically exterminating the Muslim minority, is the worst outbreak of communal violence in recent Indian history. It is far and away the best organised. It has long been planned and it has been directed from a very high level. Its immediate aim is to clear the eastern Punjab of Muslims. Its eventual aim, in the minds of the more fanatical Sikh leaders, is to restore Sikh supremacy in the Punjab. These aims are reinforced, in the minds of the ignorant people, by the lust for revenge and the just for loot. Beneath it all is that strange and terrible animal frenzy, a sort of mass *muth*, which in India is ever ready to break out, is easily aroused, and is ordinarily only held in check by strong administration.

Talk to a Sikh and he will say—"But look what the Muslims did to the Sikhs at Rawalpindi in March." About 5,000 Sikhs were slaughtered then, in circumstances of great brutality, and it was the arrival in the Sikh cities of the east Punjab of some of the survivors, some with scars and all with bitter tales to tell, that greatly worked up the desire for revenge. The Rawalpindi massacre was thoroughly exploited by Sikh leaders. If ever there was an illustration of the truism that violence begets violence, it could be found here in India. None of the leaders, not even the highest in the land, seems able to forget the past, clear his mind of recrimination, and start breaking this vicious chain of action and reaction.

The present slaughter is the heaviest to date because the best organised. (My own estimates are that the Sikhs have killed about 10,000 Muslims in the past month and are still killing them at the rate of about 300 a day. The true figures may be much higher.) But the Muslims have been slaughtering Sikhs and Hindus in the west Punjab. The reign of terror in Lahore before and after August 15th was a Muslim assault on Sikhs and Hindus which, although causing only a few hundred deaths, destroyed millions of rupees worth of property and reduced the Sikh and Hindu population from over 300,000 to about 10,000. And when it comes to brutality, there is little to choose between the two sides.

Sikh Anger at Partition

For many weeks past the Sikhs have been in a state of tension, almost of hysteria, because partition was bound to hit them hard. Many of their holy places, including the birthplace of the founder of their militant reformist Hindu sect, much of their land and property and several prosperous canal colonies, populated predominantly by Sikh peasants, lay in the Muslim majority areas of the west Punjab. Their political power, moderately strong in a united Punjab, was bound to be reduced if the province were divided in two. At this climactic in their fortunes they have suffered from a dearth of able and constructive leadership. Their leaders, none of them outstanding personalities, have, in default of sensible united policies, resorted to wild inflammatory tactics. The violence which they built up is now expending itself on defenceless Muslim villagers. Having unchained the beast, they cannot get it back into its cage again, even if they wished to. The Sikhs are strange people, greatly addicted to intrigue and dissension, and one wonders if they have sufficient self-discipline to accept good leadership. One remembers that of all classes in the Indian Army they were the trickiest to command and that they were far better in attack than in defence.

Sikh reactions apart, the general feeling amongst neutral observers about Sir Cyril Radcliffe's boundary award is that it was not a very good award, but that, whatever award he might have made, there would still have been trouble. The reports accompanying both the Punjab and the Bengal awards were very thin and sketchy and he gave no adequate explanation of his decision to include in Hindustan several contiguous Muslim-majority areas.

Several weeks ago the Viceroy foresaw that there would be trouble in the Punjab, and he took steps to create a special neutral force to try to maintain order—Junjab Boundary Force. It consisted of the famous 4th Indian Division, plus additional units, and came under the control and direction of the Supreme Commander, Field-Marshal Auchinleck, not of the Indian or Pakistan Governments, although both the latter pledged themselves to support it. As from September 1st, however, their respective armies have assumed responsibility for their territories in the Boundary Force area. The force was intelligently used and on the whole did a good job. But for its presence the slaughter would probably have been ten times worse. But this has not really been a situation with which the Army, unless in overwhelming strength, could deal effectively. In the districts worst affected, Jullundur and Hoshiarpur, there were four battalions spread over an area the size of Sussex, with a population of perhaps two million. Moreover, these troops of the Indian Army were subjected to a tremendous emotional and psychological strain. As well might one expect British troops in Palestine to remain neutral and impartial. Despite virulent accusations made by civilians on both sides that Sikh and Hindu troops have attacked Muslims and vice versa, I have come across no authenticated instance of this happening, although it has happened repeatedly on both sides in the case of the civil police.

Plight of the Refugees

The immediate result of this war in the Punjab is to cause a refugee problem which shows signs of dwarfing the migrations in Europe resulting from the last war. It is a problem with which the civil administration on both sides of the boundary is at present quite incapable of coping. The main stream of traffic is from India to Pakistan. Tens of thousands of simple villagers are trekking westwards, with the surviving members of their families, with what beasts they could save, still subject, until they reach the boundary, to attacks by Sikh *jathas*. They may stay in Pakistan. They may return to their fields (incomprehensible as this sounds) if conditions return to normal, so deep and enduring is the attachment of the Indian peasant to his land. Nearly always in India in the past the refugees have returned after a time and lived again with their late murderers.

Another result of this war is to sow the seeds of lasting bitterness between India and Pakistan. There are many intelligent Indians and Pakistanis who regard war between the two dominions as lying in the logic of the future. Their number is increasing daily. It is dangerous when people start taking the inevitability of a war for granted.

The fashion amongst the British who remain in Lahore is to make cynical jests about that "peaceful transference of power" which was repeated *ad nauseam*, and for which British speech-makers took no little credit unto themselves, in all the inaugural celebrations in Karachi and Delhi. It is impossible, if one is on the spot, to see this thing in perspective. Many recent outings with patrols reveal that in all the villages, even in some of the Sikh villages, there is an atmosphere of fear that is almost tangible. Hundreds of thousands of people, the very night that this is being written, are awake in their little mud huts, starting at every noise, dead tired but unable to sleep, in a state of acute physical fear. And now this murderous madness has again spread eastwards to Bengal. From the north-west there have only been ominous rumblings and threats to send a hundred thousand Pathans to avenge their Muslim brethren.

The "surgical operation," which was another cliché of the Independence Day speeches, is bleeding where the cut was made, as do all surgical operations. It is still too early to pronounce on the success of the operation. It depends how soon the bleeding can be staunch.

The Treaty of Petropolis

[BY A CORRESPONDENT]

THE draft of an inter-American treaty of mutual defence, which was signed last Tuesday at Petropolis by the representatives of all the states of the Western Hemisphere, except Canada, Ecuador and Nicaragua, undoubtedly represents a success for United States policy. America was determined that, according to the provisions of the Act of Chapultepec, this conference should concern itself with defence and not with economic measures. And the conference after some initial restiveness concentrated on its prescribed task. The delays and ineptitude of the State Department's actions earlier in this chapter of Pan-American relations are thus largely atoned for. Admittedly, however, this has been made easier by two extraneous factors.

An increasing resistance to Communism has brought the American States more closely together in face of a common external danger. And, secondly, Argentina has proved less intransigent than at one time seemed likely. This more co-operative attitude of Argentina may bear investigation. In the first flush of his sweeping victory General Perón's policy, though astute, was too truculent and too opportunist. Demagogic measures such as the immediate implementation of his promises of price control did not please the whole country. In particular the ceiling price of many foods was fixed too low so that farmers had little incentive to produce. Thus, now that they are coming to realise the disparity between the low prices they receive and the high prices for which the Government monopoly sells, they are disgruntled. Industrialists, too, are showing unrest over the conditions imposed on their activities. And abroad there are signs that the sellers' market—the main prop of Argentine foreign policy—is weakening. The Government realises this, as a recent series of broadcasts by Perón shows. And its more accommodating attitude at the conference points the same way, although it should be noted that it was the Argentine delegation that was most forward with proposals to restrict the scope of the treaty. The important point, however, is that they did compromise and have subscribed to the treaty.

Thus, what promised to be a conflict between, broadly speaking, Argentina and the United States has been resolved by mutual concessions. For Mr Marshall and Senator Vandenberg, the conference also has marked a personal triumph. In his forthright first address Mr Marshall made it plain that he had come to discuss defence treaty and nothing else, and this clear declaration undoubtedly contributed to the comparatively speedy conclusion of the conference's work.

Rights of Intervention

The treaty it has produced is both more precise and more binding than similar previous documents. Of particular importance is the provision that every signatory has, when an aggression has been committed against any American state, the "obligation" as distinct from the "right" of the Act of Chapultepec, to intervene even before an inter-American conference is called. For an armed attack against any one of the American Powers is now considered an attack against all. Yet the nature of that intervention is left vague. Once a conference has been summoned, decisions for collective action taken there will, if passed by two-thirds of all signatories of the treaty, be binding on all. But, again, no state is required to use its armed forces without its consent. This proviso removes one main anxiety. If United States forces are attacked in areas outside the security zone of the Americas—which now stretches from the North Pole to the South Pole and extends far out into the Atlantic and the Pacific, including Greenland and the Aleutians—the other American countries are not automatically involved. Their fears that they might be committed to give armed support to United States policies are thus mitigated.

To reach its decisions the conference worked through three committees, and it was on Committee II dealing with "Collective Measures to Meet Aggression" that Mr Vandenberg is reported to have distinguished himself. Clearly the work of this Committee was delicate and complex, and the success of the conference must owe much to it. It was this Committee, which by a secret vote and in conformity with the concentration on defence matters as laid down at Chapultepec, rejected the Cuban proposal to include "economic aggression" as a *casus foederis*. The discussion of economic affairs was also kept within bounds by President Truman in his address to the closing session. The economic problems of Latin America, he said, were smaller and less urgent than those of Europe, the restoration of which should, in fact, be a major

objective of the economic policy of the Americas. In any case, these problems could not be solved by specific measures, but only by long-term collaboration. This collaboration has been the object of many Pan-American conferences, and is to be discussed next at Bogotá in January. At Bogotá, also, United States policy is likely to prevail.

It can be forecast, however, with some certainty that, whatever the precise nature of the discussions there, this policy will show a preference for working through existing machinery—the Pan-American Union, the World Bank and the International Monetary Fund—and, as President Truman indicated, will be aimed at the gradual development of Latin American productive capacity through private enterprise. In other words, America would prefer individual national agreements and not a Marshall Plan. The Bogotá conference will discuss routine matters of Pan-American interest, welfare, education and so forth. But it will also choose a joint inter-American military staff and thus carry the work of the Petropolis conference a step further.

Canada and the Marshall Offer

[FROM A CORRESPONDENT IN OTTAWA]

THERE is as much scepticism as optimism in Canadian discussions of the Marshall offer of United States aid in the reconstruction of Europe. Among Government experts doubt and pessimism are common. They are not, however, directed at the very sketchy and nebulous idea which is all that Ottawa so far has been able to find out about the so-called Marshall plan. In fact that idea was being discussed in Canadian Government circles long before it was put into words by Mr Marshall and recognised then as the only alternative to a continuing deterioration of world trade.

Full realisation that the only solution lay in an outright gift from the United States for the reconstruction of Europe was first brought home to Canadians when they faced the fact that Canada's own resources for extending credits to finance export trade were at an end. Canada has been riding high on a wave of post-war prosperity created very largely by the fact that every bit of surplus production in the country was needed by the outside world and would be taken so long as credit could be extended to those countries not able to pay cash. Thirty-five cents of every dollar of Canada's national income today is attributable directly to export trade. But in 1946 one-third of those exports were financed by the export credit programme and this year the percentage will be as high, if not higher.

First Warnings

The first official warning that these halcyon days could not last came from Mr Graham Towers, the Governor of the Bank of Canada, last February. To keep its industries producing as well as to maintain the present standard of living Canada was draining its own reserves of the only real form of international cash at present—United States dollars and gold—in order to finance steadily growing imports from the United States. The warning has been underlined now by the trade figures of the first six months of 1947. While total trade was at a record height, the favourable balance dropped to a lower level than at any time since 1938. A trade deficit with the United States of \$489 million—only \$8,000,000 less than the entire deficit in 1946—has had to be financed, while a surplus with the sterling area of approximately \$392 million has produced only \$220 million in cash.

Few Canadian experts have held any illusions that Britain, much less Europe, could be brought back to self-supporting production with the limited amount of United States assistance made available through the British loan and credits to continental countries. It was no surprise when it became apparent that the United Kingdom would not be able immediately to assume the burden of bringing sterling back to a pay on demand basis. Canadian hopes have been pinned solely on the possibility of the United States awakening in time to the necessity on the basis of self-preservation of extending a free gift to Europe with no string attached other than the assurance that it should be complemented by as full a measure of self-help as possible.

The Marshall offer looks like that awakening at least so far as the Administration is concerned. And the fact that a Congressional study of available supplies has been launched may indicate a wider realisation. Even then there is the question of whether the awakening has come in time to be really effective. It would probably be late in 1948 before any plan was brought into operation. For Canada alone, to say nothing of the United Kingdom and Europe generally, this might be too late unless stop-

gap measures could be devised to prime the pump with United States dollars. But if a Marshall plan could be put into operation in time, Canada would regard it not only as the only solution but as a logical adjustment which gets to the real root of the trouble. The Minister of Reconstruction, Mr Howe, has described it in the one word "salvation," and he was not speaking of Europe, but of the world in general and Canada in particular. There is some significance in the first place in the fact that Canada has a Minister of Reconstruction. There has been no physical war devastation in this country, but the fact that it was tied so closely to the United Kingdom has placed Canada economically among those countries which have to be rebuilt and which depend on the one real source of supply, the United States. More fortunate than European countries, it has been able to use its own resources to the extent of slightly less than \$2 billion, excluding contributions to Unrra, in supplying Europe. But it has been realised that this was little more than a fleabite. On a basis of population a comparable investment by the United States would amount to approximately \$22 billion and on the basis of national income to \$33 billion.

Inadequacy of Former Measures

In the opinion of Canadian experts the present crisis is merely a symptom of the root cause, which is the inadequacy of the moves to date to place American production at the disposal of Europe and the rest of the world. The Marshall offer seems to represent the first full-scale attempt to bridge the gap which exists between Europe's need and America's supplies. It may be that when all the cards are on the table it will be found that Washington has in mind a plan which still falls short of the essential objective, and that it may also envisage credits to be used only in the United States. These are factors in the situation about which Canadian experts would like to be better informed before they venture any opinion on the effect the Marshall offer may have on world trade generally.

Even if credits were tied, however, Canada would stand to benefit by the general improvement in the cash position of the assisted countries which would result. If they are not tied, or, in other words, if Canada and South America are taken into partnership in supplying the needs of Europe, it can mean in

itself a solution of Canada's own dollar difficulties and a reasonably early return to balanced trade. The Marshall offer is also being viewed here in the light of Canada's own growing dependence on the United States economy—a dependence that has been only accentuated, not created, by the war. There is no industry in Canada today which is not to some extent dependent on imports from the United States. Even wheat cannot be harvested without the import of raw materials to manufacture binder twine.

There is a good deal of support in Canada, very vocal at the moment, for a move to integrate Canada more closely with the sterling area, or, in other words, to pare imports from the United States to the bone and work toward self-sufficiency within the Commonwealth. There is a substantial portion of luxury goods and finished products which might be stopped at the border, though politically that move would be unpopular. But even without these imports there remains a long list of imports essential to keep the wheels of Canadian industry going and to supply goods to the United Kingdom and Europe.

Canada's Dependence on Multilateralism

Even assuming that the Commonwealth could supply all or most of the materials now imported from the United States, geographical considerations obviously make such a policy unsound except as a possible short-term arrangement to meet an emergency such as the present dollar shortage. Canada's normal position in world trade is that of an important customer of the United States and a major supplier of the United Kingdom and other parts of the Commonwealth. Canadian trade with the United States may be brought into better, but never into complete, balance so long as the expansion of the manufacturing industries continues. An adverse position is the complement of Canadian prosperity and something about which no Canadian is likely to worry in a world where deficits to the United States can once again be settled with the proceeds of sterling trade. But this can only come when the economic devastation of war has been repaired and the nations of the world are no longer clamouring for the capital goods which can be supplied only by one nation.

THE BUSINESS WORLD

Scope for Multilateralism

TO the trading world overseas, and to bewildered consumers at home, the sudden suspension of sterling's convertibility into dollars appears to have severed—or at least endangered—many of the vital strands of international trade. Such an impression is understandable, for in the past fortnight the air over Britain and far beyond has been thick with discussions of the need for a rapid reorientation of trade. Yet this assumption lays too much at the door of sterling's "inconvertibility." It is important to get the diagnosis right. Otherwise, amid present confusion, the wrong remedies may be over-hastily sought.

This is not an argument of easy optimism. The severance of some trading links, and the threat to others, are grim realities. And the damage that is being done would not be repaired if, by some miracle, the lightning decision of August 20th could be as suddenly reversed. The convulsions of world trade, the *saute qui peut* run on convertible sterling and the world-wide tightening of buyers' purse-strings, result from a more fundamental process—the crucial dollar famine throughout a large part of the world—in which the ending of sterling's dollar convertibility was hardly more than an inevitable incident. Its importance, on a longer view, is that it has quickly brought the whole world, and not merely a purblind British Government, face to face with the realities of the underlying problem. The fact of sterling's full convertibility, indeed, had acted for a brief spell as a partial soporific upon governments and traders overseas. The extra burden which Britain assumed—necessarily, maybe, but against all reason—meant an equivalent lifting of other people's burdens. Others saw, or thought they saw, the possibility of delaying exhaustion of their own dollars by earning or using convertible sterling instead; and, so long as Britain's dollars lasted, there was logic in the assumption.

Now the grim realities are inescapable. Thoughtful people perceive not only the immediate implications of world-wide dollar shortage but the truth that further subventions from Washington—whether to Britain or to a European group—cannot solve the basic problem, indispensable though such aid may be if disaster is to be averted while remedies are being devised. The basic facts are starkly simple. Broadly, the trading world divides into two regions—the Western Hemisphere, which is the only area that has a surplus of produce, and it is a colossal surplus; and the Eastern Hemisphere, which has a huge deficiency even in terms of bare necessities of life and rehabilitation, yet is virtually without the means of buying the surplus of the West. There is, unhappily, no reason to suppose that rehabilitation of Europe could correct this disequilibrium by an expansionist route—in such a way as would enable the West to sustain its huge export surplus.

For the medium-term, therefore, the countries of the Eastern group have no alternative (whether or not more dollars are provided to ease the immediate phase of greatest stress) but to reorientate their economies—in the quite literal sense of reducing their dependence upon the West. This process involves for all a deepening austerity (or at least continued austerity), and harder and more efficient work. But apart from these indispensables, there are two possible routes. The dollar-deficient countries can act separately—or in concert or co-operation. There is no doubt which is the path of wisdom.

It is against this background that the future of sterling, and indeed of almost all currencies outside the dollar area, must be viewed. Exchange problems cannot be discussed simply in a financial context, nor can a clue be obtained merely by studying the existing network of exchange agreements. Yet if the dollar-deficient countries will but appraise objectively the advantages which remain to them, they will find in these agreements—of which Britain happens to be the chief architect—a foundation upon which much can be built of value to all. The aim of such countries, considered as a group, plainly is to achieve an equilibrium by mutual trade, not indeed on a basis which makes them independent of the dollar area (for that is economically impossible and politically unthinkable) but on one which enables them to pay for their dollar purchases out of their aggregate dollar earnings (plus, for the time being, such dollars as are furnished in aid).

The level, in terms of standards of living, at which such an equilibrium may eventually be attained will depend very largely upon the extent of freedom of movement of trade within the group, and upon the degree to which the planning of trade is genuinely reciprocal and not mutually antagonistic. Desperate cuts in imports within the group (as distinct from cuts in dollar imports) are the worst possible basis from which to build an equilibrium at a high level. The right course, where such import cuts are contemplated because in present circumstances the goods supplied are relatively inessential, is for the purchasing country to explore the possibility of getting alternative, more essential goods; and for the supplying country, even at the cost of drastic change in its productive structure, honestly to try to meet the need. The wider the area within which this mutuality obtains, the less will be the structural changes required. In principle, there is no other way of achieving the optimum result.

Moreover, while for some purposes the co-operating countries may be conceived as a group, the system will break down if individual members are for long in substantial disequilibrium even in their dealings within the group. Recent experience has driven home the truth that the first requisite of international acceptability of a currency is that it shall be convertible into goods; and that the second requisite is its convertibility, at one or more removes, into the right goods—goods which the holders need and cannot buy more cheaply elsewhere. This condition, too, may require drastic changes in internal economies, as British consumers and producers are learning now; but the same processes are afflicting many others abroad, and the lot of all would be the lighter if the whole series of operations could be dovetailed.

These are first principles of international trade. The American-sponsored attempt to construct a world-wide system, embracing hard and soft currencies alike—what may be called an omnilateral system—has broken down, as it was always apparent that it would. But that does not mean that the principles of multilateral trade should not be followed within the more limited, but still large, area in which they may work. Much more is likely to be heard of them when the report of

the European Economic Co-operation Committee appears. If the countries primarily concerned, outside as well as within Europe, honestly try to follow this route, much can be done. But even when the will to build multilaterally is present, the process will be laborious or impossible in the absence of a foundation of an internationally acceptable currency.

Sterling, even now, can furnish such a foundation—provided that Britain, in common with the sterling area proper and others of the wider sterling group, honestly plays its part, by making whatever structural changes are necessary to ensure the supply of goods which alone can make sterling permanently and widely acceptable. Britain has in any case no choice but to organise thus. If within the whole group of countries primarily affected there is confidence that all will work on these lines, Britain and all others will start with the inestimable advantage that sterling is at present already widely acceptable—for its acceptability, given only confidence, will afford an indispensable latitude wherever latitude is needed.

It is important, therefore, for all concerned to realise the extent of this area of acceptability, and to do so before unilateral measures are decided upon which may rashly endanger what has been so laboriously built up. To define that area involves a brief survey of the network of sterling agreements as it now stands.

Britain during the war was obliged to capitalise to the full the willingness of others to send goods without immediate payment, and accordingly organised bilaterally. Outside the dollar area (to which, apart from Mutual Aid, all payments had to be in dollars or their equivalent) and outside the sterling area (within which there was complete freedom of movement), the usage of sterling was strictly canalized, principally through the system of "special accounts" operated under payments agreements. All payments from the sterling area to, say, Argentina or Chile or Brazil had to be made in sterling to the credit of a "special" account of the country concerned, and the sterling thus accumulated could be transferred only within the particular country or in the sterling area. Between the many distinct categories of sterling thus created there was normally no interchangeability, although specific transfers from one category to another were increasingly permitted.

From last autumn until July 15, however, the London authorities made major efforts to make sterling interchangeable with as many categories as possible and to extend this freedom of usage to payments to the US dollar area and Canada. The non-sterling area countries which directly benefited from these facilities were those whose monetary authorities were willing and seemed able to operate "transferable" sterling accounts strictly for the purpose of current as distinct from capital transactions. Before the recent suspension of convertibility into dollars, sterling on such accounts could be freely used for current payments not only to any of the countries operating

this system and to the sterling area and to certain other countries, including Russia, but also to the US dollar area. The effect of the decision of August 20th is to withdraw this last right—the right of automatic transferability to the US dollar area—and to withdraw, too, the similar transferability to Canada and Newfoundland.

This change, it will be seen, is simply in line with the realities of the dollar famine already discussed. But the range even of automatic convertibility (which works through the powers delegated to the authorised banks, as distinct from the wider convertibility achieved by specific decisions by the Exchange Control) remains very wide by contrast with the conditions obtaining until a few months ago. Sterling in the hands of non-residents—that is of residents outside the sterling area—falls into four main categories according to the degree of freedom with which it is usable:—

1. *Transferable Accounts Group*.—Multilateralism within the group (provided that payments are made to and from transferable accounts, specifically declared as such, which the authorities concerned are able to supervise) plus the sterling area, and freedom to make payments to certain other countries (those in Group 4 below):

Argentina, Belgium (including Luxembourg, Belgian Congo and Ruanda Urundi), Brazil, Czechoslovakia, Egypt, Ethiopia, Finland, Holland (including the NEI and NWI), Iran, Italy (including Sicily, Sardinia, etc., San Marino and Vatican City), Norway, Portugal (including the Portuguese Empire), Spain (including Canary and Balearic Isles, Ceuta and Melilla, Spanish Morocco and the Spanish colonies), Anglo-Egyptian Sudan, Sweden, Uruguay.

2. *"Bilateral" Group*.—Principal countries with which no "transferable account" agreements have been reached or with which special negotiations are proceeding, as in the case of Canada. Payments are in these cases restricted to payees in the sterling area and in the individual country concerned; there is no transferability within the group.

Austria, Bulgaria, Canada and Newfoundland, China, Denmark (excluding Faroe Isles but including Greenland), France (and the French colonies and mandated territories, etc.), Greece, Hungary, Poland, Rumania, Switzerland and Liechtenstein, Turkey, Yugoslavia.

3. *US Dollar Area ("American Accounts" Group)*.—Sterling held by residents of this area remains convertible into dollars; it can be used freely anywhere within the group and also for payments to groups 1 and 4 (and, of course, to the sterling area).

USA, the Philippines and any territory under US Sovereignty, Bolivia, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Peru, Salvador and Venezuela.

4. *Residual Group*.—Free transferability within the group and in the sterling area.

Includes all countries other than those in the three principal categories, notably Russia, Liberia, Cyrenaica, and Afghanistan. (Excluding, however, Paraguay, sterling on whose "special" accounts is canalised bilaterally).

It will be seen from this classification that, outside the US dollar area, the only countries with which the principles of wartime bilateralism still formally obtain are those in Group 2 (and Paraguay). Sterling held on the accounts of residents of

any one of those countries is automatically available for payments only to residents in that country or in the sterling area. In practice, however, in all categories (and especially for payments to and from the more important trading nations in Group 2) much wider transferability than the automatic freedom defined above is permitted by administrative arrangements. With Canada (which, until August 20th, was within the transferable account group) special discussions are proceeding; but in several other important cases the principal obstacle to the conclusion of full transferability agreements has been that the countries concerned were not yet prepared to accept sterling unconditionally when offered for current payments by any of the countries operating the full system.

Unquestionably, there already exists in the sterling agreements a formal structure for far-flung currency multilateralism. It

could serve as the foundation for progress towards multilateralism in trade—the only kind of multilateralism of any real consequence, without which the formal currency structure will collapse. This structure, indeed, could be irreparably damaged almost overnight. A sustained refusal by even one or two of the main trading nations to adhere to their agreements to accept sterling would rapidly make it unacceptable to many others. It is heartening to find, therefore, that two of the countries which adopted a particularly cautious attitude after the dollar link was severed—Argentina and Sweden—have decided to work the agreements while longer-term plans are being worked out. Thus is a breathing-space afforded. All who would plan expansively must use it to devise convincing measures that multilateral convertibility can be backed by a flow of goods.

Export Policy Preview

A MONTH has passed since the Prime Minister raised the sights for the export drive from 140 per cent of the 1938 volume by next June, and to 160 per cent by the end of 1948. A fortnight ago, the Chancellor of the Exchequer announced the "temporary suspension" of convertibility of sterling into dollars. The opportunities—and the dangers—for British trade which may emerge now that the external crisis has reached a climactic are examined in the preceding article. What it involves in terms of the future structure of British industry has yet to be unfolded. The Prime Minister referred only in the most general words to sacrifices for employers and workers, and to directions to firms "to ensure that their capacity is used to produce, not those goods which yield the highest profit, but those which are needed in the interests of the national economy." Sir Stafford Cripps's promised elaboration next Friday of future British export policy, and its reactions on British industry, will be earnestly studied; it may well be one of the most momentous steps in economic direction which this Government has yet taken.

A hint of what may be in store is perhaps to be found in the proposals put to the motor industry by the Minister of Supply last week. They can be briefly summarised as follows: first, the size of the "essential" home demand for cars is to be estimated (a calculation which the withdrawal of the basic petrol ration might almost have been designed to simplify); thereafter, the allocation of raw materials to the industry would be "for export only." There is nothing essentially new in this policy; as the motor industry itself well knows, raw materials have long been allocated with strict regard to the volume of export trade which the industry has undertaken to provide from its total output. Within the last week, the industry has agreed to raise its export business to 75 per cent.

But Mr Wilmot then proceeded to make some far-reaching demands about the future organisation of the industry. He argued that, in order to secure maximum economy, there would have to be a much greater degree of standardisation, and a more rapid reduction in the number of models. This would involve "difficult technical considerations," and "the number of firms continuing to manufacture passenger cars must be limited to those firms whose cars are most readily saleable abroad." The representatives of the motor industry seem to have departed from the Ministerial presence in a rather crestfallen mood, and they have reserved their comments on the proposals.

Mr Wilmot's arguments may perhaps be taken as a broad indication of the Government's export intentions, over a much wider field than the motor industry. Within the limits of efficiency of the materials controls, supplies will be diverted to production for export and away from the home market. That is a right, and inevitable, extension of the austerity drive

—and it is a pity that it has not been more consistently applied before, particularly in the textile industries, where the brunt of the loss of production during the February and March shut-down fell, not on the home consumer, but on exports. This sort of planning is, of course, subject to particular limitations. For example, it is possible to control the export quotas of industries which use one or two primary raw materials, like cotton or wool; but it is less easy to control those which use a number of primary materials, or whose output depends upon the assembly of components or sub-contract work. And all recent experience shows that, owing to the continued drain on industry's stocks of materials and intermediate products, the working of the physical controls, even where it is efficient, is becoming increasingly insensitive and harsh.

But the outline of the Government's intentions for the future of the motor industry (for Mr Wilmot did not indicate that these were in any sense interim proposals for the duration of the crisis) goes far beyond these questions of efficient allocation of raw materials. They raise doubts, it seems, on the Government's part, about the ability of many sectors of British industry, even if the necessary materials are provided, to export at competitive prices. It is, of course, easy to make a case against the motor industry for lack of standardisation—though in response to criticism some firms have made useful progress in that direction. In order to get the optimum run of output of a single model (or at most a very limited number) in one factory, the wartime principle of concentration is to be applied. British standardised styles are to invade the world market at lower prices.

If this is the line of the Government's argument, not only for cars but for other export industries too, it will require very close examination indeed. So far as the car industry is concerned, it seems *prima facie* to be reasonable, though it is impossible to be certain until far more facts about the industry are brought into the arena of public discussion. Unlike Sir Stafford Cripps, Mr Wilmot has kept the findings of his private working parties in a top secret file, and the early publication of the report of the Joint Committee which examined the motor industry some time ago is now essential in order to judge how far Mr Wilmot's *prima facie* case is fully supported by the facts. What is the potential export market for British cars? How long will it be sustained? What economies are to be expected from concentrated production? Will average British export prices be lower than American? Some supporters of the policy have made no secret of their belief that the motor industry is a luxury industry, and that its scale should be reduced permanently to cover minimum home needs plus maximum exports. Is this in the Government's mind, too?

Clearly, if the methods suggested for the motor industry by Mr Wilmot are also to be applied by Sir Stafford Cripps in the industries for which the Board of Trade is accountable, the Government will claim a wide and detailed control over many sectors of British industry. If this is evidence of a newly-discovered industrial policy, it will be welcome indeed. But have the Government really discovered the expert manpower which will be required to make the necessary structural changes in industry, and to decide in which industries it would pay to concentrate output in order to sell abroad at lower cost? Most of the Working Party reports have given some indication of future export possibilities, within the limits of available manpower and within the limits, also, of the efficiency of existing plant. But they have not usually examined what might happen to production costs if the labour forces of the undermanned industries were restored—as it is hoped to restore them under the policy of direction of labour. To take only one example, a good deal of the capacity in the cotton industry which is now idle for want of labour is not greatly suited to long runs and standardised production. And, while it may be hoped, it has yet to be proved that overseas markets will readily absorb great quantities of standardised British manufactures, even if it is possible considerably to reduce their costs by a policy of permanent peacetime concentration.

These are some of the points on which industry will closely examine the proposals to be submitted by Sir Stafford Cripps next week. It will also learn the Government's plans for each industry's exports, which, according to last week's announcement, are now being revised in order to "secure" (a confident word indeed) the new export targets for next year. The recent course of the volume of exports (which was examined in detail in *The Economist* of August 9th) is in many respects disturbing. And, at the risk of reading too much into the available figures, it hardly seems that the expansion of the labour force on export business since the end of the war has so far justified itself in a corresponding increase in the volume of goods actually exported. Between the middle of 1939 and last May, the number of persons engaged in manufacture for export is shown

by the Ministry of Labour to have increased by 50 per cent. This figure is almost certainly inflated, but even so, it does not compare very favourably with the estimate that the volume of British exports of manufactures in the second quarter of this year was only 16 per cent higher than in 1938.

It may be objected that the delayed reactions of the fuel crisis affected exports during the second quarter of this year, and that in many cases production for export is completed only after many months of work on the intermediate stages of manufacture. That is true, for example, of most heavy engineering output. But, granted the very rough basis of comparability between the figures, the following comparison of the expansion of manpower in typical export industries since the end of the war and the resulting volume of exports is instructive:—

Increase in Manpower on Export Orders June 1945—May, 1947	%	Increase in Volume of Exports 2nd qtr. 1947 compared with 2nd qtr. 1945	%
All manufacturing industry	265		163
Metal goods, engineering, vehicles aircraft and ships	422	- Iron & steel manufactures - Non-ferrous manufactures - Cutlery, hardware, etc. - Electrical goods - Machinery - Vehicles, ships, etc.	361 131 166 139 222 610
Chemicals, paint, etc.	152	- Chemicals, drugs, etc. - Oils, fats & resin	31 135
Textile industries	95	- Cotton yarns, etc. - Woollen manufactures - Silk and rayon - Other textiles	14 69 3 255
Clothing	289		128
Building materials, pottery & glass ..	142	Pottery, glass abrasives	121
Leather, wood & paper	227	- Footwear - Leather manufactures - Paper & cardboard - Wood manufactures	238 177 252 261

Before profound, and perhaps irreversible, changes in the structure of British industry are undertaken with the intention of boosting selected export trades, it would be well to examine some of the disparities in this table. It suggests, though it may not prove, that productivity per head in several export trades has not increased commensurately with manpower. Is this a deficiency on the side of labour, or plant, or management? In many instances, the reason is shortage of coal and raw materials, which has resulted in concealed under-employment of the labour forces which, statistically at least, are supposed to be busy on production for export. If the new export plan is to work satisfactorily, some means must be found of making the priorities for export materials work far more efficiently and smoothly than they have yet done. And it is doubtful, granted the all-pervasive forces of inflation which are now at large in the country, whether the controls—which are expensive in manpower in any case—can succeed unless home demand is ruthlessly cut down.

In planning for an increase in the volume of exports by the end of next year to 160 per cent of the 1938 volume, the Government is putting industry into an economic forcing-house. The target itself appears to be one which the Government would have been well satisfied to attain by, say, 1951 instead of 1948. To attempt to reach it by controls and compulsions invites great risk of further industrial dislocation, for obviously production programmes cannot be changed overnight. The willingness of overseas countries to accept British exports may conceivably gain something from the suspension of convertibility; but it is too early to judge whether this will in fact be the outcome, or whether international trade as a whole may not fall in the next year or two—in which case the success of the export drive will be determined by British export costs. Nothing that has been said here should in any way be taken to diminish the urgent need for the maximum export of which British industry is capable, and which importers are ready to absorb. But it may, perhaps, illustrate some of the difficulties which confront Governmental planning to produce that desirable result.

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

Business Notes

De Profundis

On Wednesday the *Financial Times* industrial ordinary share index fell further to 104.2; a week earlier it stood at 112.6; and the highest point it touched in the carefree January boom was 140.6. During the past week the fall has been unremitting and indiscriminating. There have been ugly suggestions of selling "forced by the banks," and though little factual evidence has been put forward to substantiate this idea, an element of distress has been evident in some of the liquidation. Otherwise, how would it be possible to explain the relentless pressure to sell even at the cost of wholly disproportionate falls in prices? There has been no evidence of a *saute qui peut* flight from equities. The majority of investors, rightly or wrongly, have stayed invested, and institutional investors (if market report is reliable) have scarcely sold a share.

The answer, presumably, is to be found in the combination of a further dose of realism about Britain's economic plight—underlined this week by the spreading Yorkshire coal stoppage—and the desperately narrow character of present-day markets. The technical limitations on dealing which produced precipitate advances during the boom are now doing the reverse during the slump. That is not to say that the general level of equity prices has necessarily fallen too far—indeed, there are good arguments for the opposite view. But it does mean that the absorptive function of the market is now so restricted that falls, when they occur, take place far more quickly and consequently less discriminately than was the case when London could look with some pride at the Stock Exchange as the example of the perfect market. It is so no longer.

In the end, however, fundamental factors must prevail over such technical considerations. If the slide in the equity markets during the past fortnight had been merely a technical affair, some partial recovery, in particular share groups at least, might have been expected by now. Instead, even after the new Account opened on Wednesday, the majority opinion clearly held to its view that the economic future was so dark, that until the market as a whole had shown some capacity for rallying from the worst, it was too early to look for groups, or even shares, in which the fall had been overdone. To this there were a few exceptions—like Woolworth, which fell as much as 4s. on Tuesday to 73s., but recovered

to 75s. with the opening of the new Account—but its broad truth is confirmed by the general behaviour of the market. All attempt to rationalise the market's behaviour in terms of prospective inflation have been abandoned, for if a major industrial crisis is developing here and now, and not waiting for the winter (as even the realists a week ago were disposed to believe) there is no virtue in nice calculations.

The accompanying table of the price movements of the constituent shares in the *Financial Times* index borrows and extends to the current week a useful table compiled by an established firm of brokers. It points no morals, though it provides some illuminating comparisons between the relative falls of different shares from their peaks and the wide variations in the relationship of present prices to the 1940 "lows." The index as a whole shows a yield of 5½ per cent. Out of the 30 shares listed, two still yield less than 4 per cent, 12 between 4 and 5 per cent, 10 between 5 and 6 per cent and 6 (including one or two exceptional "high yielders") more than 6 per cent. On paper, a satisfactory relationship between a 3 per cent gilt-edged yield datum and equity yields has now been established. But will it survive the threatening industrial prospect and the possibility of a realistic autumn Budget?

* * *

The Bank and Fund Meetings

It is generally assumed that the importance of the second annual meetings of the International Monetary Fund and the International Bank, for which officials from Washington and representatives of member countries are now flocking, will lie principally in the opportunities afforded to Treasury and central bank experts of many countries for informal discussions outside the conference chamber. No doubt this is so; from this wider standpoint, the occasion could scarcely be more opportune. But the meetings will certainly be fateful for the future of the Bretton Woods twins. Until a few weeks ago, despite the gathering crisis and the rising stringency of world dollar famine, the projected agenda for the Fund meeting apparently ignored all the major problems. An informed article from Washington which appears in the current issue of *The Banker* suggests, indeed, that it then included nothing more than formalities strictly consequential upon the terms of the Fund agreement.

Mr Dalton was evidently trying to breathe some realism into this programme when, in the debate in Parliament last month, he announced that he would raise at this week's meetings "the question of whether we should not extend and modify, as far as the constitution permits, the purposes for which the Fund may be used." It is uncertain, even now, whether this proposal has reached the agenda; but Washington guesses of what Mr Dalton has in mind—they include suspension of the present limit on the proportion of a country's quota which can be drawn from the Fund in any one year, and a reduction in interest charges on drawings—seem to have aroused noisy protests there. Mr Dalton himself admitted that the original purpose of the Fund was "to iron out purely temporary fluctuations in the balance of payments," and Washington authorities seem determined to adhere closely to this principle. If they succeed, it would mean that the Fund is powerless to assist Britain or the needy countries of Europe in the extremities of their balance of payments crisis. It is generally contended that, if either of the Bretton Woods institutions is to be an important vehicle of aid in present circumstances, that aid must come through the International Bank. But all experience to date shows that the Bank has still not thrown off the effects of the overdose of Wall Street financial orthodoxy which it experienced some months ago. And although it was recently stated that "close consideration" would be given to any application by Britain for a loan to finance industrial reconstruction, the impression conveyed was that finance would be available only for very specific projects, the merits of which would be judged, it seems, by traditional banking principles.

If the prospect of more positive and constructive action than this—on the part of both institutions—does not emerge from this week's meetings and the surrounding discussions, most people will feel that the Bank has decisively failed in its mission and that the IMF, whatever its eventual role, will virtually have to go on a care-and-maintenance basis for an indefinite period. It may be true that the Fund was designed as a fair-weather mechanism, and its machinery may even be well designed for that purpose.

With over 60 Branches at the leading centres of Industry and Commerce, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business in India or intending to open connections in that country.

B. T. THAKUR, General Manager.

But what about Imports?

There is an urgent necessity to re-establish our export trade, and the private Banking House of Glyn, Mills & Co. offer their financial services to undertakings extending their export business. But as the economic situation improves, so should the natural balance be restored, and the national import trade grow once more. Business houses anxious to develop their import trade will find invaluable this private bank's international contacts and intimate knowledge of foreign conditions.

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA • CEYLON • BURMA • SINGAPORE
MALAYAN UNION • BRITISH NORTH BORNEO
SARAWAK • CHINA • HONG KONG
THE PHILIPPINE REPUBLIC
FRENCH INDO-CHINA • SIAM • INDONESIA

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

But if it cannot play any useful part in helping to solve this, the greatest exchange crisis which has ever confronted the world, its prestige and authority are bound to be so far undermined that it would be questionable whether it could ever be resuscitated for useful work when calmer weather eventually returns.

How Did the Money Go?

It is undeniable, even in the absence of statistical proof, that the convertibility crisis and its antecedents produced a large exodus of funds from London. How did the money go, and what effects has its movement had upon the banking system and the structure of Governmental finance? Was the overseas sterling, which has since been turned into dollars, simply held on deposit at the banks? Or was it in gilt-edged securities or in tap or tender bills which had to be liquidated as the first step towards obtaining dollars? If so, were the securities mainly sold through the market and the banking system, or were they taken over in blocks by the authorities themselves? All these are questions which ought to be answerable, at least in general terms, if investors and students of Government finance are to obtain a reasonably accurate picture of what has been happening. Yet, despite the figures given by the Chancellor in the debates of July and August, and despite the apparent wealth of statistical material in the National Income White Paper and the regular financial series, none of these questions can be answered with precision and hardly any of them even in general terms—a circumstance which underlines once again how the deliberate withholding of information by the authorities makes a mockery of the many figures which are given.

An attempt to penetrate the fog is nevertheless worthwhile. The starting point for enquiry is the floating debt, both because this is the form in which most of the overseas balances have been held and because it is to reduce this debt that any net sterling receipts from sales of dollars are applied. The portions held in deposits with commercial banks or in gilt-edged securities have always been relatively small, though it should be noted that in recent weeks these portions—and especially the deposits—may well have been the most volatile. The sale of dollars for sterling previous held in "tap" or "tender" Treasury bills will not, of course, result in any reduction in the "active" floating debt—the portion financed through the banking system, and comprising tender bills allotted through the discount market and Treasury deposit receipts—because the Exchequer will have itself to furnish the cash which the dollar purchasers pay to it. Nor will such operations necessarily produce a reduction even in the internal portions of the debt, for the bills surrendered by overseas holders may be retained by the "departments" instead of being cancelled. In such a case, an exchange of tap bills for dollars would have no effects visible to the outside scrutineer. Where, however, the foreigner held tender bills, the most probable result, given the policy of roughly stabilising the total tender issue, is a complicated switch within the active portions of the debt—a reduction in bank holdings of TDR's offset by an increase in their call money, bills or even bonds. In this context it should be noted that overseas dollar purchases financed by drafts on deposits or sales of gilt-edged to the public do produce effective debt reduction: the Treasury receives cash which it uses to redeem TDR's (and the clearing banks experience either a loss of deposits or an increase in their other assets). On balance, however, it seems probable that the main impact of overseas demands for dollars has fallen upon the "internal" portions of the debt.

Floating Debt Analysed

Unfortunately, analysis of the movements on these principles is made virtually impossible by reason of the huge internal Exchequer adjustments during the period in question. At March 31st last the total floating debt stood at the record level of £6,955 million; now, at end-August, it stands at only £6,286 million—a drop of no less than £669 million in five months. By far the greater part of this decline has occurred in the "internal" debt, as above defined. The end-March total cannot be precisely broken down into its components, but if the figure for April 5th (£6,944 million) be taken for the purposes of analysis, it will be found that a decline of £588 million in total floating debt between then and August 9th (when outstanding tap bills reached their lowest point, at approximately their present level) was distributed as follows:

CHANGES IN FLOATING DEBT (April 5—August 9, 1947)			
	April 5	August 9	
<i>"Internal" Debt:</i>			
Dept. Ways and Means	593	348	- 245
B. of E. Ways and Means	19	4	- 15
Tap Bills	2,704	2,424	- 280
Non-Market Tender Bills*	1,129	1,201	+ 72
			- 468
Market Tender Bills†	1,056	979	- 77
Treasury Deposit Receipts	1,444	1,401	- 43
			- 120
Total Floating Debt	6,944	6,356	- 588

* Estimated aggregate of bills then outstanding which were allocated in the first instance to quarters other than the discount market.
† Estimated aggregate of outstanding bills allotted initially to the discount market.

These figures show that there has indeed been a substantial switch from internal to active floating debt, since the decline in the former has been very much greater than in the latter.

Buying Overseas Bill Holdings?

These figures afford no direct clue to the movement of foreign money because a dominant influence has certainly been the spurious character of Mr Dalton's much-vaunted surplus. In the period to end-June alone there was an "above-line" surplus of no less than £220 million ostensibly available for debt reduction; but in fact some £190 million of this represented only nominal revenue, so that most of the consequential debt reduction must have occurred in the internal items—tap bills or ways and means advances. On the other hand, it is now known that in these three months the Treasury received no less than £238 million from actual sales of borrowed dollars and, even after allowing for "below-the-line" outgoings, therefore ostensibly had nearly £200 million available for redemption of the active portions of the debt. In fact, the outstanding total of tender bills and TDRs was reduced in this period by a mere £5,000,000.

The disparity between the funds apparently available for debt redemption and the amount by which the active debt was in fact reduced is but another facet of the disparity between the Exchequer and the banking figures to which attention has frequently been called in these columns. Taking items both "above" and "below-the-line," the Exchequer figures adjusted for nominal revenue suggest that in the second quarter of 1947 about £215 million was available for repayment of Treasury borrowings from the banking system; yet in fact only about some £60 million of such borrowings was repaid (net bank deposits rose during the three months by £64 million, but £97 million was required to finance additional advances and a further £24 million to absorb investments which may be presumed to have been sold to the banks by the public).

Once again, it is clear that the authorities have required finance for undisclosed purposes. Evidently, the money cannot have been needed for the acquisition of gold, for the Chancellor's recent statement suggests that the net gold holding showed little change in the first half of this year (the gross holding appears to have declined by approximately the amount of the UK subscription to the IMF). Equally, there is no reason to suppose that on balance any substantial sum was employed in giving direct support to the gilt-edged market. In the circumstances, since large-scale movements of overseas funds were known to be taking place, it is tempting to assume that at least a significant portion of the Treasury's "excess" borrowings was required for the purpose of turning foreign-owned securities into cash. Governmental direct purchases of blocks of short bonds from, say, one of the overseas currency boards, or of Treasury bills (whether tap or tender) from other overseas authorities would certainly be consistent with the facts so far as they are known, and would resolve some of the more intractable puzzles in the figures quoted above.

Loss of Deposits?

The publication this week of the clearing banks' figures for the August make-up (August 20th) makes it possible to carry the analysis forward through the critical period which included the formal restoration of convertibility and ended with its suspension a fortnight ago. In two respects, this latest period—the seven weeks since end-June—presents instructive contrasts with the preceding three months. For the first time for many months an attempt to reconcile the banking trends with those shown in the Exchequer returns does not reveal any wide disparity. In recent weeks, it seems, the resources ostensibly available to the Treasury

for debt redemption have not been substantially diverted to undisclosed uses. Paradoxically, this change has happened at a time when the large nominal surplus "above-the-line" has turned into a nominal as well as actual "above-line" deficit.

In the period July 1st to August 23rd (the nearest date both to the latest banking figures and to the suspension of convertibility) there was an ordinary deficit of £35 million after bringing in £54 million of revenue which may be presumed to have been only nominal, giving a true "above-line" deficit of £89 million. "Below-the-line" there was a further deficit of no less than £100 million, principally in consequence of war damage payments. The actual dollar spendings have been officially disclosed for all but a week of this period; assuming £20 million for that week, the total for the seven weeks would be £220 million. On balance, therefore, the Treasury should ostensibly have had a surplus of £31 million available for repayment of "active" floating debt—if the dollars were wholly sold for cash. Over the same period net bank deposits declined by £24 million, but the public apparently required £40 million of additional bank finance (advances rose by £27 million and gilt-edged portfolios by £13 million). In other words, but for these demands by the public, bank deposits would have fallen by £16 million—a figure which, given the difference of three days in the periods covered by the Exchequer and banking returns respectively, aligns quite closely with the £31 million ostensibly available.

At the same time, the banks' TDR holdings (which actually rose in the three months to end-June) have at last begun to fall substantially—by £82 million in the two months. Significantly, too, the outstanding total of tender bills originally allotted to the discount market (which fell by approximately £100 million in the earlier period) has since risen by £70 million—partly, however, in consequence of the special credit-smoothing operations at the abnormal tender of August 15th.

In view of this contrast, the conclusion which emerges from the whole analysis is, first, that in the earlier period, the overseas demand for dollars must have come principally from balances formerly held in bills or bonds, and that the credit repercussions of these movements were both concealed and neutralised by the actions of the authorities. In the final period, however, the effects became discernible; this suggests, perhaps not a change in official policy, but that in this phase the balances converted were already

held in the most liquid forms—in deposits with the clearing banks outside banks or in maturing tender bills.

Mexican Eagle Compensation

Out of the blue of Mexico City on Monday came messages that a settlement had at length been reached between the Mexican Government and the Mexican Eagle Oil Company regarding the company's properties which were expropriated in 1938. So many false hopes have been dashed in this case that the market was justified in waiting for official confirmation, which duly followed that evening. As a result, the ordinary shares which, almost alone in the whole Stock Exchange list, advanced from 14s. 4½d. to 17s. 6d. on Monday, became an extremely active market in early dealings on Tuesday, but the opening dealing range of 20s.-22s. 6d. was not proof against extensive profit-taking, and the shares now stand at 18s. 3d.

The official statement records that, after providing for claims between the Mexican Government and the company, and for private claims against the latter, the Mexican Government will pay \$US81½ million, plus 3 per cent interest from March 18, 1938, to September 18, 1948. Payment will be made in fifteen annual instalments of \$US8,689,257.85 on September 18th in each year beginning with 1948 and ending in 1962. These annuities include interest on the outstanding balances during the period of repayment.

This settlement has been warmly welcomed both by the Government and by the City. It has been produced after discreet negotiations of a very different sort from those which were contemplated in the excessively formal procedures laid down in the exchange of Notes between the two Governments in February, 1946. Those negotiations broke down at an early stage in expert disagreement. The final agreement, between the Mexican Government and the company, does not, apparently, restrict the payment of compensation to British and Dutch subjects, as was proposed in 1946. It is difficult to make any accurate estimate of the eventual value of the compensation per share. And since payment does not start until a year hence and is spread over 15 years, the market's reflection this week that the present worth

SINGER MOTORS

SINGER MOTORS LIMITED · BIRMINGHAM AND COVENTRY

The Singer Super-Twelve, a full five-seater with generous luggage room, is now in production. In comfort and finish, performance and workmanship, this is a car above and ahead of today's accepted standards.

A superb shaving instrument
made specially for
men of discriminating taste

Now, for the first time, a razor blade has been produced specially for men who are accustomed to the finest that money can buy. It is a precision instrument—the most superb double-edged razor blade in the world... Its name is Personna, the precision blade.

Like a barber's razor, the new Personna precision blade is hollow ground. This gives a remarkably keen edge, so flexible that it follows the curves of the face with astonishing ease. Each blade passes 17 rigid inspections

before it leaves the factory. Each blade is specially wrapped for perfection.

The Personna precision blade will give you a master barber's shave with your own razor. Available at all high-class barbers, chemists, and stores. Price five shillings for a box of ten blades.

PERSONNA
PRECISION BLADES
Fine as a rare jewel

per share of the compensation instalments is to a large extent conjectural, is probably wise. If the total receipt per share amounted to 30s.—some estimates put it higher—the increment over the present price of 18s. 3d. would represent a gross return (without entering into any subtleties about accumulating interest) of about 8 per cent per annum. Whether this is a fair measure of the risks which now attach to Mexican credit remains to be proved; it would be a somewhat flattering measure of what has happened in the past. Perhaps some closer estimate will be possible when the full terms of the settlement are received in London.

* * *

Dis-saving Continues

The more reluctant Mr Dalton is to resort to an autumn budget to bring financial pressures to bear in the reshaping of Britain's overstrained economy—and Mr Bevin's speech this week suggests that he shares this reluctance—the more imperative it becomes to re-vitalise the drive for voluntary savings. The savings campaign is not, of course, any substitute for budgetary action, for it could never succeed in reversing the inflationary process. At best, it could do no more than put a brake upon the accentuated inflation which threatens to result from the enforced reduction in the supply of consumable goods—or, in monetary terms, from loss of the budgetary relief which has been afforded by external borrowings. On the test of recent experience, even that is a slender hope. Although the main holiday season is over, the latest weekly figures reveal another net disbursement by the authorities to meet small savers' encashments of past savings. In the week ended August 23 (for which figures are reported during the following week) gross receipts totalled £15,258,000, whereas repayments required £15,403,000—excluding £585,000 paid out in interest on encashed savings certificates.

The target of £1,000,000 per day—£366 million in this fiscal leap year—was presumably chosen because it was a nice round figure, which is indubitably necessary. But there never was any reason to suppose that it could be attained without a quite miraculous revolution in the technique of propaganda, for it represents an increase of some £30 million on the figures actually achieved in 1946-47, when "savings" were largely and artificially boosted by Mr Dalton's ill-omened "last chance" tactics—and by

attracting subscriptions from "large" savers by offering them what was, in effect, an increased rate of interest. This same device—which certainly cannot be used again—explains the ostensibly good start to the current savings year. In the first seven weeks, net savings totalled £57.3 million. Now, fourteen weeks later, the year's cumulative total is £4,000,000 less than that, and is almost back to the level of mid-May. It is true that these fourteen weeks embrace the whole holiday season, in which the pressure of encashments is at its maximum. But in no week since early June have this year's encashments been less than in the corresponding week of 1946, and in the similar fourteen weeks of 1946 nearly £45 million was added to the cumulative total of net savings.

The cumulative position now, indeed, is worse than it was in May, for in the meantime the authorities have been paying out interest on encashed certificates—this interest is not included in the repayment figures—at the rate of between £400,000 and £600,000 per week. In addition, accrued interest on certificates retained mounts up at the rate of about £2,750,000 per week. Finally, it must be noted that in this financial year, in addition to the encashments of bonds before maturity, £37.9 million of 3 per cent bonds have been repaid at maturity. Some at least of this money (not to mention the large payments now being made on war-damaged chattels) must surely have been reinvested. To this extent, the figures of gross "new" savings are even worse than the published statistics imply.

In short, if these efforts are the brakes on inflation, it is all too plain that they desperately need re-lining. Will the "silver lining" campaign do the trick, in this setting of strikes and public gloom? The time is fast approaching when the only kind of propaganda which stands any chance of success is that of the mailed fist—a threat of blocking of bank deposits and restriction of encashment facilities unless the spending orgy is slowed down. But if such measures could be contemplated even as a threat, the "tough" budgetary policy which is the only proper course would presumably be equally acceptable to this timid Government.

* * *

The Rise in Petrol Prices

The latest rise in the price of petrol, which since last Monday retails at 2s. 1½d. a gallon, has attracted surprisingly little com-

ment—presumably because the private motorist is much more concerned about the prospective abolition of the basic petrol ration, and the business motorist, being enured to continually rising prices of almost everything he handles, reckons that another penny on the gallon is of little or no account. Nevertheless, it is difficult to see why the announcement of the increase should not have included some more particular justification than the usual reference to increased costs of materials.

With those commodities which enjoy an international market and sell at a price determined by world supply and demand—and petroleum is one of them—the home price must follow the world trend if profits are to be kept stable. Equally, however, the home price should not anticipate the world price, unless it is the declared policy of the Government to allow increased profits to be made at the expense of petroleum consumers. Since the war there has been a world shortage of petroleum products, and the unsaturated demand is naturally forcing prices upwards. The cif value of imported motor spirit increased from £30.3 per thousand gallons in May, when domestic prices were last raised, to £31.6 per thousand gallons in July—an increase of 4 per cent, which almost entirely reflects an increase in the world price. Thus the new rise of a penny a gallon, which also represents a 4 per cent increase, appears reasonable.

In most price changes the relevant factors are complex, and that is particularly true of oil prices. There is no ground for supposing that the latest increase is unreasonable. But it could have been appropriately explained in greater detail. The Ministry of Fuel and Power has insisted on a Consumers' Council, which is to operate when the oil companies regain their separate identities next year. Is there any less reason why the consumers' interest should be ignored during the closing months of the Petroleum Board's operations?

* * *

Banks Keep their Gilt

For a month which embraced both the formal restoration and ending of convertibility and two severe cracks in the gilt-edged market, the latest clearing bank figures reveal, at first glance, surprisingly unspectacular changes. The wider credit repercussions of the dollar drain are fully analysed in earlier Business Notes this week, but it deserves to be noted that there is little sign that in the five weeks from July 16th withdrawals of foreign deposits came from accounts with the clearing banks. In this period, net clearing bank deposits actually rose by £25 million—to which movement a further expansion of investments and advances contributed £21 million. On the assumption that this expansion was not indirectly associated with the liquidation of overseas balances, it is in the movement of the banks' Treasury deposit receipts and money market assets that this liquidation would be mainly reflected. The inverse movement between these two items—bills and call money are up by £37 million and TDRs are down by £35 million—suggests that in this period balances formerly held with outside banks or in maturing bills were the principal source of the strain. In the previous banking period, the first half of July, the repayment of TDRs exceeded the expansion in money market assets by £28 million—a difference which suggests that in this phase there may have been overseas withdrawals from clearing banks themselves.

As for the other major financial event of the month, the break in gilt-edged, it is clear that the activities of the banks cannot on balance have contributed to the pressure. The total gilt-edged portfolio has risen by another £4 million to the new high level of £1,492 million. Although this increase is much smaller than that shown in any month since January, it is noteworthy that it reflects a highly consistent policy among the several banks. Only one of the eleven banks has reduced its portfolio during the month—one of the smaller institutions shows a decline of £700,000. The largest individual change was an increase of £2.1 million by Lloyds; the National Provincial portfolio, which had been substantially reduced in the second quarter of this year, has risen by £1.5 million. The movement of bank advances affords no reflection of the probably exaggerated rumours that the fall in stock markets has led to an insistent pressure for increased margins on accounts secured by Stock Exchange collateral. Total advances have risen by £17.0 million, despite a decline of fully £12 million in the advances of the National Provincial Bank (which are liable to rather erratic movements in consequence of the importance of tobacco financing in this case). The hesitant tendency of advances in the previous month was evidently purely ephemeral.

Higher Rayon Prices and Output

Last Monday the price of rayon yarn was increased by 4d. a lb. for all types except for one or two qualities and deniers of viscose and acetate yarns. Viscose staple fibre was increased by 2½d. for all qualities. This rise reflects the recent increases of raw material prices, particularly of wood pulp, and the increased costs of operation which, in the present inflationary situation, are common to all manufacturers. The price rise has been the first since October, 1941, when continuous filament weft was sold at 55d. a lb. In April, 1945, it was reduced to 52½d. a lb. and again in May of this year to 46½d. a lb. when the 6d. Excise Duty was removed. The latest increase raises the price to 50½d. a lb., so that two-thirds of the benefit of the lifting of the Excise Duty has been lost to the consumer. The price of staple fibre will now be 18d. a lb.

These price increases are unlikely to have any damaging effect on the demand for rayon, which for some time has been more than capable of absorbing all supplies. In any case, staple fibre remains considerably cheaper than the other textile fibres and even the differential price spread between continuous filament and cotton or wool is still lower than it was before the war.

Simultaneously with the increase in prices, it was announced that output of rayon and nylon in July was the highest ever recorded in the United Kingdom; the total was 18.2 million lb. compared with 16.8 million lb. in June and 17.6 million lb. in January. The production of rayon yarn increased by 5 per cent during the month to 10½ million lb. and staple fibre by 13 per cent to 7,700,000 lb. The steady recovery since the February fuel crisis has thus been more than maintained; indeed the output has now surpassed the pre-crisis level. The quantity of staple fibre produced continues to account for a larger share of the total; in 1939 it represented 33 per cent of rayon output, in 1946 39 per cent, in January, 1947, 41 per cent and in July 42 per cent.

DELIVERIES OF RAYON YARN
('000 lbs.)

	Jan.-Mar. 1947	Apr.-June 1947
Weaving	10,776	13,615
Hosiery	3,241	3,030
Warp knitting	2,381	2,839
Narrow fabrics	874	874
Lace	428	363
Hand knitting	299	315
Industrial purposes (tyres, etc.)	3,969	4,518
Miscellaneous	416	444
Exports as yarn	2,960	3,288
TOTAL	25,344	29,286

An analysis of the delivery of rayon yarn (including strong yarn, but excluding nylon) to the principal users during the first two quarters of 1947 is shown in the accompanying table. Weaving, warp knitting, industrial purposes and exports, which represent four of the five major outlets, showed an expansion during the second quarter as compared with the first. On the other hand, hosiery, the other important consumer, took less yarn in the second three months.

* * *

Trust Metamorphosis

Another instance of a complete change in the activities of a long-established investment trust has come to light this week with the publication of a statement for information relating to the Northumbrian and Crayford Trust, Limited. This undertaking is the successor to the North Queensland Mortgage and Investment Company, Limited, which was incorporated as long ago as 1886 to carry out a mortgage and investment business. In July, Close Brothers, Limited, acquired almost the entire share capital in the company, a new board was appointed, the company's name was changed, the bulk of its old assets liquidated and new interests acquired in four greyhound racing and breeding concerns.

It is a long journey from loan and mortgage business to open up the new sheeplands of Queensland in the 'eighties to the tote and electric hare at Gosport and Bexley Heath. But there is, of course, nothing particularly novel about the technical procedure by which it has been accomplished. The recipe is quite simple. No new capital may be raised nowadays for the purposes of a financial trust. Hence it is open to those who wish to undertake new business of this sort to sidestep the barrier which the Capital Issues Committee has set up if they can find an existing trust (preferably a not too going concern) with wide investment powers

under its articles and a portfolio of securities which can be realised without great difficulty to provide finance for the new business which the purchasers have in mind. A recent instance of this kind was the purchase of the Aurochs Investment Trust by the Whitehead Industrial Trust, and another, of a rather different order, was the acquisition by Hambros Bank of the Conversion Investment Trust a year ago.

The latest metamorphosis illustrates the limitations to the legal doctrine that the objects of a company can be effectively circumscribed by its articles of association. Objects clauses have always been drawn sufficiently widely to cover almost any activity or contingency. There was, indeed, a prewar case in which a company which originally set out to make jam later proposed to make gramophone records. Where such wide scope exists for a change in the basic character of a company's operations it is difficult to see what force still resides in the legal doctrine that a company's acts must be *intra vires*. The latest case is interesting for one particular feature—namely, that the new shareholders have undertaken to purchase at par any of the 4 per cent debenture stock from holders who do not desire to retain their investment owing to the change in the character of the company's holdings.

Sharp Rise in Import Prices

There was a sharp rise in the prices of imports in July, which was reflected in a further advance of 3 per cent in the Board of Trade index during the month. The average cost of raw materials was 4 per cent dearer, manufactured goods 3 per cent, and food, drink and tobacco 2½ per cent. Thus the rising trend of import

IMPORT AND EXPORT PRICES INDEX NUMBERS
1938=100

	April	May	June	July
Imports:—				
Food, drink & tobacco	229	232	236	242
Raw materials	254	271	282	282
Manufactures	223	232	237	244
TOTAL	234	241	245	253
Exports:—				
Food, drink & tobacco	216	217	219	220
Raw materials	218	222	227	232
Manufactures	221	226	227	230
Metal goods	200	204	207	208
Textiles	297	301	301	310
Other manufactures	214	218	220	221
TOTAL	221	225	227	230

prices continues on its apparently unshakeable course, and the rate of increase has itself begun to rise.

The rise in export prices amounted to only 1 per cent, which was reflected almost entirely by the increase in the average export

value of manufactured articles. Export prices for textiles, which had remained stationary during June, increased by 3 per cent, but there was virtually no change in the price indices for metal goods, other manufactures or food, drink and tobacco. For the third month in succession the average export price of raw materials has risen by 2 per cent, but in view of Britain's present inability to export coal the benefit of this increase to the balance of trade is microscopic. Had raw materials played the same part in Britain's postwar export pattern as they did in prewar years, they would now be playing an important part in redressing the adverse balance of payments. The accompanying table shows the monthly index numbers of import and export prices compiled by the Board of Trade for July, with comparative figures for the three preceding months.

Reduced Synthetic Rubber Consumption

A definite tendency has been evident during the first five months of this year for world consumption of synthetic rubber to fall. In January consumption totalled 67,500 tons, but by May it had fallen to 55,000 tons. Production, however, fell more sharply, with the result that stocks of synthetic rubber were reduced to about 125,000 tons at the end of June compared with 140,000 tons at the end of 1946. The synthetic rubber position is, of course, completely dominated by the United States, and there the downward trend in synthetic consumption has been proceeding fairly steadily during the first half of this year. In June, United States' consumption was estimated at 42,358 tons compared with 48,663 tons in May and 62,899 tons in June, 1946, and the total for the first half of the year amounted to 312,953 tons against 409,493 tons in the first six months of 1946.

This situation looks superficially satisfactory, particularly when it is set against the comparable figures for natural rubber consumption in the United States. In the first half of 1947 American industry used 258,872 tons of natural rubber compared with 84,525 tons in the corresponding period last year—an impressive threefold increase. But in each of the six months beginning with last January consumption has remained fairly steady at about 43,000 tons a month. Thus, the decline in American synthetic consumption has not been made good by any corresponding increase in natural rubber consumption. Nor, indeed, can it be increased until action is taken towards a further modifying of the notorious R.L. instruction (which determines the proportion of synthetic rubber to be used by the manufacturers) in favour of the natural product or by annulling it altogether; it still seems unlikely that any action will be taken in this direction before Congress meets at the beginning of next year.

World natural rubber consumption has expanded during the first half of the current year, but output has increased still further, causing a net increase in world stocks which at the end of May were reported as 907,500 tons as against 895,000 tons at the end of

1946. The rate at which stocks are accumulating is, however, declining as the trend in output since last March has been downwards. Malaya is now faced with yet another obstacle to production, for the Government of the Dominion of India has announced its intention to continue the embargo on the emigration of Indian

labour unless wages are brought into line with those paid to Chinese labourers. Chinese rates are double the Indian rates, but Chinese labour has a higher productivity. Under existing conditions it would not be financially possible for the rubber industry to accede to the Indian Government's conditions. In any case a surplus of labour is expected on the estates shortly, unless there is an impressive expansion in the demand for rubber. Following the recent fall in prices, a number of plantations had to close down. In addition Malaya is confronted with a replanting problem. In December last 70 per cent of the rubber trees were over 21 years old and only 12.7 per cent of the total acreage has been planted with high yielding stock. A rubber tree is generally expected to reach its optimum yield at between 13 and 17 years of age. There is at present an urgent need to reduce plantation

costs, but this can only be effectively done by re-planting with high yielding trees; even then the results will not be seen for some years.

Gas Turbines for Ship Propulsion

The application of the gas turbine principle to marine propulsion has been carried a stage further by the installation of the first engine of this type in a naval vessel. A Metropolitan-Vickers gas turbine in HM motor gunboat 2009 is now undergoing exhaustive sea trials in service conditions, and the Admiralty is planning a larger installation for an escort vessel. The present set is, of course, purely experimental, and has been installed in place of one of three petrol engines to drive the central propeller shaft when added speed and power are required.

Considerable research has been carried out, notably in the United States, Great Britain and Switzerland, in this new form of engine, which uses oil fuel to impart a rotary as opposed to a reciprocating motion. The engine can thus have all the advantages of the smooth-running steam turbine and, by obviating the need for boilers to supply steam, shows considerable economy in weight and saving of space. There are certain technical difficulties, however, to be overcome, notably the metallurgical problem of providing turbine blading and other parts which can withstand for a sufficient length of time the extremely high temperatures of the products of combustion. Reversing, too, apparently presents difficulties, which may have to be solved by the use of turbo-electric drive or by fitting variable-pitch propellers—another recent development on which marine engineers are working.

Further experiments in this direction will follow when a BTH gas turbine unit is installed in the "Shell" group's diesel-electric tanker *Auris*, at present under construction. This turbine will be used in place of one of the diesel generators for experimental purposes. It may be some time before sufficient data can be acquired to show whether advantages in fuel consumption, reliability, length of life and increased revenue-earning cargo capacity will offset initial costs to make the gas turbine of practical value for merchant ships. But it may be recalled that only a few years after the appearance of Charles Parsons' small *Turbinia* the *Lusitania* was crossing the Atlantic with the then revolutionary form of steam turbine propulsion.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement; Union Cold Storage; Calico Printers' Association; Distillers.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7.6 per cent). (i) To latest redemption date. † Free of tax.

COMPANY MEETINGS

AMALGAMATED ROADSTONE CORPORATION, LIMITED

IMPROVED TRADING PROFITS

The eleventh annual general meeting of the Amalgamated Roadstone Corporation, Limited, was held on the 29th ultimo at River Plate House, London, E.C., Mr G. F. Nalder (chairman) presiding.

The following is an extract from the statement by the chairman which had been circulated with the report for the year ended October 31, 1946:—

It is with great satisfaction that I am able to report to you that the merger with the British Quarrying Company, Limited, was duly completed and I take this earliest opportunity of welcoming to our Board of Directors Messrs J. S. Killick, D. W. Cleaver, A. H. Arnold and Ian Fraser, directors of the British Quarrying Company, Limited.

The benefits of the amalgamation are not reflected in the accounts now before you, and only a partial benefit will be felt in the current year. The full effect should be apparent in future years.

The profits earned, including E.P.T. recoverable, enable your directors to recommend a final dividend of 5 per cent., making with the interim dividend already paid, 8 per cent. for the year, thus slightly exceeding the rate of distribution made last year in respect of the 19 months' period to October 31, 1945. You will also observe the reduction in carry-forward of £6,517, but this is far more than offset by the allocation to capital reserve of £11,436 and to debenture redemption of £7,517 and by the retention in the accounts of subsidiary companies of profits for the year amounting to £8,656, and the payment of the non-recurring charge of £8,000 being compensation to directors—three of British Quarrying Company, Limited, and two of this Company—who retired on the amalgamation. These items amount, in the aggregate, to £35,609. The results achieved in the year under review were to the extent of £79,885 assisted by recovery of E.P.T.

CURRENT YEAR'S OUTLOOK

As regards the current year, already so far advanced, we are glad to be able to state with confidence that without any such assistance the results will be shown to be still better. This in effect means an improvement in trading profits of more than £80,000 in spite of three seriously adverse factors with which we have this year had to cope—first the exceptionally severe winter, which naturally hit hardest outdoor activities such as quarrying; secondly, the consequent power cuts and, thirdly, the fact that this was immediately followed by drastic reductions in the road programmes of all public authorities. As regards the future, more than £240,000 has been spent on additional equipment of which only a small part has been productive for only a short period in the current year; consequently, given continuance of even the prevailing conditions in our industry, which can hardly be described as normal, next year should show a further increase of profits. We do not feel that the present critical state of national and international affairs should prove particularly adverse to our company.

Addressing the meeting, the chairman said: In my printed statement I referred to our expectation that the current year's trading profits would exceed last year's by more than £80,000. More up-to-date draft accounts have now become available which show that that was an under-statement; in fact, we are now justified in anticipating an improvement of at least £130,000. These improved results are in the main due to the greatly increased availability of Coast-wise shipping this summer, the shortage of which had been our greatest hardship during the preceding two years.

The report was adopted.

LONDON ASIATIC RUBBER AND PRODUCE COMPANY, LIMITED

DIVIDEND OF 10 PER CENT

At the annual general meeting of the London Asiatic Rubber and Produce Company, Limited, held in London on the 1st instant, the chairman, Mr H. J. Welch said:

It is a great pleasure to be able to put before you accounts which, unlike those for the years 1942 to 1945, show a substantial credit balance and allow of a dividend of 10 per cent. being recommended. For this result we are indebted in the first place to the men who went out, after the liberation of Malaya from Japanese control, to re-lay the foundations of estate organisation and working under conditions of great difficulty and considerable hardship.

From October onwards, the company's production was at a level not very much lower than before the invasion. The estates which in the past manufactured sole crepe were able, one by one, to reintroduce this grade.

Owing to the serious shortage of supplies of leather, the premium on sole crepe has been considerable, and at present this is still the case, though the prices obtainable for forward sales have declined and the demand is much more discriminating than it was in respect of types and quality.

For 1947 the estimated crop amounts to nearly 13,000,000 lb. (or over 5,800 tons), of which we hope at least 1,000 tons will consist of sole crepe and 200 tons of another special form of rubber. Without being unduly optimistic, it seems clear that the company's net profit this year will be greater than last, and that in spite of the prevailing difficult conditions the stockholders are not likely to consider the results for the year unsatisfactory.

The accounts were adopted unanimously.

TELEPHONE MANUFACTURING COMPANY, LIMITED

CHANGE-OVER DIFFICULTIES

The seventeenth annual general meeting of this company was held, on the 25th ultimo, in London, Mr Fred T. Jackson, O.B.E., Comp.I.E.E., chairman and managing director, presiding.

The chairman, in the course of his speech, said:

The gross profit on trading is £134,896 and in comparison with that of the preceding year of £410,559 shows a reduction of £275,663. This reflects in part the cancellation of contracts following on the cessation of the war and the change-over to civilian requirements. The total distributable balance is £66,577. An interim dividend of 2½ per cent. has already been paid and a final dividend of 6½ per cent. is proposed.

The change-over from war work presented us with difficulties which could not be foreseen, as they arose from national policy created by the Government and were altogether outside our control. The material supply position has been, and still is, one that causes very great anxiety, and during the present shortage it can only be dealt with by a system of priorities. There is far too much material being used in non-essential manufacture to the detriment of the country's effort in export and home trade.

We are up against problems over which we have no control, and our only hope is that the Government will recognise its mistakes and allow private enterprise unfettered freedom. Given this freedom, your company is in a good position. We have a good order book amounting to over £1,800,000 at June 30, 1947. I would say that our prospects over the next few years are excellent, especially if the supply of raw materials becomes more plentiful.

The report was adopted.

WILLSON'S (LONDON AND PROVINCES), LIMITED

RECORD TURNOVER

The fifteenth annual general meeting of Willson's (London and Provinces), Limited, was held, on the 3rd instant, in London.

Colonel The Rt. Hon. Lord Barnby, C.M.G., C.B.E., M.V.O. (the chairman), in the course of his speech, said: The company's turnover and profits for the year under review, which is the 21st anniversary of the foundation of the business, have exceeded the preceding year's record figure. The number of customers served, too, has been a record one.

The accounts before you show that for the year ended January 31, 1947, the profit amounted to a sum of £134,468, compared with £103,381. There is a disposable balance of £18,533 from which your directors recommend that a dividend of 25 per cent. for the year (less tax) be paid on the Ordinary shares for the year ended January 31, 1947, which compares with a dividend and bonus totalling 17½ per cent. paid for each of the previous two years.

The company has always pursued a policy of building up reserves before distributing dividends, and the result is that you have before you a balance-sheet of marked strength with reserves totalling the substantial sum of £146,216. £43,000 has been set aside for Excess Profits Tax. This brings the total provisions made for the Excess Profits Tax since it was instituted to £226,000.

SUCCESS OF NEW ISSUE

Since the accounts for the period were closed the company has issued to the Ordinary shareholders the authorised but unissued "A" Ordinary shares capital, and this provided an additional £100,000 working capital. This issue was not underwritten and all the shares available were readily taken by the existing Ordinary shareholders, in fact, it was over-subscribed. The assets have been written down in accordance with the policy consistently adopted. For instance, the whole of the fixtures, fittings and shop furniture in all the branches, offices and warehouses stand in the books at the nominal figure of £14,877, and on the accounts before you fixed assets aggregating £318,492 are nearly £80,000 more than the total issued capital. It might interest you to know that of the turnover in the accounts, the percentage absorbed by wages and salaries is a very high one, for the company follows the policy that the remuneration of all employees shall be at the highest possible economic level.

During the year we have obtained part possession of a large block of buildings in Edgware Road, which we secured some years ago on very favourable terms but which has remained under requisition.

The main anxiety with us (as with all manufacturers and suppliers of consumer goods) is with regard to supplies, but it is again my pleasure to express our thanks to each of the suppliers who has assisted the company in a successful but difficult year's trading. I also wish to tender our thanks to those who have, despite many difficulties, worked so hard in factories under our control to meet our requirements.

I am sure that I shall be complying with your wishes by saying how much we appreciate the individual efforts made by every member of our staff in contributing to the continued progress of our business, and to thank them for their share and assure them that their contribution is valued.

There is one matter which I feel sure you would wish me to mention. In the autumn of the year under review the 21st anniversary was celebrated of the business by your managing director, Mr Maurice Mauray. Though we have roughly 100 branches at the present time, plans and organisation are in readiness for the controlled expansion to the second hundred.

The report was adopted.

GOVERNMENT RETURNS

For the week ended August 30, 1947, total ordinary revenue was £78,352,228, against ordinary expenditure of £81,544,989 and issues to sinking funds £50,000. Thus, including sinking fund allocations of £4,461,384 the surplus accrued since April, 1st is £248,287,466, against a deficit of £418,292,900 for the corresponding period a year ago.

UNIVERSITY OF CAMBRIDGE

The Appointments Committee of the Faculty of Economics and Politics will shortly proceed to the appointment of a University Lecturer in Economics, to be filled by a person primarily concerned with the teaching of Economic History (mainly since 1750). The appointment will be governed by the Statutes and Ordinances of the University. The initial pensionable stipend of a University Lecturer is at present £250, and for the year 1947-48 there will be paid a non-pensionable bonus addition to the stipend of £75, or £50 if the Lecturer is a Fellow of a College. An allowance of £50 for each dependent child will also be paid. A lecturer who is not a Fellow of a College may be granted a further pensionable allowance of £250.

Candidates are required to send their applications to reach the Secretary of the Faculty, The Marshall Library, Downing Street, Cambridge, by October 31, 1947. Eight copies of the application should be sent. Candidates are not required to send testimonials but may submit the names of not more than two persons to whom reference may be made, and may also submit one copy of any publications.

APPLICATIONS are invited for a vacancy which exists in a Market Research Department (Capital Machinery) from, preferably, ex-Service men, aged 27-32, with statistical knowledge and University background. Knowledge of textiles and economics an advantage.—Box 554.

IN a crowded Chamber, the House of Lords sat alone this week, against the Government's wishes, ostensibly to review any orders that might have been made under the Supplies and Services (Extended Purposes) Act, really to hear a Government statement on the economic situation. The ostensible and original purpose of the sitting disappeared for the simple reason that only a few, and those insignificant, Orders under the Act have so far been made—which provides a good commentary on the fuss that attended its passage through Parliament. But quite enough has been happening in the last few weeks since Parliament adjourned for the noble lords to have expected at least a partial explanation of Government policy even if they could not expect a statement of what the Government intends to do in the future. They were, however, disappointed. No information, no Government statement, said Lord Hall, could be made to one House, especially the unelected House, while the other House was in recess.

It is through declarations like this that the British constitution is moulded, and, no doubt, to the historians of the future it is the constitutional rather than the political aspect of the Lords' brief sitting this week that will merit attention. The British people of to-day are, however, less concerned with constitutional niceties than with a desire for a clear indication that the Government is capable of steering them out of the present difficulties. So far all they have been given are small instalments of cuts that add up to very little. They know that the dollars are gone, but they do not yet know how it will affect their food supplies. They know that another fuel crisis, with all that it entails, is almost inevitable in the coming winter. What does the Government intend to do? And what does it expect the people to do? That was the burden of the Lords' debate, and they were right to ask these questions on behalf of an anxious people, whose own representatives are at present powerless to ask them. If the Government was unable, constitutionally, to answer them in the House of Lords, its proper course is to recall the House of Commons and answer them there. It is not as if the Government have had nothing to say since Parliament rose for the vacation. There have been several most important decisions announced on the wireless. And this very week Sir Stafford Cripps is to disclose another facet of the Government's proposals to a public meeting at the Central Hall. What sort of constitutional propriety is it that will choose almost any vehicle of publication other than the Houses of Parliament? The effect, inevitably, is to deepen the impression that the Government are getting steadily less sure of themselves.

These lines have to be written in ignorance of what Sir Stafford Cripps's contribution to policy will be. But unless all the advance indications are liars, his proposals will add up to the imposition of more and stricter controls on industry. Export targets will be set, and the means proposed for securing that they are attained will be, in short, tighter controls on production for, or consumption in, the home market. Much of this is inevitable. Much of it is even praiseworthy. Sir Stafford Cripps is one of the very few Ministers who has always seen clearly what was coming on the road the country is travelling, and has not attempted to

Priorities for Western Europe

mislead the country into thinking that it would be an easy road to travel. But even Sir Stafford Cripps has not succeeded in giving the impression that he has a policy, in the sense of a clearly thought-out set of measures to get the country on to a different road, and one suspects that his new proposals have been forced upon him by events rather than deliberately excogitated as an effort to recapture the initiative. Even the President of the Board of Trade is panting after events, not leading them.

There are, in theory, various possible lines of policy that might be pursued in an effort, not indeed to solve the formidable economic difficulties that confront the country—for a large part of them turn on the decisions of the American President and Congress—but to put Britain back into a posture where the assistance needed from abroad is reduced to a minimum and the advantage that can be taken of any aid granted is raised to the maximum. Two of the more extreme prescriptions can be dismissed fairly quickly. Not many people even in the right wing of the Conservative Party really believe that it would be a tolerable and effective policy to remove all the controls, restore the rule of the market and let things rip. There is too much real scarcity for anything of the sort, and even in the United States, where the conditions were much more favourable for the restoration of market freedom, the opinion is now widespread that decontrol went too fast and too far. The other extreme is a policy of more and more immediate socialism. This is even less relevant to the immediate problems of the day. The attempt has been almost abandoned to claim that there is anything specifically Socialist that could be done and that would bear fruit in less than five years. Indeed, the one expedient that is unquestionably Socialist—the nationalisation of basic industries—has had a lot of the gilt taken off its gingerbread by the obstinate insistence of the strikers of Grimethorpe that the National Coal Board is merely the old boss class writ large.

*

Even when these extremes—which are emotional states rather than policies—are ruled out, there are still various courses that might be followed. The trouble is that they all lead, sooner or later—and most of them sooner—to the necessity for doing things that are politically impossible. For example, one course, which has frequently been advocated here, is that of deliberately reducing the flow of incomes until it is no larger than the flow of available and desirable goods and services. The symbol of such a policy would be the creation of a real budgetary surplus of some four or five hundred million. But any such compression of the flow of incomes could be entirely frustrated if the capitalist could draw on his capital and if the trade unionist could insist on raising his wages to offset every rise in taxation or every cut in food subsidies. The difficulty of preventing spending out of capital is perhaps more technical than political. But the difficulty of preventing wage increases—for that is what is meant by the often-repeated demand for “a wages policy”—is purely political. The recent Trades Union Congress made it perfectly clear that they would agree to anything else, even to labour conscription in peacetime, rather than brook any interference with each union's sacred right to exploit its bargaining strength to the utmost.

Another possible policy would be to close the gap between the flow of incomes and the flow of desirable goods and services, not by reducing the income but by increasing the prices at which the goods and services are valued. (At first sight, there is something contradictory about a suggestion that inflation can be cured by rising prices; but that is, of course, the classical way in which all inflations have restored the balance between demand and supply and brought themselves to an end.) This might be technically easier, in many ways, than the compression of incomes. But it also comes up against the hurdle of wages policy, for if every rise in prices is to be immediately and completely offset by an increase in wage incomes, then the

rise of prices would have to continue a very long way indeed before it accomplished its object—it would have to go on until the whole of the required adjustment had been squeezed out of those classes of the population who could not protect themselves.

The third possible policy is to go on defying the inflationary gap and trying to keep everything in its place, or to move resources to where they are needed, by the sheer brute force of the planned and compulsory economy. This is the policy that the Government are following, for while they are doing nothing to close the inflationary gap—at the moment they are acquiescing in its enlargement—they are steadily increasing the compulsions with which they seek to keep the economy at an impossibly full stretch. Within the last few weeks the direction of labour has been re-introduced, the supplies of goods and services on which the individual is allowed to spend his money have been reduced, and it will be surprising if Sir Stafford Cripps does not extend the system of the allocation of materials—that is, of their compulsory withholding from a whole range of activities.

The completely planned economy, which not only dispenses with the techniques of the free market but deliberately defies the normal patterns of economic behaviour, lends itself to the working out, on paper, of the most intricate economic patterns and therefore has an attraction for the theorist. But in practice, in the actual circumstances of Britain today, the further intensification of compulsory controls is bound to fail. For one thing, there is already an acute shortage of competent controllers. The administrative machine is already strained to breaking point, and it was publicly asserted the other day, without excessive exaggeration, that the only way to get an answer to any query directed to a Government Department is to address it through a Member of Parliament. If there are to be more and tighter controls, they will not work. This is the more certain because, in a democratic country, the worm always retains plenty of power of turning. If there were a serious intensification of controls, either there would be a public revolt or else there would be a wide growth of black markets, or both together.

*

Nevertheless, if the Government were now resorting to an intensification of controls because of a coherent and deliberate preference for this route above all others, the effort would have to be made to understand the policy, to improve its details and, so far as possible, to work it successfully. But unfortunately it is all too clear that the Government are entering on this road not because they have taken thought and decided that it is the most promising one, but because it is the only one that is not barricaded at the very entrance by political obstructions, either by the immediate necessity of eating their own words or by the immediate veto of an entrenched vested interest whom they do not dare to disturb. The obstructions lie only a little further down the road of tighter controls, but for the moment it enables Ministers to have the semblance of a policy without taking decisions which, as politicians, are too painful for them to face. This, it is to be feared, is the real reason why it is being chosen. It is a *pis aller* as well as a blind alley.

But what are politicians for, if not to take the responsibility for painful decisions? For what else do they get their salaries, and the pomp and glory they enjoy? The clue to the crisis, it is necessary to go on insisting, lies in Downing Street. Indeed, even that may be a little premature, for “crisis,” as a correspondent to the daily press has been pointing out, derives from a Greek verb meaning “to decide”; a crisis is not a time of difficulty but a time of decision. That being so, it is when the crisis arrives in Downing Street that the country will begin to feel better.

THE first three reports—on food, fuel and shipping—prepared for the Conference of Sixteen at Paris have now been published.* The report on food establishes two disturbing facts—that West European food production is only 63 per cent of the 1938 level, in spite of a phenomenal rise in population of some 21 millions since that year, and that a marked fall has taken place in this year's harvest. Last year, West European production of cereals reached 55.6 million metric tons. The harvest this year is only 48.9 million. Very slight increases in other foodstuffs—such as meat and milk—cannot offset this serious decline. The supplies which Europe hopes to receive from the United States amount to some 30 million tons of cereals each year until 1951. The fuel report shows a similar dependence on American coal, which must be imported at the rate of 40 million tons next year; but it is hoped to reduce these imports in succeeding years until, by 1951, such sources as Poland and South Africa will make good Western Europe's very small deficit. Similarly, in the case of shipping, it is hoped by 1951 to be completely independent of “dollar tonnage” and to return to normal maritime competition between European and American shipping.

These reports have this special interest, in that they underline Western Europe's two most pressing and inescapable needs—for wheat and coal. In the three principal countries of the Marshall Plan—Britain, France and Italy—the outlook for both commodities is growing darker. The French have had the worst harvest since Napoleonic times; strikes in Northern Italy endanger the gathering of the precious rice harvest and thus threaten to increase the strain on the domestic wheat crop, which is up to normal dimensions, but still inadequate. The troubles in the British coal industry make the modest target of 200 million tons by the end of the year look very remote and the getting of coal in the Ruhr, although it is improving, is still not much above the figure for last March. In these conditions, it is not surprising that the deficits for 1948 estimated in the report run to 30 million tons of cereals and 40 million tons of coal.

At the same time, the dollar reserves are all but exhausted. If the Italians and the French cannot each secure a \$250 million advance from the World Bank (which they hope to do in London next week) or if the French have to rely, as they virtually do now, on withdrawing their permitted quota from the Monetary Fund, at the rate of about 25 million dollars a month, both countries may be stripped completely of the means of buying either coal or wheat by the beginning of the new year. Domestic harvests might carry them on for a little, but the loss of coal would be felt in an instant fall in production. A favourable decision on the Marshall Plan by Congress, even if it were given as early as March, would not produce any wheat or coal for several months after that. Very prolonged negotiations and delays would be necessary to transform a Congressional appropriation into wheat actually moving across the Atlantic. And if these delays were to require tremendous shipments of wheat later in the year to make up for the empty months, the transport system could hardly handle it. In which case, the European Governments might fail to cover the domestic ration, with what political and social consequences can be imagined.

This deterioration in the European economic position has immediate and obvious consequences for the Marshall Plan, both for the framers of it in Paris and for the sponsors in

* The available figures are published in full in this week's issue of the “Records and Statistics” Supplement to *The Economist*.

Washington. As one distinguished American columnist put it: “A blood transfusion is of little use if the patient is already dead.” Yet American reactions are a little confused. On the one hand, according to “inspired” leaks to American correspondents, strong American pressure is still attempting to alter the report and, above all, to reduce its requirements. Mr Clayton does not believe, apparently, that the figures will be acceptable to Congress and would like the scaling down to continue. But the final report is to be signed next week—Mr Bevin will go to Paris for the ceremony—and presumably no further modifications will be made. But while Mr Clayton is trying to cut down the scale of the programme, the State Department is apparently trying to speed up its timetable. The tempo of Europe's deterioration is far too fast for the relatively leisurely procedures envisaged for the Marshall Plan—its consideration during the autumn by the President's Committees on American capacity to help and on Europe's needs, by the Herter Committee, by the Foreign Affairs Committees of both Houses and the preparation of legislation to be considered by Congress when it reassembles after Christmas. The process of educating American public opinion to the existence of a much more urgent crisis, to the need for a special session of Congress and for an interim appropriation has already begun. First, Mr Lovett, the Under-Secretary of State, broadcast his view that bad harvests, the hard winter and the contagious effect of the British financial crisis made immediate help to Europe essential, and now Mr Marshall himself, on his return from Rio, has spoken of an interim programme of aid this autumn. The summons to a special session of Congress apparently awaits only the President's return.

*

The deepening crisis in Europe is bound, meanwhile, to have a marked effect on the Sixteen Nations. The principle behind the Marshall offer and the principle which brought them together in Paris was the belief that better results would be achieved and a saving of dollars (and the resources they represent) would follow, if a concerted plan took the place of the individual national scramble for funds and goods. But it has to be remembered that the greater the stringency, the greater is the temptation for the various nations to see if they cannot step out of their place in the orderly Marshall ranks and push ahead on their own to see what exclusive benefits Washington might, or might not, be prepared to concede. The worse the plight of Europe, the greater the strain on the loyalty and unity of the Sixteen. Countries like Italy, in particular, which are conscious of enjoying an exclusive advantage in America—the size of the Italian vote—are under especial temptation to open negotiations on the side, and the more the Americans feel inclined to reduce the global figure, the more individual nations will be tempted to see if their share of the inadequate total cannot be increased by a little private negotiation. But any general yielding to such a temptation would quickly destroy the whole Marshall approach and return Europe to the jostling scramble in which each nation's chief aim is to jump its place in the queue.

This problem of the cohesion and loyalty of the Sixteen Nations is much more than a problem of holding the ranks through the stringent months that lie ahead. It raises questions fundamental to any negotiations with the Americans, whether they concern a short-term plan for immediate stop-gap assistance, or the Marshall Plan as a whole. How are the Sixteen planning to conduct their campaign? How do they

envisage the presentation of the plan, and its expounding to Congress? And later, if they are successful, what machinery will they set up to see that a plan which began as a co-ordinated effort does not slip back into national smash-and-grab, once the appropriations have been made and the dollars are available? In this sense, the question of their future co-operation may be the decisive factor in the success or failure of the Plan.

It is reported from Paris that a delegation, led by Sir Oliver Franks, the chairman of the Co-ordinating Committee, will go to Washington to conduct the negotiations with the Americans. On the question of the presentation of the Plan, both to Congress and to American public opinion, the delegation would presumably allow themselves to be guided to a great extent by American advice on the best way to proceed. But there are certain questions which the Sixteen will have to decide for themselves and which they cannot decide too soon. The allocation of some \$5 or \$6 billion worth of supplies a year will be beset at every turn by fearsome problems of priority, by bottlenecks, by shortage of transport and, since supplies will have to be bought in a largely uncontrolled market, by the possibility of sharply rising prices. Orderly processes of procurement and supply are essential and, above all, the Sixteen must find ways of not bidding against each other for supplies which are scarce and thus forcing up their price. At the moment, there is no suggestion that the Sixteen Nations should establish a Purchasing Mission and a Priorities Board. Yet how can they secure the best results from the hoped-for appropriations unless some such mechanism exists? It is equally important to associate with whatever agencies are established representatives from the principal suppliers—the United States, the Dominions, certain

of the Latin American States—and to set up bodies which to some extent resemble the Combined Boards of the war. Only two such agencies exist today—the International Emergency Food Council and the European Coal Committee, whose functions are being transferred to the European Commission of the United Nations. Neither body quite fits the needs of the Sixteen Nations, but their mere existence is a reminder of how vexed and urgent is the problem of allocating scarce world supplies among competing national demands.

It is not too early to consider these problems. If the search for dollars is successful the effectiveness of the next stage in the Marshall Plan depends upon agreement between the Sixteen on the best use to be made of the first year's dollars; and the use they make of them will in turn determine the likelihood of receiving the second, third and fourth appropriations, each of which will have to run the whole gauntlet of Congressional criticism and inquiry. But if the search for dollars is unsuccessful, the need for the closest co-operation in the use of scarce resources is even more essential. European self-help may be the condition of success under the Marshall Plan; it would be the condition of survival in a world without dollars. No one will suggest that it is easy to recreate in the much more difficult and complex circumstances of today a degree of co-operation which was achieved only with great effort under the simple, more straightforward compulsions of war. But the compulsions for the next year, at least in Europe, are likely to be the equally simple compulsions of starvation and mass unemployment and if the nations of Western Europe cannot unite successfully in face of these then clearly they do not have within them the means of their own survival.

Before the General Assembly

WHEN the General Assembly of the United Nations opens its second regular session in New York next week, it will have a number of difficult and important international problems on its agenda—chief among them the report of its Committee on Palestine. But it is to be hoped that the pressure of particular problems will not prevent the delegates from devoting some attention to the general question of the kind of instrument they have created for their international purposes, and the use they are making of it. The United Nations has been in being for over a year, and has been very active. In his Report, Mr Trygve Lie points out that, from July 1, 1946, to June 30, 1947, the General Assembly held 443 plenary and committee meetings, the Security Council 347, the Economic and Social Council 168, the Trusteeship Council 56 and other United Nations bodies 897 meetings.

Equally, however, all this activity has been singularly barren of results. The assembled nations would be well advised to do a measure of stocktaking now so that, if errors and weaknesses are apparent, they can be changed before they acquire the sanctity of precedent. The Secretary-General's annual report and the presentation of the \$39 million budget provide the opportunity for such a review.

A criticism often and justifiably put forward is that the Secretary-General has failed to grow to the stature which his world position (and his scale of remuneration) demand. He has not been able to establish himself as an arbiter above the conflict, a figure genuinely respected, whose voice on any issue can rise above the clamour of interested governments. No intervention of his could mitigate the major clashes, but a man of greater moral standing and world influence could certainly have sweetened tempers, shamed crudities and even increased co-operation in all matters of less importance. As it is, rancour runs from the top to the bottom of international life.

The inadequacy of the Secretary-General is repeated, with one or two brilliant exceptions, in the senior staff. The governments are largely to blame, for, in spite of all their lip service to international action, few of them have placed at Uno's disposal men of the technical ability and personal authority necessary to give the Organisation what it so urgently requires—a status apart from governments, an authority derived from its own competence and impartiality. Who, after all, will listen to an international agency when infinitely more competent people are sitting in the government offices at home?

What the United Nations lacks in competence, it has unfortunately made up in size. Mr Lie admitted in his Report that much of the growth of the Organisation had been haphazard, undertaken in answer to uncoordinated demands of the various councils and commissions, whose chief aim in life appears to be to encourage everybody to investigate everything. The grim result has been an endless proliferation of committees, a considerable degree of overlapping, both within the United Nations and between it and the specialised agencies, an immense duplication of secretariat, a severe shortage of competent technicians and, last of all, a mound of documentation in five languages which threatens to submerge Lake Success in a new lake of paper. No organisation can prosper with such a degree of elephantiasis. What is needed is a decision at the highest level—the General Assembly itself—that the United Nations Organisation shall restrict its field by establishing priorities and concentrating on a defined area of action, simplify its administration and improve the quality of its officers. This, on the part of the Governments, would entail the most important decision of all—the decision to release to international government men who in their own countries would be either in the Cabinet or at the head of the civil service. A compact, highly efficient unit of international organisation, speaking with the highest competence and authority and impartiality in every sphere, might not restore

good relations between the Great Powers, but it could restore confidence in the possibilities of international action and might even lead (or shame) a number of governments into more co-operative policies.

The fact remains, however, that Uno's greatest defect is the stultification of the Security Council by the use of the veto, for which Russia must bear much the largest share of the blame. It is thus on the question of the veto that most talk of "reforming the Charter" has concentrated. Argentina has had the abolition of the privilege of the veto placed on the agenda of the General Assembly and in the United States there are signs of growing support in public opinion for the same proposal. Russia, on the other hand, has made it clear that any attempt to tamper with the veto would be fought to the last by the Slav bloc, and there have been some suggestions that a decision to modify the veto might send Russia out of the United Nations.

It is important to remember, before dismissing the Slav attitude as purely obstructive, not only that it was American insistence on the protection of national sovereignty that helped to write the veto into the Charter in the first place, but also that an unexpected, almost unnoticed, but vitally important, development in the United Nations in the last year has, if anything, reinforced the need for some form of veto. The organs of Uno are supposed to function under a written constitution, which defines their powers and the limits of their authority; the most significant of these limits is the provision of Article 3 of the Charter that "nothing contained in the present Charter shall authorise the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state or shall require the Members to submit such matters to settlement under the present Charter." Further, Uno is supposed to maintain "respect for the obligations arising from treaties." In the short time since its foundation, however, Uno has shown a tendency, both to encroach on the domestic jurisdiction of its members and to override international treaties.

In the first *cause célèbre* of Uno, the Soviet and Ukrainian appeals against the presence of British troops in Greece and Indonesia, the issue was plainly, in both cases, juridically within the domestic jurisdiction of the recognised Governments of Greece and the Netherlands, by whose sovereign invitation and consent the British troops were in the respective areas. The majority on the Security Council were, in both cases, favourable to the British case, but as there was no way of automatically disqualifying an appeal as being outside the jurisdiction of the Council, both cases were debated at length as if they had been genuine disputes between states of the kind provided for by the Charter. Later, when the question of the treatment of Indian settlers in South Africa was raised in the Assembly, South Africa claimed domestic jurisdiction, but the Assembly rejected the claim and passed a resolution condemning South Africa. More recently, when the Dutch resumed military operations in Java,

and Australia brought the matter before the Security Council, the Council ordered a truce, although the Netherlands Government, with British and French approval, claimed domestic jurisdiction, and only the French veto prevented the Council from assuming full control over Dutch action. Lastly, in Egypt's appeal to Uno against the retention of British troops in Egypt, it is not in question that the troops are there in accordance with a treaty; it is simply that Egypt wants to revise or cancel the treaty and asks the Security Council to direct Britain to give up treaty rights—in other words to assume the power of a world legislature with an unlimited right of repealing or amending existing treaties.

In all these cases the question is, not whether the Assembly or Council have acted rightly on the merits of the case, but whether they have had any legal right to act at all. It is true that the wording of the Charter is inexcusably vague and that it is possible to make a case for Uno jurisdiction in any matter, however domestic, "which might lead to international friction or give rise to a dispute" (Article 34), in spite of the express prohibition, already quoted, of intervention in domestic concerns. Similarly though the Charter contains no provision, as the Covenant of the League did (though abortively), for the revision of treaties, it does say that existing obligations that conflict with the Charter shall yield to it. There are thus large enough margins of doubt and authoritative interpretations of the Council's jurisdiction will have to be given. It has several times been suggested that the International Court of Justice should be asked to give a ruling, but the proposal has always been voted down and the Council has decided to be the sole judge of the constitutional legality of its own actions.

This can hardly be satisfactory to the lawyers, and it is still less satisfactory from a political point of view. For whatever may come in the future, there can be no doubt that the United Nations is composed of and, if it is to work at all, must work through sovereign governments. Nations have with great reluctance parted with some of their sovereignty in order to enable an international organisation to keep the peace of their world, but the authority they have conceded to Uno was meant to be used within constitutional limits, not to be turned into a right of general supervision over any affairs which any nation, however remote its interest, may decide to bring up. The more Uno strays outside its constitutional sphere in the absence of any judicial check to keep it within bounds, the more it will be involved in collisions with nations which suffer from its usurpations, and the more acute the jurisdictional issue will become. One effect of this will be to strengthen attachment to the veto in the nations which possess the right, for if Uno's actions are not to be confined within any constitutional limits, the veto becomes the only means, short of open defiance of Uno, by which a nation can protect its residual sovereignty.

What can be done to check this abuse, which may render

1 3/4 per cent.

"... besides the strong actuarial basis used there is a contingencies reserve of £500,000... within this contingencies reserve there are free sums more than sufficient, if we deem it desirable at a later date, to strengthen the valuation basis of our life assurance business still further to a 1 3/4 per cent. net premium valuation." Extract from Chairman's Speech, 27th March, 1947

EQUITY & LAW

even more ineffective the working of the international community? The answer seems to lie in the same direction as does the reform of the Secretariat—a restriction and definition of activity in order that within that sphere, action may be both clear and effective. In other words, it can be argued not that the veto should be abolished but that, as in the League Charter, it should be open to all powers on an equal basis, except in a certain defined area in which, if possible, all should abandon it. That sphere would be concerned with the genuine disputes

between nations and be hedged around with proper constitutional guarantees. Such a solution may seem retrograde to the exponents of full immediate world government, but the alternative appears to be the disappearance of the last traces of international action. Both in the Secretariat and in the Security Council and Assembly, the United Nations today is failing by attempting too much. In assuming the right, the duty and the possibility of doing everything, it may end by accomplishing nothing at all.

Finding the Nurses

ONCE again, the nursing profession has been dissected. It might have been thought that there had been enough, inquiries, official and unofficial, into the shortage of nurses to have made the appointment of a working party superfluous. But much of the information disclosed by these earlier inquiries is now out of date. Moreover, they relied for the most part on estimates, impressions and personal opinions. The working party went into the field and attempted to discover the facts for itself. Through sample surveys of representative hospitals and nurses, it has put the earlier impressions into precise and objective form.

These impressions may be summarised as follows. First, the nursing shortage, at least in recent years, has not been due so much to a falling off in the number of nurses as to a greater demand for their services both in hospitals and outside. Secondly, the flow of new recruits would be sufficient to keep pace with this increased demand if there were not so much wastage, both of trained nurses who leave the profession after only a few years' practice, but particularly of students, who fail to qualify as trained nurses. Thirdly, this wastage is the result of a number of factors which may be summed up as unsatisfactory conditions of work and unsatisfactory selection of recruits. Fourthly, there is a great difference, both as regards wastage and the shortage of nurses, between one hospital and another. Fifthly, there is a vicious circle—many of the bad conditions cannot be improved until there are enough nurses, but until conditions are improved, nurses and student nurses will continue to leave the hospital service.

The accompanying tables and diagrams show how some of these impressions were put into statistical form by the working party. Table I shows the estimated number of nurses (male and female) and midwives, trained and untrained, in actual employment at the end of 1945, compared with 1938.

I—NUMBER OF NURSES AND MIDWIVES IN EMPLOYMENT
(In Thousands)

	End 1938		End 1945	
	Trained	Other	Trained	Other
Hospitals—				
General hospitals	24.2	43.9	25.3	56.4
Mental hospitals and institutions	15.3	14.0	14.2	12.2
Maternity hospitals	1.2	1.8	3.0	2.5
Infectious diseases and T.B. sanatoria	6.0	7.9	5.0	8.8
Total	46.7	67.6	47.5	79.9
Public Health—				
Industry	3.5	3.5	3.5	3.5
Schools	2.2	0.2	2.0	...
Health visitors, district nurses and midwives	18.4	...	17.0	...
Nurseries and children's homes	0.5	1.6	1.3	7.2
	24.6	5.3	23.8	10.7
Private nursing	6.0	6.0	4.5	4.5
Other nursing	1.5	0.3	1.8	0.9
Total Civilian Nursing	78.8	79.2	77.6	95.0
Armed forces	0.9	5.6	10.1	67.0

Including those in the armed forces, the number of trained

nurses thus rose between 1938 and 1945 by about 8,000. The estimated intake of new recruits has been as follows:—

II—ESTIMATED INTAKE OF STUDENT NURSES

	General Training Hospitals			Special* Training Hospitals
	Voluntary	Municipal	Total	
1937	7,950	3,800	11,750	12,850
1938	7,850	3,400	11,250	13,550
1939	8,500	4,700	13,200	14,000
1940	8,600	3,600	12,200	11,250
1941	8,800	3,600	12,400	8,450
1942	10,150	4,900	15,050	7,600
1943	10,300	5,100	15,400	8,100
1944	10,200	3,750	13,950	5,850
1945	10,050	4,050	14,150	5,600

* I.e. mental, infectious diseases and sanatoria.

If the length of working life of a trained nurse were reasonably long, and if a reasonable proportion of student nurses completed their training, there would hardly be a nursing shortage, except in the special hospitals. Instead, the working party found that the average working life of a trained nurse employed in a hospital—it was not able to make a similar estimate for trained nurses outside hospitals—is not more than nine years. The number of trained nurses leaving hospitals each year who do not transfer to other nursing employment is about 5,600. Of these, about a third leave to get married, about 2-3 per cent retire, a proportion varying from 5 to 15 per cent, according to the type of hospital, leave on health grounds, and about another third "resign." The wastage of student nurses is even more depressing. In the general training hospitals, voluntary and municipal, the average annual intake in the seven years 1937 to 1943 was 13,100. But the average annual wastage was 37 per cent of the intake. In the special hospitals, the wastage was far worse—56 per cent in infectious diseases hospitals, 65 per cent in sanatoria, and as high as 82 per cent in mental hospitals and institutions. What is more, these estimates of wastage, most of which take place in the first year of training, do not include failures in the final state examinations.

The working party was not content merely to estimate the amount of the wastage. It also undertook a special analysis of the reasons for abandoning their training given by 400 representative ex-students. From this analysis there appears to be a composite factor underlying all causes of wastage of which by far the most significant was hospital discipline, and, next in importance, the attitude of the senior staff. Further surveys and interviews showed, too, that a large number of the students who abandoned their training ought never to have been accepted, either because they were temperamentally unfit or because they were lacking in intelligence. If a selection procedure for students were adopted, the working party estimates that about a quarter of the new recruits in recent years would be found to be temperamentally or intellectually unfitted for training as nurses.

Weeding out unsuitable students would not, of course, help to increase the supply of trained nurses. In fact, it would, in the

short term, increase the hospitals' difficulties by removing some 5-6,000, if general and special hospitals are taken together, of those who do so large a part of their domestic work. Nevertheless, this loss would be more than offset if the rest of the wastage could be reduced to a minimum and if, at the same time, the life of a trained nurse could be extended. To achieve this, the working party makes two big recommendations: the complete reorganisation of a nurse's training and a completely new attitude towards conditions of work, including discipline, on the part of hospital authorities and the senior members of the nursing profession.

Many proposals have been made before this for reorganising a nurse's training, but the only response from the General Nursing Council has been to overload the curriculum more and more and to make its examinations correspondingly stiffer. The working party, unfortunately, does not go into the question of the curriculum; it does, however, note that there is little or no relation between marks obtained in the examination and assessments of nursing proficiency subsequently made, and it comments on the absurdity of providing a similar training, with consequently similar qualifying tests, for a body of students who, as diagram I shows, have such a wide range of natural ability. (It should be pointed out that part at least of the higher intelligence shown by student nurses compared with trained and assistant nurses may be attributable to differences in age.) Those who fall in the lowest group of intelligence (E) would, for the most part, be excluded by the selection procedure but would, if otherwise suitable, be eligible for training as nursing ancillaries into which class should, the working party proposes, be rolled up the present grade of "assistant nurses"—those who qualify for that title by virtue of their nursing experience but who do not, at present, sit for any examinations. For the general body of students with average intelligence, the working party recommends a drastic but sensible simplification of the training course which would reduce its length to two years—eighteen months to be common to all students and six months to be devoted to specialisation in the branch of nursing which the student chooses. This simplification and shortening of the course could only be carried out if the students are recognised and treated as students instead of, as at present, paid employees of the hospital. A large part of a student's time in the existing three years' training is wasted through being spent on domestic work or, as diagram II shows, on acquiring skills which could be learnt in half the time or less.

This new attitude towards student nurses is intimately linked

up with the conditions of work in hospitals which are such an important cause of wastage—of students and trained nurses. It is discouraging that after so much has been written and said in the last twenty years about the need for a more modern attitude towards discipline that the working party of 1947 should still find rigid and authoritarian traditions so widespread. The hospital matron, and even more, perhaps, the ward sister, who regards a tidy locker as more important than a contented patient, brought up in the disciplinary atmosphere of the past, are determined that each new generation of students and young nurses shall go through the mill as they did, and they set their faces firmly against any proposals to take the drudgery and unnecessary discipline out of nursing. Like will promote like, and thereby hidebound traditions are maintained.

Whether the selection procedure for promotion to senior nursing posts, suggested by the working party, would be feasible is uncertain. But at least some means of controlling, if not dismissing, unsatisfactory—in this sense—sisters and matrons should be employed and there are grounds for hope that, with the new regional hospital organisation, this should be more possible than it has been in the past.

Yet, discipline and the attitude of the senior staff apart, can conditions of work be improved with the present and foreseeable nursing strength? Has the working party, in fact, broken the vicious circle? It estimates, very tentatively, that to introduce the three-shift day—the greatest single improvement that could be made for trained nurses—and the student status in training schools would together require an additional 22-24,000 trained nurses and some 14,000 nursing orderlies. Nor does this allow for any expansion in the nursing strength that may be required for the new health service—the working party frankly shirks making any estimate for this. It is possible that 20,000 suitable recruits may be found in the next few years, which would go some way towards filling the gap. It is possible that considerable economies may be achieved when the hospital services are integrated. But the immediate effect of the working party's reforms is almost bound to be a further closing of hospital wards. Can this be allowed, even if it will mean a contented, adequately staffed nursing profession in the future? And if the gap is filled in the next few years, by one means or another—more part-time nursing, more male nurses, more nursing orderlies—will it be at the expense of other necessary demands on the nation's womanpower, which will fall by 1951 by 530,000. One member of the working party thinks it will be, and that is one reason why he is to sign a minority report.

NOTES OF THE WEEK

Beviniana

There have been fewer overseas repercussions to the two novel proposals in Mr Bevin's speech at Southport last week than might have been expected. He said that he knew his proposal for the redistribution of American gold would annoy the Americans, and so it has—but much less than might have been feared. It was too obvious nonsense to be taken seriously and there was too obvious a retort to the effect that Mr Bevin would be better employed worrying about the extraction of coal from holes in the British ground than of gold from holes in the American ground. Not much harm has been done, and nonsense though the idea was, there has been a general tolerant willingness, in both countries, to accept it as a manifestation of the role that Mr Bevin has chosen in recent months to play—that of the rogue elephant in politics. Unfortunately there is reason to believe that the elephant never forgets and that the Foreign Secretary is insisting on having his idea taken seriously. Perhaps he had better consult his colleagues after his speech, even if he did not do so before.

His other suggestion, that of an Empire Customs Union, has been received more seriously but not very much more favourably. It has been made clear that both Australia and New Zealand would find it very difficult to revise their tariffs on British goods, especially those that protect their secondary industries. And from Canada, as at the time of the suspension of convertibility, there has been a significant lack of comment. Silence certainly cannot be taken as consent in this case; it more probably denotes complete puzzlement in Canada which, more than any other country, depends on freedom of transfer between the sterling and dollar areas.

The most interesting reaction to the proposal of an Empire Customs Union has been at home. The first effect of Mr Bevin's speech—of which these two proposals were, of course, only a small part—was to raise his stature in the Labour Party. But the extravagant praise lavished on it by Lord Beaverbrook's papers have led to some second thoughts. It is probably true that there is no other single thing that could more effectively damn any Labour leader in the eyes of the faithful than to fall under the suspicion of being in covert alliance—be it only on a single issue—with Lord Beaverbrook. The Empire Customs Union, for this reason, has raised the chances of Mr Attlee remaining at 10, Downing Street.

Settlement at Grimethorpe?

The strike at Grimethorpe, at least for the time being, is over. It was announced on Thursday that the men will resume work on Monday—but to work the old stint until the fact-finding committee appointed by the union, with the consent of the Coal Board, has reported. Until then the question had been—could the Coal Board afford to hold out, and if so, for how long? Every day the Yorkshire stoppage continued, the position of the Board was weakened both for that dispute and also for all other possible disputes during the year, for the margin of coal stocks which is the only real buttress upon which the Board can lean was becoming smaller and smaller. All the time, the men and the Board knew perfectly well that technically the Board was in the right. All the right machinery was used to settle the dispute, and "as a matter of principle" the Board could have refused to yield. But it is doubtful if the fluid atmosphere of human relations can be settled by the rigid application of machinery and principle. If the Board had yielded, it would have lain itself open to every charge of opportunism, but humans are so far from rational or consistent, and the atmosphere of the mines is so very unlike that of the ordinary factory, that a special flexibility of approach is required. However correctly the conciliation machinery was used, it is clear that something has gone very wrong with conditions at Grimethorpe. However wrong the men may have been in principle there must have been some serious mishandling of them for the stoppage to have developed as it did.

The dispute illustrates clearly how delicate a balance has to be kept between technical reorganisation and the men who have to put this reorganisation into effect. The Yorkshire Division of the Coal Board is outstanding for the vigour of its directors and the energy with which plans for improving the mechanical efficiency of the mines are being pursued. It is possible that the Board have been going too fast for the men, and that management has been

treating the miners too much as digits set to work exciting new cutters and conveyors, and has been attempting too little to carry them along as human beings. Is this, in fact, yet another illustration of how Socialism, which claims to uphold the interests of the common man in general, stumbles over his unwillingness to co-operate in particular?

New Policies for the Ruhr

British and American experts who have spent some weeks in Washington discussing the problem of increasing productivity in the Ruhr have reached satisfactory conclusions and their report includes proposals for a new Anglo-American Joint Board to replace the old exclusively British North German Coal Control and for various incentives to increase output in the mines. The changes in management are acceptable to the British, whose policy has been vindicated by expert discussion, and it only remains to secure the opinion of the other western nations vitally concerned with the Ruhr. The problem of extra incentives has at no point caused any serious disagreement between the British and the Americans, for from the beginning the British have maintained that there was fundamentally no other problem in relation to productivity in the Ruhr save that of giving the miners and their families food, homes and hope. The difficulty here has been the fact that extra incentives meant extra disbursements in dollars at a time when the British could not really afford their existing commitments—a fact which has now been made plain to the Americans. It seems, however, that a first step has been taken to overcome this difficulty. The American Government has asked the Senate Appropriations Committee to return to Washington for an emergency meeting to discuss the new position in Germany, and while the Committee is not in a position to make new appropriations, it can authorise a diversion of money to Germany from sums set aside for occupation duties elsewhere. This diverted money will need to be made good later on, but by that time another session will have opened in Congress. It is ready money on which the American Administration wishes to lay its hands and, as so often, the most elaborate conspiracy must be set in motion in order to circumvent the ordinary workings of the American Constitution.

Greek Coalition

The Greek Communists can now claim to have achieved what no other force in Greece has done in the last thirty years—an alliance between the Monarchists and the Liberals. Under strong American pressure, the Populists (the Monarchist Party) have abandoned the claim to the premiership and a majority of the Cabinet seats which their numbers in the Assembly warrant. Instead, they now accept Mr Sophoulis, the veteran Liberal leader, as Prime Minister and accept a rough parity with the Liberals in the distribution of other Ministries.

The new coalition is undoubtedly a great improvement on the narrow right-wing Governments of recent months. In a sense, the political situation has been forcibly returned to the point at which Mr Hector McNeil left it in the autumn of 1945, with this difference: that the co-operation of more radical groups seemed then to have been assured. Unhappily, this is not the only difference. Both the security position and the economic crisis have grown worse since, and it will be by its ability to meet these two unpleasant challenges that the new coalition will stand or fall.

The Liberals claim that their presence in the Government makes the offer of a new amnesty practical politics. Two Liberals, Mr Rentis and Mr Ladas, have taken over the vital offices of Public Order and Justice, and with this move the threat of reprisals has, so the Liberals declare, been removed. The local defence volunteers are also to be disbanded, and surrender of arms both by the guerrillas and the volunteers will be the test of pacification. Nobody believes, however, that the situation is as straightforward as the Liberals believe.

The economic situation is equally obscure. Not enough American aid has arrived so far to judge whether the new supplies are going the way of the old—to the black market and the pockets of the few. The Americans do not appear to have elaborated any startling experiments in supervision and Liberals are not noted for their devotion to economic controls. Perhaps the clock should be put back a little further than the autumn of 1945 and the one man

recalled who really attempted to impose order on Greek chaos—Mr Varvaressos's duties at the World Bank are not so onerous that he could not be spared for a special assignment.

Operation Oasis

The despatch of the *Exodus* Jews to Hamburg—called for some obscure and horribly ironic reason "Operation Oasis"—has now been completed; most of the tragic crowd left the three ships without resistance, and it appears that only a hard core of fanatics offered violence. The trouble seems to have subsided once the refugees reached the trains. All in all, there was less violence, less bloodshed, less savage fighting than was expected, and correspondents in general seem to agree that the British soldiers showed forbearance and tolerance. And, indeed, it is not they who should take any blame for carrying through thoroughly unpleasant tasks with such relative restraint. The responsibility lies squarely on the Government for permitting an operation that might well have been a tragedy. The excuse is made that some strong action must check the stream of illegal immigrants to Palestine, but why should publicity and martyrdom do so, since this is precisely what the Zionist organisers seek? Nor is there any strength in the argument that there is nowhere else to send them now that Cyprus is full. The Middle East is full of camps from which Polish and Greek and Yugoslav refugees have been removed.

What next? The Jews are back in German camps—at Pöppendorf and Am Straw. Do they remain there? And what is to happen to the some 700,000 other refugees who are equally rotting away in European camps? The British Government might at least make amends for the casual thoughtlessness of its latest action by setting an example of generosity in receiving a larger quota of DPs—including Jews—and of using this example to initiate a world effort to back the work of the International Refugee Organisation.

Arab Counsels of Despair

Zionist leaders seem genuinely surprised at the unanimity of British public opinion in rejecting the United Nations Committee's recommendation that Britain should be the principal agent in enforcing its unworkable partition scheme. Never conspicuous for political sagacity where non-Jews are concerned, they were apparently still counting on an unaltered British intention to hold on to Palestine at any cost. The sudden awareness that there may be no such intention has left them in the position of a bridge player, who finds after a high bid that the supposed ace of trumps in his hand is really an ace of another suit. In the Palestine Hebrew press last week there was in consequence a new concern for British interests. Official Jewish reaction was given by the Zionist General Council in Zurich which, by 61 votes to 16, agreed that the majority report should be further studied. Outright acceptance could not be expected, but in Jerusalem there were hints in a press conference at the Jewish Agency that the port of Jaffa was an unwelcome gift, which might be used to bargain with the Arabs.

Among the Arabs the commonest reaction to the majority plan was first one of incredulity, and then one almost of relief that it should be so outrageous. Arab official statements have been sprinkled with warlike phrases—"the bloodiest struggle ever waged in the Near East," "by force of arms," "to fight with all means." Rejection of the minority plan as well seems foolish, but it would be a mistake to think it does not reflect a genuine attitude. For some time the Arabs have been employing Polish (Christian) ex-officers to train their underground formations, and the state of mind which prefers a "show-down" to any settlement has been spreading. Even by progressive Arabs there is a fatalist acceptance of the necessity for bloodshed that gives point to the Iraqi Premier's hint that Arab youth must be prepared for sacrifices. All Arab States have accepted his invitation to a conference in the Lebanon this week. One report is that their secret plans include a mass immigration of Arabs into Palestine.

In America the report has been received without enthusiasm. The *New York Times*, it is true, permitted itself with ostrich-like complacency, to point out that the question was now in the hands of the United Nations. But this was not typical, and it may be assumed that the State Department is now trying to discover whether Britain will accept a share in enforcing a solution, and if so on what terms. If it is still possible to avert a Jewish-Arab war, it can only be done by America's taking a more realistic view of its own responsibilities as the principal Zionist patron and also as a

The Economist's New Premises

From Tuesday, September 23rd, the offices of THE ECONOMIST will be established in new permanent quarters at 22, Ryder Street, St. James's, London, S.W.1. Ever since our pre-war offices were destroyed by enemy action in May, 1941, we have been working under great difficulty in cramped and separated temporary quarters. We have now acquired a building in which all departments can be comfortably housed for, we hope, many years to come.

Will all readers and friends of THE ECONOMIST therefore please note that from Tuesday, September 23rd, the address for all purposes will be—

The Economist,

22, Ryder Street, St. James's, London, S.W.1.

Telephone: WHItchall 1511

Telegrams: ECONOMIST NEWSPAPER, LONDON.

Cables: MISTECON, LONDON

The offices of the paper will be closed (except for publishing purposes) on Friday, Saturday and Monday, September 19th, 20th and 22nd. Some dislocation of business may continue for a week or two after the move and we apologise in advance for any inconvenience that may be caused thereby.

major Middle East Power. Unless that happens, the proceedings in the United Nations Assembly this month will be as pointless as Mr Gromyko could wish them to be.

Mr Snyder in London

The meetings of the International Bank and of the Monetary Fund are taking place behind closed doors. Whether they are also taking place behind closed minds is difficult to ascertain. That these two Bretton Woods institutions were designed for a world very different from that which in fact exists at present is, by now, painfully obvious. So far both of them seem to prefer the policy of waiting until the world for which they were designed arrives rather than of adapting themselves—if they could—to the conditions of today. Mr McCloy, of the Bank, has insisted that it is "not in the stop-gap business" and that its loans will be granted only for "productive" purposes. The Fund, *per contra*, was specially designed to stop gaps, but very much smaller and shorter gaps than exist today. From the Fund's and the Bank's point of view, this policy of waiting is no doubt a wise one, and perhaps the only possible one. But they may have to wait a long time.

This being so, the Bretton Woods twins will find their greatest justification—as the Bank for International Settlements did—in the international gatherings of financial authorities for which they provide occasion. This time, the most eagerly awaited arrival was naturally that of Mr Snyder, the Secretary of the United States Treasury. It is easy to suppose that Mr Snyder's conversations are not limited to the agenda of the annual meetings of the Bank and of the Fund. It is significant, therefore, that on landing at Southampton he declared that he liked the British and wanted to help them. This might, of course, have been just the common form for such occasions. But there is reason to believe that, in Mr Snyder's case, it was genuine.

Mr Snyder has, in fact, been unjustly represented to the British public. For the first few days of Sir Wilfrid Eady's negotiations in Washington last month, the press dispatches reported that he was meeting with difficulties at the hands of the Secretary of the Treasury. This led *The Economist*, in the issue of August 23rd, to take Mr Snyder as representative of that section of American public opinion which still cannot see the degree of America's responsibility for what is falsely called the "sterling crisis." But within a day or two the earlier reports were reversed and it became apparent (as our correspondence from Washington emphasised in the following issue) that, in fact, the Secretary of the Treasury had been the most understanding and helpful of the American officials with whom the British delegation had to deal. The point is perhaps a small one; there are, unfortunately, all too many Americans, even if Mr Snyder is not among them, who persist in regarding the world's economic crisis merely as a contrast between Wise Virgins and Foolish Virgins. But since injustice was done to an individual, it is right and proper that it should be corrected.

* * *

Iron and Steel Nationalisation

The debate on the nationalisation of the iron and steel industry at Southport was something of an anticlimax. It has long been apparent that the immediate nationalisation of this industry had come to be regarded by the Left wing of the Labour Party as a kind of touchstone—if you believed in it you were among the elect. Not long before the Conference, the Iron and Steel Trades Confederation, the major union in the industry, had declared in favour of immediate nationalisation. It was therefore expected that the Conference would be asked, from more than one quarter, to face the issue of nationalisation next session and that some clear guidance to the state of feeling on the industrial side of the movement would result.

Events turned out differently. The chairman of the TUC read a letter from the Minister of Supply giving an assurance that the Government would nationalise the industry, but not necessarily in the next session, and after some debate, which did little to clear up this vague assurance, the position was accepted by the Conference as satisfactory by 4,857,000 votes to 2,360,000. The trade unions within the industry ranged themselves on either side very neatly. The Confederation and the blast-furnace men were prepared to trust the Government to know best about the timing of the Bill. The foundry workers and the constructional engineers declared for immediate action.

What does stand out from the debate at Southport and its result is that the Government successfully evaded the real issue there, which was when they propose to act. A statement by this

Government that it will nationalise iron and steel some day is almost meaningless. No doubt, some day, if they are still in power, they would like to nationalise Madame Tussaud's. It may be that the Cabinet are still undecided whether to include this Bill in the King's Speech for next Session. It may be that they have already compromised the diverging views within their own body and that Mr Wilmot's letter to the TUC is the result. In the meantime, the industry is left to wait and see what fate politics will bring to it. Certainly many in it will sympathise with Mr A. Callaghan, of the blast-furnace men. Mr Callaghan was against half-baked measures likely to injure the industry, just as he was against the risk of post-nationalisation strikes, of the kind that have occurred elsewhere. In short, his union wants no Grimethorpes. Maybe the industry has escaped this year's tumble; and maybe, as in Paris, one postponement will prove to be just as good as a reprieve.

German Prisoners in Britain

It cannot be said that the Prime Minister's statement on the subject of the release of German prisoners of war still in Britain is likely to allay the unease that many of them feel at their continued detention. The statement was made in the form of a reply to a memorial submitted by the Save Europe Now organisation, with wide support, asking that prisoners should be sent home before the end of 1948, the date now stated as a target for the last release. The best Mr. Attlee could do was to promise to "explore the possibility" of this; and there is by now something almost sinister about that bland official phrase. Official explorations of difficult problems are almost predestined to failure.

The problem of German prisoners of war, in effect, remains where it did. In those countries with no shortage of manpower, as in the United States, they have been released. Where there is a shortage of manpower they have not. The arguments advanced to defend this are likewise the same. First there is the, very thin, legal argument that since there is no peace treaty with Germany there is no obligation to release German prisoners. That is followed by a more practical one. Germans caused the war, and thus much of the damage. Let the Germans stay and help, directly or indirectly, to repair it. That is a tolerable argument if countries are given personalities. When it is applied to individuals it is not. If Feldwebel X was captured by the Americans at Cherbourg he is probably back home. If he was captured by the British at Caen he is probably still working on some English farm. Such a state of affairs is unjust to the individual and it is better to face that fact than to attempt to bury it in official language. The final issue remains: is Britain, or any other country, entitled to be unjust to individual Germans because the former rulers of Germany were criminally unjust to the rest of the world? That is a moral question. The answer of the Government seems to be in the affirmative, and while it remains so they cannot complain if protests continue.

But parallel with the moral argument there is another practical one. Retention of the Germans on the ground of manpower shortage is a lazy attempt to solve the problem by compulsion of the defenceless. Is it certain that the number of Germans compelled to remain and work here could not be replaced by an equal number, first, of Germans who would willingly stay here (if paid normal wages) plus displaced persons still in Germany, Austria and Italy? It is always more trouble to think out ways of attracting people to work than it is of compelling them to work, but in other fields that is one of the professed aims of the Labour movement as a whole. Are incentives subject to a nationality test?

* * *

Fascist Disturbances

The final two days of the TUC conference at Southport last week were marked by two events of some significance, a demonstration by the conference of its uneasiness at the spread of virulent anti-semitism, and fascist activity, particularly in London, and a debate on the nationalisation of the iron and steel industry. On the first the demonstration took the form of a resolution to refer back a rather mild paragraph in the TUC annual report on "fascist activities," which was carried against the executive.

One does not have to be a trade unionist, or a Jew, or an inhabitant of London, to be concerned over any recrudescence of fascist activity in Britain. At the moment the principle vehicle by which the fascist-minded conduct their public activities seems to be an organisation known as the British League of Ex-Servicemen, which is a fine title for any organisation that happens to think of it first. Hackney and Stepney are the two London boroughs to which the League seems to be devoting its attention. There, not unnaturally,

its meetings are met by Communist demonstrations and the result of those meetings is to be seen in the London police courts the following Monday morning (as was the case this week). A more serious accusation, made from the Left, is that the Metropolitan Police are prosecuting one side only and that, although fascist speakers indulge in the most open incitements to violence, it is not they who are subsequently charged. The facts are hard to come by; but it is certainly safe to assume that the dimensions of any revival of fascist activity are being vastly exaggerated by the professional viewers-with-alarm on the Left. It would be surprising if the numbers involved ran even into three figures.

In any case, whatever the dimensions of fascist activity in Britain, it is advisable to stick to principle. The principles involved are that no man should be punished before he commits a crime and that it is no crime to think as you wish. This principle must be adhered to and applied to fascist thinkers equally with Communists. On the other hand, it is a crime for anyone to advocate violence, just as it is a crime, under the Public Order Act of 1935, for anyone to wear a black shirt as a uniform. Mr Chuter Ede has won a reputation for both balance and firmness as Home Secretary, and there is no reason to believe that those qualities have suddenly deserted him. But it would do no harm if he did inform the public whether any speaker in London has publicly advocated violence against anyone, whether he has sufficient evidence of that to justify a prosecution and, if so, when the prosecution will be launched.

* * *

Turks and Foreigners

Between the two world power systems, Turkey has chosen to belong to the American. There can be few countries where this choice has been made with more genuine and widespread popular support; yet even here difficulties loom ahead. There is no Russian party in Turkey, and it was not hard to suppress attempts to form one. But there has been a steady development from January, 1946, when Turkey ceased to be a one-party state, until today, when the ruling party itself is in danger.

The government crisis last week, when six ministers resigned, reflected a cleavage in the Republican People's Party, which has ruled Turkey ever since the revolution. President Ismet Inönü, who succeeded Atatürk as head both of party and state, was induced to give up leadership of the party after the elections last July. In these the newly formed opposition Democratic Party did not win many seats, but it got more than was expected. Since then it has been making itself felt more and more.

The full extent of the split in the People's Party will not be known until November, when it holds its national congress. At a private meeting of its parliamentary group, following the resignations of the six ministers, 47 votes were cast against Mr Peker, the Prime Minister, and 194 for him. Mr Peker has now resigned for "reasons of health." The number of the dissidents, mostly younger deputies, had increased by 13 since a meeting a week before; it is possible that they may break away and join the Democratic Party if their adherents increase. The differences are confined entirely to internal affairs; even in that sphere they are not very precise, and to talk of left and right in this context is meaningless. But the opposition are supposed to be more friendly to private enterprise than the ruling majority.

As all major industry in Turkey is state industry—for industrialisation was due to the state—free enterprise in industry among a nation of peasants means foreign enterprise. The part to be played by foreign enterprise today is a live issue, because there is no group in Turkey which wants to see utilities under foreign control, and none which wants to de-nationalise the basic industries. American military aid to Turkey was in the first place a straightforward inter-Government loan of \$100 million for the purchase of surplus and obsolete equipment, plus expert advice. But it is to be followed by large-scale economic aid, which is what Turkey really needs; and to make this palatable to Congress it seems to be intended that it should take the form of private investment by Americans in Turkish development. This was why the 20th Century Fund appointed Mr Max Weston Thornburg, a US engineering consultant, to direct an unofficial economic survey of Turkey, with particular reference to opportunities for American investment. In June, Mr Thornburg startled a Turkish audience in Ankara by a forthright warning against the "extreme expression of state socialism" which he suspected was lurking in the Turkish interpretation of state control. To carry out the US programme of economic aid to Turkey is not going to be as plain sailing as it was in Persia or Saudi-Arabia.

* * *

Korean Deadlock

Attempts to settle the problem of Korea on an agreed Russo-American basis have again failed. For two months a Joint Com-

mission has attempted to consult with "democratic Korean groups" in order to set up a provisional government for both zones. But the consultations have proved impossible since the Soviet representatives sought to debar "as undemocratic" every Korean group or individual who was not either Communist or a fellow traveller. The Americans also accuse the Russians of seeking steadily to infiltrate into the southern American zone trained Communist labour leaders and political organisers. When they replied to this Soviet move by arresting a number of "left-wing

agitators," as they termed them, the Russians issued a violent statement denouncing the Americans for

"the mass arrests of leaders and the virtual closing down of democratic parties and public organisations of Left tendencies" and for "pogroms of Left democratic newspapers and arrests of workers in . . . the press."

It was against this sulphurous background that the Americans asked that the whole problem of Korea be referred back to the Four Powers who signed the Moscow Declaration on Korea—Britain, China, Russia and the United States. This suggestion was flatly turned down by Mr Molotov, and there for the moment the deadlock remains. But it seems more than likely that the United States will submit the dispute to the General Assembly and attempt to secure an impartial inquiry, or report and recommendations to the occupying Powers on the establishment of a Korean regime and the withdrawal of the increasingly unpopular occupation forces.

* * *

Statistics Without Food

After the recent spate of international conferences passing well-meaning but ineffective and platitudinous resolutions, it has been gratifying to see the Food and Agriculture Organisation at Geneva last week take one step in the right direction. They have decided that the proposed World Food Council, which is to consist of 18 nations, is to be regarded as a long-term institution, rather than as one to be brought into operation immediately. The original intention was that the World Food Council should take over the international allocations of foods and fertilisers from the International Emergency Food Council during the coming year.

It is an open secret that the IEFEC has been more tolerated than cherished by certain governments. But the fault lies not so much with the work of that organisation, which has the invidious task of aligning the requirements of deficit countries to the export surpluses of the producing areas, as with its limited powers. Had the World Food Council been instituted for immediate operation, it could have done no better—perhaps worse. One of the glaring deficiencies at the moment is the lack of reliable international statistics and the absence of accurate authoritative, forward estimates. These data must exist, if countries participating in such an organisation are to have any confidence in its deliberations. And that would require a large and well qualified secretariat.

The World Food Council is now thought of as covering wider purposes, such as ensuring the maximum mobilisation of food for human use, promoting long-term agricultural development and nutritional programmes, reviewing the commodity situations in agriculture, forestry and fisheries and promoting joint activity

among governments. These purposes are laudable and necessary, but no organisation set up overnight can possibly carry them out efficiently. The need of the hour is more food, not new international organisations. When the urgency of the problem is past, then the World Food Council can be organised.

Gambling with Grain

Mr Strachey has decided not to accept the October grain allocation from the United States owing to the dollar shortage. Breadgrain stocks in the United Kingdom are known to be satisfactory; it is thus physically possible to postpone purchase without affecting the bread ration. But the wisdom of such a move is not merely questionable, it is almost imperceptible. Perhaps the Minister of Food imagines that this withdrawal from the American market will have a bearish effect on grain prices; in any case Britain could not hold off for many months without either acquiring an alternative source of supply or reducing domestic consumption.

The question, however, is not one of prices—and what appears to be the Ministry of Food's appreciation is questionable enough—but of supplies. President Truman has already warned the world that the US exportable surplus will be below what was hoped for. With the shortage of feed grains, particularly maize, American farmers are being urged to feed wheat to livestock. Thus by the time Britain thinks fit to come on to the market again, American wheat will be scarce, in spite of the bumper harvest.

However, two possibilities may be in Mr Strachey's mind. Slaughter of livestock in the United States is increasing beyond the normal seasonal expansion, particularly in the drought-affected areas. This increased supply of meat may induce a fall in meat prices and thus make it unprofitable to feed high-priced wheat. But the current rise on the future's market is evidently one to farmers covering their forward feed requirements. If the Marshall Plan goes through, European countries will only be able to purchase grain supplies by competing with American farmers. There is thus no convincing indication that wheat prices will tend to fall; indeed, if Britain must purchase wheat from the United States, it should do it now.

The second possibility is the shipment of 55 million bushels (approximately $1\frac{1}{2}$ million tons) of wheat from Australia to the United Kingdom, which was recently announced by Lord Addison. Before the war, Britain received between 1 and $1\frac{1}{2}$ million tons of wheat annually from Australia, but under the international allocation scheme, the Australian exportable surplus is now shipped to India and the Pacific. It has not yet been divulged whether the shipments to Britain will be additional or not; in any case, they will be deducted from Britain's allocation. But, if this wheat was previously diverted in part to dollar-earning areas, the Treasury will now lose yet more of this scarce currency. If on the other hand, the wheat was sold to sterling countries, how will alternative supplies be provided and from which source? If from America, Britain is surely no better off. Nevertheless, these 55 million bushels should more than balance the loss of American wheat shipments to Britain.

Musicians' Monopoly

To the many thousands who are looking forward to welcoming the Vienna State Opera Company next week, the recent protest from the London Orchestral Association against the engagement of the Vienna Philharmonic Orchestra to accompany the opera season must have seemed offensive and stupid. The Association, it is stated, does not object to concert performances on the stage from foreign orchestras, but it does object to foreign orchestras in theatre pits—which for many years in London have been reserved for members of the Musicians' Union only. In reply, the Covent Garden Opera Trust points out that this distinction falsely implies that less ability is required to play "Don Giovanni" than the "Haffner" symphony. The Trust also states that it has not engaged the Vienna Philharmonic to accompany the opera company, but that it has brought to London the Vienna State Opera ensemble, of which the orchestra is an integral part.

As the Vienna company was billed to appear over two months ago, it may be that last week's protest was a formality to safeguard the musicians' position in the future. But even as such it is some evidence of the obstructive nature of the Union's activities. The standard of much British orchestral playing has been all too slapdash, and at least some of the responsibility for the low standards and limited repertoire lies with the Union for its prohibitive restrictions on rehearsal time. Only international comparisons can

remind the musical public of what standards are possible—the Edinburgh Festival has already had a bracing effect here. International competition is more needed in the sphere of opera than anywhere else.

The statement from an official of the Musicians' Union that they objected to foreign musicians receiving permission to enter and perform, without the Union being consulted by the Ministry of Labour, shows the degree of control which this self-important Union would like to exercise. The ideals of the closed shop, restriction of entry, and self-sufficiency could hardly go further, or be less appropriate. Apparently music knows no boundaries, only trade union demarcation lines.

The Education of a Scientist

It is consoling to the ordinary man to know that the scientists themselves are concerned about the process of evolution of their own species. At the session on "The Education of a Scientist" at the meeting of the British Association last week, a number of distinguished scientists strongly criticised the present methods of teaching young scientists, as being too narrow and specialised. If these lords of their own creation feel misgivings, it is excusable for the man in the street to admire as well as fear their works. The scientists have a responsibility for controlling as well as splitting the atom.

How is it possible to be both a good scientist and a good member of society? The boundaries of scientific knowledge are extending at such a rate that it is becoming more and more difficult to keep pace with the developments within them, let alone know anything outside those boundaries; politics, history, languages, the arts, and even the ability to write decent English prose, become "frills." This tendency towards specialisation is further aggravated by the system of university scholarships, which the universities themselves do nothing to counter. In the scramble for scholarships the wretched schoolboy is squeezed and drilled to answer more and more highly abstruse questions, which a few years ago were only studied at the universities, and is allowed to neglect all that general knowledge and culture which is supposed to characterise civilised man.

To counter this deterioration in general attainments a number of remedies were suggested—to broaden the range of studies at school, to give greater emphasis to general papers in the Higher School Certificate and scholarship examinations, and to improve the quality of science teaching itself. The universities blame the schools and the schools the universities, but there is no doubt that if the universities refused to accept candidates, however technically brilliant, who were unable to express themselves in good clear prose and who lacked all the proper interests of an educated man, they could work a revolution on the schools. Or, rather, they could work a revolution—that the schools can get teachers who can teach. There is at present great concern about the drift of good specialist teachers from the upper ranges of the secondary schools and the lack of new recruits from the universities. The Burnham scales for men with good degrees compare most unfavourably with what such men can get outside teaching—particularly in industry. And at present industry is clamouring for good scientists. Unless, however, the schools get good teachers there is no hope for industry or the universities in the future.

Shorter Note

The further reduction in unemployment which at the middle of August was 247,728, or $1\frac{1}{2}$ per cent of the total insured population, is the most encouraging feature of the Ministry of Labour's latest manpower return. It suggests that in the former black spots of unemployment, the old Depressed Areas of South Wales, Scotland and the north-east coast, the Board of Trade's plans to provide alternative employment are at long last bearing fruit. Unemployment in Scotland is now 54,000, or $3\frac{1}{2}$ per cent of the insured population. In the northern region, the figure of 29,683 is slightly below that of the London and south-eastern region and represents 3 per cent of the insured population. The situation in Wales, with an unemployment proportion of $5\frac{1}{2}$ per cent, is still serious, although it shows a marked improvement on recent months. There, the main need is to find work for women, 7 per cent of whom are unemployed. This figure is a glaring example of the desirability for greater mobility of labour. Satisfactory as are the current unemployment returns, it is inevitable that with the restriction of non-essential production, there will again be an increase in unemployment.

Letters to the Editor

Mr Morrison and Incentives

SIR,—In your issue of August 30th (page 354) commenting on my broadcast of August 23rd, you say—"Mr. Morrison dismissed incentives as 'bunk'." This follows similar assertions in the more partisan Press.

What I actually said was (see *The Listener* of August 28th, page 352):

"People talk a lot about what they call incentives, and for myself I believe a lot of this talk is bunk."

I should be sorry if *The Economist* got into a habit of turning the qualified into the unqualified.—Yours sincerely,

HERBERT MORRISON

[We had no desire to misrepresent Mr Morrison. Even to the inaccurate stronger version of the remark we added the comment "He may be right." And we would be in at least partial agreement with what Mr Morrison actually said. A great deal of the present talk about incentives is bunk. It is, at least, very doubtful whether anything that it is now possible to do by the broadcast distribution of "incentives" would accomplish more good than harm. But this is because of the peculiar circumstances of the moment, and we are glad to notice that Mr Morrison appreciates the dangers of generalising from them.—Editor.]

An Expanded Agriculture

SIR,—Your article on an expanded agriculture in *The Economist* of August 30th was so admirable that it may be unreasonable to criticise. I would, however, like to pursue rather further the question of the Schedule B taxation which the writer of the article summarily dismissed.

If one accepts that the principle guiding taxation should be "from each according to his ability" no case can be made out for Schedule B. If, on the other hand, one takes a more realistic

attitude, there is much to be said for it. In these days taxation is not merely a method of raising revenue, to be spread as fairly as possible over the whole community; it can be a valuable means of encouraging certain types of production and discouraging others. It is commonly agreed that the present method of taxation discourages output, above a certain level, both among employers and employees, whereas what is needed is precisely the opposite—there should be an increasing incentive for production above that level rather than a diminishing one. Schedule B offers just this increased incentive—a farmer's profits up to a certain point bears tax, but any additional effort that he makes, over and above that, is in effect tax free. Such an incentive is not only cheaper, but also far more effective than the increase in prices that has just been announced.

But it would not only be unfair, but also unreasonable, if such an incentive were offered to the farmer alone. It should be offered to the farm worker, and, indeed, to all workers engaged in essential industries. They would then be taxed on the basis of their statutory wage, and anything they earned over and above that would be tax free. The argument against this scheme (apart from the obvious objections to any system of discriminatory taxation) is the reduction in the total amount of money collected by direct taxation. This can either be met by lowering the level at which income tax starts, or by restoring the rate to that which prevailed during the war. In its favour are the clear incentives to increased production among those already engaged in essential industries; the incentive to those engaged in non-essential industries to transfer to the essential ones, without any direct compulsion; the simplification of office work, both for employers and for the Inland Revenue; and the checking of rising wages and prices which cannot be avoided if only orthodox financial incentives are employed.

In the face of these advantages, it is surely for the opponents of Schedule B applied not only to farmers but to employees also

AUSTRALIA'S INTERNATIONAL AIRLINE

The BIG name in Australian Aviation. Partner, with B.O.A.C., in the maintenance of British Air supremacy, Qantas operates modern air passenger and freight services from Karachi and Singapore to Sydney, on the England - Australia Air route—and from Sydney to New Guinea—and Brisbane to Darwin. Qantas helps to make Australia a neighbour to the world.

Qantas Empire Airways
in association with
BRITISH OVERSEAS AIRWAYS CORPORATION **B.O.A.C.**

It takes 560,000 lbs. of Paint to preserve and decorate a battleship of the Vanguard class. The enduring preservative qualities in paint are due, largely, to the chemical preservatives used in its manufacture. Today P.C.M.C. (parachloro-metaresol) is one of the most efficient preservatives used

for this purpose. Monsanto are the only manufacturers of P.C.M.C. in Great Britain.

SERVING INDUSTRY . . .
WHICH SERVES MANKIND

to make out a strong case why it should not be introduced.—Yours faithfully,
H. D. WALSTON.

Thriplow Farms, Cambridge

[We cannot accept Mr. Walston's proposition that the burden of proof about Schedule B rests upon us. He admits that on grounds of equity no case can be made out for it. His arguments for the taxation of farmers' and farmworkers' incomes only up to the limit of a statutory profit or wage may have some justification in terms of incentive, but surely it is against public policy and sound fiscal practice to create a class of privileged incomes which would largely escape their fair share of taxation?—EDITOR.]

SIR,—In your leading article "An Expanded Agriculture" you ask "First, what are the Government's reasons for believing that British exports will never again be sufficient to pay for the pre-war volume of imports?" May I offer a realistic answer from an entirely detached standpoint?

Britain is now committed to a position of external indebtedness on capital account and of a precarious balance in her domestic finance maintainable, if at all, at its wonted levels, by importing raw materials (for processing and export) and food for its work people (or a large proportion of them) whilst they manufacture for export. The countries that supply the raw materials and food on the other hand have largely passed through the initial stages of development and are hard at work, in different degrees, in organising their own primary and secondary industries. Examples are Canada, Australasia, South Africa, Argentina, Brazil and others which are all rich in undeveloped resources—India, China and Japan are not far behind them. All these countries are far distant, and British commerce with them involves voyages across at least one ocean. This is the crux of the position, and those who cannot realise it have failed to cross the *pons asinorum*. British exports, in competition with the output of the primary and secondary industries of the developing countries, are handicapped by the cost of (a) freights and insurance for a double transoceanic voyage, and (b) high wage rates and almost paralysing taxation applicable to the processing in Britain of the imported raw materials. Can British industry and commerce with such a handicap still win through?

A final factor is that the most welcome of British exports to the developing countries is the export of skilled labour, craftsmen, organising engineers and technicians. They will get excellent terms and prospects. But their departure marks an economic loss to Britain.

I submit that on broad lines, this is the true picture.—Yours faithfully,
HENRY HARRISON
Stephen's Green Club, Dublin

SIR,—Your article on "An Expanded Agriculture" ends by claiming that

the British industrial consumer, by his failure to produce efficiently for export, has deserved to reap this bitter harvest. But he has at least the right, before he agrees to this new policy, to demand the fullest and most convincing answers to three sets of fundamental questions.

I am not quite sure who "the British industrial consumer" may be, but is not the most fundamental question for every food consumer the one which our rulers ought to have asked themselves two years ago—Where Is the Food to Come From? If at last they have been brought to realise that there is, in substance, only one answer, they are surely to be congratulated, not accused of advancing a "doctrine of despair." For there could be no despair greater than that which would be engendered by an indefinite period of sub-nutrition pending the miraculous return of world agricultural conditions which have ceased to exist.

May I suggest, with all respect, that it is the writer of the article who should be asked "fundamental questions," such as

(a) What grounds he has for stating that "it is as good as certain that world prices for food will fall, and fall heavily, before long"? Is this not precisely the sort of wishful thinking which has produced the present food crisis?

(b) What he means by agricultural "efficiency," bearing in mind that the number of acres of fertile land at our disposal are strictly limited, while our need for food is great and is increasing?

(c) What alternative to higher prices and extra capital he has to put forward as a more "economical method of procuring additional food supplies"?

(d) Whether he read the new Agricultural Bill before asserting that there are "no sanctions to ensure good farming"?

(e) What he expects farmers to do other than "their reasonable best"? Is not this what everyone is being urged to do?

(f) What grounds he has for bracketing "tradition and inefficiency," and for claiming that the small farmer is "steeped" in them?

(g) Why he implies that it is somehow reprehensible in such farmers to "pay off debts and put by profits for retirement"?

(h) Why he is so perturbed at the projected increase in cereal acreages, seeing that cereals are essential, not only for human consumption, but for feeding the livestock and poultry of which he seems to approve?

(i) Why it should be "certain beyond doubt" that an increase in the production of essential wealth "will mean a further, and permanent, reduction in the British standard of living"?

Some considerations which should be of interest to your contributor (and readers) are to be found in "The Case for the Full Development of Agriculture" published by the Rural Reconstruction Association, and in the Memorandum on Food Production prepared by the Research Committee of the Economic Reform Club and submitted last winter to the Ministers of Food and Agriculture.—Yours faithfully,

JORIAN E. F. JENKS

Walnut Tree Manor, Haughley, Suffolk.

Italy's Former Colonies

SIR,—Having recently returned from serving with the British Military Administration in Somalia, I should like to comment on the correspondence arising from the article in your issue of June 28th. I find it disturbing to read such palpably partial views as those of Professor Bentwich and others who use Ethiopia's former misfortunes to put forward specious arguments for the transfer to her of neighbouring Italian Colonies. Of Eritrea, where the position is admittedly somewhat different, I am not qualified to speak, but I am certain that the future of Somalia does not depend upon Ethiopia.

Certainly Somalia is "an unappetising desert," but, as Mr Cora points out, great efforts had already been made to develop the territory agriculturally where possible; indeed, by the outbreak of the European War, a considerable quantity of bananas and citrus fruits, as well as some cotton, was being exported to Europe. The

majority of the farmers were *bona fide* settlers, no less than the British in the so-called White Highlands of Kenya, in spite of assistance by the Italian Government, notably in the construction of an extensive irrigation scheme at Genale. Until the Ethiopian war brought in hordes of gangsters and thugs recruited by the Fascists, together with their camp followers, there was no evidence of any more harsh treatment of the natives than can be found in colonies of other nations. Even if the war did result in compulsion of labour, with some attendant ill-treatment, there was full employment. The absence of this now is clearly reflected in the general lawlessness in Mogadishu and other towns.

As Professor Bentwich apparently recognises, the Somalis, essentially a nomadic people, are not ready for self-government, in spite of recent ostentatious demonstrations to the contrary by the vociferous Somali Youth League. The alternative propounded by the admirers of Ethiopia (whose Government has difficulty in keeping its own house in order) is that Somalia should be "linked" to Ethiopia, to which it is "historically, ethnically and economically attached." It would not be impossible to show that these attachments are not so strong as they appear, but there is a more important consideration—religion, not to mention the language difficulty. It is noteworthy that the handful of Ethiopians resident in Mogadishu are unpopular with the majority of Somalis, and there is certainly no widespread desire for closer contact.

The statement in the British official publication *The First to be Freed* that the Somalis "had a positive hatred for their ex-masters" was a particularly unfortunate one. The authors may have intended it to have a wartime propaganda value, but it is more likely that they mistook contempt for hatred. The Somalis had seen a well-equipped European army defeated after a brief campaign, and the reaction was naturally a feeling of admiration for the conquerors. Six years of an amateur, if well-meaning British Military Administration has disillusioned them, but it has not led to a desire for union with Ethiopia or for immediate independence. On the contrary, there is now a considerable proportion of the population more favourably inclined to the Italians than to the British. Italian is widely spoken by all classes in Mogadishu and other places, and Italian influences are still strong. A democratic Italy, under adequate supervision, could do much towards developing a backward territory, at the same time preparing the Somalis for eventual self-government. An Ethiopian overlordship, on the contrary, would be as harsh and corrupt as ever the Fascist rule is alleged to have been. However, the main requirement for all the Colonies is speed, and the longer they are left under make-

shift administrations, starved for both funds and policy, the more difficult it will be to implement whatever decision is finally taken.
Yours faithfully,

ERIC H. DODSON

The Knoll, Ladythorn Crescent, Bramhall.

"Premium Days" in Engineering

SIR,—I should like to reply to the point raised by Mr L. D. Levy in your issue of August 30th in regard to the loss of production in engineering and allied industries consequent on the so-called "premium days."

I can only assume that Mr Levy's criticism of the effect of these "premium days" is based on his experience of a particular district where there is no local "holiday week" and the balance of the premium days over the ordinary Bank Holidays falls on the days immediately following the Bank Holidays. May I, therefore, enlighten your correspondent on the position obtaining on the North East Coast and in the majority of areas where there is a traditional holiday period?

Certain Bank Holidays are agreed premium days. The balance of premium days, in the period prior to the holidays-with-pay agreement fell within the local holiday week, in this area Newcastle Race Week, i.e., Tuesday noon to Saturday noon. Subsequent to the introduction of holidays-with-pay and the staggered holidays scheme, the premium payment days were transferred from Race Week to the official holiday week of the firm concerned, and they are not paid at overtime rates unless they are worked during the holiday week. That is to say that although Race Week is the last full week in June, if a firm's holiday week is fixed for the last week in July, then overtime payment is only made to those workers who are called upon to work any part of the period from Tuesday to Friday during the last week in July. In no case, obviously, does this involve more than a few necessary maintenance workers, and there is no loss to production.

If the position as stated by Mr Levy obtains in certain districts, then may I suggest that the obvious remedy is in discussion between the local engineering employers and the Confederation of Engineering and Shipbuilding Unions for the purpose of agreeing a transfer of the premium days, other than Bank Holidays, to the recognised holiday week?—Yours faithfully,

MARJORIE NASH

43 Hillfield, Monkseaton, Northumberland.

Books and Publications

Philosophy and the Sociologist

"Reason and Unreason in Society. Essays in Sociology and Social Philosophy." By Morris Ginsberg. Longmans, for the London School of Economics and Political Science. 327 pages, 15s.

THE title of Professor Ginsberg's book is really an *ad hoc* invention to cover a mixed bag of occasional writings scattered over sixteen years. The form of the book, in fact, rules out sustained or developed argument. Its sixteen essays are loosely strung together, and vary much in subject, scale, and success. It is difficult to avoid broken interest, and not until the reader has plodded a pedestrian course through the first third of the book does he begin to discover the distinctive traits of the author's thought. A dull book is a likely verdict from the casual reader—which is a pity, for somewhere about page 100, Professor Ginsberg begins to write as if he had something to say, and the last two parts have a good deal of meat to compensate for the bread at the other end of the sausage.

To be frank, Professor Ginsberg is much better at developing his own thought than at making other people's ideas interesting. Nobody is likely to be fired with enthusiasm by his account of the problems and methods of sociology or the sketchy review of the recent tendencies in sociology. It is the brief paper on Social Science and Social Philosophy which first comforts a reviewer's flagging sense of duty. Professor Ginsberg argues, with the conviction born of long experience of teaching, that a separation between the questions of fact dealt with by the social sciences and the questions of value dealt with by social philosophy tends to produce a distorted view. The fledgling sociologist, untrained to handle and weigh judgments of value, hovers between scepticism and dogmatism. (Professor Ginsberg's first epigram in one hundred and twenty-three pages marks his quickened interest. "They either conclude that moral judgments do not permit of rational analysis but are matters of taste or feeling about which

there can be no argument, or else they accept the now fashionable dogma that value judgments merely express the needs of the dominant sections within any given community." But these are both large assumptions, not to be swallowed uncritically; they need discussion and examination. Here is the importance for the sociologist of a philosophical training which would enable him to bring out into the open and test disreputable prejudices and hidden assumptions disguised too often by talk about the moral neutrality of the social sciences.

In half a dozen of the later essays in this book Professor Ginsberg shows with real success the fruitfulness of philosophical method applied to social problems. What he does is to take some large topic like National Character, Anti-Semitism, the Causes of War, the Idea of Progress, each of which has become encrusted with prejudice and obscured by muddled thinking. He then examines, with patience and lucidity, the different views that are held about these topics, disentangling the self-contradictions and laying bare the improbable assumptions which they involve. At the same time, he has a shrewd eye for the underlying truth contained in facile and well-worn generalisations on such matters as national character. This essay on National Character and the concluding lecture on Moral Progress show Professor Ginsberg's method at its best. It is quiet and unpretentious—deceptively so, perhaps—without any displays of intellectual fireworks or gaudy paradoxes, but it has the effect of leaving the reader a good deal clearer about the issues involved in these much-thumbed problems.

Professor Ginsberg at one point refers to Bertrand Russell's remark that if only men could agree about matters of fact, they would find their disagreements on judgments of value far less formidable than they commonly imagine. One of the chief justifications of the social studies is the very considerable area which the pioneers in such studies as anthropology, comparative morals, comparative religion and the investigation of social customs and conventions have reclaimed from the quicksands of controversy.

In these later essays Professor Ginsberg suggests further ways in which the most controversial questions can be simplified by the cool scientific investigation of questions of fact hitherto treated as matters for inspired guesses or simple dogmatic assertion. His own analysis illustrates no less clearly the advantages of clear, critical, disinterested thought, even when neither very profound nor original, over the intellectual muddle of the woolly-minded and the specious simplifications of the partisan.

Middle Eastern Minorities

"Minorities in the Arab World." By A. H. Hourani. Issued under the auspices of the Royal Institute of International Affairs, by Oxford University Press. 140 pages. 10s. 6d.

THIS is an excellent study of the position of religious and racial minorities in the Arab world, which was completed in the first half of 1945. The author excludes from his field of study the question of European Jews in Palestine and the relation of Sunnis and Shi'ah in Iraq.

The first part of the book is devoted to a general description of the minorities, their historical background and their several problems. The effect of increased interference by the Great European Powers in the Middle East from the decline of the Ottoman Empire onwards and how this has largely conditioned the outlook of many of the Christian minorities in the Levant and their relationships to the majority is clearly brought out. The effect of increased trade with Europe and America, leading to the growth of a new type of minority, is described and also the spread of Western education, which further widened the gap between the Christian minorities and majority. The author has some interesting remarks to make on the attitude of Moslems to Western civilisation, the effect of the rise of nationalism on the position of the minorities, the influence of the examples of Turkey and the USSR after the first world war, and of social change within the Arab world itself.

The second part of the book describes the position of the minorities territory by territory and brings out the conflicting trends both among the minorities themselves and in the attitude of the majority towards them. The author regards the Christian-Moslem problem of the Levant states to be largely a question of Franco-Arab relations, while he considers a settlement of the relation of Sunni and Shi'ah and of the relation of Iraq to the rest of the Arab world fundamental to a settlement of the minority problems of Iraq.

The immediate problems of the minorities are seen, not in isolation, but as one aspect of the prevailing instability of the political life of the Arab world. The author considers certain essential guarantees necessary to enable the minorities to lead a normal and healthy life, and believes that a prerequisite to the ultimate solution of the problem of the relationship of the different communities, which must take place, not only in the political, but also in the intellectual and spiritual sphere, is a solution of the problem of the instability of indigenous governments.

Was Hess Mad?

"The Case of Rudolf Hess." Edited by J. R. Rees, MD, FRCP. Heinemann. 224 pages. 12s. 6d.

WHEN Hess stood up in the dock at Nuremberg on November 30, 1945, and said, "The reasons why I simulated loss of memory were tactical," the world laughed; but some withheld judgment. They reflected that it is often impossible for the unstable man who, for example, is invalidated for psychiatric reasons from the Army to face this failure. How much more satisfying for him to believe that he has "worked his ticket." That their caution was wise is clearly shown by this book, in which Hess's background and personality, his behaviour and state of mind while in this country and at Nuremberg are fully described by the psychiatrists who looked after him.

Although the approach is medical and the account strictly a case-study, the political motives for his flight are not ignored because, in the event, they proved to be so psychopathological. In the main the language used is suitable for the layman as well as the expert, apart from a highly speculative chapter devoted to the psychopathology of the case which, written in the customary jargon of the subject, will be difficult for many to understand; and a clear picture of Hess steadily emerges from the day-to-day accounts of those who lavished such care upon him.

Medically the main interest centres on the diagnosis. His persecutory beliefs, expressed time and again in interviews with his doctors, in the statement he wrote in England in prepara-

tion for his trial, and finally in a letter permitting publication of this book, and the abnormal behaviour based upon these fantastic beliefs, could only have led, had he been an Englishman, to his certification as insane. Delusions of this type, however, have always to be evaluated in terms of the culture in which they have grown up. Can Hess be called mad, if his persecutory delusions, which led him to believe that he was being poisoned and tortured, are considered in relation to the highly abnormal environment of Nazi Germany? With one or two dissenting voices, the doctors have concluded that he was not mad, in the strictly medical sense that he was not suffering from a progressive paranoid psychosis. His illness, for that he suffered from a mental illness there can be no doubt, was a reaction of a highly unstable personality to the imminence of his failure in his own country, and to the stress of having his mission rejected and of being detained as a prisoner of war. This view accords with the results of the psychological tests carried out on him at Nuremberg and with his transient hysterical symptoms.

Hess had little or no insight into his delusional illness, and his claim to have been malingering referred only to his periodic losses of memory, relatively unimportant episodes in his case history. When he "recovered" so dramatically during his trial, all the facts related in this interesting book were known to few. The doctors have had the last laugh, for the expert commission which examined him before the trial explicitly stated: "the amnesia of Hess may end upon his being brought to trial."

Cartels Analysed

"The Aluminum Cartel." By Louis Marlio. Brockings Institute (Fabers). 129 pages. 9s. 6d.

"International Cartels." By Ervin Hexner. Pitman. 555 pages. 30s.

It is nearly time for writers on cartels to form a cartel themselves with a view to avoiding duplication and exchanging technical information, if not to allocating markets and restricting production. The formidable bibliography already existing, to which was added within the last month Professor Whittlesey's excellent study "National Interest and International Cartels," has now been strengthened by two new volumes, also from the United States, covering much of the same ground, though from instructively different angles. Professor Hexner's encyclopaedic work consists, as to half its length, of appendices giving the actual texts of cartel agreements, and thus provides a body of material for study more solid than anything in the contributions of his rivals or colleagues. The study proper has the dispassionateness and apparent inconclusiveness of a judge's summing up—it is for the jury to decide. Mr Marlio, for twenty years managing director or chairman of the French Aluminium Company and for thirteen years chairman of the International Aluminium Cartel, supplies an authoritative apologia for his organisation's policy, backed by production statistics, price analyses, and detailed examination of inter-company negotiations and relationships.

Despite a natural difference in approach, the two authors reach, explicitly or implicitly, very similar conclusions. Short of a complete change in public attitudes, in international trade policy, in commercial and patent law, cartel agreements, formal or informal, are bound to exist. Such agreements may result in a net restriction of trade, in exploitation of the consumer, in penalising progress, in strangling technical advance, and all the other traditional crimes of monopoly. But they need not; on the contrary, they may diffuse the best techniques, fruitfully marry inventions, and pass on to consumers the benefits of a rational and well-integrated co-operation. Mr Marlio claims, with evidence, that, apart from a shortlived and financially disastrous buccaneering period forty years ago, that is precisely what the Aluminum Cartel has done; and Professor Hexner, in dealing with that industry, says nothing to contradict him. But Mr Marlio, like Professor Hexner (and Professor Whittlesey) is unwilling to leave to the leaders of cartelised industry the power to combine in just such ways and for just such ends as they choose. Combination must be for promotion of trade, not for its restriction, the terms of agreements must be subject to authoritative scrutiny, and the authority should be international perhaps an agency parallel to, or actually deriving from, the International Labour Office, thinks Mr Marlio; perhaps carried on by individual Governments working under an internationally agreed convention, thinks Professor Hexner. Possibly Mr Marlio, arguing from the experience of a cartel dealing with a product of highly elastic long-run demand and thus constantly led by self-interest to expand rather than to restrict, is over optimistic. But that experience, and the large measure of agreement between him and the more academic students of the question, are encouraging to hopes of a solution.

AMERICAN SURVEY

Military Republic?

(From Our US Editorial Staff)

THE Eisenhower-for-President boom, publicised to coincide with the American Legion Convention and corroborated by a Gallup poll, offers an occasion to speculate on the extent to which the United States is becoming a military republic.

Running a victorious general for the Presidency is an old American custom. It began with Washington, though the better part of a decade elapsed between the end of the actual fighting and his inauguration, during which he performed a not inconsiderable civilian service as chairman of the Constitution-making convention. It happened again after 1848 and 1865; Teddy Roosevelt's Rough Rider charge up San Juan Hill helped him on the steeper ascent to the Presidency; and, if Pershing's cold correctness failed to turn into a candidacy, it was not for want of ears hopefully kept to a ground that echoed no stampede in his direction.

No one is sure if General Eisenhower is a Republican, however natural it appears to the group that for some time has been working for him in Kansas. But the respective supporters of Mr Dewey and Mr Taft must be wondering if he is not a very threatening alternative to their success on an early ballot. An Eisenhower-Stassen ticket, it is admitted, might be popular enough to reduce Democratic certainties to South Carolina and Mississippi (it would offer the one circumstance in which Mr Stassen could run with dignity in the second spot). But unless the need for that much popularity were very clear, it is

unlikely that the regular party stalwarts would want a bandwagon on whose front seat room was not made for one of their own number—Mr Martin, for instance.

In disclaiming his candidacy some months ago, General Eisenhower pointed to his past as a professional soldier. Yet it is unlikely that the charge of being a military man would be made with much conviction against him. Perhaps because of his Guildhall speech at war's end, perhaps more because of a public friendliness unalloyed by brass, he is assumed to be in accord with civilian views about a proper relation between a democratic country and its armed forces. Secretary Marshall, too, whose declaration of no political ambitions on accepting civilian office was taken seriously, is credited with a similar devotion, perhaps indeed more finely tempered, to a civilian society.

So there is not much to the idea that the election of General Eisenhower would be a move in the direction of a military republic. But that is not to say that signs of a military republic are not visible in the United States. The maintenance of lively democratic institutions under the shroud of a necessary military security is no easy matter.

A number of the trends toward a military republic were begun for reasons irrelevant to the issue. It is an anomaly for a country that fondly imagines itself to be non-militarist to have the civilian functions of its government exercised through

BRITISH NEWSPAPERS AND THEIR CONTROLLERS

by VISCOUNT
CAMROSE

Lord Camrose, who controls the Daily Telegraph, gives in this book all the facts that anyone could wish to know about the daily newspapers and 'opinion forming' weekly periodicals of this country: the origins of each paper, its circulation, who ran it in the past, who owns it now, what other interests are controlled by the same parties. The Royal Commission will discover little of consequence about Newspaper ownership which is not to be found in this book.

MINORITIES IN THE ARAB WORLD

by
A. H. Hourani
10s. 6d. net

(Published under the auspices of the Royal Institute of International Affairs)

This is a comprehensive study of the minority problem in Egypt, Palestine, Transjordan, Lebanon, Syria and Iraq. Mr. Hourani marshals his facts with deep knowledge and admirable lucidity. In his final chapters he outlines what he holds to be the essential safeguards, international as well as national, for the minorities of the Arab world, and makes proposals about the machinery which should be set up to ensure their realization.

the army in the occupied territories abroad. Yet the anomaly was produced not by a grasping military but by the refusal of the State Department to take over. Mr Byrnes's horror of being a bureaucrat was evidenced first in his determination to keep the Office of War Mobilisation (of which he was once the head) a co-ordinating and not an operating agency; as Secretary of State after VE-Day, he declined responsibility for Germany on the ground that his was a policy-making department only, and that the army had trained men. Actually, the "point" system of demobilisation had decimated the Military Government. Nor has the trend stopped: the recent decision to close down the US Commercial Co. has consigned the inhabitants of the Pacific Islands to rule by a reluctant Navy.

As a result, the decisions taken in Tokyo and Berlin are taken by generals, neither of whom is lacking in top brass quality and both of whom are advised with a certain reticence by their superiors in Washington. Necessarily, they are available to the State Department for pro-consultation only through the intermediary of the War Department, which recalls General Marshall's wartime rule of non-interference with a commander in the field.

More important perhaps than the attitude of the professional military men is the attitude of the business men who worked closely with them during the war and who are still—or again—in governmental posts. Their only previous government experience was in circumstances which made it unnecessary to say much, under security regulations which made it desirable to say little; they would be less than human if, beset by bone-breaking problems, they did not now feel a nostalgia for the days when to say of a policy that it would contribute to the winning of the war was enough to get consent from the country at large and in tangible dollars from Congress.

Moreover, their Hamiltonian background—Wall Street alone has contributed Mr Lovett, the Under-Secretary of State, Mr Saltzman, the Assistant Secretary of State for Occupied Areas, Mr Forrestal, the Secretary of Defence, Mr Draper, the Under-Secretary of the Army—is a background in which conversations

in closely held confidence are normal ways of getting things decided, and selling the country on the result is a project for the advertising men at a later date.

A transfer of this pattern is currently visible. The constant contact between those responsible for politics and economics as instruments of foreign policy and those responsible for the use of military instruments, lest commitments get out of balance with capacities, means that the officers of the State Department and of the new tripartite departments of defence now form the same sort of little cabinet that the heads of agencies concerned with domestic economics formed during the early New Deal. The resulting foreign policy of the United States is discussed by them with great candour, in confidence, with small numbers of responsible individuals. Osmosis being what it is, a considerable group of top people of one sort or another are thoroughly apprised of the way affairs are shaping. But the country at large is not.

The drying up of the Presidential press conference under Mr Truman, and the post-war persistent overclassification of departmental documents are making it more and more difficult for the Washington correspondents to do a good job. And the pertinent officials are doing next to no job. Next to no job, that is, on explaining general policy, inducing the overall understanding that gives a country a sense of direction.

By contrast, a smartly tailored job is being put out to sell the country on several specific parts of general policy. Most of the major government departments have lobbies related to them. The Isaac Walton League and other conservation-minded societies keep a benevolent eye on the fortunes of the Department of the Interior. The Department of Agriculture does not move far without the Farm Bloc. In the 1948 Budget \$11,256 million is destined for national defence, not counting the \$7,343 million for veterans' service and benefits, which has a special lobby of its own. The relations of the military to the country, after total war and in uneasy peace, are so different in scale from what they have been before as practically to be different in kind. Contacts with industry, contacts with reserves

and, most important, contacts that reach down into the communities of the nation are making people support the armed services in a new way. The most overt salesmanship has been applied to universal military training; the Army's trial run at Fort Knox earlier in the year was publicised with blandishments comparable to the advertisements for tooth paste and soap powder, assuring the great American mamma that her boy will have plenty of chaplains and not too much liquor.

It is possible that these paternalistic assurances are not what the country wants. Most of its doubts about the value of universal military training, of which a recent Gallup poll finds a majority in favour, have concerned the suitability of the training to be given to the requirements of modern war; the change from the Army-sponsored Bills introduced during the war to the Army plan for military training announced last autumn indicates a tempering process due in no small measure to civilian insistence. It is a process which many civilians believe it is important should continue, not only on theoretical grounds of the relation of the military to a democratic society, but also on grounds of the quality of resulting decisions.

The qualms about the beehive state which are being felt in Britain in connection with direction to work, even by consent,

have a counterpart here in connection with the report of the President's Scientific Research Board, issued on August 27, which recommends the annual expenditure of one per cent of the national income by 1957 on research and the training of scientific manpower. The need for such research is clear with an awful clarity. Yet the inducement to specialisation thus offered is currently unparalleled by comparable concern for the capacity to make overall decisions. Science can furnish material, and without it, in topnotch quality, a nation is nothing. But there are similar variations in quality in decisions taken on how to use material. And unless the training of specialists is accompanied by the training of generalists, the alternative, some day, might be to make do with generals.

The country has an uneasy sense of the gravity of its situation. But it by no means regards its situation as warranting abdication of the power of decision. Unless those in the know share, and offer for national debate, the maximum that can be shared of their knowledge, the sources of consent will dry up and the country will express its ignorance through Congress. Does the quite exceptional skill which has been shown to date in handling the close-in phases of the Marshall Plan have a broader counterpart?

Power on the High Plains

(From a Correspondent in Colorado)

ONCE, shortly before he died, George W. Norris, for many years the leading progressive influence in the Senate, was interviewed by a reporter at his home in McCook, Nebraska. Naming several institutions for which Norris was largely responsible, including the Tennessee Valley Authority, the reporter asked him which in his opinion would be most valuable and enduring. He seemed a little disconcerted. Finally he said, gently: "You forgot the REA."

Norris's choice is understandable. The Rural Electrification Administration, of which he was the principal architect, has probably brought more prosperity, happiness, and freedom from exhausting toil, to more people than anything else which he helped to bring about. It is noteworthy that, with all their savage cries against the "New Deal" and promises about what they would do to its projects if they got into office, the present Republican Congress has hardly touched the REA. Appropriations enabling it to make loans to extend electrical service to more rural dwellers total one-fourth of a billion dollars for the fiscal year 1948, nearly all that was asked for.

Under REA, the government loans money at two per cent interest to qualified co-operative associations of farmers and small-town dwellers, who use it to provide themselves with electrical power facilities. When they have paid back the government, the power facilities become their own property. REA originated in 1935 to extend electrical service and its accompanying benefits to people comparatively neglected by the private power companies. The neglect was not so much because of the poverty of rural dwellers as because, in the country, the distances between customers require an extraordinary amount of line and other equipment per customer.

A typical REA area is the seemingly limitless prairie of the High Plains in Eastern Colorado. The vast over-arching bowl of the sky seems to dwarf the flat earth, on which in any direction the eye meets nothing to break the horizon save the grain elevators that rise here and there like mediæval towers. To the town-dweller this land is frightening. It is savage, and the almost untamable. Abused, it strikes back. Every year the savage lash of hail destroys thousand of acres of crops. Millions of tons of this land blew away during the "dust decade," but when the rains came back, those who had stubbornly stuck it out began to cash in. This year this land has borne its greatest and most valuable crop of all time.

A recent visitor found that the incessant and almost awe-stricken discussion of the greatest of wheat crops, then coming

in, shared attention with only one other topic, the full implementation of the Highline Electrical Association, REA, with headquarters at Holyoke, Colorado. Highline covers the whole Northeastern corner of Colorado and a bit of Southwestern Nebraska. Its area is about 7,600 square miles. Eventually it will supply some 4,000 customers, including virtually all farms and the dwellers in seven tiny villages, that means about two customers per mile of its eventual grid—the statistic is enough to explain why the private power companies never bothered to serve the area. Highline has 985 miles of line now activated, serving about 2,000 customers. There are 362 miles lying ready, but with no power supply. It has a Federal loan of \$600,000 with which to build another 600 miles of line. It has borrowed \$1,848,000 from the Government, on which it is repaying principal and interest at the rate of \$60,000 yearly. It has a surplus of \$50,000.

For years Highline's officials and customers have dreamed of "the big power from the mountains." Hitherto they have had to make out with power from three small municipally owned plants and from one private company. This has not been enough, and the rates have been high. The average wholesale rate has been 1.6 cents and the retail charge \$9.80 for the first 200 kilowatt hours (about 3d. per unit).

But in the Rockies, dimly visible on the Western horizon on very clear days, the government has been building large multi-purpose dams that pour out really "big power." The Bureau of Reclamation has planned grids to carry this power far out on the plains, to the town of Holyoke, for example. The private power companies, perennial opponents of REA, had strength enough until last year to prevent appropriations for this grid. But the 79th Congress finally provided the money, and the "high-line" is being built. Holyoke hopes for it in time for Christmas. Wholesale rates will then go down to 8.5 mills—still 50 per cent over TVA rate but a boon to this power-starved area—and cheaper power will flood into farm homes. Salesmen of electrical appliances are already swarming into the region, taking "down payments" on everything from washers to feed-grinders. Farmers estimate that just to be on an REA line adds some 10 per cent to the value of a farm. Highline now sells about 3,500,000 kilowatt-hours yearly. Sales are estimated to run to 12 million Kwh yearly when the new power is available, with use by rural small industries, as well as for farming.

There are now some 900 REAs like Highline, some smaller,

some very much larger. The government has lent them about a billion dollars, two-thirds of which has already been spent for line construction while the rest awaits delivery of construction materials. Approximately half a million miles of line have been energised, and 1,700,000 consumers have been connected.

The programme is spotty. South Dakota and North Dakota, vast plains states, have only 15.8 and 13.6 per cent of farms electrified as against 95.5 for Connecticut and 79.3 for Utah, for example. Generally speaking, the states of the Deep South and of the Upper Missouri River Basin have lagged behind. One criticism advanced against REA is that, by bringing electric power to them wherever they are, it tends to fix people on the land whether or not their presence is economically and socially desirable. Thus, in the case of some High Plains areas, there is a question whether it is actually for the national good to have unstable soil with scanty rainfall exploited as farm land. Elsewhere, too, there are marginal lands where the application of either human energy or horse power is of dubious value. On the other hand, a major argument for the REAs is that in many areas they make possible, for the first time, effective operations with justifiable returns.

Private power companies are still fighting REA, though in many cases they have no desire or ability to serve its areas. Where they cannot stop the REAs themselves, they execute a strategic retreat, attempting to dominate their sources of supply. They have fought the extension of publicly owned transmission lines from the government dams. When they are faced with public competition, they have in many cases cut their rural rates deeply, both at wholesale and retail, and extended facilities. Since the beginning of REA the percentage of farms with electricity has increased from less than 11 per cent to about 57 per cent.

In a very few cases, REA co-operatives have been unable to make a go of it, and have sold out to private companies. But most of them are exceedingly strong, and are well ahead on their government commitments. When those are paid off, and the co-operative becomes the sole owner of the system, rates can be cut again. REA engineers and those of the Bell Telephone system, in co-operation, have worked out the principles by which telephoning may be done over power-lines, thus making telephone service available to farmers who have power-lines but no telephone lines.

American Notes

Interim Aid

The steady accumulation of "distress reports" from Europe this week forced a still reluctant Administration to admit that interim assistance must be given on a scale that could not possibly accrue without specific sanction from Congress. In his carefully worded statement in Washington on Wednesday, Mr George Marshall put on all possible pressure apart from calling for a special session of Congress—and that was beyond his power. There can be no doubt whatsoever now that Mr Truman will recall Congress as soon as material is available for study by the appropriate committees.

In fact, moves towards a special session have been taking place for some days now, following Mr Lovett's first admission a week ago that European events would demand a telescoping of the Congressional time-table. The Senate Appropriations Committee will meet on September 20th "to discuss financial policy in Europe," a move that followed discussions with Mr Kenneth Royal, the Secretary for War, and other departmental heads. A good many weeks must still elapse before the way is clear for any sort of appropriation by Congress. The report from the European Economic Committee must be dovetailed into the estimates submitted by the State Department, the special Congressional committee now in Europe, and the committees appointed

by President Truman. But, as already suggested here, the European Committee's estimate of about \$21 billion now accords quite closely with the higher range of figures submitted earlier by the State Department, and it is said that Mr George Kennan, the special State Department delegate to the European Committee, has also submitted a similar total for minimum aid over the longer-term.

Mr Marshall was careful to stress that "interim aid" would represent, not a simple stop-gap device, but part of the longer-term programme on which Congress would require more time for study. There seems now to be every reason to believe that Congress will be sufficiently impressed by the plight of Europe to sanction the short-term programme as expeditiously as possible, though any fuller programme will not secure assent without considerable opposition, not only from the incorrigible band of American firsters, but also from a number of sincere and able men who are entirely puzzled by the swift pace of events, and by the seeming inability of Europe to make more of a concerted effort on its own behalf. To overcome this opposition President Truman will no doubt stress once again the purely political consequences of European failure.

The Administration's new move rules out the possibility of a stalemate between the executive and legislative branches that might have followed from a decision to use specific funds of the Administrative agencies for stopgap treatment, pending a Congressional vote. It is true, of course, that substantial funds are available through the Reconstruction Finance Corporation and the Export Bank; little short of \$3 billion in fact. But such an evasive measure would have stiffened Congressional resistance, as Senator Vandenberg showed plainly in a speech last week. The RFC funds may now be used to save a little time, between a Congressional vote on an assistance programme and the actual appropriations vote. But approval of the programme will also bring sanction for direct Treasury operations within a short period.

An ominous reaction to Mr Marshall's declaration concerning the threat of "intolerable cold and hunger in Europe" has been the fresh rise in Chicago grains, which have been advancing steadily since European reports began to stress the gaping deficiencies in 1947 crops. September wheat in Chicago is up from \$2.61 to \$2.78 in a week, and maize from \$2.50 to \$2.63 (an all-time record). For the time being, nothing can stay new high levels for all grain prices, meat, and dairy products, and organised labour is even now pressing for still further wage concessions.

Exports Down Again

Preliminary figures for July show the expected further decline in exports to \$1.1 billion—unaccompanied by any general setback in price-levels. This level is 8 per cent below the June figure of \$1.2 billion, and about one-fifth lower than May which brought the post-war peak.

These figures have naturally aroused fresh discussion concerning a turn of the business trend. On any assessment, of course, it is quite clear that US industry has now passed the phase where foreign countries could afford to take whatever goods were on offer in New York ports. The stringent controls now governing shipments to Latin America are arousing real concern to many exporting concerns. Unless Congress acts much more generously on the Marshall programme than it would be realistic to expect, exports certainly will not be maintained at about recent levels without further considerable drafts on other countries' gold and dollar reserves, coupled with very substantial remittances by American citizens in the form of tourist expenditures and dollar gifts. In other words, it must take some time before there is any considerable relief through an increased level of US imports, and quite apart from the inability of Europe to speed production, there is no sign of any radical revision in domestic tariff policies.

If Congress supports Mr Marshall but delays the final appropriations, something like an export slump is still more certain, while failure to give substantial assistance would in all probability bring the further "freezing" of loans from such agencies as the World Bank and the Export Bank, since these institutions are professedly built as "non-political" units, and have certainly given any earlier relief only after the most rigid checks.

These considerations do not give any precise answer to the question of how far an immediate export decline will affect the general level of industrial activity. Most observers now expect that activity will be maintained at high levels for some while yet. But some stress is being put on the fact that the seasonally adjusted

Federal Reserve Board Index of Industrial production (1935-39) is now back to 178 against a post-war peak of 190 in March. This index has now fallen over four consecutive months, the July decline being attributed partly to holidays and raw material shortages. Moreover, civilian employment in August fell slightly below the 60 million level held both in June and July, though non-farm employment was actually higher, and unemployment no more than 2,100,000.

Reserve Board officials now predict that August production figures will be better, and most observers are unwilling to give clear-cut forecasts when so many earlier predictions have been falsified by events. None the less, it may be said that the US economy over the next few months at least will ride a rather precarious trail, and might quite easily face some untoward developments before 1947 is through.

Getting Up Steam for 1948

In holding the first nation-wide political rally on the air the Democrats have served notice that the campaign of 1948 is on. They have, of course, one advantage over the Republicans: they know their candidate, and the Republican charges that such early partisanship is bad taste carry a flavour of sour grapes. Even without the unanimous conclusion of recent public opinion polls that the President's popularity has so revived that he could take on with ease any Republican except Governor Dewey, there has never been any doubt that Mr Truman would lead the party in '48.

Basic to the Democratic campaign is the magic Roosevelt formula: a little left of centre. Mr Truman's Labour Day message was carefully phrased to avoid irritating Congressional sensibilities on the score of the Taft-Hartley Act, but he insisted significantly that good labour relations are not created by laws, and he urged restoration of the authority of the Department of Labour, the broadening of Social Security, and the raising of the minimum wage. The very able list of speakers who took part in the broadcast to 3,000 party meetings represented the Liberal wing of the party; they included Mrs Douglas of California, Mr O'Dwyer, the progressive Mayor of New York, Senator Sparkman of Alabama, and Senator McMahon of atom fame and with the exception of the latter, their common target was Republican reaction. The chief problem exercising the Democrats is the choice of a running-mate who will complement Mr Truman geographically and add political glamour to the President's good works.

In contrast, the Republicans are riding off rapidly in all directions. Senator Taft has set off on his conquest of the West with a reported intention of proving that he'd rather be right than President. He may have the opportunity. Like President Roosevelt in the famous Teamsters' speech, Mr Taft is determined to "smoke Dewey out," but unlike Mr Roosevelt, Senator Taft may not have the divine gift of knowing where to stop. Mr Stassen has also departed on a speech-making tour. Governor Dewey's political silence is proving a happy bonanza for the cartoonists, but his early strength is spurring rival candidates to a candour and early effort which promise a lively race for the nomination.

Most Republicans by now realize that the formidable strength of President Truman demands from the opposition a candidate of unusual appeal to the independent voter. Those who do not were rudely reminded last week by Senator Baldwin's attack on the "rock-ribbed" Republican record in Congress. This, as well as the desire to "stop Dewey" is sufficient to account for the interest being shown in the possibility that General Eisenhower might be persuaded to resolve a Taft-Dewey deadlock in the convention.

After Bilbo

Senator Bilbo's death at the end of August has removed permanently one of the most hated members of Congress and left unresolved the question of whether the advocacy of racial violence is a sufficient cause for exclusion from the Senate. Senator Bilbo was squarely in the Huey Long tradition, a radical demagogue who exploited consciously, and to perfection, the ignorance and the prejudices of the poor whites of one of the Union's most backward States. Like Huey Long, however, he provided broad as well as circuses; apart from the race issue, he was a strong supporter of the New Deal.

His exclusion from the Senate was not taken well in Mississippi. The Governor had made clear his intention of reappointing "The Man Bilbo" if the senate had excluded him. The hatred of outside interference on which he relied so long sustained Bilbo

to the very end. The choice of a successor now rests with the people of Mississippi, or rather with a small number of them, for no primary is to be held, and the winner need receive only a plurality of votes cast. Among the large number of possible contestants, the most prominent is Representative Rankin, who is said to be the only man capable of "out-Bilboing Bilbo." To this is added the dubious qualification that unlike Bilbo he believes the rubbish that he talks. The issue of "white supremacy" has been sharpened in Mississippi by charges of Northern interference in race relations.

Rail Rates Plea

The Ford Motor Company's decision to raise prices for most models by rather more than four per cent is, perhaps, the most eloquent of all recent commentaries on the strength of the inflationary forces now dominating the entire economy. The general movement has now reached the stage—classically regarded as the ultimate—or at least as the penultimate—phase of boom where price advances are covering the least volatile sections such as rents, power rates, passenger fares, etc. But the Ford Company, following the path of its founder, has put up such a staunch resistance to cost increases, that many believed it would be able to "hold the line" until a turn in the tide.

Railroad wage concessions now promise one more turn of the screw. From September 1st, non-operating employees secured a wage increase of 15.5 cents an hour, bringing the hourly average wage for these workers up to \$1.18, at an estimated annual cost of \$440 million. The powerful "Brotherhoods" (unions representing the so-called operating rail workers) have yet to stake their full claims, but for more than a year they have pressed for new "feather-bedding" rules which, on the managements' estimate, would add \$1 billion to the annual wage bill, and for wage concessions which might take another \$300 million. The non-operating workers will not enjoy any retroactive payments, but the Brotherhoods will, in all probability, demand that any concessions made to them shall date from September 1st.

Rail freight traffic is still at, or near, peak levels and 1947 gross income is expected to top \$8 billion (more than double the 1939 rate) against \$7.6 billion in 1946. Net income for 1947, however, was not expected to be much above \$450 million even before the recent wage concessions. The new claims make it quite certain that the Interstate Commerce Commission must concede freight rate advances, and hearings began this week. In July, the railroads were seeking advances averaging about 16 per cent over the whole country, sufficient to add \$1 billion to revenues on current traffic levels. This would bring the general level of freight rates to one-third above those of 1939. A new demand is for an immediate increase of 10 per cent, and a later advance of nearly 17 per cent. The ICC is expected to grant the request for emergency treatment, but to move slowly on the general claim. The railroad managements now fear that they will be caught, not only by a general decline in car-loadings, but by a simultaneous loss of the profitable long-haul traffic generated by war and post-war boom conditions. Their financial position, fortunately, is now very much stronger than in 1939.

Shorter Notes

Something like the Queensberry rules seems to be needed by committees of Congress conducting investigations. Hard on the heels of the Hughes investigation comes the news that a counsel for the House Committee on Education and Labour has seized a witness by the throat and knocked him down. The witness was abusive, it is true (he was Mr Padway, counsel for the American Federation of Labour) but Mr McCann's subsequent action goes far to justify the charge of "Gestapo Tactics" which provoked the assault.

Preliminary reports suggest that a large proportion of ex-service men will cash the Armed Forces Leave Bonds which became formally negotiable on September 2nd. The available total is about \$1.8 billion, and thus represents rather less than 1 per cent of disposable personal income on current account, which, through the first half of this year, was running at an annual rate of \$170 billion. Ten years ago, a similar bonus payment (on a disposable income level of about \$70 billion) brought a decided stimulus to business, and with supplies now so tight the present payment is expected to give a fresh twist to many retail prices.

THE WORLD OVERSEAS

First Aid for France

(From Our Paris Correspondent)

ONE of the biggest obstacles confronting the Paris Conference in its endeavour to organise European economic co-operation is France's own chronic state of economic, political and financial crisis. The delegates have had before them this week the spectacle of rapidly accelerating inflation, swooping prices, strikes and demonstrations compelling the administration to post armed police all round the conference buildings, growing alarm and public indignation. They have seen the government appealing for heavy new subsidies for the nationalised coal mines, without offering evidence that the revenue will simultaneously increase. They have read of men and women striking for more bread as if convinced that the world shortage is a deliberate conspiracy by the French authorities.

By an ironic chance, these eruptions have come precisely at the moment when the French government (along with seven or eight other participating members) has submitted to the Paris conference a general plan for a return to orthodox finance, a balanced budget and the oft announced *assainissement financier*. The French delegation can hardly complain if their assurances are greeted sceptically when their own public opinion and press is openly and scornfully incredulous. But the French Government and its advisers are perfectly well aware that none of the present plans, either for financial, commercial or productive co-operation between the states of Europe, will make sense without some radical improvement in the French situation. M. Ramadier is confronted with an ever-recurring choice, and one which cannot be lightly made: should he remain in power, compromising on matters of principle, sustaining ambiguities to conceal differences, making concessions to demagoguery and hawking on foreign colonial and domestic policy? Or should he resign, leaving leadership to the extreme left or right, possibly jeopardising French independence, and delaying indefinitely the painful process of national reintegration?

The Root of the Trouble

M. Ramadier's survival is not itself sufficient to set the French house in order, or to ensure its contribution to Europe. The French Government believes that it is today necessary to have immediate external aid to save the franc and restore confidence, before what has now become a vicious circle of inflation and panic reduces the country to impotence. The reassurances from Mr Lovett and other notable Americans have already improved the atmosphere; but tension persists.

The root of the trouble is food: under-production and bad distribution. Between January and August of this year the cost of living based on 29 items of food has risen by 30 per cent. Having seen the peasants resist successfully the efforts of a corrupt and understaffed administration to collect and redistribute their produce, the town population came round to the view that it would be better for the produce to reach the towns at the peasant's price than not to arrive at all. The Government gave way to a campaign for lifting controls and maintained severe price restrictions only on the essentials: bread and milk. By so doing they put a premium on the production of non-essentials.

The meat market illustrates the process: when controls were lifted, supplies vastly increased but prices did not fall. The "normalisation" of the market merely encouraged peasants to feed grain to animals. While the rural population and the wealthy minority now eat meat twice a day, the rest of the population scrape and save on other items of the budget to pay exorbitant prices for what remains. The effect on wheat cultivation has been disastrous. In the 30s an average of 5,200,000 hectares was cultivated, this year only 3,310,000. This deficit, followed by the worst harvest yields in living memory has produced a situation in which France—once self-sufficient—will this year be unable to cover one-third of her normal consumption of bread. Just before the present harvest, adjustments in wheat prices were made; but non-controlled secondary cereals are still a very much more profitable crop than wheat.

Awareness that this wheat shortage was only one part of a

world crisis, and that France would not be able to replenish her stocks from abroad has created something like panic within the last few weeks. This has been aggravated by some ill-advised pronouncements of political leaders which sent the prices of all stockable foods rocketing up again as housewives queued to fill their larders. Potatoes were among the commodities on which there was heaviest pressure, although the potato crop is better this year than last: 12 against 11 million tons.

Without bringing food prices under control the whole policy of freezing wages became impossible: the Government have had to make very considerable concessions both to their own employees (over 2,000,000 today) and to industrial workers, whose wages are now under governmental control. The results affected industrial prices and for the first time since the Blum experiment began there has been this month an all-round edict permitting price increases of up to 5 per cent.

This levelling upward of wages recreated a budgetary deficit, despite the Government's repeated assurances that the 1947 "ordinary budget" (i.e., excluding reconstruction costs and military operations in the colonies) would balance, and the solemn warning in the Monnet plan that French revival depended upon it. In order to limit the impact of the wage increases on prices, the Government decided to continue subsidising coal; so that while expenditure increased by about 35 billion francs for paying civil servants an extra allowance, the anticipated gain in suppressing industrial subsidies had to be postponed. Before adjourning this week the assembly approved a new subsidy for coal costing 7,370 million francs; it is expected to tide the nationalised coal industry over the recess, until November 15th, when the whole economic policy of the Government will come under review.

Besides upsetting the plans for budgetary equilibrium, soaring prices further intensified the disequilibrium in the French balance of payments. French exports, particularly to the dollar area, are almost at a standstill because of the disparity between French and American prices; this is partly the result of superior equipment in all branches of American industry and agriculture, but mostly of the artificial rate of exchange maintained between the dollar and franc, despite the collapse of the franc's purchasing power.

While the dollars almost stopped flowing in, they flowed out much faster than estimated. The dollar reserves, which are for practical purposes today exhausted, were used up at an unexpected pace for two reasons: the rise in American prices, and the need to import from America more coal than expected, following the disappointment of hopes of cheaper coal from the Ruhr.

Threat of Paralysis

France has therefore this week had to sanction new drains on the gold reserve to the value of 12 billion francs and amounting to 90 tons of gold. The gold reserve of 1939 has thus been reduced from 2,159 tons to 592 tons after the last withdrawal. It is now generally recognised that any further withdrawals would reduce it below danger point. It has therefore been necessary to call a halt to the import programme and cancel all imports except those of fuel, grain and fats judged indispensable.

These import cuts will deprive France of raw materials for textiles, machinery, agricultural implements, food and rubber. They mean a suspension of the five-year modernisation plan, with a consequent check to the raising of French productivity. Industrial production, once the existing stocks are exhausted, will be almost paralysed. The return to financial equilibrium will be almost postponed. Deterioration in living conditions will add to political instability and shatter the confidence required for saving and investments.

These are the main reasons why urgent help to France is the indispensable condition of useful long-term American aid to Europe. Even M. Ramadier cannot survive if the franc collapses under him; and a French internal crisis would postpone seriously—perhaps indefinitely—European progress towards prosperity and self-sufficiency.

Federation for the West Indies

(By a Correspondent)

AN important conference is taking place in Jamaica during the present month on proposals for federating the several colonies of the British West Indies, the members of this conference being composed of representatives of the legislatures of each of them. For many years hopes have been expressed throughout the West Indies that the most urgent of the problems of the region might be solved in some degree through administrative machinery that could be set up, were the colonies grouped together into a larger political unit, and the time has now arrived to test the possibility of translating a rather vague discussion into terms of practical politics. The Secretary of State is attending the conference himself, and has thus emphasised its importance.

The most superficial inspection of the political organisation of the British West Indies demonstrates the strength of the case for these proposals. Approximately half the population of the territories concerned is concentrated in Jamaica (1,289,072 inhabitants in 1945), the remainder being scattered through six colonies, of which one, the Windward Islands, is merely a loose federation of four more colonies. In consequence, the responsibilities of government are entrusted to a succession of petty states, with populations varying in 1946 from that of the larger colonies of British Guiana (376,146) and Barbados (192,841) to the not-so-very-mighty atoms of British Honduras (59,149) and Dominica (47,682). The results are, indeed, somewhat ludicrous; and the colonies concerned are racked by the effort of supporting the full pomp and panoply of government when the financial resources and the officials of at least the smaller of them are hardly more extensive or numerous than those of an English rural district council.

In a dispatch issued in 1945 the Colonial Office called the attention of the West Indian Governments to the need for endeavouring to promote such constitutional reforms as would make it possible for them to keep pace with modern administrative requirements. This might well have been dismissed as a truism, had it not been that the dispatch also referred to the political consequences of administrative stagnation, adding that, "It will be generally agreed that under modern conditions it has become more difficult for very small units, whatever their outward political form may be, to maintain full and complete independence in all aspects of government." Unless, indeed, the difficulties of size can be overcome, the constitutional advancement of the British West Indies is likely to be checked by the operation of this factor alone.

The case for federation therefore rests on two grounds; the first and more obvious is the need for establishing a higher degree of technical efficiency in the administrative apparatus of government; the second, and perhaps in the long run the more important, is the need to meet clamant demands for the freeing of the colonies from the external controls hitherto imposed on them. It is important at this stage to note that the political movement for British West Indian federation has hitherto been closely associated with a much wider movement for a more general Caribbean federation. This fact is clear from the proceedings of the conference on "The Economic Future of the Caribbean," which took place in 1944 at Howard University, Washington, for the papers read at this conference represented the points of view not only of the British West Indies and the United States, but also of Puerto Rico and Cuba as well. It is also significant that the Anglo-American

Caribbean Commission, founded in 1942 for the joint discussion of problems of common interest to the United States and the British West Indian Colonies, was reconstituted in 1945 as the Caribbean Commission by the adhesion to it of the French and Netherlands Governments.

From the political point of view the movement for the federation of the British West Indian colonies must therefore be studied in this wider context. Barbados, it is true, looks first and foremost to Great Britain when it considers its place in the modern world, but Barbados is an island apart, out of sight of any other land. Jamaica, on the other hand, is conscious of ties with the Spanish-speaking peoples of Cuba and Central America, and with the French-speaking people of Haiti. Trinidad is fully aware of the importance which its geographical position gives at the crossroads between several lines of communication to and from South America. Most obviously of all, British Guiana knows so accurately what the possibilities are that lie before it as a South American State that it resents any attempt even to classify it as a West Indian territory. So far as politics go, there are therefore strong bonds of common interest which extend far beyond the British West Indies and the islands of the Caribbean region, to cover in some degree all Central America, and in addition Colombia and Venezuela.

This is even more obvious when the case for the wider Caribbean federation is studied as it has been put forward on economic grounds. The leading British West Indian exponent of these views is Prof. Eric Williams, of Howard University. In his judgment, the West Indian Islands such as Trinidad, Cuba, and Puerto Rico, can continue by themselves only "at the economic mercy of the more advanced and more powerful countries of the world." Writing in 1944 on "The Economic Future of the Caribbean" he has said that "Federation will . . . give the Caribbean a bargaining power in the world which its isolated units do not now have." While worthwhile industries could not be established in such small countries as Barbados, Jamaica, or even in Cuba with its population of 4,000,000, he argues that the combination of all the separate units of the Caribbean would produce a population of 14 millions, which would make the attempt "to work out industrialisation plans and talk of greater self-sufficiency or a planned economy" practical politics.

Parish Pump Politics

There can be little doubt, however, that if any of the West Indian Colonies were forced to make a decision, there would be extreme reluctance to sacrifice the advantages which the close ties between, say, Jamaica and Great Britain, Puerto Rico and the United States, and Martinique and France, bring in obtaining a secure market for sugar and other commodities for the sake of the problematic advantages which might derive from "greater bargaining power" and the possibilities of easier internal trade between one Island and another. The strength of the case for the narrower British West Indian federation is therefore political rather than economic, for the extent to which industry could be developed for the local market in an area containing merely twice the population of Jamaica is very small indeed. Politically, federation will bring with it a much-needed widening of the public stage, and it is to be expected that this would have the effect of diminishing the curse of parochialism which has undermined West Indian political life ever since the days of Emancipation.

Nevertheless, federation would give the British West Indies great opportunities in so far as economic development would be facilitated by greater political stability and administrative efficiency. But these opportunities can only be realised if the ideal of a wider Caribbean federation is renounced, and the ties between the West Indies and Great Britain capitalised for purposes of economic development. The chief economic asset of the West Indies is manpower, which is one of the most important shortages in Great Britain. The West Indian statesman would thus be given a chance to promote economic development by linking the industries of his region with those of Great Britain in such a way that processes which require relatively large amounts of unskilled and semi-skilled labour could be carried out in the West Indies. Textiles, rubber goods, and light industry generally afford good examples of possibilities in this direction. The importance of developments of this kind for the welfare of the West Indian peoples can hardly be exaggerated.

The decision to exploit the advantages of the connection with Great Britain rather than to create a new independent state out of the fragments left behind by colonial rule in the Caribbean

may, in fact, prove easier than it has appeared in the past to many politicians. Political trends are swinging in that direction at the moment; the possibility of exchanging the King Log of British rule for the King Stork of American social and economic domination may be one of the deciding factors in this change. Be that as it may, it is undoubtedly significant that the Caribbean Labour Congress has just decided at its session in Jamaica to press for Dominion status for the British West Indies. It is an influential body, as it is composed of trade union and political representatives from all the territories of the British West Indies. It will present its demands to the Secretary of State when he attends the conference on federation, and its voice will not go unheard.

No Marshall Plan at Bogota

[FROM OUR CORRESPONDENT IN LATIN AMERICA]

THE emphasis laid on European recovery at the recent Pan-American Conference at Petropolis makes timely a brief survey of the attitude of the chief Latin American states to this problem, its present suggested remedy—the Marshall Plan—and to their own difficulties. The more so when it is recalled that, before the Conference got down to its real business of drafting a defence treaty, suggestions were current that Latin America, like Western Europe, would become the object of regional economic help. Yet even before the firm but negative attitude of the United States finally disposed of the idea, the prospects and usefulness of such help were doubtful. For the needs of all the republics differ so much that they could not be met by any one co-ordinated scheme. Moreover, the importance of the European market is so great that the best contribution the United States can make to Latin American development and prosperity is to revive it as soon as possible.

Thus far there is broad agreement. On the measures to be taken by the Latin American States opinion and approaches differ. These differences are complicated by conflicts of local ambition and interest. The position of Argentina is the most interesting. The Argentine Foreign Minister agrees that Europe must be put on its feet if Latin America is to thrive, but at the time of writing has made no specific proposals towards this. Argentina has not joined the food agencies of the United Nations because they are officially considered Utopian and impracticable. On the other hand, Argentina claims to have used its strong economic position to help in the recovery of other countries. Argentine spokesmen point to the various trade treaties their country has concluded and to the fact that Argentina alone in February, 1946, voted at the Governing Board of the Pan-American Union for holding an economic conference.

Little Faith in Conferences

Other countries, however, both in Europe and Latin America, take a different view of Argentine aid. Chilean spokesmen, for example, refer to Argentina's attempts at economic domination and look forward to the day when world crops are normal and Argentina's hold over its neighbours will decline. They have a poor opinion of economic conferences, whether proposed by Argentina or any other country, and are not hopeful that anything of value will result from the Bogotá Conference or the alternative economic conference late in 1948. Mexico, for different reasons, also has little faith in conferences. It is feared that recent measures to stop the drain on its dollar holdings will prove unsuccessful. The crisis is likely to be reached before any general remedies can be agreed in conference. Thus either the *peso* will be allowed to go and paper money printed to finance development schemes, or a new dollar loan obtained. Nor is this view confined to Mexico. Countries which have strategic advantages to offer the United States are hopeful of negotiating direct and individual help. It is said that such an agreement was discussed by President Truman with the Brazilian Government during his recent visit. Indeed it is also said that the President had intended to sign a trade treaty which Mr Snyder's visit some weeks earlier had brought almost to completion, but that last-minute Brazilian objections prevented this. And Chile is believed to be negotiating with the United States for a further loan from the Export-Import Bank.

Chile, however, would like to see more imports coming from Britain. But both countries are short of dollars. So with Uruguay, which strongly supports the Marshall plan for Europe and is, in the words of a member of the Cabinet, particularly and vitally interested in Britain's recovery. A triangular trading arrangement between Britain, the United States and Uruguay has

been suggested as a small but concrete measure of help. But this plan, like so many others, is stultified by the shortage of dollars.

To sum up, opinion in Latin American countries recognises that the United States possesses the key to their problems, but also that the United States is right in giving prior, if not exclusive, attention to Europe. A Marshall Plan for Latin America has no real attraction. The Republics look for individual attention to their needs. But, while accepting that economic aid to Europe should have chronological priority, they feel, though they do not widely proclaim, that the development of Latin America should logically have long-range priority. For it is a secure region and investment here will bring more benefit to the United States than the same volume of investment in Europe. Financially this may be true—in the long term. But in the short term the political incentives for the United States to spend money in Europe are paramount.

Debunking the West

[BY A CORRESPONDENT]

LAST June the Soviet Union lived through another "ten days that shook the world." However, Russian citizens learned about this only in August when the news was spilled by their newspapers. The great event was a ten days' conference of Soviet philosophers which was convened on Mr Stalin's personal initiative. So at least Mr Zhdanov, member of the Politbureau, Governor of Leningrad, recently promoted to be the Philosopher-in-Chief and Literary Critic-in-Chief of Soviet Russia told the assembled philosophers. These were probably not quite taken aback by the announcement, for they had been accustomed to look up to Mr Stalin as the father of modern philosophy. What they may have found surprising was the choice of the moment for the great tournament of ideas. They must have been impressed by the fact that with so much work on his hands—the Five Year Plan and many international troubles—Mr Stalin could still afford to give some of his time and energy to cogitation on gnosis and meditation on dialectics. Yes, Mr Stalin could afford it; and Mr Zhdanov told the assembled thinkers what was the result of the leaders' cogitations. After Mr Zhdanov had spoken, forty-eight philosophers took the floor. Thirty-six dialecticians, in addition to the forty-eight, were ready to make their discourses, but as time was getting short the tournament had to be interrupted in the middle. However, the voices of the thirty-six have not really been muzzled, because Mr Zhdanov's harangue plus the forty-eight pronounced and the thirty-six unpronounced discourses have all been published in the thick, first volume of a new journal called "Problems of Philosophy."

The subject matter of the disputation was the three volume "History of Western European Philosophy" by G. F. Alexandrov. Mr Stalin had read the work and, frankly, did not like it. His doctrinal conscience was not satisfied by Alexandrov's exposition of ancient and medieval philosophy any more than by his exposition of the systems of Bacon, Descartes, Spinoza, Kant and Fichte. Worst of all, he found, was the chapter on Hegel. The work suffered from two deadly faults. It was lacking in militant, Marxist spirit. And it treated the various philosophical schools in a "false objectivist" manner. It also showed revolting signs of a "slavish adulation" for western European thought. It is certainly extraordinary that such sins should have been committed

by Mr Alexandrov who until recently was—and for all we know may still be—in charge of the Party's agitation and propaganda department. How is it that the virus of philosophical liberalism has penetrated into the mind of so outstanding a Stalinist?

The real sting in Mr Zhdanov's criticisms has been his bitter remark on the "slavish adulation of western European thought," of which not only Mr Alexandrov but nearly all Soviet philosophers have been guilty. The recent ban on marriages between Soviet nationals and foreigners has now apparently been extended to the field of philosophy; and like some Russian decrees, this decree, too, is thought to have retro-active powers. But, alas, the authors of the ban have willy-nilly become involved in an embarrassing family scandal, for Stalinism itself has been the offspring—it has not been conclusively ascertained whether a legitimate or an illegitimate one—of parents who most viciously offended against that ban. Its two grandfathers, Marx and Engels, were Germans of good Rhinelandish stock. Moreover, those grandfathers prided themselves on a very complex international parentage, claiming to be the spiritual heirs of German philosophy, French Socialism and English political economy. One would have thought that some adulation for western European thought, which need not conflict with respect for good, pristine Russian traditions, was a natural sentiment among people with such a complex and ramified family tree. This has apparently been the sentiment by which poor Mr Alexandrov has been carried away. He has now been reminded by the Philosopher-in-Chief that this was utterly wrong. The ban on philosophical marriage bonds with western Europe is being enforced. And this was what the forty-eight plus thirty-six scholars were convened for to Moscow in the middle of June.

"Revaluation of Values"

What is poison for Soviet philosophers cannot possibly be meat for Soviet technicians. There must be no adulation for western European science either! But Russian text-books on the history of science have, as Professor Zvorikin recently pointed out in *Pravda*, been tainted with that deviation. The esteemed Professor has revealed to his readers a new version of the history of all the great technical discoveries and inventions. Who says that the technical inventions of Bessemer and Martens have been responsible for the development of the steel industry? The real revolution in the technology of steel was the work of the Russian Dmitri Konstantinovich Chernov. It is stupid to credit Edison with the invention of the electrical bulb when its real inventors were Russians. And has there been a more striking proof of the wickedness of western science than the fame enjoyed by Marconi, when a Popov was the real inventor of radio? And why should the name of the Englishman Stephenson be hammered into the heads of Russian children when the Cherepanovs were the real inventors of the steam engine? Why speak about Morse when it is well known that the telegraph had been in use in Russia even before the west had an inkling of it?

It is to be feared that *Pravda* has this time dangerously overreached itself for among the rulers of Russia who have taken much trouble and paid much money to bring foreign technicians into their country, Mr Stalin himself has held pride of place.

The "revaluation of values" is in full swing; and the columns of every Soviet newspaper and journal are filled with the silliest exercises in debunking the West. This is the comic aspect of the tragic division between East and West.

Retreat from Convertibility

THE Chancellor's broadcast on August 20th marked the end of an epoch, or at least of an experiment—the first attempt to rebuild Britain's overseas payments system on the lines of free and multilateral convertibility. In itself, the failure symbolised by the suspension of convertibility of current sterling into dollars was a condemnation not of the choice of ultimate objectives but rather of the pace at which Britain had been compelled to travel towards them before the vital prerequisite, the establishment of reasonable equilibrium in the British balance of payments, had been satisfied.

At first it seemed that some of the fruits of the labours of the past two years might be saved from the wreck. A detailed survey in these columns last week showed how wide was the technical system of sterling convertibility which remained, even after the dollar area and Canada had been withdrawn from the main region within which sterling was automatically transferable in settlement of current transactions. Obviously, there was a danger that this structure, given the severance of the link with the dollar area, would no longer withstand the pressures imposed by the hard facts of world trade disequilibrium. But there was at least a slender hope that the various monetary authorities concerned would perceive that their best interests, on anything but the shortest view, lay in taking every possible step to preserve as much of the system as was conceivably practicable. Already, it seems evident that this is not to be.

The ending of sterling's dollar convertibility inevitably required the re-negotiation, or at least reconsideration, of each of the sixteen or seventeen "transferable account" agreements so laboriously reached with leading trading nations in the past twelve months. The first such re-negotiation, with the Belgian monetary area, has resulted not in the retention of the principle of automatic convertibility of sterling within a limited area, but in a retreat to the basic wartime principle of bilateralism which obtained until the ill-fated experiment was launched. In practice, every effort will be made to make sterling more widely usable, but any resultant trilateral or multilateral convertibility will result from specific administrative action, which is a very different thing from the principle of automatic freedom.

In short, since this agreement is a clear pointer to what lies ahead, it seems evident that the British authorities already believe that the task upon which they embarked two years ago must now be started all over again. In the circumstances, the details of the new agreement with Belgium, and the background against which it has been reached, deserve the closest scrutiny.

A Belgian financial delegation came to London only towards the end of last week and, with a rapidity which betokens the urgency of the situation as well as the good will that was brought to the discussions, the heads of the new agreement were quickly reached and announced on Wednesday. The agreement replaces that of October 5, 1944—the first of Britain's monetary agreements with Western Europe—under which each party undertook to sell its currency to the other at a fixed rate of exchange, and to hold the other's currency up to a limit of £5,000,000 or its equivalent, anything beyond this figure being convertible into gold. In addition, there was a supplementary agreement signed on February 26, 1947, by virtue of which Belgium was made one of the countries in the "transferable

account" group and was thus given the right of expendability of current sterling not merely in other transferable account countries but in the dollar area. The suspension of convertibility of sterling into dollars clearly called for a re-negotiation of this agreement, but it will be noted also that the three-year term of the original agreement was about to expire.

From the wider aspect the most significant feature of the new arrangements is that they involve, as already indicated, Belgium's departure from the transferable account group. In future, Belgian residents will be called upon to accept sterling only from those "third" countries which have been specifically agreed upon between the two governments. Both parties undertake to encourage the use of sterling in international payments as much as possible; they consider, however, that for the time being there would be an advantage for their respective payments outside the sterling area to be controlled by the monetary authorities in each country and no longer to be delegated, as was the case under the transferable account mechanism, to the authorities of other countries. This may be taken as a clear intimation that the transferable account system is now in the process of liquidation. In future, transferability of Belgium's sterling to countries outside the sterling area will cease to be automatic. The system towards which Britain is moving is that which may be termed "administrative transferability." This means that each case will be judged on its merits and transferability of sterling will be extended only as and when the authorities in Britain are satisfied that the sterling in question will be made available for current purposes, strictly defined, and will not be provided in quantities which are likely to endanger the gold reserve.

The new Anglo-Belgian agreement, however, has its more reassuring aspects. Each central bank will continue to sell its currency, within defined limits, against the currency of the other country, and will do so at the prevailing rate of 176½ Belgian francs to the £. To meet the needs of the new situation these limits to the accumulation of currency have been increased from a figure of £5,000,000 to £12 million, or its equivalent in Belgian francs. In addition, the National Bank of Belgium will, if necessary, increase its holdings of sterling by a further £15 million, which is the amount of certain debts from the Belgian Government to the United Kingdom falling due during the next few years. It will thus be seen that, as from October 5th next, when the new agreement comes into force, the Belgian National Bank will be prepared to hold up to £27 million in sterling. The increase in the British currency which Belgium is willing to hold is a welcome and appreciated token of that country's readiness to help in the difficulties that beset Britain. That help, however, is not being given for no consideration. There is to be an exchange guarantee which will in future cover the balances accruing to either side up to the ceiling of £12 million. This, it should be added, is a strictly bilateral guarantee designed to ensure that neither party is adversely affected by a decision of the debtor country to devalue its currency in terms of that of the creditor. There is no question of a guarantee in terms of any third currency or in gold. If Belgian francs and sterling were to be devalued *pari passu*, the exchange guarantee would not come into play.

It is unfortunate that exchange guarantees should again have to appear in Britain's monetary agreements with other countries. Such guarantees had to be given in some of the agreements with neutrals during the war, but it was hoped that that chapter had been closed. Unfortunately, it has been reopened by the suspension of convertibility of sterling into dollars. If in the new circumstances non-sterling countries are called upon to accumulate larger holdings of sterling which is not automatically thus convertible, it is reasonable to expect them to demand an assurance that they will not lose if sterling were to depreciate in terms of their own currencies.

It is as yet impossible to estimate how the payments arrangements between the sterling area and the Belgian monetary area will operate and on which side the balances will accumulate. There can be no precision on this point until the amount of sterling which "third" countries will be allowed to transfer to Belgium, in respect of current payments between them, is foreseeable. One may assume that the intention of the Belgian and British monetary authorities will be to operate "administrative transferability" in such a way as to maintain the accounts between them as close to equilibrium as possible.

The relative economic strength of Belgium, and the pressure to which Britain is certain to be subjected in its external payments for the next few years, suggest, however, that it is Belgium which will be accumulating sterling and Britain which will, in effect, be giving the exchange guarantee.

The arrangements with Belgium will probably set the pattern for others that are either in process of negotiation or have yet to be begun. In some of the preliminary discussions that have already taken place the other countries have shown a less helpful attitude than that reflected in the arrangements with Belgium. If other countries refuse altogether to hold sterling and insist on payment in gold for any current surplus in their

trade with the sterling area, the only means of dealing with the situation will be to ensure strict bilateral equilibrium in the trade with them. Such a reversion to virtual barter would be deplorable and mutually damaging, but there would be no alternative to it in the prevailing circumstances.

Hitherto, the reactions to suspension of convertibility of sterling have been more satisfactory than could reasonably have been expected. No country has definitely stopped buying sterling or exporting to Britain. Momentary hesitations and doubts on the part of certain countries such as Uruguay and Sweden seem to have been satisfactorily resolved—at least for the moment. Argentina was, perhaps, the crucial test case, and, after an initial flurry it seemed that no undue dislocation of trade would result; but this week's news of suspension of exports of canned meat pending a clarification of the sterling situation is rather ominous. The agreements with American account countries will presumably stand, although, in the absence of further dollar aid, the turnover through American accounts will have to be curtailed to the size of Britain's dollar earnings. Finally, there are the amended arrangements to be made with the sterling area countries. Most of these have already indicated their firm intention to play their full part in overcoming common difficulties, all of them by making further cuts in dollar imports, Australia by promising to sell Britain the whole of the newly-mined gold, and New Zealand by undertaking to increase further its sterling balances against larger exports to Britain. The sterling area will certainly stand the strain that is being put upon it—and the presence in London of representatives of the Dominions attending the Bank and Fund meetings will provide the opportunity to discuss these "family affairs."

But, despite these sources of reassurance, the whole drift is disquieting. The retreat from automatic transferability of

The word 'dollar' is a corruption of the German 'Joachimsthaler' or 'thaler,' the name given in the 16th century to coins from the silver mine of Joachimsthal in Bohemia.

For many years Barclays Bank have fostered the growth of Anglo-American trade by providing a comprehensive foreign banking service re-inforced by the establishment of a Representative's Office in New York. Today, when the expansion of our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

sterling may be a step which Britain is compelled to take. Some pressure to move backwards along this road is likely to come from the transferable account countries which will wish to be free of the unconditional undertaking to accept sterling—now inconvertible—in payment for their exports to third countries. Even greater pressure to that end may be exerted from Britain, which has recently seen in the uncontrolled and unpredictable movement of sterling within the transferable account countries one of the main channels through which sterling has been presented for conversion into dollars. But although the need for

Overhauling the TUC

THE ghost of Grimethorpe walked at Southport. The shadow of the Yorkshire strike and the failure of the miners' leaders to control their men lay heavy over last week's Trades Union Congress. Yet there seemed to be a tacit understanding not to refer publicly to the causes or consequences of the dispute, which was regarded as a matter solely for the National Union of Mineworkers and the Coal Board to settle between them. This omission was typical of the conference, where such burning issues as wages, unofficial strikes, hours, productivity and incentives were barely mentioned. Indeed, although the economic crisis and measures for the direction of labour were discussed in general terms Southport was mainly remarkable for the questions it left unanswered. It tended, even more than the Margate conference of the Labour Party, to become a debating society on world affairs rather than an industrial forum.

Equally marked, though perhaps less striking from the public point of view, was the failure of the TUC to pay serious attention to the problems of its own structure and organisation, and to the need for equipping itself to meet the heavy responsibilities which are now falling on the unions. From this point of view it was regrettable that a resolution of the Amalgamated Engineering Union, proposing that the TUC should consider appointing a number of full-time members to the General Council, received only scant consideration by the Congress and was brusquely brushed aside by the Council's spokesman. This resolution, it might have been thought, could have provided the opportunity for a full-dress debate, not so much on the responsibilities which the unions are seeking and assuming in industrial and economic affairs, as on the capacity of their membership methods and machinery to fulfil them. The engineers' resolution was turned down because the General Council thought the appointment of full-time members would be undemocratic and would tend to create a bureaucracy of permanent officials who would inevitably be out of touch with the day-to-day activities of the membership.

There is admittedly a danger that such a change might lead to bureaucracy and to an ossification of the General Council, with conflicts between the full-time and annually elected members. Yet it is painfully obvious that the members of the General Council today have too much work and too many responsibilities. They are expected to serve intelligently and assiduously on a plethora of committees, both on trade union work and on the numerous liaison bodies with the Government and the employers. In consequence, few of them have any time for the tasks of clear thinking and policy-forming which the TUC needs so urgently. As nominees of particular industrial or occupational groups, they must inevitably tend to think and act sectionally, rather than in the interests of the movement as a whole. There is also the question of sheer physical capacity. The danger is that they will fall short of what is required of them both as members of the Council and as leaders of individual unions. It is, indeed, highly creditable that, in spite of all the difficulties and dis-

some retreat from wide and automatic transferability of sterling may be conceded, that development strikes a serious blow to hopes of the re-establishment of sterling as a truly international currency, to London's pretensions to be an international banking centre and to the chances of expanding trade. The damage can be mitigated by the most liberal operation of "administrative transferability," but the loss of automaticity must in itself act as a serious deterrent to confidence in sterling, to the readiness with which it will be accepted in international payments and—even more important—to the role it can play in the re-expansion of world trade.

advantages, the TUC should have increased its authority as much as it has done. This is due mainly to the patience and perseverance of its late General Secretary, Lord Citrine. Indeed in recent months the TUC has frequently shown itself to be ahead of the Government in demanding far-reaching measures to deal with the economic situation.

The AEU's solution may not be the right one. But it is clear that some means must be found of strengthening the machinery if the TUC is both to keep abreast of developments and perform adequate service to its affiliated unions. In particular, an expansion of headquarters staff, above all on the research side, is urgently required. This would help, but it would not solve the main problem, which arises not so much from the inadequacy of administrative resources as from the structure and traditions of the trade union movement. Every union affiliated to the TUC is jealous of its individual autonomy, suspicious of any attempts to dictate policy from the top and determined not to surrender any of its "inalienable" rights. In these circumstances, and so long as the TUC is content to remain a co-ordinating body, with an inadequately equipped secretariat, its central direction is bound to be weak. This, more than anything else, explains the rejection, at Brighton last year, of a suggestion (also emanating from the engineers) that the General Council should examine the possibility and desirability of a wages policy—because of the unwillingness of the TUC to accept any form of discrimination, whether in wages or rations, in favour of one particular section. It also explains the omissions from the Southport agenda.

The question of organisation and leadership has been made particularly urgent by the appointment of many prominent members of the General Council to the boards of nationalised industries. This year, at Southport, no fewer than six members of the Council were displaced, either because of retirement or because of their appointment to serve on public bodies. Sir Joseph Hallsworth, who has gone to the Coal Board, Mr Benstead and Mr Bussey, who have gone to the Transport and Electricity Boards respectively, have followed in the wake of Lord Citrine and Mr Ebby Edwards. The leadership of the unions at a crucial stage has thereby been rendered significantly weaker. But if fresh blood is needed in the hierarchy of the TUC, so far there is little evidence that the younger men are coming forward and few signs of potential leaders among the unions. Much has been said about the importance of training, and equipping trade unionists to hold responsible positions in public service or in the TUC—that was the main theme of Lord Citrine's swan song last year—but in practice insufficient attention is paid to the problem. Most of the present generation of trade union leaders grew up in the hard school of struggle. Today's round-table discussions and advocacy before a tribunal require different techniques and qualities. The TUC's schemes for training in trade unionism, as well as its courses in general education, well-devised though they may be, barely touch the fringe of the problem.

It is not only the machinery of the central body of the TUC itself that is ill-equipped to meet the present situation. The whole organisational structure of the movement is out of date. It may have been adequate enough in the early days, but its lopsided and unbalanced character—the result of historical development—is completely out of keeping with the needs of the post-war world. Little has been done to improve the situation, in spite of resolutions passed repeatedly at previous conferences and in spite of the General Council's 1944 report on "Trade Union structure and closer unity." This report examined trade union structure "with regard to uneconomic overlapping and competition" and to see "what amalgamations are desirable and what structural or other changes are necessary to ensure maximum trade union efficiency in the future." The report recommended an intensification of the process of amalgamations and showed how this could be done, industry by industry. It acknowledged that the movement could not "retain its pre-war conception of organisation if it is properly and efficiently to fulfil its ideological and practical functions."

Three years have confirmed this conclusion, but comparatively little has been done. The formation of a national union for the miners, instead of the loose district federation; the affiliation of the AEU to the Confederation of Shipbuilding and Engineering Unions; the amalgamation of the two unions catering for shop assistants and distributive workers—these are the three main developments since 1944 towards a more unified organisation. But, in many industries, unions compete for members and conflict where they should co-operate. Within the railway industry three separate unions cater for operative grades, locomen and clerks—although in this instance reasonably effective co-ordinating machinery exists. Six different unions are concerned with the organisation of tobacco workers. Building workers are loosely organised in a Federation, although the objective is still "one big union." The situation in the textile industries is chaotic. Over a hundred autonomous local and district associations, belong to six different federations, operate in Lancashire. As the General Council report points

out, "there is no industry in the country in which it is more essential to secure the greatest possible unification of the administrative and economic policy of the unions"; the cotton Working Party reached the same conclusion. The same is true of wool, where, as in cotton, local rivalries and the prestige and vested interests of local branch officials have prevented the absorption of the smaller unions by the larger organisations. There is competition to organise clerical workers—the dispute between the miners and the clerical workers over the colliery clerks is a case in point—and to organise public employees and local government officials. In addition, the two large general workers' unions compete against other unions and against each other to build up their mass membership wherever they can.

Size is not necessarily a criterion of efficiency in a trade union, or in any other organisation—the Transport Workers' Union and the General and Municipal Workers' Union are notoriously no more efficient in representing their members' interests or imposing their authority, than many smaller bodies. But, broadly speaking, it is true that a large organisation which caters for workers with a community of interests is likely to be more effective than a host of smaller ones. This is, of course, easiest to achieve in industries the boundaries of which are clearly defined, as in mining, or where there is already a strong trade union tradition. The TUC Disputes Committee has done much to smooth away difficulties, but its effectiveness, like that of the TUC itself, is limited by its lack of authority.

The barriers of tradition and vested interest are hard to wear down. But the unions will obviously have to be prepared to surrender some of their functions to the central body of the TUC if they are to exert an influence commensurate with their membership, now nearly eight million. The charge that the unions want to plan everything and everybody except themselves can be levelled with great force against the lack of planning of their own organisation and structure. The TUC at the moment is rather like a vast army—an army which is certainly marching, but precisely where it is going no one can be sure, for lack of a properly equipped and united General Staff.

Business Notes

Markets and "Stopgap" Aid

The performance of stock markets this week—that is, the seven days since the last issue of *The Economist* went to press—is in quite astonishing contrast to that of the previous week. In the earlier period the stream of disquieting economic news had been mirrored in unrelieved gloom on the Stock Exchange, and ominously persistent selling sent equity prices plunging downwards. The loss in capital values, as measured by the *Financial Times* index, was almost 7½ per cent, for the index dropped from 112.6 to 104.2. Yet on Friday of last week it shot up again by 4½ points, and a continued though less violent advance since then has virtually restored it to the level of a fortnight ago. Some leading equities, such as Woolworth, have gained more than 10 per cent in hardly more than a week.

From this violently erratic behaviour two conclusions emerge. The first underlines the fact discussed here last week, that the London market in present conditions has virtually ceased to fulfil its proper function as a shock-absorber. In circumstances of its proper function and major change the jobbers play for safety which uncertainty and the violence of last week's fall ever way the current is flowing. The violence of last week's fall resulted substantially from the unwillingness of dealers to absorb the stock; the violence of the subsequent recovery is a measure of the extent to which they succeeded in avoiding doing so. And such technical factors have certainly played a larger part in the second movement than they did in the first.

The other conclusion has more fundamental implications. This week's behaviour suggests that, despite the shocks of the past two months, the mood of investors has not basically changed, but is still governed by the incorrigible heads-in-the-sand attitude which produced such extraordinary results in the markets in the

first half of this year. To some extent the rally resulted from the action of institutional investors who, long embarrassed by the difficulties of securing an adequate yield from gilt-edged, soberly calculated that industrials were worth picking up at last week's levels. But such buyers would certainly not have pursued the market upwards. The main reason for the movement seems to have been a semi-speculative reaction based chiefly upon the first indications that America might extend "stop-gap" aid to Europe pending the working out of the Marshall plan. Without such aid Europe this winter will certainly face a crisis of incalculable gravity. With it, the Continent may be spared the worst pangs of hunger and its economy may be saved from collapse. But succour measured in such terms—and more than this is hardly physically possible—is a poor justification for advances in prices on the scale seen this week. It is certainly no reason for ignoring the still deteriorating drift of Britain's internal situation, the best barometer for which is the trend of coal output. And this week's reading, seen against the background of the Grimethorpe stoppage, is particularly disquieting, as a subsequent Note shows.

Meanwhile, the delays in disclosure of the Government's programme for meeting the crisis and the way in which each successive batch of proposals is being announced in isolation, ensure the minimum of response psychologically. Yet the very impotence of physical controls over a wide range of the economy makes the psychological factor all-important. Nothing tangible has been revealed about the results of last week's Ministerial discussions with the FBI on the pruning of the capital programme, and nothing positive has been said about an autumn budget. If such a budget is being planned, it would be psychologically valuable to say so now.

Coal Prospect Now

At this, the tail-end of the holiday season, there is usually an upswing in activity at the coal mines. But any slight improvement in production there may have been this year for this reason has so far been more than offset by the strike in South Yorkshire. Provisional figures for the first week in September show a decline in total production to only 3,638,300 tons, compared with 3,698,600 tons the week before. Tonnage lost through disputes, accidents and breakdowns amounted to 289,950, compared with only 105,600 tons. In the troubled South Yorkshire coalfield output was no more than 337,700 tons, against 404,800 tons in the previous week.

The revised target for average weekly production of deep-mined coal, recently announced by the Prime Minister, was "at least 4,000,000 tons" from September 1st onwards—say, 4,200,000 to 4,300,000 tons for total production. To attain even the original production target set out in the *Economic Survey*—200 million tons for 1947—a weekly average output of over 4,000,000 tons would be necessary between now and the year end. This is now manifestly impossible; and if there are a few more weeks of production at a rate of only 3,600,000 tons, even the "unofficial" estimates of 195 million tons for the year will no longer be attainable—a contingency which cannot be ruled out even though the Yorkshire strike will have terminated on Monday. For the trend of recruitment, which until recently was almost the only reassuring aspect of the coal situation, is now distinctly disquieting. There were only 717,900 men in the pits at the end of August compared with 719,000 in July.

Until the end of August, the latest period for which figures are available, coal stocks were mounting steadily towards the goal of 15 million tons by end-October. On August 30th, they stood at 12.7 million tons. But the South Yorkshire strikes have forced firms in the north to make inroads into their coal dumps, a fact which may yet force a revision in some areas of one of the assumptions on which the winter coal allocation programme was to have been based—namely, that all firms would be assumed to have three weeks' stocks laid by at the end of October.

This week's production statement is apparently the first of a resumed series of weekly output statements from the Ministry of Fuel and Power. The decision taken, at the beginning of the summer season, to revert to only monthly statements was widely and rightly deplored. Perhaps the welcome reversal of that decision now is a sign of increasing realism; but at least it demonstrates in practical fashion that the authorities belatedly recognise the public disquiet at the way in which the whole problem of coal is being handled.

* * *

Steel Output Spurts

Steel, in contrast to coal, achieved in August a gradual recovery in production from the disappointingly low levels of July. Pig-iron output reached a weekly average of 147,300 tons, compared with 143,500 tons in July and 145,300 tons in August, 1946. Production of steel ingots and castings followed a similar trend. Weekly output in August was 234,200 tons, against 211,700 tons in July and 225,900 tons in August last year.

PIG IRON AND STEEL PRODUCTION
('000 Tons)

	Pig Iron		Steel Ingots and Castings	
	Weekly Average	Annual Rate	Weekly Average	Annual Rate
August, 1946.....	145.3	7,558	225.9	11,747
July, 1947.....	143.5	7,460	211.7	11,007
August, 1947.....	147.3	7,660	234.2	12,178

The annual rate of production of steel thus recovered from 11 million tons in July to 12.2 million tons in August. By the end of the month, production was running at 13½ million tons a year. This is a particularly significant figure, for, if this rate can be maintained for the rest of the year, the 1947 target of 12½ million tons announced in the *Economic Survey* will be achieved, and there will be some grounds for expecting that the target of 14 million tons for 1948 recently fixed by the Prime Minister may also be reached.

There has never been any doubt that, given the necessary supplies of coke and other fuel, these targets were within the industry's capacity. But there remains considerable anxiety about the adequacy of coke supplies for the rest of this year; a shortage of coke would certainly hold up pig-iron production and so throttle any recovery which might be developing in ingot and steel castings output.

The IMF and World Disequilibrium

The second annual meetings of Governors of the International Monetary Fund and the International Bank for Reconstruction and Development opened in London this week under the chairmanship of the Chancellor of the Exchequer who is British Governor of both institutions and for the past year has been chairman of their respective Boards. The meetings could hardly have been better timed. They have drawn to London the highest financial authorities of the 45 member countries and there will be no lack of material for their deliberations. As was foreshadowed in these columns last week, however, no sense of the importance of the occasion will be obtained from a study of the agenda, with its suggestion that the main concern of the governors will be the receipt and approval of the executive directors' reports of the past year, the admission of new members, the election of next year's chairman, and other routine matters of the same character. This reticence, however, cannot veil the significance of the opportunity offered for a discussion of the growing financial paralysis which is creeping over world trade and recovery.

The reports of the Fund and Bank presented to the meetings deal frankly with the present position. It is inevitable that they should be somewhat out of date, given the pace at which events have recently been moving. But, even so, the executive directors have shown good foresight. Those of the IMF, writing well before August 20th about the transferability of sterling, pointed out that:—

the assumption of the obligation to permit the transfer of current sterling may add significantly to the burden of the deficit in the British balance of payments. There is, therefore, a danger that if efforts to improve the United Kingdom's international position and the general international payments situation are not effective, the assumption of this obligation may compel the imposition of even more severe restriction of imports and thus, in some degree, reduce the flow of trade.

The second annual report of the Fund again stresses the limitations of that institution in the abnormal circumstances of today. The executive directors point out that:—

The Fund's objectives can be fully realised only in a world in which the war damaged and war devastated countries have restored their productive efficiency to the point where they can achieve balance in their international payments with a level of trade conducive to their own and to the general well-being. Now, more than a year after the establishment of the Fund, the world is confronted with seriously unbalanced trade, with an urgent problem of financing international payments, and with severe shortages of goods for reconstruction and even for maintaining the minimum consumption standards in many countries. The Fund cannot solve these problems but the role which the Fund will be able to play in the future must inevitably be determined in large measure by the way in which these problems are solved.

The executive directors add that the resources of the Fund are not intended for reconstruction, that it can and will provide temporary assistance to its members during the transition period but that "if the Fund is to continue to help its members to maintain stable and orderly exchange arrangements it must be in a position to provide financial assistance after the transition period." That the Fund has not been entirely idle is shown by the fact that during the year to June 30th last it sold US \$50 million to France, and \$6,000,000 and £1,500,000 sterling to the Netherlands. There is reason to believe that since the end of the financial year further sales of dollars have been made to France and also to Mexico, both of which have largely exhausted their permissible purchases from the Fund for the current year. The executive directors' report recognises the turning point of economic policy which the world is approaching and again proclaims its faith in the principles of international co-operation: "either we seek through a concerted effort the goals of expanded production and higher standards of living or we resign ourselves to economic conflict and impoverishment."

World Bank's Reconstruction Loans

The report of the International Bank states that in addition to the loans of \$250 million to France and \$195 million to the Netherlands granted before August 10, 1947, the end of the period covered by the report, two loans have been granted, namely \$40 million to Denmark and \$12 million to Luxembourg. The loan to Luxembourg is of particular interest because it is intended to cover expenditure in Belgium and the resources out of which it will be financed will in fact be provided from Belgium's quota contribution to the Bank. The report emphasises that in order to carry out its task of helping to raise the level of world

AIRPORT BANKING

With the opening of a branch at NORTHOLT Airport and arrangements made for one to be established shortly at Croydon the Midland Bank extends the special services which it offers to travellers by air. A branch is in operation at London Airport, Heathrow, and banking services are available at Prestwick Airport through a branch of the Clydesdale Bank, an affiliation of the Midland Bank. Full facilities are provided at these branches for foreign exchange and all banking transactions.

IN Flintshire, North Wales, Courtaulds have four factories. Three (Aber, Castle and Deeside) are in the Borough of Flint; the fourth (Greenfield) is in Holywell.

To meet the increasing demand for viscose rayon yarn, the Company purchased Aber works in 1916 and built Castle Works in 1920-1922. Then in 1927 Deeside Mill was purchased for rayon crepe processing—that is, preparing and creping yarn for use by textile manufacturers.

This new and vigorous industry helped to revive employment on the Dee estuary—a district amply supplied with water and coal, and near the great rayon weaving mills of Lancashire, Yorkshire and Cheshire. Today it contributes substantially to the national output of continuous filament rayon.

Between 1928 and 1933 units were set up in these factories to investigate the production and spinning properties of "Fibro"—Courtaulds' name for their viscose rayon staple. First made in 1918, this revolutionary product could be spun and woven on existing textile machinery into an unlimited range of fabrics.

Large-scale production of "Fibro" was essential, so in 1934 Courtaulds decided to build Greenfield Works—their fourth in the county—in which to concentrate an output of 20 million lb. a year.

One of the largest of its kind in the world, this factory started production in 1936 and today turns out 75 million lb. a year. Further large extensions are being made to it. "Fibro," a basic textile material, is now an important factor in the national economy.

Of over 21,000 people employed by the Company in the United Kingdom, more than 6,000 are hard at work in these four factories in the smallest county in Wales. Rhwydd hynt i'w hymdrech! — Ymlaen, Gymry!

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

Issued by Courtaulds Ltd., 16 St Martins-le-Grand, London, E.C.1.

production as greatly and as rapidly as possible, the Bank must concentrate on "those projects or programmes which promise the greatest increase in productive output in the shortest possible time." Accordingly, the Bank has up to now given particular attention to the problems of European recovery, but the report stresses that reconstruction and development needs in other areas, Latin America, Africa, Asia and the Middle East, are being actively considered and indeed that "it should not be very long before the financing of development projects in those areas will tend to become the primary concern of the Bank"—hardly a reassuring forecast from the European point of view.

Although stabilisation loans were, on United States initiative, marked out as coming within the scope of the Bank's activities, it appears to be the tendency of the present management of the Bank to favour loans for specific reconstruction projects, and in particular to favour those projects which in turn will prepare the ground for private investment; in the words of the report, "to provide a catalyst by which production may be generally stimulated and private investment encouraged." The report states that in private loans the Bank limits its commitments as far as is practicable. At first it lends only enough to cover an initial phase of the long-term development project, leaving the remainder of the application to be considered in the light of progress during this initial period. This probably explains why the French demand for a \$500 million loan was cut down to \$250 million. The French Finance Minister has announced this week that the second instalment of this loan is now being requested.

The Bank report discloses that most of the loan applications so far submitted have come from European members. The applications to which no definite answers can yet be given are Chile, \$40 million for hydro-electric and transportation plans; Czechoslovakia, \$350 million for reconstruction of war damage and restocking of raw materials; Iran, \$250 million for industrial and agricultural development; Mexico, \$209 million for irrigation, hydro-electric and transportation development; Poland, \$600 million for reconstruction of coal mining, iron and steel and textiles, electricity and transport.

* * *

Marshall Plan and US Prices

Food prices in the United States have once again started to move rapidly upwards—in many commodities last November's peak has already been regained—and the present trend looks like continuing. The disclosure last week-end of Europe's prospective food requirements under the Marshall Plan naturally gave a further impetus to the general rise, but the full effect is unlikely to be felt until the deficit countries are able to operate on the market. Before the war, the sixteen European countries represented at the Paris Conference had an annual grain requirement of over 90 million tons, of which some 65 million tons were produced domestically and the remaining 25 million tons imported. Domestic output of all cereals for these countries aggregated only 55 million tons in 1946-47, and the severe weather last winter has reduced the current season's supply to under 50 million tons. Even if Western Europe can import 30 million tons this season, total available supplies will, therefore, be over 10 million tons short of the prewar level; the probable deficiency is nearer 15 million tons—between 11 and 17 per cent of total prewar requirements. But the cereal position is even more serious than this. The population of those 16 European countries has already increased by 8 per cent above prewar. On the basis of prewar *per capita* consumption, therefore, the cereal deficit for 1947-48 is likely to be about 20 million tons—even on the assumption that 30 million tons of grain can in fact be imported.

Meat supplies are equally short; production in Western Europe for 1947-48 is estimated at only two-thirds the prewar figure of 9 million tons. And expansion in the livestock industry is a slow process, highly dependent on the supply of feeding stuffs. Milk production is also lower; it is 20 per cent below the 1934-38 average of 72 million tons, but recovery to that level is expected by 1950-51. Oils and fats (excluding butter) are not quite in such short supply, while sugar output is estimated to exceed the prewar level by 1948-49.

Even on a three-year view, the food prospects for Europe look far from bright. By 1950-51 domestic production of all major foodstuffs except meat will, it is hoped, have regained its prewar magnitude. If imports, however, are restricted to a 1934-38 average, consumption per head of population may still be reduced. As the Western Hemisphere countries alone have exportable surpluses which are not wholly earmarked under long-term contracts, much of the increased demand for food imports by Europe will be reflected in Western markets—provided that the European countries have sufficient foreign exchange available. In

producing areas such as the United States, where the high level of prosperity encourages an expanded home consumption, a decline in the exportable surplus may aggravate Europe's problem. Perhaps sufficient economic incentive still exists for the currently high food prices to induce farmers to expand output—at least in those countries where the farmers receive the benefit of those high prices. But expansion in the production of one commodity invariably presupposes a reduction in another unless new food-producing areas are developed.

* * *

"Non-utility" Prices: Is Control Desirable?

The Board of Trade last week made an Order fixing, as from October 1st, maximum prices for men's non-utility made-to-measure "outer wear." The maximum price, excluding purchase tax, which a tailor will be able to charge for a made-to-measure suit or overcoat will be 110 per cent above the price charged in the three months ended August 21, 1939, or £15, whichever is the larger. When a customer has his own cloth made up, the corresponding maximum making-up charge will be 100 per cent of the 1939 level, or £10. Tailors who were not in business in 1939 will be limited to a charge of £15 for the complete suit or overcoat. From October 1st onwards all tailors will have to display notices of their permitted maximum prices, including purchase tax.

Naturally, any attempt to prevent the unscrupulous from exploiting the consumer by charging exorbitant prices is praiseworthy in principle, and this move will undoubtedly benefit some consumers—even though the margin over 1939 value looks liberal, by the standards of price-control as now practised. But it is questionable whether the restraint upon exploitation will be effective in the very cases in which it is already most extreme; and, what is worse, whether it will check the seepage of cloth from export allocations into the home market. To the extent to which tailors who have been charging more than the new maxima now reduce their charges, the shortage of non-utility supplies will become more acute, and the possible gains by the unscrupulous will be *pro tanto* increased. Obviously, so long as the basic policy of trying to stabilise the prices of essentials continues, the price control of utility clothing is imperative, however frictionally it may work. But, surely, when there is such urgent need for maximum economy—especially in supplies which are still readily marketable abroad—the consumer who, for whatever reason, avoids the utility grades should pay fully for the privilege. Is this really the moment to encourage such expenditure, however clear it may be that some tailors have been behaving unreasonably? Which is worse—to have some tailors charging excessive margins, or to put an additional premium on law-breaking, penalising the honest and encouraging black-marketeering, and risking further diversions from export supplies?

Even in the sphere within which it is effective, the Order is likely to work creakingly. Given the policy—which in unstandardised goods is inevitable—of controlling prices by reference to a past datum line (1939), control for new businesses is bound to be arbitrary. In this case there will obviously be inequity as between new tailors of high-grade (restricted to a flat £15 maximum) and pre-war tailors of similar grade who charged "exclusive" prices before the war and now will be able to operate at prices up to double the maximum enforced on their new competitors. Another type which may be unfairly hit is the low-price, multiple bespoke tailor who achieved low costs before the war by spreading overheads over a large output, but who now has supplies sufficient only for a fraction of his pre-war turnover. Finally, there is the question of quality. Is it really possible, in these unstandardised lines, for either tailor, customer or price controller definitely to ascertain in every case the 1939 equivalent (and its related price) of the cloth which is being sold now? If there is room for honest difference of opinion, the Order will be unenforceable.

In short, there is now a strong case for pruning-down the scope of price control beyond the range of essential articles and utility grades. This Order is a good example of departmental enthusiasm which has results wholly unrelated to, and indeed at variance with, the needs of wider policy.

* * *

More Natural Rubber for US

The Office of Materials Distribution in the United States has announced the elimination of controls on the use of natural rubber in some 30,000 items, all unconnected with the transportation industry. This modification of "R.I." will undoubtedly encourage increased consumption of natural rubber in America, but its effect

will be limited. The specification for the manufacture of tyres and inner tubes still stands, and in 1946 this accounted for three quarters of America's total consumption of rubber.

Last year American industry consumed 756,000 tons of synthetic rubber, of which 549,000 tons was used for transportation purposes and 207,000 tons for other uses. Obviously, not all of this latter quantity will be replaced by the natural product; indeed, in certain more specialised applications, synthetic rubber may well hold its own, while for other purposes reclaimed rubber will probably be used. Nevertheless, it would seem reasonable to suppose that there is an outlet opened up for at least an additional 100,000 tons of natural rubber. Moreover, now that natural material may be used in the manufacture of certain rubber products, the markets for them may expand. Although the effect of this modification of "R.I." may not be very appreciable in the rubber market, it at least shows a welcome change in the official US attitude.

In transportation, it is not expected that natural rubber will be allowed to compete on equal terms with the synthetic product. But the recent announcement at least raises hopes that Congress may take a more sympathetic view when fixing the level of synthetic output. If this were restricted to 250,000 tons a year, natural rubber would have a total potential US market for some 780,000 tons based on 1946 consumption figures. Part of this, however, would be taken up by the use of reclaimed rubber.

Depositing Securities: An Unfortunate Confusion

The Treasury is naturally anxious to ensure wide publicity for its measures to implement the Exchange Control Act, 1947, which comes into force on October 1st—and especially for the provisions which require bearer securities and certain securities which can be loosely described as "foreign" to be kept henceforth with an authorised bank. Banks, solicitors and stockbrokers have been circulated and space has been procured in various journals to inform the public. This is the normal procedure when such information has to be disseminated. But in a broadcast announcement recently after the BBC news—an announcement addressed to the whole body of investors "and every one who receives interest or dividends"—the Treasury apparently succeeded in misleading and disturbing many a maiden aunt and penurious widow—at all events, many of the less instructed of investors felt it necessary to telephone either the BBC or a responsible newspaper for an interpretation before hustling to their investment advisers to deliver up their stocks and shares.

The facts seem to be these. The BBC received the text of the broadcast, not as a news item, but as an announcement worded by the Treasury, and read it as such. Responsibility for its abruptness and any misinterpretation is not, therefore, on the BBC's head. The Treasury for its part ought to have realised that the people it sought to reach by a general broadcast were the very ones who most needed the clearest and simplest explanation possible. It also seems to have underestimated the effect upon a public keyed up to hear the worst—especially upon the investing fraternity, who might be excused for being rather more on edge than others.

Actually, the purpose of these arrangements is simply to prevent holders of certain internationally negotiable securities from using them to acquire foreign exchange, and there is nothing frightening about them at all. The actual classes of securities which, from October 1st, must be kept in an "authorised depositary" are four—bearer securities, securities on which interest or dividends are payable by coupon, registered certificates issued by a registrar outside the scheduled territories (i.e., the sterling area), and registered certificates issued by a registrar inside the scheduled territories in respect of securities which can be transferred without the registrar's consent to a registrar outside the scheduled territories. All other securities owned by United Kingdom residents can be kept at any place the owner chooses.

Switzerland and Gold

One of the more remote consequences of the suspension of convertibility of sterling into dollars has been a ban on gold coin sales by the Swiss National Bank. Since last November the National Bank has sold gold coins freely at the official price, provided the gold was not destined for export. The danger that these coins might be exported was thought to

have been mitigated by charging the purchaser a seigniorage premium of 5 per cent plus a turnover tax of 4 per cent. These charges have, however, been powerless to arrest a considerable smuggling of coins out of the country, particularly into France and Italy, where high prices are quoted for gold in the black markets. The demands for gold coins from the National Bank increased considerably after the suspension of convertibility of sterling and rose to a pitch at which the Bank was compelled to suspend these sales. The official announcement notifying this change of policy states that gold coins had been put into circulation in Switzerland as a means of absorbing the gold accumulating through the surplus on Switzerland's balance of payments. By putting gold into circulation, instead of keeping it in reserve and issuing additional notes against it, it was believed that the danger of inflation would be averted. The announcement goes on to say that recent international currency developments had led to a vastly increased demand for gold and that, since Switzerland was the only country selling gold to the general public, she became a focal point in this traffic and, unwittingly, an instrument of international speculation and smuggling.

This undesirable situation has been remedied by the suspension of gold coin sales. Another result of the suspension will be to close the gap between the rate for "financial dollars" and the official dollar rate. This gap has recently widened, partly as a result of the demand for gold. The National Bank of Switzerland does not freely accept dollars against Swiss francs at the official rate unless those dollars are the product of *bona fide* current commercial transactions. Financial dollars have to find their own level, and that level has been falling rapidly, since the Swiss francs required to finance gold coin purchases from the National Bank have in large measure been obtained by sales of dollars. Another consideration which may have encouraged the Swiss National Bank to suspend sales of gold coins is the change in the prospective balance of payments in Switzerland threatened by the present international monetary developments. Given the considerable curtailment of tourist traffic to Switzerland, there is less likelihood of that persistent surplus in the Swiss balance of payments which in the past encouraged the Swiss National Bank to get rid of its surplus gold by putting it into circulation.

Australian Banking Uncertainties

Very little definite information has yet reached London about the project for full-scale nationalisation of the Australian banking system which was so suddenly announced four weeks ago (and was discussed in *The Economist* on August 23rd). All the evidence tends to show, however, that the Commonwealth Government is determined to proceed. It is clear, as was surmised at the outset, that the announcement was a sequel to the High Court decision which in effect frustrated the Government's plan to concentrate the banking business of public bodies and local authorities in the state-owned Commonwealth Bank. But it is fairly certain that the Government's decision was not taken suddenly in a moment of pique. The Government obviously was piqued, but it appears that some members had all along wanted to go the whole hog in nationalisation, and were only awaiting an appropriate excuse for pressing their plans.

Obviously, it should not be taken for granted that the project will be carried through; all save the most extreme and doctrinaire advocates must well know that the existing arrangements already give the Government all the advantages which, from its own standpoint, it might hope to reap from full nationalisation. Its powers enable it to grip the commercial banks in almost as tight a strait-jacket as it chooses to impose. The commercial banks themselves had certainly assumed that nothing worse would befall them than the structure of control imposed by the perpetuation of the wartime principles, and they were beginning to adjust themselves accordingly. That explained the two bank mergers announced early this year. In view of the new uncertainty, it was to be expected that the merger between the Bank of Australasia and the Union Bank of Australia, which had not been consummated, would be suspended. An announcement to this effect has been made this week, making it plain that the plans have not been irrevocably dropped, but are being pigeon-holed until the general situation is clarified. The main reason, it is believed, for the earlier delay was the heavy burden of stamp duties which the merging institutions would have to shoulder. Obviously, it would be a foolish waste of effort and of stockholders' resources to proceed with the scheme if both institutions are shortly to be swept into the Governmental machine.

Higher Cocoa Price for Growers

The Gold Coast Cocoa Marketing Board has announced that the price to be paid to farmers for cocoa beans for the season 1947-48 will be increased from 30s. to 50s. a load. This is equivalent to an increase of from £56 to over £93 a ton. It seems hardly likely that a similar improvement in prices can be withheld from the farmers in Nigeria, since conditions of production and marketing are broadly the same as in the Gold Coast, although a much smaller crop is harvested.

The price at which the West African Produce Control Board (after October 1st it will be the Gold Coast Cocoa Marketing Board, but this will involve no important changes in the mechanism of marketing) buys cocoa from the farmers is fixed at the beginning of each season. The avowed object is to insulate the farmer from short-term fluctuations in the world price. But the Board sells at the world price to both the Ministry of Food and foreign buyers, and in recent years the price fixed for purchases from the farmers has been well below the selling price. Hence the Board has been able to build up the handsome surplus of about £20 million, most of which is intended to provide a buffer for the farmer against a sudden fall in the world price. Recently, the margin between the price to the farmer and the Board's selling price has been widening still further. Some mid-crop cocoa has lately been taken up by the Ministry of Food and by American buyers at 29½ cents a lb. Even a price of £93 a ton to the farmer is equivalent to only about 20 cents a lb., so the proposed increase in cocoa prices in the Gold Coast will still leave a large margin.

The continued buoyancy of the open market price in New York is an indication of the continued pressure on available world supplies. It is quite clear that if the present high level of the world price is maintained, the price paid for cocoa by the Ministry of Food, and hence by manufacturers, will be forced above its present level. Although this will mean dearer chocolate, there is, of course, the compensating factor, from the point of view of public policy, that cocoa is a useful earner of dollars. Meanwhile, the West African cocoa farmer benefits from the high world price by a direct increase in his cash price and in the growth of the "cushion" against a possible eventual fall in prices when the pressure of purchasing power on comestibles in the United States has eased off. If the smoothing principle eventually works as intended, the benefit should be substantial—not only, or perhaps even mainly, because of the support in seasons of low prices, but because under present conditions of general scarcity, the "reserve" purchasing power if released now would be largely dissipated in the high prices paid for consumables.

World Oils and Fats Problem

The shortage of oils and fats is causing considerable hardship to importing countries. Although production last year showed a 5 per cent increase on 1945—the United States Department of Agriculture estimated the world total at 15.7 million tons—it was still some 20 per cent below the pre-war level of 19.3 million tons. The total quantity available for international trade during the current year was calculated to be 3,100,000 tons, in contrast with 5,800,000 tons in the 1935-39 period. And it will probably be five years or more before consumption in the deficit countries can be restored to its pre-war level. Some illuminating facts on the present position were given last Monday by Mr Geoffrey Heyworth at the meeting of Lever Bros. and Unilever Ltd. He estimated the 1947 output to be some 2,500,000 tons short of the pre-war figure, with a total deficit of 4,000,000 tons after allowing for an increase in world population of 8 per cent.

The recovery of production in the Far East has been disappointing. Only very small quantities of palm oil and copra were available from the Netherlands East Indies, while exports from Malaya are but a little more than one-third the pre-war quantities. Shipments of soya beans from Manchuria have been severely restricted and India is no longer an exporter. The Philippines alone of the chief pre-war sources has expanded output. In that country, the recovery of the copra industry has been phenomenal; in 1946 exports had reached the pre-war level of 375,000 tons of oil and during this year they are proceeding at the rate of 600,000 tons a year. Supplies from the Far East, the major source for international trade, are nevertheless heavily curtailed. In Western Europe production has also shown a serious decline, and here it is mainly in the form of butter and lard. The shortage of feeding stuffs is the main obstacle to expansion, and it is unlikely that the pre-war output will be reached for some years.

But there are other operative factors. Consumption in most producing countries has increased, reducing the available export surplus. Thus India, which until 1939 was an important source of supply, is unlikely to export on any large scale in the future. The increased consumption of liquid milk, encouraged by various governmental nutritional schemes, has necessarily curtailed the supply of fats, while under the International Whaling Agreement, a season's catch is restricted to a level which in 1946/47 produced only 320,000 tons of whale oil, compared with 500,000 tons in the pre-war years.

Mr Heyworth's prescription for increasing supplies to cover the present annual oils and fats deficit of 4,000,000 tons is simple and, were it carried out, might well be effective. The deficit countries should co-ordinate their purchases rather than compete against one another on the world market, and subsidies should be withdrawn from consumer prices to enable consumer resistance to react upon the current high prices for oils and fats. Additional supplies should be obtained by more development projects such as the East African groundnut scheme, by expanding production in Western Europe, and by increasing the exportable surpluses of those countries where liberal supplies allowed on the home market are creating artificially low domestic prices out of proportion to world market prices. An increased use of materials derived from mineral oils could provide additional quantities of detergents, and the limitation on the catching of whales should be temporarily suspended. On oils and fats, Mr Heyworth speaks with authority. It is to be hoped that his advice does not fall on deaf ears.

Higher Retail Sales

Retail sales for July, as indicated by the index numbers published by the Board of Trade, show the pressure of home purchasing power on the goods in retail supply after the seasonal contraction of sales in June. Last year, the index was carried steadily from 125 in July right up to 161 in December. Although sales in July this year are thus 14 per cent higher than in the corresponding period last year (sales of every category except books and stationery show an increase on July, 1946), the development of the austerity programme is unlikely to permit any such expansion of sales as occurred in the autumn and Christmas season last year.

INDEX NUMBERS OF SALES PER WEEK
(Average for 1942=100)

	Apparel	Household Goods	Non-Food Merchandise	Food	Total
July, 1946.....	112	185	124	123	125
May, 1947.....	159	222	165	135	147
June, 1947.....	141	225	150	134	139
July, 1947.....	140	232	152	138	142

INDEX NUMBERS OF APPAREL STOCKS
(Average for 1942=100)

	Women's Wear	Men's and Boys' Wear	Footwear
July, 1946.....	93	66	70
May, 1947.....	114	90	83
June, 1947.....	133	99	89
July, 1947.....	123	99	95

Of the items which contributed to the rise from 139 in June to 142 in July, the index for household goods was the highest this year and the food index the highest yet recorded. Tobacco sales continued their recovery from the fall which followed the Budget, and the rise in café and restaurant sales was maintained. It is particularly interesting that the sales index for apparel, which at this stage in the coupon period ought to be dropping rapidly, in fact lost only one point. This is partly accounted for by an increase from 125 to 144, in sales of men's and boys' wear. The amount spent per coupon in July was about 8 per cent higher than a year ago.

Stocks of footwear were the highest since 1944, but while stocks of men's and boys' wear maintained an overall high level, wholesale houses at the end of June had less than two weeks' supply of some items at the current rate of sales. The decrease in the retail sales of women's wear appears to have been more than balanced by an increase of 16 per cent, over the same period, in stocks at the wholesale stage. But the really critical period

Homburg Hats — new issue

Our Fenchurch Street shop is offering a new issue of the most excellent Homburg Hats. Their colour is of course black but the outlook when under one is very bright indeed as they promise to pay vast dividends in comfort and appearance. The preferred price is 51/- but there are others and sizes fluctuate very conveniently. Other hats in various shapes and shades are reported to be good buys, particularly 'Snap Brims' from 38/6.

The Small Firm Puts its View

The meeting on Monday between the President of the Board of Trade and a deputation from the National Union of Manufacturers comes as a timely reminder not only of the grievous strain which government by control and licence, however necessary it may be at present, puts upon the small firm, but also of the opportunities which exist among small firms for efficiency and enterprise in the production drive.

It is sometimes forgotten that two-thirds of the whole volume of production and services is sustained by the small men. Yet this fact alone means that, in an age of industrial controls, two-thirds of industry is forced to put managerial and technical resources, which can ill be spared from small staffs, to the task of filling forms, collecting statistics for official use and supporting the industrial bureaucracy which is inseparable from the present system of control. But more than this, it emphasises the disadvantages under which the major portion of the industrial economy may have to operate if official policy in general and allocation of scarce materials in particular is determined mainly by reference to the requirements and experience of large units of production.

Yet, if labour is to be attracted to the undermanned industries and if production for export over the widest possible industrial field is to be stimulated, a technique will have to be developed for getting the men and materials to the small firms which are engaged on priority work, and especially to those industries where most of the firms may be classified as small.

There is plenty of scope for improvement in export sales technique among small businesses, especially if they are to compete seriously in the United States market, and the deputation to the Board of Trade last Monday obviously realised this need. But there is wide scope, by smoother and more realistic allocation of men and materials for production, for aid from official policy and administration. It is all to the good that this fact was emphasised five days before Sir Stafford Cripps's announcement of the export plan last Friday.

Burmah Oil Corporation

The doggedness shown by the Burmah Oil Corporation in its struggle to resume production in Burma is admirable. But the latest manifestation of faith strikes a faintly pathetic note against the background of anarchy which has plagued the birth of the new republic. The Corporation states in its annual report that it expects shortly to reach an agreement with the new Burmese

Government, and though no date is mentioned for the possible restarting of production, late in 1950 is stated as the probable time for opening the new refinery—if local conditions are propitious and deliveries of plant come up to schedule. In preparation for these developments, up to the date of the balance-sheet £872,589 had been spent on rehabilitation, and evidently money is going into the erection of the refinery. Plans have also been made for continuing exploration to establish new oil reserves to replace the main Yanangyang and Chauk fields, which have yielded most of the company's output for the past sixty years and are now nearing exhaustion. The Corporation's hopes are obviously being backed with hard cash. But while investors await the outcome of the representations being made in Burma, they can console themselves for interim disappointments by reflecting that only a small proportion of the Corporation's eggs has been left in the Burmese basket.

In fact, a calculation of the break-up value of the £13,736,513 ordinary stock, taking credit for only a nominal valuation for fixed assets in Burma (£2,927,536 was transferred from the war contingencies reserve in 1946 to write off these assets), gives a figure of £3½ per stock unit, compared with the current market price of £34. This is, perforce, a tentative estimate, for though total current market values of investments are included wherever this is possible, where it is not—in the case of the gilt-edged portfolio—the balance-sheet figure has been taken. Further, in 1946 only one-sixth—substantially less than in 1945—of the total profit of £3,133,887 was derived from trading in India and Burma. The remaining five-sixths came from other subsidiaries, associated companies and investments, and showed a 12 per cent increase over profit from these sources in 1945. Interest on Government securities rose from £379,733 to £564,829, although the total holding was reduced from £23,059,998 to £16,713,447 to repay loans and make advances to subsidiaries. Income from associated and other subsidiary companies showed only a small increase, these being mainly concerned with trade in the disturbed Orient. The accounts were prepared too soon to reflect the record year of Anglo-Iranian, in which the Corporation has a direct holding of £4,292,985 ordinary stock, and, through its wholly owned subsidiary, the BOC-Anglo Iranian Share Trust, a further £1,050,000 ordinary stock. Nor has the latest increased payment on the £1,200,000 ordinary stock of Shell Transport and Trading been credited; the heavily weighted interest in these oil producers is an appreciating asset which next year should show a substantially increased return. Indeed, in view of the narrowing of profit margins in the retailing of oil and the delay in the resumption of production in Burma, the "holding" side of the Corporation has become the core of the business.

Industrial Disputes

Until the outbreak of the Yorkshire coal disputes, the industrial record of 1947 had been reasonably creditable. The number

COMPANY MEETINGS

LEVER BROTHERS & UNILEVER, LIMITED

REBUILDING EUROPE'S FAT SUPPLIES

The annual general meeting of Lever Brothers & Unilever, Limited, was held, on the 8th instant, in London.

Mr Geoffrey Heyworth presided and in the course of his speech said:—

Apart altogether from the war there are other causes which in varying degree contribute towards the shortage of oils and fats. First, there is the tendency for producing countries to consume a greater part of their own production, which, for the time being, has a serious effect on supplies available for Europe. A second factor is the increase in the habit of drinking milk. This is chiefly noticeable in the United States and Great Britain. It is to be welcomed, but it reacts adversely upon the supply of available oils and fats. Thirdly, there has been a serious decline in the production of oils and fats in Western Europe. The shortage of animal feeding stuffs and the likelihood that improvement will be slow means that it will be a long time before the European production of butter and lard can be brought up to the pre-war level.

In all I estimate that the 1947 world production of oils and fats is about 2,250,000 tons per annum below the pre-war figure of nearly 20,000,000 tons. If one takes into account the fact that the population of the world must have increased by about 8 per cent. since 1939, which would mean an additional requirement of 1,500,000 tons per annum, the total deficit compared with pre-war quantities amounts to about 4,000,000 tons. With Europe in its present condition

it is doubtful whether it could afford to purchase its share even if it were available.

QUESTION OF CONTROLS

It is said that if Governments would abandon their controls and leave the business to those who are experienced in it, there would be greater supplies and prices would more quickly get back to normal. I believe this to be true as a general proposition, although I do not think it is yet expedient in the case of oils and fats. It would be easy to argue from the experience in the United States, with its quick rise and its sudden precipitous fall, that the advocates of de-control were right, but in spite of freedom from control inside the United States the prices are still artificial in the sense that they are sheltered from the demands of the rest of the world which is not so well supplied. The gap between supply and demand is too big to permit abandonment of Government controls in either Great Britain or Holland at this time.

I do, however, urge that the shortcomings of Government control should be mitigated as far as possible. The critical position today of the countries of Western Europe, illustrated by their trade deficits, is due in no small part to the high prices of imported foods, including oils and fats. First of all, then, the Governments of Europe which agree to the allocation of supplies by the International Emergency Food Council should not make their deficits worse by competing in their purchases, but should co-ordinate their buying. Secondly, whereas an ordinary business would act very cautiously

in the face of the high prices which are being paid today for the marginal quantities of oils and fats in Argentina and elsewhere, Governments, even when advised by competent business people, in their anxiety to maintain supplies probably pay a much higher price than the public itself would pay.

Politically, the decision may be difficult to make, but, providing all unessential imports had first been cut, the Government, like any other buyer, ought to take the risk of smaller supplies in an attempt to break these high prices. European Governments today are paying in some markets seven or eight times the pre-war level for oils and fats, and I cannot believe that the public itself would consider such a level justified even with the present supply position. Under the conditions with which we are faced I am emphatically of the opinion that the earliest abolition of the subsidies on food is essential.

Another step that would help to reduce the excessive prices that are being paid for marginal supplies of fats would be the granting by the United States and the Philippines of larger allocations for export. As we have seen the United States' internal supplies are now liberal, and no undue disturbance should result. The release of relatively small amounts should greatly strengthen the hands of the European buyers in resisting high prices elsewhere.

These then are the actions that can be taken to bring about lower prices within the present supply situation. They are of urgent importance for Western Europe, whose immediate problem is to get as much or more than it is getting now for less money. But the basic problem of increased supplies remains, and we must now explore it.

PROBLEM OF INCREASED SUPPLIES

First, whale oil. I question whether in times of such gravity as the present it is sound policy to maintain the restrictions on the number of whales to be caught. The extra quantity of oil each year for the next

(Continued from page 460)

of working days lost through strikes in the first seven months of the year was 1,485,000, compared with 1,330,000 in the same period of last year. The main loss of working days occurred in coalmining, which accounted for about half of the total, with transport following second. In July, 167,000 working days were lost, transport being the main industry affected.

The statistics of wage increases, published in the Ministry of Labour Gazette, suggest that by comparison with the very large advances in wage rates secured during 1946, increases this year have been moderate. Between January and July, 1947, 1,750,000 workers gained increases in their weekly wage rates of £488,500, compared with increases of £2,250,000 in the wages of 6,300,000 workers during the same period of 1946. Advances in the weekly wages of 537,000 workers amounting to £190,000 during July have brought the increase over September, 1939, up to 67-68 per cent, compared with the 66-67 per cent for the end of June.

The progressive reduction in working hours, which has been a feature of post-war industrial agreements, has been continued. During July, a further 670,000 workers, mainly in the main line railways, secured reductions in working hours, amounting on the average to 3½ hours per week. The actual reductions in working hours are of course likely to be offset by the extensions which are now being planned, especially in the industries producing for export. These will not, however, affect the terms of industrial agreements on the shorter working week since they will be on an overtime basis.

While the review of wages and hours up to July suggests that the situation has been kept relatively stable, it would be unwise to deduce from this that the upward pressure of wages has reached its limit. Certain unions, including coal mining and building, are pressing for wage revision and if successful, may encourage other unions to follow their example.

Rehabilitation in Tin

The rehabilitation of tin mining in both Malaya and the Netherlands East Indies is showing encouraging results. The

Malayan production of tin-ore has expanded steadily over the first six months of this year, reaching 3,056 tons in June. The second quarter aggregated 8,217 tons, compared with 4,614 tons for the first three months, giving a half-yearly total of 12,831 tons. Increased output has been obtained by both European and Chinese mines. Total mines operating in June numbered 370, against 295 in April, and the native labour force has expanded to 34,184. But the high mining costs are causing considerable difficulties at the present controlled price of the product—dredging costs are estimated at double their 1941 level. Although supplies of consumer goods are increasing, the cost of living—particularly rice—has remained consistently high.

Output in the Netherlands East Indies has also shown an upward trend in spite of the unsettled conditions. Estimated production for the current year is put at 21,000 tons compared with 8,747 tons in 1946, and by 1948 it should have regained its pre-war level. New dredges have arrived and are being put into operation; Holland has already built six dredges since the end of the war. Much, however, will depend on the political situation, but given more normal conditions, recovery should be fairly rapid.

Shorter Notes

The Society of Motor Manufacturers and Traders is to present a memorandum on the Government's decision to end the basic petrol ration. They claim that the price of cars exported depends on the amount sold at home, that the motor industry at present is earning £1,000,000 a week from overseas, and that a rise in costs would quickly lose this country more than the £5,000,000 it hopes to save on petrol imports.

The Leather, Footwear and Allied Industries Export Corporation has prepared a scheme to increase exports of footwear by 100 per cent; the scheme has received official approval. At present, targets are being assigned only to manufacturers already engaged in the export trade.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the Records and Statistics Supplement. Notes on the following company reports also appear in the Supplement: John Lewis; Fairey Aviation; Burmah Oil Corporation.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Rows in italics are for securities not yet issued.															

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at ½% in the £. (f) Flat yield. Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

few years when the need is so great would, I think, justify any risk that there might be in suspending the operation of that part of the international agreement for two or three years.

Help can also be derived from what are known as soapless detergents. We, in this company, have been interested in soapless detergents for many years and have spent considerable sums on research upon them. We have ready for the market products of this nature and would make them to the fullest possible extent limited only by the supply of the various necessary materials and the suitability of the final product.

The main effective improvement in the supply position of oils and fats must, however, come from the restoration of production still suffering from the effects of war and from the development of new sources.

The need for new sources is emphasised by the fact that the world's population is steadily increasing. As it is desirable that the standard of living everywhere should go on rising, it means that new sources of supply must likewise go on being developed in a corresponding degree.

There are two approaches. First, through annual crops, of which the most important are groundnuts, sunflower, rapeseed, soya beans, and linseed; and secondly, through tree crops, such as palm oil and kernels, and copra. The British Government's East African Groundnut Scheme, in which you will remember we are playing a prominent part through the United Africa Company as the Government's managing agents, is an outstanding example of how to tackle the problem. This scheme will take six years to come to full fruition, when it is expected to produce an oil equivalent of 250,000 tons from 3,250,000 acres. Big as this scheme is, the quantity will not fill the gap in supplies caused by India's partial withdrawal from the export market. It will be apparent that a number of schemes of this magnitude must be undertaken, and even if tackled now it will be two years before they could begin to show results.

The magnitude of these projects is such that they immediately raise the question of the provision of the necessary capital resources. Normally the territories to be developed would look to Europe for this, but whether the labour force and production facilities to make the equipment needed can be provided is, at least, open to doubt. The alternative is to look to America, which again raises the question of balance of payments.

INTERNATIONAL BALANCE OF PAYMENTS

We cannot leave the discussion of the world shortage of oils and fats without some reference to the international balance of payments problem. Even if the necessary supplies of oils and fats were available, most of the countries of Western Europe would be unable to pay for their full requirements. The full restoration of pre-war standards of consumption is therefore possible immediately only if imports can be financed by loans or met by gifts; and ultimately if the industrial capacity of the countries with unbalanced accounts is developed until they can pay by exports for what they wish to import.

The maintenance of the standard of living of Western Europe is therefore dependent either on some new orientation of her productive plant and labour force that will increase the total productivity of her natural resources and her people, or on outside help, or on both. If we accept that it is undesirable as well as improbable that outside help will be forthcoming without Europe itself making a contribution, we must consider whence increased productivity within Western Europe can spring.

There is at present an annual world shortage of some 4,000,000 tons of oils and fats. Supplies can be increased, but the process will be slow.

The steps which can and should be taken to improve the situation are: First, the con-

trol system, although it cannot yet be abolished in Western Europe, can be made to operate so as to improve the terms of trade by more effective combination in the purchase of raw materials and by the removal of subsidies on the finished products. Secondly, the countries of Western Europe can increase their home production. Thirdly, the production in overseas territories which exported before the war must be restored to the full, and the re-establishment of the conditions which will make this possible must be accorded the highest priority. Fourthly, additional production must be found by bringing into cultivation unused tracts of land as typified by the East African Groundnut Scheme. Fifthly, an increased use of materials derived from mineral oils can provide additional quantities of detergents. Sixthly, limitation on the catching of whales should be temporarily suspended.

And finally, because of the economic plight of Western Europe, the resources necessary for the development of new supplies of oils and fats, and indeed of all goods urgently needed, can only be accumulated through better utilisation of existing production facilities, and the foregoing of expenditure on them. The most effective accumulation of these resources will be achieved by treating Western Europe as a whole and by following a policy of "make-do and mend," in all fields of activity which do not immediately contribute to the alleviation of essential shortages.

The report and accounts were adopted. [The Chairman's speech will be reprinted in full as a pamphlet, "Rebuilding Europe's Fat Supplies." Copies may be obtained from the Secretary, Lever Brothers & Unilever, Limited, Unilever House, London, E.C.4.]

LEVER BROTHERS & UNILEVER N.V.

The annual general meeting of the members of Lever Brothers & Unilever N.V. was held at Museumplein, Rotterdam. Mr P. Rykens presided and made a speech in similar terms to that delivered by Mr Geoffrey Heyworth at the annual meeting of Lever Brothers & Unilever, Limited, reported above. The report and accounts for the year 1946 were adopted. An amendment of the Articles of Association, whereby the authorised capital of the company is increased from Fl.500,000,000 to Fl.530,000,000 by the creation of a further 30,000 4 per cent. Redeemable Cumulative Preference shares of Fl.1,000 was approved.

THE RHODESIA RAILWAYS, LIMITED

DIVIDEND MAINTAINED

The fiftieth ordinary general meeting of the Rhodesia Railways, Limited, was held on the 28th ultimo in London, Mr. Arthur E. Hadley, C.B.E., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

The gross revenue of £6,349,480 for the year ended September 30, 1946, including an amount of £52,549 transferred to it from reserve for arrears of maintenance, was £156,720 higher than that of the previous year, and as working expenditure increased by £607,318 net earnings were lower by £450,598 at £1,665,802.

After adding to this operating profit of £1,665,802 the various amounts credited in the net revenue account, there was a total amount of £2,218,619 to meet debenture stock interest £854,706, debenture stock redemption £245,996, excess profits tax in the Union of South Africa £11,082 and income tax in the United Kingdom and the Dominions £981,835, leaving £125,000 which enables the directors to recommend the payment of the same dividend as last year.

The Southern Rhodesia Government has now purchased from the Rhodesia Railways Trust, Limited, the entire share capital of

this company, the change of ownership taking effect from March 31, 1947.

The estimated gross revenue for the first eight months of the current financial year, that is to May 31, 1947, is £342,177 higher than in the previous year, while working expenditure, due chiefly to increases in the cost-of-living allowances and wages, is higher by £447,665, so that the surplus of gross revenue over working expenditure has decreased by £105,488.

The report was adopted.

HUNGARIAN CREDIT BANK MAGYAR ÁLTÁLANOS HITELBANK ANNUAL GENERAL MEETING

The Hungarian Credit Bank recently held its annual general meeting, when an account was given of the period from January 1, 1944, to December 31, 1946. Details were given of the merger with the Hungarian Country Central Saving Bank (Magyar Országos Központi Takarékpénztár, Moktár), and of the change that occurred in the list of principal foreign shareholders. On the basis of the Potsdam agreement, shares of the German group were transferred to the Soviet Union. The representative of the Soviet Union was elected to the Board of Managers at the special annual meeting in 1946. The forint balance sheet of the bank, as at January 1, 1947, is as follows:—

GOVERNMENT RETURNS

For the week ended September 6, 1947, total ordinary revenue was £54,308,133, against ordinary expenditure of £86,732,772 and issues to sinking funds £3,121,598. Thus, including sinking fund allocations of £7,582,982 the surplus accrued since April 1st is £212,741,229, against a deficit of £449,602,000 for the corresponding period a year ago.

BANK OF NEW SOUTH WALES

(Incorporated in New South Wales with limited liability)

FIRST AND LARGEST COMMERCIAL BANK IN THE SOUTH-WEST PACIFIC
LONDON OFFICE: 29 Threadneedle Street, E.C.2. HEAD OFFICE: Sydney

GB47058

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000

ASSETS EXCEED £97,000,000

CLAIMS PAID EXCEED £181,000,000

(1946 Accounts)

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in SOCIAL ADMINISTRATION in the Faculty of Economic and Social Studies. Duties to commence as soon as possible. Salary £450 per annum. The person appointed will be required to assist in the supervision of practical work as well as in the ordinary teaching duties of the Department. All applications must be sent NOT later than September 25th, to the Registrar, the University, Manchester 13, from whom further particulars may be obtained.

A LEADING commercial organisation in India invites applications from young qualified Chartered Accountants to fill a senior Executive vacancy. The selected candidate will be required to enter into a four-year contract on a salary of Rs.1,000s. per mensem in the first year, plus standard dearness allowance which at present is 30 per cent of salary, plus overseas allowance of Rs.25s. per mensem. Annual increments. Post offers good prospects and carries with it liberal Provident Fund benefits. First-class steamer passages provided. Applications stating date of birth, full details of qualifications and experience, including present employment, should be addressed to Box 544.

CONSULTING ACCOUNTANT, wide experience in organising, desires Assignments. Advanced methods, with labour-saving systems in Financial, Cost, Budgetary Control and Group Accounting.—Box 536.

STATISTICIAN fully trained is required by large Industrial Group centred in the Midlands, to take charge of all statistical work of the Group.—Reply, giving particulars of age, qualifications and salary required, to Box No. 400, 8, Serle Street, London, W.C.2.

ASHRIDGE, BERKHAMSTED, HERTS (Principal: General Sir Bernard Paget, G.C.B., D.S.O., M.C.). Ashridge is a Residential College for Education in Citizenship and provides an open forum for discussion. Course 41. Week-end 17th-20th October, 1947. INDIA AT THE CROSSROADS. Subjects: The New Indian Constitution: The Rt. Hon. R. A. Butler, M.P.; The Strategic Position of India in Relation to Imperial Defence: Lt.-General Sir John Swayne, K.C.B., C.B.E.; The Future of Rural India: P. L. Brayne, Esq., C.S.I., C.I.E., M.C.; The Future of Burma: Sir John Wise, K.C.N.G., C.B.E. The course assembles Friday evening and disperses early Monday morning. Inclusive fee, £3 3s.—Application for enrolment should be made to the Bursar, Ashridge, Berkhamsted, Herts. Tel.: Little Gaddesden 3191.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

CAPITAL ISSUED AND FULLY PAID UP £20,000,000
RESERVE FUNDS STERLING £4,000,000
RESERVE LIABILITY OF MEMBERS £20,000,000

Head Office: HONGKONG.

Chief Manager: THE HONOURABLE MR. A. MOSS, C.B.E.

The Hongkong and Shanghai Banking Corporation, is prepared to act as Executor and
Trustee in approved cases. Trustee Companies, also affiliated to the Corporation, are established
in Hongkong and Singapore. Full particulars may be had on application.

THE ENGLISH, SCOTTISH & AUSTRALIAN BANK, LTD.

Head Office: 5 Gracechurch Street, London, E.C.3

Subscribed Capital £5,000,000
Paid-up Capital 3,000,000
Further Liability of Proprietors 2,000,000
Reserve Fund 1,815,000

Chief Office in Australia:

Collins Street, Melbourne,

and many Branches and Agencies throughout Australia.

With its widespread connections, this Bank offers every facility for the
conduct of all classes of Banking and Exchange business with Australia.
J. A. CLEZY, London Manager and Secretary

THE FEDERATION OF MASTER COTTON SPINNERS' ASSOCIATIONS, LTD., invite applications from qualified persons, with previous experience on the spinning side of the cotton trade, for a post which will require extensive knowledge of:—

- (1) Mill and factory accounting and costing systems.
- (2) Principles and practice of wage and price fixing on time and piece rates.
- (3) Principles of modern scientific management.

Candidates must be over 30 years of age and should state professional qualifications and salary required.

The appointment will carry participation in a Pension Fund. Qualifications such as Chartered Accountant, Chartered Secretary or Works and Cost Accountant would be an advantage. Applications to be submitted to The President, The Federation of Master Cotton Spinners' Associations, Ltd., 68-70, Deansgate Arcade, Manchester, 3.

LARGE expanding group of companies, with Head Office north of London, has the following Vacancies. The posts are additional with scope of advancement, and there is a Contributory Pension Scheme:—

TWO ACCOUNTANTS—as Assistants to the Chief Accountant—engaged in monthly accounts, consolidations, reconciliations with costs, and general accounting experience an advantage:

- (a) Preferably qualified and with some commercial experience. Age 30/40.
- (b) Not necessarily qualified, but capable of taking accounts to completion. Age 25/40.

WORKS ACCOUNTANT—not necessarily qualified—for S.E. London factory, capable of organising production of works' statistics and making on-the-spot investigations and taking charge of plant records. Age 25/35.

CONFIDENTIAL SECRETARY to Chief Accountant. Shorthand-typist, preferably with fair knowledge of accounts, filing, etc. Either sex.

Apply, with particulars of qualifications, age, salary, marital status, etc., to Box No. 233, Tudor House, 24 Tudor Street, E.C.4.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability)

DIVIDEND NOTICE.

ORDINARY CAPITAL STOCK.

At a meeting of the Board of Directors, held to-day, a dividend of two per cent (fifty cents per share) on the Ordinary Capital Stock in respect of the year 1947 was declared payable in Canadian funds on November 1, 1947, to shareholders of record, at 3 p.m. on September 22, 1947.

By order of the Board,

FREDERICK BRAMLEY, Secretary.

Montreal, September 8, 1947.

Following the meeting, Mr W. M. Neal, Chairman and President, stated that the payment of this dividend was possible solely because of income derived from sources other than railway operations. He added that while gross earnings from freight and passenger traffic had shown an increase compared with the previous year, the higher wage rates and advances in prices of materials and supplies had resulted in a lower net railway income.

No Motive Power

SIR STAFFORD CRIPPS is, beyond question, one of the ablest and most courageous members of the present Government. He has a clear and logical mind and he has, in recent years, lived down some of the more fantastic prejudices that he used to parade in public. It was to be expected that his contribution to the Government's effort to find an economic policy would be lucid, consistent between its parts and expounded with great skill of advocacy. There can be no doubt that his speech and his broadcast of last Friday have given a greater impression of confidence, determination and courage than all the rest of the Ministerial pronouncements put together.

It would be pleasant to go on to say that last Friday's export plan marks the turn of the tide and the beginning of a policy that will get the country out of its economic difficulties. Unfortunately, that would not be true. An export plan is, indeed, badly needed, and Sir Stafford Cripps was wholly right to produce a "realistic" plan in detail rather than to rely on generalised exhortation. His plan, as is argued in a later article (where it is considered more closely), is arithmetically perfect—in fact, rather too precisely perfect. It is very doubtful whether anybody could produce a better export plan than this, and it goes without saying that every effort must be made to carry it out in full. And yet the major doubt remains: it is almost impossible to believe that it will work. Even the most perfectly designed machine will not work if the motive power is lacking. And it is the motive power behind any and all of their economic schemes that the Government persistently ignore. Unfortunately, it has to be said that by far the best plan the Government have yet produced is the one that most conspicuously illustrates their ability to see every point except the main one.

The instruments on which Sir Stafford Cripps places his main reliance for the execution of his plan are, as was expected, the direction of labour and tighter allocations of materials. It is very doubtful whether anybody believes that the direction of labour will work to any significant extent. It has been handled in a very gingerly way by the Minister of Labour—as is, indeed, proper in a democratic community—and it is not apparently to be applied, in a positive sense, to any but unmarried men. It will be of some use in preventing a deterioration in the labour supply available for the export industries; but it should not be counted on to secure any improvement.

Allocation of materials is a more powerful weapon. But it is also one that is much more difficult to use for such a variegated purpose as the stimulation of exports. The immediate producers will no doubt get their priority allocations, and so perhaps will their direct suppliers. But who will look after the more remote suppliers, whose contribution is no less essential? To take a simple example which has been used before in these columns—The Economist is largely an export business. We receive an additional paper allocation for our export orders. But will the paper makers get their coal allocation? And will priority be extended to the manufacturers of the wire for the staples—for lack of which production of The Economist, in a form fit to export, has

several times almost been suspended. The manufacturers of the wire probably have no idea that it goes into exports, and even if they did, would have no means of distinguishing this particular wire from the rest of their production. If the way is really to be cleared for exports, then priority allocations for direct exporters are not nearly enough; the allocation machinery must go down to every ha'porth of tar that goes into exports. This will be the more necessary because Sir Stafford Cripps made it clear that there is to be no attempt to reduce the clamant demands of the home market, they are merely to be held back by the allocation machinery. The pressure of demand on the supplies available for the home market will be greatly increased, and anyone who has any experience of allocation knows how great a strain this will throw upon the control machinery—even if it be supposed that there are enough competent controllers to man it.

There is still another major difficulty, perhaps the greatest of all. Even if the goods can be produced, can they be sold? Sir Stafford did, indeed, mention this difficulty, but not in such a way as to suggest that he put it where it should be—at the very centre of his plan. There is hardly a country in the world that is not engaged in cutting down its imports and expanding its production for exports, and it is not enough to say that if British industry cannot sell one thing it must sell another. The central factor—and it will soon be dominant—is that of price, and unfortunately there is all too much reason to believe that British prices are, in general, a long way above the competitive level. Moreover, an economy based on directions and allocations, on wheedling, fighting and arguing for every essential component, is one—as everybody now knows—that puts costs up to astronomical levels. If industry is to meet its export targets, it will have to do a great deal of selling at a loss, and it cannot be expected to be very enthusiastic about doing so.

South of the Caucasus

THERE is no accounting for the curious and irrational timing of Russian diplomatic moves. Just when Mr Marshall is obviously scrutinising the Palestine prospect with a rueful expression, wondering how far he can take Americans towards acknowledgment of their stake in the Middle East; just when there is the chance of an impatient British Cabinet saying it will withdraw its troops from Palestine; and just when the rumour is going around London that Mr Molotov may be all smiles at the November conference of Foreign Ministers—just at this moment the Russians choose to rap out a request that the Persians should agree immediately to joint working of oil concessions north of, but not far from, Teheran. They are reported to have suggested that a draft treaty, handed by their Ambassador to Qavam es Sultaneh on August 12th, should be signed forthwith without submission to the Persian Parliament; to which the Persian Prime Minister very properly replied that such action would be unconstitutional.

The story then began to receive accretions of the kind which enabled Qavam, in the spring of 1946, to score the masterly diplomatic triumph over the bewildered Russians, for which Uno took the credit. The American Ambassador in Teheran was reported to have concluded a lecture on the evolution of parliamentary government with an unqualified pledge of United States support for Persian independence. And then the British Ambassador was reported—with substantial if not literal accuracy—to have covered his colleague's words by suggesting in Teheran that if Parliament rejected the oil concession treaty with Russia, the door should be left open for further friendly discussion of the matter. By the time it had been explained

There is, in short, no department of the national economy where the policy of defying natural economic forces by the brute force of compulsory controls works under a greater disadvantage than in the stimulation of exports. And by the same token there are few departments where the opposite policy, so often described in these pages, could be expected to be more effective. The only way by which the export industries will get the labour they need at the wages they can afford to pay is by restoring a certain amount of competition in the labour market and making a job once again something that is prized. The only way in which exporters will get the materials they need—including the ha'porth of tar—is by making other people less clamorously intent on pre-empting them for other purposes—that is, by reducing competing demands and not merely trying to hold them back by barriers of red tape. And the only way in which industry can be made enthusiastic about exporting is by making it at least as profitable to sell abroad as to sell at home.

Unfortunately, Sir Stafford Cripps did not discuss this alternative policy—unless an off-hand dismissal of “the old-fashioned method of . . . producing a poverty-stricken and partially unemployed working population” is to be regarded as discussion. It is a sad state of affairs when responsible Ministers deliberately close their minds to a reasonable line of argument and will mention it only in the form of caricature. No responsible person wants mass unemployment, but only the restoration of a little elasticity to the labour market. Nobody wants a poverty-stricken population, but only that the community should achieve an equation between its energies and its appetites. Do Ministers never wonder why their plans do not succeed? Do they really believe that it is always somebody else's fault? Or will they eventually open their minds to the possibility that their economic system is limping for lack of motive power?

that the British Ambassador had made no “request” and that the American Ambassador, in fact, only said that patriotic Iranians, when considering matters affecting their national interest may rest assured that the American people will support fully their freedom to make their own choice, the old Persian oil question was well in the limelight, provoking the familiar explanations and conjectures.

The Russians have, indeed, reason to be impatient with the Persians. The agreement of April 4, 1946, was to the effect that the Persian and Soviet Governments should form a joint company to develop and exploit oil resources in the north for a period of fifty years. After it was announced, remarkably little happened until the Russians presented a draft treaty a month ago. The pacification of Azerbaijan, the holding of elections and a number of less convincing reasons were offered by the Persian Prime Minister to explain the delay in submitting the proposal to Parliament. It was doubtful from the first whether the Persian deputies would accept the agreement, concluded, as it was, under duress with Russian troops still in their country. And Qavam probably calculated that a refusal could be made more safely if time were gained to enable American policy to develop its full resistance to Russian pressure. The latest Russian reminder and the manner of its presentation make it difficult for him to delay the test much longer; and the peroration of the American Ambassador already quoted will hardly increase the chances that the concession will be approved by the Persian Parliament.

Any prophecy about Russian diplomatic tactics is foolhardy; but it is reasonable to suppose that their primary aim in the

present campaign of pressure against Persia is not to get a share of Middle Eastern oil but to find where, in the eyes of Washington, the international frontier runs south of the Caucasus. Everyone knows that the Truman doctrine covers Turkey. The question is whether it also covers Persia—and it is by no means academic for the Russians. The Caucasus and northern Persia form the soft under-belly of the Soviet Union; they are vulnerable parts on any reckoning of strategic possibilities. There is no reason to explain Moscow's concern about them by bringing in arguments about oil. The need for oil has far less influence on Russian interest in Persia than it has on British and American interest in the whole Middle East. The Persians understand this quite well and would certainly not object to drawing further revenues from Russians working oil in the north, if they felt certain that they would not bring with them the type of official and business man who was known in Hitler's day as a “tourist.”

The Russians are not, of course, wholly devoid of interest in Middle Eastern oil, particularly in the next few years. Production in the Soviet Union in 1946 was estimated at only 22.8 million tons of crude, or about a quarter of the average production between 1938 and 1940. This deficit is almost certainly due to the temporary factors of shortage of equipment and difficulties of rehabilitation after the war. Russian oil reserves at 22.5 billion barrels (17 billion of them in the Caucasus) are actually greater than those of the United States at 20 billion barrels, and the Russians do not need to export oil. There seems to be no reason to suppose that, in the long run, it is a vital interest of the Soviet Union to have exclusive access to large quantities of oil in Persia or elsewhere in the Middle East.

★

Once the idea is put aside that Russia urgently needs additional oil which can only be secured from northern Persia, it is possible to concentrate on the other alternative explanation of the resumed diplomatic offensive. This lays all the stress on the vital interest in Middle Eastern oil of the western nations—especially the United States. It is possible that in years to come the Middle East will prove to be the soft under-belly of the “Anglo-Saxons”; its security is already one of the prime strategic interests of the British Commonwealth. So fast are events moving in this direction that the British pre-war policy of conserving oil in that area has given way to an American policy of maximum production. World demand for oil products has risen steeply: for 1947 it is estimated at 3,079 barrels or 242 million more than in 1946. Most of this increase is due to demand from the United States, which not only itself produces and consumes 60 per cent of the world's present output, but is rapidly becoming a net importer of oil products. Moreover, it is now believed that henceforth proved reserves of oil in the United States will decline and that within a period of thirty to fifty years the easily producible oil will be nearly exhausted.

Although the biggest exporter of oil is still the Caribbean area, where Venezuela alone produced over 55 million metric tons of crude oil in 1946, the Middle East comes next with an output of 33.4 million tons or nearly nine per cent of the world total. Nearly all of this was available for export; so that, although these figures are dwarfed by the 234 million tons produced—but largely consumed—in the United States, they are of greater significance for the world at large.

When it comes to reserves, the Middle East leaps to the front. The latest figure for proved reserves was 16 billion barrels, but an American official mission estimated the actual reserves in 1943 at 27 billion against the 20 billion of the United States and the 22.5 billion of the Soviet Union. Even more striking is the fact that only 150 exploration wells were required to arrive at the Middle Eastern estimate, which is less than five per cent of the number of exploration wells drilled each year in the United States. Then again, Middle Eastern oil obtained more cheaply and easily than in most other countries: 1000 tons a day may be given by a well without pumping, and a well completed this year in Persia is giving 3000 tons a day. Add to these facts the estimates that the next five years will see some £500 million—two-thirds of it British—spent on capital installations, that the Middle Eastern area is now capable of refining a great part of its production on the spot, and the vital and precious stake of Britain—as well as of the United States—is only too evident.

Yet it is in this very area that least is known about how vital the Russians regard their interests to be or about how ready the United States is to bring it under the umbrella of the Truman Doctrine. For all practical purposes the dominant and effective Power in the area is still Britain, although the Middle East bit by bit is coming—or has already come—into the American sphere of influence. What is British and American policy to be if the Russians persist in pressing the Persians to fulfil an agreement which they will say was reached under duress? Will the Security Council be asked to exert its dwindling authority in a matter of which it has such painful memories? Or will the British role be the conciliatory time-saving one already played by the Ambassador in Teheran? If so, there will be official and unofficial American criticism of the kind there has been already, with questions about why Mr Bevin cannot be as firm as Mr Marshall in a matter affecting vital British interests. Indeed, the criticisms would be justified, for the time is still far off when the defence of British interests in the Middle East can be left, even partly, in American hands.

It is unfortunate in some ways that Mr Marshall is at the moment absorbed in a diplomatic experiment. The Washington correspondent of *The Times* has described it as an attempt to play the Russians out of the court by following each American drive up to the net and smashing the Russian return out of reach. Those are very exhilarating tactics and, no doubt, if Mr Bevin joined Mr Marshall at the net very few Russian balls

would get past. But the Middle Eastern court calls for rather different tactics.

It was argued in *The Economist*, when Mr Truman made his momentous declaration of foreign policy, that it would be a British interest to support the Americans in its execution so long, and only so long, as it was understood that their ultimate object was a general diplomatic agreement with the Russians. Six months have passed since then, and Mr Marshall should soon be able to judge whether his smashing tactics are weakening Mr Molotov. The present session of the General Assembly of Uno should supply some evidence, the Foreign Ministers' conference in November even more. If Mr Marshall is satisfied by it that his strategy is beginning to succeed, then he could do nothing better than propose to the Russians a Soviet-Anglo-American exchange of views on the demarcation of their vital

The Coal Board

THE incident of the Grimethorpe strike cannot be said to be over until the fact-finding commission of three have found their facts and the men have finally accepted the results. There may be more difficulties yet to come. But this strike has had a much deeper significance than the loss of over half a million tons of coal—serious though this loss is. Abroad, and particularly in America, it has been given great symbolic importance, coming as it did at a time when attention was directed to Britain's willingness and ability to contribute coal to European reconstruction. And at home it has served to bring out three fundamental difficulties in the new organisation of the coal industry under a national board. These difficulties may be summarised in three antitheses: syndicalism *versus* socialism; bureaucracy *versus* local enterprise; men *versus* machines.

The first difficulty was briefly discussed in these pages two weeks ago; it arises from a misconception by the rank and file of the miners—or at least by a substantial number of them—of what nationalisation meant. To them nationalisation signified the handing over of the mines to the miners, not to a remote London-bound Board; it meant giving the management of the mines to the men—or at the very least to their direct representatives. Instead, control for all day-to-day purposes appears to the working miner to be virtually unchanged; some mine managers have gone, but most of them have stayed. Moreover, the manager is no longer responsible to a board of directors, who were sometimes flexible in their outlook, who were often locally known and who always knew the special conditions of each pit; he can now claim, and usually with truth, that his hands are tied by the instructions of the local office of the Coal Board in his area. To ease the transition and console the men, joint consultative machinery is being set up from end to end of the industry to replace and improve upon the old pit production committees. But however well this works, and however zealously the colliery manager consults, it will not give and ought not to give the men any responsibility for control. Only one man can be manager.

★

The second difficulty is much harder to analyse succinctly, for it is compounded of so many elements. The basic case for the nationalisation of the coal industry still stands: without it the clash with labour would have been violent instead of veiled; the financial problem of the industry would have been insoluble; and little or no progress could have been made with the technical reorganisation of the industry. But the general justification for nationalisation does not automatically justify its particular manifestation as it is at present being evolved from Berkeley Square. There are too many reports of excessive interference in local management, of conflicting policies being

interests in the Middle East. It might fail to produce agreement but every party would gain useful information; the cards and stakes would be quite different from those held in the peace conference and in the Moscow meeting; and by merely making the proposal Mr Marshall would convey to Moscow, in a courteous and formal manner, that his government is indeed vitally interested in the Middle East, and recognises the Russian interest in the area south of the Caucasus. In no other part of the diplomatic field is such an approach now possible; every other part is littered with the debris of past conferences. It is quite obvious that the latest Russian moves in Persia are intended to test American sensitiveness, and no good will be done—least of all to British interests—if the American reaction is just vague and irritable or, like the American Ambassador's peroration, either meaningless or misleading.

pursued by different departments of the Board, of technicians wasting their time on unnecessary administration, of demands for sheaves of reports and estimates of expenditure for approval—in short too many complaints of the characteristic sins of a bureaucracy—for there to be much doubt that control is too tight and that initiative at the periphery is being smothered by over-organisation at the centre.

It would be grossly unfair to the Board to imply that it is being proved a failure. The legacy which the Board inherited was not an easy one; and nothing but a miracle could have produced a really satisfactory output of coal this winter. And in fact there were many indications in the public report that Lord Hyndley made last week that real progress is being made, that the organisation of the Board is taking shape, plans of reorganisation are being begun and that mechanisation is progressing reasonably well—at least in some areas. With nine full-time members of the Board, 900 staff at headquarters and over 25,000 in the rest of the country, some results ought to be visible by now. And indeed there are some encouraging signs. In some Divisions, notably in Scotland and in the present mischief-maker Yorkshire, planning and reorganisation are being energetically pressed ahead, and divisional officers are throwing their whole weight into increasing productive efficiency. But if the Board is not a failure, it is equally not a success, judged by the acid test of the output of the industry as a whole. The major responsibility for the continuing disappointments of the production returns must be laid on factors that are outside the scope of this article. But among those who are in a position to observe what is happening, there are also doubts about the organisation of the Board itself. The Board consists of nine members, each of whom (apart from the Chairman and Vice-Chairman) is responsible for a different department. The system might work well if the members of the Board had been chosen as a team. But they were chosen as almost the opposite of a team, as a political balancing of opposing considerations. That being so, is there too much tendency for the different departments to act independently of each other? Is the Board itself effective in producing a coherent policy from these divergent elements? Can policy at the centre, in any event, be satisfactorily divorced from local execution? And can the impersonal character of a public institution be given the characteristics of a human mind in the local pit?

Theories about public boards in general have only a limited application to the coal industry in particular, for in no other sphere of public control has an attempt been made to organise either so large or so highly differentiated a structure. The BBC, or the London Transport Board or the Port of London Authority all run public services in which equal treatment is meted out to all customers: the same public service element

will apply to the transport services as a whole under the new Transport Commission. But coal is won from hundreds of pits, each with its individual problems and its own distinct groups of workers. Clearly this is a case when rules must be at their most elastic, and the opportunity for local variations at its greatest. Only the broad lines of policy should be worked out at the centre, and they should be transmitted to the eight Divisions and fifty Areas in such a way that they can be interpreted freely in the light of local conditions without absolving individual colliery managers from personal responsibility. There are those who claim that the Board is showing signs of doing what it ought not to do—that is, of centralising control—while leaving undone what it ought to do—that is, to give those who bear the local responsibility a clear definition of the broad lines of policy on which their efforts ought to be directed.

Report has it that there have already been serious strains and stresses in the Board itself, although these have been somewhat eased by the departure of Lord Citrine. Differences of opinion about the pace at which reorganisation and the closing of pits are to be pursued or about the elaboration of methods of training are natural and inevitable, and there is little evidence as yet that these differences have seriously interfered with the work of the Divisions and Areas. But they will have to be settled soon if work is not to be held up. It is impossible not to feel uneasy at the very small scope of Lord Hyndley's report of the progress being made in the concentration of production at the more efficient pits and in the closing down of inefficient pits. This may have been due to the danger of creating trouble by making public statements in advance of local warnings to the men affected. Or it may have been due to the Board's inability to make up its mind. But this is the crucial issue, and the public should be told what is happening.

The relation between those sections of the Board dealing with labour and production is, indeed, the most ticklish organisational problem the Board has had to face. The conception that men with trade union experience should be put in charge of manpower, recruitment and labour relations has obvious attractions, but it has also obvious disadvantages. The Government's gentleness towards the unions over the last two years shows how hard it is to be firm and hard-hearted with one's own supporters. This difficulty is magnified in the case of the miners, for they are in a stronger position than any other group of workers in the country. And however fairly the labour officers of the Board may work, there is the danger of divided loyalties. As the Board gradually trains its staff in its own needs and methods, and the ingrained suspicions of the men are softened by the experience of fair dealing, this difficulty should be overcome. Meanwhile the need for the fullest understanding

between the Labour and Production officers from top to bottom of the Board is the surest key to success.

★

The difficulties between the Labour and Production division's of the Board are not, however, merely questions of organisation. They arise from a much more fundamental conflict of men *versus* machines. The miners cannot be driven; they must be led. They cannot be ordered to evacuate South Wales and go to Yorkshire; they must be persuaded. Nor is it of any use to press forward with the introduction of machines like the now famous Meco-Moore's if agreement cannot be gained on how to work them, nor to introduce other new methods if the men are untrained to use them. The country demands greater output with an urgency which is getting more and more frantic. But it is patently clear that exhortation alone will not move the miner, and that, as at Grimethorpe, he will rebel if driven harder than he is prepared to go. It is easy to rail at him. But the miner can only be touched personally in his own village, and in his own pit. The National Union of Mineworkers, in its efforts to get an increased production of coal, is itself in danger of becoming, to the ordinary miner, as remote and unsympathetic a body as the Coal Board.

Every action of the Board which encourages its managers to reach agreements at the pits, and gives them full support when they do so, is to be welcomed. It is for the Board to make the main lines of its policy clear; to resolve its own conflicts and to issue the bare minimum of general instructions on reorganisation, equipment, supplies, training, recruitment and the like, and then to leave the rest to the man on the spot. The suggestion for solving the deadlock over the extension of the five-day week by local agreement, which was put forward by the union last week, is a good example of a sensible method of finding a solution. Everyone knows the extension was needed. Local conditions vary—why not let it be settled locally?

It is, nevertheless, all too easy to be critical of the Board. Because the urgency of its task is so great mistakes are liable to be magnified in the public eye. Eight months to set up a huge and entirely new organisation controlling 700,000 workers and, until January 1st, broken into 800 units is a colossal task. And new reorganisation schemes take months or even years to work out. The Board inherited certain schemes which it is continuing, but the effects of the Board's own schemes cannot be seen yet, and the more ambitious projects will not bear fruit until 1948 or 1949. This is irritating to the impatient, but the facts are obdurate. In the short run output can only be increased by the individual miner working harder. That is a job of persuasion. And if the Coal Board has not found the perfect solution, it can at least be urged in its defence that no one else has either.

Argentina's Two Faces

(By a Correspondent recently in Buenos Aires)

TO the outer world, Argentina still shows a bold, indeed a brazen, face. In his diplomatic struggle with the United States, President Perón has won nearly all the tricks. In his economic relations with Britain, Señor Miranda can still use forcing tactics and gain so much by them that he can afford a few charitable gestures, from which a tinge of patronage is not wholly absent. The court paid to Señora Perón in Europe was eloquent evidence of the strong position in which Argentina stands. But a strength that depends entirely upon the present peculiar posture of the world's markets is not very durable. Behind the bold front the processes of change are already at work.

At this time last year it was commonly claimed in Buenos Aires that the main reason for the current inflation in Argentina

lay in the export surplus, which during the war produced a balance in Argentina's favour of 4,000 million pesos (\$1,000 million). Once imports begin to come again, it was argued, customs duties will balance the budget, and the goods will mop up purchasing power. This line of thought hardly took sufficient account of the size of the budget deficit, which was 3,651 million pesos in the three years ended 1946, and is estimated at 3,000 million pesos for the two years to 1948. But through the rose-coloured spectacles of a country selling what the world could not do without, namely food, and accumulating what all the world wanted to accumulate, namely gold or dollars, it seemed to be an easy explanation and a pleasant forecast. It has proved completely wrong. Argentina is rapidly heading for, or rather is being steered towards, a position where it will become a bad risk.

In the light of the strength of the Argentine position a year ago this may seem difficult to believe. But the facts do not admit of any other interpretation. In mid-June, 1946, Argentina held over 6,000 million pesos of gold and foreign exchange, or the equivalent of \$1,500 million. By mid-June, 1947, in spite of a large and continuing export surplus, it had only 4,474 million pesos or the equivalent of around \$1,000 million. And of that, £150 million, or \$600 million, is pledged to the purchase of the railways. Thus, effectively, the Argentine gold and foreign exchange reserves have fallen from the equivalent of \$1,500 million to less than \$500 million in a year, and the process is likely to continue. Such figures may, of course, be misleading, because they do not take into account the forward commitments in either direction; but the fact remains that the position has become sufficiently serious to warrant the imposition of much stricter exchange control and the wholesale prohibition of imports, even of such conventional necessities as cars and cloth.

This impression that the position has changed radically is strengthened by the trade statistics themselves. For recent periods these show (in million pesos):

	Year 1946	Last Six Months 1946	First Three Months 1947
Exports.....	4,604.8	2,747.7	1,291.3
Imports.....	2,330.3	1,176.3	887.5
Export surplus	2,374.5	1,671.4	403.8

Thus, during the nine months to the end of March, Argentina had a surplus on trade account of 2,075 million pesos (say \$500 million). Yet its gold and foreign exchange holdings fell by 1,500 million pesos in only a slightly longer period, excluding the amount pledged to the purchase of the Argentine railways.

Furthermore the position has deteriorated since March, and for the first time in years Argentina had an important surplus in May:

	(millions of pesos; gold movements excluded)		
	Imports	Exports	
May, 1946	196.5	313.7	+121.2
May, 1947	414.4	388.7	- 25.1

This change indicates how Argentina has been buying abroad, particularly in the United States. In view of the heavy orders already placed, and now coming forward, it seems doubtful whether the country can again achieve a substantial export surplus for some time to come, if ever. It is true that import restrictions have been imposed and foreign exchange control tightened. But the latter will not affect trade. And the former cannot have an immediate effect as they do not immediately cancel outstanding permits. In any case Argentina is likely to continue in deficit with the United States, now running at a rate of \$400 million a year.

A partial explanation of the discrepancy between the trade surplus and falling exchange reserves, is that some goods are being exported on credit, since Argentina has granted 2,400 million pesos, or say \$580 million, of such credits, largely for political motives. But goods have not yet moved under them in anything like these amounts. There is, therefore, only one possible explanation of the discrepancy, namely that there has been a very heavy flight of capital from Argentina during the past year.

Up to July the Argentine foreign exchange control was organised to impede the entry of foreign capital on the grounds that it might be "hot money." On the other hand, there was no restriction on the purchase of foreign exchange, which had only to be formally notified to the Central Bank. Thus, for example, a *bona fide* traveller to Argentina had to make special application before he could receive any remittances over \$2,500 in three months. But the Argentine citizen who wished to purchase \$100,000, or even more, of foreign exchange, was able to do so without waiting for a permit. At one time, income tax returns were printed to include a declaration of

foreign assets, but an amendment slip was rapidly attached making this optional. Cruel tongues in Buenos Aires wagged to the effect that there were many in high places who could not make such a declaration without disclosing sources of income which were, to say the least, "extraordinary."

*

The second reason for tightening up the foreign exchange control and the import-licensing regulations lies in the enormous future orders for goods which are outstanding, and the large quantities of not always suitable goods already bought by the state-controlled *Instituto Argentino de Promoción del Intercambio*. Whilst it has sometimes been said that "paralysis" and not "promotion" should stand for the "P" in IAPI, this is not shown by the trade statistics. It is true that IAPI has cut out a large number of foreign traders, so long as it could make up to 50 per cent profit on the export of certain commodities. It is also true that a fair part of the imports that it has bought are not what the Argentine consumer wanted. But the value of trade is nevertheless higher than it was last year.

The value of exports in the first quarter rose from 754 million pesos in 1946 to 1,291 million in 1947. But the proportionate rise in the value of imports was even more, from 416 million in the first quarter of 1946 to 888 million in 1947. It must, however, be said that the rise in the value of exports was entirely due to higher values, the relative figures of volume being 1.6 million tons in the first quarter of 1946 and 1.7 million in the first quarter of 1947. Thus for 5 per cent less tonnage Argentina received 70 per cent more money and still contrived to draw on its reserves.

This however, is not the end of the story. Every trader in Argentina has covered himself as far as possible forward against reductions in import licences by making exchange applications to the Central Bank. Until recently, if these exchange permits were not taken up the trader paid a fine of 1 per cent. He did not, therefore, mind if he took up only half the foreign exchange allotted to him under his permits, since he could easily recover the small fine on the balance. When the first batch of import restrictions were introduced, every importer in lines not yet affected at once applied for exchange permits to cover future imports in his line—and received these permits. Later, however, the Central Bank issued a circular according to which holders of forward exchange permits must either use them before the expiry date or pay a fine of 20 per cent. The amount of the obligations outstanding against the Central Bank in respect of these permits is, of course, not known to the public, but it must have been a strong factor in inducing the Government to suspend the issue of further permits. The suspension cannot, of course, be permanent. Argentina must trade in order to be able to sell its agricultural surpluses. With all the world short of gold and dollars, and dependent on American aid for the present, Argentina cannot expect to be able to rehabilitate its foreign exchange position. As before, it will have to take the goods which it needs. Thus the ill effects of the suspension on British exports to Argentina may be exaggerated, since by the time current orders are completed, other conditions may prevail. But a warning should be sounded that, if delivery of existing orders is delayed, existing permits may not continue to remain valid. This would be a serious matter in certain cases.

There is another factor that tells against a long-continued restriction of imports. About one-third of the receipts in the Argentine budget come from two items. These are import duties and the profit on exchange made between the various rates charged by the Central Bank. If the suspension of the issue of import permits were continued for a very considerable period, so that it actually did diminish imports, the results on the finances of the country would be serious. Although budget-balancing is not one of the better-known Argentine pastimes,

the inflation is already causing political difficulty, which is a further reason for assuming that Argentina will not try to commit *hara kiri* by autarky.

*

Another of the reasons lying behind the decision to stop granting import permits lay in the large quantities of goods ordered, chiefly from American surplus stores, by the IAPI. At the end of July the port of Buenos Aires and its surroundings looked like a dump of second-hand lorries and cars. Many of these were of wartime design, construction and usage, and not popular with civilian users. IAPI was therefore finding them very hard to move into consumption. This did not apply to motor vehicles only, since IAPI had taken a plunge on most things from Bolivian tin, which it could not smelt, to prime movers of various sorts, which it could not sell. In fact, it had gone into the import market in a big way without having the experience that had enabled some firms to make fortunes in the same trade. The new decrees will help IAPI to unload without loss—or without too much loss.

So by a flight of capital, which must have been in the region of \$1,000 million, by speculative ordering of goods, and by unwise buying by the government trading body, Argentina has been brought face to face with a possible shortage of exchange

NOTES OF THE WEEK

Marshall With the Gloves Off

The tough line is being taken by the Americans at Lake Success, and Mr Marshall is himself leading them in the General Assembly of Uno to see that the punches are well and truly planted. Knowing that the General Assembly feels aggrieved at the way the Powers have ignored its suggestion, made in December, that they should "make every effort to ensure that their right of veto does not impede the Council in reaching decisions promptly," Mr Marshall is trying to direct its indignation against the Security Council and the Russians.

Three lines of attack are laid down: firstly Mr Marshall has announced that the Assembly will be asked to vote on a resolution about Greece similar to that already vetoed by the Russians in the Security Council, and will be asked as well to take up the question of Korea, in which there has been stalemate after stalemate between Americans and Russians. Then he is challenging the right of the Russians and the Poles to resist majority proposals for an international agency to control atomic energy. Lastly, and most important, he wants the Assembly—in this very session—to form a committee of all its members which would sit continuously for a year and provide additional machinery for dealing with dangerous situations and disputes. These are all smashes aimed into the Russian court. There can be little doubt that if the last suggestion is persisted in, with a majority of the Assembly following the American lead, the Russians might find it necessary to choose between a serious weakening of their position in the Security Council and withdrawal from Uno.

As at the time that the Truman doctrine was announced, the State Department has launched this surprise attack without consulting London; so Mr McNeil has had to refer back for instructions. It is hard to see how he can oppose such an ingenious method of strengthening Uno authority now that the basic idea of the Security Council—unanimity of the Great Powers—has proved unworkable.

Clearly, with vigorous American leadership, the Assembly could make this an opportunity to split the United Nations from top to bottom. Whether there would be British support for such an attempt to force the Russians and their seconds out of the ring is more than doubtful. It is a pity that Mr Bevin will not be there to decide on the spot. He may be keeping himself fresh for the November conference on Germany, but things might happen at Lake Success which would make that meeting impossible.

Whatever is done or attempted to stop the farce of the veto the Assembly may well be treated to a special example of it. Before that body can make recommendations about action to maintain the integrity of the Greek frontier, it has to receive a request from the Security Council that it should do so. As it is almost certain that the Assembly, if asked, would recommend the super-

for real needs. Although this government trading body has ridden on the high tide of a sellers' market so far as concerns the prices at which it has sold, it has actually exported less produce. One is therefore entitled to ask, in the light of its import trading, whether it could not in fact have helped Argentina and the rest of the world by exporting more. It is easy to criticise the Argentine Government for having reversed the role of Shylock and got a pound of gold for each pound of meat. But that would not be a wholly fair criticism, and it is human nature to sell at the best price obtainable. Where the criticism becomes more serious in its implication is when it suggests that the Argentine government trading organisation was not taking steps to increase exports, or was deliberately hindering them, thereby holding back supplies from a hungry world and forcing prices higher; and that then the same Argentine authorities were allowing the hard paid money to be frittered away in an unrestricted export of capital for the benefit of the few, and in the purchase of unnecessary goods which would not benefit the many.

Some possible reasons for this may lie in internal policies or politics. There are certainly many curious aspects of Argentine economic life today which are hard to explain and which will be examined in a succeeding article.

Finale in Paris

Mr Clayton's "do or die" methods have worked in Paris with the sixteen governments of the Marshall plan conference. Ceremony will set the seal on seven weeks' hard work next Monday, and there is no reason to suppose that there will be hitches or second thoughts over this week-end. Last week-end was all second thoughts when the American representatives, conferring formally for the first time with Sir Oliver Franks and his colleagues, had shown impatience and disappointment with their draft report. Mr Clayton wanted more evidence of readiness among the sixteen to work together, to make mutual sacrifices and, above all, to give assurances of thrifty housekeeping by their respective governments. So the winding up of the conference was postponed for another week, while M. Alphand led the way back into Mr Clayton's good books by translating some of his suggestions into French.

The final draft that emerged is not profoundly different from that which the Americans rejected—quite rightly if they honestly believed that Congress would riddle it with criticism. The cost of carrying out its recommendations and meeting the needs of the sixteen remains 21 billion dollars. The schemes for economic co-operation in production, commerce and finance remain as they were, but sounding rather more forcible and looking more impressive in a new dress of italics and capitals. Individual governments are formally to pledge themselves to observe the pledges the report contains. So far there is little to account for the temporary row of the sixteen, led by the French and Italians with the British calling halt, which followed Mr Clayton's first salvo of criticism.

But the last of the six points which distinguished the revised draft presented by the French is significant. It proposes that the co-operation committee representing sixteen governments should remain intact throughout the five years of the scheduled Marshall plan, to supervise its execution. At first sight that would appear to represent a surrender of sovereignty by governments which have shown themselves suspicious of any such thing. But the committee will have no powers, will not allocate dollars or commodities, or act in any way as a distributing or controlling agency. It will be able to bring to bear nothing but "moral,

pressure" on individual governments which do not fulfil their parts in the joint recovery programme. Emphasis is laid on their desire that unity should remain on a "strictly economic plane," a phrase of which the principal purpose has been to calm the doubts and fears of the Scandinavians and the Swiss.

* * *

Sent on Approval

The trouble taken to define so generally the future relationship of the sixteen was necessary not merely to keep open the door to eastern Europe; and to anticipate the Russian charge of dancing to the American tune. It was also needed to meet such difficulties as the Swedish objection to French ideas of carrying out the Monnet steel programme at the expense of the Germans who might buy Swedish ore; or the Benelux fear of French predominance in western Europe; or the British reluctance to agree to joint allocation of steel production at the expense of the present plans. The common economic interests of this rump of Europe were found less compelling than the State Department believes them to be.

Mr Clayton's acceptance of the plan—not yet published in full—does not mean that it has been sold to Washington, still less to Congress. It will be delivered on approval. For the next few weeks less attention will be given to it than to the provision of "interim aid" for Europe and to deciding whether that shall be part of the total Marshall plan or something extra and apart.

At the same time the French and the Italians—determined to get American aid before the winter—will be pressing ahead with discussion of a customs union between themselves, as well as taking part in a study group which will examine the possibility of wider European union. All those governments which were invited to reply to the Marshall offer but refused have been invited to join in the work. There is no reason to suppose they will accept.

It is clear that the Italians will gain little but American applause if they secure customs union with the French, because their immediate economic interests pull them eastward towards the Danube area. In the case of Switzerland and Sweden there is the same tug-of-war between trade links and ties of political interest. As time passes and Mr Marshall's general foreign policy develops the sixteen governments will probably admit to their peoples, what they do not care to confess now, that the value of the Marshall Plan will lie as much in the political security it offers as in the economic benefits it may confer.

* * *

Peacetime Control of Labour

The long-awaited text of the Control of Engagements Order, which is to come into force on October 6th, follows expected lines. It will apply to men between 18 and 50 and women between 18 and 40. Exceptions will be made for married women with children under 15 living with them, for certain categories of administrative, professional and managerial workers, and for Service men and women on demobilisation leave. The worker's freedom will be restricted, in that if he becomes unemployed he will have to find a job through an employment exchange; the employer will be limited in the same way and he will no longer be allowed to offer vacancies through advertisements. In theory, at any rate, the order should give the Ministry of Labour an instrument to direct the flow of unemployed labour into the most productive channels. But how much labour will be available through unemployment? Is the Government going to create unemployment by combing through unessential industries or restricting their activities by one means or another? This is still not certain, but if there is no such intention the order will clearly only apply to a small minority.

The limitation in practice of the order in effecting the redistribution of manpower are acknowledged officially by the decision to back it up, where necessary, by the exercise of the powers of direction, which the Minister of Labour already has. Exactly what these powers will amount to, or against whom, or under what circumstances they will be used, remains to be seen. There is, apparently, no intention to direct people to work away from their homes, although this may be done in the case of young unemployed men and women without responsibilities. It seems inevitable that direction will be used in only the most restricted sense, and it is obvious that without the wartime paraphernalia of registration and sanctions, it cannot be fully effective. Mr Isaacs continues to breathe fiery threats against the "spivs and drones"

—those who are engaged in "obviously unessential or anti-social activities"—and it is against them that the powers of direction are primarily aimed. But whether a Government which has run away from so many manpower problems and acted so timidly in dealing with the more tractable members of the community can suddenly act with vigour and boldness in tracing and controlling the elusive few is more than open to doubt. In any case, what real use are such people in productive employment, in coal mines and textile factories?

* * *

Battle of Edge Hill

It is not difficult to decide which of the three parties must be most disappointed at the result of the Edge Hill by-election. The Liberal candidate, generally assessed as a fairly strong candidate, polled only 910 votes and forfeited his deposit. The electorate preferred to see the fight as a straight one between Labour and Conservative and voted accordingly.

Both of the two major parties have cause for rejoicing and both have cause for disappointment. The Government can be pleased that, two years after the General Election, its record of not having lost a by-election is still unbroken. Hitherto, it had only had to contest safe or established Labour constituencies. Edge Hill, however, had in the past returned a Conservative candidate, though it is true that in 1935 his majority was only 301. The Conservative candidate was a local man and, by all accounts, a very able candidate. The Labour candidate, on the other hand, was brought in from outside. Further, Edge Hill is a Liverpool constituency, and Liverpool has suffered more than most in the post-war world. Unemployment is relatively high, and, in spite of the lack of better prospects, the Government has refused to schedule Liverpool as a development area.

The Economist Moves

After the present weekend, the address of THE ECONOMIST, for all purposes, will be—

The Economist,
22, Ryder Street, St. James's, London, S.W.1.

Telephone: WHItEhall 1511

Telegrams: ECONOMIST NEWSPAPER, LONDON.

Cables: MISTECON, LONDON

The offices of the paper will be closed (except for publishing purposes) on Friday, Saturday and Monday, September 19th, 20th and 22nd.

Here, surely, if anywhere, the Conservatives should have been able to turn grievances and discontent to their own advantage. That they failed must be as much of a disappointment to them as the apparent loyalty of the Labour rank and file will please Transport House.

Yet the Labour leaders would be advised to study all by-election figures carefully. It is not only that the Labour majority at Edge Hill was reduced from 6,039 to 1,953 in a poll of virtually the same size. More important is the fact that almost imperceptibly the trend of voting in by-elections in the last twelve months is moving away from Labour. Up to the middle of 1946, it was still possible to say that Labour was consolidating and even improving its position; it was, that is, obtaining a larger proportion of the total vote at by-elections than it received in the same constituencies at the General Election. Since then, however, Labour's proportion of the total vote has been falling. At Edge Hill, it fell from 64.9 per cent at the General Election to 52 per cent, and the Conservative proportion rose from 35.1 per cent to 42.6. At the three by-elections fought so far this year, the percentage of the total vote given to Labour has fallen from 72.7 to 63.5, whereas the percentage given to the Conservatives has risen from 27.3 to 32.9. These changes may seem small, but it is not often remembered how small a swing in the total vote would put Labour out of office at the next General Election.

* * *

Food Talks Break Down

As has so often happened, the food talks with Denmark have broken down. It is still too early to say whether it is only the end of round one or whether the fight is over. Both contestants have shown their strength, and each has refused to be frightened by the other. In the past, after some preliminary sparring, Britain has generally given in and accepted its opponent's terms. It is only natural that Denmark should count on the same thing happening again, especially as Britain is in a weaker position than it was last year. Officially, agreement could not be reached because the Danish export boards asked for an increase in the price of butter from 242s. a cwt. to 341s. 6d. and for bacon from 161s. to 235s. a cwt. These increases are large; but according to the Danes they are necessary to cover farm costs, particularly as export subsidies are to be abolished. Moreover, the new prices would compare favourably with the high prices paid by other European countries. In any case, the quantities available for export would be much smaller than in 1946-47 owing to the bad harvest and the shortage of feed, and of the smaller exportable surplus larger quantities have to go to other countries which can supply Denmark with essential imports.

In trade negotiations Britain is always in the unenviable position of having to demand from its suppliers specific quantities of foodstuffs within certain periods without being able to reciprocate by guaranteeing delivery of coal or capital equipment. Had Britain these exports to help its bargaining position, it is unlikely that the price of Danish butter would be much above that of New Zealand. Nevertheless it is a poor advertisement for the highly prized long-term contracts, when they are so loosely drawn up that they become invalidated as soon as there is disagreement at the annual price reviews.

As regards butter, the answer to the Danes is readily available to the Ministry of Food, but whether it is acceptable to the Cabinet is another matter. If the 6 oz. weekly ration of butter and margarine were covered solely by margarine, butter could be sold unsubsidised and unrationed. In the first few months its price would no doubt be nearer 5s. a lb. than its present level, but within a year the competitive power of New Zealand and Australia would soon bring Danish prices down to a more reasonable figure. The same policy, however, could only be adopted for bacon were there another foodstuff to cover the basic ration requirements.

* * *

Act Four in Palestine

The decisive factor now for the future of Palestine is the unreadiness of American public opinion to accept the commitments in the Middle East to which its economic and strategic interests so clearly point. To say this is not to attribute blame in a peevish manner; it is to make clear the delays which must attend any attempt by Britain to reduce its own commitments in an area where the frontier between rival power interests is not yet clearly drawn. How long these delays will be in the case of Palestine—as in the case of Greece—may be revealed by what the Americans have to say in the debates which will take place

in the General Assembly of Uno, which has begun work this week.

With the special committee's report and recommendations on the table, some initiative will be required from Britain. Sir Alexander Cadogan must say something, and that something can hardly be a blank No. He is virtually committed in advance to accepting any recommendations for giving independence to Palestine and for terminating the Mandate. If the British delegation then welcomes these particular features of the committee's conclusions, it can do one of three things. It can go on to accept the majority partition scheme, totally rejected by the Arabs, together with the suggestion that Britain should have assistance in carrying it out. Or it can qualify in some way acceptance of the majority scheme by suggesting modifications—which would certainly be resisted by the Jews. Or, lastly, it can decline to have anything to do with carrying out—which means enforcing—the majority scheme of partition, and declare its preference for withdrawing British troops at the earliest possible date.

Of these three choices the first is certainly the worst; whatever the assistance offered by Uno the main burden and all the odium for a difficult military operation would fall on the British. The second puts Britain in the wrong tactical position; if its execution went wrong the blame would be attributed to the British modifications. The third is consequential and in every way to be preferred. In asking the Assembly to designate the authority to which Palestine is to be handed over, the British delegation could add to the effect of its declaration by declaring the readiness of the British Government to produce, if called upon, a practical plan of transfer, as in India, where no communal issues were prejudged by Britain and where the people themselves were left to make the choice for partition and for or against war.

Official America is bound to approach the Palestine issue with a divided mind. Oil interests pull one way and the largest Jewish population in the world pulls the other. If to appease the Jews of America it is necessary to impose a policy which will provoke the Arabs to armed resistance, it would suit the Americans that the British should do the imposing. But it would be the height of folly for Britain to accept a division of duties which might bring it into conflict with the Arabs while America remained at peace with the Zionists. American support—for that is what United Nations assistance would mean—in enforcing the majority partition scheme would make Mr Bevin appear to the Arabs as Mussolini appeared to the Greeks. Impatient as he is to redeem his public pledge to solve the Palestine problem, the Foreign Secretary can hardly aspire to that role.

Trieste Without a Master

Last Tuesday the Free Territory of Trieste was put on the map, in more senses than one. The most obvious symptoms of the trouble it will cause are that the Security Council have still not agreed about who should be the governor, and that on the very night that the new Yugoslav-Italian border came into being Marshal Tito's troops tried, in the phrase of the American general on the spot, "to pitch a fast curve." What was intended to be a daylight operation, in which Italian and Yugoslav troops should line up opposite one another on the Morgan Line, suddenly became a night operation in which four separate armies might easily have collided. After agreeing that the move should take place on Tuesday morning, the Yugoslavs informed the Americans at 7.30 on Monday evening that they would take up their positions immediately, in view of the fact that the ratification of the Italian peace treaty became effective at midnight. Only very fast and skilful staff work on the Allied side prevented skirmishing in the darkness which might have had unpleasant consequences. It is to be hoped that the Yugoslavs will realise that American and British patience with such behaviour is wearing very thin.

In the absence of a governor the Free Territory will be administered by Allied military government with the help of 15,000 troops, to which Britain, the United States and Yugoslavia each contribute a third. They will be needed, for it is unfortunately only too clear that the atmosphere of the town and the territory is and will remain explosive, and that more than one European or even world-wide tremor can be started in Trieste. In the serious rioting and street fighting which went on for three days last week, Italians and Yugoslavs seem to be equally to blame.

No one really knows whether the population of Trieste itself is now 250,000 or 400,000, so that the unemployment figure of

27,545 for the town does not reflect its grave economic difficulties. Exports through the port in 1946 were 45,000 tons against 654,000 tons in 1938; whereas imports have risen from 930,000 tons in 1938 to nearly 1½ million tons thanks to supplies for Allied Military Government and Unrra freight. Commercial cargo has been negligible. Something could be done to improve the prospects of the port if the British and Americans used it instead of north German ports for sending supplies to Austria and Czechoslovakia, and if the present Lloyd's practice of charging a special premium on voyages to Trieste were reconsidered. Naval experts now handing over the port point out that only one ship entering or leaving Trieste has suffered damage since March, 1946.

Recovery of the important industries in the territory is being delayed by the political passions of the population. Orders and capital are not forthcoming, and as a result the military administration of the Territory has been costing something like \$20 million a year. The economic prospect is no more cheerful than the political.

The Civil Service Machine

The Fifth Report of the Select Committee on Estimates, issued under the cumbersome title "Organisation and Methods and Its Effect on the Staffing of Government Departments," deals with a question whose importance has grown, since pre-war days, out of all recognition; that of efficiency in the Civil Service. The Organisation and Methods Division—O and M as it is generally known—is a very young body, evolved during the early years of the war from a nucleus of office-machinery experts; it is, as befits its central position, incorporated in the Treasury machine, but is supplemented by O and M sections in the larger Departments, and aided by a part-time panel of business men from the highest ranks of industry. Its work, as described in the evidence before the Committee, ranges from advising on the installation of Lamson tubes to save the legs of messengers to overhauling the registry system of Uno at Lake Success. On the whole, however, O and M functions low down rather than high up, and on detailed rather than structural jobs. It may cut down the flow of intra-departmental minutes, straighten the meandering course of a document's progress or simplify the form of records; but neither constitutionally nor by convention does it deal with the actual allocation of work between Departments or, what comes to virtually the same thing, the departmental affiliations of individuals handling particular jobs. The reorganisation which transferred the issue of new passports from the Passport Office to the labour exchanges, thereby releasing some 400 persons from the former besides giving a vastly better service to the public was quite exceptional. O and M, in short, looks after the machine's lubricating system; it does not redesign the machine itself.

This, however, is surely just the field in which it could do most good. The Civil Service in wartime proliferated almost impromptu; even if not a man or a woman had then been redundant or misplaced, the process of adapting the whole patchwork to peacetime uses could hardly be properly carried out piecemeal by the Departments themselves. Then there is the question, more urgent than ever, of providing smoothly and organically functioning links between the Civil Service proper and the new National Boards, public corporations, local authorities and other bodies. The Select Committee follows the Macdonnell Commission, the Haldane Committee, and the Tomlin Commission—whose recommendations suffered equal neglect—in counselling boldness. To release Civil Servants for other work is only part of the advantage to be gained. The essential is that the Departments, whatever their ultimate size, should do their job properly. Probably no reorganisation would enable them speedily to digest and translate into efficient administration the Government's gargantuan doses of new legislation; but they should be given the best possible chance to do so.

A Reply to the NUJ

The Royal Commission on the Press has now published the evidence submitted to it by the Institute of Journalists (HMSO, 9d.). Like the National Union of Journalists, the Institute is a trade union, but unlike the NUJ it is mainly concerned with the professional standards of journalists, and that it does not like the NUJ is made very clear from its evidence to the Royal Commission.

On the whole, this evidence is in direct conflict with the evi-

dence submitted by the NUJ (discussed in *The Economist* of July 26th, page 139). The Institute does not find that there is undue interference with the presentation of news by the proprietors of newspapers. The real villain, in any menace to editorial and journalistic independence that exists, is not a Beaverbrook or a Rothermere but the NUJ itself and the Public Relations Officer of a Government Department. The closed shop campaign of the NUJ, which went so far in 1943 as to attempt to prevent a journalist from reporting the proceedings of the Trades Union Congress unless he held an NUJ card, is severely attacked—and rightly so, for, in the interests of good journalism, any editor should be free to appoint the best person available to his staff without reference to his trade union affiliations. There is also a great deal of force in the Institute's criticisms of the PROs. Too much is probably made of the monopoly inherent in the handing out of official news through the sole medium of the Public Relations and Press Officers' Departments; thanks to them Government Departments give out publicly far more information about their activities than they used to, and for this both press and public should be thankful. But the old criticism, repeated by the Institute of Journalists, that the PRO or Press Officer regards his main function as being to cover up his Ministry's mistakes and to put the best possible gloss upon its activities, is still justified.

All this, however, is a very long way from the terms of reference of the Royal Commission, which are to inquire into the control, management and ownership of the newspaper and periodical press and the news agencies, including the financial structure and the monopolistic tendencies in control, and to make recommendations thereon.

The Institute has assumed that the Royal Commission is examining the far wider question—What Is Wrong with the Press?—and if it were relevant its own main answer, better journalism, is the right one—although its proposals for achieving this are not so unquestionable. It will certainly be interesting to see what conclusions the Royal Commission itself comes to, what with its prejudiced terms of reference and the hotchpotch of partly irrelevant and mainly contradictory evidence that has been submitted to it by the two organisations of journalists.

County and County Borough

A fierce controversy has flared up among local authorities in Lancashire over the reorganisation of local government. It was always clear that there would be a struggle between the eighteen county boroughs, almost every one of which can make out a good individual case for boundary extension, and the county council which naturally resists these claims. The first step was for the county boroughs to table claims to the Boundary Commission, which taken together would create a solid block of all-purpose authorities in Southern Lancashire and deprive the county of well over half its population, area and rateable value. But then the issue became more complicated. Manchester did not feel that these proposals would provide (any more than does the existing system) the unitary control of town-planning and other major services which is undeniably desirable for its surrounding region; and supported by a number of minor authorities it put forward a scheme for the creation of a "Manchester County Council." But if a single major authority (with lesser authorities under it) is necessary for the whole Manchester region, is not the same true of Merseyside too? And how about North Lancashire? The Lancashire County Council, neatly pocketing the idea, declared itself in favour of the division of the county into three "ridings," each of which would have a population of nearly two million and a rateable value of over £10 million. The necessary corollary of the scheme is, of course, the complete abolition of the county boroughs.

This is a very far cry from the county boroughs' original plans. Understandably incensed, all the Lancashire county boroughs (with the significant exceptions of Liverpool, Manchester and Salford) have this week registered a strong protest to the Boundary Commission to the effect that such sweeping proposals should only be considered on recommendation from a Royal Commission. They claim, with some justification, that the county borough has been to date the most popular and successful type of authority in Lancashire. Lancashire is highly municipalised, 64 per cent of the population live in county boroughs, and most other areas have county borough status as their goal; popular sentiment, it is claimed, is strongly municipal and lukewarm towards regional ideas.

The county boroughs' case, especially since it has roots in popular tradition, calls for a better answer than the advocates

of urban regionalism have yet put forward in public. The answer, however, is very likely there. The County v. County Borough controversy is very largely beside the point, which is that both types of authority are too thick on the ground and that larger better-balanced units of local government are urgently necessary. Whether these new units should take the form of more concentrated counties or of enlarged county boroughs must depend upon local circumstances, which it is the business of the Boundary Commission to investigate. (The difference between them is that a county has subordinate local bodies and a county borough does not.) The case in Lancashire, on grounds of efficiency, for the creation of some type of Greater Manchester and Greater Merseyside authorities is very strong; but in the country as a whole there is room and need for both counties and county boroughs—so long as each type of authority is sufficiently enlarged and reformed.

* * *

The Dutch Move Right

While a consular mission representing the United Nations was moving last week into and around Java, to watch observance of the cease-fire order given by the Dutch and the Indonesians, both sides were still firing, even at the consuls. And the communiqués of the Netherlands Army were announcing daily the occupation of new towns. So the "police action" begun on July 22nd goes on, and it looks as if the Dutch will occupy the whole of Java, whether such an operation is authorised from The Hague or not. The occupation of east and west Java alone can obviously contribute little to the settlement of central Java where the Republican headquarters are; and unless Jogjakarta directly feels the impact of the "police action" it will settle nothing.

Unfortunately the solution of Indonesian difficulties, and the release to the world of the islands' precious food and raw material crops, are tied up with the political situation in Holland, where the tendency is towards the right. The military operation of the last seven weeks has strained to breaking point the government coalition of the Labour Party and the Catholic People's Party; it was only approved in the first place by Labour on condition that it should be limited to local operations and to the checking of nationalist violence. With the right-wing press and members of the Catholic party now pressing for a full military occupation, Labour Ministers might resign. If they did the present Cabinet could be succeeded only by a right-wing coalition or by a "national" Cabinet. The Dutch Catholics, who pride themselves on being a centre party with progressive sympathies, would not like the first solution; and a national government would have to include extreme right-wingers of the Labour Party and some "neutral"—which means conservative—strong men.

The prospects for a conciliatory Indonesian policy are in any case not bright. Uno's interference has stiffened the nationalists, who were already irresponsible enough, and the opportunity to send a new team to Batavia from The Hague has been missed. British mediation should again be available if asked for, but the Dutch will be much less impressed than they used to be by references to the results of "progressive" British policy in India and Burma.

* * *

West Indies Federation

The conference in Jamaica on West Indies federation has worked quite fast. By the time Mr Creech Jones left it on Tuesday the first step towards federation had been taken. It was agreed to ask legislatures of the individual colonies taking part to appoint representatives to a committee which would plan federation and report by June, 1949. Of the three main resolutions passed, the first accepted the "principle of a federation in which each constituent unit retains complete control over all matters" not specifically assigned to the federal government.

All this was fairly plain sailing, but when the question came up whether advance towards federation would or should hold up the development of responsible government there was some strong talking. The Jamaican delegation in particular, led by Mr Bustamante, said it would and threatened to have nothing to do with the plan. After the representative of Trinidad had told Mr Bustamante that the rest of the West Indies would go ahead without Jamaica—which contains half their population—there was a scene of the kind that Mr Bustamante enjoys, followed by a pacification. In the end the conference's second resolution insisted that the political development of each colony "must be pursued as an aim in itself" and not subordinated in any way to progress towards federation.

This resolution will soothe the vanity of some of the legislatures, but it should not be allowed to frustrate the efforts of those who want to remove the curse of parochialism from West Indian politics. Some of the colonies are too small for complete independence, and it is better to say so quite frankly now.

* * *

Restrictive Practices

Within the last month, leading men in the three political parties have referred to the problem of restrictive practices and all agreed that something must be done. Mr Churchill, in his broadcast speech on August 16th, said:—

Instead of attacking capital we will attack monopoly. Instead of imposing restrictions and controls we will attack restrictive practices of all kinds.

Mr. Fothergill, more recently, made the abolition of restrictive practices one of the main points of Liberal policy. Mr Bevin, in one of the more obscure and inconsequent parts of his speech at Southport, said that the Labour Government had come completely into the open and said, "We cannot play down to your foibles and petty restrictions. We must ask the executive to remove them all in order that the battle of production may be won, once and for all." He also invited every trade unionist to get a copy of the White Paper on Employment Policy. If they do they will see that paragraph 54 of that paper calls on both workers and employers to abandon all sorts of restrictive devices and concludes:—

The Government will therefore seek power to inform themselves of the extent and effect of restrictive agreements, and of the activities of combines; and to take appropriate action to check practices which may bring advantages to sectional producing interests but work to the detriment of the country as a whole.

That statement was made two and a-half years ago, but nothing has been done. At Manchester on Tuesday Sir Stafford Cripps mentioned a scheme for improving production which, merely by a rearrangement of men and machines, had increased output by 67 per cent. But because five men became redundant the scheme was successfully resisted by the operatives. In his previous speech on Friday Sir Stafford was forthright, but gave no indication that the Government yet realised the limitations of appeals to goodwill:—

These restrictions were an essential protection in the days of unemployment, but now that we can only save ourselves and our country by greater production, restrictive practices of any kind are anti-social and a grave danger to the country. Anything which restricts our capacity to produce must be got rid of with all speed.

Mere exhortation, however, are insufficient, and restrictive practices, on the part of both employers and labour, will continue until some Government introduces a Bill to stop them. The conditions of the present moment, when there is an overriding need to increase output from the existing labour force, and when the fear of large-scale unemployment is absent, provide the best possible opportunity for suitable legislation. Will the Government have the courage to take this first step to remedy the inadequacies of the legal framework for the economic system? The statements from Mr Churchill and Mr Fothergill show that in introducing any legislation it should be able to count on the support of the Oppositions.

* * *

Mr Strachey and the Virtues of Competition

Street traders and the grower-to-consumer movements have found a useful ally in the Minister of Food. In the debate on food supplies at the beginning of July, Mr Strachey contrasted the refreshing winds of free competition with the sheltering hand of the Ministry of Food, so comforting to many readers. Since then, the greengrocery, fruit and vegetable, and tomato trades, the fish trade (where abuses were frequent and the removal of controls was thus strongly resisted), and the soft drinks industry have all to some extent been de-controlled and opened up to new entrants. The confectionery trade, too, may soon return to competitive enterprise.

Mr Strachey has said that he is "all for healthy competition," and within a limited sphere he clearly is. It is to be hoped that this guidance will not be lost on the inter-departmental committee of the Ministry of Food and Ministry of Agriculture on the costs of distribution, which was set up over two months ago. The chief offenders are the wholesalers, who want restriction of entry by licensing and guaranteed profit margins (always, of course, in the interests of cheaper goods to the consumer). Dr Summer-

skill's remark, however, that "I think there are too many wholesalers" has fortunately not been followed up in the recent policy of the Ministry. Meanwhile, Mr Strachey should keep to his promise that an improvement in supplies may lead to a return to a free market. Perhaps this principle might even eventually be extended to bulk purchasing?

Salaries of Social Workers

The report of a joint committee under the chairmanship of Professor Simey on "Salaries and conditions of work of social workers" ought to be read more widely than its somewhat turgid style may allow. Quite simply, the committee is concerned with what type of people is best suited for social work, what their qualifications should be, and how much they should be paid. "Social workers" is a heterogeneous term, and covers probation officers, inspectors of the N.S.P.C.C., personnel managers, women housing managers, hospital almoners, settlement workers, and many others. With so many separate agencies in the field, one would expect some discrepancies in methods of recruitment and conditions of work, but on the most important point there is distressing uniformity—salaries are all equally low. In these days of full employment and high wages, it is a particular shock to find that few, very few, social workers ever earn more than £400 per annum. Pension schemes, moreover, are often unknown or inadequate. The report therefore recommends a higher scale of salaries, together with dependants' allowances, and a general superannuation scheme. It is suggested that a permanent joint committee should be established with the object of getting these reforms adopted as general standards. Where voluntary agencies cannot afford the higher salaries, it is recommended that they should restrict their field of work.

These provisions for better remuneration are all the more important in view of some of the other recommendations of the report about educational standards. Clearly, if it is hoped to employ more workers with a university training, salaries will have to be increased considerably, and the report also calls for financial help for students during their course of training.

In general, the report reflects the change from days when the voluntary spirit, rather than the public authority, was the driving force in social work. But now the voluntary agencies have been denuded of funds and workers, by high taxation and the lack of sufficient women with leisure to enable them to offer their services for a small income. In these new conditions, the status of social workers must be improved sufficiently to attract the

professional worker if there is to remain any sort of personal contact in the social service state.

Latter-Day Suffragettes

Last week the British Housewives' League held a meeting in the Central Hall, Westminster. The meeting was attended by some 500 branch officials and members. It was described as a general meeting, and, as a result, Mrs Lovelock, the President of the League, and Miss Dorothy Crisp, the Chairman, seem to be satisfied that they have the full support of those attending. This they attained in circumstances described in various ways by the press representatives attending, one of the more sober accounts being that in the *Manchester Guardian*, which contained the following:

The shrill ululations of a hundred and fifty female voices booing in unison has no male equivalent; it is a fearsome and unpleasant sound.

But the results of the meeting, and the conduct of those attending it, still leave the outside observer in a puzzled state of mind. The deeper purposes of the League were never very clear. Its executive cannot have believed that the nation was so homeless that it knew nothing of the trials of the housewife or that politicians were so indifferent to the women's vote (if there is such a thing) when women form the majority of the electorate. The League from the start has been non-party. It claimed no political theories, it advocated no political remedies. Apparently it received some £1,750 from the Road Haulage Association towards the cost of an Albert Hall Meeting (one had no idea that such meetings were so expensive), but, after all, it is well known that most transport drivers are married men, too often cut off from the benefits of home life, to their regret. All the League seemed to want was more food—and more clothing coupons—and who could complain of that?

Perhaps now that clarity of aim and singleness of purpose have been established, the non-British Housewife (or British non-Housewife) may learn what the programme of the League really is and how the deficiencies of the Cabinet, so dreadfully male, can be put right. In the meantime, it is only fair to add, as a reassurance to those women who were not at the meeting, that the belief of the rest of the country in their sanity, and capacity for patience and hard work, while temporarily obscured, is not likely permanently to suffer.

Letters to the Editor

The British Export Drive

SIR,—After something over twenty years of selling Lancashire cotton goods in the South African market, it was indeed a pleasure to read the optimistic article on Lancashire in your issue of August 9th. The British cotton industry has been buried so often that one hopes that the coming resurrection will be permanent. May I offer a criticism which I think will help to make it so.

For the last few years every manufacturer in Lancashire has had his output limited to x square yards by the Cotton Control. There has been a strong tendency to make this square yardage account for the highest possible turnover by the manufacture of a much greater proportion of high grade, and consequently high priced, cloths than usual. Nobody in his right mind would decry the policy of "trading up" and putting all the accumulated skill of the industry into its products, but there must be a sense of proportion in this as in all things.

The wartime sellers' market undoubtedly created a false sense of security in that it was assumed the easy sale of these high grade cloths would continue indefinitely. As far as this export market is concerned the time has come to call a halt; the seller's market is over. Because of the bottled up spending power and rigid control of supplies to the home market, this may be difficult for the Lancashire manufacturer to realise when he knows that, were his home market open to him, he could sell every yard he could produce twice over for quite a long time.

During the war there were thousands of artisans earning double pay through overtime. Part of the pay of every member of the Forces came back to their wives and families, many of whom were also working on their own account. That extra income no longer

exists, returned soldiers' gratuities have been spent and we are back to what—for want of a better word—we can only call "normal" conditions. Purchases are made in the light of today's incomes, there is a definite price resistance.

Your article mentions the Ventile fabrics. I have seen and handled these, it would do the pessimists good to be told of the achievement these fabrics really are. No moribund industry could have produced them and I would pay tribute to the research and ingenuity which went into their conception, to the highly skilled work in their manufacture and not least to the lives they actually saved during the war. The experience gained in the manufacture of such cloths and the technical difficulties overcome cannot but react favourably on the industry as a whole, but to imagine that such specialised products are the answer to Lancashire's efforts to re-establish her position in the export trade is to shut one's eyes to reality.

These Ventile cloths cost not less than 10s. per yard at the mill. By the time they are shipped to this market, made into garments and put into the hands of the consumer, the value of every yard of material in the garment is well over £1. Those who can afford this figure are in the minority.

There is no shortage of dollars in South Africa. Importers are free to purchase to their hearts' content from the USA or Canada or any other market. Lancashire cottons come into the full glare of competitive trading and the light is very searching. It shows at the moment that the every day "bread and butter" lines are conspicuous by their absence. Where are the straightforward cambrics and haircords that used to cost about 9d. at the mill and are now 2s. to 2s. 6d. per yard? The public is willing and able to pay Lancashire's present price if she would only make these goods as well as the admittedly beautifully made but expensive

cloths costing twice this figure. The basic prosperity of the cotton trade must be built on the essential needs of the medium income group which forms the great bulk of the purchasing power.

Lancashire will need exports not only this and next year but in ten or twenty years' time. Now is the time to relay the foundation of prosperity by supplying what the consumer wants and can pay for—or will Japan do it again?—Yours faithfully,

P.O. Box 2184, Cape Town

T. K. BYERS

Sir,—Consideration of Sir Stafford Cripps's speech on export targets shows that the Government's planners still hope to find a way out of our difficulties by juggling with figures.

Look at one aspect only. Says Sir Stafford

some less essential articles like radio sets and motor cars have found increasing difficulties in entering markets. The tendency has been to concentrate upon capital goods for the building up of their own economy and to prohibit consumer goods other than those vitally necessary to their people.

Clearly, judging by the outstandingly large increase in the export target for machinery, Sir Stafford believes that the foreign customer is always right. Yet he makes it clear that these exports must be at the expense of home needs. Apparently, our own industries are to be starved of modern machinery. Our competitive position is to be steadily worsened. There can be no other interpretation of this latest plan.

Now listen to Sir Stafford again. "We cannot contemplate the permanent lowering of our standard." What else is this Government doing by this plan and all its plans but making certain that our standard will be permanently rather than temporarily lowered, though it may camouflage the facts to keep the people confused and quiet?

How much longer must we wait before the country is put on the only way out of its economic troubles—that is the real hard way? It is consumption that must be cut, our comforts that must be ruthlessly suppressed, including capital projects from housing to the levelling of footpaths. And there seem to be only two ways of doing this—the totalitarian method as exemplified in Russia and the free enterprise method which the United States almost alone seems to be trying to preserve. We are still in a position to make a choice but we shan't be much longer if the present dithering continues.—Yours faithfully,

G. E. ROSS
Northgate House, 20-24, Moorgate, E.C.2.

SIR,—I was sorry to find on a recent visit that the poor quality of British exports is widely discussed in Denmark—and as widely regretted.

I heard about the boy whose British bicycle came apart in a Copenhagen street. I heard about the cigarette lighters which were useless after a week, and the electrical equipment of which 60 per cent was faulty. I heard about the "pure cotton" shirts which turned out to be of Italian woodpulp fibre.

As a holiday-maker I obviously could not investigate these tales, but their prevalence among a people so clearly friendly to the British led me to feel that they might have substance.—Yours faithfully,

G. O. CANNING
Hawthorns Hotel, Woodland Road, Bristol, 8

Chocolate Circus

SIR,—May I reply to R. T. K.'s letter in your issue of August 30th? There were many more successes than failures in the prewar race, and at any rate it remains a fact that in 1939 there were operating in the industry some 600 manufacturers who were licensed under the subsequent Licensing and Control Order (190 of whom were the target firms I referred to), and many hundreds of very small units, all presumably making a living out of the manufacture of chocolate and confectionery. Let it be admitted, however, that there were many and serious casualties resulting from the competitive race; the question remains, under what system of organisation shall this industry, and many others like it, be conducted in the future? There are only, as far as I know, the three ways mentioned in my previous letter. It cannot be seriously contended that the present system, based as it is upon 1939 firms, 1939 tonnages, no competition and no new entrants, can be continued indefinitely. There are only two other ways, first, a rationalised system under some kind of government control, second, the system of effective competition (which I understand is the Government's preference), accompanied possibly by such proper measures, designed to meet or mitigate the disadvantages of the system, as industrial statesmanship can devise. Which method does R. T. K. support?

The present crisis may postpone the point at which the restora-

tion of the competitive system can conveniently be made, but it cannot do away with the inevitability of a decision on the question of principle.—Yours faithfully,

Eastcheap, E.C.3

A. W.

Indonesia—The Real Issues

SIR,—I have seen lots of nonsense written about the Netherlands East Indies lately, but that penned by Mr Neil Stewart in your issue of August 30th is a trifle sillier than most. I hold no brief for the Netherlands authorities, but I know something about the territories, based on thirty years' study and not a few years' residence.

Your correspondent naively observes that the incomes of Europeans are normally higher than those of Javanese (there is "no such thing" as an "Indonesian"). He is seemingly unaware that the incomes of Chinese (domiciled in the Indies for centuries), are far higher than those of Europeans. Perhaps the most ridiculous statement in your correspondent's letter is that the prewar death rate in the territories was double that in the Netherlands. The entire area lies in the tropics bang on the Equator. The death rate in the Netherlands East Indies before the war was the lowest in any tropical area, lower than India, lower than Malaya, lower than Burma, lower than in any of our African colonies.

So far as Mr Stewart's statements on the Dutch attitude towards native political aspirations before the war go, was it not the present Lord President of the Council who said that children cannot be entrusted with a latchkey or firearms?

The reason why native incomes are lower than those of Europeans and Chinese (even lower than those of Hindus and Arabs established in the islands), does not rest on economics at all. The Malayan peoples are not renowned for their trade-consciousness or organising abilities.—Yours faithfully,

London

H. S. ASHTON

Nationalism in the Colonies

SIR,—Your leading article published in your issue of July 16, 1946, contains two statements which should not go unchallenged. According to you, "the Ibos are, at the moment, progressing

From *The Economist* of 1847

September 18, 1847

There is no hint given in scripture that a man can justly have one measure for himself and another for other people. On the contrary, it is emphatically said, and with universal assent, that by what measure ye mete, by that shall it be measured unto you. The linen draper, silk draper, and carpet dealer, however, have formed "The Equitable Measurement Association," to induce persons to sell goods to them by one measure, which they are to dispose of by another. Nay, they go so far as to propose, by combination, to overrule the law and coerce other persons to come into their plan. That a yard shall contain "thirty-six inches, each inch to be of the length of three grains of barley," has been the law of England since the reign of Henry I. By 5 Geo. IV, cap 74, the last act, we believe, on the subject, a standard yard was described and established . . . and "the third part of the said standard yard," the act says, "shall be a foot, and the twelfth part of the said foot shall be an inch." Thus a legal standard yard, the unit of all measure of extension, contains thirty-six inches now, as in the time of Henry I, and no other yard is recognised in our courts of law . . .

. . . Notwithstanding these legal and moral difficulties . . . the committee of the Equitable Measurement Association has come to this resolution:—

That the members of this committee do hereby firmly pledge themselves to give a *decided preference*, in their purchases, to those houses which sell their goods at the rate of *thirty-seven inches to the yard*, and do hereby determine to give to such houses their cordial and united support.

The committee has issued a circular in which the secretary says in its name,—

. . . By declining to purchase of every house refusing to comply with these requests, you will materially increase the strength of the association, and greatly assist in effecting the object it has in view. . .

By something like a threat of exclusive dealing, the association proposes to coerce the wholesale dealers into setting aside the legal standard of measurement and forming contracts which would not be legal, unless they carefully specify the proportion of the drapers' yard to the standard.

well ahead of the other diverse elements that make up the Nigerian population "and" they are . . . conscious, too, of their own superiority over the Moslems of the North and the Yorubas of the South."

As your first statement stands, the only construction which can be put on it is that up to now the Ibos have made more progress than the other Nigerian peoples. That is certainly not the case at least as far as the Yorubas are concerned. The facts of the Nigerian situation as it is, in trade and commerce, in the general level of social and cultural advance, in education, in the co-operatives, in the public services, in the professions, taken as a whole, do not bear out your statement.

It would be truer to say, however, that the Ibos are making a vigorous effort to catch up with the Yorubas and that they are steadily closing the gap. The publicity given to Ibo achievements in a section of the Nigerian press may well give overseas readers and others an illusion of their being well ahead, but it remains today at least an illusion.

Your second statement gives rise to the question whether the Ibos are in fact "conscious of their own superiority over the Moslems of the North and the Yorubas of the South." If they are not, may one ask you not to make for them any extravagant claim they are too sensible to make for themselves nor to invest them with any *herrenvolk* mentality they would hesitate to assume? And if by any stretch of the imagination they are, one can only ask, superior in what?—Yours faithfully,

F. A. OGUNSHAYE

Fascist Disturbances

SIR,—I cannot let pass, without protest, one passage in your note last week on the revival of Fascist activities in which you state: "It would be surprising if the numbers involved [presumably the number of Fascists involved] ran into even three figures."

The writer has quite obviously never attended any of the regular outdoor meetings held by Fascists in East London. On a recent occasion, an orderly meeting which I was addressing in Ridley Road, Dalston, was invaded and broken up by a marching column of between two and three hundred Fascist sympathisers singing the *Horst Wessel* song and chanting the name of Mosley. In many other districts of London, Fascist organisations are recruiting misguided youths at an alarming rate. In addition, Mosley Book Clubs and discussion groups now exist in practically every British city.

Views may differ about the extent to which democracy should concern itself with this Fascist revival. But it is surely at least as dangerous to underestimate the strength of Fascism as to overestimate it.—Yours faithfully,

FREDERIC MULLALLY

Poverty in Franco's Spain

SIR,—In the first of your recent articles on Spain it is stated that "at the root of present difficulties is the decline, owing to the civil war, of Spanish agriculture." This is a misstatement which, I submit, gives a wrong picture of Spain's plight. It is my contention that the decline of the Spanish agriculture is the unavoidable result of Franco's rule and that the root of the present difficulties is the survival of a regime in which the ruling minority is deliberately bleeding white the country as a whole.

The Ministry of Agriculture receives around 1 per cent of the National Budget, that is to say less than Falange. This fact by itself already shows that the blame for the present decline of agriculture cannot be laid on what happened during the civil war which ended in 1939. The real reasons for the ruin of the Spanish countryside today have to be found elsewhere.

Franco embarked Spain on the road to industrial autarky and made the success of his plan dependent on German machinery for the big plants to be set up. An orgy of industrial plans and schemes without due regard to available resources ensued while no attention was paid to agriculture. The demands on manpower for the new industrial Spain, the big armed forces and the huge Falangist bureaucracy made it impossible to keep agriculture at its former level. Besides, it was thought that "Imperial Spain" had left behind for good the agricultural stage and that the expected share-out of the French North African territories would supply all the necessary foodstuffs.

Thus the Franco regime squandered the national resources in a clumsy attempt to bolster the establishment of new industries, and now Spanish agriculture is paying for this unbalanced distribution of outlay. But the guilt of the Franco regime does not stop there.

There is another point to which your recent articles have not paid due attention.

Fixed prices for agricultural products, out of proportion to costs and market prices, are imposed upon the peasants so that the Falangist bureaucracy may live by reselling them. The fantastic price of olive oil is an example of Falange's achievements.

Because of the arbitrary prices, the peasants do not sow crops which are badly needed. For instance, while the production of sugar is half the prewar figure, the journal *El Economista* of Madrid published on March 30, 1946, a dispatch from its correspondent at Pamplona saying that the peasants were not sowing as much sugar beet as they could have done, because they did not find the price fixed for the crop "remunerative enough." Of course, the actual price in the black market is "always remunerative enough," but the Falangists and Military are the sole sellers there.

Huge budget deficits (owing to the disproportionate allocations for the armed forces, police and Falange) financed by the printing press and coupled with a decline of production as a whole has increased the cost of living to a figure many times that of the year 1936 (at least 600 per cent), but Government policy prevents wages and fixed incomes rising in the same degree. In fact the ruling caste in Spain is living in luxury by robbing a share of the income of the vast majority of the Spanish people.

The great disproportion between the corresponding rises in the cost of living and the incomes of most people has brought about a lack of purchasing power among broad masses of the population which has created serious problems for many industries manufacturing consumer goods for which there is not enough demand—the crisis in the shoe industry is a typical instance.

The present rulers of Spain are bent upon maintaining by force the present state of affairs. Healthy financial and economic reforms, long overdue, cannot be carried out because this would mean the end of Franco's dictatorship. The drastic curtailment of the expenses for the armed forces, police and Falange, the abolition of the economic monopolies enjoyed by the Falangist Syndicates, the end of the officially sponsored profiteering and the readjustment of the purchasing power of the small rentiers and salary and wage earners would remove the very props which are holding up the Franco regime.—Yours faithfully,

SPANISH LIBERAL

The Balance of Payments

SIR,—As an exporter of British manufactured goods of many years standing, I am interested in your article of August 30th under the heading "The Terms of Trade," but frankly I am puzzled at the conclusion you come to that

there can be no doubt at all that the "favourable" trend in the terms of trade in the 1920s and 1930s was, in fact, as well as in economic jargon, very favourable to the British community.

My experience was different. The balance in purchasing power between ourselves, as exporters of manufactured goods, and our customers abroad who sent us food products and other raw materials in exchange was lost as a result of unequal fluctuations in the selling prices of the two categories of goods. You allude to this in your next paragraph when you say that Britain adopted the course of importing the same volume and having unemployment in its export trade, but you do not appear to attach great importance to the fact. You even state that the standard of living of the community as a whole benefited. I well remember, at the end of the 1920s and beginning of the 1930s, that the drop in prices of our raw material imports, in particular agricultural and pastoral imports, was so great, 50 per cent and over, that our overseas customers were unable to pay for the goods they wanted from us and the value of our exports fell by 50 per cent. As our own prices had not fallen in the same way this meant an equivalent fall in volume and the effect was shown by an increase in the number of unemployed in the country of 1,500,000. Similar loss of purchasing power by our own farmers accentuated the trouble.

Personally, I cannot see any advantage to a country in a so-called "favourable trend in terms of trade." It simply means paying an unfair price for imports, thereby upsetting the prosperity of our own customers and suffering an equivalent loss in demand for our own products. My own experience points so clearly to the fundamental need for stability in exchange values of goods flowing in trade if prosperity to each and every community engaged in trade is to be attained and maintained.—Yours faithfully,

Books and Publications

Two Kinds of Liberal

"The Economic Problem in Peace and War." By Lionel Robbins. Macmillan. 86 pages. 3s. 6d.

"Economics in One Lesson." By Henry Hazlitt. Benn. 224 pages. 6s.

IF the theories of Einstein had so penetrated the public mind that to maintain the rate of acceleration of falling objects to be thirty-two feet per second per second was to court obloquy and derision, the teaching of elementary physics might get rather confused. An analogous confusion exists in economics today. Because Keynes, the Einstein of his field, went beyond the particular equilibria studied by the classics to demonstrate the possibilities of expansion and contraction in the economic universe, lesser men with minds either hopelessly confused or warped by political prejudice wave aside the whole of pre-Keynesian theory. No wage can be too high, since it has been shown that in some circumstances a lower general wage level may fail to increase the demand for labour. No capital project can be extravagant, since the rate of interest ought to tend towards zero. And how can anyone advocate free trade when exports of goods may be merely exports of unemployment? Even where the authority of the General Theory cannot, however inappositely, be directly invoked, there is always the indirect attack. According to the traditional economists, for instance, competition lowers costs of production and so raises the real income of consumers; or, price movements indicate the need for expansion or contraction in such and such an industry; or, additions to the stock of capital of an enterprise increase the productivity of its labour. Ah, no. Competition is evil, or extinct, or both; price movements indicate nothing but the need for price controls; a higher productivity of labour is merely a threat to employment. Economics teaches otherwise? What economics? Adam Smith? Marshall? Just so.

The liberal economists' defence has too often gone by default. Whatever might appear in the *Economic Journal*, their opponents have had it all their own way on the ground floor, the level of the press, the book clubs, the party meetings and the study groups. Mr Hazlitt partly accounts for this phenomenon in his first chapter; half-truths relating to immediate effects or effects on particular groups (such as the proposition that labour-saving machinery throws men out of work, or that an industry will benefit from a protective duty) are much easier to present than whole truths relating to long-run effects on the whole community. His subsequent handling of those half-truths would do one's heart good were it not that his economics is not merely pre-Keynesian, but pre-John Stuart Mill. Bastiat is his buckler, Mises his morion; the Treasury View is his gospel, and the only possible cause for depressions is "capricious Government interference with business." Liberal economics should pray to be delivered from its friends, particularly those of obviously illiberal mind.

Professor Robbins is not writing on the ground floor. "The Economic Problem in Peace and War" is a reprint of the three Marshall Lectures delivered at Cambridge this spring; an argument in the great academic tradition, formal, dignified, the work of a highly civilised man addressing a highly civilised audience. It is a re-evaluation of the main tenets of liberal economics, the economics of free enterprise and the price system, in the light of war experience; and there emerges from it a body of generalisations and of directives for future work which either Marshall or Keynes would have approved. It would be absurd, of course, to claim that this slim *pièce d'occasion* achieves the synthesis between Keynesian and neo-classical economics; it never attempts to. That may come later, if ever Professor Robbins writes his "Principles." But it does, in a very real sense, synthesise their spirits. Any intelligent Socialist who values liberty should give Professor Robbins a hearing; and how desirable—how even more desirable—it would be that the transatlantic Copernicans, large or small, should do likewise!

Belgium's Minority Problem

"Economie Wallonne." Rapport Présenté au Gouvernement Belge par le Conseil Economique Wallonne, Liège.

THE racial and linguistic problem in Belgium has recently lost much of the venom which it possessed in the earlier years of the century. This is largely due to the fact that the Flemings have

received what they long demanded, complete equality of French and Flemish as the official languages of the Central Government and the exclusive right to their language in their own provinces and their own universities. Today it is rather the Walloons who are on the defensive. They are becoming a minority in Belgium, and this minority position will become emphasised as the economic union with the Netherlands is fulfilled. This defensive attitude is apparent throughout this report on the *Economie Wallonne*, a report prepared for the Belgian Government by an economic committee invited to do this task by the Belgian Prime Minister, M. Spaak. It is a carefully compiled and detailed document which describes the economic difficulties that face the southern Walloon part of Belgium, which attempts to account for these difficulties and which then sets out a plan of remedial measures. All the facts are there: the falling population, the ageing industry—particularly serious in the case of coal mines—the inadequacy of the economic equipment. The complaints are a little less objective. There are accusations that the Central Government in Brussels has systematically neglected the Walloon country in favour of Flanders, and that all the emphasis in the development of transport and of new industry has favoured the northern region of Belgium. What the report does not bring out with sufficient candour is the fact that most of the difficulties which appear to beset Wallonia are of its own making.

A falling birthrate, a record of greater labour instability, these are phenomena which no amount of favouritism by the Central Government can be expected to remedy. Nor can the Government in Brussels rejuvenate the coal mines of Charleroi which have for some years past shown signs of reaching the end of their useful economic life. The remedy lies with the Walloons themselves. Belgium is one of the last refuges of genuine free enterprise in Europe. Given adequate vigour and a capacity for work which will match that of the Flemings there will be no lack of projects and developments that will be attracted to Wallonia, the traditional industrial base of Belgium.

Shorter Notices

"Le Gouvernement des Grandes Organisations." By H. Pasdermadjian. Presses Universitaires de France. 252 pages. 350 frs.

THIS is an ambitious survey of the principles of large-scale administration, whether of political, military or economic entities, ranging from the evaluation of the *Führerprinzip* through the discussion of devolution to estimates of the proper rank to be held, in a manufacturing company, by the head of the research department. It is backed by wide reading, observation and experience, and abounds in references. In his last chapter the author asks himself whether the power to organise has not now dangerously outstripped the development of the human qualities, moral, civic and psychological, needed by those wielding the power which organisation bestows; apart from this, his book is depressingly void of leading ideas.

"Freedom and Order." By the Rt. Hon. Anthony Eden. Faber and Faber. 436 pages. 15s.

THIS is a collection of Mr Anthony Eden's speeches from 1939 to 1946. It is in consequence a record of the public thoughts of a sane and intelligent man, but one who appears more as a commentator than as a leader. Has Mr Eden the qualities that would enable him to command events? This volume provides clues, but no firm answer.

AMERICAN SURVEY

American Motives

(From Our US Editorial Staff)

LARGE-SCALE aid to Europe under the Marshall Plan is and has been urged, both here and abroad, on five bases. Much more will doubtless be heard of all five during coming weeks. Without suggesting the order of importance, which will be dealt with later in this discussion, these five are: to prevent an American depression (nearly half of the French population believes that Mr Marshall's proposal was so motivated, according to a Gallup poll); to provide an outlet for the investment of savings; to relieve hunger and destitution; to advance world reconstruction; and to ensure military security.

The first of the reasons, depression prevention, seems plausible in view of the large current exports and the repeated dirge of the 1930's that internal demand is unlikely to prove adequate to absorb production, at the level of full employment, for a significant length of time, a dirge still being intoned by some people. In truth, exports in the second quarter of 1947, at an annual rate of \$21.2 million, were enormous, and so was the net balance of payments at an annual rate of \$10 billion for the first half of this year. But these figures need to be kept in perspective. The large second quarter exports were only slightly over 9 per cent of gross national product. The net foreign investment of the first half was a little less than 4½ per cent. For factory production alone, exports accounted for about 23 points out of the 191 of the Federal Reserve index of production in May, the month of peak exports. This was about 12 per cent; the comparable figure in July would be about 10 per cent.

These figures demonstrate the overriding importance of domestic, not foreign, considerations in the maintenance of employment and output. A fluctuation of 5 per cent to 10 per cent in domestic activity is equivalent to a 100 per cent fluctuation on account of external factors. And fluctuations of 5 per cent to 10 per cent are not large in view of the historically demonstrated volatility of the American economy. Nor does history suggest any close relationship: while the gross national output fell from \$104 billion in 1929 to \$56 billion in 1933, or a fall of \$48 billion, net foreign investment fell by only a little more than half a billion. And if it be suggested that exports or foreign balances are subject to a "multiplier," so are several domestic items.

Of course exports are more important in certain specific lines. For example, during the first half of the current year, 54 per cent of freight car production was exported, 31 per cent of lubricating oil production, 21 per cent of motor trucks, buses and chassis, 106 per cent of rolled steel products. And the Department of Agriculture expects that about 8 per cent of the available food supply will be exported this year, with very much higher percentages of certain specific items. But these high percentage export items are the very ones in greatest demand for domestic purposes, so that a reduction of external demand of itself would hardly be the cause of depression in the near future. And, again, the maintenance of this high domestic demand even for these specific products, is primarily dependent upon domestic conditions.

All this is not to deny for a moment the fundamental importance of foreign trade to the United States; but the importance is of a different order from the prevention of cyclical fluctuation and will be discussed below. It is hard to see how foreign trade can, at the most, do more than cushion cyclical fluctuations—or exaggerate them, as it has sometimes done.

The second suggested motive for the Marshall Plan, to serve

as an outlet for domestic savings, is of a more technical economic nature and results from the Keynesian analysis and American applications made of it. The thesis is that the American economy will have a chronic tendency to generate more savings than can be invested domestically so that, without an outlet abroad (or large government investment, or both), underemployment will necessarily result. But the thesis is essentially of long-term application. As such it may prove to have some validity, though opinion is divided on the matter. But it has little if any relevance to the Marshall Plan, which is a matter of the short run, or to present conditions, where the actual and potential demand for capital for domestic investment is very large—given even moderately favourable internal conditions.

The third suggested basis, humanitarian considerations, has distinct force in the United States. Its motivation is not charity in any narrow, supercilious or derogatory sense, but a genuine moral attribute. But the same moral sense includes a Quaker-like concern that aid should not produce the result of habit-forming sedative.

The fourth motive, world reconstruction, encompasses wide political, philosophic and security considerations. There is a widespread desire in America to see world conditions established which would entail the most productive and efficient use of resources and lead away from nationalism (and socialism) with their inevitable economic stresses between nations producing an atmosphere of hostility and perhaps eventually of conflict. It is as an instrument of the efficient use of resources that international trade is regarded as significant, instead of as a device to regulate the trade cycle. It is trade multilateralism that permits the most efficient specialisation of production, resulting in higher standards of living instead of the waste of resources by growing bananas and olives in Alaska. And it is the concentration of the more efficient use of resources and the resulting benefits that lead away from the international stresses produced by nationalism and statism. These convictions are very deep and widespread both in popular and in official thoughts and emotions. And the achievement of these ends, even the gradual progress towards them which is as much as can be expected for the present, requires the reconstitution of economies abroad.

Professor J. B. Condliffe (now at the University of California), in a widely circulated discussion, says:

The important objective to aim at is the restoration of efficient production and economic independence in borrowing countries. Such restoration is an essential condition of political security and stability. . . . Lending is in fact not the most important factor in economic recovery. The restoration of political security, of confidence and courage, and of organising and technical skills, is more important.

The fifth of the suggested motives, military security, is in bluntest terms, a precaution against failure and it therefore counts most heavily with those who have lost hope. If world reconstitution is unattainable—and the American people are far from convinced of that—then the best preparations for chaos must be made. While there is still any uncertainty this consideration cannot be lost from sight.

All five of these bases for advocacy will be used both internally and from abroad. Support will be sought where and by whatever arguments may be most appropriate. But there can be no doubt that the fourth is by all odds the most powerful,

from top ranks of officialdom through all the segments of the American population. To the extent that conviction grows that aid will contribute to those objectives, to just that extent will Congressional action be speedy and large. But to the extent that feeling develops that other ends will be served, that nationalism will grow, that economic reconstruction will not be realised, the speed and size of aid will be lessened. This country does not wish to give something for nothing, to par-

ticipate in a useless or worse-than-useless endeavour, and is thinking deeply of the warning of Professor Condliffe that "lending which maintains living standards, prices, exchange rates, and export costs at levels that cannot be sustained when the lending stops is an evasion of the real issues." But the American people will give, and speedily, a great deal for even a very little in what they are becoming increasingly persuaded is the right direction.

The National Security Act

(From a Correspondent in Washington)

UNDER the National Security Act, passed by Congress on July 25th, the United States now has a National Military Establishment in which the armed forces will be integrated by the capable hands of Mr James Forrestal, now Secretary of Defence and formerly Secretary of the Navy. The new defence organisation came into being this week when Mr Forrestal was sworn into his new post. The Act does not in any sense "merge" the armed forces, and brings to a close the long, bitter controversy on an earlier plan by which the chiefs of the three military departments would have secured only secondary roles.

Apart from the fact of unification itself, the most important result of the new law is the emancipation of the Army Air Forces from the War Department. They are now called the United States Air Force, and General Carl Spaatz relinquishes the title of Commanding General of the AAF and becomes the Chief of Staff of the Air Force. Thus he now ranks with General Eisenhower, Chief of the Staff of the Army, and Admiral Nimitz, Chief of Naval Operations. Also established is a new Department of the Air Force, which will have a civilian secretary ranking with the Secretaries of the Army and of the Navy.

The aim of the Act is to unify the nation's entire war-making potential, industrial as well as military, in a single system. The Secretary of Defence will have decisive power, second only to the President, who will continue to exercise his prerogatives as Commander-in-Chief of the armed forces. A factor regarded as of equal importance with the integration of military effort is the co-ordination of foreign and military policy through the National Security Council.

In the new Act each department will have a full-ranking Secretary. They are deprived of Cabinet status, but they will have the privilege of making a direct appeal to the President in case of disagreements with the Secretary of Defence. And each department will have its own Chief of Staff, having a direct responsibility only to the Secretary of his own Department. Each military department is to have operational and administrative autonomy, including the right to prepare its own budget and to have that budget submitted to Congress in a manner which will show in parallel columns its own estimates and any proposed reductions by the Secretary of Defence. Witnesses from the armed forces convinced Congress that the thought of a single department for procurement of supplies for the three departments was unworkable and might prove disastrous. In consequence each department will continue to carry out its own procurement programme, but the principle of cross-servicing and cross-procurement, practised in a degree during the war, will be implemented in every possible case.

In addition to the National Security Council, other agencies provided for in the Act are the Central Intelligence Agency, the National Security Resources Board, the War Council, the Joint Chiefs of Staff, the Joint Staff, the Munitions Board, and the Research and Development Board.

The President will preside over the National Security Council, whose members are the Secretary of State, the Secretary of Defence, the Secretaries of the armed forces and the Chairman of the National Security Resources Board. The President may also appoint as additional members the Secretaries of other executive departments, and the chairman of the Munitions Board and of the Research and Development Board.

Apart from co-ordinating domestic, foreign and military policies, this all-important agency will also

... assess and appraise the objectives, commitments, and risks of the United States in relation to our actual and potential military power, in the interest of national security, for the purpose of making recommendations to the President in connection therewith. . . .

It is hoped this council will prevent future Pearl Harbours and avoid occasions, as in the past, when the State Department would talk as if it held a big stick when it really held a straw.

*

The Joint Chiefs of Staff will prepare strategic plans and provide strategic direction of the military forces; prepare joint logistic plans; establish unified commands in strategic areas, formulate policies for joint training and for educating members of the armed forces. In other words, it will effect the co-ordination of military effort which the discarded Army plan had sought to do through the single Chief of Staff. The Joint Staff will consist of 100 members drawn from the three armed forces to serve the Joint Chiefs of Staff.

In the National Security Resources Board will be co-ordinated industrial and civilian mobilisation, and the planning of natural and industrial resources for civilian as well as military needs. It would in time of war stabilise the civilian economy, unify the activities of Federal departments concerned with production, procurement and distribution of military and civilian supplies and plan the strategic relocation of industries.

The United States, which believes itself to have been unduly naive in some aspects of intelligence work in the past, is now endeavouring to build up an effective world-wide intelligence system through the Central Intelligence Agency, affiliated by the Act to the National Security Council. The War Council will advise the Secretary of Defence on matters of broad policy relating to the armed forces. It is composed of the Secretary of Defence, as chairman and with the power of decision; the Secretaries of the armed forces, the Chiefs of Staff of the Army and of the Air Force and the Chief of Naval Operations.

The Munitions Board (already established) will co-ordinate the procurement of munitions, plan the military aspects of industrial mobilisation, prepare estimates of potential production, determine relative priorities in the procurement programmes and perform many similar duties. The Research and Development Board will keep abreast of scientific developments and integrate and assign research programmes to avoid duplication of efforts.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

The High Cost of Prices

An American crisis of high prices is now underlining, in an untimely and sensational fashion, the most effective argument which has been advanced against the Marshall plan. The Department of Agriculture's estimate of the maize crop, made on September 1st, was reduced by only 33 million bushels (to 2,403 million bushels) from the estimates of August 15th, but the magnitude of European deficits likely to be added to American domestic demands has sent grains and all the products into which they enter—meat, eggs, butter and milk—chasing each other up the price ladder. The theme of the most influential of Mr Marshall's critics has been, from the first, the dangerously inflationary effect of Europe's scarcities upon American production; the high cost, in terms of domestic prices, rather than in dollars, of foreign aid. The Administration has, of necessity, embraced the idea that foreign aid should be extended only within "safe" limits. But this year's corn crop, America's basic grain, is now down by slightly more than the total of last year's grain exports for relief: that is, the over-all American grain surplus has been wiped out, and an early frost may make further inroads. The illusion that the granting of foreign aid could be both effective and painless has been exploded, in grain, at least; and it is bread that Europe needs this winter. If there is to be a Marshall plan, or an interim aid plan this autumn, it must be, in food grains at least, not a plan for financing surpluses, but for sharing a short harvest, and in a free economy, paying a high price for the privilege.

Mr Harriman's speech at Cleveland, with its appeals for voluntary cuts in American food consumption, conceded that, however genuine the desire to help, the mechanism for such sharing simply does not exist. This is the dilemma of 1946 again, sharpened by domestic shortage, dollar scarcity abroad, and the liquidation of controls. The Department of Agriculture has announced that, if 925 million bushels are allowed for domestic consumption and 175 million for carry-over, only a little more than 400 million bushels of wheat would be available for export this year. Included in domestic consumption is 325 million bushels for livestock feeding; however shocking this may be, it falls short of the 500 million bushels of wheat required to maintain livestock feeding at last year's rate. Even the reduced export target may be difficult to meet. November grain exports have already been cut to 35 per cent below the October figure. The powers under which the Administration in the past prohibited the use of wheat for distilling, raised the extraction rate, and forbade feeding of wheat to livestock lapsed with the Second War Powers Act. Full purses feed the demand for dollar steaks, dollar butter, dollar-a-dozen eggs; and since livestock products are providing more than half the farmer's record income this year, only the most enthusiastic adherence to meatless days will stay the farmer's ready recourse to his wheat bins. With no powers of compulsory collection, the only method of assuring wheat for export is to buy it in the open market, through the Commodity Credit Corporation, which has the funds, if the Administration will run the risk that Congressional authorisation will be forthcoming later. The Department of Agriculture is now said to be considering the partial substitution for wheat of higher-cost dried and canned fruit, sugar, and certain fats and oils. Europe may have cake, if it cannot have bread—but the price of both will be high.

For the Administration the crisis is domestic as well as foreign. A continued rise in the cost of living is squeezing the lower income groups, and will set off another round of wage demands if it is not checked, threatening the current uneasy armistice in labour relations. Just how intolerable the situation is felt to have become can be judged by the cautious edging into

public discussion of the formerly forbidden subject of price control. It is reported in several quarters that the Council of Economic Advisers, alarmed that current trends may be setting the stage for depression, rather than recession, is unhappily considering the advocacy of a revival of price controls. Senator Kilgore emphasises, on the other hand, the need of stabilising the purchasing power of any prospective foreign loans. But no revival of price controls is politically conceivable, the complexion of Congress being what it is; and without rationing, price controls would be swamped in a sea of purchasing power.

The urgency of the issues involved is shown by the fact that a report from the President's Cabinet Food Committee will probably be presented to Mr Truman soon after he returns. It may, even now, not be too late to request the restoration of controls on the use of wheat if a special session of Congress is called. But this would hardly solve the problem. Mr Harriman has already insisted publicly that it is American incomes rather than foreign exports which are responsible for rising prices and he is supported in this thesis by the report on food prices prepared by experts of the Joint Economic Report Committee. But the high cost of living is likely to be the central issue at the next election, and it will require political courage of a rare order for either Mr Truman or Republicans like Senator Vandenberg to risk the charge that by sponsoring foreign aid they are forcing up prices at home, and to face the fact that high prices, with all their injustices, are all that a free economy has to offer in place of a rationing mechanism which would share America's feast with Europe's famine.

The New Monopoly Drive

The Justice Department's new crusade against monopolists has spread rapidly. Specific charges against the steel industry, already noted, have been accompanied by a drive against the automobile tyre industry and colour film manufacturers. Unlike the procedure for the steel industry, the Department of Justice has filed with the New York Federal Court a criminal charge against the leading tyre manufacturers, and has simultaneously asked the Federal Court of Los Angeles, in a civil action, to "break the hold of Technicolor and Eastman Kodak on colour films."

The tyre industry is a persistent defendant in anti-monopoly procedure. A fairly recent Congressional report held that four major undertakings, Goodyear, Firestone, US Rubber and Goodrich took more than ninety per cent of gross sales for the industry, and held more than ninety per cent of its assets. Price reductions have been announced in tyres quite recently, with supply well in pace with demand. But the government agency claims that these reductions were only a belated response to official investigations, and it has renewed earlier charges that the industry "feather-beds" large retail organisations at the expense of independent dealers. In colour films, Technicolor does no doubt hold a very firm grip on the industry, although company officials dispute the charges of complete monopoly levelled against it by the Justice Department.

Industry is worried by the new drive more by reason of the adverse publicity thus given than by any real fear that the energy of the various Federal agencies can have permanent results. The general view seems to be that Mr Truman realises the futility of recent declarations on price-levels, and that he is determined in one way or another to shift the ground for price controversies away from Washington.

The current "hit-or-miss" methods of the Justice Department do not suggest any formidable movement against industry as a whole. For steel and cement, however, there might be more serious implications. The charges against these two industries concern the so-called "basing point" sales system whereby "all sellers at a given destination calculate delivered prices on the fiction that all are shipping from a common point," and where non-base firms collect "phantom freight." Efforts on the part of the Federal Trade Commission have in some measure broken the earlier rigidities of the "basing point" system, and its challenge to the cement industry has now reached the point where a Supreme Court decision is due in the autumn. FTC lawyers have constantly held that "basing point" and all related "price equalisation" methods are illegal under anti-trust laws, but admit also that present uncertainty means a continuing process of charges against individual industries. The FTC is now pressing for a revision of the Sherman Act which would enforce a straight f.o.b. mill pricing system. This is most unlikely, at least from the Eightieth Congress.

when TI consults TI

Not the least advantage which the country derives from the TI association of companies is due to that unreserved interchange of knowledge and experience which can only flourish where there is true community of interest.

What happens when TI consults TI? . . . A recent example of pooled enterprise suggests an answer.

The project was to develop prefabricated metal components for a bus skeleton frame which would be stronger, and lighter, quicker to construct, yet would meet every normal demand of the coach-building industry. No one company could know all the answers, so four TI companies formed a team to examine possibilities.

Their solution introduces a new British industry. It is a bus skeleton which ingeniously allies tubular and cold-rolled elements to extruded sections, high-tensile steel to light alloy. Its structural simplicity (and export value) may be judged by the fact that a whole double-decker frame, down to the very bolts, goes neatly into one packing case—while semi-skilled labour can put it together in twenty-two man-hours.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paints—the whole is TI.

"Goods, Not Dollars"

The announcement that the Harriman committee will not have its report on American capacity and European needs ready before October 31 may somewhat delay the calling of a special session. But there is no reason to suppose that Mr Marshall will not be successful, despite conflicting reports from the *Missouri*, in convincing the President that a start must be made toward securing the Congressional assent which Mr Marshall considers essential for interim aid. What is less certain is that it will be much easier to get consent for a stop-gap loan than for the whole Marshall plan. Alarm over rising prices may well precipitate a full-dress debate over the whole range of problems raised. In that event, the Administration might feel justified in falling back on the "free lunch counter" of the Commodity Credit Corporation or the \$800 million resources of the Export-Import Bank.

Beyond the Congressional hurdle lies the problem of allocation of aid. Much of the discussion in Washington revolves around the concept of "goods, not dollars." A return to the Lend-Lease approach has, perhaps, the advantage that it would be the American procuring agency which would first feel the brunt of high costs, and that purchases would be centralised. But it must be recognised that it opens the door to more highly detailed control of the national reconstruction policies of the receiving nations than may be altogether welcome in Europe. Even among strong advocates of the Marshall plan, the desirability of some degree of American control is recognised. Mr Harriman has lost no time in seizing the opportunity presented by Mr Bevin to press the central role of British coal in solving the dollar crisis and in speeding reconstruction. This is the opening and all-too-justifiable move. Discussions of the American administration of the Marshall plan range from the creation of a centralised agency to deal with purchases and to allocate the proceeds, to a scheme for "contracting out" by the State Department to other government agencies. But under any scheme for distributing goods rather than dollars it would be possible to earmark proportions of the aid offered for genuine rehabilitation rather than current needs: in Britain, for example, for modernisation of the coal mines.

THE WORLD OVERSEAS

Abundance in Belgium

(From a Special Correspondent)

BELGIANS have for so long been told by foreigners and by some of their own pundits that they are living in a fool's paradise, that they can be pardoned for the lighthearted incredulity with which they still accept this warning. And when they look beyond their frontiers to the south, north, east and west is it surprising that their reaction to the warning—especially when it comes from visiting Britons—should be "let us at least be thankful that it is paradise"? They still see all around them and experience the good and abundant life which has now become one of the show pieces of the European economy. The shops are filled, the trend is still towards de-rationing, and in the free or black markets that have all along been an essential part of this two-tiered economy, the abundance of goods has been such as to narrow the gap between free and fixed prices. The combined gold and foreign exchange reserve of the National Bank shows no sign of contraction, amounting at the beginning of September to 40½ milliard Belgian francs as against 36 milliard a year previously. The country appears, therefore, to be enjoying a life within its own means. The external position is, in fact, better than even these figures suggest, for during the past year Belgium has been a net lender on foreign account. It has given credit to Britain by its readiness to increase its holding of sterling balances—from about £5,000,000 to £20 million—and by lending to the Netherlands and to Luxembourg.

It cannot, however, be denied that the suspension of convertibility of sterling on August 20th caused the Belgian financial authorities grave concern. The decision to which Britain was driven on that day was as serious a single blow at Belgian

To keep the purse-strings in American hands in this fashion would go far to satisfy Congress that the Marshall plan really is self-liquidating, but the political awkwardness of an American veto over European industrial policy is equally manifest. Congress may, perhaps, be dissuaded from attaching flagrantly political conditions to foreign economic aid, but there may well be overwhelming American support for economic conditions designed to help Europe to help itself.

Pointer in Pennsylvania?

Neutral observers will feel that the Republicans, after all their discouragement over recent evidences of Mr Truman's revived popularity, are entitled to a mild jubilation over their success in the special election (by-election) to Congress in the Eighth District of Pennsylvania. But the rejoicings of Mr Carroll Reece, the chairman of the Republican National Committee, and other stalwarts, seem a little excessive. For the Eighth District embraces the stronghold of that almost legendary figure, Joseph R. Grundy, former head of the Pennsylvania Manufacturers' Association and arch-lobbyist for high tariffs. That a Republican success in Uncle Joe's backyard, won by a candidate of the Grundy machine, could be regarded as a portent, as "a wonderful encouragement" for the Republicans, shows how times have changed. The District has been Republican since 1938 (after having deviated to the New Deal in 1932, 1934, and 1936), and the winner in the recent election increased the majority of the previous incumbent by 2,676 on a total poll of 78,000.

The Democratic candidate, Mr Phil Storch, is president of the Lehigh Valley Newspaper Guild, affiliated to the Congress of Industrial Organisations, and he made repeal of the Taft-Hartley Act his chief issue. The Political Action Committee of the CIO gave him strenuous support, raising the cry of "carpet-baggers" from the Republican machine. Where Democratic strategy went astray was in accepting this race against heavy odds as a test of the popularity of the new Labour law. The political seers will have to look beyond Pennsylvania for a reliable index of the state of the parties.

external equilibrium as has been struck since the end of the war. The Belgian balance of payments may appear in fine fettle when viewed in global terms, but Belgium is very much a part of the world economy, serves a world market and long ago emancipated itself from the crude barbarism of bilateralism; and therefore that global equilibrium is the product of many debits and credits with the individual countries that trade with Belgium. For some time past Belgium, like every other nation other than the United States, has been running a substantial deficit with the dollar area. This deficit has been rather more than balanced by surpluses with the Congo, the sterling area, Europe and South America. Since the beginning of this year Belgium has, by arrangement with Britain, been numbered among the countries prepared to pay and receive sterling in respect of their mutual current transactions. Since Belgium has, by and large, been a substantial creditor with these countries, and since, at the same time, Britain has been a substantial debtor on current account to those countries, it is not surprising that Belgium should during the whole of the present year have been receiving large amounts of sterling in payment for her exports. Like Canada, Argentina and many other countries, Belgium has, therefore, been put in the position of having to offer that sterling for conversion into dollars in order to balance her payments with the United States. The decision to suspend convertibility of sterling is, therefore, a development the gravity of which needs no stressing.

The disparity between the Belgian balance of payments with the United States and that with the rest of the world has been enhanced by the fact that after the liberation nearly every import duty

was temporarily suspended. In this decision, made to help the flow of imports and the economic rehabilitation of the country, Belgium matched in its tariff policy the courage it had already shown in its monetary policy—the compulsory blocking of the greater part of the country's bank credit and monetary circulation. One of the results of the lifting of the import tariff has been to encourage a considerable volume of re-export trade. During the past three years import and export agencies have mushroomed in Belgium. Their highly profitable business has been to import textiles, cars and consumer goods of all kinds from the United States and re-export them to France and other European countries. There could be little objection to this trade as long as the buying countries met their payments to Belgium in gold. This has until now been the procedure in almost all cases, the normal pattern of Belgium's payments agreements being an arrangement to hold the currency of another country only up to a small ceiling and thereafter to insist on converting surplus balances of that currency into gold. But the prospects of getting payments in gold are rapidly deteriorating, and Belgium now faces the prospect of paying out dollars and accumulating inconvertible currencies in respect of much of this re-export trade. Steps are, therefore, being taken to check this trade and to reserve the free entry into Belgium for goods that are destined for domestic consumption and not for re-export.

Dollar Luxuries

But even the satisfactory closing of this particular gap through which dollars have been escaping will not go far to restore equilibrium in Belgium's current payments with the dollar area. The deficit with the dollar area has recently been running at the rate of about \$40 million a month. The materialisation of that deficit is there for all to see in the large number of new American cars that crowd the roads of Belgium, in the unrationed petrol, in the American nylon stockings with which the shop counters are laden, in the ample supplies of cereals. Some of the less essential of these dollar imports may well have to be sacrificed, for the convertibility of sterling no longer provides the mechanism through which the main part of the Belgian surplus with the non-dollar world was made available to cover the deficit with the United States. A Marshall plan may, of course, change all that—not by putting dollars directly at Belgium's disposal (Belgium would not be a recipient in such a plan), but by keeping alive the multilateral pattern and mechanism of trade and payments in Europe.

A widely prevalent impression obtains outside Belgium that the strength not merely of the balance of payments position but of the whole economy of the country depends upon the export of uranium from the Belgian Congo to the United States. There is no more than a grain of truth in this assertion. It is true that an important export of uranium is taking place from the Congo to the United States. These sales are being made under a two-year contract which expires soon and which yields the Congo a fair, though by no means extravagant, dollar income. But the finances of the Congo and of the mother country are wholly independent. The foreign exchange income of the Congo is held by the Banque du Congo Belge and is not pooled with that of Belgium. If, however, the Congo requires francs to meet its current payments to Belgium, whether for the excess of imports from the mother country or for other current items such as dividends on the substantial Belgian capital invested in the colony, these francs can be and are obtained by sales of dollars or sterling to the Banque Nationale de Belgique.

"Rhythm of Pick and Shovel"

The basis of Belgium's economic strength is not to be found in some unearned and adventitious income of this kind, but in far more substantial and meritorious factors. The rapidity of the liberation left the industrial equipment of the country largely untouched and undamaged. One week Belgian industry was working largely for the occupying power. The next it was working for the Allies. The subsequent "occupation" of Belgium by British and American troops left in its wake a substantial sterling and dollar income which the Belgian authorities then proceeded to spend in launching a policy of incentives—filling the shops with consumer goods, many imported, in order to give the people the spur to work and produce and earn money. Judging by results, the policy has succeeded. The people work hard and well. There is no evidence of restrictive practices. There is no organised resistance against the introduction of foreign labour. The "rhythm of the pick and shovel" which an American observer recently found so frighteningly sluggish in

Britain was, in his view, quicker and also more cheerful in Belgium than in any other country of Europe. That is the first element in Belgium's economic recovery.

Other elements are to be found in the stability of the political and monetary situations. M. Spaak has succeeded in getting a really effective coalition between the Catholics and the Socialists. The partnership is working well because Belgian Socialists are an essentially moderate Socialist party, and, as symbolised in the person of the Prime Minister, represent the solid middle-class virtues rather than any exaggerated doctrinal zeal for the Socialist creed. As for the Catholic party in Belgium, it has long ceased to represent reactionary conservatism, but stands increasingly for the familiar type of Christian democracy which, when it speaks for labour, as it does in Christian trade unions, often does so with greater effect than do the Socialist unions.

Financial orthodoxy, which was given its excellent start after the liberation through the Plan Gutt which froze the greater part of the country's currency and credit, is still in the saddle. Few prophets of financial severity receive the credit that is their due in their own country, and M. Gutt is no exception to the rule. "Il m'a volé mon argent" is still the cry that goes up from nine out of ten Belgians when the name of this very great servant of Belgium is mentioned in that country today. But a comparison of the state of Belgian finances and Belgian currency with those of neighbouring France epitomises all that Belgium gained by the courage which immediately after the liberation immobilised and neutralised all the inflationary potential that the German occupation had left in its wake. That the flag of orthodoxy is still nailed to the mast may be seen from the fact that the Banque Nationale has recently been increasing its rate of discount as a psychological astringent. The figure has now risen to 3½ per cent, which is not by any stretch of imagination a penal rate, but which bears rather better relation to economic realities than a Bank of England rate which has remained unmoved through all the events of the past two years.

Export Prices too High

Beneath this apparent solidity and prosperity there are grounds for concern and, here and there, for apprehension. The problem of the balance of payments and, particularly, that *vis-à-vis* the dollar area, has already been mentioned. Belgium's basic industries—coal, iron and steel, heavy engineering—are showing signs of shabbiness and, in some cases, decline. The incentives policy applied to workers should be extended to entrepreneurs. There is insufficient encouragement in the present fiscal mechanism for ploughing back profits and renovating plant. Above all, the lifting of controls and the policy of abundance has allowed prices and wages and costs to get somewhat out of line with world parities. As compared with 1938, Belgian wages and prices have nearly quadrupled. Allowing for the small depreciation in the currency in terms of sterling and the larger depreciation in terms of dollars that was agreed early in the 1940s, this leaves Belgian export prices rather high. The handicap has not been seriously felt in the sellers' market that has recently prevailed. The fact that Belgium has recovered quickly, has been able to export and to offer early delivery dates has more than counterbalanced the relatively high prices of such articles as Belgian steel, locomotives, cement, textiles. But the situation is already changing and a time may come when Belgium, unless "floored off" into equilibrium by a further rise in dollar and sterling prices and costs, may seriously have to consider the alternatives of a drastic bout of deflation or of a devaluation of the franc.

Switzerland Keeps Right

[FROM OUR ZURICH CORRESPONDENT]

IN the democracy of Switzerland the active collaboration of the people does not stop at electing its legislators. It really does have the last word about the laws which affect the lives and actions of individuals. A century of referenda and elections has shown that the ordinary Swiss citizen uses his judgment independently of the official and party slogans, and that he has a sure sense of what is in the long run good for his country. Moreover, when they seem justified he will accept all kinds of sacrifices. There was a time, a few years before the war, when foreigners marvelled at the sight of the Swiss agreeing in a referendum to the lengthening of

the period of military service; and they have also approved financial programmes which meant considerable sacrifices for the ordinary taxpayer.

Recently there were two referenda the results of which set the course of social reform and economic development for decades ahead. The result of one was a four to one majority in favour of old-age insurance, which means considerable annual payments by individuals until they begin to enjoy the fruits at 65. The other decided general principles about the relation between state and national economy.

The Swiss Constitution guarantees to each individual the right to work and trade freely. Hitherto, limitations of this right could be imposed only on police grounds, that is to say for the protection of health, public order or security. They could not be imposed to counteract the effects of free competition. The existence of statutes of freedom to trade and work and giving a constitutional guarantee of that freedom as a right of the individual is a peculiarity of Swiss legislation, and in the new economic articles of the constitution it is again explicitly acknowledged. But at the same time these articles empower the federal government to limit freedom of enterprise, if that should be necessary for the maintenance of a healthy peasantry and an efficient agricultural system. Likewise, other branches of economic activity and certain professions can be protected if their survival is threatened. Measures taken under these articles are, of course, to pay due regard to the general interest. The state has further received the right to take, in co-operation with private economic interests, measures to avoid crises and to combat unemployment caused by them.

Compared with the development of state planning and supervision which has been going on in Europe, to say nothing of nationalisation, the innovations in Swiss economic legislation represent a very slight increase in the influence of the state over economic life. Yet they were approved by the people with only a chance majority and only thanks to the enthusiasm aroused by a simultaneous measure for old-age insurance. And this in spite of the fact that the innovations were recommended and supported by all parties and by all leading organisations of trade, industry, labour and farmers.

Socialist Reforms Rejected

This reluctant attitude in no way sprang from a feeling that the influence of the state on economic life was not developing fast enough and that state intervention should be on a more drastic scale. On the contrary: exactly six months before this the Swiss people had rejected, by a quite decisive majority, a socialist plan of economic reform. Before that they had rejected a proposal for constitutional amendment which would have given the state legislative powers over transport. So, with the struggle between east and west going on all round them, the Swiss people in three separate referenda, deliberately decided for the free way of life in economic matters.

But it would, of course, be an error to think that there is no state economic control in Switzerland. There was an organic development of public ownership long before other countries were moving towards nationalisation. Postal, telephone and telegraph services and, since the turn of the century, most of the main-line railways, came under federal control. Some three-quarters of the people are provided with electricity from power stations in public ownership. The local authorities provide gas and water. In banking state and communal interests control 51 per cent of the funds. And in insurance, too, the state exerts great influence through its own institutions and by its supervision. But the transformation industries were not touched by this development. Made up of a large number of relatively small concerns, they were not suitable for public ownership. Likewise the variety and complications of the craft industries have kept them outside the development of public enterprise and have provided a bulwark against the interference of the state.

But even in spheres where the state did not itself become a producer and organiser it intervened from an early date. The workers' conditions of work have long been protected and at the end of last century there began a far-reaching and complicated process of protection for agriculture. The two world wars brought state controls of raw material imports, and there was considerable control of their use by the federal government. At the same time world economic crises, the complicated systems of controls on trade and industry of some nations, and the authoritarian measures of others made it necessary for Switzerland to take defensive measures. Restrictions on exports and imports, payment agreements and other measures led again and again to

interference in internal economic life, and measures have also had to be taken to protect the export industries against developments threatening the partisan middle class.

Criticism of Controls

So in the course of years there has grown up a *de facto* system of controlling economic and social conditions which was out of line with the principle of free enterprise enshrined in the constitution. The new clauses in the constitution simply recognised the principle of "freedom with order" which had long been followed in practice.

The hesitation of the Swiss people to approve the undermining of their liberty by such legislation is a warning to the authorities only to intervene in economic affairs in cases where it is indispensable to protect important national interests or where a state of emergency has to be dealt with. Today as in the past, the Swiss citizen demands that the state should leave him as free as possible in his economic affairs. For he still believes that a free economy can promote the material and moral welfare of the people better than can the state, and that freedom spurs the working man and woman to exertions and achievements which are the real source of well-being in a country so poor in raw materials.

Rumania's Part in the Molotov Plan

[BY A RUMANIAN CORRESPONDENT]

RUMANIA has joined those countries which are trying to put some order into their monetary affairs. The currency stabilisation at more or less the 1938 level which was carried through on August 15th seems technically a very satisfactory job. To prepare it, the Government took two related steps. It produced a "super-inflation by decree" by raising all the official prices to a level above that ruling in the black market. And it produced a simultaneous artificial currency and credit scarcity through the intermediary of the National Bank and of the official industrial trusts.

The actual monetary conversion did the rest. All Rumanian currency in circulation was blocked, all foreign currency, gold (excepting jewellery), and gold coins were declared Government property, and the equivalent of between two and five shillings per head, according to the social category of the individual, the peasants and workers being "favoured," was freed for use in the first week of the new currency's existence. Government commissions will decide "on the individual merits of the case" what should happen to the rest of a citizen's convertible money.

Socially, this conversion will prove a useful weapon in the hands of the Communists for the liquidation of social groups opposed to them. Its efficacy should not, however, be over-rated. Politically, it will prove a powerful weapon against the opposition, each of whose prominent members will have to pass before a partisan committee of inquiry into his private affairs.

But the monetary reform is only part of a larger pattern which is becoming known as the "Molotov Plan" for eastern Europe. Rumania's part in that plan can only be seen if the whole of its economic position is kept in mind. This is at present determined by four main factors: the payments to Russia and the other direct costs of the war, the state of the harvest, the effects of war and political changes and the political atmosphere in the country.

In 1938 the national income of Rumania was estimated at some £400 million—or about £330 million for its present-day territory. Since the rising against the Germans on August 23, 1944, it has never exceeded £200 million. Out of this income and the movable capital and consumption goods in existence in the country at the time of the rising, Rumania by July, 1946, had paid to Russia, according to the official statement made at the Paris Peace Conference by the leader of the American Economic Delegation, Mr Thorp, the equivalent of about £250 million. And at least another £150 million have been paid since. During that period a further £110 million were expended on the equipment and maintenance of the army. Between August, 1944, and August, 1947, Rumania has thus paid under the above mentioned headings about £510 million, which is probably the equivalent, or not far from it, of the total national income in that period.

Threat of Starvation

The harvest is the most important single item in Rumania's economy. Some of the "cash" items, like oil and timber and

lately certain industrial products, might take precedence in international trade, because they are the ready money for whatever Rumania has to buy from abroad. But Rumania could still live, though not prosper, without them and as a matter of fact, and because of the payments which have still to be made to Russia precisely in those products does so live at the present time. A bad harvest, on the other hand, and even more so a series of bad harvests, implies for the population the danger of direct physical extinction, if no help is available from abroad. Such a series of bad harvests has been Rumania's lot since 1944, with 1945 and 1946 as complete failures. But there is a hope that this year chiefly due to a probable bumper maize harvest, there will be no more widespread starvation.

These external factors are independent of the efforts of the population. Of those factors directly affecting the contribution of the Rumanians towards increased production and the rehabilitation of the country the war itself has pride of place. The loss of some 800,000 able-bodied men in a population estimated at 15-16 million people, the destruction already noted, the large-scale removal of factory plants and all kinds of implements by the Russians, the severe reductions in transport facilities (more than two-thirds of the rolling stock having been removed by the Soviet military authorities and almost the whole of the merchant fleet being now Soviet property by a decision of the Soviet High Command), all contributed to a widespread and severe fall in industrial and agricultural production. The estimate made in May this year by the Vice-Premier of the present communist-controlled Government is that "the general production of the country is only 48 per cent of that of 1939," and that "in 1946 it was smaller than in 1945."

Political Brakes on Recovery

But the direct impact of the war, severe as it was, does not account for the whole of this decrease. The political changes which have occurred so far and even more so the general political atmosphere add their weighty share. A few quotations from a confidential memorandum presented on May 28, 1947, by the Vice-Premier to the leaders of the coalition parties in the Government will best illustrate this:—

"The most important (of the causes which have maintained national production at this low level) after the disaster brought about by the drought, is the general lack of trust which prevents the mobilisation of all the forces of the nation in the service of production. As long as this lack of trust exists, every attempt at reconstruction will be doomed to failure and the country will continue to suffer from the bad feelings caused by a bankrupt economy."

He goes on to mention some of the reasons for this lack of trust: the "excesses concerning preventive arrests" (which have greatly increased since), the "treatment applied to the political detainees and those condemned for political offences" (there have been official British and American protests on this account), the "regime of requisitionings . . . with all its abuses and excesses." This leads, according to the memorandum, to a "state of dissatisfaction and mistrust common to all the social categories, without any exceptions."

The above-quoted memorandum, while advocating a new approach by the Government towards these problems, also emphasises the urgent and vital need for Rumania of a foreign grant of at least \$600 million. The Rumanian Government, however, has unanimously endorsed the Communists' alternative proposals and rejected the Marshall plan which had been put forward meanwhile. The Soviet Union is already well established as the major factor in the economic life of Rumania and has assimilated or taken over every major branch of Rumania's economy by means of the "SovRom" companies, in which the Soviet Union or Soviet organisation has 50 per cent of the shares, while the Rumanian state and big Rumanian companies and organisations have the other 50 per cent. These companies can be dissolved only by a majority decision of the shareholders, which implies their continued existence as long as the Soviet Union should so desire. The "SovRoms" so far constituted control Rumanian shipping, air-traffic, wood and timber production, banking (except one major bank), insurance and all the oil production not belonging to foreign interests. The machinery of the state is used to give every advantage to the "SovRoms" and squeeze out the companies not included in them.

The Communist plan for the reconstruction of Rumania as part of the larger "Molotov Plan," is now being played up as a constructive alternative to the "enslaving" proposals of the Marshall Plan. The items in the Communist plan, as first published on June 15th this year, may be roughly divided in two: those which,

under the present circumstances, could be implemented without too much difficulty and those for which extensive foreign credits or a radical change in the internal situation are needed

Penetration by Communists

Among the first are the reduction of the state apparatus, the monetary reform and the direction and regimentation of labour. The reduction of the state apparatus has a two-fold significance: it will reduce state expenditure, and it will eliminate the majority, if not all, of those civil servants who are lukewarm towards Communism. This step is the logical completion of the process begun with the flooding, during the last two years, of the administration with Communists or their sympathisers, who will now remain in sole possession of it. The Government hopes that the re-valuation of the currency will prove sufficient to ensure a stable monetary basis for future reforms. It will be backed by the Bank of Rumania's gold reserves of about 240 tons and its gold exchanges which have been considerably increased by the recent measures. The regimentation of labour, combined with a more complex system of piece-rate payments and incentives will, according to the plan, increase productivity this year up to 60 or 70 per cent of the prewar figure. To these measures must be added those initiated before the publication of this plan—such as the regimentation in state-directed trusts, of all industrial production which does not yet come under the "SovRoms."

The second category of the proposals implies a definite, and in certain cases a large, contribution, from external sources. They deal with the re-equipment of agriculture, the extension and modernisation of the railways, a large increase in the production of the extractive and manufacturing industries, and the creation of stocks. The only item in this category which could be immediately implemented, at least within certain limits, is the compulsory delivery of agricultural products by the peasants (greatly helped by the severe rationing of money by the new reform) to serve as an incentive for increased industrial production. The rest, after the rejection of the Marshall plan, could only be put into practice if large credits were forthcoming from another source. That source could only be the Soviet Union.

It is therefore interesting to try to visualise the problem from the Russian point of view, as being the determining factor. Russia is faced with the same problem now facing almost the whole world: the allocation of scarce factors of production, which for Russia are represented by machinery and tools. Would it be better economics to try to increase production in the Rumanian subsidiary or in the old firm at home? Rumania is a restive country in which a handful of Soviet agents have to keep down and perhaps try to win over the large majority of the population. Would it be good policy to try to help that population to prosperity and thus hope to win it over, or to "starve" it into submission, at least until its leaders have been eliminated? The decision to be taken is difficult, the more so as Rumania is not the only subsidiary with which Russia has to deal.

Russia Plays Safe

On the whole it appears that Russia has decided for the moment to play safe. If it can give any direct help, it will give it first to those countries which seem more actively pro-Soviet. As far as machinery and finished products are concerned Rumania cannot therefore expect much for some time. But Russia and the Soviet zone in Europe have almost overcome the shortage of raw materials prevailing in western Europe and can without much difficulty provide at least coal, cotton, iron and manganese. The pattern of Rumanian economy in the immediate future thus seems to be one of full utilisation of existing industries but of very little, if any, expansion or even rebuilding. Nor will the whole benefit of even this "full employment" accrue to Rumania, as virtually all exports will have to go to the USSR in accordance with the Moscow trade agreements, thus making it impossible to acquire in exchange the much needed industrial and agricultural machinery which the USSR cannot at present deliver.

The adoption of the Molotov plan as an alternative to the Marshall plan by the Communists in Rumania has thus at the best put back the natural development of the country's economy by at least three to four years—and this at a time when the urgency of economic recovery is paramount.

THE BUSINESS WORLD

Export Arithmetic

IT is very apparent that British industry has not yet taken the measure of the comprehensive export programme announced by Sir Stafford Cripps last week and discussed in some of its wider aspects in an earlier article. Some bewilderment at this stage is indeed inevitable. The programme extends to no less than a hundred and fifty-three items or groups of items, specifically listing such minor commodities as razor blades and combs, and fixes specific export targets for each, both for the middle and the end of next year. But, despite the minuteness of detail with which it grapples, hardly any of these targets had been discussed in any formal way with the industries concerned; they had apparently been worked out by the responsible Government departments and co-ordinated by the Board of Trade. Sir Stafford claimed that the departments had made "an extensive and careful inquiry into all the main industries of the country to see what export task we could realistically place upon them." Yet it is plain that what has emerged is primarily an arithmetical exercise, the very tidiness of which makes it the more suspect.

The adverse balance to be bridged is still estimated at £600 million for the coming year—it is admittedly a very hazy estimate—before allowing for the £228 million of import cuts already announced. In the absence, therefore, of further cuts (and none are apparently in contemplation), £372 million, or £31 million per month, has to be provided by additional exports. The official blueprint produces this total precisely, and achieves this precision despite the fact that the targets for many of its small components are expressed to three places of decimals.

The excellence of this arithmetic is indeed an apt commentary on the whole scheme. Most of the proposals are unexceptionable in theory, but gravely deficient or even patently unworkable in practice. Yet in one sense the plan as a whole gives the first clear sign, if not of realism, at least of determination on the part of the Government to take drastic measures. At last there is clear evidence of intention to concentrate productive resources upon vital needs, specifically defined. The new principle is that if a manufacturer cannot sell for export, he may not be allowed to sell at all. If his normal products cannot be marketed abroad he will be expected to switch to others which can be, and otherwise his materials and labour are to be diverted to export manufacturers in other industries. If the principles of this scheme could be put into practice by the techniques and in the detail which the Government contemplates, it would undoubtedly be one of the most far-reaching and courageous measures of economic planning ever attempted in peacetime. But, as the article on page 465 argues, it cannot thus be carried through.

Industrialists are already predicting three distinct sources of dislocation, and the Government would do well not to dismiss these fears by any airy assumption that they spring simply from the unwillingness of private enterprise to make unpalatable changes. The first fear is that, if an attempt is made to impose the plan by the technique of priorities for labour and materials, the result will be a chaos of administrative bottlenecks and insufficient co-ordination. The second fear is that unless these techniques are supported by realistic fiscal and financial measures to reduce the pressure of home demand, the black markets will

grow so large that the allocations, even if successfully made at the first stage, will later be undermined by wholesale evasion. The "spivs" will find a new vocation in "fiddling." The third fear is that even if, despite all such obstacles, the actual production for export approaches the targets, it will then be found that the rapidly changing conditions abroad have already killed the market.

It must, in fairness, be conceded that the Government foresees many of these difficulties. But its only remedy for them is more detailed planning. Thus it is said that the system must be flexible; but how can officials who are swamped with detailed work be expected quickly to revise particular firms' targets for specific goods and then speedily to withdraw or make available (through the other responsible branches of the huge administrative machine) the corresponding quotas of labour, materials and components, and to do so without getting the multiple currents grotesquely out of phase? Yet this is not the end of the tale of complexity. The Government is to attempt a flexible policy so as to take account of differences in the "conversion factor" of particular goods, to minimise the use in exports of scarce or imported supplies. Equally, it is to direct supplies to the hard currency areas and to others which can promise a return flow of the goods which Britain most needs. It hopes, finally, to vary its directional policy to meet changing conditions in markets overseas. Yet these things are to be done "by general control rather than by complex licensing," and as large a responsibility as possible is to be delegated to district organisations which "we have not yet learnt to use thoroughly."

It is small wonder that industry doubts whether the plan can work, or whether any substantial increase in exports can be achieved in the conditions of administrative crisis which are almost bound to arise in the responsible departments. Yet, given the Government's continued reluctance to relieve the pressure by what Sir Stafford Cripps calls the "old-fashioned" financial techniques, it is hard to see what more could have been expected than a programme framed on these lines. Given, too, the speed with which the departments have had to work—because of the dilatoriness of the Government in admitting, and acting upon, the extremity of Britain's need—the only possibility of preparing a programme of targets at all was for the departments to do the job themselves largely behind closed doors. But it would be wrong to suppose that this blueprint is valueless. It is better to have a *pro forma* programme than none at all, first because it brings home to each of the many industrial groups the broad extent of its task, and, secondly, because it is a foundation from which more realistic targets can be worked out. But it is already plain that, within the global totals, large revisions will be necessary.

British industry as a whole is expected to raise its exports from a monthly rate of £89 million in the last quarter of 1946 to a rate of £114 million by the middle, and £132 million by the end of next year—assuming no further worsening of the terms of trade. These are the totals, in terms of end-1946 prices, which are needed to achieve the global target rates already announced in terms of volume. If the objectives now more specifically defined were achieved, the volume index, in the absence of any change in prices, would be raised from 111

per cent in the last quarter of 1946, and from approximately 108 per cent now, to 164 per cent by end-1948. The crucial intermediate target, equivalent to an export volume of 43 per cent above that of 1938, is that required to close the estimated

EXPORT TARGETS FOR 1948

N.B.—In order to express the changes in volume, it is necessary to adopt constant prices. The price-level selected is that for the fourth quarter of 1946.

over-all gap after allowing for the cuts in imports. It represents an expansion of the total of British exports in terms of money values by almost one third from its present level.

If the gap is to be closed before Britain's remaining exchange resources fall to their minimum working level, this formidable increase must be achieved in not more than nine months from now. This effort, it should be emphasised, is required to save the economy from complete breakdown. It postulates, not any relief from present austerities, but, on the contrary, a sharp accentuation of them, as the home shortages of goods now to be diverted to export are added to those which emerge as the import cuts take effect. The higher target which is planned

for the end of 1948 is, therefore, intended partly to provide some slight elbow room for an increase in imports for home needs, but also to pay for the additional imported materials which will be required for the export drive itself—on the assumption that the total volume of production will by then be rising.

Of the total additional £43 million, in terms of monthly rates, which is projected for end-1948 by comparison with end-1946, nearly three quarters is expected to be provided by three main industrial groups. These are machinery, vehicles and textiles, which divide a target expansion of roughly £30 million almost equally between them. The importance of machinery in the programme shows how heavy the impact is likely to be upon home capital programmes. Sir Stafford Cripps estimates, indeed, that between £50 and £60 million of the additional exports will be in the form of capital goods, because the war-shattered economies abroad, now that their dollars are running out, are at last putting first things first and thus offer diminishing opportunities to British exporters of the less essential consumer goods. Whatever doubts there may be about the wisdom of exporting capital goods which are needed here, Sir Stafford Cripps is certainly right when he says that the bilateral bargaining upon which Britain is to embark will break down unless some proportion of such goods can be offered in almost every case.

*

The targets which have been set for vehicles—that for private cars is 150 per cent above the end-1946 rate—seem hardly consistent with this line of argument. They are the more surprising in view of the publicity which has been given to the fact that more than twenty countries have just imposed import restrictions of varying severity upon imports of British vehicles. It may indeed be true that general dollar shortage and sterling's non-convertibility may lead some countries to switch their purchases from America to Britain (though Sir Stafford admitted that policies of general import curtailment are equally probable in some cases), but it is surely futile to expect British exports of private cars to benefit significantly from such a switch at this stage. If this is so, the position of the motor car industry will provide a critical example of the difficulties which will arise in switching production to other exportable manufactures, such as commercial vehicles or tractors or agricultural machinery—switches which would raise at once the intractable problem of ensuring a balanced flow of components. This problem is, indeed, crucial to the whole programme. Given the speed with which it has been compiled, it would not be surprising to find that some of the targets are, in fact, mutually exclusive, not because of shortage of labour or basic materials (for, in theory, these can be secured by switching), but because of insufficiency of supplies of specialised constituents and even of capacity to

produce them. In the textile field, however, some attention has evidently been paid to this problem. The effort there is to be concentrated upon export of end-products rather than of yarn, though it is admitted that supplies of certain fine quality yarns will present difficulties, principally for currency reasons.

While the three main groups must provide the actual bulk of the expansion, even larger percentage increases are expected of many less important industries, including some which in the past have not been generally regarded as significant exporters at all. In the classification by groups, the targets for the following twelve categories show the largest percentage changes:—

	VOLUME INCREASES (1938 = 100)		Col. 2 as % of Col. 1
	4th Qtr. 1946	Export Target End-1948	
Rubber manufactures....	222	425	91
Vehicles.....	177	316	78
Footwear.....	183	295	61
Machinery.....	147	254	73
Rayon.....	150	245	63
Woolens and worsteds....	89	182	104
Pottery and glass.....	159	223	40
Leather.....	79	138	75
Miscellaneous.....	121	173	43
Chemicals.....	161	206	28
Coal.....	9	40	344
Cotton.....	43	69	60

It is too early yet to guess the extent of the drain upon home supplies which would be required to achieve the targets, but it will certainly be felt over a very wide range, and in some instances the domestic shortage is bound to be severe. Vehicles are a case in point. In December last, when their export value was 177 per cent above the 1938 level, 50 per cent of the total production was going for export. Hence the target level of 316 per cent, could it be achieved, would leave only a trickle of supplies for the home market. At the other end of the scale, the projected increase of 344 per cent in coal

Payment by Results

THERE is still no sign that the Government is prepared to sponsor a wages policy designed to avoid the wastages inherent in the rising inflationary pressures. But there is a vital aspect of the wages problem which presents no such political difficulties. Everyone now agrees upon the need to ensure that wages—and especially wage-increases—as linked as closely as practicable with productivity. Both sides of the industry represented on the Minister of Labour's National Joint Advisory Council have agreed on the need to extend systems of payment by results, wherever possible, as an incentive to greater output, and individual industries have been urged to examine the possibility of introducing or extending such systems. Even the TUC, while adhering to its traditional attitude that this is a matter which must be left to its affiliated unions to determine, has given its general blessing to the idea, which at one time it tended to discourage. So far, however, no very clear ideas have been forthcoming, either from the employers or the unions, about the scope for extending the existing systems, or about the new industries to which they could be applied.

The reason for this is, no doubt, that, except in building, where the concept of nation-wide payment by results is revolutionary by comparison with the limited and local schemes which existed before the war, the bulk of industries are already operating some system of output incentives, and for these it is a question of extending its application, rather than breaking fresh ground. There are some industries and occupations where payment by results obviously cannot apply. Road and rail transport are examples of natural time-rate industries, though even here

is equivalent to about 1,200,000 tons a month—one sixteenth of the conceivable, if optimistic output rate of 4,800,000 tons per week which might be attained by end-1948, given increased labour and further mechanisation in the mines. In steel, an additional 250,000 tons a quarter is expected to be required for work on exports, a demand which will make heavy inroads into home supplies.

This particular burden, however, will be eased, so far as the home consumer is concerned, by the cuts which are contemplated in the capital programmes—and especially in building—to the extent of perhaps £200 million. In textiles, on the other hand, Sir Stafford has said plainly that very drastic cuts in home supplies are inevitable unless production is increased. In this instance, an expansion of total production by 10 per cent would suffice to meet the immediate export need.

More production is, indeed, the only solution to the whole problem. If the Government will not stimulate effort by creating financial stringency, the prospect of increasing austerity ought, perhaps, to be welcomed. It may bring home to individuals the truth, which the size of their incomes seems to deny, that only by making more can they avoid consuming less of the things they need. That is the approach to the problem by way of the consumer. The approach via the producer is, perhaps, even more important. The more production can be raised, and the greater the voluntary co-operation from industry, the less the need for the frightening apparatus of control which is threatened. Sir Stafford declares that the responsibility is upon industry to win this battle of the Balance of Payments. It is, indeed; for industry is, in effect, being asked to do not only its own job, but the Government's as well—to achieve this task though all the pressures of the domestic market, pressures which the Government does nothing to relieve, pull in the opposite direction.

bonuses for prompt running might be regarded as a limited form of payment by results. In dock work, where time wages might on general grounds be thought to be the appropriate basis, payment by results is extensively applied and now governs the pay of about 90 per cent of the workers. The schedules are extremely complicated, and rates vary according to the cargo handled, conditions at the port, the provision of mechanical gear, type of ship, and other factors. The smoothness with which payment by results operates in this complicated situation depends, in large degree, upon the efficiency of the local negotiating machinery, since rates frequently have to be agreed on the spot and many difficulties of interpretation may arise for immediate settlement. But, in general, it might be said that if payment by results can operate successfully in dockland, it could be applied almost anywhere. There is no doubt that if the system were to be abandoned, the tempo of the work and the turn-round of ships would at once be slowed down.

Piece-rate working is normal practice among underground miners, and it is doubtful if it could be usefully extended beyond the existing pieceworkers, who now represent about 40 per cent of the labour force. It might, however, be possible to operate some form of collective bonus, on the basis of a seam or colliery, which would give day-workers a more direct interest in the output of their pit. There would seem to be comparatively little room for the extension of payment by results in the cotton textiles and boot and shoe industries, where output is fairly easily measured in physical units, and where both sides have long experience of negotiating the price lists.

Greater scope may exist for extending piecework operation

in the engineering industry, and this is now being considered. An agreement was recently reached to cover the payment of pattern makers, and negotiations for its introduction into foundries are proceeding. Most of the larger firms already operate payment by results but there are some smaller firms which adhere to the time basis where piece rates might with advantage be introduced. That, however, calls for negotiations in the workshop rather than on the national level. There has in the past been bitter resistance from the unions to certain forms of piecework which were associated in their minds, not with increased earnings, but rather with unpopular methods of speed-up and price cutting. This opposition was frequently expressed by strike action, in spite of the national agreement of June, 1931, which was directly intended to safeguard employees against rate cutting and to protect the good employer. It provided that no piecework price, bonus or basic times, once established, could be altered except, first, where there had been a mistake in calculation; secondly, where material, means or method of production or the quantities had changed; or, thirdly, by mutual arrangement between the two sides. As might be expected, it was the second of these three escape clauses which gave rise to disputes.

The opposition to piecework was largely eliminated during the war, when "the sky" was virtually the limit on piecework rates. Indeed, Government policy, as defined by Mr Bevin, who was then Minister of Labour, was to encourage high rates. Mr Bevin declared in Parliament in July, 1941, that he "did not mind what was earned on payment by results so long as it represented production." It was not unusual to find men in the engineering industries earning piecework bonuses equivalent to 100 or 200 per cent of their ordinary time rates, as a result of the combination of piece rates and overtime working. Since the end of the war the inflated piecework earnings have naturally dropped, but the practice of payment by results has not appreciably diminished. It is estimated that about 50 per cent of all the workers in the industry are on piece rates, the proportion in the case of fitters, turners and other machine workers being about 75 per cent. The same proportion is found among railway shopmen.

Piecework systems vary considerably, and they add further complications to the already highly complicated structure of engineering wages. The simplest method is straight piece rates, where the worker is paid a rate of so much per piece, which provides a direct incentive to increase output. Because of its simplicity, that is the most popular method among the men, who do not feel they are being "cheated" of any earnings. The wage award of the National Arbitration Tribunal in May, 1944, provided that piecework prices should be such as to enable a "workman of average ability" to earn at least 27½ per cent above the basic time rate. This award took into account the restoration of the 2½ per cent cut imposed in June, 1931. Engineering employers contend that in practice piece-rate earnings average about 50 per cent above time rates. The unions regard this estimate as unduly high, and for this reason, among others, they have pressed for higher basic rates.

Systems of premium bonuses differ from straight piece rates. Instead of being calculated in terms of money rates per piece produced, they are based on a standard time for a given job, with a bonus for time saved, which is credited to the worker. The two systems mainly operated in this country are the Rowan system, first introduced in Glasgow in 1898, and the Halsey system, which originated in the United States. The Rowan system provides a greater incentive at the early stages, but is regarded as being less favourable to the slow worker than the Halsey system. There are also the methods of collective bonuses, related not to individual performance, but to that of a group of workers whose output cannot be assessed individually—such, for example, as workers on an assembly line.

The experience of the engineering industry in operating schemes of payment by results is no doubt being carefully examined by the building industry, in which at long last, a scheme for the operation of incentive payments may be introduced, if the ballot now being taken among building workers is favourable. No indication has yet been given of the methods which may be applied, beyond the likelihood that the scheme will enable a bonus of 20 per cent on the time rate to be earned. The building industry does not lend itself so easily as engineering or cotton to straight piecework rates. Quite apart from the varied nature of building crafts and operations and the difficulty of measuring the different processes which go into the making up of the final product, the multiplicity of small firms in the industry (to many of whom the idea of scientific progressing and costing of jobs is quite unfamiliar) makes it difficult to apply a universally acceptable scheme.

Various schemes have been propounded in the past for payment by results in building. One, put forward by a group of larger builders, attracted considerable attention in the *Builder* last year, and this might at least provide a starting point. The essence of this scheme is that it is a collective, and not an individual, bonus, and that it is based on the time saved on each job. A standard time would be set, based on the time taken on the job before the war, but including a percentage addition to conform with current circumstances; thus a kind of national schedule of man-hours for different processes would be drawn up and checked by an independent authority—for example, a committee representing the two sides of the industry and the quantity surveyors under an independent chairman. This would protect both employees and good employers against unscrupulous practices. In order to provide incentives for efficiency under this scheme to the operative and also to the contractor and the client, it is suggested that all three should share in the proceeds. This suggestion is rather debatable, for if the benefits of a reduction of man-hours compared with the target are shared, the operative will obviously have less inducement to increase his individual effort. Two points require emphasis. First, the operatives should fully understand the basis on which any bonus scheme is operated, and their full agreement will have to be obtained. Secondly, it will, in the first instance at any rate, be easier to secure such agreement in each locality rather than through national negotiation. Indeed, local differences of building methods make such local agreements almost inevitable, whatever may be said for a national agreement in principle. Whatever method is finally adopted, speed in reaching agreement is urgent. Productivity in building is now estimated to be about 40 per cent of the prewar level and far too much time has already been lost, primarily as a result of the opposition of the union leaders, to the acceptance of incentive payments to raise output. And the fact that the building programme must be cut to provide room for exports makes higher productivity more than ever important, for the building work which is undertaken in the next year or so will inevitably be of the highest priority.

Payment by results is not the universal panacea that it is sometimes made out to be, for building or for any other industry. It is only one aspect of industrial efficiency, which includes good management, good industrial relations and welfare provision, the smooth flow of raw materials and components, an adequate fuel supply, and the quality and quantity of plant and machinery. But payment by results can play an important part in increasing output, where the other conditions are favourable. Providing that the rate-fixing machinery works quickly and efficiently, and that an increased money income is an incentive, it can be most valuable. But if the rates are unduly favourable, or if workers use the system merely to enable them to earn the same money income in a shorter time, its benefits, in terms of increased output, will be negligible.

Business Notes

Markets and the Export Plan

Rather unexpectedly, there has been no clearly marked response in markets to the announcement of the export plan. In the few industrial groups where the link with the Government's proposals is both direct and readily apparent, some response has, of course, been discernible. The rise in textile shares is the outstanding instance, but other examples are to be found in the easing of prices in building shares and in those relating to domestic retailing. But such changes have been of moderate extent, and mainly reflect the marking up or down of quotations rather than any speculative business. Indeed, the most striking feature of the equity markets has been the further decline in the volume of business, which on one or two days this week was at its lowest ebb for some considerable time. The level of the market as a whole has been virtually unchanged—so that the speculative gains of the previous week have been held.

This inertia is somewhat surprising, even granted that, at times of major economic change, it is always hard to discern the effect upon particular securities or even particular groups. One reason for the inactivity might be the general assumption that the Cripps scheme simply cannot work on the lines planned. Yet it might have been expected that the prospect of drastic changes in the structure of industry—changes which are likely to take place in an atmosphere of administrative friction and delay—would have been reflected in further disquiet among investors. Fortunately, this has not happened, and the most common City view seems to be that the steep decline in values which had already occurred discounts the probability of a good deal of industrial dislocation this winter, in any case. From the standpoint of the stock markets that seems to be a rather sanguine view, and it is likely to be roughly shaken if the Government decides at last to support its physical planning by budgetary action. In the meantime, these inactive markets gain something from the strengthening of the technical position which resulted from the severe shakeout of three weeks ago. The significance of the technical factor was apparent when the new account opened this week, for the firmer tone then was certainly attributable more to this influence than to any of the deeper explanations—such as the speedy window-dressing of the Paris plan to bring it into line with American requirements—which many people tried to find.

Meanwhile, the gilt-edged market seems to be reacting rather to the general influences of the economic crisis than to the monetary and technical factors which tended to dominate it in the recent past. It is true that the accentuation of the sagging trend on Tuesday was apparently due to the news of the draft on the Exchange Account's gold stocks. In its strictly technical application, this transaction meant that the authorities had correspondingly larger sterling resources available to support the market, should they choose to do so. But the City's reasoning was quite plainly on much broader lines: it argued simply that, the smaller the gold reserve, the greater is the danger of a general breakdown until the effectiveness of the wider corrective measures has been demonstrated.

Drawing on the Gold Reserve

Britain's need for dollars is now being satisfied by sales of gold to the United States. On Monday last the Treasury announced that the Bank of England had sold £20 million of gold to the Federal Reserve Bank of New York. The proceeds will be credited to the working balances of the Bank of England and will make resources available with which to continue purchases of sterling in New York against dollars at the official rate. The final drafts on the American loan had, it was thought, provided for a fair amount of dollar expenditure, but it is probable that these anticipated requirements were for account of others rather than Britain, so that the rapidity with which drafts on the gold reserve have had to be started is not a reflection of the rate at which Britain needs dollars for her current requirements. These requirements apply not merely to the direct trade with the United States, but to the trade with a number of countries to which payments have still to be made in convertible currency or US dollars. The reserve of gold into which Britain has just begun to dip was estimated by the Chancellor of the Exchequer to be about £600 million at the beginning of August. Given the steps that

are now being taken among representatives of the Dominions—assembled in London for the Bank and Fund meetings—in order to conserve dollars and curtail imports from the United States, it is to be hoped that the further drafts on the gold reserve to meet current dollar expenditure will show a steady diminution. The gap should also be narrowed by the accelerated export drive and by increased canalisation of British exports to hard currency countries. It should also be possible before long to finance a further part of the dollar deficit by means of the final \$400 million immobilised in the US line of credit. Mr Snyder, the US Secretary to the Treasury, made it clear at a press conference this week that this \$400 million would again be available as soon as the United States was satisfied about the trend and character of the new payments agreements negotiated by Great Britain following the suspension of free convertibility of current sterling into dollars. Mr Snyder would not specify what this desired trend should be, but he made it clear that in his view the events of August 20th last should not be regarded as a fundamental departure from the provisions of the Anglo-American financial agreement. The United States authorities are evidently under the impression that the suspension of sterling convertibility is a very brief deviation from the line of conduct and policy that was marked out in that agreement. If this view does not accord with that of the British authorities it may be hoped that no opportunity was lost in the past week—and the opportunities were there for the asking—to remove any possible misunderstanding.

Recourse to the Fund

The second instalment in the search for dollars needed to tide Britain over until the measures taken to balance external accounts become fully effective has been the purchase of \$60 million from the International Monetary Fund. This operation was arranged in London during the course of the meeting of the IMF governors. The sanction of this dollar purchase is of significance in that it implies that to the Fund authorities the present balance of payments difficulties from which Britain is suffering, and in covering which the help of the IMF has been sought, may be regarded as a "temporary disequilibrium." There can be no doubt that, but for last week's export programme announcement, this requirement would not have been regarded as satisfied. But this programme, with the measures taken to reduce imports, offers some reason to hope that some time during 1948 the balance of payments will again be on an even keel. That in itself was probably sufficient to satisfy the IMF authorities about the eligibility of Britain's application for purchasing dollars from the Fund. Further strengthening of the British case must have come from the sale of \$20 million of gold to the United States, an operation which showed the United States and all concerned that Britain was dipping into her final reserves before approaching the IMF for assistance.

It may be assumed that this week's purchase of dollars by Britain will be followed by other similar operations before equilibrium in external payments is reached. The Chancellor of the Exchequer, in the economic debate in the House of Commons at the beginning of last month, had indicated that Britain's facilities with the IMF would be left in reserve, partly because of the onerous terms which apply to drawings upon the Fund. That, however, can hardly be said of the initial purchases. What is in fact taking place is the recapture by Britain from the Fund of some of the gold which it subscribed to the capital of that institution. In paying its Fund quota of \$1,300 million, Britain contributed \$210 million in gold. Under the Fund agreement a member country may purchase currency from the Fund against its own currency without interest charge until the Fund holds in that member's currency an amount equal to its quota. This means that Britain can purchase foreign currencies from the Fund up to \$210.4 million, plus whatever sterling the Fund has sold to other members (at the moment this amounts to \$6,000,000 worth sold to the Netherlands) without incurring any charge other than the "once for all" service charge of ½ per cent levied on all exchange operations by the Fund. Up to about \$217 million, therefore, Britain's recourse to the Fund would be made on extremely cheap terms.

Even thereafter the borrowing from the Fund would not be expensive by current interest rate standards.

The amount that Britain can obtain from the Fund cannot in itself be said to represent any considerable contribution to the problem of bridging the immediate gap. This first operation by Britain should, however, have greater value than its magnitude might imply. There can be no doubt that hitherto there has been considerable reluctance among members in using the facilities of the Fund. Apart from a small sale of dollars and sterling to the Netherlands, the Fund's operations have been restricted to comparatively poor "risks," namely, France and Mexico, both of which have in the course of a few months virtually exhausted their first year's facilities with the Fund. Despite Britain's extremity, the first sale of dollars to this country may be said to make recourse to the Fund "respectable," and it may be hoped that Britain's lead will soon be followed by a number of other countries suffering from the prevailing universal dollar shortage. If this occurs, the Fund may indeed become an appreciable instrument in easing the dollar strain, taking the pressure until greater help is forthcoming through a Marshall plan.

Raw Materials and Export Targets

To the extent that progress towards the export targets of the various industries is achieved simply by switching supplies from the home market, the question of availability of raw materials naturally does not arise; but where the export drive involves changes in the character or total volume of production it is evident that significant problems will have to be overcome in many instances. Unfortunately, it is not possible to evaluate the possibilities statistically owing to lack of data, but some of the broader issues are already foreseeable.

In wool, although there are ample supplies available in the world market, there is a scarcity of the better types, and the success of the export effort in this field, as Sir Stafford Cripps emphasised, may depend upon the supply of quality products. Utility worsteds may have to be accepted on the home market, but they cannot necessarily be forced on to the foreign consumer. Thus, to the extent that wool textile production will be for export rather than for the British public, the finer types of wool will be in greater demand and the inferior crossbreds will tend to weaken. In raw cotton, stocks would be adequate to cover expanded production for some months to come, but, even here, difficulties may be experienced if imports of Egyptian supplies have to be curtailed for currency reasons. Output in the Sudan has expanded almost to its limit; to replace Egyptian cotton on the British market it would have to be doubled or trebled. Even rayon depends on imported raw materials which have to be procured largely from hard currency areas. And unless the supply of wood-pulp and cotton linters increases, production cannot be expanded. But in rayon, at least, products of export quality can be made without much difficulty, and this cannot be said of either cotton or wool textiles.

Supplies of rubber in the world market are relatively plentiful, and Malaya would welcome an expansion in demand. Increased output of manufactures is likely to be restricted by other factors such as the supply of channel black for tyre manufacture. The leather position has also improved. Imports into the United Kingdom in the first seven months of this year totalled 83,600 tons (including undressed hides), compared with 59,500 tons in the corresponding period of last year and 46,200 tons in seven months of 1938. In leather goods, therefore, the limiting factor is likely to be productive capacity rather than material supplies. Of the non-ferrous metals, lead is likely to remain in short supply, but world output is expanding. Provided that supplies of copper and zinc will still be available from hard currency areas in the same quantity as last year, the export targets dependent on these metals could be attained—but only at the expense of the home market.

From the raw material standpoint, it is apparent that the textile industries are likely to have the most difficult task—not because of an inadequacy of supplies, but rather through the shortage of high quality materials which a competitive export market will demand.

Cotton Programme Elaborated

At Manchester on Tuesday, Sir Stafford Cripps elaborated the export programme set for the cotton textile industry in the main export scheme. By reducing the individual target for yarn, thread and cotton manufactures to a total yarn-equivalent basis, he was able to show that exports will have to be increased from

a weekly average rate of just under 4,000,000 lb. in the second quarter of 1947 to 5,600,000 lb. by mid-1948, and to 6,800,000 lb. by the end of 1948.

The corresponding total production which will be necessary to reach the target without reducing supplies to the domestic consumer is shown in the accompanying table. To reach this level of output involves, in effect, an increase in yarn production by 20 per cent by early next year, to provide a supply of woven cloth sufficient during the subsequent nine months to reach the end-1948 target for cotton manufactures. If there is no increase in production, yarn supplies to the home market will have to be cut by as much as 25 per cent during the next six months. As, on available evidence—especially of probable coal supplies—there is small prospect that the spinning mills could reach 120 per cent of this summer's level of output by about next March, a diversion of supplies from home to export markets is inevitable.

COTTON TEXTILE PRODUCTION: EQUIVALENT YARN BASIS
(Assuming Export Targets met out of Increased Output)
(Weekly Average Production: mn. lb.)

	Exports	Home Supplies	Total Output
Second quarter, 1947	4*	11	15
Target, mid-1948	5.6	11	16.6
Target, end-1948	6.8	11	17.8

* Slightly below this level; exact figure not available.

If production is to be raised at all, and exports are to be sold in the discriminating markets where hard currencies are earned, Lancashire must have more coal and more labour, and must reduce its production costs and make its marketing system more flexible. The spinning mills need the coal and labour immediately. On coal, Sir Stafford would say no more than that industry would have its full requirements this winter "apart from some unforeseeable eventuality" and that coal supplies in the North West would be concentrated on "vital manufactures." On labour, he was more specific, but it is clear that the now familiar measures, reliance on the Control of Engagements Order, increased recruitment of women and juveniles, more European Voluntary Workers, rearrangement of machines and labour to increase output per head, and extra hours in key sections of the industry—add up to a desperately slow solution of the problem of the shortage of labour. Action in so many of these cases is entirely dependent on prior negotiation between employers and operatives. Only six to nine months are available in which to build up output to the new high levels which are the minimum targets; but the recipe for smoothing the flow of materials and men is little changed.

Some confusion, and hence delay, may arise, too, from misunderstandings about the efforts to "redeploy" the labour force. "Redeployment" was conceived, until this week, as part of the modernisation scheme which was to be carried out in three stages. On Tuesday, however, Sir Stafford Cripps hinted that modification of existing equipment rather than re-equipment may be the best way of increasing output in the short period, so that there would be an extension of the time-limit to the Government's offer of a 25 per cent grant towards modernisation of the spinning mills. Such a change, however regrettable, may be necessary, if the cotton industry is to maximise output over the next fifteen months; but it would be fatal to hopes of increased production if decisions from the Government on this point were delayed, for that would encourage procrastination by both sides of the industry in mobilising resources for the immediate production drive.

Winter Coal Allocations

The plan for winter allocations has now been worked out. Mr Hugh Gaitskell said in Leeds this week that it will be in the hands of industrialists before November 1st, as indeed it must be if essential industries are to have time to plan their production programmes to take cognisance of higher export targets. Sir Stafford Cripps has said that, in all, industry could expect 244 million tons in the winter six months. This will, of course, be far below industrial requirements, even when eked out with stocks laid by from the summer allocations. The summer budget provided, on the basis of a consumption equal to the six summer months of 1946, for 25 million tons—and consumption is always higher in the winter, owing to the demand for coal for heating as well as for purely production purposes. Little is known about the basis on which the allocations will be made, beyond the fact that the requirements of the steel industry will be met, and that priority will be given to the industries producing for export.

From last week's provisional output figures and the details for late August and early September, it is difficult to share the optimism expressed last week by Lord Hyndley about the effects of

the five-day week and the production and manpower prospects for the rest of the year. Admittedly, the Yorkshire strike and the tail-end of the holidays cost the nation 338,500 tons last week, and, had it not been for these, the total output from deep mines and opencast workings would have been just over 3.9 million tons. It is true also that absenteeism, at 11.24 per cent from all causes, is lower than for some time past, and that the holidays and the recent tragic series of pit disasters have had a bad effect on recruitment. Yet, the number of men on colliery books last week was only 717,600, compared with 717,900 the week before, and unless the miners are prepared, in practice as well as on paper, to accept Poles and other European workers, the chances of reaching the manpower target of 730,000 by the end of the year are remote.

The export targets for industry will be reached only if increasing supplies of coal can be moved to the mills and factories between now and early next year—and, in addition, there is the target for exports of coal as such. There is no prospect of achieving these targets without hardship to "non-essential industries" and domestic consumers unless the current trend of recruitment and output in the mines is sharply reversed in the next few weeks. With every week that passes, any shortfall in output below the level of 4.1 million tons a week makes the prospects of achieving even a total production of 195 million tons of coal this year increasingly precarious—despite the bluff assurances of the Grimethorpe miners that they will make up for lost time.

—And Coal Board's Plans

This dreary trend of output lends added urgency to the Coal Board's plans for improving production by re-equipment. These schemes are of both short and long term significance. Indeed, one of the Board's difficulties has been to strike a balance between the needs of the immediate situation and the development of future plans. Neglect of capital investment in the past and the complete cessation of development work during the war have brought the industry almost to danger-point.

The Board's short-term projects include the placing of

£9,000,000 worth of orders for machinery and the development of "drift" mining from shallow seams. Some seventy drift mine schemes are projected for the next few years, which should bring a net increase in output of 3,000,000 to 4,000,000 tons a year, at a total cost of £3,500,000, and with the use of 8,000 workers. The long-term plans include the reorganisation and concentration of a number of pits. For example, in Durham, the labour of ten pits will be concentrated on four in the next five years, while, in Lancashire, three collieries' labour concentrated upon one shaft will eventually produce 2,000,000 tons a year. These concentration schemes involve difficult human problems, such as the miners' objections to being transferred; they will have to be handled with the utmost tact. A number of new sinkings are planned, and work at Rothas (Fife) and Calverton (Nottinghamshire) has actually started. At least one major reconstruction plan for each of the Board's forty-nine areas will be prepared by the end of this year. Twenty of these are expected to be started in 1948. Each will cost up to £3,000,000 and will take up to six years to complete.

Sterling Discussions

The discussions between the British financial authorities and foreign countries for renegotiating payments agreements following the suspension of convertibility have not been interrupted by the Bank and Fund meetings. At least half a dozen negotiations are in train in London and the time-table of the authorities at the Treasury and the Bank of England appears to be fully booked up until almost the end of the year. Apart from the agreement with Belgium, the only definite announcement has been that referring to Finland, with which an arrangement has been made "which is as satisfactory to both sides as present circumstances permit." This official definition bears all the evidence of the compromise between conflicting views which has had to be reached in this agreement, and which will no doubt re-appear in those that have yet to be negotiated. All the countries with which Britain is negotiating demand the fullest possible resumption of convertibility for their sterling at the earliest possible moment. The most important of these negotiations from the supply point of view will be that with Argentina. There are no signs as yet of initiative on Britain's part to get the talks under way, and un-

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA • CEYLON • BURMA • SINGAPORE
MALAYAN UNION • BRITISH NORTH BORNEO
SARAWAK • CHINA • HONG KONG
THE PHILIPPINE REPUBLIC
FRENCH INDO-CHINA • SIAM • INDONESIA

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

Manchester Branch: 52, Mosley Street, Manchester, 2
West End (London) Branch: 28, Charles II Street, LONDON, S.W.1
New York Agency: 65, Broadway, New York
Associated Banking Institution in India: The Allahabad Bank Ltd.

THE CHARTERED BANK OF
INDIA, AUSTRALIA AND CHINA
(Incorporated by Royal Charter 1883)

fresh fields for endeavour

Because of their great importance in the economic life of the world, the Dominions of Australia and New Zealand afford many opportunities for commercial development and expansion. The British industrialist who contemplates establishing a branch or a business 'down under' will find ready help at The Bank of Australasia, where an extensive fund of up-to-date commercial information and complete banking facilities are at his disposal. Please address enquiries to the Overseas Department.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter 1835)

Head Office: 4, THREADNEEDLE STREET, LONDON, E.C.2.
(Manager: G. C. Cowan)

mistakable evidence of impatience on the part of Argentina may be read in reports from Buenos Aires that exports of canned meat to Britain have been stopped. These are obvious preliminary war cries before the battle is joined. Meanwhile shipments of carcase meat from Argentina are unaffected.

During the coming week the principal interest will be focused on the Dominion talks in London on financial policy. The presence here of the highest financial authorities in the Dominions, attracted by the Bank and Fund meetings, provides an opportunity to discuss problems of common interest, and in particular the policy to be followed, in concert if possible, to meet the dollar shortage and to adjust the sterling area dollar pool mechanism to the new situation. News has already come from Australia and New Zealand of measures to cut imports from the United States. Australia is reducing the tax on gold mining so as to encourage production of the easiest and most automatic material for producing dollars. It is to be hoped that other gold producers may also make their contribution, even at the cost of increasing their sterling balances, in building up the central gold reserve. Eire will be represented at the discussions, at which she must play an important part, given the size of her London funds.

Canada's Problem

Many countries have been "put on the spot" by the temporary suspension of convertibility of sterling, but none is in a more difficult spot than Canada. During the first half of this year Canada's merchandise deficit with the United States amounted to \$488 million, while there were substantial surpluses on other trading, especially with Britain. Hence Canada's dependence upon convertibility, a dependence heightened by the fact that Canada works on comparatively small gold and dollar reserves, the figure at the end of 1946 being \$1,245 million, or not much more than a single year's net dollar requirements at the rate at which that deficit has recently been running. For the time being, however, Canada still has the benefit of convertibility for the whole of the net surplus with the UK which is not covered by drawings on the Canadian line of credit. The present arrangements are that one half of that net deficit due by Britain to Canada is met by drafts on the credit (which on this basis is likely to last another fourteen months) and the other half in "cash or convertible currency," i.e. in US dollars. The resultant situation is one which places considerable strain both on Canadian and British reserves. The most hopeful way of easing that strain would be to reduce the "triangularity" of Canada's payments by diverting part of Canada's present imports from the United States to British goods. There are important lines of goods, ranging from cotton textiles to paper-mill machinery, where Canada's present dependence on the United States is of quite recent origin and replaces trade which was formerly done by Britain. The Canadian authorities and trading community ask nothing better than to restore such trade to its traditional British channels. The issue reduces the sterling problem to its familiar essentials: the question of British production, of acceleration of the right types of exports and their canalisation into the required directions.

Bank and Fund Meetings

The meetings of governors of the International Monetary Fund and the International Bank have run their course smoothly and expeditiously. The Chancellor of the Exchequer has proved an admirable chairman. The chairman for the ensuing year will be Mr O. K. Yui, Governor of the Central Bank of China, but it has already been decided that the next annual meeting will be held in Washington and not in Chungking. The rule will be to hold meetings at the headquarters of the institutions in alternate years and in the intervening years only in capitals of the other member countries. As regards formal business, the concluding meeting of governors last Wednesday passed seven resolutions relating to the admission of Finland to membership increases, the quotas of Iran and Egypt, a new liaison agreement between the United Nations and the Bank and Fund, the election of an additional executive director to the Fund, and silver. The last of these merely calls upon member countries to submit data relating to silver and its uses and calls upon the Fund to assemble and distribute these data by March 1st next. The only hint of friction at these meetings has come from the Latin-American countries, whose representatives have for some time shown resentment at the alleged favouritism which Europe has been receiving in obtaining loans from the International Bank. Their complaints were listened to politely and their suspicions so far as possible

assuaged by a promise that the Bank would give equal consideration to loans for development as to loans for reconstruction.

The real work of the meeting was, however, done outside the published agenda. It was in the lobbies, the social gatherings, to say nothing of the cocktail parties, that the opportunities created by this convening of the financial authorities of more than forty countries were capitalised. The sale of dollars to Britain, discussed above, was part, perhaps the most important part, of this informal activity. The basis was also laid for the financial discussions which will emerge from the Marshall Plan talks in Paris, and will probably be held in London during the coming week. There is increasing belief that the Bank will play a considerable part in this finance and Mr McCloy has already left London on a tour of European countries. In this tour he will look not merely for opportunities to lend, but to borrow. There are some markets in Europe whose abundance could well be skimmed by participation in Bank loans and made available for more needy countries. Among the projects which the Bank will certainly pursue is that of financing the reconstruction of the Ruhr coal industry.

Grain Prospects Worsening

The prospects of adequate grain supplies in Europe this winter are deteriorating. The United States Government has officially intimated that wheat exports this year would be cut by about 10 per cent in spite of a bumper harvest. The November grain export allocation totals only 29.5 million bushels compared with 46.7 million bushels in October, with none to the United Kingdom. This reduction reflects, of course, the shortage of dollars in the consuming countries and the effects of that shortage have been accentuated by the high American prices—prices which many European buyers can no longer afford to pay. The statistical position for wheat in the four main exporting countries is shown in the following table:—

	1946			1947*		
	Production	Domestic Consumption	Exportable Surplus	Production	Domestic Consumption†	Exportable Surplus
United States.....	1,156	913	243	1,409	1,209	200
Canada.....	421	152	269	353	153	200
Argentina.....	221	130	91	190†	130	60
Australia.....	117	78	39	200†	80	120
	1,915	1,273	642	2,152	1,572	580

§ Crop-years 1946-47 and 1947-48. * Provisional. † Forecast.

The output of these four countries is expected to show a considerable increase on last year, owing mainly to the good harvest in the United States and the bumper crop expected in Australia. In Canada production has dropped in the last twelve months, while the coming season's prospects in Argentina are poor. The acreage, it is believed, will show a 12 per cent reduction on the previous season, whilst the dry weather has made growing conditions unfavourable.

In spite of the increased output, the exportable surplus is likely to be some 10 per cent less than last season. The failure of the maize and oat crops in the United States has already made farmers turn to wheat as an alternative feeding stuff. In Argentina last season's wheat and maize crops were below expectations. The wheat outturn was first estimated to be between 240-250 million bushels, whereas the latest reports suggest as little as 221 million bushels. The third official estimate for the maize harvest gives a figure of 5,815,000 metric tons, compared with the second official estimate of 6,150,000 tons and the trade estimate of 7,000,000 tons. For Canada, Argentina and Australia, domestic consumption in the coming season has been assumed to be similar to last season's, but there are chances that it may increase.

Europe's position is even worse than Britain's. Of the Canadian exportable surplus of 200 million bushels, 160 million are already earmarked for the United Kingdom under the wheat contract, leaving only 40 million bushels for the "free" market. And again, of the 120 million bushel surplus in Australia, Britain expects to buy some 55 million bushels. Assuming that all Argentina's exports come on to the world market, "free" supplies of wheat from the four main exporting countries will total only 365 million bushels, or under 10 million tons. This year's European harvests have been bad and all grain stocks, except perhaps in Britain, are low. The main hope is that the winter will be mild; even then it is difficult to see how Europe can possibly live through the coming months without suffering

increasing hardship. And the scale of hardship will be so vast that a few emergency grain shipments from a conscience-stricken America will be of little avail.

Five-Year Plan for Electricity

The manufacture of electricity generating equipment has the highest priority in the allocation of manpower and materials for capital investment. Whatever capital projects have to be postponed to speed production for the export drive, generating equipment for the electricity undertakings is not likely to figure prominently among them. Despite this priority, the gap between the plant extension programmes and actual deliveries to domestic undertakings remains disturbingly wide.

Plans have been approved and work is in progress on 6 million kilowatts of additional plant which is scheduled to be installed by the winter of 1950. This week the Central Electricity Board has announced that programmes have been prepared for the years 1951 and 1952. The decision to plan five years ahead instead of for the customary four has been taken, says the CEB, because of the longer period required for completing and commissioning new plant. The Board has planned for an additional 3,923,500 kilowatts to be installed in the fourth and fifth years. Thus, for the whole quinquennium ending in 1952, a total extension of 10 million kilowatts is projected at a cost of about £450 million.

Such figures look astronomical beside the present rate of delivery of equipment. In the first seven months of this year, deliveries to electricity undertakings totalled only 90,000 kilowatts. It will clearly be difficult to maintain even the low level of deliveries reached in 1946, when net installations totalled 272,000 kilowatts. The delay in obtaining delivery has, of course, been partly attributable to the shortage of materials, especially steel, in the electrical equipment industry, and to the long period which must elapse between the starting of manufacture and the actual delivery of equipment. But it has also been due to an overhasty approval of orders for export, orders which must continue to occupy considerable fabricating capacity for some months yet. In the first five months of this year, of 354,000 kilowatts of delivered steam turbo-alternators of 10,000 kilowatts capacity or more, 209,000 kilowatts were for export.

The higher priority now given to orders for generating capacity for home use should ensure a substantial improvement in deliveries in 1948, but it is now obvious that those expected during the remainder of 1947 can make little or no impression upon the available power supply. Irrespective of how satisfactory coal stocks may be this winter, there will be a shortfall of 2 million kilowatts of capacity by comparison with peak demands for electricity. The gap can be closed in only two ways—by spreading the peak industrial load, or by electricity cuts.

The Invisible Stag

The long established but indefensible practice of swelling the volume of tagging of new issues on the Stock Exchange by the device of using fictitious names has at last to come to an end. An order issued by the Stock Exchange Council this week gives notice that any member of the Stock Exchange following or knowingly allowing this practice to be followed will be liable to be brought under disciplinary rules. Thus the small man's to be secured a large allotment of a promising issue by submitting a large number of separate applications is greatly narrowed, for few of the smaller fry are likely to be able to muster battalions of real persons as numerous as the unnumbered ghosts of bygone days. Not everyone is prepared merely to lend his name to an application for the benefit of the stag; and the stag himself will obviously find little point in subscribing for the benefit of real persons.

Yet this is not a *vale dicta* to the stag, who may perhaps consider himself lucky to enjoy as much scope as he does under the present regime of control. He is a timid but resourceful beast and no doubt there will be much canvassing for real names among friends and relations when next the business in new issues comes to life. It has been said, too, that the onus of preventing abuse of the ban will largely rest with the brokers, and some may find it difficult to avoid innocent connivance in the matter.

Decline in Empire Wool Stocks

The first post-war season of free wool auctions will certainly be recorded in the woolgrowers' annals. Prices for the better

qualities have been steadily rising; the increase in fine wools was as much as 75 per cent, although quotations for medium and coarse crossbreds have been only a little above their reserve prices. The Joint Organisation which is responsible for the orderly disposal of the Empire wool stocks accumulated during the war has also had a successful season. The net offtake from stocks was 1,271,000 bales; thus more than half the stockpile has been sold within two years, in contrast with the original estimate that disposal of the 10½ million bales would take thirteen years. The annual reduction in stocks is shown in the following table:—

Stock at	Australian Wool '000 bales	N.Z. Wool '000 bales	S. Africa Wool '000 bales	Total '000 bales
30 July, 1945.....	6,796	1,777	1,834	10,407
30 June, 1946.....	3,789	1,425	572	5,786
30 June, 1947.....	3,076	1,092	347	4,515

South African wool, being mostly merino, found a ready market, and existing stocks are equivalent to about half a normal season's clip. Sales of Australian wool have also been large, and the 6,800,000 bales held at the end of the war have been reduced to 3,100,000 bales, or approximately one season's production. New Zealand wool, being generally of inferior quality, has not fared so well, and the current stock is about 10 per cent more than a year's output.

Actual sales made by the Joint Organisation totalled 1,427,637 bales, while the quantity of wool bought-in amounted to 193,876 bales, consisting almost entirely of carbonising and medium crossbred wools of average to inferior style. The JO purchases of offerings which failed to reach the reserve prices comprised 108,000 bales from New Zealand, 64,000 bales from Australia and 22,000 bales from South Africa; they were confined almost entirely to the Dominion auctions where the bulk of the new clip was offered. Purchases at auctions in the United Kingdom amounted to 231 bales.

In the following table an attempt has been made to break down the current JO stocks according to counts. The delimitation of each group is not exact, but the figures give a reasonable guide to the present composition of the stockpile.

Over one-third of the total consists of merino type wool (60s and above), largely Australian, but of these 1,653,000 bales nearly a million consists of medium to heavy burry or carbonising wools. And it is these types which are not in great demand at the moment, buyers preferring wools free from burrs and fault. Inferior wools account for another 1,500,000 bales, including

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2.

Next week's issue of *Records and Statistics* will contain the Annual Review of British Insurance.

South African natives and karakuls. Thus, out of the present existing stock of 4,500,000 bales, some 2,500,000 bales consist of wools for which there is no ready sale. More than half the stock is located in Australia and a little over 1,000,000 bales is in the United Kingdom. But it is probable that wool will be transferred from the Dominions for sale in Britain during the current season should that prove to be a more profitable method of marketing.

* Carbonised. † Slipped.

Demand in the present season is still firm and buying is likely to remain selective. The wool textile industries in western Europe have made a remarkable recovery; the Dutch industry is operating at about 40 per cent above pre-war level and the Belgian about 10 per cent above, while the French has recently surpassed the 1938 figures. Stocks in these countries are high—about nine months' supply compared with six months' before the war. But if activity is maintained there is unlikely to be any slackening of demand for raw material.

Anglo-Argentine Tramways

Speculation about the future of British assets in Argentina shifted this week from rails to tramways and has generated quite a burst of frothy excitement in the Stock Exchange. Cabled rumour has pushed matters to the point of naming a figure of £11½ million to be paid by Argentina for the holdings of the Anglo-Argentine Tramway Company in the Buenos Aires Trans-

port Corporation, which the company acquired in 1938 in exchange for the surrender of the physical assets and operating rights. When subsequent calculations showed this to be a generous sum by comparison with the market value of the company's quoted stocks—about £4,000,000 before the report—some fertile minds in London tried to add credence to the tale by suggesting that the sum embraced also companies such as Buenos Aires Lacroze Tramway and Buenos Aires Towns and Docks. Then the future of Buenos Aires Central Railway became an obvious talking point. All this was good fuel for the bulls in stocks of the companies concerned in the railway take-over scheme proper. The issues of Anglo-Argentine Tramways rose as much as 25 per cent on Monday, although reacting later, and the whole market was afire.

Yet in fact no deal has been concluded, and the report has been denied from Argentina. Ever since last May, representatives of Anglo-Argentine Tramways have been negotiating with the Argentine Government, but no agreement has been announced so far. Now it is feared, at least from the British side, that the rumours may prejudice the outcome of the talks. It is difficult to avoid the impression that many of the reports which circulate on the subject of the payment for British assets in Argentina are specifically directed towards the stock market. Rumour, counter rumour, speculation and denial seem to follow in an inevitable sequence, and they invariably produce swings of prophetic dimensions in market prices.

Shorter Notes

An increase of 3s. 6d. per ton in all kinds of cement which will come into force on September 15th is due to the current rise in coal prices and railway rates, to both of which cement costs are particularly susceptible.

The Ministry of Transport proposes to carry out the 10 per cent cut in fuel consumption of goods vehicles on October 1st by issuing to each driver 90 per cent of the rate of the issue in the previous period, with supplementary issues in exceptional cases. Applications and vehicle records will be scrutinised. The first issues will be for four, eight or twelve weeks, but the normal rationing period will later be twelve weeks. On October 29th a new type of "X" coupon will be introduced, on which a signature will be required in exchange for petrol; the intention being to discover the identity of those who wrongfully dispose of coupons.

In announcing that 20 clothing coupons would be available for the ration period of five months which begins on October 1st, the Board of Trade adds that the continuance of the same rate for the six months following March, 1948, would depend on a 10 per cent increase in textile output.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the Records and Statistics Supplement. Notes on the following company reports also appear in the Supplement: International Tea; Fairley Aviation; Staveley Coal and Iron.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be paid at the earliest date.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (n) Net yields are calculated after allowing for tax at 5% in the U.K. (f) Flat yield. Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 1.6 per cent.) (i) To latest redemption date. † Free of tax.

Beverley Minster

CENTURIES OLD ABBEYS, churches, castles, mansions of imposing exteriors... furnishings and decorations, priceless heirlooms of craftsmen of the past—these are the historic background of the Yorkshire of to-day with its thousands of craftsmen skilled in so many trades.

This tradition is to be seen throughout Yorkshire, among its people, in its cities and towns, in its industries, and is the solid foundation upon which "The Yorkshire Post" is established.

Owned, edited and published in Yorkshire it is indeed part of Yorkshire life, yet with that breadth of outlook which causes its viewpoints to be studied and quoted throughout the world.

LONDON TRANSPORT provides passenger transport services over an area of 2,000 square miles. This area stretches 58 miles from Aylesbury, beyond the Chiltern Hills, to Gravesend, where ocean-going liners pick up their pilots—and 65 miles from Baldock on the Great North Road to Horsham in Sussex. It is only one twenty-fifth of the area of England, but within it lives nearly a quarter of its population. These people travel more than any others in the world. London Transport is fully aware of its responsibilities, both now and in the new London that is being planned. It is proud to be **AT LONDON'S SERVICE**

Where does INFORMATION end and Propaganda begin?

IT WAS A shrewd sense of propaganda values which named Britain's wartime propaganda ministry a Ministry of Information. Do we not, in this country, profoundly distrust propaganda? Is it not something practised by unscrupulous foreigners, which shrouds fact in veils of fiction, and distorts or suppresses truth?

We like to think that we tell just the plain truth.

Inconsistently, however, we like it much better when it is told well. "We shall not flag or fail, we shall go on to the end..." moves us far more than the mere meaning of the words. "And gentlemen in England now a-bed shall think themselves accursed they were not here..." gives us truth as we would really have it—magnificently.

Information can only be facts. But when we set out to register facts, with an audience, we should ring the bells of Heaven.

Shakespeares and Churchills arise but rarely: the need to expound and persuade, daily. It is wise to recognize that, in general, the business of presenting truth persuasively must depend upon a developed skill. And this skill is a product of exhaustive study of people—their habits and preferences and the secret springs of their hearts' desires; it comes from long acquaintance with the responses of people (different kinds

of people, all kinds of people) to different stimuli; it requires the expert employment of creative imagination and of the arts in applying those stimuli; and, above all, it depends on a technique of planning.

The perfection of a Technique of Planning has been the constant concern of the J. Walter Thompson Company throughout the 83 years of its history. As applied today, that technique unswervingly ensures that advertising based on it is aimed at the centre of the target. . . . It does not often result in "campaigns" which the public admires, or laughs over, or is even aware of as campaigns. People seldom say of a J. Walter Thompson advertisement . . . "How clever!" They often do what the advertisement suggests they should do.

A Director of the Company will be pleased to talk to you about the application of JWT's Technique of Planning to any problem of persuasion. J. WALTER THOMPSON COMPANY LTD. 40 Berkeley Square, London, W.1. (Telephone: Mayfair 9496.) And 29 offices abroad, serving the United States, Australia, Canada, South Africa, India, Argentina, Brazil, Chile, Mexico. The JWT office in Belgium has been reopened: for the present, 12 correspondent offices cover other European countries and Egypt.

Seven o'clock—and all's well with this young traveller and his mother. What a story she could tell as they sail over the seas on the wings of a great Short flying boat! It is a fine ship which skims off the water like a bird and flies through the clouds—so serenely—to land as gently on the other side of the ocean.

Dinner is served—upstairs in the dining saloon. The generous hull of a Short boat permits roomy arrangements on two decks, with cocktail bars, lounges, or other amenities. The passengers enjoy their dinner with that grateful sense of well-being that comes from flying "over the sea in ships."

This year, next year—some time it will be your turn to travel. Enquire from your travel agent, then, the routes served by Short flying boats. At present they include U.K. to Africa, India, China, Australia, and New Zealand, as well as services in South America.

It's fun to fly by flying boat!

STOPPED—FOR REPAIRS

Water can be a major nuisance to industry for it may cause scale deposits or corrosion which reduce efficiency in heating and cooling systems or block the main supply.

The introduction of minute quantities of 'Calgon' (sodium metaphosphate) into industrial water systems is now a recognised way of preventing scale formation, corrosion, and the troubles which follow in their wake.

In dramatic contrast to the caravan trails of comparatively recent memory, the Bristol Freighter conquers difficulties of terrain and distance, transporting in its capacious hold up to five tons of merchandise. The speed, safety and economy of the versatile Freighter have been proved throughout the world in a series of demonstration flights which included a 21,000 miles tour of the Middle East . . . flights which show that this aircraft, and its 36 seater passenger counterpart, set new standards in common-sense design and superiority of construction

THE BRISTOL AEROPLANE COMPANY LIMITED

COMPANY MEETINGS

THE BURMAH OIL COMPANY, LIMITED

MR ROBERT I. WATSON'S STATEMENT

The forty-fifth annual general meeting of the members of The Burmah Oil Company, Limited, was held on Friday, September 12, 1947, in the Merchants' Hall, 30, George Square, Glasgow.

Mr Robert I. Watson, chairman and managing director presided.

The following are extracts from the statement by the chairman which was circulated with the directors' report and accounts.

Rather than delay the payment of a dividend by literal adherence to the normal and correct practice, resumed only last year, of merely recommending the final dividend on the Ordinary stock, your board decided to return, at any rate for this occasion, to the war years' procedure of declaring a second interim with a recommendation to this meeting that this be the final for the year. The two interim dividends respectively of 2½ per cent. and 10 per cent. less tax thus leave the dividend for 1946 unchanged at 12½ per cent.

PROFIT AND LOSS ACCOUNT

Trading results for 1946 show a drop of £1,165,437 on those in respect of 1945. In my statement last year I indicated that with the cessation of the military demands, which reached their peak in India in 1945, and continued controlled civil demand there we must expect a considerable falling off in trading results. This, together with a smaller sum available in respect of previous years' adjustments, accounts for the fall in profits of our Indian trading subsidiary, which is the main source of our trading revenue. Our Burma trading subsidiary recommended operations in Burma on April 1, 1946, with imported oils and has made a welcome start in spite of the damaged and unsettled state of communications throughout the country and deficiencies in storage and other equipment which we would normally regard as essential for the trade.

Investment income is up by £273,904 and with a small increase in Transfer Fees credits aggregate £3,133,887. Total debits amount to £661,723, and thus the balance of profit for the year amounts to £2,472,164. Adding the amount £459,530 brought forward from last year, the disposable sum becomes £2,931,694, out of which the board has allocated £350,000 to General Reserve, bringing this reserve up to £4,350,000, and, after providing the Preference and Ordinary stock dividends, £2,017,064, and the further addition to Provident Funds of £94,345 consequent on the latter, we are left with a balance of £470,285, an increase of £10,755, which the board recommends should be carried forward.

THE BALANCE SHEET

Turning to the balance sheet the main change is a reduction of some £6,300,000 in Government Securities accounted for partly by an increase in the advances to subsidiary companies, mainly those operating in Burma, amounting to £2,100,000 and partly by some repayment of loans received from our Indian trading subsidiary, reflected under the reduction in "Amounts owing to Subsidiary Companies" on the liabilities side of the balance sheet. The reduced amount shown as accrued dividends from wholly owned subsidiary companies is of course due to the lesser amount already referred to available as trading surplus from these companies.

With the re-entry of our operating and trading companies into Burma on April 1, 1946, we have considered this a suitable time to segregate in the consolidated balance sheet the expenditure on capital assets including stocks of stores, products, etc., of

these subsidiaries as represented by the *ad hoc* book values at the time of denial in 1942 from the expenditure on similar items incurred since April 1, 1946, and thus show clearly the measure of our new investment from this date. The book value of the denied assets is £2,927,536, and as you will see this has been offset by a like amount transferred from the War Contingencies Reserve created in 1942, leaving the latter reserve at £472,464.

WAR DAMAGE AND DENIAL CLAIMS, BURMA

Official assessment of our denial claims for replacement of destroyed assets (which claims are of course in no way related to the book values referred to above) has been considerably interfered with by the unsettled conditions in Burma on which I have already commented and there is still no definite information as to when this work will be completed and settlements made to ourselves and others.

RECONSTRUCTION IN BURMA AND GEOLOGICAL AND GEOPHYSICAL SURVEYS AND FIELD DEVELOPMENTS IN INDIA AND BURMA

Despite this unsettled issue and despite the many uncertainties inherent in the constitutional and political changes in Burma and India consequent on the transfer of power from this country on the completion of its mission to lead their peoples to manage their own affairs and thus to complete independence under a democratic government, the company's subsidiary and associated companies in both countries have been steadily demonstrating their publicly expressed professions of belief and confidence in the security of, and a square deal for their continued operations under the new governments. In Burma we have not for a moment hesitated over, or delayed in any degree the measure of reconstruction of our producing and refining activities already long ago decided on. The target we have set ourselves has been determined by the best assessment we could make of what remains of the already proved resources and of the period over which we might expect to extract them consistent with sound practice. The raising of that target will depend on our success or failure in discovering new sources of production and, notwithstanding the lack of encouragement which has dogged our past efforts in that direction both in Burma and in India, we have large and costly programmes already beginning to develop in the field not only to clear geologically exposed and suitable structures still waiting for the final verdict (for the great bulk of exposed structures have already, over the years, been weighed up and found wanting) but to finish the extensive geophysical surveys of both countries which we started shortly before the war and which it interrupted. Given the official sympathy and support which our nation building activities of the past in India entitle us to expect from the new governments there, we possess both the will and the resources to make India as we made Burma independent of imports of petroleum if further petroleum is there and is physically get-at-able in such considerable quantities. Her weakness in that respect remains both our regret and our stimulus.

Reverting to the programme of reconstruction in Burma, perhaps I need not, but I am still going to remind you that the present company and its predecessor have been securing their Burma production since 1886 broadly from two areas only, that is from Yenangyaung and Chauk, the latter field being brought in by us in 1902. By American methods, of at any rate the not very remote

past, these fields would have been exhausted long ago and, although they have been carefully nursed and scientifically produced, the years of production remaining to them, to say nothing at all of profitable and economic production, are clearly numbered. The resumption of our activities in Burma in all the uncertain conditions I have touched on is therefore something more than merely an act of faith. It is a recognition of the basic origins of this great and successful company and a gesture of our goodwill to Burma and of our active help and good wishes for her successful rehabilitation. We shall make our own contribution a success if the elements of success are there, but we shall need and shall expect the wholehearted assistance of government and people in our efforts. Every economy in operation which is possible, the use of the most efficient methods of production and of refining, and outlets in the nearest markets on fiscal conditions at least not inferior to those of the past seem to be essential. We can promise the first two. As to the third, Burma will still have exportable production and, just as in the days of British Imperial Government, the new Governments in India will no doubt carefully weigh the possible strategic advantages of that surplus accessible, if need be, over a land frontier against the fiscal consideration necessary to preserve it—at any rate as long as she herself is almost entirely dependent on sea borne supplies of petroleum.

Consequent on my retirement your board has decided to appoint as from January 1, 1948, Sir Kenneth Harper to be chairman of the board and joint managing director with Mr. W. E. V. Abraham.

The report and accounts were unanimously adopted.

The second interim dividend of 10 per cent. (2s. per £1 unit) paid on June 27, 1947, was confirmed as the Final dividend on the Ordinary stock for the year 1946.

The proceedings terminated with a vote of thanks to the chairman.

METAL TRADERS, LIMITED

ALL ROUND INCREASE IN ACTIVITIES

MR FRANK BAER'S STATEMENT

The twenty-seventh ordinary general meeting of Metal Traders, Limited, will be held at the registered office of the company, 7, Gracechurch Street, London, E.C.3, on 24th instant.

The following is the statement by the chairman, Mr. Frank L. Baer, circulated with the report and accounts:—

The statement and accounts for the year ending March 31, 1947, which I have the honour to submit, covers the first full year's trading since the cessation of hostilities.

It will be observed from the accounts that there has been an all-round increase in our activities, which was indicated to the stockholders by our having declared an interim dividend in September last.

PROGRESS OF SUBSIDIARIES

Metal Traders, Inc., New York, have had another satisfactory year.

In submitting the accounts a year ago I ventured to indicate that the outlook for our two other subsidiary companies was favourable, and this is fully borne out by the balance sheets which we publish, as has been our practice now for some years.

Brookside Metal Company, Limited, have done, and continue to do, a large and profitable business.

L.P.C. Lead Pigments and Chemicals, Limited, have also had a successful year with

164805
X 100,000
0.43.15.3

a considerable expansion of their business. It will be seen from that company's balance sheet that its authorised capital has been increased to £50,000. The present subscribed capital of £2,000 is out of all relation to the company's current business, and we propose to take steps in the early future to increase the subscribed capital to £25,000. This will be done in conjunction with certain business friends who will participate, resulting in our holding 75 per cent. of the issued capital. This adjustment will appear in our balance sheet at March 31, 1948.

NO RELAXATION OF CONTROLS

The last twelve months have seen no relaxation of the control of the activities of non-ferrous metal merchants in this country. Indeed, I have watched with apprehension the deterioration of London as the centre of the metal world, and consider this to be the direct result of the new economic doctrines imposed upon this country's trade and industry.

During the cotton debate the President of the Board of Trade told the House of Commons a number of things which came as a great surprise to us and no doubt to many others engaged in trade. For instance, on the subject of the services rendered to trade by cotton merchants I learned that "a large buyer can provide those services more cheaply." And again: "A large buyer can very often buy more cheaply, especially if he can buy for a period of time." It should by now be apparent to all that this has not been borne out in the case of the bulk purchasing of non-ferrous metals by the Government.

PRICES AND BULK PURCHASING

It was argued that bulk purchasing must take the place of a free market when there is a shortage, because otherwise there would be a scramble for the short commodity with resultant high prices. For this reason the terminal market in non-ferrous metals, which was closed at the outbreak of the war, remains closed. The advocates of bulk purchasing claimed that their policy would result in more stable and less extravagant prices than would be the case in a free market. That their policy was, and is, far from sound and well-considered may be observed from a study of the increases, shown in our last report, in copper, lead and zinc prices, reaching in July, 1946, the following peaks: copper, £84; zinc, £50; lead, £55; and from the fact that these peaks have now been left far behind and at present stand at: copper, £132 after £137; zinc, £70; lead, £90.

MERCHANTS OR SPECULATORS

I still believe that a free market would not have produced more extravagance and at least would have secured a fuller measure of supply to this country.

The President of the Board of Trade, I regret to say, does not seem to hold a high opinion of the "merchant" as such. During the cotton debate, for instance, he referred to the "merchants and speculators" although no mention was made of the ratio of the one to the other.

I can assure our Stockholders that the management of this company have at all times tried to eliminate the speculative element in our business and that with the judicious use of the facilities of the London Metal Exchange when it was open, we were definitely successful in our endeavours.

The men whom I would designate "speculators" are those who are wilfully throwing away the fruits of the honest trading reputation of the City, built up over a period of years of prosperity for many, for the sake of a fanciful picture of future prosperity for all.

I would like to place on record the directors' appreciation of the loyal support throughout of the management and staff which has contributed materially to the results achieved.

INTERNATIONAL TEA COMPANY'S STORES, LIMITED

RECORD TRADING PROFIT

The annual general meeting of the stockholders of this company will be held in London on 7th proximo.

The following is an extract from the annual review by the chairman and managing director (Mr. Guy Collier), circulated with the report and accounts.

I feel that, bearing in mind all the difficulties of trading, the stockholders will consider the result satisfactory. The most important to the stockholders is the trading profit which, at £1,079,795, is a record in our long history.

SHORTAGE OF MANY COMMODITIES

During the whole of the period under review, April, 1946-April, 1947, there was a shortage of many commodities, and towards the end of the financial year we were faced with the fuel and power cuts, which affected not only our own factories, but the output of many of our suppliers, on whom we rely for a number of products which we distribute to the public.

The increase in the trading profit is due to one factor, and one factor only—namely, additional registrations. As I have said, there were shortages in supplies throughout the year, and yet it is reasonable to assume that our customers and the purchasing public in general appreciated that during and since the war we had done the best we could for them in difficult and trying circumstances. The number of customers registered with us has increased, until the latest census of registrations taken at our retail branches discloses the fact that our present figures establish another record.

I think it is necessary for someone with a knowledge of the food trade to make quite clear, both to the Press and to the public, the exacting regulations governing food distribution. Comments on the trade appear in the Press from time to time and I am afraid that they sometimes give a wrong impression.

There is a very small percentage of goods in which we trade, where the selling prices are not fixed, but it must be apparent that they could not be sold at prices in excess of those charged by our many competitors. I feel it necessary to deal especially with this subject as the public generally is apt to accept the suggestion "too high prices" without giving thought to, or having knowledge of the true position.

DISTRIBUTION OF PROFITS

The directors are recommending a final dividend of 11 per cent., making 16 per cent. for the year, which I am sure the stockholders will appreciate. In my review last year I drew attention to the fact that the Ordinary stock in this company is spread over a very wide number of investors, the average holding then being £86 5s. 9d. The position is roughly the same now. To these remarks I would add that a large number of the stockholders are either employees or customers of the International and its associated companies, who have put a part of their savings into an undertaking, of which they have, to say the least of it, some personal knowledge.

In these difficult times, in a world situation such as we have never been called upon to grapple with previously, it would require a brave man indeed to venture any prophecy as to the current year's results. I certainly am not going to be drawn in that direction. The administration of your company is second to none, and I have no hesitation in saying that, whatever the conditions, we shall present to you results which will bear comparison with those produced by any other business in our trade.

SILENTBLOC LIMITED

INCREASED PROFITS

The 12th annual general meeting of Silentbloc Limited, was held on the 17th instant, in London.

Mr. H. Vezey Strong (the chairman) said that the trading profit for the year ended May 31, 1947, having risen from £75,166 to £81,947, the net profit at £34,251 showed an increase of nearly 30 per cent. on that of the preceding year. The directors recommended the payment of a final dividend of 4d. per share, less income tax. Current assets exceeded current liabilities by £135,506, while fixed assets stood at £194,294 compared with £97,517 a year ago. Silentbloc Limited had had the good fortune to acquire a freehold property within a mile of its present location which would provide for the much needed expansion of the business and make for still greater efficiency of production. Their subsidiary, the Andre Rubber Company had also purchased from the Government all the buildings and machinery erected and installed during the war. As a result of those transactions the company was well placed to cope with the immediate requirements of the postwar period which tended to become rather overwhelming in their scope.

Their policy had always been to extend the application of their products far and wide and it was reassuring to know that they now catered for the needs of a large number of industries far beyond the automobile industry which had given them birth and with which they were still closely concerned to the extent of about 30 per cent. of the combined turnovers. The balance of business they transacted today with no less than 75 trades and industries all of which were satisfied users of Silentbloc and Andre products and, at a time like this, it was comforting to contemplate such a spread of risk, with a mounting demand from essential industries.

INTERESTING PROJECTS AFOOT

In his view and in that of his co-directors the prospects of the company were greater than at any previous time, for they had some projects afoot of more than usual interest. They had, for example, produced for use in the textile industry what were known as Condenser Rubbers. Those "Rubbers," hitherto always made in leather, were not only in extremely short supply, but had never had a sufficiently even surface to produce what the trade called "slubbing" or yarn free from "blebs." The Andre synthetic Condenser Rubbers for which patent application had been filed not only rubbed a perfectly even "slubbing," but they also rubbed it infinitely tighter than anything previously achieved in this country with any type of condenser rubber. Their subsidiary's lining and covering department, which was also one of the later developments, was becoming almost a business on its own account and in addition they had effected a promising entry into the printing industry. When he told them, therefore, that they had widened their scope, it would be appreciated what that might mean in terms of future sales and how important a part research played in their general scheme of things.

Turning to overseas activities, they were successfully nearing the end of some prolonged negotiations towards securing an interest in the U.S.A. and in Canada. They had entered into a new agreement with Mr. Leon Thiry, the Silentbloc patentee, for a long term under which they had secured certain American and Canadian rights, upon the exploitation of which they were actively embarked. The board believed that that and other agreements now in course of negotiation would prove to be a far reaching step forward in the history of the company.

The report was adopted.

GOVERNMENT RETURNS

For the week ended September 13, 1947, total ordinary revenue was £36,799,769, against ordinary expenditure of £38,284,780 and issues to sinking funds £130,000. Thus, including sinking fund allocations of £7,712,982 the surplus accrued since April 1st is £211,126,218, against a deficit of £467,241,293 for the corresponding period a year ago.

COMPARATIVE ANALYSIS

£ million		1946	
-----------	--	------	--

very far to ensure any integration of the metallurgical industries of Western Europe.

The real test of whether the Paris Report is more than a shopping list lies not in what it has been able to achieve for the present, but in what it promises for the future. Here again, it is necessary to remember the time-table. There is no undertaking, however qualified, to create a Customs Union. The principles to which the participants pledge themselves are very general. And even the promise to set up a permanent organ of co-operation had to be left, owing to the opposition of the "neutrals," in a rather ambiguous state. But could more have been expected in two months?

Much therefore depends on the energy and sincerity with which these fine-sounding phrases will be crystallised into actual policies in the years to come. Some European tongues no doubt were in their cheeks. But the Americans will take these statements of principle, and the continuing organisation, very seriously. They constitute the *quid pro quo* on the strength of which Congress is to be asked to vote very large sums of money. There will unquestionably be attempts in Washington to turn vague principles into precise conditions, and those conditions will be enforced. The attempt to enforce conditions might, of course, ruin the whole proceeding, if the conditions were unworkable, as those attached to the British Loan were, or if they intervened in party politics, as would a demand for a halt in nationalisation. But any European who is tempted to argue that there must be no conditions at all had better think again. There certainly will be conditions. What is to be hoped for is that Congress will choose wise conditions. And Europeans, on their side, should realise that they will never achieve unity without external pressure of some sort and that there are many forms of external pressure that would be very much worse.

But what do the Americans regard as wise conditions to impose? It is here that the ITO charter becomes relevant, for there is no doubt that a steady movement towards it will be the prime condition. Both the provisions of the Charter and American ideas about how quickly it can be introduced have been much mellowed since the days when the loan to Britain was negotiated. The crucial point, as always, is the doctrine of non-discrimination. In the Charter, it is hardly to apply at all for five years, there are exemptions for trade between a mother country and its colonies, for discriminations that are part of a plan of development, and for action taken by countries in difficulties with their balances of payments. These exemptions (which replace the provisions of the Loan Agreement) should remove most of the harms that the former rigid doctrine of non-discrimination has already begun to do.

But surely something more is required of an inspiring

doctrine of human salvation than that it should be deprived of all possibility of doing harm. What one searches the Geneva Charter for, and searches in vain, is a positive principle. It is perfectly true that no solution of the world's economic problem is thinkable without freer and more rapidly expanding trade or without fuller scope being given to the advantages that can spring from the division of labour. But it is really not possible any longer to believe that the mere removal of barriers will achieve the result that is desired. Some positive effort is required and an opportunity has been missed to say what it might be, to list not only what it is wrong for nations and their governments to do in the field of international trade but also what it is right that they should do.

Much the same can be said about the other great prescription that America is urging on Europe, that of fiscal reform and balanced budgets. It is necessary enough, in all conscience. Without confidence in the currency, all economic reconstruction is vain. But, again, is it possible to believe that fiscal reform by itself will achieve very much? What, for example, does it contribute to the great economic problem with which all Western Europe is faced—that of securing enough saving and capital creation to ensure economic progress without permitting an intolerable inequality of wealth?

So the major reflection with which the reader of these two documents is left is a melancholy one. The American intervention in Europe may, indeed, attain its primary object: Europe may be preserved from starvation, economic collapse and political insanity. And that will be much cause for gratitude. But where shall we be then? Simply back where we were before. The element in the Marshall proposal that aroused so much hope earlier in the year was the suggestion it made that Europe's present extremity could be used as a lever to create something better and stronger and firmer than existed before. But those hopes are diminished. The Western European nations find it very difficult to rise above their national preoccupations. And the price that America asks them to pay for the aid they are to receive is adherence to a set of principles which, in a European context, are almost wholly negative.

Western democracy, on both sides of the Atlantic, in short, is still trying to fight Communism with little but nostalgia to offer in its place. What Marshall-cum-Clayton offers, if all goes well is to get back to the mixture as before, and though that would be something achieved compared with the frustrate chaos of today, it is difficult to see in it anything that will create the economic or (what is perhaps even more important) the social, political and moral *élan* needed to restore real productivity and real social stability or to withstand the perpetual hammering of Communist opposition. The initiative has not yet been seized for twentieth-century liberalism.

Must Uno Split?

THE Soviet Union is still a member of the United Nations, although a week ago Mr Vishinsky treated the General Assembly to a tirade which sounded in parts like a defiant farewell. Indeed, on the main issues now before it Mr Vishinsky need hardly speak again, for that speech had everything: the main heads of indictment against the West, all the grievances, all the suspicions, everything except what everyone wants to know—the real motives of Russian policy. It was utterly unconstructive, blatantly unco-operative; its self-righteousness was frightening. It offered for the rest of the Assembly's session no prospect save that of bitter wrangling over problems which demand action, but which can be dealt with only in defiance of a Soviet delegation voting in a perpetual minority.

Nothing could seem at first sight more futile, but it is a vital Soviet interest to remain in the United Nations, to cripple

the Security Council by delaying tactics if it tries to act against Soviet or satellite policies, to widen its jurisdiction if that will embarrass the Americans or the British, to build up its prestige as a rostrum from which a nervous and irritable world can be addressed in ideological terms. At Lake Success and Flushing Meadows a picture can be built up of a world hostile to Russia which is transmitted, with every appearance of truth and completeness, to the Russian people and to Communist parties all over the world. In this political strategy the veto is of course the key weapon; and it is at the use made of it by Mr Gromyko on twenty different occasions that Mr Marshall's present operation in the "cold war" is aimed. That is why Mr Vishinsky's counter-attack was so violent, and why, in a speech lasting an hour and a quarter, less than four minutes were given to the American proposal that the Assembly

should form a standing security committee to consider disputes and dangerous situations.

Yet this American proposal was something more than a dramatic and unexpected move in the diplomatic attack that began last March with the proclamation of the Truman Doctrine. It expressed very fairly the sense of impatience and frustration among the vast majority of Uno delegations caused by the way in which their own recommendations and those of a majority of the Security Council had been flouted—not only in the case of the Greek frontier situation, but also in the cases of the atomic energy commission, of the general disarmament resolution of last December, of the recent applications for membership and of the discussions on Uno's international force. They have seen no progress in any direction, nothing but success for systematic obstruction. The equality of sovereignty promised them in the Charter—on occasions eloquently defended by Soviet spokesmen—has turned out to be no more than equality of impotence. The fact that the Soviet Government can count for certain on no more than five votes against 45 or more in a major issue and yet get its own way seems to them a travesty of Uno's function. And so it is. Are the members of the Assembly then to cross their fingers and hope that time will bring them a solution and their rights? Or are they to take sides in the American-Russian duel and try to make the international machinery work before it breaks down at the first major test?

★

The answer is obvious and, whatever may be thought of the timing and manner of Mr Marshall's lead to the Assembly, he was right to give a lead. That he was acting as an American statesman first and on behalf of the General Assembly second need not affect judgment on that question, because in many important respects the interests of Uno and those of the United States are identical. All the main benefits that the organisation was intended to provide would further the permanent purposes of American policy: security through international forces, arbitration in disputes, international co-operation in commercial policies, social stability and prosperity. And it is because of Russia's manifest unwillingness to help in assuring such benefits to postwar Europe that the Americans began playing—with reluctance and foreboding—the role of a European Power. If Mr Vishinsky cannot believe this, he should ask himself what accounts for the tremendous difference between the foreign policies of the United States in 1945 and 1947, or what ideas and fears have made it possible for Mr Marshall in eight months to stride so far ahead of Mr Byrnes.

Unfortunately, it looks as if the judgment of Mr Molotov and his assistants is permanently clouded by an obsession: by the dogma that Western Europe is doomed to decrepitude within their lifetime by the diseases of the capitalist system, that its banker and patron, America, is doomed to a slump, and that both victims will grow desperate and dangerous as they feel their symptoms growing on them. Whence it follows that it is good policy to aggravate the symptoms by all possible means while taking every precaution against the reactions of the victims. Russian hostility to and fear of the West has behind it a long tradition based on some bitter experiences. How tempting it must be to believe that at last the monster is dying, that its end can be hastened without using the sword. The same ideas can be presented in Marxist terms, but it is fairer—to men as intelligent as the rulers of Russia—to believe that their hopes and fears are rooted in their national experience and not in foreign doctrine. And it is only on such an assumption that one can explain both Mr Stalin's repeated assertions that the Soviet and the capitalist systems can live side by side in peace, and also Mr Molotov's obvious belief that they cannot.

Here probably lies the root of the trouble, not only in Uno but in Europe. And it was one of the few good features of Mr Vishinsky's speech last week that it provoked Mr McNeil into

a candid and polished analysis of the trouble. Provided with very clear and firm instructions from London, Mr McNeil presented a cool, intense and elegant argument which made Mr Marshall sound a little ponderous and colossal, Mr Vishinsky more than a little vulgar and hysterical. He denounced as "nostalgic nonsense or dangerous dishonesty" the pretence that the company of nations that fought Fascism still had today the common aims it had in the war. Relations, Mr McNeil declared, could not begin to be normal until they had achieved with Germany and Japan a "real, responsible and rational settlement"; nor indeed until all nations accepted "several assumptions that are beyond dispute." Those assumptions are that no nation is omniscient or omnipotent, and that "no nation can expect to have its views accepted at all times by other nations." Here Mr McNeil put his finger on the fundamental misunderstanding; for, if the Russian analysis of Europe's sickness and of America's prospects is correct, everything that has been done in Soviet policy since the war must seem in Russian eyes not only wise but right. And, what is more important, that policy was scoring success after success until Mr Marshall called a halt. In other words, the condition of reaching understanding with the rulers of Russia is a demonstration that there will be no more successes and that their analysis is wrong. Quite clearly those are the two main objectives of American foreign policy, of the Truman Doctrine and the Marshall Plan.

It is unfortunate that public opinion in the United States has had to be aroused to support them by actions and words which have created heat where only warmth was required. Much is being said and written there which must read like "warmongering" to any Russian official who has placed on his desk a daily digest or clippings from the American press. Digests of the Russian press and radio comment give exactly the same impression, and were already doing so many months ago, when American policy was hesitant and confused and when friendliness in Britain towards Russia was widespread and politically important. Even now it is inconceivable that Moscow is not informed by its diplomatic representatives of the eagerness with which press and public seize on hopes of a trade agreement, on a report that Mr Molotov smiled at Mr Bevin, on an opportunity to entertain rare visitors from Russia.

It is the refusal to be conciliatory even for tactical purposes that is so bewildering, so impossible to explain save on the assumption that Soviet statesmen believe time is entirely on their side. The latest inexplicable achievement of this diplomacy has been to bring M. Bidault down on the western side of the fence, just at a time when he hoped to remain seated until the November conference.

In this situation it is quite clear on which side Britain must stand. Already it has been humiliated and frustrated by the Soviet use of the veto, and by "those unpredictable inconsistencies" of principle with which Mr McNeil charged Mr Vishinsky. The Corfu incident was shamefully mishandled; the Security Council has proved as impotent to deal with the Greek situation as was the League Council to resist the first Japanese aggression. The field of debate on Egypt and Palestine is already littered with irrelevancies. Mr Bevin's suggestion, made last December, that the Great Powers should agree on a code of conduct for their use of the veto has got nowhere. The men who organised the east European bloc and forced the Czechs and Poles to reject the Marshall offer now attack the Paris economic conference for its violations of national sovereignty. On this record Mr McNeill would have been entitled to bring no friendliness into his reply to Mr Vishinsky; instead he went out of his way to recognise the "legitimate aspirations" of Russia, to disavow any intention to "curb the extensions which it has legitimately sought."

It is also clear that the British Government must join in the struggle to stop the abuse of the veto, to make the machinery

of the Security Council work. Its interest in doing so is identical with that of the United States; neither nation wants to maintain large forces, to be forced to think in strategic terms, to abandon the hopes and pledges that went into the Charter of the United Nations. But, at the same time, any British Government must reserve the right to form its own estimate of the rightness and timeliness of the moves in Mr Marshall's present campaign. It must maintain a position from which it can remind the Secretary of State that British forces guard his flanks, that many vital British interests lie far ahead of the nearest American outposts. The American public, too, has to be reminded from time to time of the futility—if not of the dangers—of barking without the intention to bite—indeed, without the power to bite immediately, and in the right place. To find ways of securing even a slight change in Soviet policy may take years; the attempt may bring moments of danger and

sacrifice. At such moments Americans may falter at the prospects revealed by a check or a failure; or a run of successes in the "cold war" might make them over-confident and impatient. Both possibilities are dangerous, for in both cases the vital objective in relations with Russia, agreement on and the demarcation of vital interests, might be lost from sight. For in international affairs the policy of the United States is still not fully formed; it tends to fluctuate from one extreme to another, instead of pursuing a steady course. The British Government should not expect—it certainly cannot demand—to be consulted at every stage in Mr Marshall's diplomatic offensive. But it has the right, indeed the duty, to point out mistakes, even to avert and correct them, without incurring official and public reproach from Washington. Neutrality in the "cold war" is not possible for Britain, but an independent and persistent attempt to end it by a negotiated peace may be.

Agricultural Expansion

THE recent appearance of the agricultural statistics collected in June every year offers an opportunity for the re-examination of the Government's targets for agricultural expansion. If all goes according to plan, the history of agriculture over the twelve years 1940-52 will represent a remarkable picture of a see-saw climb to a record altitude of production.

There are downs as well as ups in this progress. The present year represents a trough between the peak wartime output of 1943 and the record target projected for 1951-52. It is a lower trough than was originally anticipated. Although the long spell of fine dry weather has enabled harvesting to make excellent progress, and the grain is mostly in good condition, the yield of every principal crop is likely to be below average (in the case of wheat well below average), and both the tillage acreage and the arable acreage, as revealed by the preliminary June 4 returns, show an appreciable decline on last year. The area under wheat has fallen far short of the original target and, with the exception of poultry, there is an all-round decline in numbers of livestock, which is especially serious in the case of sheep and lambs. The hay crop has been fairly good and the present abnormal shrinkage of milk production should be a temporary phenomenon. For the general melancholy picture the weather, in the shape of winter snow followed by summer drought, is of course mainly to blame. But the leeway to be made up towards the target is very great.

The goal to be reached by 1951-52 has not yet been stated with much precision in official pronouncements. Farmers have

been asked to expand net agricultural output (that is, the value of produce *ex* the farm, less the cost of imported feeding-stuffs) by 20 per cent or £100 million, half of which should come from "improvement in efficiency" at the rate of 2 per cent per annum and the other half from "additions to the resources of the industry." The statement as it stands makes little sense to an agricultural economist. But the meaning appears to be that for half the extra output, farmers are to rely on increased supply of labour and feeding-stuffs, while the other half must be brought about by their own exertions. Targets have also been set, as percentages of the prewar base, for the principal crops and livestock products. The crop targets gain more meaning (at the risk of receiving more precision than the Government intended) if translated into acreage terms as is done in the chart below. Yields per acre increased during the war, as a result of the improved application of fertiliser, and the reasonable assumption has been made that they are maintained at the 1943, rather than the prewar, level. On this basis, it emerges that the total grain acreage in 1951 in England and Wales will need to be very little less than its highest wartime peak, and ideally much the same should hold true of the total arable acreage. There will be less wheat and potatoes, but more barley, linseed, and temporary grasses.

The livestock targets, which are more important and more certainly justified, will be harder to secure. The possibility of compulsion, which could be reintroduced for cropping, hardly arises for livestock. To reach these targets requires a rapid

restoration of the decimated sheep flocks, a substantial increase in numbers of cattle, an improvement in milk yields, and something like a trebling of the pig and poultry population.

All in all, British agriculture is being asked to expand rapidly to a size which it never attained even in the prosperous seventies. It is doubtful whether the physical means of doing this will become available as quickly as the Government expects. Imported feeding-stuffs are again crucially scarce, although their supply should surely improve from next year onwards. Labour is the crux of the problem. There are still 78,000 prisoners of war working on the land who must shortly be replaced, yet the net intake of regular labour over the last year was only 10,000. There seems little immediate prospect of expanding the labour force—the immediate problem will be to keep it from declining. If Mr Bevan could bring himself to restore grants for the reconditioning of rural cottages, more labour might be quickly attracted. Something is hoped for from the recruitment of foreign labour, a great deal more from the displacement of workers in quarrying and other rural industries which are ancillary to the shelved national housing programme. But the Government has no positive plan for getting the labour which its targets presuppose.

*

There are thus grave physical scarcities to be overcome before the agricultural targets can be reached. But a more fundamental question, and a more basic source of doubt, is whether the Government is setting about its programme in the right way. The official policy is delightfully simple. It is to put more money in the farmers' pockets, in the shape of much higher guaranteed prices, in the confident expectation that they will at once respond by expanding output. The hook has been nicely baited; but will the fish rise? And, still more important, will the nation be permanently able to afford the cost of such a tasty bait?

For the Government should realise that its agricultural policy ought to be a long-term one, and not merely a temporary expedient for tiding over the foreign exchange problems of the next few years. Agriculture has an important role to play in righting Britain's adverse balance of payments. But it is a permanent role, which cannot be properly performed unless ceaseless regard is had to the declared objectives of the Agricultural Act—stability and efficiency. In concrete terms this means that it would be better by far for agriculture to expand slowly on a sure basis of rising efficiency than for it to be blown up quickly in a way that makes it a drag on the whole national economy.

Yet this is the likely effect of Government policy. The price increases which have recently been authorised are very considerable, amounting to about 15 per cent in the case of wheat, barley, oats, sugar-beet, fat cattle, fat sheep and fat pigs

and 10 per cent for milk and eggs. In addition, there are new acreage payments for wheat, rye and potatoes and for ploughing-up old pastures. The Minister will not reveal his estimate of the total additional cost involved. But, on the basis of the new prices, it certainly looks as if the 20 per cent increase in output (supposing it to be obtained) will involve something like a 40 per cent increase in the total cost of home-grown food—and that means 40 per cent further increase in an item that is already a long way above the prewar level. As a business proposition, this hardly sounds attractive. There are, however, various extenuating circumstances which need examination.

In the first place, the increased prices are intended both to cover in full the recent rise in wages and other farming costs, and also to put farmers in funds for purchasing machinery and making other improvements. They are thus intended to forestall claims coming from the National Farmers' Union over the foreseeable future. The glib way in which Mr Williams has been brought to agree, in practice if not in theory, to the cost-plus method of price-fixing has been commented on too often in these columns for any repetition to be necessary. Suffice it to say that this is a dangerous and pernicious principle. But the notion of inflating farmers' incomes to the point where the less efficient farmers can afford, if they choose, to make capital improvement is a novelty. It is the opposite of Socialist theory since it involves putting windfall profits into the pockets of some farmers *pour encourager les autres*. It is far more wasteful of the taxpayers' money than the method of giving direct subsidies for approved schemes of improvement and for the purchase of fertilisers and (if necessary) machinery, which is in every respect preferable. The direct subsidy method is already in use to some extent and is to be extended by grants for the proper conservation of grassland and by a temporarily free service of artificial insemination. Perhaps, in present circumstances, further direct subsidies are not worth their administrative cost. There will in any case be no shortage of demand for such capital equipment as is available to agriculture. Why then artificially inflate this demand? And, what is more, why inflate it in the least selective and most costly way possible?

In the second place, it is urged that "high farming" means higher average costs, a concept which seems to be cheerfully accepted by the National Farmers' Union. It is probably true, for milk and cereals at any rate, that on a national scale costs tend at the moment to rise with output. But this is just the contingency which the much talked of improvement in agricultural efficiency should be adequate to offset. It is by no means inevitable that costs should rise and in the long run, given sufficient capitalisation and attention to new techniques, a rising output should be perfectly compatible with falling costs. If, however, it is seriously maintained that the 40 per cent increase in price is a necessary corollary of the 20 per cent

A Capital Annuity!

part capital, part interest . . . £203 per annum guaranteed for ten years of which, on average, £185 is capital repayment and £18 is taxable interest . . . and, after the ten years, an annuity of £305 (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty-four for a present investment of £3,000.

EQUITY & LAW

increase in output, then the consumer or taxpayer (whichever is to bear the burden) may be forgiven for doubting whether even in present straits the bargain is worthwhile.

In the third place, it may be contended that higher prices must be offered now, to get expansion going, with the inner reservation that they may be brought down once it is under way. But this crude type of bribery is hardly the way to secure either stability or efficiency. Moreover, there is a residual doubt whether it will even work. The Government is going to give almost every farmer a reasonable profit on his present turnover. With the present dearth of incentives, will the farmer labour hard to expand production? Or will the law of diminishing returns begin to apply to his own efforts? In so far as the Government's programme depends upon the farming community working harder, its financial inducements are likely to have only limited effect; and in so far as it depends upon increased supplies of feeding-stuffs, machinery and labour, the difficulty is not one of finance but of availability.

Argentina's Two Faces

(By a Correspondent recently in Buenos Aires)

IN an article last week the apparent contradiction between Argentina's favourable trade balance and its rapidly deteriorating foreign exchange position was considered. Since external influences—and not least high prices for agricultural products—all favoured Argentina, the basic deterioration in the situation can only be explained by internal reasons, to which the immediate flight of capital must be attributed.

The three most important economic factors under the Perón Government have been, first, the enforcement or enactment of social and labour laws strengthening the position of the workers; second, the continued inflation; and, third, the concentration of much of the country's foreign trade in the *Instituto Argentino de Promoción del Intercambio* (IAPI).

Inflation, which produced a surplus of jobs and a consequent lack of fear of unemployment, has aggravated the effects of the labour laws. Coupled with provisions which make it extremely expensive for an employer to dismiss anyone and the feeling that, for the first time, there is in power a government which supports workers and not employers, these laws have contributed to the considerable fall in productivity, which is estimated at 30 per cent. The party appeal of President Perón—and perhaps even more of Señora Perón—has been to the underprivileged. "My dear *descamisados*" (literally "shirtless people") is the form of address to which they are accustomed. These tactics are perfectly legitimate politics. The Peróns are doing no more than any democratic politician when they make the most of what they have done for the working classes. Furthermore, most wise Argentines admit that the social legislation was overdue, and that other parties have only themselves to blame if the Peróns get the credit.

The reasons for the second important trend—inflation—are largely political. Each year the Budget contains heavy defence appropriations. If these were cut, it would be balanced. It would require a strategic expert to comment authoritatively on the need for such a vast programme of military works. To the ordinary intelligence the likelihood of an attack on Argentina by Brazil or Chile seems hardly sufficient justification; but it is certain that the support of the armed forces is normally an essential condition for the continuance in office of a Latin-American government. If a number of generals became redundant, they would become dangerous. Apart from this, a heavy expenditure on military construction allows the possibility of commission payments to buttress the loyalty of the higher officers. Finally, much of the defence expenditure is on a secret vote, so that

The state of the nation does not warrant a panicky attempt to get as much food as possible, as quickly as possible, quite irrespective of costs and consequences. It does most earnestly demand a progressive endeavour to raise by a parallel process both the output and the efficiency of British agriculture. Neither of these aims can be realised any faster than the physical shortages can be overcome, and for the present this is the problem to which the Government should direct its energies. As and when lack of finance handicaps the progress of re-equipment the remedy should be sought in a judicious use of direct subsidies. But to try and raise output by making bad farming pay is to risk creating costly inefficiencies which need never exist and whose existence will be a standing menace to the industry's stability. For if the expansion of agriculture is constructed on an unsound and costly basis, it will be dispensed with the moment circumstances permit; and if, as some say, that moment never comes, then it will be a perennial cause of national poverty.

the ultimate destination of the funds is not published and is not subject to parliamentary control. The cost of maintaining the armed forces as the second essential prop for the Peronistas is revealed in the figures of the Budget deficits:—

BUDGET DEFICITS (Million Pesos)				
1944	1945	1946	1947	1948
1,007	1,268	1,350	1,873	1,146

The estimated deficit for 1947 is equal to nearly 100 pesos, or about \$25, per head of the population. If the expenses of administration continue to rise and if, as was suggested in the previous article, there is a serious shrinkage in customs and other revenue through import prohibitions, then the deficit estimated for 1948 will be exceeded.

These continued deficits have been reflected in the supply of money, as the following table shows:—

MONEY IN CIRCULATION (Million Pesos)			
	Dec., 1944	May, 1946	May, 1947
Current Accounts	2,637	4,513	6,122
Currency in Hands of Public..	1,870	2,774	3,611
Total Amount in Circulation..	4,507	7,287	9,733

It will be seen that, in the period of two and a half years to May, 1947, the liquid money supply in the hands of the public—currency in the banks has been deducted—has more than doubled; even since May, 1946, when the flow of imports was beginning to mop up money, it has increased by 2½ billion pesos, or \$600 million, or \$32 per head of the population. The internal inflation has been such that neither the inflow of goods nor the flight of capital, which must have amounted to some 4 billion pesos, could stop the increase in purchasing power. It is small wonder that in the year ending July, 1947, the cost of living increased by roughly 40 per cent for the average person.

Actually, the knowledge that this inflationary situation existed was reflected in a distrust of the currency, which was a major cause of the flight of capital, and the distrust of bonds. The Central Bank for some time this year has had to support the Government bond market fairly extensively, and latterly, when the flight of capital and the belief in an ultimate slump in Argentina became widespread, even to support the industrial share market. Such a policy of pumping Central Bank credit into the monetary system did less than nothing to relieve the inflationary pressure, but it helped many Argentines to export their capital. The Argentine authorities were of course on the

horns of a common inflationary dilemma. Given the deficits, they ought to raise the money by long-term or medium-term borrowing from the public, and they had to support the market to be able to do so on cheap terms. Perhaps we in England had better throw no stones on this particular topic.

IAPI, the third new feature in the situation, has been in some respects the most important. As interpreted by its name, it is an institution to promote international interchange. As seen by the farmers, it is an institution for their exploitation, buying their produce at low internal prices and selling at high world prices. This has, incidentally, led to shortages of important foods, since the farmers had little incentive to produce them. As seen by the majority of export merchants, it is an institution designed to take their business from them whenever it becomes profitable. But as envisaged by the planners of the Argentine Government, it was designed to keep internal prices down and yet to sell abroad dear, taking the profit to finance the five-year plan. IAPI must have been making vast profits. Señor Miranda, who is, in effect, the country's economic dictator, recently boasted in a public speech that the Government had made a profit of 780 million pesos on the last linseed crop.

*

But IAPI has also made mistakes. The internal price for maize was 10-12 pesos per 100 kilos while the external price was 30-35 pesos, and similarly on other grains. However, these profits cannot have been sterilised for future use or the inflation would hardly have continued. Like the military expenditure, moreover, IAPI accounts have never been made public, and so far as is known there has been no promise of publication. One can only speculate on what has happened to the IAPI profits. It is known that considerable purchases of equipment, sometimes not very satisfactory, have been made in the United States. It is known that recently IAPI was long of a large stock of hides on which it stood to make a loss—and a large loss—if they went bad. It was known that IAPI was so slow in payments to the meat packers that many of them were heavily in debt to their bankers. This latter fact hardly supports the view that IAPI had any surplus cash, but leaves in doubt where its profits have gone. All that seems certain is that profits were not being accumulated at a rate sufficient to finance the estimated annual cost of 1,332 million pesos for the five-year plan. Furthermore, the inflation continues and the rise in the cost of living is the most serious threat to the popularity of the Peróns.

There is, however, another facet to all these economic plans and controls. This is the increase in graft, which has been helped by the need for so many licences. All unbiased observers are unanimous in lamenting this situation. Various scandals

The Balance of Payments—IV

Buying and Selling Cheap

THE preceding articles in this series have presented an attempt to analyse the mysteries of the Terms of Trade. Britain's chances of balancing its international books within the foreseeable future—say, in the decade of the 1950s—depend absolutely on the terms on which British manufactures can be exchanged for food and raw materials from overseas. At present, the terms of trade are disastrously bad—food and raw materials are scarce and very dear. But as recently as 1932-33, the terms of trade were no less favourable; primary commodities were available in any quantity desired and at prices so low that the British people could meet their requirements and still have enough purchasing power left over to start a housing boom, which in its turn lifted the country out of the Great Depression. There cannot be any doubt that the Terms of Trade are a matter

have broken from time to time, but they do not always appear to have been deeply probed. The most noteworthy concerned the Telephone Company, which was bought from the International Telephone and Telegraph Corporation of New York in September, 1946. By June, 1947, the police accused various of the Argentine managers appointed by the Government of appropriating over 3,000,000 pesos. The charges were immediately dropped and the chief of police, who had been a staunch supporter of Perón, was dismissed. When the case was reopened later, Señor Miranda defended the position before a Senate committee, stating that the fraud was unimportant, as the total amount was only 700,000 pesos—about \$175,000.

Apart from specific incidents, it sometimes seems as if economic policies were framed with at least one eye on helping the favoured classes within the country. It is obviously more economical for the overstrained transport system to move grain to the ports nearest the grain-growing areas. Yet Rosario and La Plata have not been fully used, although Buenos Aires, which is further away, is crowded out. In order to get loading facilities or a berth it is frequently cheaper to pay bribes to officials. Certainly it is well known that priorities are granted on some system other than that of first come first served. The effects of this have been magnified by the fall in the efficiency of dock labour, which has increased cost and loading time surprisingly. A freer use of the ports available would have increased Argentine exports, particularly as there were, and are, considerable stocks of wheat lying up-country; but permits and priorities would have to be granted more freely. This system should be relaxed as far as possible if Argentina is to derive the maximum benefit from the present sellers' market, and the world from the food it can provide.

The future dangers in the situation are thus contained in continued inflation and lower labour efficiency. Although the industrial share in the national income is now higher than the agricultural, Argentina's economy remains based on agriculture. When the buyers' market returns once more, it must be able to move produce from farm to ship economically; at present Argentine costs are amongst the highest in the world. It is quite vain to hope that any miracle-working form of autarky can be created in Argentina, and the present level of warlike expenditure can only be continued if the standard of life of the people is kept down. It was this general realisation of the dangers ahead which prompted the flight of capital, since most thinking Argentines believe that present policies are not taking advantage of the present conjuncture to build up an impregnable situation for the future. On the contrary, they are believed to be steering the country towards collapse.

But this is hardly true if "the Terms of Trade" are defined, as often happens in the textbooks, as simply the ratio between one set of prices and another. Britain is vitally dependent upon the volume of trade that can be done as well as in the prices at which it is done, and it is likely to be in achieving the necessary volume that the greatest difficulties will be met. The various possibilities were set out at some length in the third article of the series. The conclusion was then reached that it will be very difficult, to the verge of impossibility, to pay for imports in the same volume as were bought in 1938. If the import target is reduced to 85 per cent of the prewar volume, then it will require exports of 120 per cent of 1938 if the terms of trade were 10 per cent more favourable to Britain than they were.

before the war, and of 150 per cent if the terms of trade remain as they were last year, 10 per cent less favourable than in 1938. At first sight, the target to aim at would obviously seem to be highly favourable terms of trade and a small increase in the British export effort. But "favourable" terms of trade are likely to mean either such a fall in the prices of primary products that a large part of the world will be impoverished or else British prices so high that British exports will be unsaleable. Whatever high hopes were entertained two years ago, it does not now seem likely that the general volume of international trade will be much higher than it was. There are few countries that can afford, or will be willing, to open their doors to a great flood of imports, in which Britain could expect to keep a fair share. In technical language, the elasticity of the world's demand for imports-in-general is not large. It follows that Britain's only chance of securing an increase in exports is to beat other countries at the competitive game, and to exploit the much larger elasticity of demand for British-imports-in-particular. But competitive prices and "favourable" terms of trade mix rarely, if at all. The British problem may, therefore, paradoxically, be easier to solve by the medium of relatively "unfavourable" than by strongly "favourable" terms of trade. The way out is by buying as cheap as possible and selling still cheaper.

How far is such a reversal of present price trends likely to occur in the next few years? The often-predicted fall in prices on the world market has not yet happened and so far at least as concerns foodstuffs, demand still seems to be greatly in excess of visible supplies. But if one thing is quite certain it is that prices will fall some day, even though nobody can predict when or how far. In the present level of world demand for foodstuffs and other commodities there is, beyond any question, a substantial inflationary element. Part of the abnormal demand is based on real needs; but part is based on monetary inflation, and unless all past economic history is a liar, the inflationary tide will some day start to ebb. Perhaps it has already turned. When the inflation of demand has disappeared, and when Europe regains its normal production, it still seems overwhelmingly probable that, as last time, the net effect of all the disturbances of the war years will be that the supply of most commodities will have been increased in greater proportion than the effective demand for them. If so, the prices of primary products will turn down and the terms of trade will move in Britain's favour.

*

On the other hand, there is no reason to expect any such catastrophic fall as occurred between 1920 and 1921, when the price index of imports into Great Britain fell from 288 to 186 and the terms of trade moved in Britain's favour by nearly 15 per cent in a single year. It is not impossible (though it seems fantastic at the moment) that the supply of goods may some day be as extremely in excess of demand as in 1921; it is not for that reason that so extreme a fall in prices seems unlikely. The difference is that, in 1921, the world was still in the main a free market and supply was allowed to work its will on prices. If such a relationship were repeated now, Governments would mobilise a whole armoury of control devices to prevent it from having its full effect on prices. Price control has not prevented prices from rising during this second war, but it has succeeded in slowing down the rise. Conversely, when the world conjuncture turns to deflation, price control can be expected to cushion the fall. And just as price control on the way up achieves its results at the cost of creating a still greater scarcity, or at least a still greater excess of demand over supply, so price control on the way down tends to bank up enormous supplies of the commodities whose price is being controlled—either actual supplies, when price control takes the form of buffer stocks, or potential supplies when it takes the form of restriction schemes.

The post-war world depression, when it comes, will therefore probably not produce any such sensational reversal in prices

as it did after the first war. But it will tend to leave large stocks on the sellers' hands, and therefore leave them more than usually anxious to find a market. And since Britain is even more gravely concerned to do an adequate volume of business than to do it at favourable prices, this turn of events should be highly favourable to British interests. It suggests a policy, not of beating the foreigner's prices down to a highly "favourable" ratio, but rather of standing ready to do business in large volume on terms which he can be induced to regard as reasonable.

But it should never be forgotten that there are two sets of prices to be taken into account—the prices at which primary commodities sell in the world market and the prices put upon British exports. If the bargain is to be regarded as a reasonable one, leading to that large volume of trade which can alone release the British economy from its present strait-jacket, it will not only be necessary to refrain from driving the foreigner's prices into the pit, but also to quote him fair prices in return. Once the world is again a buyers' market, Britain, the world's greatest buyer, will be in a strong position. But that position will not be so strong that overseas countries will be willing to take British goods of inferior quality or at outrageous prices. Where bargaining strength can be very useful in securing that competitive prices secure a large volume of trade. If it is used to force goods on unwilling customers it will work, if at all, only as long as it takes the customers to escape from the necessity. Once again, the argument leads to the same conclusion—that there is much more possibility of achieving the necessary volume of exports by selling cheap than by selling dear, even though on paper selling dear would require a smaller increase in exports. The task of British commercial policy is not to make the Terms of Trade as favourable as possible, but to prevent them from becoming too favourable.

*

Thus abstract argument, as so often happens, comes back to common sense—can British industry compete in the world market? And that in its turn leads to the familiar grim alternative—the British people will either have to increase their productive efficiency or else reduce their standard of living. By one means or another the prices at which British goods are quoted in the world market have got to be reduced to a level at which, quality for quality, they attract and do not repel. No one can estimate how large a reduction in costs and prices will be needed. But as a very rough guide it may be said that any cut in present British export prices of less than 30 per cent is hardly worth looking at. And if this is not to mean reductions in wages, it must mean great increases in efficiency.

This is, of course, part of a much wider argument which there is no intention of developing in this series. Some special aspects of it, directly relevant to the balance of payments, will be discussed later. But it may be worth while concluding the present article by stopping up one favourite bolt-hole for complacency. This is the widespread belief that the necessary adjustment can be easily made, when the time comes, by devaluing the pound sterling. Devaluation may indeed be necessary, and there can be little doubt that in 1931 it brought much relief. But it cannot be expected to make dear British exports cheap. A large number of the world's currencies are formally or informally tied to sterling and would fall with it. Many others would follow. And when the pound depreciated in 1931 it was followed inside eighteen months by the dollar itself. Devaluation of sterling would be of relatively minor importance to the balance of payments. It certainly does not provide an alternative to the hard way of making British goods attractive.

Some of the hard consequences of the hard way will be considered in the next article, which will be the last of the series.

NOTES OF THE WEEK

Does Coal Come First?

If Britain is to retain the leadership in European economic co-operation which the Paris conference so readily acknowledged, its people must understand at once the principal commitment accepted on their behalf in the proposals offered to Mr Marshall. It is that 250 million tons of coal will be produced in 1951, and that there will be available, for export to Europe, six million tons next year rising to 29 million tons in 1951. It is true that this commitment is expressed in the form of a hope, but the pressure that will come from Congress and other American sources to turn it into a pledge will be tremendous. And with reason. For Americans have been told recently by Mr Harriman that if British coal production could be restored to prewar level, Europe's dollar requirements would be reduced by "something in the neighbourhood of 700 to 800 million dollars a year."

Their insistence that this effort should be made may be misrepresented as interference in British internal affairs. It would be more fairly represented as part of the effort to break the vicious circle that begins in Britain, runs through Germany and ends in France. For if sufficient British coal were obtainable by the French, they might be persuaded to accept a reduction in exports from Germany, where every ton of coal that can possibly be retained will be needed to speed industrial recovery and to re-equip the transportation system and the mines themselves. With the Americans considering favourably the British suggestion that they should shoulder the whole burden of dollar expenditure in the two zones, it is reasonable to expect that they will demand a casting vote on the allocation of Ruhr coal. They will want to discourage its export to Europe and to urge the British to save the French, and the Italians and their neighbours, from the costly expedient of buying coal from the United States.

The prospects and undertakings that Sir Oliver Franks was able to contribute to the Paris report on behalf of Britain had Cabinet authority. It may therefore be assumed that the Cabinet Fuel Committee is urging on the miners' representatives the immense importance of producing coal for export. But friendly and experienced American visitors who have seen British coalfields and recognise their problems are asking why coal production is not given absolute priority in the national effort. It seems to them only common sense that extra food, consumer goods and other incentives to production should be provided for the miners out of whatever assistance Congress can be persuaded to give. When the political and social difficulties of such a policy are explained to them, the phrase "soft Socialism" comes only too readily to their lips. The prospects of the Marshall plan depend to an alarming extent on convincing Americans that planners can enforce priorities.

*

Back to Eight Hours?

It looks as if the British Government has at last seen the red light. The painfully achieved compromise on mining hours between the National Union of Mineworkers and the National Coal Board has been held up because the Cabinet refuses its assent, and the report—apparently authoritative—is that the Government wants the restoration of a full eight hour day, without any payment of overtime rates for the additional hours. One element in this sudden stiffening is said to be the clearest of hints from Washington that an eight hour day in the British mines is likely to be taken in Congress as an indispensable symbol of British willingness to play its part in the reconstruction of Europe. And another element is undoubtedly a reaction against the sublime impudence of Mr Horner's latest demand for a wage increase of £2 a week.

Symbols are important and there can be no complaining if Washington and Paris combine to put pressure on London. An overwhelming majority of British opinion will rejoice that something has at last happened to stiffen the Government's spine against the miners. But it may unfortunately be true that they have run away so far that to turn at this moment may do more harm than to keep on running. The important thing, after all, is to get the maximum production of coal, not to have an eight-hour day that nobody observes. Both the union and the Coal Board are naturally incensed by the Government's last minute stand and will offer little or no co-operation. The effort to impose an eight hour day might lead to a strike, and even if it did not, would almost certainly lead to increased absenteeism. The industry should never, of course, have been allowed to get into

its present position, with the union simultaneously dominant and aggrieved. But since it has got there, no good will be done by the Cabinet's simply going into reverse.

Never before has a British Government—or rather two British Governments, for the rot started under the Coalition—made such an appalling mess of an industrial policy that it must confess itself helpless before the justified rebukes of the whole world.

*

Dismantlement in the Ruhr

Nobody in Germany now denies that an intense struggle for the support of the German people will fill the weeks before the November Conference. The great asset enjoyed by the Russians is the complete subservience of the Communists in their zone and the unified control of propaganda, which makes it possible to pour out week after week an account of Allied policy in the West which may by mere repetition gain attention and belief. The account is the familiar one—the Marshall Plan as a plot on the part of American capitalism, the "exploitation" of the Ruhr for the West European countries, the stripping of German resources to make good British and French needs.

Hitherto, the most effective counter-argument of the Western Powers has been the contrast between the constructive possibilities of the Marshall Plan and the ruthless policy of exploitation and dismantling pursued by the Russians in their zone, not to mention the extent to which the remaining industry is made to work solely on Russian account. Some estimates suggest that as little as 5 to 10 per cent of the remaining industrial plants are working to satisfy German needs. Now, however, at a moment of crucial political importance it looks as though this asset may be thrown away. It has frequently been urged in *The Economist* that to begin the winter with a wholesale dismantlement of factories in the Western Zones would create so great a revulsion against Western policy that industrial unrest and direct political opposition might undermine not only the plans for running German production but even upset some of the basic calculations of the Marshall Plan. A leakage last week of the names of 900 industrial plants due for reparations has already roused indignant protests, and if the full plan is carried through—it is believed to cover some 1,800 factories—the protest may well become passive resistance. The decision can perhaps still be stayed and Sir Brian Robertson, who is to succeed Sir Sholto Douglas as Commander in Chief at this unenviable time, would be justified in using all his influence to avert a development which can undermine all the constructive results he is expected to achieve.

*

An Autumn Budget?

The possibility of an autumn budget is now being actively canvassed. This is as it should be; for it is obvious that no reliance on physical controls, whether by rationing, allocation, or direction of labour, can bring anything like full results if the whole weight of fiscal policy is simultaneously bearing in precisely the opposite direction, as it is now. To leave the same amount of money in people's hands while forbidding them, with increasing severity, to spend it on any of the things they really want, whether house-room, food, clothes, coal or petrol, is to invite a further and further distortion of the economy and a more and more active black market. The more surplus income is diverted into the uncontrolled second-bests, the pools, the dogs, the fun-fairs, and all the other things on which people spend because they have not been able to spend on what they really want, the more profitable will become the supplying of that second-best, the higher its providers will be able to bid, licitly or illicitly, for labour and materials, and the harder will become the supplying and staffing of the essential industries. This is not a problem which can be solved by exemplary fines and jail sentences on the odd black-marketeers who are unlucky enough to get caught; it can only be removed by removing the conditions in which black marketeers thrive and until production has sufficiently improved for controls to be lifted that can only be done in one way—by a swingeing fiscal attack on the surplus income which makes for distortion in the first place.

It is hardly likely that the attack will be made by way of the income tax. Whatever the Chancellor's touching faith in the willingness of business and professional men to go on exerting the maximum of effort, and displaying the maximum of incentive, for a fraction of their nominal reward, the record of PAYE shows

that no similar faith can be placed in the wage earner, who has very little use for an hour's overtime on half pay. Dr Dalton might, of course, regard this as the opportunity for restoring or replacing EPT, as threatened when it was first lifted. Some political sweetener to more effective action, such as the reduction of the food subsidies or an increase in purchase tax, may be needed. But EPT, which is a tax on growth, is a thoroughly bad tax. Even an increase in the profits tax, bad though that would also be, would be preferable. Probably the inflationary situation could not, in the short run, be remedied by anything short of a "Gutt Plan" on the Belgian model—a drastic sterilisation of deposits, designed to keep accumulated purchasing power out of the consumption market; but the favourable moment for a Gutt Plan was missed long ago, and Dr Dalton is not the man to recapture it.

* * *

Policy for the Development Areas

One of the figures recently in circulation which has now received semi-official confirmation is that £200 million is to be cut off the capital investment programme. What is presumably meant is the gross investment programme—that is, including work to be paid for out of accumulated depreciation and similar reserves. If so, the cut is one of about 15 per cent. Nothing very definite has yet emerged about the places where these cuts will fall, but the inspired guesses cast hospitals, schools and the housing programme in the role of chief victims. This will, of course, be very painful; but if the choice betokens a determination to give priority to capital projects that will directly further production for export, it cannot be criticised. A sharp eye should, nevertheless, be kept on the omissions from the list of victims. Nothing, for example, has been said about cuts in the Government's projected expenditures for its own buildings. They are no more directly productive than schools and must join equally in the cut.

In the case of expenditure in the development areas, there has been a hint that there will be no cut at all, and this also should be scrutinised very closely. It has never been possible to feel very happy about the overriding priority that the Development Area policy has been receiving. More than half of the Board of Trade's post-war factory building programme has been located in these areas, which before the war included only about one-seventh of the total population of Great Britain. To date only 11,000 jobs have yet been created, and though this is only the first instalment of an estimated ultimate total of 192,000, even that seems a very small return for such a large slice of post-war capital resources.

The White Paper on Employment Policy accepted the doctrine of "taking work to the workers," and it is a good doctrine within its limits. But to push it to the length of giving industry no alternative to the Development Areas and of progressively cutting down all capital expenditure in other parts of the country, is far too much of a good thing. Not only does such an extreme policy encourage immobility of labour at a time when the national interest requires the utmost mobility, but the present pressure on the expanding industrialist to go into the Development Areas is so strong that many of the new enterprises will inevitably be found, when competitive conditions return, to be located in the wrong places. The whole policy is based on two large assumptions, and even if the first—that private industry, in following its own interests, does not automatically best serve the national interest—can be accepted in these days, the second—that Government officials can accurately assess the national interest—becomes more doubtful with every day that passes. The Development Area policy is not wrong. But it is not so right that it deserves an overriding priority.

* * *

Petrol and Incentives

The petrol farce goes on. The announcement that no restoration of the basic ration would be even considered before July of next year conveys to the mind, when taken in conjunction with other pronouncements, much the same effect as the slam of a door behind a disputant taking the shortest way out from a controversy in which he has had the worst of it. The calculation of £5,000,000 saved by the abolition of the basic ration was made before Mr Attlee's pronouncement, on the occasion of his refusal to see a deputation from the motoring associations, that allowances would be made for essential domestic uses as well as for business purposes. The ensuing tidal wave of applications, which swamped the local control offices, kept their staff toiling like bees over Sunday, and led to an SOS for volunteer workers, must by now have led to some depressing second thoughts on the actual net

gain, while the cost in man-hours of dealing with the flood must, on the other side of the ledger, be far more than originally estimated. It was not too late to reverse the decision and merely make a further reduction in the value of the petrol unit; but one of the least endearing traits of the Labour Government has always been its extreme reluctance to admit itself mistaken.

To this slightly ludicrous obstinacy is now added some surprising evidence of illogic. The restoration of the basic ration, motorists are told, depends on how the export drive goes. If the target of 140 per cent of the 1938 volume has been hit by next July, and that of 160 per cent is in sight, they may have their petrol back; if not, not. To whom is this supposed to be an incentive? Are the workers in the export industries going to work harder because their hearts bleed for the motorist? If every factory had, as in America, its workers' car park, they might indeed feel some force in the argument. Actually, a certain perceptible fraction of man (and woman) hours which might have been devoted directly or indirectly to the export drive will now be spent on waiting for buses, taking children to school on bicycle carriers and recuperating from the additional strenuousness of a car-less existence. If incentives are sought they must be more realistic than this, which arouses sympathy for the wail of the bad boys caught, a few days ago, after absconding from their approved school: "When you're bad you get caned or fined or put on bread and water, but when you're good you only get a good mark for your house."

* * *

Service Cuts

It is evident that the Cabinet have determined upon an additional cut in both the size and cost of the armed Forces, and it is equally evident that no public announcement on the details of the Cabinet's plan is likely to be made before Parliament meets next month. But a third thing is equally clear. From various sources it is possible to piece together the direction that the Cabinet's cuts are taking. Manpower is to be cut by some 500,000 below the present level. Money is to be cut by some 25 per cent.

As always after a major war, there arises a classic conflict of opinion over the future of defence. The demand for security in an unsettled world is matched with the demand for men in industry for peaceful ends, the prestige of the successful war leaders clashes with the mounting power and responsibilities of the politicians. And, as always, there is a temptation to take an easy way out, to make an overall cut in men and money and leave it to the Services themselves to sort out the details.

In the present stage of information it is difficult to go beyond generalisations, but it is perhaps worth while repeating the standpoint which *The Economist* has consistently taken. That is that you must start with the foundation, which is manpower, plus the fact that a 12-months' period of compulsory military service is all that the country can afford and will tolerate. The resulting size of the armed Forces can then be worked out in five minutes on the back of an envelope. The effective ceiling is of the order of 750,000 men, and the actual figure, taking a realistic view of voluntary recruitment, is likely to be rather less. The second fundamental is that modern wars are fought not by professional soldiers but by nations in arms. It is essential, therefore, to have an organisation, installations and equipment that can be mobilised as fast as those of any other nation. The degree to which the three Services can rapidly expand in wartime is very different, being greatest for the Army and smallest for the Navy. From that it follows that it is not possible to economise in both men and money at the same time. The fewer the men the more money per head is needed, for each man, whether in uniform or in a war factory, is a cadre, not a single unit.

A final lesson from the past is the danger of adopting too rigidly any assumption, as was done after the First World War, that war is not likely within a certain time—ten years was the period chosen in the twenties. The danger is that each year the figure ten is repeated; no one ever likes to insist that next year must be D minus nine not D minus ten. Rigidity of this kind does more harm to the efficiency of the Services than almost anything else.

What this all adds up to is that no simple plan, such as an equal proportional cut in expenditure, can possibly be right. If there had been a little more realism in high places two or three years ago, a policy would by now have been worked out to combine minimum permanent forces with maximum expansibility in wartime. This is the policy that is needed, not just a cut-down version of a different policy.

De Valera in England

With the visit of Mr De Valera and some of his Ministers to London last week for conversations with the British Government, a friendlier atmosphere has crept into the relations between Britain and Eire. The old estrangement, based on political suspicion and mistrust and resuscitated in milder form under the recent wartime circumstances, is beginning to give way before the obvious advantages to both peoples of a much closer measure of economic co-operation. These advantages are greater to the smaller country, and it is a good sign that Mr De Valera has descended so far from his empyrian aloofness as to tour London and Paris, and that Mr Lemass, the Minister for Industry and Commerce, has recognised in a recent speech Eire's interest in co-operating to protect sterling and to assist European recovery.

The new friendliness, however, does not alter the fact that hard bargaining is going on behind the scenes. Eire wants dollars and Britain wants food, but neither party will receive its requirements fully or unconditionally. Eire's balance of trade has become increasingly adverse since the war ended, and in particular its exports to the dollar area are negligible in comparison with its import requirements. The dollar deficit has been met to date by drawings on the London dollar pool, but it is clear that, as a logical consequence of the suspension of convertibility, Eire could now be asked to balance its accounts with the dollar area. This extreme requirement, which might cause considerable hardship in Eire, is unlikely to be imposed, but from now on dollars will certainly become scarcer.

This situation underlines Eire's need to expand trade with the sterling area. The best, almost the only, way of doing this is a large increase in the volume of agricultural exports to Britain, which on this side are urgently wanted. The increase could not be rapid, unless the Irish Government is prepared, as it very well may be, to put firm restrictions on the mounting domestic consumption of food. But in the long run the possibility of getting much more food from Eire is undoubtedly there, so long as the British give guarantees that there will be stability of trade over a long period and the Irish give up their dream of getting United Kingdom prices for their farm products.

* * *

Delhi and Karachi

The Governments of India and Pakistan have now issued a joint statement declaring their intention of avoiding a conflict with each other and of suppressing communal violence in their respective territories. This statement followed the journey of Liaquat Ali Khan, the Prime Minister of Pakistan, to Delhi for consultation with Mr Nehru and the threat of the Pakistan delegation to the United Nations to lay a formal complaint against India if the persecution of Moslems was not stopped. There has in fact been large-scale killing on both sides and each side is firmly convinced that the other is solely responsible; most of the outbreaks have taken the form of reprisals for atrocities committed by the opposite party elsewhere as related by refugees.

The spreading floods of refugees going in each direction—Moslems from India, Hindus and Sikhs from Pakistan—are indeed, as one correspondent has put it, the carriers of infection; their plight arouses their co-religionists to fury and the shedding of blood in places where the communities have lived together peacefully for generations. Without firm action there would be no logical limit to the vicious circle of massacre and reprisal until the entire minorities in each Dominion had been exterminated or "exchanged." But a complete exchange of populations in both territories—as distinct from the transfers within the Punjab, which have been serious enough in their effects—would be utterly catastrophic in view of the numbers involved, and an effort to prevent it is imperative for both Governments. The balance of the latter has the greater interest in halting the process and has proposed a team of United Nations observers to watch the execution of India-Pakistan agreements for preventing further slaughter.

There are many both in India and in this country who are now saying that the massacres which have taken place show that partition was a mistake and was no solution to the problem which faced the British Government a year ago. The surge of violence has, of course, astonished those who have always underestimated the strength of communalism in India and has produced in some quarters a suspicion that British imperialism has deliberately quartered a venomous serpent in the basket of independence. But what has happened in India is less disastrous than what certainly would have happened if the attempt had been made to enforce the

Change of Address

The address of *The Economist*, for all purposes, is now

The Economist,

22, Ryder Street, St. James's, London, S.W.1.

Telephone: WHitehall 1511

Telegrams: ECONOMIST NEWSPAPER, LONDON.

Cables: MISTECON, LONDON.

We take this opportunity of paying public tribute to the work done by the contractors, Sir Robert McAlpine & Sons, Ltd., in preparing for occupation a building which had suffered bomb damage. The energy and resourcefulness they have shown in dealing with the exceptionally difficult conditions of all building work to-day have made it possible for us to occupy our new premises several months earlier than it would have been reasonable to expect.

* * *

The Return of Censorship

It is announced that, from October 1st, the wartime practice of opening the mails to and from overseas countries will be resumed, with the object of preventing the illegal export of currency, securities and other valuables. Only a proportion of letters will be opened, and any prohibited documents discovered will be confiscated.

This is damnable. It may be necessary, but it is none the less damnable that there should be no method of private communication left between this island and the outside world. It is true that, according to the explanations given, the new censorship will be concerned only with enclosures to letters, not with the contents of the letters themselves. But nobody will feel confident of the truth of this, and once the principle of opening letters is re-introduced, it will be an easy step, hardly deserving a public announcement, to start reading the contents and acting upon them. The general public would be horrified if they knew what use of the postal censorship was made during the war. Intercepted letters were copied out and used by Government Departments even where no question of breach of the law was involved. Sometimes the excuse was to "test morale," but sometimes it was simply that the officials found the letters interesting. On one occasion a long letter from the late Lord Keynes to a Harvard Professor had quite a wide circulation in Government Departments.

From the first opened letter to this sort of thing, the slope is, very slippery. If exchange control cannot be operated without postal censorship, it would be better to face the consequences of not having exchange control.

The Shops and the Law

Behind the scenes, argument continues on the Gower Committee's recommendation of a general closing hour for shops of 7 p.m. with a weekly extension to 8 p.m. Both employers and Union representatives, in the trade press and in a deputation to the Home Secretary, have protested against this recommendation, demanding instead a 6 p.m. closing time with a 7 p.m. extension. Their arguments, as expounded to Mr Chuter Ede by the Early Closing Association, are backed by figures showing that very little trade is now done after 5 p.m., nearly two-fifths of the total, in one sample inquiry, occurring between 1 and 2 p.m. The inference is that the miserable shopkeeper would, failing a statutory obligation to close at 6, be forced to remain open for an additional hour to no purpose; the extension would, in fact, constitute almost a flouting of the observed public desire to shop in the lunch hour. This argument has a union rider: longer shopping hours would cause workers to leave the shops, a deplorable prospect. It does not appear that any deputation waited upon the Home Secretary from that general public which struggles in the lunch-hour maelstrom or, foiled at midday, emerges from its workplace to find "Closed" signs all along the street.

These contentions are of course riddled with fallacies. The first is a minor one: that the public shops at midday by choice. The public shops at midday because it knows that the time available after its own day's work is done and before the shops shut is inadequate for anything except the odd emergency purchase. The second is that permission to open is compulsion to open. The ambitious and esurient, working till 7, would steal the trade of those shutting down at 6 or 5; therefore, all must—it seems—stay open till the legal curfew. In fact, all do not, even now; plenty close at 5 while their competitors continue for another hour in the evil courses of public service. In any case it is not clear why shops should constitute a special case. Restaurants open and close, cinemas run late houses or not, at their own sweet will. Taxis ply the streets between hours determined by their owners. Industry arranges its shifts to suit the mutual exigencies of employer and union; and the law, while protecting the interests of women and juveniles, leaves it free to do so. There is no logical reason—providing that union action, or if need be, the law, safeguards the leisure of the shop assistant—why any eccentric shopkeeper who chooses to remain open all night should not do so. Finally, there is little reason to suppose that longer hours would either increase the need for, or diminish the supply of, shop assistants. At present shops have to maintain a staff sufficient to cope with a ridiculously disproportionate midday peak; with that peak halved by the reinstatement of the evening shopping period they might well find themselves able to manage with fewer. At the same time either shift organisation or the alternation, for any shop worker, of long and short days, could maintain an average of working hours sufficiently attractive to maintain the distributive working force. Whether, on more general economic grounds, that force should not in fact be reduced, is another story.

Hungary Starts Again

With 22 per cent of the votes in the recent election behind them, the Communists of Hungary have gained most of what they wanted in the new Cabinet formed this week. They hold the key ministries of foreign affairs, the interior, communications and welfare, and Mr Rakosi, "the old fox," is one of the two Deputy-Prime Ministers. The Smallholders, now purged to a state fit for a Left coalition, provide Mr Dinnyes as Prime Minister, and are granted a voice in finance, agriculture and education as well. The Social Democrats, who reckon to have been defrauded of 200,000 votes, have secured for the nimble Mr Szakasits the other deputy-premiership and for his followers the direction of commerce, industry and justice. Such a division looks fairer than it is, and it gives no indication of the dominating voice that Mr Rakosi will continue to have.

Relations with Russia and the execution of the three-year plan come first on the new Cabinet's agenda. A mission led by State Secretary Vasarhelyi is at present in Moscow making what profit it can out of the election results and finding the Russians more reasonable than usual over reparation payments and their handling of German assets in Hungary. Not on the agenda, but at the back of many Ministers' minds, will be the question of how the three-year plan can possibly get Hungary back to the production and living standards of 1938 without aid from the West. A long time must pass before food surpluses will be sufficient to buy what is needed for the equipment of industry and agriculture. Credit must come from somewhere to tide over that time, and Hungarians will watch with anxiety how Poland fares in its relations with the World Bank.

Drang nach Westen

Refugees from the Russian Zone of Germany seeking asylum in the American Zone are becoming as distinguished as they have been numerous. Dr Paul, Prime Minister of Thuringia, who disappeared from his State ten days ago, has appeared in Hesse, and Herr Mertens, Mayor of Jena, has reached Frankfurt with his wife and five children. Dr Paul is reported to have detailed knowledge of a plan to create a Soviet Socialist Republic in eastern Germany—if the Foreign Ministers' Conference in November should fail; Herr Mertens claims that he was threatened with arrest by the Communist-controlled Socialist Unity Party of the Russian Zone.

What evidence there is points to widespread political persecution of all rivals by the Socialist Unity Party of eastern Germany, persecution to the point of deporting men and women to Russia or incarcerating them in concentration camps. Refugees from this regime are naturally making for the American, and to a lesser extent for the British, Zone, in the hope of receiving shelter as political refugees. This presents a difficult problem to the authorities of both zones. If the new exodus is encouraged, it may well become a regular traffic. If it is discouraged by the forcible return of refugees to Russian-occupied territory, there will be bitter complaints from the Social Democrats of the west.

The Minister in charge of refugee affairs in the Bavarian Government stated two months ago that roughly 50,000 persons had crossed the frontier illegally from the Russian Zone since June. Another report states there are 10,000 in Hesse alone. Reports appearing in the press of western Germany gave the daily arrival at Giessen camp as 251 during June. It is believed that there are several thousands of refugees in Bavarian camps now awaiting return on General Clay's orders.

Landräte and other officials, as well as journalists and welfare workers, have pieced together a picture of the general reasons for the movement. Most of the refugees are boys and single men; most of them left the Russian Zone to escape the call-up for compulsory labour in factories, plants or mines under Russian management. It is also known that last year specialists and skilled workers were being deported in considerable numbers eastward. It is clear that the other main reasons for the exodus are political. All refugees speak of the sense of insecurity which prevails beyond the zonal frontier. One-party rule and the fact that criticism of the Socialist Unity Party is a punishable offence have created a new class of political offenders, frequently members of the prohibited Social Democrat Party. Numbers of them are believed to be in Buchenwald and in a new concentration camp at Stern-Buchholz, near Schwerin, interned with ordinary criminals.

Add to these facts the neglect and decay of industry in the zone, its ruthless exploitation by the Russian authorities, the poor living and working conditions in the towns and mines, and it is clear that the urge to press into the already overcrowded western zones may grow overwhelming. It will be interesting to see whether General Clay is able to maintain his present policy of forcible return.

Good Fish in the Sea

The best that can be said for the North Shields drifter men who last week were refusing—some 400 of them—to put to sea so long as the minimum price for herring in Hartlepool is below 85s. rod. a cran, and threatening with violence those fishermen from other ports who are willing to take a lesser price, is that plenty of other people have set them the example. Undercutting is blacklegging. While sharp practice towards buyers, inefficiency, go-slow, sabotage and every form of dog-in-the-mangerism, whether by owners or by workers, may be theoretically condemned, this is the one really unforgivable sin. The practice of Governments, Marketing Boards, Trade Associations, business combines, professional groups and Trade Unions has for a generation or longer been based on this ethic. The notion that any man or any firm or any local group has any *prima facie* right to dispose of their produce at whatever price appears to them good enough is, both to the corporative-minded capitalist and the syndical-minded union member, a quite revolting heresy, from which North Shields could hardly be expected to be immune. There is thus some excuse for what would otherwise appear a particularly flagrant attempt by the greedier or less efficient elements in the industry to dictate the terms on which the rest should work.

The herring fisheries have, of course, a long and painful record of violent price fluctuations and of heartbreaking waste of effort

in the bringing to port of fish which turns out when landed to be of fertiliser value. The fisherman cannot plan his output, one eye on demand and the other on a reasonably foreseeable cost schedule, as do business men in general and fish-curers and distributors in particular, but must take what is sent him by the luck of the weather and the whims of the shoals. His bargaining power is thus, even in a propitious economic climate, essentially weaker than that of his customers, and the brunt of depression is concentrated upon him even more than on other primary producers. Few of the restrictive organisations spawned by the inter-war depression years could put up a stronger case for their existence and activities than the Herring Board. But when an overall decision has been reached, and the prices at the various ports have been settled, the matter should at least be allowed to rest there, without attempts by local groups to build yet another course or two of restrictive practices on to the barrier already separating the consumer from his food. The English Herring Catchers' Association, like so many of the Trade Unions proper, evidently needs to establish closer discipline in its rank and file.

* * *

Costings by Miss Nightingale

It has long been a textbook commonplace that the structure of the British Government's accounts is thoroughly unsatisfactory. In an attempt to supply Parliament with material for a detailed control of finance which it does not in fact exercise, the Treasury fails partly or wholly to satisfy any of the three functions which its accounting should perform—accounting, that is, in the narrower sense of the control of the Government's own finances, as apart from the wider function of relating these finances to the working of the economic system as a whole. First, members of the House of Commons need crisp non-technical summaries, bringing out the main trends, on which to base general discussion of policy. Secondly, the Committees of the House engaged in more detailed investigation of particular fields should be able to call, not merely for penny cash-book accounts designed simply to ensure that there is no dishonesty and that appropriations have not been exceeded, but for proper cost accounts designed to bring out the full costs and economic efficiency of particular

services. And, thirdly, the Treasury itself needs similar cost accounts to maintain a running audit of the efficiency of departments. Principles apart, manpower shortage must in any case make the general introduction of a system on these lines impossible for the moment; for the time being, penny cash-book accounts must continue. But that is no reason against developing cost accounting in special fields where the need is obvious, even outside the trading services where it is applied already; and, with the agreement of the Treasury, the Select Committee on Estimates* have now recommended that a start should be made in the form of special cost accounting appendices to next year's Estimates on housing and on research and development.

Cost accounting is by no means new in the national finances, even apart from the trading services. The War Office placed its accounts on this basis in the early twenties; but the system was expensive, and was in due course dropped because (if one reads between the lines of the Treasury's evidence) Ministers at that stage had no intention of making any practical use of the results. What did survive was a cost accounting system for the Army's medical services, on which the Select Committee comments favourably. Inquisitive members of the Committee proceeded to probe into how this system had survived so well. And there was indeed a special reason; for it was installed by Florence Nightingale. The Treasury, as the uniqueness of the example suggests, and as its own evidence confirmed, is in principle opposed to the general application of a similar system in other fields.

*

This is undoubtedly a case where national finance might learn from local finance. In cost accounting and the presentation of accounts to councillors, and the public, municipal accountants have been far and away ahead of the Treasury; and indeed in accounting practice generally. *Local Government Finance*, the official organ of the Institute of Municipal Treasurers and Accountants, is entirely right in claiming that, as the principle of public accountability is more and more carefully enforced at all levels, the experience of the Institute's members should prove of steadily increasing value.

* Fourth Report of the Select Committee on Estimates. HMSO, 1s. 6d.

Letters to the Editor

The Education of Our Masters

SIR,—I should like to reply to your comment on my letter of September 6th. To recommend unemployment as a spur to greater effort on the part of the worker is one thing; to recommend "moderate, short-term" unemployment as a corrective for the present rigidity of the labour market is another. If my argument regarding the former is accepted the problem becomes this: How can the required flexibility be restored without increasing the fear of unemployment?

The first requirement, clearly, is to keep unemployment to a minimum. Apart from such a long-term factor as the location of industry, the ability of trades to stabilise their labour requirements and the efficiency of the labour exchange machinery will largely determine whether the minimum is to be more or less than 4 per cent. The second need is to emphasize continually to the workers, by word and deed, the short-term nature of his unemployment and its purpose, and to make it, while it lasts, as little of a social calamity as possible.—Yours sincerely,

69 Exeter Road, N.W.2

R. P. LYNTON

SIR,—In connection with your note on Mr Lynton's letter of September 6th, I suggest that the figure of 5 or 6 per cent of unemployment as the minimum for efficiency was considerably on the side of pessimism. Statistics alone can show whether it is indeed the figure usually taken; Lord Beveridge, admittedly an advocate of full employment policies, suggests in his "Full Employment" that a figure of 5 per cent is not "the irreducible margin required to be standing by to make change possible." He gives your "lowest possible" figure of 3 per cent as a "conservative rather than unduly hopeful aim." And the emphasis, I would stress, in this as in other works of a similar nature is laid on the *possibility*, rather than the *desirability*, of reducing unemployment to this figure. It is regarded as the minimum possible, not the minimum desirable, figure.

It may be that a figure of 1½ per cent of unemployment is insufficient to allow for corrections in our present distorted economy. But when the necessary adjustments have been made, there is no reason to believe that a figure as high as 6 per cent of unemployment will be necessary to ensure the necessary flexibility in our industrial system. And, as Mr Lynton rightly points out, the *fear* of unemployment is a far greater deterrent to full productive effort than the lack of it.—Yours faithfully,

Oriel College, Oxford

K. A. F. SAINSBURY

Fascist Disturbances

SIR,—Frederic Mullally's letter in your issue of today's date calls for an answer, especially in view of the current trend amongst authors and correspondents to condemn everything "Fascist" while apportioning no blame, apparently, on the activities of that equally extremist body, the Communists.

It is well to remember, however undesirable the return of Fascist activities may be, that no political freedom whatsoever would be tolerated under a COMMUNIST-controlled State, any more than it would be under the Fascists. There is evidence enough these days of what would happen to all truly democratic people in this country should we ever be so unfortunate to come beneath the shadow of "A Free People's Government."

Sufficient powers, and Mr Mullally probably knows the law better than I, are already invested in the Home Secretary for him to deal with those people convicted for incitement in any form, whether racial or otherwise. Nor, under these laws, are the penalties particularly light, though it is to be admitted we have no "Corrective Camps."

It is to be sincerely hoped, however, that the Home Secretary has equally sufficient powers to deal with those persons who avowedly cry loudly and frequently for the overthrow (by revolution, too) of "reactionary" governments (i.e., all non-Communist governments). High treason seems to be a more dastardly offence than some of which the Communists have charged the Fascists.

If we are to abolish political freedom, freedom of choice, by curtailing the activities of one extremist wing, let us at least kill two birds with one stone!—Yours faithfully,

PETER M. EASTWOOD

"Rothbury," College Road, Hoddesdon, Herts.

Soviet Oil Production

SIR,—The Soviet oil production in 1946, if correctly estimated at 22.8 million tons, was nearer three-quarters of the average production (according to official Soviet figures) between 1938 and 1940, than one-quarter, as stated in the article "South of the Caucasus" in your issue of September 27th. I assume the error was a clerical one and that it was not reflected in the argument of your article. But what I take to be the general line of this would have been much less vulnerable if it were in fact possible to envisage a figure of over 90 million tons for Soviet domestic output when back to normal. It could then be maintained that consumption needs would be more than covered within the range of current planning. But, as it is, the highest figure for a year's output yet admitted, 37.8 million tons in 1941, does not look like satisfying an economy expanding at the planned rate on so vast a territory, and including an agriculture based on tractor power, not to mention large and probably well-exercised armed forces. It is less than a sixth of the United States' production and consumption in 1946.

In so far as your argument rests alternatively on a comparison of Soviet and American "proved resources," I venture to question the significance of the statistics quoted as they stand. There is not a direct correspondence between potential annual output and these reserves for the reason—fully recognised elsewhere in your article—that some deposits produce "more cheaply and easily" than others. I do not know whether there is material apart from Soviet surveys for an authoritative opinion on the relative potentialities of the North Persian fields, but there are certain grounds for supposing that the Soviet petroleum authorities should have been able to assume a better return in Persia for a given outlay in capital installations (which is assumed to be inelastic) than in existing Soviet fields.

It may be reasonable to suspect that the Soviet diplomatic offensive against Persia is timed to fit a wider political strategy, or even to reconnoitre, as you suggest, the front line of the Truman doctrine. Moreover one may not be entirely confident that the Soviet oil statistics are not misleading. But the whole problem will, I suggest, be dangerously misinterpreted if the Soviet need for more oil is underestimated.—Yours faithfully,

Trinity College, Cambridge

MICHAEL VYVYAN

[The sentence referred to should have read: "Production in the Soviet Union in 1946 was estimated at only 22.8 million tons of crude, or about a quarter less than (not 'of') the average production between 1938 and 1940."—EDITOR.]

From The Economist of 1847

September 25, 1847

The affairs of Italy increase in importance. The Duke of Lucca has abandoned his dominions, and has placed himself at Milan under the protection of Austria.

Have our readers considered the nature of the contest into which Austria is entering, a contest not only against the liberties but against the religion of the Italians? Have they noticed, that in this contest the Government of Austria will no longer be aided by the church but opposed to it? For the first time for many years the priest and the patriot are united in Italy. The spiritual influence of the Pope, man's faith in religion, which has hitherto been ranged on the side of legitimate government, is, by the attack of Austria, to be ranged on the side of its opponents. There is no longer an alliance between the Church and the State in Catholic Austria, but the two powers have entered into a conflict. There the watchword will be Pope or Emperor, not Pope and Emperor, which makes more difference between this and other contests in Italy than we can find words or space to describe. The Tyrolean troops, in an affair with the Hungarians, are said to have already struck a blow for the Pope, and Austria, therefore, is provoking a dissolution of its own power, and breaking up all legitimate government, while it is assailing the patriot Pontiff and the national guard of Italy. . . . In our view, no more important question has engaged the attention of Europe since the commencement of the first French revolution, than the combined movement of the populace, the patriots, and the priesthood of Italy.

Books and Publications

In Search of Justice

"Rediscovery of Justice." By F. R. Bienenfeld. George Allen and Unwin. 263 pages. 15s.

THERE are many roads that seem to lead to justice, although no one can feel any assurance that they reach their destination. Professor Bienenfeld chooses that marked "Law."

His book falls into five sections. The first is a short account of the age-old problem: is man naturally just and, when not so, distorted by society, or is man naturally unjust and only brought towards justice by society? The second is a most illuminating comparison between the emotions and conflicts within the family (analysed on a Freudian basis) and the related emotions and conflicts that trouble humanity in its world-wide social and economic contacts. The third section examines justice in modern society, chiefly in the field of international relationships. The fourth—and a most valuable one—discusses the evolution of the concept of Natural Law and its component parts, individualism, self-determination and social co-operation, with the added problem of authority. The final section propounds a minimum Bill of Human Rights and the prospects of justice.

Professor Bienenfeld has the mind of a Continental lawyer. That is to say, he conceives law, at its best, to be a logical framework controlling, directly or indirectly, all human activity and relationships. This frame is not rigid, but it is *ex hypothesi* comprehensive and logical. The Anglo-Saxon approach to law is somewhat different. It sees it as a body of working rules, made up to meet a case as it arises and not requiring logic as an essential component. Law is a mirror, reflecting, not the average, but something a little better than that. It does not reflect the highest aspirations of man, for to do so would conflict with the essential requirement of workability.

The differing points of view are best shown by the author's approach to the problem of a Bill of Human Rights. He sets out certain propositions for such a Bill, as part of a framework of valid and accepted international law, and then proceeds to whittle down the practical effect of each statement of principle. The English lawyer would be far more inclined to admit that he recognises that, say, piracy is in fact internationally regarded as a crime, but to draw no further deductions from such a statement. The kind of difficulties in which Professor Bienenfeld becomes involved can be illustrated by one quotation from his rules concerning uncontested "Natural Laws":

Science and its teaching are free, provided that, in the opinion of unprejudiced scientists appointed by UNO, the teaching is not, under the cloak of science, intended to assault by way of propaganda those aims which are fundamental for the well-being of humanity, according to the Charter of UNO and the Constitution of UNESCO.

How many practical questions are not begged in those few lines?

But this is a most valuable book in that it directs attention to the fundamental problems of human society, and examines them with a mind that is disciplined, sincere, experienced and lucid. The discussions that it will provoke can do nothing but good.

America—Impersonal and Personal

"The United States in World Affairs." By John C. Campbell. New York: Harper. London, Royal Institute of International Affairs. 585 pages. 25s.

FOR the United States Council on Foreign Relations the outbreak of war meant the cessation of their annual surveys of international affairs. Now, like their opposite numbers at Chatham House, they are resuming publication of their periodic surveys, while the lacuna of the war years is being filled in another form—by a special historical study under the direction of Professor Langer. This volume, which for most purposes runs from V-J Day to the proclamation of the Truman doctrine, is the first volume of the revived annual series. Readers on both sides of the Atlantic will welcome the return of its familiar contours. They will rejoice to find that in its accuracy, honesty and objectivity it matches its pre-war prototypes.

Any treatment of a theme as vast and discursive as this volume's must make a choice of evils. If it narrates chronologically, it sacrifices the logic of topic to the logic of sequence as well as complicating the lazy reader's search for threads. If it proceeds by topics, continuity and interaction are obscured. This survey

makes the second choice and pays the inevitable price. It is a high one. In no country is politics, domestic or foreign, less compartmentalised than in the USA—Palestine spills into the Loan, Parity tugs at Unrra, presidential aspirations colour occupation policies—and any treatment which neglects that necessarily robs the facts of some of their living reality. The faults which careful scrutiny can detect in this volume are such as follow naturally from this limitation—for example, a grossly inadequate treatment of American public opinion and the press (which latter is not even mentioned, individually or collectively, in the index), or the relegation to passing allusion of such hurricane incidents as the Fulton speech. The result, without the least falsification being intended, is inevitably to give to American policy an appearance of consciously sustained purpose which it sadly lacks outside the pages of the State Department's intra-office memoranda. Against such shortcomings, however, the sensible reader will set the generous frankness of the whole treatment of contentious issues, which does not shirk the allocation of blame or the exposure of inadequacy, and the generally high level of scholarship displayed throughout.

"The Roosevelt I Knew." By Frances Perkins. Hammond, Hammond. 327 pages. 18s.

THE Roosevelt Miss Perkins knew was not the international figure and war leader who stood so high in British popular esteem. He was the Governor of New York State and the crusading New Dealer. He was the legendary "that man" of irate Republicans and the party chieftain of both willing and unwilling Democrats. He was the idol of Louis Howe, the supplanter of Al Smith, the carpiece of Harry Hopkins, the sour taste in the mouths of Raymond Moley and James Farley, the victorious and patronising opponent of Landon, Willkie and Dewey, and the consistently loyal boss of his Secretary of Labour. It is a measure of the success of Miss Perkins's portrait that all these Roosevelts are recognisable in it. Even the last-named, who might have been expected to eclipse the rest, takes his place, but only his place, alongside the others.

"It is my final testimony that he *never let me down*," says Miss Perkins; yet while the tribute carries instant and complete conviction, it is set in a context which leaves it still quite comprehensible that a different verdict might fall from other lips and have a validity of its own. In fact what Miss Perkins has achieved is a blend of intimacy and objectivity which no other book on Roosevelt has approached. With a modesty that other Roosevelt memoirists might copy she disclaims any finality for her portrait, and indeed for the full understanding of his enigmatic complexity other testimony and fuller disclosures will be needed. Nevertheless her success is such that it leaves one with a deep regret that her experience went only as far as it did—that there remains one side of Roosevelt's work on which she can cast but little light, his foreign policy. Roosevelt as an international figure occupies only a small concluding fragment of her book. What she has to say here is interesting, vivid and obviously honest, and provides a valuable corrective to the post-prandial meditations of Mr Adamic and the filial romancings of Mr Elliott Roosevelt. But she was not—and does not pretend to be—pry to this side of his public life. With the passing of Harry Hopkins will the gap ever be filled?

"Woodrow Wilson and American Liberalism." By E. M. Hugh-Jones. "Teach Yourself History" Series. English Universities Press. 295 pages. 5s.

MR. ROWSE's editorial conception of history as a series of expanded obituaries has presented Mr Hugh-Jones with an almost insuperable task—to tell, within about 60,000 words, the story of American liberalism from the death of Lincoln to the collapse of Wilson as well as the narrative of America's role in the first world war and the peace settlement. Something must suffer; Mr Hugh-Jones has decided, probably wisely, that the details of Wilson's private life and a full analysis of his diplomacy, both European and Senatorial, can best be spared. He has concentrated, with considerable success, on the Wilson least known to British readers, the apostle of the New Freedom. It is a useful story to have in popular form, engagingly and fairly fully expounded; it is a pity that the demands of the series oblige it to share living space with so much that is necessarily cursory and compressed.

AMERICAN SURVEY

Prices and Politics

(From Our US Editorial Staff)

TWO types of public problem engage the politician—those that he exploits eagerly and those that he grasps because he must. The new price rises combine the features of both. Properly exploited, they may make the fortune of a Congressman. Taken timidly, they are sure to sting.

On the domestic front, public clamour and political reaction against these new rises were slow to start. The basic commodity index of the Department of Commerce (1939 = 100) has been climbing since early June (when it had slipped back to a low of 295), but it was not until September that the storm broke. On September 2nd the index registered 307; nine days later it hit 324. Wheat and rye were selling for \$3.00 a bushel. Eggs and butter commanded, at retail, a dollar a dozen or a pound. Beef moved into the same expensive circles. Milk rose. Fruits and vegetables, to be seen rotting in the country, sold in the city at price levels that would be high in January and were fantastic during the harvest season.

The cause of this new inflation is unclear, though not for lack of explanations. Familiar whipping boys have been trotted out to satisfy the public anger, and in accordance with the interests of the trotter. Labour says the cause is excess profits, and asks a return of price controls. Representative Sabath of New York, and Senator Flanders of Vermont called for an extra session of Congress to investigate price-fixing by meat packers, dairy producers, commission merchants. Meanwhile a joint Congressional sub-committee, to which the Senator belongs, is warming up by holding preliminary price hearings across the country. The Mayor of New York discussed with restaurant keepers a plan for restoring the wartime practice of serving meat only five days a week. Senator Taft's advice was "Let people eat less, and less extravagantly"—an admonition, unpopular at any time, which aroused raucous laughter when it coincided with a photograph showing the Senator cutting into a thick slice of meat at a California barbecue.

As the commotion increased, one government agency after another grasped the nettle and tried to find in it an artichoke. The Department of Justice issued subpoenas summoning eighteen of the leading meat packers to appear before a special jury and explain alleged price-fixing. Federal District Attorneys throughout the nation are directed to begin drives against "collusive" price agreements or practices which might increase costs of living in their districts. The Commodity Exchange Authority asked that the minimum cash margin for speculative dealing in grains be doubled, a request which would only bring it up to 33½ per cent as compared with the 75 per cent required on the Stock Exchange under the Securities and Exchange Act. The Secretary of Commerce stated firmly that high prices were not caused by the amount of produce going to Europe, but by high prosperity and hence expanded markets at home. President Truman's contribution took the form of a request that the nation practise voluntary rationing.

So far, there has been very little open attack on over-employment, high competitive wages, or the agricultural policies instituted by the New Deal in a very different period and still operating. These last are, of course, based on a policy of raising farm incomes by subsidy and price support; the paradox that they should continue in a period when abundance of everything is needed and prices, supported and unsupported, are reaching new peaks may be laid at the door of a democratic system in which farmers, as well as workers and business men, have votes. For different reasons, the search for a satisfactory whipping boy has not touched inflation, nor whistled at the

door of those makers of the nation's monetary policy, the Treasury and the Federal Reserve Board.

The argument can be made with some force that this new price rise shows the characteristics of a classic inflation, and is due, in large part, to the fiscal policy which, like the nation's agricultural policies, was invented to cure extreme depression and has hardly been altered since. Cheap money, expanded credit, a loose hand on the brakes, were instituted in 1933 as accompaniments of deficit spending to rouse the nation from its then state of economic paralysis. It was explained at that time that when those measures had done their work and the free enterprise system was again working freely, the stimulants would gradually be withdrawn. War, coming before the cure was complete, provided a new stimulant so powerful that controls not comprehended in the original plan had to be applied to credit and prices in order to keep the expanded machine from running so fast that it would wreck itself. With the ending of the war those latter controls were withdrawn at the insistence of men in Congress who said, and probably believed, that the economy was grown strong enough to right itself with no more restraints than those provided by supply and demand.

The days of deficit spending are over, war expansion is done, the budget is balanced. Theoretically, the price of money should be encouraged to rise. But there has piled up, as the cost of the cure, a mountain of national debt that must somehow be serviced. The citizens' interest seems to dictate that it be serviced as cheaply as possible. Caught between the need for cheap money to be used in debt-servicing, and its dangers in promoting over-spending, the Treasury and the Federal Reserve Board have so far given no sign that they are ready to move from one horn of the dilemma to the other. The techniques invented to accompany deficit spending still continue, if only as a matter of habit. Their inflationary effects multiply. To reverse the fourteen-year-old trend may take a political revolution as sharp as was that of the New Deal which was invoked to break the equally vicious effects of too much thrift.

In any event, the economic policy of the United States is at present in the hands of political appointees hardly likely to overhaul the basic philosophies which brought their party into power, or to re-install unpopular controls which might lose it votes. The Democrats, who run the executive offices, find it far easier to make political capital out of such surface phenomena as the Republicans' discarding of price controls last summer. The Republicans, who control Congress and are hoping to elect one of their number to the White House a year hence, are busy fending off criticism of what was a popular move only a year ago. They will hardly propose new controls at a moment when their most important problem is how to win friends and influence independent voters. President Truman's decision to rely on voluntary rationing induced by moral indignation, or an inadequate pocketbook, is an indication that both parties hope to ride out the storm and to turn its potential dangers to their separate advantages.

Meanwhile economists issue warnings that this may be the last flurry before recession sets in, and *Pravda* makes capital out of an unfounded rumour that the United States may stop exporting wheat to Europe. The international dangers of the situation are admittedly serious. Even Americans know that rising prices bore a large share of responsibility for the failure of the British loan to accomplish its purpose, and thoughtful men are now asking themselves what this new upward trend may do to the Marshall Plan.

PR on Trial

(From a Correspondent in Ohio)

IF, as many students of government like to think, American municipal politics follow a cycle of reform and corruption, urban America has been on a sharp upswing during the past few years. Last year 80 cities discarded more or less obsolete local governments for the approved model, which combines a small elected council with an appointed City Manager. Altogether, about 700 cities and towns now have City Managers. But some municipal reformers complain because only 12 communities, mostly small, elect their councils by proportional representation; and of this dozen, three, New York, Cincinnati and Long Beach (Long Island), will vote on the repeal of PR in November. New York and Cincinnati are the two most important PR cities in the country. The outcome of these elections will have a considerable influence upon the somewhat spotty career of PR in the United States.

Why this sudden flurry to test PR at the polls? One reason is that an election held in an off-year, when there is no complication of a Presidential contest, usually means a light vote, which offers an advantage to Republican and Democratic organisations opposed to PR. Another reason is a growing public reaction against minority bloc voting in the United States. In local or national elections, PR is the great guarantor of minorities. Of course, the manoeuvring of minorities is an old story in American municipal politics, especially in the big cities. New York's Tammany machine in its heyday never made up a slate of aldermen without including an array of Jews and Irish and Italian Catholics. The ward composition of most city councils lends itself to exploitation of neighbourhood sentiment, so often coloured by race, religion or economic status. The habit of bloc thinking has, however, been growing in recent years thanks to the national and racial sympathies—and animosities—aroused during the war. The "Negro Problem" has swelled dramatically in many sections of the country. The Roman Catholics are becoming more politically conscious as a group. Labour has arrived at a stronger sense of solidarity. In some American cities minorities have found an avenue to political power in proportional representation. Under PR, minority representatives are not chosen by party bosses thanks to the accident of birth, confirmation or economic class. They are chosen—or nominate themselves—as minority leaders, with Causes. Once elected, they tend to promote those causes by deals and log-rolling.

PR on the European continent generally follows the party-list system. American advocates of PR prefer the variant more familiar in Great Britain. This provides a single, transferable vote on a ballot listing individual preferences by number. There can be no doubt that this system guarantees representation to minorities and has helped to cripple, or at least to weaken, several political machines. A vigorous effort is now being made in Boston to smash the Curley machine with the PR weapon. In Cincinnati, where its leading defender is Mr Charles P. Taft, an eminent Republican who often disagrees with his distinguished brother, the Senator, PR is credited with having destroyed the notorious Cox-Hynicks Republican "gang" which had misruled the city for 40 years. Its advocates also thank PR for the city's reputation, since 1926, as "America's best-governed city." Evidently the voters have agreed, for PR has survived two tests at the polls, though by uncomfortably slim margins.

In New York City the PR system adopted in 1936 has likewise survived two repeal attempts. But the attack this year is being waged jointly by Tammany and the Republicans and has the support of the most influential newspapers including the *New York Times*. Up to now, five American cities, including Cleveland, have dropped PR, by popular vote or through court intervention. Hence, the November tests in New York and Cincinnati are regarded as crucial alike by the friends and by the foes of PR.

In the past, the favourite epithet hurled against PR was "un-American." This referred not to its alien origin—the Australian ballot is also in use in America—but to its alleged tendency to work against the traditional American two-party system. This year the "un-American" argument is timed to quicken the average man's apprehensions about Soviet Russia and the native Communist Party—the minority bloc which most acutely concerns Americans. Wide publicity is being given to the fact that at the Moscow conference last spring, Mr Molotov proposed that the PR system of voting be extended throughout Germany, and PR is said to have paved the way for dictators both in Germany and in Italy. To these charges the friends of PR make varying, and not always consistent, retorts. But their defence has evidently influenced the metropolitan newspapers less than the fact that in New York's election of 1945 two avowed members of the Communist Party won seats in a council of 23. Nobody believes that the New York Communists number anything like 10 per cent of the electorate, or that a pair of them could have been elected under the orthodox system.

In Cincinnati, a more homogeneous town with a large and lively reform group, a vigorous drive is under way to "get out the vote and save PR." But the opposition can point to the election of 1936, in which a radical preacher, advocate of the single tax, of the municipal ownership of utilities and of the curious notions of Father Coughlin, won the controlling seat in a council otherwise equally divided between the parties, and promptly offered to sell his vote to the highest bidder. (The offer was accepted—by the reform group). Two subsequent elections resulted in divided councils, with the decisive votes held by independents who could never have been elected under a plurality system. In Cincinnati, as in New York, some independent voters who originally favoured PR have been dismayed by the ease with which alert and energetic minorities can gain representation out of all proportion to their numerical strength in the voting body. In an editorial voicing its disappointment with PR, the *New York Times* said:

If we assume that the chief object of representative government is to represent, then the case for PR is strong, for it does represent small minorities more accurately than other systems. But if we assume that the chief object of representative government is to govern, then the case for PR is much weaker. For PR is divisive in its effect; it emphasises and aggravates differences among groups instead of helping to reconcile them. PR in New York City must be considered to be still on trial.

It is emphatically on trial this year in the two American cities where it has made its most spectacular progress. Thanks to the combined opposition of Tammany, the Republican organisation and war veterans' groups, New York seems likely to abandon the experiment. The story may well be different in Cincinnati, where PR has been attended by more than two decades of honest and efficient government and where the Negro, Jewish, Catholic and CIO-Labour minorities have been encouraged to unite in its defence.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

Labour and the NLRB

When, a fortnight ago, Mr William Green, President of the American Federation of Labour, gave it as his opinion that the leading officials of the AFL would sign the anti-Communist affidavits demanded by the Taft-Hartley Act, it was taken as the crumbling of the unions' united front. The greatest danger the Act has run is that both labour federations would boycott the machinery it established and reduce the law to a dead letter. But if the AFL signs, its chief rival, the Congress of Industrial Organizations can hardly afford to refuse, for by qualifying to have cases heard by the National Labour Relations Board, a marked advantage is gained in jurisdictional disputes.

At the eleventh hour, however, Mr John L. Lewis has blocked compliance with the Act by refusing to make the insulting affirmation of the very obvious fact that he is no Communist. Mr Denham, the new General Counsel of the NLRB, will hardly be thanked by the authors of the Act for giving Mr Lewis this power of veto by insisting that all the hierarchy of each labour federation must sign the affidavits if their constituent unions are to be permitted to have cases heard by the NLRB. Mr Taft himself, in the light of experience, has recommended a more lenient interpretation. But the relevant passage of the Act reads that no union shall have any standing before the NLRB unless there is on file an affidavit "by each officer of such labour organisation and the officers of any national or international labour organisation of which it is an affiliate." The language is all too specific, and it is very doubtful whether the NLRB will choose to help Mr Taft escape the consequences of his own drafting by attempting to reverse the Denham ruling.

A little time has been bought by extending the date by which affidavits must be filed to October 31st, thus putting the question squarely before the conventions of the AFL and CIO, which take place, one after the other, early in October. Majority opinion in the AFL favours compliance; that in the CIO defiance. In the AFL it is very clear that the calculated bias of the Taft-Hartley Act toward craft unionism has provided a bait almost too tempting to be resisted in the divided state of American labour. Mr Tobin of the Teamsters Union has already filed his affidavit, and is expected to lead the opposition to Mr Lewis. It is suggested that the convention, if it is not able to budge Mr Lewis, might circumvent him by declaring that the office of Vice-President, which he holds, does not make him an officer of the AFL. The unity of resentment created among the unions when the Act was passed has proved short-lived; Mr Taft and Mr Hartley may yet succeed in their strategy of divide and conquer. Mr Lewis alone in the AFL has shown a shrewd perception that something bigger than jurisdictional gains is at stake.

* * *

Taft's Trial Run

Mr Taft's premise of a livelier Western tour than that of Governor Dewey is being generously kept. The Senator has rushed in where political angels—let alone Mr Dewey—might fear to tread; and the CIO escort which has picketed him in town after town has suffered no lack of material for picket signs reading "We eat less, Mr Taft. Do you?" "What about Republican high prices?" and "Taft Helped Kill OPA." Senator Taft's trial run is designed to test sentiment for his possible Presidential candidacy, but the speeches he has been making provide an even more interesting index to the policies a Republican Congress may pursue when it reconvenes.

Travel is said to broaden the mind, and Mr Taft, while vigorously defending the Labour Act which bears his name, has found it politically comfortable to advocate a little leniency in its application. One version of the closed shop, the union hiring hall,

might, he conceded, not come under the ban, after an interview with the head of the American Federation of Labour's Sailors' Union. More important is his diagnosis of high prices and his prescription for the ailment. The responsibility for present discontents he lays at the door of the Truman-Roosevelt wages and price policy; Mr Truman, it appears, took Congress too seriously when he abolished price control and liquidated the Wyatt housing programme. A more gradual liquidation of controls would have been preferable, according to the Senator, and this should have been accompanied by more stringent control of exports, cuts in government spending, and acceptance of the tax cut. This tax cut, which the President denounced as inflationary, would, by the Senator's ingenious reasoning, have cushioned costs, and tended to prevent further wage increases.

The Senator accepts as permanent wage and price levels 50 per cent above 1939, and believes that increases in productivity and supply and decreases in abnormal consumption will bring prices back to that level. To stabilise the new level, he advocated—and this may well become the Republican programme—further reduction in government spending; the restriction of exports, particularly those in short supply; "voluntary" rationing in the United States of short commodities like meat; continued attack on excessive profits through the anti-monopoly machinery; and the discouragement of further wage increases. It is clear that the Marshall plan may suffer severe cuts both in money and in goods under the first two items of Senator Taft's new economic policy. Beyond these present negatives, however, Senator Taft holds out a vision of a "programme of progress": Republican support for health, education, and other welfare measures—once there is a Republican President in the White House, more sympathetic to Republican liberalism than Mr Truman has proved. This search for an alibi for Congress's sins of omission suggests an uneasy awareness that in the West tax cuts and restrictive labour laws do not add up to as impressive a Congressional record as they did in Washington, DC.

* * *

A Lippmann Doctrine

Mr Walter Lippmann, the dean of American columnists, and the most creative thinker on foreign policy outside the State Department, has long been critical of the Truman Doctrine as likely to dissipate American resources without substantial results. He is now publishing a lengthy dissection of the assumptions on which the State Department is acting, as they were elaborated in an article in *Foreign Affairs* under the signature "X" and generally attributed to Mr George Kennan, the chief planner and Russian expert of the Department.

Mr Lippmann argues that a number of "X's" fundamental assumptions are invalid or strain the limits of credulity. These are that the Russian system carries within it the "seeds of its own decay"; that a policy of containment and counterforce at points chosen by the Russians can speed either the mellowing or the collapse of the system; and that the United States system has sufficient reserves, resolve, flexibility and constancy to withstand Soviet pressures over a period of years. Mr Lippmann is also pessimistic about the motley crew of allies through which American policy must work as it pursues the Truman Doctrine. The "X" programme, he concludes, is a plan of "holding the line and hoping for the best," which can succeed only if each of a number of optimistic assumptions holds good.

It is all too true that the American system, which only comes to the boiling-point of action in a crisis, is not designed for a patient, expensive policy of containment, which requires not only money and men, but continuous national attention and understanding. It acts slowly at the best of times; the cry of "Wolf, Wolf" is perpetually necessary to shock a sluggish Congress into action.

It is to Mr Lippmann's credit that he has not been content to find fault. He has proposed in place of the Truman Doctrine a Lippmann Doctrine: that the Russian problem can best be solved by the speedy evacuation of Europe by the Red Army, through the early signing of the peace treaties and the withdrawal of British and American occupation forces. Were this accomplished, he is persuaded that Russian influence in Europe would wither; European countries would no longer feel themselves pawns in a cold war; and the Soviet would be restrained from violation of the treaties by the knowledge that a single aggressive step would precipitate a general war.

The critics are bound to ask, but would it? How much easier it is for Russia to seep back into Europe than for America! Assuming that the United States withdraws from Europe, would there be sufficient interest in five years' time to declare war because the Russians were once more in Bulgaria? Would this not set the scene for another and larger Munich, with all Europe in the role of Czechoslovakia? And if the United States withdraws, who would control German resurgence, the French, Belgians, Dutch and Scandinavians are certain to ask.

If "X" is optimistic about the burdens America can be asked to carry in world affairs, Mr Lippmann is too defeatist. The exposition is not yet complete, but it is not too early to point out that although Mr Lippmann is no isolationist, a justification of withdrawal, however "realistic" in motive, is dangerous doctrine at a time when the Administration is struggling to educate public opinion to America's stake in the world.

* * *

Fiorello La Guardia

It is unlikely that Mr La Guardia had any future in politics. Maverick that he was, he belonged to the Roosevelt era. He was out of place in these Truman-Marshall-Vandenberg-Taft times. Yet the regret that his death has caused is not only a tribute to the honest, if somewhat volcanic, government he gave New York during twelve memorable years. One more vivid character has gone from the stage, a character who had the power to dramatise public issues and who, by arousing strong loyalties and fierce antagonisms, imparted a constant exhilaration to politics.

In the space of three years the United States has lost four men who were masters of the art of making the democratic process interesting, exciting and very personal to millions of their fellows. The other three were Alfred E. Smith, Wendell Willkie and Franklin Roosevelt. La Guardia was not of their standard, but he was of their kind. His death accentuates America's present poverty of dynamic politicians. It is said that the Democratic Party managers are searching the hedges and high roads for a vice-presidential nominee who will bring "glamour and

magnetism" to the ticket in 1948. But it is precisely these qualities in politics which constitute the only real scarcities in America today.

Shorter Notes

Americans who have grown cynical and confused about their heritage will have an opportunity to refresh their patriotism and democratic ideals when the "Freedom Train" comes to town. This seven-car train, sponsored by the Department of Justice, is a travelling museum containing the original Bill of Rights, George Washington's copy of the Constitution and other precious historic documents. But even such national treasures are no guarantee against controversy: Republicans charge the "Freedom Train" as a Democratic campaign stunt; the Communists that it is backed by reaction; the negro poet Langston Hughes asks pertinently:

When it stops in Mississippi will it be made plain
Everybody's got a right to board the "Freedom Train"?

*

Mr Herbert Hoover, who has enjoyed a revival of prestige and authority at the hands of the Administration, recently gave friendly Democrats a rude shock by publishing a magazine article reiterating the isolationist charge that Japan was unnecessarily provoked into Pearl Harbour and that the United States might well have stayed out of the conflict, bringing its unimpaired resources to the peace table to enforce a just settlement. Mr Hoover's hindsight is as faulty as his foresight on this issue.

*

The widely welcomed decision of the Atomic Energy Commission to release radio-active isotopes for scientific use abroad was not, it appears, unanimous. In the first split in the Commission on a major issue, Mr Lewis Strauss, the former New York banker, opposed the move on security grounds. The majority view was that "the risks were minimal and the advantages very large." Any public disagreement between members of the Commission on the security aspects of atomic energy may well be echoed later in the Joint Congressional Committee on Atomic Energy.

THE WORLD OVERSEAS

Summary of the General Report of the Committee of European Economic Co-operation

Chapter I—Historical Introduction

THIS chapter gives a general historical background to the work of the Committee and

- (i) describes the wealth and productivity of Western Europe before the war and the dependence of this wealth upon a high degree of international trade and of internal division of labour;
- (ii) describes the shattering of this delicate mechanism by the war and by post-war shortages;
- (iii) gives an account of the remarkable degree of recovery achieved immediately after the war thanks to self help, American aid and the work of Unrra;
- (iv) explains the reasons for the setback in recovery after the hard winter and drought of 1947 which has taken the form of an exhaustion of gold and dollar reserves at a time of great dependence upon the American continent;
- (v) and outlines the various steps taken by Mr Marshall and others to bring about the Paris Conference.

Chapter II—The European Recovery Programme

The recovery programme is based upon four points:

- (i) a strong productive effort by each of the participating countries;
- (ii) the creation of internal financial stability;
- (iii) the maximum co-operation between the participating countries;
- (iv) a solution of the problem of the participating countries' trading deficit with the American continent, particularly by exports.

The scale of the productive effort required represents an expansion of output similar in general scale to that achieved by the United States in the mobilisation years 1940-44, when coal output was increased by 34 per cent, steel output by 31 per cent, electric power by 61 per cent. The corresponding figures for Europe are 33 per cent, 60 per cent and 44 per cent. Europe's resources are insufficient to supply all the materials of recovery. At the same time neither Eastern Europe nor South-East Asia can produce their prewar share of Europe's imports. This fact enhances Europe's dependence upon supplies from the American continent and hence upon dollars. Without a solution of the dollar problem, there can be no effective recovery.

Chapter III—The Production Effort

The Committee concentrated its work on the key factors—food, agriculture, fuel and power, steel, timber, transport, and related industries such as agricultural and mining machinery and the general problem of labour. These factors are all inter-dependent, and shortages in one hamper recovery in the others.

By 1951, the population of Western Europe will exceed the prewar figure by 11 per cent. Goods and services must be provided to meet this increase.

National programmes aim at attaining the following objectives:

- (i) restoration of prewar bread grain and other cereal production, with large increases above prewar in sugar and potatoes, some increases in oils and fats, and as fast an expansion in livestock products as supplies of feeding-stuffs will allow;
- (ii) increase of coal output to 584 million tons—i.e., 145 million tons above the 1947 level (an increase of one-third) and 30 million tons above the 1938 level;
- (iii) expansion of electricity output by nearly 70,000 million kwh., or 40 per cent above 1947, and a growth of generating capacity by 25 million kw., or two-thirds above prewar;

- (iv) development of oil refining capacity in terms of crude oil throughout by 17 million tons to two and a half times the prewar level;
- (v) increase of crude steel production by 80 per cent above the present level to 55 million tons, or 10 million tons (20 per cent) above 1938;
- (vi) expansion of inland transport facilities to carry a 25 per cent greater load in 1951 than in 1938;
- (vii) restoration of prewar merchant fleets of the participating countries by 1951;
- (viii) supply from European production of most of the capital equipment needed for these expansions.

Food production is the first essential. By 1951 cereal production can be restored to prewar levels—but livestock will require more than four years—and meat production will only be 90 per cent of prewar. The supply of fish is already at the prewar level and can be raised. The following table summarises food output. According to these figures, France and Italy must have restored their cereal production by 1951.

Year*	1934-8	1946-7	1947-8	1950-1
All cereals.....	64.5	55.6	48.9	55.8
Bread grains.....	34.0	28.3	21.4	34.0
Potatoes.....	57.7	50.7	61.6	68.2
Sugar.....	3.4	3.3	3.4	3.9
Meat.....	9.0	5.9	6.0	8.1
Milk.....	72.5	55.7	57.0	73.4
Oil and fats.....	2.8	2.0	2.2	2.9

* Years run from July 1 to June 30.

The export surpluses of the participating countries will form an automatic and increasing type of mutual aid. The estimated increases in export surpluses are:

	1946-7	1950-1
Butter.....	87,000	154,000
Eggs.....	52,000	223,000
Meat.....	398,000	630,000
Fruit.....	550,000	1,991,000

Soil fertility must be restored and fertilisers are essential. Their production is already above the prewar level and present production will be doubled by 1951. With adequate supplies of phosphates and potash, this amount will cover the requirements.

Special long term projects such as the production of ground nuts in Africa will help to increase fat supplies.

Fuel and power must be increased. The United States today consumes 4½ times as much per head as Western Europe. Even before the war the ratio was 2½:1. Before the war, four-fifths of the power was drawn from coal. The substitution of petroleum products and hydro-electric power is planned.

Coal production is summarised in the following table:

	1938	1947	1948	1951
United Kingdom.....	231	199	214	249
Western Germany:—				
Bi-Zone.....	206	133	149	193
Saar.....	14	10	14	17
France.....	48	51	51	65
Belgium.....	30	24	26	31
Other Countries.....	23	22	24	31
Total.....	552	439	478	584

The increase in British production will be achieved by increasing manpower, modernising machinery, and introducing capital developments, among them 20 new sinkings.

The supplies of mining machinery amounting to over \$1 billion will be almost entirely produced in the United Kingdom.

Britain hopes to begin exports in April, 1948, with a figure of 6,000,000 tons for 1948 rising to 29 million in 1951.

The output in Western Germany in 1951 will still be less than in 1938 owing to the scale of destruction.

Mining supplies were examined and it is hoped that Sweden will raise its export of pitprops to 300,000 solid cubic metres a year (50 per cent above prewar).

Consumption of electricity in 1948 may be 80 per cent above 1938. The annual increase in generating capacity must be four times that of 1937/8.

A special working party is examining a completely international and co-operative power plan which includes 6 hydro-electric plants in Italy, France and on the Austro-Italo-Swiss frontier together with 2 lignite thermal plants in Germany and one geo-thermal plant in Italy.

To meet the disturbance in normal supplies of coking coal from the Ruhr and Britain, the Committee has evolved an emergency scheme of coke economy to cover the deficit originally estimated at 20 per cent in 1948. If this plan is successful, the following steel figures should be reached:

PRODUCTION OF CRUDE STEEL
(Million tons)

	1938	Best prewar Year	1947	1948	1951
United Kingdom.....	10.6	13.2	12.7	14.0	15.0
France.....	6.2	9.7	5.8	10.4	12.7
Belgium & Luxembourg.....	3.8	7.0	4.6	7.3	7.9
Italy.....	2.3	2.3	1.6	2.5	3.0
Other participating countries.....	1.8	1.8	2.0	2.3	4.1
Bi-Zone of Germany.....	17.8	17.8	2.8	4.1	(b) 10.0
Saar and French Zone.....	3.0	3.0	0.8	1.7	2.7
	45.5	54.7	30.3	42.3	55.4

(b) This figure does not prejudice any decision which may be taken later by the Council of Foreign Ministers.

Modernisation and re-equipment of the steel industry will be more important than new plant. Only 20 per cent of the 1951 output will come from new capacity. To secure the best results from their modernisation and development schemes for the steel industry the nations have agreed to an exchange of information.

Steel increases will make possible extensions in engineering. Western Europe can provide over 90 per cent of its need for mining equipment (estimated at \$3,700 million) and also for generating plant (\$5,300 million). It will produce two-thirds of the equipment for the petroleum industry. Apart from such items as continuous wide strip mills, it will provide most of the equipment for the steel industries. It can cover its long-term needs in agriculture. Enough locomotives can be produced to provide small exports, but freight cars will remain short. Economies are being examined in the form of an international freight car pool and it is proposed to standardise the design. The war loss of 22 million gross tons of shipping will be largely made good in the European shipyards.

Participating countries are to raise the production of timber by 10 per cent and the present high rate of cutting will be maintained in Western Germany.

Every nation has a labour shortage except Italy with a surplus of 2,000,000. Recruitment may later be possible in Western Germany. The Italian surplus, suitably trained, could meet all the participating nations' needs.

Chapter IV—Internal Financial and Monetary Stability

The report analyses the forces making for inflation in Western Europe of which the chief two are inadequate food production and budgetary deficits. Lack of faith in the currency encourages hoarding—of food, goods and capital—which in turn increases the gap between expenditure and real income.

External aid alone will permit sufficient distribution of consumer goods to break the spiral. Thus the provision of dollars will not only finance the trading deficit, it is the essential first step in internal stabilisation. By 1951, it is the aim that national expenditure and national income shall balance.

Various governments, in particular France and Italy, have undertaken to take the necessary measures to balance their budgets and to balance expenditure against revenue. All the governments are pledged to achieve internal stability. But the painful process of checking inflation would be greatly assisted by the injection of external resources to raise each country's reserves of gold and dollars. A general estimate of the sum needed is in the neighbourhood of \$3,000 million.

Chapter V—Economic Co-operation

The Report analyses the normal measures of self-help traditionally practised in Western Europe by means of trade.

The Governments pledge themselves:

- (i) to abolish as soon as possible the abnormal restrictions at present hampering their mutual trade;
- (ii) to aim at a sound and balanced multilateral trading system.

Both steps depend largely on Europe's ability to sell to the American continent.

The nations will pursue the multilateral reduction of tariffs and a Customs Union, to "be achieved by progressive stages over a period of years," is under consideration. A study group has been established for this purpose.

The French Government has declared its readiness to negotiate customs unions with nations "capable of being combined with the French economy in such a way as to make a stable unit." The Italian Government has associated itself with this declaration. Greece and Turkey have also undertaken to consider a regional customs union between their two "friendly and neighbouring countries."

The principal achievements of mutual co-operation are:

- (i) Co-operative plans to expand electric power without regard to national frontiers.
- (ii) Standardisation of types of equipment such as mining machinery and freight cars.
- (iii) An international freight car pool.
- (iv) Exchange of information on national steel programmes.

Where suitable international machinery for economic co-operation exists, the participating nations intend to use it. The technical committees have suggested the submission of some production problems to the Economic Commission for Europe.

The Committee may be reconvened after consultation. The Chairman, the Rapporteur General and various delegates will hold themselves in readiness to provide the United States Government with information on the Report.

Chapter VI—The Import Requirements

In estimating the scale of imports necessary to implement the Plan, the Technical Committees have attempted to estimate the supplies available and have valued them at the prices ruling on July 1, 1947. The following table gives the general result.

£'000 MILLION AT JULY 1, 1947, PRICES

	From U.S.A.	From rest of American Continent	Total from American Continent	From other non-participating countries	Total
1948.....	6.0	3.2	9.2	4.7	13.9
1949.....	5.3	3.9	9.1	5.4	14.5
1950.....	4.8	3.8	8.6	5.9	14.5
1951.....	4.3	3.9	8.2	6.2	14.4

The volume of imports is much the same as in a normal prewar year, but whereas 40 per cent normally came from the American continent, the complete disruption of non-American sources of supply, particularly in Eastern Europe and South East Asia, has now raised the proportion to two-thirds.

The report assumes (i) "a substantial and steady resumption

of East European food and timber supplies." The flow of cereals will be at the prewar level in 1951 and timber will be 75 per cent of prewar; (ii) a steady recovery in Asiatic supplies.

IMPORT PROGRAMME FROM THE AMERICAN CONTINENT (\$'000 Million at Prices of July 1, 1947)

	1948		1951		Total 1948-1951		
	U.S.A.	Rest of America	U.S.A.	Rest of America	U.S.A.	Rest of America	Total
Food and Fertilizers	1.5	1.8	1.2	2.2	5.4	8.3	13.7
Coal	.3	...	.05	...	.7	...	.7
Petroleum Products*	5	...	.55	...	2.2	...	2.2
Iron and Steel	.4	...	.3	...	1.2	.1	1.3
Timber	.1	.2	.1	.1	.4	.6	1.0

* This table appears in Chapter VII, but for the sake of logic is included at this point.

There will be a permanent increase in imports of petroleum. The rise (from 49 million tons in 1947 to 78 million tons in 1951) assumes no petrol rationing. Consumption in 1951 per head of population will be 15 per cent of consumption in the United States.

"Other imports" are mainly raw materials normally needed in Europe's economy, such as cotton and non-ferrous metals.

Food imports are based on estimated availability rather than need.

IMPORT REQUIREMENTS OF FOOD AND FEEDING STUFFS

	1934-8	1945-7	1947-8	1950-1
Bread grains	14.0	15.3	23.7	17.9
Coarse grains	11.4	4.7	8.6	11.7
Sugar	2.7	1.7	1.7	2.3
Meat	1.7	1.6	2.1	2.5
Fats (oil equivalent)	2.6	1.1	1.7	2.3
Oilcake*	5.0	1.9	3.5	5.4

* Including the oilcake contents of imported oilseeds.

This programme should give the following consumption per head of population.

(Kg. per Head per Year)

	1934-8	1947-8	1950-1
Bread grains	192.0	159.0	179.0
Potatoes	236.0	228.0	245.0
Sugar	27.4	20.0	25.2
Meat	42.9	30.0	37.6
Fats (oil equivalent)	24.1	17.0	22.6

Definite estimates of the provenance and distribution of the cereals is difficult to make. The belief is that 20 of the annual figure of about 25 million will come from the American continent, with 8,000,000 to 9,000,000 tons from the United States.

Chapter VII.—The Problem of Payments

The account of the problem of payments "is built primarily from the experts' view of the prospective commodity supply to the participating countries as a whole, rather than from independent and unco-ordinated financial estimates from the individual countries." The analysis deals with trade with the American continent rather than with the United States, since dollars are generally necessary.

BALANCE OF PAYMENTS OF PARTICIPATING COUNTRIES AND WESTERN GERMANY IN 1948 (\$'000 Million)

	American Continent	Other Non-participating Countries
Imports	9.17	4.70
Exports	2.16	4.30
Net Surplus (+) or Deficit (—) on invisible account	0.57	0.38
Dependent Territories, net surplus (+) or deficit (—)	0.45	0.22
	8.03	0.24

The adverse balance with the American continent is not abnormal. In 1938 it was \$1,750 million dollars. What is abnormal is the loss of other assets, overseas investments, colonial sales to America and dollar earning trade with the rest of the world which used to provide the multilateral balance.

Assuming favourable external conditions and a steady fall in the price of imports from America, the following deficits are expected:

(\$'000 Million)

	1948	1949	1950	1951	Total
U.S.A.	5.64	4.27	3.23	2.62	15.81
Rest of American Continent ..	1.94	1.82	1.30	0.91	5.97
Deficit of Dependent Territories	7.58	6.09	4.58	3.53	21.78
Total	0.46	0.26	0.07	0.13	0.66
Less Possible Capital from the World Bank	8.04	6.35	4.65	3.40	22.44
Total	0.92	0.89	0.72	0.60	3.13
Total	7.12	5.46	3.93	2.80	19.31

The decline in dollar requirements is due to four factors:

- a fall in the need of American imports of certain types.
- increased production in Europe.
- more supplies available in the rest of the world.
- an export drive to the United States. The proposed export drive to the American continent is planned on the following scale:

('000 Million)

	U.S.A.	Rest of American Continent
1948	0.85	1.31
1949	1.11	1.72
1950	1.23	2.14
1951	1.48	2.46

By 1951, western Europe hopes to have a favourable balance with other non-participating countries of \$1,800 million.

These plans depend upon the American continent buying from Europe or permitting other countries to earn dollars in America.

The Trade Charter

A Summary

THE Charter of the proposed International Trade Organisation has now been published (Cmd. 7212) in the form in which it emerged from the four-month debate in the second session of the Preparatory Committee of the United Nations Conference on Trade and Employment meeting in Geneva. In its latest version the Charter cannot yet be regarded as the final product of the drawn-out discussions to which it will have been subjected. There are no less than 65 individual reservations and expressions of dissent appended to the latest text (eleven came from Chile and two from the United Kingdom) and they promise some continuation of the debate and even of the process of amendment when the Charter is submitted to the full meeting of the United Nations Conference on Trade and Employment which is to be convened in Havana, Cuba, in November. It should, however, be reasonable to assume that further amendments will be of relatively minor importance. It was in Geneva that the real debate on this document took place, as may be gauged from the extent and variety of the differences between the Geneva version and its predecessor, the Lake Success version of the Charter.

The main structure of the document remains unchanged. It contains nine chapters, of which the last three may conveniently be ignored at the moment since they deal solely with the organisation, administration and other technical matters referring to the mechanism of the proposed International Trade Organisation. Of the first six chapters some also call for fairly summary treatment.

The first is merely a statement of the purpose and objective of the proposed ITO. The second deals with employment and economic activity, and in relation to its length—a mere five short articles—caused more concentrated debate than any other section. What this chapter says may be summarised as an assertion that all members will do their best to achieve and maintain full and productive employment and that, since they accept international responsibilities for such policies, they will forswear measures that will help them in this objective merely by exporting their unemployment to others.

The third chapter on economic development has been considerably expanded and, as it now stands, provides what amounts to a virtual blanket exemption from the provisions of the Charter to countries whose resources are as yet relatively underdeveloped and which desire to diversify their economies by setting up secondary industries behind the protection of high tariff walls. There is, however, an article in this chapter which has considerable topical importance and interest in view of the Marshall Plan discussions. It is Article 15, which states that special circumstances may justify the setting up of new preferential arrangements between two or more countries, even when those countries are not contemplating a customs union, if the arrangements are part of programmes of economic development or reconstruction. This would appear to give ITO blessing to the development of preferential arrangements in Europe even if these do not ostensibly anticipate a customs union.

The fourth chapter, that dealing with commercial policy, is the crucial section of the Charter and further reference will be made to it subsequently.

Chapter five deals with restrictive business practices and has suffered little amendment in its latest phase of evolution. It still avoids the frontal attack on cartels and monopolies which earlier versions of the Charter envisaged, but rather sets up the ITO as a recipient of complaints against the abuse of restrictive practices and as the ultimate creator of a body of case law to be applied against offenders.

Finally, there is chapter six on inter-governmental commodity agreements which defines the conditions under which inter-governmental action to stabilise prices, control production and influence consumption of primary commodities would be justified. These provisions and others setting out the manner in which such commodity agreements should be operated and the objectives they should serve will no doubt acquire considerable importance in due course. But the problems of glut with which they are primarily concerned are not those that face the world in the immediate future and without in any way decrying their importance or denying the inherent necessity for including commodity agreements in the Charter of the proposed ITO, one may be excused at present for turning aside from this chapter and returning to the articles dealing with commercial policy.

It is this section of the Charter which has undergone the most significant amendment in the course of the Geneva debate. It emerges from that ordeal in a form far more realistic and appropriate to the peculiar circumstances of the times than could be claimed for any of the prior versions of this chapter. At the risk of sinning against that meticulous accuracy which can apparently only be gained within the phraseology of legal jargon, it may be helpful to give a free and very abbreviated translation of the more important articles of this chapter, which is divided into six sections and 28 articles. The first of these, Article 16, redefines our old friend, the most-favoured-nation treatment clause, and significantly asserts that this treatment is to be accorded to other members of ITO only. This opens the door to escape from the unconditional over-all application of the MFN clause, which in the past has done nearly as much harm as good, partly by visiting on the undeserving the benefits of other countries' virtues (and therefore making vice pay), partly by condemning many attempts by small groups of nations to extend among themselves the principles of freer trade.

On the relation between the reduction of tariffs and the elimination of preferences (Article 17), the new text is more elastic than the old, which demanded that every reduction in tariff rates should be automatically applied to reduce or eliminate margins of preference. Under the new text, it will be possible concurrently to negotiate reductions in tariff and in preferential rates provided that the margin between the two is not increased.

It is around Articles 20 to 23 inclusive that the main debate raged. These are the articles dealing with the application of quantitative restrictions on imports and exports. Since in the years immediately ahead the trade of the world must inevitably be powerfully influenced by balance-of-payments difficulties, recourse to quantitative restrictions is inevitable and the topicality of these articles is, therefore, self-evident. The Charter sets out as a general principle that quantitative restrictions on imports or exports should be eliminated, whether these restrictions be imposed through quotas, licensing or other measures. Apart from some specific exceptions to this rule, of which the most important refer to restrictions on agricultural or fisheries products designed to help inter-governmental control schemes, the Charter then goes on to define a wider range of exceptions intended to safeguard members who are in balance-of-payments difficulties. These may restrict imports to forestall or stop a serious decline in their monetary reserves, or, in the case of a member with low monetary reserves, to achieve a reasonable rate of increase in its reserve. Article 21, in which this general authorisation of quantitative restrictions is made, states that it is recognised that in the early years of the ITO all members will be confronted in varying degrees with problems of economic adjustment resulting from the war and that during this period the ITO

shall take full account of the difficulties of postwar adjustment and of the need which a member may have to use import restrictions as a step towards the restoration of equilibrium in its balance of payments on a sound and lasting basis.

The Charter then proceeds (Article 22) to lay down that quantitative restrictions must be administered in a non-discriminatory manner:

No prohibition or restriction shall be applied by any member on the importation of any product of any other member country or on the exportation of any product destined for any other member country unless the importation of the like product to all third countries or the exportation of the like product to all third countries is similarly prohibited or restricted.

The danger of casting the distribution of international trade into a rigid and unalterable mould which is evoked by this clause, and the suggestion that because imports have to be cut from one country, owing to balance-of-payments difficulties, they must be cut from all others, are largely removed by the next section of the Charter (Article 23), which lays down the exceptions of the rule of non-discrimination. These are so important and so relevant to present-day circumstances that they deserve rather fuller translation than has been given to preceding articles of the Charter. The Charter accepts the argument that when "substantial and widespread disequilibrium prevails in the international trade and payments" a member may be able to increase its imports from certain countries without unduly depleting its monetary reserves

if it is permitted to depart from the rule of non-discrimination. Accordingly, it provides that when such disequilibrium prevails

a member applying import restrictions under Article 21 may relax such restrictions in a manner which departs from the provisions of Article 22 to the extent necessary to obtain additional imports above the maximum total of imports which it could afford in the light of the requirements of Article 21 [allowing quantitative restrictions] if its restrictions were fully consistent with Article 22 (i.e., if those restrictions were administered in a non-discriminatory manner).

Up to March 1, 1952, members are given what is virtually a free run in availing themselves of these exceptions to the rule of non-discrimination. The Charter asks members "to recognise the need for close limitation of such departures so as not to handicap achievement of multilateral international trade"; and it also makes some provision to prevent the development of bilateral and discriminatory trading arrangements to a point at which trade in terms of convertible currencies would be seriously restricted. These, however, are mere exhortations to reasonable conduct. They are not precise instructions. Provided members keep the ITO informed about the actions they take in departing from the strict line of non-discrimination, and provided "such action does not cause unnecessary damage to the commercial or economic interests of any other member," the deviators are granted virtually complete freedom of action. Nor later than March 1, 1952, however, any member who maintains or proposes to embark upon discriminatory quantitative restrictions on trade must seek the approval of the ITO. Thereafter the initiative for such action and for judging whether prevailing circumstances justify it, will lie not with each member but with the organisation.

Beyond these blanket exceptions from the rule of non-discrimination up to March 1, 1952 (the transitional five-year period under the International Monetary Fund agreement), Article 23 of the Charter also provides three sets of specific exceptions. The first is that which allows discriminatory commercial arrangements between groups of territories having a common quota in the IMF (this would allow arrangements of this kind between Great Britain and the colonies). The second relates to measures designed to assist until the end of 1951 a country whose economy has been disrupted by war. The third is the provision by which the Charter throws the door wide open to any discriminatory measures which members may apply if Article 7 of the IMF agreement (the scarce currency article) is invoked. After all these exceptions are allowed for, there is not much that remains of the doctrine of non-discrimination, except as an objective which members of the Organisation will strive to reach by 1952 and which, even then, will be hedged by escape clauses to which appeal will be available to any member in genuine balance-of-payments difficulty.

In all these issues involving consideration of the balances of payments and the monetary reserves of members, the ITO will act in close consultation with the IMF. Article 24 of the Charter sets out the general lines of this co-operation and lays down the general principle that the two international organisations shall pursue a co-ordinated policy with regard to exchange questions.

The next five articles of the Charter (25 to 29 inclusive) deal with subsidies, with special emphasis on export subsidies, which are defined as those which result in the sale of a product for export at a price lower than the corresponding price in the home market. In general, export subsidies are only permitted to continue for two years. Thereafter export subsidies will only be permitted with the sanction of the ITO.

After this comes the section of the Charter dealing with state trading. The relevant Articles 30 and 31 apply not merely to direct state trading activities, but to those of marketing boards established by member states. The general intent of these two articles can be stated briefly: it is that state trading enterprises shall be guided by commercial considerations in making their purchases and sales. Commercial considerations are to include "prices, quality, availability, marketability, transportation and other conditions of purchase or sale"—a definition which should not be found too restrictive. The Charter also endeavours to legislate regarding the margin between the price at which a state monopoly purchases goods and that at which it sells in the home market—a margin which is tantamount to the import duty the state would levy if the goods were brought in by private traders.

The remainder of chapter four on Commercial Policy is devoted to "general commercial provisions," including the regulation of such matters as freedom of transit, anti-dumping duties, customs valuations, marks of origin, information, statistics and trade terminology.

When the full Charter was presented to the plenary meeting of the preparatory committee at Geneva last month Mr Harold Wilson, Secretary for Overseas Trade, made a speech which portrays the attitude of the British Government towards this document and to its applicability in the abnormal circumstances that prevail. The salient passages of this statement deserve quotation.

The work of the past four months has proceeded against a background of a darkening storm in international economic affairs: hence the criticism that our work here has been in vain and remote from the realities of the present situation. I want, for our part, to repudiate that suggestion. But none of us would claim that our work here can ever yield its true value unless all nations recognise that the hopes we all hold of establishing a new order in international trade are dependent for the fulfilment on the solution of the world problems which are now pressing upon us.

The Draft Charter [the committee] has drawn up, shows what is necessary to achieve a multilateral trading system based on the freest possible flow of world trade: this, we believe, is in the long run as much in our own national interests as in those of the world as a whole.

It is of the utmost importance that we should not bring discredit on the fundamental principles of non-discriminatory multilateral trading by attempting to move too far and too fast in this difficult period when many of the conditions essential for such a system have not yet been realised.

It is not for us here in Geneva to say how equilibrium can be restored... it is a problem of restoring our national production in each country, of building up again our war-shattered economies... in our own case we shall find it necessary and desirable to have even closer economic co-operation with other countries of the Commonwealth. I feel that the Governments represented at the Preparatory Committee must face the position frankly, not only that our work itself will be in vain unless all the Governments and agencies concerned can solve this overriding problem, but also that the methods we may have to use in the intervening months and years may appear to be opposed to the principles and methods of the Draft Charter. Many of us will certainly have to assist our position by agreements with particular countries.

But in these methods designed to meet short-term and urgent problems which are pressing upon us, the guiding principle must be that we do not establish permanently artificial channels of trade which will in the long run defeat the principles and methods we have been discussing here. To do so would reduce the total volume of world trade in goods and services and bring about a lower standard of living for the peoples of the world than we hope to achieve as a result of full economic co-operation on a multilateral basis.

Photography's 'TIME MICROSCOPE'

This 'Kodak' high-speed cine camera stretches split seconds into minutes, enables events, over in a flash, to be easily observed. Locating faults in high-speed machinery... testing a drop-forging hammer... the action of a shuttle in a loom... it is for such purposes that the high-speed camera is being used in industry. Movies can be made at 3000 frames a second—with the film streaking through at 120 m.p.h.! By showing such movies at the normal 16 frames per second, time is 'magnified' nearly 200 times and valuable data is often obtained.

Can this camera help your industrial production?

By Candlelight

A woman buying an evening dress prefers not to choose the shade in daytime, because she knows that it may look different by artificial light. Colour depends on the nature of the light that falls upon the pigment or dye. The white light of the sun is a mixture of many coloured lights, ranging from red to violet. When it falls upon a poppy, a substance in the petals absorbs all except the red rays. These are reflected to the eye, and give the impression of redness. Similarly, grass looks green because it reflects the green rays and absorbs the other colours. Few coloured substances, however, reflect one sort of light to the complete exclusion of all the rest. Poppy-red reflects some blue, and grass-green some blue and yellow. Hence, grass seen by a pure green light would not have quite the same appearance as in daylight, since there would be no blue or yellow for it to reflect. Facts of this kind make it imperative for the British dyestuffs chemist to know exactly what kinds of light each dye reflects. For such information he relies on the spectrophotometer. Here the coloured light from the dye is spread out by a prism or fine grating into its colour components, enabling the quantity of each component to be measured on a graduated scale. Such data are essential, for example, when blending dyestuffs for colour photography or studying the behaviour of dyes in sunlight and artificial light. The British chemical industry has available at the service of the nation much valuable information on the colour characteristics of dyestuffs and is constantly working to enlarge it.

Research Services Ltd. specialises in market research, and has the knowledge, the experience and the organisation needed to carry out first-rate consumer surveys. It maintains a permanent and full-time field force of trained investigators and supervisors. Qualified staff is available at all stages of the work to ensure appreciation of the client's problem; a sound questionnaire; accurate sampling; skilled interviewing; expert statistical analysis; and, finally, intelligent interpretation of the results. During the past year, Research Services Ltd. has undertaken consumer surveys on a wide range of subjects; among its clients are:

THE BUSINESS WORLD

Can the Empire Supply Lancashire?

THE dollar shortage and the consequent curtailment of imports from the United States has naturally caused Britain to seek alternative sources of raw materials and foodstuffs within the "sterling group," particularly the Empire. Cotton has always been an important dollar import although in recent years relatively larger quantities have been purchased from other countries. But cotton is not a homogeneous commodity; it varies by type and staple length. Broadly, there are two main classifications: American type and Egyptian type, which are differentiated by the fineness of the fibre. Egyptian-type cotton is generally used for making finer yarns (of counts above 50s), particularly tyre and hosiery yarns. American-type cotton is used predominantly for coarser yarns. These cottons, however, are by no means exclusively produced in the two countries from which they are named. American-type cotton is grown in Brazil, the Belgian Congo, and British East and West Africa. Similarly, Egyptian-type cotton is grown in the important neighbouring area of the Sudan. The differing lengths of the fibre—the staple—play an important part in cotton spinning. Generally, American-type cotton is shorter than $1\frac{1}{4}$ in., while Egyptian-type is of longer staple; but there is considerable variation within each group. A long-staple cotton is usually considered to be $1\frac{1}{4}$ in. or longer and short-staple less than $\frac{7}{8}$ in. The bulk of the American-type cotton used by Lancashire has a short-medium staple length of $\frac{11}{16}$ – $1\frac{1}{4}$ in. About 80 per cent of all American-grown cotton consumed in Britain is of this character and almost 85 per cent of all American-type cottons used. The problem of finding an alternative supply of cotton for Lancashire, from sources other than the United States, accordingly resolves itself into obtaining an additional 70,000 tons a year of short-medium staple, which was the quantity of this type of American-grown cotton consumed in the United Kingdom in 1946. Consumption last year was, of course, sub-normal, because the output of cotton yarn in Lancashire was no more than 54 per cent of the pre-war figure. Already last year some 160,000 tons of similar American-type cotton obtained from countries other than the United States were used.

The declining dependence of Lancashire on the United States can be seen from Table I, which shows the proportionate consumption of raw cotton in the spinning industry analysed according to countries of growth. In 1939, the United States supplied nearly one-half of all cotton used in the spinning industry; by 1946, this proportion had dropped to a mere one-quarter, compared with a reduction of no more than 43 per cent in total consumption. On the other hand, supplies of American-type cotton from Brazil, British East and West Africa and the Belgian Congo showed a relative increase. Consumption of Indian cotton has also declined during the war years owing to shipping difficulties and to reduced supplies available for export. Egyptian cotton maintained its relative share in total British consumption though supplies from the Sudan increased.

These changes in sources of supply of cotton have been largely conditioned by the exigencies of war, but the shortage of foreign exchange is now closing even some of those sources which were open in war time. In 1946 Empire cotton, including Indian and Sudanese, comprised only 21 per cent of British consumption; even this figure requires careful interpretation for such Indian cotton as is exported is coarse and of short staple, while high-

quality Sudan cotton is interchangeable with Egyptian. British West Africa is at the moment the only Empire source of short-medium cotton, and if the dollar cost of American-type cotton imports is to be reduced, growth of this type must be developed in Empire countries and imported in substitution for dollar supplies. It is not surprising that, at present, Empire countries find themselves unable to play more than a minor part in supplying Lancashire, for hitherto all colonial cotton schemes have expressly concentrated on longer-stapled varieties so as not to compete with American supplies.

Any estimate of a potential increase in Empire cotton production should be reviewed in the light of world output, shown in

TABLE I U.K. COTTON CONSUMPTION BY GROWTHS

* Mainly $\frac{11}{16}$ – $1\frac{1}{4}$ inch staple. † $1\frac{1}{4}$ – $1\frac{3}{4}$ inch staple. ‡ "Tree" cotton used largely for mixture with wool. § Mainly short staple, less than $\frac{7}{8}$ inch. ** Provisional, estimated on basis of first six months.

Table II. Output fell during the war years, for cotton acreage was reduced in order to obtain greater food production. The world cotton area in 1946-47 covered only 58 million acres compared with 95 million acres in the peak season of 1937-38. But production has not declined so precipitately as the area under cultivation, for yields have continued to increase and the proportion of longer-stapled cotton grown has risen.

The Empire accounts for between 15 and 20 per cent of world cotton output but the greater part of this is represented by output in India and the Sudan. Indian cotton was formerly largely of short staple. In 1934 three-quarters of the crop was under $\frac{7}{8}$ inch. But by 1945 the proportion of short-staple cotton was reduced to no more than one-third. The greater demand for food production during the war years caused a rather severe restriction of short-stapled cotton acreage. Indian long-stapled cottons are largely consumed domestically and the short-stapled varieties (which Lancashire requires only in limited quantities) exported. The Sudan's output is of Egyptian type, grown on a communal basis on irrigated land under European supervision. The remaining Empire production accounts for a mere 1 per cent of the world total, and although much of it consists of American-type cotton, it is largely of too long staple for Lancashire. In British East Africa it is $1\frac{1}{8}$ – $1\frac{3}{8}$ inch, while in the British West Indies only high quality Sea Island cotton is grown. Only Nigeria produces a cotton of quality and staple comparable

to the type mainly used in Lancashire but its output is still small.

There is little possibility of expanding production either in India or the Sudan to meet the particular requirements of the British cotton industry. India's cotton textile industry was greatly expanded during the war to cover service requirements, and if this expanded capacity is adequately utilised—which is likely enough while the war-shattered Japanese cotton industry is being revived—India is likely to require large quantities of imported long-staple cotton from the Sudan and Uganda to supplement its increased home production of this variety. Output in the Sudan is restricted by the permitted off-take of water from the Nile and cultivation has already been developed to the limit. In any case there is little incentive for Sudanese growers to replant to an American short-medium-staple cotton, for at the moment Britain and India purchase all available quantities of Egyptian-type cotton.

The main hope of an expansion in Empire cotton supplies lies accordingly in East and West Africa, where development can be carried out either by increasing the output of the existing cotton area, or by breaking in new lands. Informed observers believe that cotton output in these territories could be doubled—given improved husbandry, water conservation, better spacing of the cotton plants, proper weeding, closer picking of the bolls, and adequate use of fertilisers and insecticides. But the small scattered plots which make up a native farm would have to be consolidated before any real progress in improved farming methods could be made. And such a radical change would require adequate supervision, careful and sympathetic encouragement, and possibly the introduction of communal farming schemes similar to those which have been so successful in the Sudan. The opening up of new areas introduces the problem of moving native populations to them, for cotton, unlike groundnuts, cannot yet be grown under fully mechanised conditions; in particular it requires a large amount of labour for picking. Resettlement alone would

be very difficult to accomplish, even though many areas, particularly in Tanganyika, are greatly overcrowded. In any case, East African cotton is too long in staple for Lancashire and its lack of uniformity, which is attributable to bad sorting and grading—causes endless trouble to British spinning mills. East African ginning mills are operated by Indians, primarily for the Indian market, which apparently does not object to lack of

uniformity in its raw cotton supplies. Replanting the East African cotton area to a shorter staple would present few technical difficulties to the farmer, although it might mean that the gins would require some adaptation. But while India continues to be a fruitful market for East African cotton, there seems to be little likelihood of getting the farmers and the ginners to switch to Lancashire types and conform to Lancashire's requirements of grading. In Nigeria many of these problems do

not arise; the staple length of cotton grown is within the short-medium range, and all the ginning is centralised under the control of the British Cotton Growing Association. But there is a long-established local weaving industry which, given the present shortage of imported textiles, absorbs much of the local raw cotton output, and diverts it from export channels.

The problems to be solved in any scheme for developing Empire cotton production, clearly, are not simple. Yet they are not insuperable, although many delicate political issues would need to be resolved. The decision to embark on such a policy must depend on the judgment whether the dollar shortage is to be regarded as a short or long-term phenomenon. If dollars are to remain perennially scarce, this factor, not calculations of relative economic cost, will be decisive. The problem would then be to increase the current cotton production of East Africa (less Uganda) and West Africa from the present level of about 18,000 tons to 88,000 tons—even on the hopelessly pessimistic assumption that Lancashire's yarn output is permanently depressed to last year's level and that none of the expansion which the home and export markets urgently require will be forthcoming. Even so, it is a tremendous task, and the initial costs of any such scheme would inevitably be high.

The scheme would have to be conceived as a long-term plan covering the next 10 to 15 years, during which American-grown cotton would gradually be replaced by expanding Empire supplies. The maximum possible expansion in the total crop by the end of this period has been estimated at 90,000 tons, although this may prove to be too optimistic. In the interim period, Lancashire would have to make do with inferior cotton and restricted supplies which would certainly prejudice its efforts in the world's export markets.

But what of the effects of such a scheme on American cotton prices? With a normal cotton crop in the United States of say, 6,000 million lb, the American textile industry, operating at a higher rate than at present, might consume about three-quarters, leaving one-quarter for the export market. Before the war, America exported 3,000 million lb, or twice this quantity. And given the absence of the United Kingdom from the American market, and perhaps (though more doubtfully) Japan and Germany, the export price of American cotton would almost certainly fall, perhaps to a level at which the increased output from Empire countries could not possibly be produced. The argument turns—apart from doctrinal questions of non-discrimination—on whether, when dollars are scarce, dear sterling cotton may not still be "cheap." The vital period, however, is the next five years. If increased sterling cotton supplies are to be developed within that time, schemes must be started at once. Since the war British purchases of American-grown cotton have already been restricted, and current stocks of this type—on the basis of last year's consumption—are believed to be somewhat over 6 months' supply. No doubt any Marshall aid will presuppose the maintenance of a certain level of British purchases of American cotton; to that extent the problems of the interim period would be eased. Only if, in the considered judgment of the Government, the dollar problem is likely to be an abiding one for this generation can the development of Empire cotton growing to the point of sterling self-sufficiency be justified. This is not a question open to proof; it is rather a balancing of hope against despair. If despair wins, then despite all the difficulties and costs, which will be numerous and burdensome, the large-scale expansion of Empire cotton growing may be justified by the sheer necessity of ensuring adequate raw materials for one of Britain's biggest basic industries.

Progress in Shipbuilding

IN this phase of "paper" targets and production crises it is refreshing to be able to point to one, at least, of Britain's major industries which has made fair headway against its supply difficulties. The target originally set for merchant shipbuilding output in 1947 was 1,250,000 tons gross, a level which, at the beginning of the year, the industry was confident it could attain. After the power crisis, when the Government began to revise its production targets, it estimated that about 800,000 tons gross was the most that could be expected in the new circumstances. More than half the lower figure, however, and nearly half the higher, has already been achieved; and there are some who hope that the supply position may improve, rather than deteriorate, during the remainder of the year.

One reason for this relatively good performance is that shipbuilding is more fortunate than many other industries in its location; the majority of the shipyards escaped the worst consequences of the fuel cuts, for Belfast and the Clyde were scarcely affected and the North-East Coast came off comparatively lightly. The exceptionally bad weather, however, was a great handicap, for a large amount of the work is necessarily done in the open air. The indirect effects of the fuel crisis were more serious, and were felt long after the weather improved, because work then began to be held up for lack of improved, because work then began to be held up for lack of component parts, and supplies of such materials as steel and timber caused increasing anxiety.

But in shipbuilding the Government's system of priority for steel created more alarm than it need have done—or would have done had it been more fully explained when it was imposed. The Government pronouncement, while it emphasised the determination to avoid a repetition of the power crisis next winter and therefore restricted priorities in steel allocation to

programmes directly concerned with the provision of fuel and power, had in fact few practical repercussions upon the shipbuilding industry. But as the official statement about steel allocations gave little or no sign of recognition of the importance of shipbuilding as a direct and indirect producer of foreign exchange, considerable perturbation was caused among shipbuilding employers and workers, as well as among shipowners and the shipping world generally. At one time the industry's steel allocations were only about half its normal requirements, but it now appears that the allotted figure existed only as a planner's calculation; in practice the steel supply was usually better than the paper figure suggested. In fact, it is reasonable to suppose that the planners found that changes in the planned "allocation" could not significantly alter at short notice the gearing of the steel industry—simply because of the fact that mills which had been designed to produce the qualities of steel required for shipbuilding would go on doing so as long as their supplies of coal and raw materials permitted. So long, therefore, as the output of the steel industry is maintained, it seems that the proportion produced for shipbuilding purposes will not be greatly changed by altered "allocations." Meanwhile, the paper cuts have been partly restored, and the vigorous protests from the shipyards about the effects of steel shortage have almost ceased.

The threat to steel supplies nevertheless seemed very real in the spring. But it takes a long time to build a ship, and in steel shipbuilders do not live from hand to mouth. Economies had to be practised and stocks carefully watched and distributed among the work in hand, frequently with the effect that work proceeded more slowly on individual ships—even though more ships, particularly at the fitting-out stage, were being handled at

THE BANK IS INTERESTED

It is interested in its customers, in their affairs and in their business ventures; it is ready, by direct assistance and friendly counsel, to help those affairs forward, for it recognises that the prosperity of the Bank is to be found in the prosperity of its customers. It is, therefore, good business to keep in touch with your Bank. The Manager at any branch of the Westminster Bank will be glad to discuss with you any problem in which the services of the Bank can usefully be employed.

WESTMINSTER BANK
LIMITED

Trading Opportunities in the NEAR EAST

Close contact, covering 45 years, with every phase of commerce, industry, agriculture and finance in the Near East, enables the Banque Zilkha, S.A.E. to provide valuable banking service to firms proceeding with plans for development and expansion in Near East markets.

Familiarity with local business conditions and customs constitute a guarantee of efficient and prompt attention.

the same time. It is notable, for example, that the tonnage of ships completed in the month of June was more than twice the combined total of the two previous months. The launching programme, too, often had to be adapted to conform with the current availability of various materials and components, so that various ships were launched in different stages of completion, some requiring more and some less than the normal volume of work in the fitting-out berth. These expedients are evidence of efficient shipyard management the effects of which become visible only over a period, and are not necessarily reflected in immediate and short-term output figures.

It should be noted, too, that shipbuilding statistics cannot tell the whole story. For example, they do not show the extent of the work which has been done in reconverting ships from war-time to peace-time purposes. The only available statistics for this type of work are, in fact, most misleading. From the figures published in the *Monthly Digest of Statistics*, for example, it would appear that some 3,500,000 tons gross of British shipping is immobilised in the shipyards, awaiting or undergoing reconversion or repair. In fact, a large proportion of this total is routine survey and repair work which may occupy only a few days between voyages, and is often carried out while the ship is loading or discharging. Apart from the normal work of ship-repairing firms, there is also a large number of passenger liners which are being reconverted by their builders. Thus, whenever shortages have delayed the completion of new ships, reconversion work has been correspondingly accelerated, and the many liners which have been returned to service in recent months bear witness to the considerable success of this task. Britain's lead in the restoration of peace-time shipping services on the North Atlantic "hard currency" route is a noteworthy example.

As a result of this effort, it is estimated that about one-third of the total reconversion programme has already been completed, which is a notable addition to the shipbuilding "output" measured by the statistics of new tonnage. Reconversion work, it should be noted, does not make such heavy demands on materials or components, since most of the equipment and furnishings were removed from the ships before they entered war service, and were then put in store.

The rate of new building, however, still depends on a continued and adequate supply of materials, especially of steel and also of timber, of which hardwood is a big and scarce item. The use of substitute materials, mostly in the finishing trades, has achieved some economy, but imported hardwoods cannot be dispensed with entirely, and the effect of the cuts in timber imports already announced is still uncertain. The supply of component parts and sub-assemblies is equally important. Indeed, it is not always appreciated that shipbuilding is to such a large extent an assembly industry. It is only necessary to compare the cost of a completed ship with that of a luxury hotel or block of flats on land to appreciate this aspect of the supply problem. Tons of paint, miles of wiring and piping, thousands of horsepower of electric and other propelling and auxiliary machinery are required for a ship of any size, involving the work of hundreds of subcontracting firms all over the country. Radio and navigational equipment, anchors, deck machinery, glass, floor coverings, propeller castings, rope and similar items are required in large quantities, and a stoppage in the supply of any one item may hold up the delivery of a ship. Instances have occurred during the year in which ships have been prevented from entering service because of the lack of such small items as taps or doorknobs—deficiencies which sometimes seem to have resulted simply from the difficulties of the licensing system. There are signs, however, that this sort of shortage is being overcome.

If more serious bottlenecks do not recur—and it would be rash at this stage to count upon a smooth flow of components and supplies—the progress achieved to date should continue. Certainly the industry's export effort should ensure it a reasonable

priority for many supplies. It is impossible to give any precise estimate of the money value of the work in the shipyards, but with well over 3,000,000 tons of orders on the books, the total cannot be much lower than £250 million or so. One-third of these orders are for direct export to many countries, including Argentina, India, Portugal, France, Norway and Sweden. The rest are for British shipowners, who will employ the vessels on the world trade routes where they will either bring in invisible income for Britain or save invisible outgo—buttressing in either way the unstable balance of payments.

Sir Stafford Cripps has set the shipbuilding industry the task of doubling the rate of exports which it achieved in the last quarter of last year by the middle of 1948, and of producing a further increase by the end of 1948 equivalent to 166 per cent of the October-December rate last year. At the prices prevailing in the fourth quarter of 1946, the monthly rates of exports which the shipbuilding industry is set to achieve are £1½ million by the middle of 1948 and £2½ million by the end of 1948, compared with £750,000 for the last quarter of 1946. So far as shipbuilding exports are concerned, the last quarter of 1946 is a favourable datum period, because at that time the amount of shipping which was being completed for foreign account was relatively small. Most of the tonnage was being constructed for British owners, though a growing proportion was in hand for foreign account. This new construction for foreign owners is steadily maturing and the shipbuilding industry does not anticipate any difficulty in meeting the export targets. At

end-1946 prices, the export requirements at the end of 1948 represent a small fraction of the total orders which are at present on the books. To maintain this volume of building for overseas owners might involve difficulty at a later stage—particularly if British costs rose further in comparison with those of other builders. But if it is conceded that export planning can be kept within the compass of 18 months or so, the shipbuilding industry is unlikely to have much difficulty in doing what is required of it.

Work on hand and on order would be sufficient, indeed, to provide full employment for the next two years, even if new contracts ceased forthwith. Doubtless the almost embarrassing spate of orders will subside, but there is a large amount of obsolescent and "austerity" tonnage in the world which shipowners must replace, and it is to the advantage of international shipping as well as British shipbuilding that such replacement programmes should be so organised and balanced that work should pass through the yards in a steady flow rather than in fits and starts. The lesson of the years between the wars was salutary in this respect, and British yards, at least, have not forgotten it. Competition from shipyards on the Continent will grow as wartime damage is repaired, but the modern equipment and methods of the British yards have given them a good lead—which the technical efficiency and energy of management, as well as of labour, should surely be able to maintain.

Business Notes

The Market's Indifference

During the past week or two, major formative influences on economic policy have been at work. One would scarcely imagine that this had been the case from the behaviour of the Stock Exchange, which has lapsed into a bemused state of inactivity. Just as there was no visible response to the publication of the export targets, so this week there has been no material reaction to the publication of the Paris report, or to its reception in Washington. It may be that these two major influences balance each other out—that investors are calculating on the austerities which are implicit in the export programme being made good at least in part by timely aid from the United States. Yet if there are even slight grounds for supposing that American aid is approaching a little nearer, it might have been expected that the speculators would try to make the most of it.

Instead, turnover has now shrunk to abysmally low levels and changes in prices, both for equities and the funds, have been of no special moment. It is clear that the technical extremes of the crisis weeks have now worked themselves out. An even balance appears now to have been restored in the market, which remains unmoved by problems of exports, dollar aid, an interim Budget (the likelihood of which seems stronger now than it did a fortnight ago) and almost by the further evidence of labour trouble in the mines from Scotland. One might almost think that there were neither bulls nor bears in these placid market groves. But such a tenuous equilibrium can hardly be maintained for very long. It will not be long before some evidence of trend reasserts itself—and it is unlikely to be upward.

Postscript from No. 11

Nowhere has the poverty of economic policy been more drearily apparent than in the sphere for which the Chancellor of the Exchequer is responsible. His silence on the weighty economic problems of the day, and the scrupulous care with which all financial instruments of policy have been hidden away, aroused critical comment even as long ago as last February, and since then the consensus among the critics has been steadily widening. Expectations ran high, therefore, when it became known that, after the broadsides from Sir Stafford Cripps and Mr Morrison, the Chancellor of the Exchequer was at last calling a press conference. It was a dismal disappointment. Even at this twelfth hour, it seems that the only contribution which the Treasury can make to internal policy is to summarise the plans for which other departments are responsible and to dot the i's and cross the t's in the unofficial interpretations achieved by economic journalists. There is, in short, still no assurance that an autumn Budget will be forthcoming, or even that financial pressures will be exerted by any substantial reduction in the cost-of-living subsidies for which Budgetary action would not be necessary. Even so, the chances of an early Budget seem to be increasing, as the inexorable march of events reveals the growing danger of inflationary wastages.

In the meantime, the divisions of the Treasury responsible for overseas finance and exchange are fully engaged in the task of recasting Britain's exchange relationships with a score or more of countries, and in providing the "stop-gap" finance which is needed now that the US dollar credit is no longer available. Mr Dalton thus described the recent drafts by Britain on its quota at the International Monetary Fund and on its gold reserve, forecasting further recourse to both these expedients. The inevitability of additional relief of this kind was, of course, already apparent; it did not need a postscript from the Chancellor to explain it or to point out that these are "danger signals." If Mr Dalton really hopes that these resources will suffice to stop the gap until the import cuts and export drive have effectively closed it, he had better heed the much more menacing danger signal which others see in the domestic inertia of his own department—otherwise the excess of money incomes which feeds the black market will undo, or at least seriously impede, the best of Sir Stafford Cripps's plans.

Until financial policy is restored to something of its former vigour, targets will be little more than patterns

on paper. Government spokesmen may make great play with them, but nobody will believe that they will in fact be achieved. The statistical pattern has been described afresh from other Government circles this week, but the lengthy statement added nothing to what was already known—except the fact that it is intended to extend the cuts in Governmental expenditure overseas to a total of £100 million instead of the £20 million previously planned. This, with the import cuts and the export targets, actually produces a paper surplus on the 1948 balance sheet, and already the planners are deciding what they will do with it. Happily, they are realists enough to declare that the first objective will be the return to the Fund of the dollars which will have been bought and to rebuild the gold which will have been sold. Second on the list comes the provision of a better flow of raw materials to industry, especially to export producers, while any easing of domestic austerity figures last. This is certainly the right order of priorities, but though the IMF may implicitly regard British disequilibrium as "temporary"—an assumption which Mr Dalton cited with evident pride—the country will be fortunate if it is able to start towards even the first of these objectives by the end of next year.

Talks with the Empire

The inter-Empire talks on financial problems arising out of the suspension of sterling convertibility and the need to economise dollars have made reasonable but not uniformly satisfactory progress this week. They will be continued into next week. The crucial point around which the debate must revolve, in each of the bilateral conversations into which these talks split, is the access of each Empire country to the central gold and dollar reserve. The point must crop up in the case of each Dominion—from Canada, where the agreement with Britain is still to match every dollar drawn on the Canadian credit by a US dollar paid to the Canadians, to India where the convertibility into dollars of the sterling released under the recent interim agreement is what in effect stands between India and the certainty of real famine. The discussions have centred in the ways and means of reducing the joint demands on the central reserve, and to this end all the countries concerned have undertaken to review their dollar import programmes and to cut out every unessential item. But the most rigorous scrutiny and curtailment of these programmes still leave the gap too great to be borne by the available reserve of gold and dollars. Concerted measures are, therefore, being devised to canalise Empire exports to the United States. In particular, attempts are being made to achieve the maximum cooperation with the United States in furthering the plan of stock-piling strategic materials such as rubber, copper, tin and nickel which might be a first instalment of aid under the Marshall plan.

The importance of expanding gold production has been stressed, and in this connection South Africa has put in a plea for higher priority in production and shipment of mining machinery from Britain. The Treasury have also promised every encouragement to the investment of British capital in new South African mining ventures, though at the same time drawing a marked distinction between such investment and the movement of "refugee" or hot money from Britain to the Union. The discussions with South Africa have inevitably involved the agreement under which gold is sold by the Union to Britain. The amount sold in each of the years 1946 and 1947 was fixed at a minimum of £80 million and efforts are being made to get this sum increased. This would be tantamount to inducing the Union to give Britain a credit, especially if South African imports from the dollar area were appreciably reduced at the same time. The result of the two factors—higher gold sales to Britain and smaller imports from the United States—would be an increase in South African sterling balances. This would be both a rare and welcome phenomenon.

The Chancellor of the Exchequer explained last week that Britain's sales of gold and purchases of dollars from the Fund were intended to feed the reserve that served the whole sterling area. It may be assumed from this that other members of the area will take their turn in drawing on their facilities with the Fund in order to replenish the common dollar pool.

The Middle East and Sterling

It is not only in London that discussion of the problems created by the suspension of convertibility of sterling is proceeding. Reports have come from Cairo of preliminary negotiations between the Egyptian Government and the Treasury representative in Egypt to amend the latest financial agreement by virtue of which Egypt and the Sudan left the sterling area. The Egyptians have two main complaints. They find their hard currency quota altogether inadequate and their exchange control and import licensing machinery entirely unfitted to the strains that have been put upon it. There are, therefore, reports of a movement to rejoin the sterling area. Such a development would be particularly welcome to the Sudan which, by reason of its common currency, had to follow Egypt's departure from the sterling area but which has been even more greatly inconvenienced by this development than its neighbour. The Treasury representative is also visiting other Middle East countries to discuss similar problems, listen to identical complaints and attempt to explain to the countries concerned that the dwindling dollars held by London are needed to satisfy more urgent needs than paying for the stream of cars and other luxury imports from America which is still flowing to the Middle East. If high personages in those countries disgorged their hard currency holdings, the immediate balance of payments problem of the Middle East might be taken a considerable way towards solution.

Nationalisation without Cause

Although the Australian Government's Bill for full nationalisation of the banks has not yet been published, sufficient information is now available to show its intentions, in some detail. And still no convincing reason for the proposal has emerged. Mr Chifley, reiterating the argument which justified the 1945 Banking Act, has declared that the Government must accept responsibility for the "economic condition" of the community; that, in view of the dollar crisis, Australia must be prepared for "serious repercussions"; and that full control of banking is necessary to ensure that no such differences can arise between the Government and the banks as arose in 1931. But the 1945 Act, in fact, gave the Government such control, as every trading bank has long been acutely aware. Now Mr Chifley contends that the Act may not be watertight. Because the Government failed to sustain its own interpretation of the relatively unimportant Section 48 (in the recent dispute about the power of the Treasurer to force local authorities to transfer their accounts to the Commonwealth Bank), it is, or claims to be, tormented by the fear that the vital Sections 18 to 22, which define the system of special deposits which the trading banks must keep with the central bank, may be equally assailable. Counsel in the recent case did apparently hint incidentally that this might be so, but the trading banks' official spokesman has retorted that the banks themselves suggested the wartime system upon which the present arrangement is founded, and would hardly challenge a plan of their own devising. That, admittedly, is inconclusive logic, for what seems appropriate in war may be differently regarded in peacetime even in a crisis; but if these powers really are un dependable (which is questionable), the right course surely would be to strengthen the Act instead of plunging headlong into full Government ownership and operation of the banking system. As presented so far, the Government's case seems to be based almost wholly on doctrinaire prejudice, supported by a string of ingenious pretexts.

On such a basis, it intends to prohibit all private banking within Australia. The Commonwealth Bank, if the scheme goes through, will take over, by agreement if possible, and by compulsory purchase "on just terms" otherwise, the shares of the banks concerned or of their assets within Australia—not excluding those of banks (such as the Bank of New Zealand) in which other Governments are involved. Failing agreement upon compensation (which the Government hopes to persuade vendors to accept in bonds of the Commonwealth Bank), the Commonwealth Bank would be required to submit its claim to a Federal Court of Claims to be established by law. The banks taken over would apparently be administered as distinct entities by control boards appointed by the Commonwealth Bank, and because the whole process would obviously be protracted, the Government apparently hopes that some, at least, of the present directors of the banks would for a time serve on these boards.

The banks themselves, who have declared uncompromising opposition to the scheme, fear that if implemented it would open the door to Governmental discrimination against individual cus-

tomers: at present the Government's powers to dictate the directions in which the banks may lend definitely exclude such specific interference. On this point the Government's statement is not wholly reassuring, for the Commonwealth Bank would be bound to preserve normal banking secrecy and not to discriminate—"except on grounds appropriate to normal and proper conduct of banking business." When no "normal" banking remains within the Dominion, it will be hard indeed to decide what would be appropriate to it.

Cripps Tour

Having addressed the representatives of employers and workers in London on the new export targets, Sir Stafford Cripps proceeded to Manchester, Edinburgh and Bradford to discuss the targets of local industries with the men on the spot. Apart from the clarification of official policy for which such visits provide a useful opportunity, they are also of psychological value in counteracting the impression, prevalent in the large industrial areas, that policy on industrial matters is worked out in London with scant reference to the views of provincial industrialists who have to make the policy work. Sir Stafford Cripps has shown before—by earlier visits to Lancashire during the protracted negotiations on the modernisation of the cotton industry early this year and to Bradford last January—his appreciation of this point.

Yet the reactions to Sir Stafford's speeches became increasingly cool as he progressed from Lancashire to Yorkshire via Scotland. His Manchester speech admittedly left queries about the practicability of increasing the output of textiles during the next twelve months, given the present labour position, but it was accepted as a practical lead for the industry. But the Scots appear to have been less impressed by his references to the *Queen Mary* and *Queen Elizabeth* and to the advantages of joint production committees, and they noted the absence of any discussion of the reaction of the export drive upon Scotland's unemployment problem. At Bradford disapproval found an outlet in a political skirmish between the chairman of the meeting and a trade union leader.

Nevertheless, the tour has brought several pronouncements of wider interest. Sir Stafford's frank admissions at Edinburgh about the present inflation of steel permits and the decision to examine the system of controls will be generally applauded. A more realistic allocation system than the present M form procedure has long been desirable. Signs that this problem is exercising the Ministry of Supply are evident in the remarks of the Parliamentary Secretary to the Ministry last Wednesday that allocations are to be adjusted to meet the larger quantities of steel which would be available to priority firms.

At Bradford, Sir Stafford made it quite clear that exports of wool piece-goods must have priority over home supplies. To sustain a level of four coupons a month, production would have to increase by 12 per cent. This will be a difficult target unless more labour and coal can be obtained over the next few months, though Sir Stafford did refer to "special arrangements" to fulfil coal allocations under the summer programme by November 1st. Though the President of the Board of Trade has had an occasionally critical reception, resolutions supporting the export drive were passed vociferously at each meeting. The criticism reflects, rather, a mood of perplexity about the application of the targets to the production and marketing arrangements of individual firms. The tablets have been handed down. The task is to put them into effect.

Exchange Control Act

A Treasury Order issued this week formally confirms the announcement, already made by the Chancellor of the Exchequer, that October 1, 1947, is to be the "appointed day" on which the Exchange Control Act comes into force. The change in the statutory framework within which exchange control is being operated provided an opportunity for redefining the regulations but the new set of orders bringing into effect the various provisions of the Exchange Control Act are largely a duplication of the controls operated under authority of the now discarded Defence Regulations. The main effect of the coming into force of the Exchange Control Act will be to restore to UK residents freedom to switch holdings of foreign securities (except Canadian) into others of the same foreign currency. There had been momentary doubts whether, given the suspension of convertibility of sterling and all that this symbolised, the permission

to "switch" promised when the Act was passed would be withdrawn. These fears have been set at rest; from Wednesday next the London market in international securities (other than Canadian securities, the proceeds of whose sales must still be applied to paying off the interest-free loan from the Canadian Government) should loosen up considerably. On the exchange side the new orders make a number of relatively unimportant changes. Collectors' pieces are exempt from the provisions of the Act relating to the surrender and notification of holdings of gold coins. Temporary visitors to the UK are exempt from the provisions relating to the surrender of gold and foreign currencies. The list of scheduled territories is amended by the removal of Egypt and the Anglo-Egyptian Sudan which since the passing of the Act have left the sterling area.

Foreign Exchange "Censorship"

From Wednesday next, the Post Office and Customs will examine outgoing and incoming mails in order to check infringements of the foreign exchange regulations which forbid the unauthorised despatch of valuables from this country and the unauthorised receipt of sterling notes sent from abroad. These departments have always had power to inspect postal packets which are thought to contain goods, dangerous drugs and other contraband, and the extension of these powers to cover notes, securities, insurance policies and other valuables follows from their inclusion in Part IV of the Exchange Control Act (which comes into force on October 1st) as items of which the unauthorised export and import is forbidden.

The examination of the mails will be on a sample basis; evidently, the authorities will rely on the risk, rather than the certainty of detection, as the main deterrent. The emphasis is also put on "suspect" packets, rather than a general opening of mails for *devisenkontrol*. In this task, the Customs officials, who will be responsible for the examination, will no doubt make use of such devices as X-rays and fluorescent light, and the proportion of mail in fact opened is likely, in the nature of things, to be relatively small, since no increase in Post Office and Customs House staffs is required.

Beyond the assurance that delays to the mails will be kept to the minimum, no indication has been given of the scope of this new searching of the mails. Mails within the United Kingdom are not affected; nor are mails to Eire or the Channel Islands—a potential gap in the defences through which a significant loss of exchange resources may yet find its way, given the ingenuity of those who have so comfortably avoided the regulations in recent months. In official quarters, horrified denials have been expressed that the new system of examination amounts to "censorship." Technically, this is true, for no examination of mails for covert evidence of exchange frauds is to be carried out. But it may be recalled that the Treasury was anxious to retain the wartime censorship of mails even when strict security needs had expired. They now have, if not censorship, a drastic power of interference with the mails which, it must be hoped, will produce adequate results to justify it.

Winter Power Prospects

From October 6th, every electricity authority in the country may be required to reduce its electricity supply to within its allotted "quota" on the instructions of the Central Electricity Board. The total of the "quotas" adds up to the 9,000,000 kilowatts of installed generating capacity. The maximum demand which may have to be met is 11 million kilowatts. The country must proceed by the unmartial methods of "staggering" or "shedding" to fight the battle of another gap.

By this date, each area should be equipped with a complicated set of schemes drawn up between electricity undertakings and firms, and between employers and workers, to spread the electricity load over the twenty four hours and so to reduce the demand at the crucial peak periods in the winter. Some firms have arranged to transfer one third of their load to night shift. Others are joining in a rota scheme by which each firm knows in advance that it is liable to suffer a power cut on a given day in the week—and hopes to be spared for the rest of the week.

The arrival of colder weather is a timely warning that increased domestic consumption and space heating in factories are not far away. It may not be long after October 6th before the whole

Prudent and active men, who know their strength, and use it with limitation and circumspection, alone go far in the affairs of the world.

GOETHE

TO recognise and seize favourable opportunities, while taking at the same time reasonable precautions, is to exercise that combination of enterprise and prudence which is essential to progressive business organisation. Energy and confidence are personal gifts, but in the observance of the wise injunction of "circumspection" conference with your bank manager can be helpful.

"staggering" system is put to the test. But although there have been repeated warnings that schemes should be ready well before October, only now are serious efforts being made in some areas to prepare "staggering" schemes. In the Lancashire area, for instance, last-minute pressure on the North West Regional Board for Industry to approve schemes is so great that a considerable number will have to go into operation without adequate consideration.

So far as fuel is concerned, the outlook for winter electricity supplies is much better than a year ago. Coal stocks at electricity undertakings are equivalent to over 5½ weeks' supply compared with 3 weeks' supply at this time last year. This winter, at any rate, it should not be shortage of coal that causes breakdown and the official plea for schemes to spread the electricity load is designed to avoid the worst of the winter peak demand. But the fear remains that, unless domestic consumers co-operate to the full, the whole complex of plans for "staggering" may be overthrown and "shedding" will take its place. The domestic consumer will suffer no compulsory restrictions this winter. But that can only be a decision of administrative expediency, for no one can honestly suppose that moral suasion is enough to keep domestic consumption down when electricity is cheap and domestic solid fuel scarcer than last winter.

The Ever-widening Gap

The trade gap widened further last month to £76.8 million compared with £64.7 million in July. The gap between imports and exports has been increasing almost without interruption this year, until the cumulative total at the end of August reached £408 million. Recent cuts in imports will probably not produce any effect for at least another two or three months, for imports in any given month may reflect purchases made several months earlier. Exports in August did not maintain the very high level of July, which were inflated by the seasonal rush to clear shipping documents through the Customs well in advance of the holiday season. Yet last month's export total of £93.6 million was the highest recorded, apart from July since December 1920. The volume of exports has been provisionally estimated at 104 per cent

of 1938, compared with 125 per cent in July and 102 per cent in the second quarter of the year. Last month's decline largely affected the manufactured items; exports of machinery fell by £2,000,000 to £15.3 million and of vehicles by £3,200,000 to £13.5 million. Exports of textiles, however, were only slightly reduced and formed 19½ per cent of total exports, compared with 17½ per cent in July.

Total imports in August at £174 million were £5,200,000 smaller than the July peak but the average daily rate of imports—August was a shorter working month—was 5 per cent higher than in July; grain and flour arrivals fell by £5,200,000 but imports of tea increased by £1,800,000; the raw materials group included 32,300 tons of linseed oil valued at £5,600,000 bought from Argentina.

Trends in Bank Advances

Movements shown by the latest classification of bank advances are rather more revealing of the underlying business trends than

those of earlier analyses. Total advances made in Great Britain by all members of the British Bankers' Association stood at £1,174 million in August, compared with £1,094 million in May and £909 million at the comparable date in 1946. The quarter's growth of over £80 million is substantially larger than that for the previous three months—despite a big decline in the food, drink and tobacco group—and is, indeed, easily the largest quarterly movement since the publication of classified figures was resumed last year. Five groups account for fully three quarters of the expansion. Financial advances other than to stockbrokers have risen by no less than £17 million, evidently in consequence of the hiatus in the flow of new capital issues which has resulted from the break in stock markets—although the growth of hire-purchase finance has probably been a contributory factor. The engineering and shipbuilding (including shipping) groups have between them absorbed an additional £25½ million. Both industries are, of course, running at a high level of activity, but the spectacular increase in demands for shipbuilding finance (from a level of between £10 and £11 million, in each of the quarters from February of last year until May, 1947, to £19.1 million in August) suggests that the principal influence has been the bottlenecks in supplies of materials and fittings, which have increased the volume of uncompleted work. These two groups now account for 9.1 per cent of the total, compared with 7.7 per cent in May.

Agricultural advances have expanded by £11.5 million and are now £17 million, or roughly 22 per cent, above their level at the similar date in 1946, a movement for which the winter's frost and flood damage and the summer drought must be largely responsible. Retail trade continues to expand—the total has risen by £10.7 million to £109 million, compared with only £62.2 million eighteen months ago—and now accounts for 9.3 per cent of aggregate advances (7.5 per cent in August, 1946). Most of the recent expansion must reflect the rising trend of prices rather than any increase in the volume of stocks, but over the longer period the reopening of businesses has been a significant influence. The sharp decline in the food and tobacco group—by £19 million to £68.5 million during the quarter—virtually wipes out the previous quarter's gain, and is presumably due to a decline in tobacco stocks as well as to the usual rather erratic ebb and flow of the financing arrangements.

The other main industrial groups show only small changes, the most significant perhaps being the further expansion in the chemicals group, the total for which now stands at £16.2 million in contrast with only £7.9 million in August, 1946. During the quarter there were small declines in coal, non-ferrous metals, transport and wool textiles. Cotton and other textiles are both appreciably higher, and so are iron and steel, builders and contractors, and building materials. The advances under these last heads, it should be recalled, do not accurately reflect the level of building activity, partly because of the finance which is provided via the local authorities (the total of whose borrowings from the banks is only fractionally higher), and partly because the classification is based on the business of the borrower and not upon the purpose to which the money is put. Hence much industrial rebuilding must be reflected in the figures for the industries concerned.

Radio Industry's Task

The first post-war Radiolympia will be staged in London next week. This should be a triumph for the radio industry—other industries have been frightened by the difficulties of staging exhibitions of their goods—and there will be no lack of spectacle rivaling prewar exhibitions. Indeed, the industry has made great technical strides during the war years, and its first postwar task is to apply to the mass radio and television market many of the scientific developments of the war period. This is a process not free from risks, yet as the accompanying table suggests, the investor at the moment is showing no lack of confidence in the prospects of the leading radio companies.

The wide scope given to the industry for development in the war years and the backlog of civilian orders at home and abroad at the end of the war, support the impression that the industry has achieved a solid investment ranking. Yet its real tasks are only beginning. The Board of Trade has now demanded of it a further expansion of exports—though of a modest character, which suggests doubt in the official mind whether the industry's most favourable export opportunities may not be fading. The indus-

try's contribution to exports was equivalent to a monthly rate of £616,700 for the whole year 1946 and at the rate of £930,000 a month in the final quarter. But there was a sharp decline in the first quarter of this year and the task of recovery to the monthly export level of a round £1,000,000 by the middle and end of next year will not be large.

In the export field radar equipment and auxiliary radio products rather than finished broadcast receivers and components are likely to find the best market. The pre-eminence of British developments in radar is disputed only by the United States and its products have wide new fields to conquer, including navigational aids and television apparatus, cable manufactures and domestic equipment—all of these the latest adjuncts of the major radio companies. Companies such as A.C. Cossor, Decca and Electric and Musical Industries have been directing their postwar researches along these lines at considerable cost. But in radio sets and components some hard battles must be expected in the export markets. The United States and continental countries are no less anxious to sell their wares abroad, and in the newer countries such as the Dominions as well as South America, infant industries for the assembly and even the complete manufacture of radio sets have been set up under the protection of high tariffs. The industry's export target may, in fact, prove to be something of a boomerang, but at least there should be an impressive display of radio equipment for all the world to see at Olympia.

Wool Prices Advance Further

The rise in prices at the London wool sales, which opened last week, fully matched that at the recent Australian auctions. Australian and South African greasy merinos were 15 per cent dearer than the closing London quotations last July, fine crossbreds were 10 to 15 per cent higher, while medium crossbreds rose by 10 per cent. Bradford buyers were also keen to obtain New Zealand slip-wool, and prepared to pay 10 per cent more for it. The demand at the London sales came largely from Yorkshire, although Continental purchasers, in particular the Russians, were also buying. British demand has also dominated the Australian auctions, but there American buyers have not yet begun to operate, as the types of wool offered so far are hardly suitable for their requirements. There is every indication that prices will continue to rise, especially as Russia is expected to buy in Australia as well as London.

The rate of activity in the Continental wool textile industries has surpassed the pre-war level, and although stocks of wool in most Western European countries are generally larger than in 1938—nine months' supply now compared with six months' then—the eagerness of buyers to purchase good quality wool shows no sign of abatement. But the available supply of the finer merino types is now becoming so restricted that really selective buying is becoming increasingly difficult, and purchasers are having to take alternative qualities. The average Continental buyer, however, does not appear to pay much regard for the price differentials between different types of wool, and is prepared to bid for the required qualities almost without limit. Under such conditions it may often pay to buy those types in lesser demand.

The increased demand from Yorkshire is directly connected with the prospect of increasing the export of wool textiles. The chances of selling utility cloth abroad are bound to be restricted, and the controlled prices schedules for the home trade rule out the purchase of finer wools for making up to supply home needs. As the wool textile export drive is intensified, Bradford is likely to show an even keener demand for high-grade merino wool.

Furniture and Exports

Last week the Board of Trade announced that the emergency import programme for utility furniture, which was introduced early last year to expand supplies until the furniture industry could increase its production, is to cease after outstanding contracts have been filled. When the scheme started there were some misgivings in the trade about its competitive effect on sales of British-made furniture in the home market. In the event, the scheme has made a valuable contribution to supplies, for total imports have represented the equivalent of 3,500,000 utility furniture units, which is equal to one month's production of domestic utility furniture. The foreign product evidently has not lacked buyers.

The end of the scheme gives official recognition to the general impression that there is now enough—some may think more than enough—utility furniture on the market. That is not to say that furniture requirements have been fully met, but that production has exceeded the limit of demand set by the issue of utility furniture units.

This surplus over the ration has been reached almost at the moment when the industry's import targets for mid-1948 and end-1948 have been made known. The industry is expected to do no more than raise its monthly rate of export from £50,000 in the last quarter of 1946 to £55,000 by next June and to make no further headway beyond that target in the following six months. Furniture, admittedly, has never been an important export industry, and this is recognised only too clearly in the level of next year's targets. If the industry can only lay such a small claim as an export industry to supplies of materials, it will fare even less well for materials for home production—apart from utility grades.

That many materials, especially upholstery fabrics, may have a direct outlet to the export market is suggested by the following comparison of the overseas trade in traditional furniture and the newer metal furniture industry:—

EXPORTS AND IMPORTS OF FURNITURE
Wooden Furniture Metal Furniture
Exports Imports Exports Imports

1938.....	461,863	403,121	347,695	Nil
1946.....	680,112	405,686	1,173,665	Nil
1947 (8 months)...	472,063	1,290,256	1,101,762	Nil

Steel furniture exports are now much larger than those of wooden furniture, and the former has been set an export target for the end of next year of £300,000 a month, compared with average exports of £120,000 a month in the last quarter of 1946. It is difficult to believe that wooden furniture of high quality would not sell in more satisfactory quantities abroad than the Board of Trade has set for it.

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, 22 RYDER STREET, ST. JAMES'S, S.W.1.

The Wages Problem

The Government's anxiety to arrest the upward movement of wages is reflected in the Minister of Labour's decision to circulate Joint Industrial Councils, calling their attention to the Prime Minister's appeal to unions not to press for wage increases at the present time. This letter has had a poor reception from the TUC General Council, which professes itself so alarmed at the possibility that the Government might intend to intervene in matters of wages that it is seeking an interview with the Prime Minister, to learn what is in the Government's mind.

The unions are afraid that this letter will be used against them in wage negotiations which are now in progress, though there is no evidence yet that this has happened. Indeed, there is evidence enough to the contrary. A new agreement, which takes effect on October 20th, raises the weekly minima of some 250,000 workers in the retail food trade by amounts varying from 7s. to 10s. (according to the area) for men, and from 5s. to 9s. for women, and reduces the working week to 46 hours. None would claim that grocers' assistants are overpaid, but at this time an improvement in earnings in the distributive trades, where manpower should not be increased, will hardly help the redistribution of manpower. It will be interesting to see what happens to the claim which workers in the boot and shoe trade—an undermanned industry—recently tabled for an increase in their minimum wages.

In the meantime, the Catering Wages Board have issued their proposals for wages and conditions for workers in licensed residential establishments and restaurants. The suggested weekly rates vary widely according to the type and experience of the worker and to conditions of service. Clearly, it would be impossible to lay down a uniform set of wage rates for so varied a trade. The Board is at least attempting to bring some measure of protection and regularity in the conditions of catering workers.

* * *

Should Whaling be Increased?

Killing of whales in the coming season is to be restricted to a total of 16,000 blue whale units, which it is expected, will produce some 320,000 tons of whale oil. Although this prospective output shows an increase of some 40,000 tons on last year, it is still well below the 1937-38 level of 600,000 tons. Seventeen factory ships will be operating; three from the United Kingdom, nine from Norway, two from Japan and one each from South Africa, Russia and the Netherlands. The whale oil produced will be allocated to the various countries by the International Emergency Food Council, but British supplies, it is hoped, will be in the region of 55,000 tons.

There has recently been a demand for unrestricted whaling for the next four or five seasons to alleviate the world shortage of fats and oils, particularly as whaling activity was limited during the war. It is argued that if the rate of killing could be increased to give 500,000 tons of whale oil each season, margarine production could be expanded and the oils now used for margarine could

be diverted to other uses. A comparison with world production of whale oil in recent years is shown in the following table:—

	1937-38	1941-42	1942-43	1943-44	1944-45	1945-46	1946-47*
Antarctic	556.7	13.0	8.5	22.0	37.3	139.0	272.0
Other areas	50.0	16.8	20.2	10.6	9.6	9.0	9.0
Total	606.7	29.8	28.7	32.6	46.9	148.0	281.0

* Provisional; partly estimated.

According to official sources, however, many scientists hold that the limit of 16,000 blue whale units is itself too high to prevent a permanent depletion in the whale population and that any extension of the limit should not be contemplated. Further, it would be inadvisable to put aside the international scheme of regulation because there is no guarantee that by 1951 world supplies of oils and fats will show a material improvement. Indiscriminate killings in the past are responsible for the present inability of the Arctic grounds to yield any large quantity of oil; without the restriction scheme, it is argued, the Antarctic area would soon be in a similar plight.

Although it is undoubtedly wise to conserve the future supply of whale oil, are these arguments against some increase in the rate of whale oil production quite conclusive, in a period of such acute shortage? Much depends on the future supply of oils and fats—on which there is admittedly no sort of certainty. To say that the world shortage will be past by 1951 is indeed a gamble, which depends on the success of many factors, including the development of colonial groundnut production, the speedy rehabilitation of the Far East—in particular Indonesia—and the recovery of the dairy industry in Europe to well above its prewar output. If, by 1951, these targets were not, in fact, realised, the exhaustion of whale oil supplies would inflict all the more hardship—not least on Britain. In these circumstances, it is perhaps as well that the Government is refusing to gamble on this critical item in British food supplies.

Shorter Notes

The New Zealand Government has announced its intention to repay in cash its 4½ per cent inscribed stock on November 1st this year, the date of maturity. The present amount outstanding is £11,200,000. No conversion offer is to be made.

The National Joint Industrial Council for the retail drapery, outfitting and footwear trades has agreed to increase minimum weekly wages for men by 10s. in London, 9s. in the larger provincial towns and 7s. elsewhere: there are smaller corresponding increases for women and juveniles. The rise will affect some 300,000 employees and will come into force on October 6th.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the Records and Statistics Supplement. Notes on the following company reports also appear in the Supplement: Distillers; Gestetner; Powell Duffryn; Murex.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked *), and those paying 3 per cent or less will be repaid at the latest date (marked †). (n) Net yields are calculated after allowing for tax at 6s. in the £. (f) Flat yield. Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (g) Also a capital bonus of 2½ per cent free of income tax. Yield worked out on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 1.6 per cent.) (i) To latest redemption date. † Free of tax.

The world agrees

Today, the traditional pastimes of this country are known and accepted throughout the world. They grow more popular every year because they're fundamentally GOOD whether it's the Royal and Ancient game of golf or that other familiar pleasure which comes from saying

Player's Please

PLAYER'S NAVY CUT CIGARETTES · MEDIUM OR MILD · PLAIN OR CORK TIPPED
[NCC 665]

One of these days you may be saying good-bye to your son as he goes away for Army Service or to live and work among strangers. Then he must find his own friends. His moral and spiritual quality will be tested under new conditions, and especially by loneliness—the loneliness of a barrack room, a strange town, or perhaps a foreign country.

One of the tasks of the Y.M.C.A. is to serve young men in these circumstances. It offers friendship and encouragement, as well as recreative activities for body, mind and spirit. Your son may be one of the many thousands who look to the Y.M.C.A. for help and guidance. By supporting this great undertaking now, you can do something to ensure that he does not look in vain. Please send a contribution to-day.

Donations may be sent to the Rt. Hon. The Earl of Athlone, K.G., G.C.B., President of the Y.M.C.A. War and National Service Fund, 112 Great Russell St., London, W.C.1

MILNERS

Safe!

This is one of the "B" range of Milners' post-war designs—a masterpiece of security. Further details of this range will be sent on request.

How is one to choose a safe? Obviously, reputation is the surest guide. Here the name of Milners is pre-eminent. For over 100 years Milners have built safes and strong-rooms for nearly every world-famous concern, and Milners' safes are to be found in every quarter of the globe. Whether it's a specially constructed strong-room to protect a fortune, or whether it's a small safe to take care of personal treasures, you can be sure that you've made the wisest choice when you specify "Milners".

MILNERS SAFE CO. LTD., 58, HOLBORN VIADUCT, E.C.1.

Telephone: CENTral 0041/5. Telegrams: Holdfast, Cent, London.

MILNERS — THE SAFEST SAFE INVESTMENT

Somebody cares Twopence

The NEOPOST Franking Machine disposes of all recriminations about that odd twopence for which the post book cannot account. For, in addition to franking and postmarking all outgoing letters and printing on them any desired advertising slogan, it faithfully records every item of expenditure thus involved.

COMPANY MEETINGS

TELEPHONE RENTALS, LIMITED

DEVELOPMENT ON PROGRESSIVE LINES

The annual general meeting of Telephone Rentals, Limited, was held, on the 22nd instant, in London, S.W., Mr Fred T. Jackson, O.B.E., Comp.I.E.E. (chairman and joint managing director), presiding.

The chairman, in the course of his speech, said: Our rental revenue amounts to £599,250, which shows an increase of about £30,000 over that of the previous year, while the profit on trading and miscellaneous receipts amount to £66,733 and compare with about £41,600 under the same heading last year.

Dividends on sundry investments do not call for any special comment and a comparison with last year would be misleading as it only covered a period of seven months. Dividends from subsidiary companies reflect their profit-earning capacity.

On the other side of the account we have shown the operating costs and expenses incidental to the business, which total £344,273. Depreciation of the capital cost of installation totals £137,186 and the other allowances for depreciation are the usual annual provisions.

NET PROFIT AND DIVIDEND

The net profit on the year's operations amounts to £198,258, and if you will refer to the profit and loss appropriation account you will see that with a balance of £38,996 and adding the profits for the year there is a total of £237,254 to be dealt with.

Of this sum, excess profits duty and national defence contribution require £31,340 and income tax £73,623, so that taxation absorbs a total of £105,000 out of our year's earnings. Of the balance remaining we have transferred £10,000 to general reserve and have made provision for dividends at the rate of 10 per cent. per annum, less tax, which is at the same rate as last year.

THE PRESENT POSITION

Now to deal with the present position. We are faced with the general shortage of materials, which appears to be the common complaint of all industrial concerns in this country. Although we are not actual manufacturers of the equipment we install and maintain, this shortage of material affects our suppliers. With most of the factories with whom we deal, the period between placing an order and the commencement of deliveries is between 9 and 12 months, and this naturally affects the time which elapses between the taking of a contract and the completion of the installation.

The increase of £30,000 in our rental revenue for the year 1946, to which I have already referred, represented rather less than a quarter of the total business in T.R. Services—Telematic, time control and factory broadcasting—actually contracted for during the year. As a result of this unavoidable delay, therefore, on January 1, 1947, we were in the position of having secured contracts representing an annual rental of over £100,000 per annum, which had not been installed.

By the end of the first half of 1947 most of the installations covered by these contracts had been fitted, but equally during that same period the volume of new business secured came in at a greater rate than that at which we were able to instal without increasing further the already very long completion period.

From this statement you will gather that the position was becoming very difficult. During the past ten years we have very greatly increased the number of our subscribers, and a large proportion of the demands made upon us came from this source, either through Telematic subscribers wishing to adopt T.R. Time Control service and vice versa, or

through the need for modifications to our existing service brought about through the switch over from war-time to peace-time production. Your directors are well aware that as an industrial concern we must be continually striving for expansion, but they came to the conclusion that our existing subscribers must have prior call upon our services, and they therefore decided that for the time being, and probably for the remainder of this current year, they would restrict our selling efforts to our subscriber market.

In this connection, I would like to mention that although there is a great measure of standardisation in the equipment we utilise, the method of construction of each installation and the facilities offered is dictated solely by the requirements of each individual subscriber.

SERVICE TO SUBSCRIBERS

Although we are a company, and an industrial concern, we have always had firmly in mind that our business was very largely a personal business, and experience has convinced us that our success depends on our ability to understand and interpret not only the requirements of our subscribers' businesses, but also the needs and desires of individuals in those businesses. It may surprise you to know that, quite apart from our technical maintenance and service staffs, we have always devoted as much money in maintaining commercial contact with our subscribers as we have devoted to the acquisition of new contracts.

Bearing in mind the difficult times through which we have passed, and are about to pass, we considered it essential that we should, as far as possible, devote our energies to giving each individual subscriber the very best service he could possibly expect, and that for the time being our main consideration should be the consolidation of the goodwill which undoubtedly exists between our individual subscribers and ourselves.

We believe that our subscribers are well satisfied with the service they get, but we have to bear in mind that many of our installations were fitted during the war when many of our skilled men were in the Forces, and we were obliged to depend on semi-skilled man-power. Since that time we have made enormous efforts to expand, improve and bring up to date our training methods by the preparation of instruction manuals and the creation of Regional Training Schools. Great progress was made in our particular industry during the war years, which has enabled us to extend the scope and range of T.R. service.

A MISLEADING TITLE

In conclusion, may I add that the title of our company—Telephone Rentals, Limited—is in these days somewhat misleading. For today, our comprehensive T.R. service not only covers internal telecommunication, which is identified and well known throughout the British Isles under the name "Telematic," but also time control, job costing and factory broadcasting. About one-third of our total rental revenue is derived from these latter phases of T.R. service, each of which is of great importance in the industrial world today, and each of which is capable of great development in the future.

In my address I have endeavoured to convey to you that your company is always looking ahead, is developing on progressive lines, and on safe lines financially, which should give you every confidence for its continued success in the years to come.

The report was adopted.

The proceedings terminated with a vote of thanks to the chairman.

FAIREY AVIATION COMPANY, LIMITED

A STRONG POSITION

The nineteenth ordinary general meeting of The Fairey Aviation Company, Limited, was held, on the 22nd instant, in London.

Sir Richard Fairey, M.B.E., F.R.Ae.S. (chairman and managing director), in the course of his speech, said: The profits of the company and its main subsidiary, Stockport Aviation Company, Limited, for the year under review, after charging directors' fees, depreciation and the service of notes, are £609,890 against £417,268 for the previous half-year. The amount put to reserve for taxation is £300,000, leaving, after the deduction of the £5,012 profit retained by Stockport Aviation Company, Limited, a net profit of £304,878, to which has to be added the amount brought forward from last year of £44,748, giving a total of £349,626 available for disposal. It is proposed this year to make an allocation of £25,000 to the Staff Pension Fund; to transfer a further £150,000 to the reserve for Research and Development, making this a total of £300,000; to leave the General Reserve at £1,000,000 and to pay an ordinary dividend of 2s. per share.

SUCCESS OF FINANCIAL POLICY

The total of share capital and reserves is now over £2,800,000, which I think demonstrates very completely the strength of the company's financial position and the wisdom of the financial policy followed by the board throughout. Only recently it has been urged by the Government that, in the national interest, dividends should not be increased and that profits should be ploughed back. This has not fallen on deaf ears, but, indeed, the ploughing back of profits has always been the foundation of our financial policy, with the result that we have built up the position that is revealed by the accounts today.

In pre-war days, what were known as "private ventures"—meaning aircraft or other projects designed by the firm to their own ideas and entirely financed by them—were a notable feature of the activities of the British aircraft industry and one that undoubtedly made an outstanding contribution to the technical supremacy of this country then held. Such private venture types, indeed, formed a considerable proportion of the equipment of the Royal Air Force and the Royal Navy. The expanded costs of the present times, coupled with the growth in size and complexity of the modern aeroplane must necessarily restrict this practice. Nevertheless, it is one which we feel should be carried on to the maximum extent possible, and we wish to maintain our freedom of action for such operations and must conserve our resources to that end. Your company has still further extended its technical activities and we are now engaged on a larger research programme than at any time in our history. The engineering staff and facilities have been further increased and are now well able to take care of these expanding interests.

MARK IV "FIREFLY"

The year under review saw the introduction of our Mark IV "Firefly" as the standard two-seater fighter reconnaissance aircraft for the Royal Navy. This type has also been supplied in numbers to the Royal Canadian Navy and the Royal Netherlands Navy, and we have every hope that in the comparatively near future it will become the basis of yet another Air Arm overseas.

Our production orders for this type of aircraft can be considered satisfactory in view of the general lowering of the production scale for military aircraft of all types.

Our helicopter is now completed and about to start flying trials. Satisfactory tests whilst tethered have been carried out and results to date seem very promising.

The report was adopted.

VERNMENT RETURNS

the week ended September 20, 1947, ordinary revenue was £43,746,539, ordinary expenditure of £51,434,271, leaving a deficit of £7,687,732. Thus, the sinking fund allocations of £7,902,982 surplus accrued since April 1st is £248,486 against a deficit of £487,623,818 in the corresponding period a year ago.

UNIVERSITY OF LEEDS

DEPARTMENT OF ECONOMICS AND COMMERCE

Applications are invited for the post of Lecturer in Economics or Economic History on the salary scale £550 rising by £25 annually to £900 a year. Applications should reach the Registrar, University, Leeds 2 (from whom further particulars may be obtained), not later than October 20th.

LONDON UNIVERSITY (Centre for Courses in International Affairs). Special course of evening lectures on "THE U.S.S.R. AND THE WEST." Monday evenings 6-7.30 p.m., Oct. 13th to Dec. 8th, London School of Hygiene. Tickets (10s. for course of 9 lectures) by advance booking only. Enquiries and appls. to Secy., Courses in International Affairs, Senate Ho., W.C.1.

ASSISTANT required in the Market Research Dept. of a large business organisation, in the London Head Office. The successful applicant, who would be aged 25-30, will concentrate on the export field, and must be capable of analysing world-wide trade and market statistics. A degree in commerce, economics, or statistics would be an advantage. Write Box 567.

STATISTICAL Clerk (Male, age under 30) is required by Market Research Department at the West End Head Office of a large group of Companies. Education should be at least up to matriculation standard, and experience in compiling trade statistics is essential. Salary commensurate with actual experience.—Write Box 568.

RESEARCH OFFICER wanted to carry out work in the North-East on industrial location. Must have Honours Degree in Economics. Salary at the rate of £500 per year. Appointment for one year in the first instance.—Write, Northern Industrial Group, 9, Eldon Square, Newcastle-upon-Tyne, 1.

UNIVERSITY GRADUATE wanted to undertake a land classification in the North-East. Honours Degree essential. Salary up to £500 according to qualifications. Appointment for one year in the first instance.—Write, North-East Development Association, 9, Eldon Square, Newcastle-upon-Tyne, 1.

RECENTLY demobilised Cambridge graduate, Economics and politics, useful intelligence experience, sound knowledge Europe, fluent French and German. Proved organising ability, initiative. Aged 25. Seeks interesting situation.—Box 562.

DOCTOR OF SCIENCE (English, aged 38), with a background of administrative experience in the biochemical sciences, especially nutrition and agriculture, is open to offers of appointment as technical executive to an industrial concern with overseas interests. Especially interested in development schemes associated with vitamins, hormones, or pesticides.—Box 553.

COMPLETE set of Books for B.Sc.(Econ.) Final exam., excellent condition.—Apply Box 560.

AUTUMN holiday? Let me arrange a holiday for you in Cornwall, Somerset or Eire, also Christmas Parties.—Box 563.

COUNTRY Week-end: October 17th-20th. Small House Party, staying at delightful old Norfolk Mill, invites few others.—Box 564.

FINANCIAL group wishes to acquire controlling interest in Limited Company of Exporters or Shippers with large clientele who are registered as exporters of rationed goods, earthenware, lace netting, furs, etc.—Full details in strict confidence to Box 558.

STATISTICIAN fully trained is required by large Industrial Group centred in the Midlands, to take charge of all statistical work of the Group.—Reply, giving particulars of age, qualifications and salary required, to Box No. 400, 8, Serle Street, London, W.C.2.

SECRETARIAL SERVICES—Hr., Day or Week (Cent. Ldn. District only). Expert Stenographer. Own machine. Highest Refs. Phone: PARK 4988 pref. by 11 a.m.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22 Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111 Broadway, New York, 6.—Saturday, September 27, 1947.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong.)

SUDAN GOVERNMENT

The Sudan Government requires a Statistician, aged 25 to 42, to fill post of Assistant Government Statistician and to work under the Government Statistician in the Statistical Section of the Department of Economics and Trade. This section is being expanded and modernised; the successful candidate will be the second in charge. Candidates should have an Honours Degree in Mathematics or Economics with subsequent experience in Statistical work, but applicants with considerable experience of an advanced statistical nature would be considered.

Appointment will be in Scale B1 on either (i) Long-term Contract or (ii) Provident Fund Contract. Under (i) Salary Scale (Scale B1) will be £E352-£E924-£E996-£E1,080 (biennial increases), with one further increase after three years to a maximum of £E1,200. Subject to completion of two years' probation, a contractual period is envisaged of not less than 7 or more than 15 years, on completion of which candidate qualifies for a gratuity according to sliding Scale. Gratuity for completion 15 years' probation of post or replacement by Sudanese before completion of contractual period. Special gratuities for discharge on medical grounds before completion of contractual period. Under (ii) Salary Scale will be £E1,000-£E1,080-£E1,170-£E1,270 (biennial increases), with one further increase after 3 years to a maximum of £E1,400. Subject to satisfactory completion of two years' probation, period of service 7 years or such longer period as will bring candidate to age 38. Candidate contributes towards Provident Fund at 7½ per cent. and receives on completion of period a Government contribution equivalent to his own contribution plus interest. Starting rates would be determined according to age and qualifications.

A Cost of Living Allowance at the rate of 45 per cent. of basis salary up to a maximum of £E18,750 m/ms per mensem is now payable under the Regulations in force. (Note: £E1 = £1 0s. 6d.) Free passage on appointment. Strict medical examination. NO INCOME-TAX AT PRESENT PAYABLE IN THE SUDAN. Further information and forms of application may be obtained from: Sudan Agent, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Statistician."

GENERAL Manager, wholesale distributive business in Motor and Cycle trade earning over £1,500 a year convinced of the non-essential nature of present work would appreciate more vital employment. Age 38. Bachelor. No academic qualifications but good record of achievement in commerce and Army.—Box 565.

COAL SHORTAGE—Install NU-WAY OIL BURNER EQUIPMENT for your central heating boiler and enjoy automatically controlled warmth.—Booklet No 15 from NU-WAY HEATING PLANTS LTD.

Withdrawal From Palestine

THE statement of the British Government's Palestine policy that was made to the United Nations Assembly by Mr Creech Jones, last week was, in the circumstances, exactly right. If the United Nations can work out a settlement that is accepted by both Arabs and Jews, then Britain will take the responsibility for implementing it. If, at the other extreme, the Assembly reaches no conclusions and adopts no policy, then

His Majesty's Government... have decided that... they must plan for the early withdrawal of the British Forces and British Administration from Palestine.

If neither extreme course is followed—that is, if there is a United Nations policy but it is not accepted by both Jews and Arabs—then the British Government's intentions are necessarily less simply stated. In substance, they will neither obstruct the execution of such a policy (for example, of the recommendations of the majority of the United Nations Commission) nor accept the major role in its enforcement; whether they will take any part at all depends upon their opinion of the policy's justice.

That this declaration is a confession of failure, and of tragic failure too, it would be useless to attempt to conceal. But the failure lies in the past, and the great merit of Mr Creech Jones's statement in the present is that, for the first time in the sorry history of the Palestine question, all the contending parties are abruptly brought up against the consequences of their activities. Jew and Arab face a day when there will be no third party in Palestine to take the blame, to repair the damage and to struggle in the face of fanatical resistance on both sides to keep intact a structure which for all its grievous errors, has permitted the Jews to establish a National Home 600,000 strong and the Arab population almost to double in twenty-five years. The American Administration, content for years to turn a blind eye to the criminally irresponsible activities of a clique of American Jews, is now confronted with a United Nations problem too urgent and too complicated to be solved with regard only to the Jewish vote in New York City. The Assembly itself must now complete the work of its Committee by devising the actual means of getting from the present impasse to the solution of partition which it recommends. Without exception, the various interests have been jolted into a reconsideration of their policies by the British statement and that is precisely what was most needed in the unbroken deadlock of the last two years.

It is not enough, however, to welcome the statement as a means of securing a more equitable distribution of responsibility. Its final aim is, naturally, to secure a lasting and peaceful settlement in Palestine and this is ultimately the issue upon which it will be judged. Will the British decision to withdraw from Palestine set moving a succession of events similar to those which led to the agreed partition of India? Will it induce a spirit of compromise on either side? The answer must depend in part on the balance of forces in Palestine and in the Middle East. The Jews are fairly well armed, they have a minority of trained soldiers and an even smaller minority of fanatics ready

for any form of military action, however desperate. They have rich friends abroad. But in a fight against the whole Arab League, the most they could hope to achieve would be stalemate; and even so, could they survive as a functioning community if they were simply a small island in a hostile Arab sea? It would seem that the Jews have more to fear from the result of fighting it out, and concessions may therefore be reasonably expected from their side. They will not retreat now from partition, from the establishment of a Sovereign Jewish State (the first official Jewish reaction to the British statement stressed this point). Nor should they. But they may perhaps be persuaded to accept a modification of the extraordinarily unbalanced scheme of partition proposed by the United Nations Committee.

The real obstacle is likely to arise on the Arab side. The Arabs are still unanimously opposed to partition and at present the only "compromise" they seem ready, according to Jamal Hussein, to accept is a sovereign Palestine ruled "democratically" by a permanent Arab majority. It is possible that the Committee's Report, with its evidence that a majority of the nations of the world are prepared to go very far in meeting Jewish hopes, will have had a sobering effect on Arab opinion. If the Assembly were to devise and impose a solution—which is one possible alternative to Arab-Jewish agreement—that solution would not, on present showing, be very favourable to the Palestinian Arabs. The room for diplomacy, persuasion and manoeuvre is pitifully small, after all the delays and hesitations of British policy in recent years. But it does still exist, and of Great Britain's determination to withdraw later should not make it a purely passive spectator of the Assembly's efforts now. All the experience, all the tact, all the skill at the disposal of the Government should be employed in the next few weeks to achieve agreement, just as they were employed in not dissimilar conditions in India earlier this year. It is one of the incidental tragedies of the present situation that there is virtually no hope of a joint Anglo-American strategy in bringing pressure to bear on the Jews and the Arabs, since, both in restraining the extreme Jews and in encouraging the Arab states—whose future revenues depend to so great an extent upon American oil interests—the Americans possess weapons that are not to be found in the British armoury.

The chance that no agreed settlement will be reached must be faced. The only possible alternative is the enforcement of some form of partition. The British Government has not committed itself to the principle of partition—indeed, not so

long ago Mr Bevin was opposing it—but clearly the logic of the Peel Report has been proved by events. To accept partition in principle, however, is not to accept the particular proposals for partition put forward by the United Nations Committee. Britain could have no hand in enforcing so flagrantly unjust a scheme and one of the difficulties facing British policy at the moment is that, thanks to the delays and the hesitations of the last year, it cannot lay before the Assembly an alternative scheme of partition which it would be willing to assist in enforcing and thus recover the initiative which passed to the United Nations once the Committee of Inquiry had made its report. The devising of a sensible scheme of partition will, nevertheless, be the next task for the United Nations and it is indispensable that Britain should play an active part in the process.

The final difficulty, given the possibility that Uno will have to impose a moderate scheme of partition, will be the actual machinery of enforcement. The United States is either so unwilling or so unable to spare its men to the Middle East that it has even asked the British to maintain their units in Greece. The French, still smarting from their expulsion from the Levant and overstrained by their own colonial wars, are not likely to show much enthusiasm. And how much enthusiasm will either Britain or America show for the entry into Palestine of a Russian contingent? A force composed of the soldiers of the Smaller Powers might avoid the great ideological split. But would such a force have the strength and the military experience to do its work? And is it likely that Smaller Powers will accept burdens falling from the unwilling hands of the Great?

So intractable is this problem of enforcement that Great Britain will now find itself under the strongest possible pressure to remain in Palestine. This pressure must at all costs be resisted. True, British policy should not appear to be simply one of scuttle. At every point—discussion with the Arabs, discussion with the Jews, elaboration of alternatives, mobilising the diplomatic resources of the United Nations—Britain must play a positive and active part. But it should not be forgotten that the only reason why the Palestine situation today is for the first time a new situation is because Great Britain has decided in the last analysis to quit. This is the only instrument by which the Arabs and the Jews, the Americans and the whole United Nations can be forced to face their responsibilities. Far from modifying its decision to withdraw, the British Government should, at the earliest possible moment, announce the date.

Equality and the Budget

UNDER the painful pressure of events, Mr Dalton really seems to be screwing up his courage to face an autumn budget. Like every Chancellor of the Exchequer, he confronts his problem in three capacities; as the purely fiscal manipulator of Treasury incomes and outgoings; as the politician aiming at popularity (or at as little unpopularity as possible); and as the economist establishing to the best of his ability a financial climate favourable to the nation's economic health. Hitherto Mr Dalton has concentrated on the first two aspects of the Chancellor's job; and his success in these has been the measure of his failure in the third. He claims to have balanced the budget; and though his critics retort that he has achieved this only by some very elastic interpretations of what can properly be called revenue and expenditure, none of them would claim that the true deficit is a very large one. But this relatively favourable aspect of the budgetary figures, in the narrowly fiscal sense, is the outcome of precisely that deadly combination of inflation with physical controls which is distorting and strangling

the economic life of the country. If he was still bent on the same purposes there would be no point or necessity in an autumn budget; fiscally and politically, the Chancellor is sitting pretty. If a budget there is to be, one can infer that its purpose is, at last, genuinely economic, that of stanching the devastating flow of money incomes corresponding to no equivalent real wealth.

How will he set about it? The national total of private incomes has risen from £4,591 million in 1938 to £7,305 million in 1946; of that total, wages have risen from £1,735 million to £3,020 million, salaries from £1,110 million to £1,675 million, and rents, profits and interest from £1,914 million to £3,226 million. By the time taxation has been taken into account, wages have increased their share of the total from 39 per cent to 44 per cent and property incomes have fallen from 37 per cent to 33 per cent. Moreover, these figures understate the shift, since "rents, profits and interest," as defined for tax purposes, is almost a nonsense category, including farmers'

incomes, the earnings of the independent professional, and the profits of active businessmen working with their own capital, as well as the purely passive incomes of the coupon-clipper or rentier, large or small. Certainly the largest single stream of incomes, and the stream moreover which has swollen most both absolutely or proportionately, is the wages stream. It is as well for everybody to be quite clear that the total flow of incomes—the inflationary pressure that is wrecking the economy—cannot be cut down without wages being affected first and foremost. The social reformer may deplore this fact and the politician may be terrified by it. But the statistician allows no road of escape from it and the contriver of economic policy, if he is an honest man, cannot dodge it.

The most direct way to reduce the flow of incomes derived from wages is to reduce wage rates. An argument can be made for such a course. But it would be a theoretical argument. Nobody is going to try to cut money wage rates. But the level of real wages is being kept artificially high by the very expensive policy of paying subsidies on food and other necessities of life. It is politically impossible to cut money wages; it may not be politically impossible to reduce the subsidies, which are now running at the fantastic rate of £428 million a year—a quarter, that is, of the entire wages bill of 1938 and not very far short of half the total yield of the income tax. Though an autumn budget might involve many other measures, the core of the question is whether Mr Dalton will have the courage to do his duty by the food subsidies—which is to make a big start with abolishing them.

If this were done, there would be some undeniable hardships—to large families existing on a single wage, to pensioners and the beneficiaries of the social services. But it would be perfectly possible and wholly right to grant countervailing increases both in family allowances and in the various types of pension and benefit; the cost would be a small fraction of what would be saved on the subsidies. What could not be admitted would be what appears to be the TUC's contention—that the general level of wages should be allowed to rise, or at least not discouraged from rising, to match the rise in prices that would follow from the abolition of the subsidies. It is easy to understand why the trade unions should stake such a claim—that is their business in life. But nobody should make the elementary mistake of imagining that, in putting it forward, they are acting as a responsible estate of the realm or that they are advancing the common interest. There are, in fact, staking a claim against the public interest. It may be beyond the Government's power to prevent all further increases in wages—it has certainly been beyond their power hitherto. But if the principle of an automatic adjustment of wages to prices is accepted—either in principle or in practice—then it makes nonsense of the whole proceeding. Nor can it be claimed that the wage-earners will as a whole suffer any great hardship if their nominal real wages decline. The total quantity of consumable goods in the

country will not be reduced—indeed, the aim of the whole policy would be to increase it—and nobody is suggesting anything that would actually give more to any other class of the population. The wage-earners would have less money for football pools and betting, for drink and tobacco, but they would suffer no diminution of the things that are scarce. It is not now, generally speaking, the level of prices, but rationing, that determines how much food people eat; artificially limited food prices mean not larger purchases of food but more income to spend—or to try to spend—on other things. They mean longer queues and barer shelves and the various forms of attempts to spend money that so grievously obstruct the really important business of the nation.

But though it would be absurd to give wages a blanket exemption from the disinflationary policy, in which they must inevitably play the largest part, they cannot be expected to bear the whole burden. That would be bad ethics, faulty economics and suicidal politics. The flow of all incomes needs to be cut down and if wages have to play the major role it is only because they are absolutely the largest and relatively the most swollen. Something will have to be done to cut other incomes also. It is true that all classes eat and that all classes would feel the abolition of the food subsidies; but the higher the income the less proportionate is the burden, and nothing is more certain than that the TUC will demand explicitly, as it has already demanded generally, a parallel attack on other incomes. The suggested spearhead of this attack is an increase in the profits tax. It is easy to understand how this idea should arise. It looks so nice and symmetrical. Real wages are cut, profits should be cut likewise. But it is neither nice nor symmetrical in reality. The profits tax, the tax on company earnings *per se*, is totally unselective as between the large and the small investor; it penalises the venturesome equity-holder as against the inactive debenture-holder; it encourages monkey business with expense accounts; it is a tax on enterprise and good management. It is not even particularly effective, for it is not companies whose expenditure needs to be cut, but individuals. If property incomes are to be further reduced as part of the disinflationary policy, then let the Chancellor raise the standard rate of income tax again, with such countervailing allowances for earned incomes as will leave them on balance unimpaired. Any number of combinations are open to him of steeper gradation, higher exemption, and larger or smaller dependants' allowances. An increase in the profits tax could not possibly be excused on the grounds that it is the only available weapon of fiscal equity.

Nevertheless, though it is right to make some inroad into the flow of incomes other than wages and other small incomes, it is idle to suppose that it could be much more than a token gesture. These other incomes have already been so severely

ASSURANCE: INCORPORATED IN 1720

handled that even their total disappearance would not produce a sum that could be set alongside the savings that could be made by abolishing the subsidies. Any Budget deliberately based on the disinflationary policy would inevitably have the effect of reducing the share of wages in the national income. There is no reason why this fact should not be squarely faced. The process of redistributing the national income has gone a long way since 1938. Even before taxation is taken into account, wages have increased their share in the national income by a very substantial proportion. After taxation has been taken into account, the shift amounts to a social revolution. The length to which it has gone has not been determined by any economic or social reasoning, or by anybody's conscious forethought. It has been the accidental result of the financing of the war. Nobody took thought and decided that a transfer of 5 per cent of the national income—before tax—from other classes to wage-earners was exactly the amount of progress towards social equality that the national economy could stand without dislocation, neither more nor less. It just happened. Nor is there any law of nature that, however far and however fast the wage-earners' slice of the national cake may rise, it must never come down, not even when a reduction in the slice may be the means of enlarging the cake.

The Labour Government's own attitude towards the equality

of incomes does not indicate a belief in universal levelling-down. Ministers do not refuse incomes that put them in the ranks of the upper bourgeoisie, and the salaries attached to membership of the new Boards are very large. If, then, there is some virtue—or at least some necessity—in a certain inequality of incomes, why should it not be openly acknowledged and at least the possibility discussed that the pace of progress towards equality in recent years has been rather too hot.

In any event, the choice before the Chancellor of the Exchequer is reasonably clear. One course is to deny the need for an autumn budget, to hearken to the TUC and to decide that every salient in the class war must be held, no matter how accidentally it has come into the possession of the workers, no matter what the cost to the national economy of holding it. The other course is to follow what the national interest clearly requires, even though that inevitably involves the loss to the wage-earners of a part—but probably only of a minor part—of the very great wartime gain in their slice of the national cake. This second course would take some courage in a Labour Chancellor—but no more courage than Tory Chancellors showed in wartime in so savagely cutting down the net incomes of their party's supporters. And there can be no doubt that it is the right course for him to pursue. Mr Dalton will have to show his hand very soon.

Food and Population in Asia

AMID the storms and tensions, the hopes and fears, that surround the Marshall Plan for aid to a distressed Europe, the distresses of Asia have been all but forgotten. In connection with the Marshall Plan, Asia figures only in the calculation that certain food supplies from Indonesia may soon again become available for the feeding of Europe. Yet the contemporary food crisis of Asia is vaster and more appalling than that of Europe. If it seems less important, it is partly, no doubt, because we happen to be Europeans, but partly, also, because Europe—or at least Western Europe—has been so unaccustomed for generations to the idea of famine. In Asia starvation or near-starvation has been traditionally accepted down to very recent times as part of the natural order of things and, whatever the suffering of the individuals thus afflicted, the catastrophes of famine evoke less horror, compassion or protest in a society thus conditioned to resignation. But Asia, as part of its modernisation, has for some time now been increasingly conscious of the new technological possibilities of an "age of plenty" and less submissive to the vagaries and oppressions either of nature or of the social order; moreover, the improvements in food supply which have actually been brought about in wide areas during the last half century now make any retrogression far harder to bear than the mere continuation of ancient penury.

But a retrogression is what has occurred on a large scale as a consequence of the Pacific war, and so slight is the margin which at any time separates the common man in Asia from starvation level that a decline in food supply quickly brings into operation the Malthusian checks on population. A few figures will indicate how serious is the situation. Before the war Burma, Siam and Indo-China exported rice surpluses to the amount of 7 million long tons annually; this has dropped to 1½ million tons last year, and India, Malaya and South China, which formerly imported most of these surpluses, have been gravely affected. In the Outer Islands of Indonesia, according to Dutch figures, rice production has fallen by 25 per cent from pre-war levels and in Java by 20 per cent; in Java, also, production of maize is down by 40 per cent, of tapioca by 30 per cent, of ground nuts by 40 per cent and of soya beans by 60 per cent. In China, the decline in agricultural production was estimated in the first year after the war at from 5 to 15 per cent, though there has been

some recovery since then. In Korea, the American authorities found a 30 per cent decline in rice production from pre-war levels owing to lack of fertilisers, which were formerly supplied by the Japanese. Almost everywhere it is the same story. The total quantity of food produced in Asia, at least in the countries east of the Indus and south of the Amur, has diminished, while the momentum of population increase continues except in so far as it is "adjusted" by new increases of famine, disease and violent death—the checks recognised by Malthus as operative in a society in which population outruns the available food supply. The first two checks may be regarded as matters chiefly of local concern, however much humanitarian feeling may be aroused in other parts of the world, but the third—which covers all forms of violent disorder, from war and civil war to rioting and brigandage, cannot in the present world system fail to affect the world at large. Warfare and disorder in any major region of the world tend to involve nations of other regions, and particularly in circumstances of Great Power rivalry such as now exist. Population pressure and destitution are not, of course, the only reasons for violent conflicts; the origins are varied and complex. But when to-day the political observer surveys the national, communal and social struggles of Asia, or when there is talk of "democracy" in Iran, India, China, Indonesia, Korea or Japan, the basic factors of food supply and population are at least relevant. And blood-letting, regarded as a check on population growth, has the disadvantage that it tends to create a vicious spiral; famine and pestilence reduce the number of mouths to be fed without much affecting the production of food by those who remain alive, but war and disorder, if sufficiently devastating and disruptive of normal social and economic life, have the effect of greatly diminishing the food supply and thus producing new pressures on the means of subsistence.

Many parts of Asia have recently been in the second of three stages of a population development which has been observed as a universal phenomenon, subject to local variations, in modern Europe. In the first stage, which was normal in Western Europe up to the eighteenth century, there is a high birth-rate and a high death-rate; population increases only slowly, if at all, except where there is settlement of new land or a notable increase in long-range trade in foodstuffs. In the second stage,

which accompanied the industrialisation of the nineteenth century, the birth rate remains high, but the death rate is substantially reduced, resulting in a rapid increase of population. This is followed by the third stage in which the death rate remains low or goes lower, but the birth rate declines until it approaches equality with the death rate and population tends towards a new equilibrium.

The fall of the death-rate in the second stage of this development was due in Europe to three factors which weakened the Malthusian checks; first to the increase of food supply by improved methods of farming, and even more by the new means of transport which made possible a large trade in foodstuffs not only between different areas of one country, but also between countries and continents; secondly, by the advances in medicine and sanitation and the control of epidemic diseases; and thirdly, by improvements in public order and the relative stability of the international political system between 1815 and 1914. An additional factor consisted of the outlets for emigration which then existed, particularly during the period of the settlement of North America.

★

In Asia these factors, except the last, have been present in varying degrees in recent times, mainly as a result either of control by Western nations or of a deliberate national "westernisation." In India under British rule the two decades 1921-1941 brought population increases of 11 per cent and 15 per cent respectively, with a total addition of 83 million persons. In Java, under Dutch rule, the increase in the decade 1930-1940, was 15 per cent, adding over 6 million and bringing the population to more than 48 million in 1940, with a density of 950 to the square mile, the highest in the world for a comparably large area. In Japan, the population has nearly trebled since 1868.

In China, on the other hand, where the Malthusian checks have remained more or less fully in operation, the population is believed to have grown very little in the last eighty years—though there are no reliable vital statistics available, and this fact is in itself a symptom of China's long delay in reaching modernity. A consequence of China's economic backwardness, how-

The Balance of Payments—V

Fewer Imports and Cheaper Exports

THE previous articles in this series have established the two major conditions on which the British international accounts can be balanced and the country can be once more enabled to pay its way out of its own resources. The first of these conditions is that the British people will be content, for quite a number of years to come, with a smaller total volume of imports than they purchased in 1938—that is to say with an even smaller fraction of the imports that they would want to buy if today's conditions of full employment were combined with 1938's relative absence of quantitative restrictions on imports.

The second condition is that the necessary increase in British exports is secured in the only way that is likely to be enduring—by offering British goods to the world on terms that, quality for quality, are rather better than competitive. If it were merely a question of maintaining the pre-war volume of British exports, and no increase were called for, it might be a feasible policy to sell dear, relying on keeping the traditional markets. In that case, "favourable" terms of trade would be the complete answer. But an increase is now inescapably necessary, and it will be far more difficult to secure even a small increase with prices that seem high to the purchaser than to secure a larger increase with competitive prices. Nothing can be relied upon

ever, has been that under present conditions, China is less endangered by the post-war declines than some other Asiatic countries. Except for the province of Kwangtung China has not in the past relied to any considerable extent on imported food. Both India and Japan, on the other hand, have become vitally dependent on external sources of supply—India particularly on Burma, which used to be part of the "Indian Empire" under the British Raj, but is now an independent country, and Japan on Korea, Formosa and Manchuria, which were formerly under Japanese control, but have now been separated from the Japanese economy. Japan must in future import very large quantities of food, if she is to feed her population at a minimum standard, as well as most of the raw materials needed for industry, in which the islands of Japan are deficient. Japan has, indeed, a population adjusted to a much more prosperous economy than it now possesses or is likely to possess in the near future, and it is still increasing, though the birth-rate was falling even before the war, thus indicating that Japan had already entered the third stage of the normal modern population development. At the present time the Japanese are dependent on the provision of foodstuffs from America; even so, widespread malnutrition is indicated by the reported general deterioration in the health of schoolchildren.

In India, perhaps, the problem is most serious of all. There is there no American authority to discharge the victor's still acknowledged responsibility to feed a people under its military occupation. India is now spending on food imports most of the precious foreign exchange vitally needed for capital construction, and if the disorder in India continues, with no economic co-operation between India and Pakistan, the foreign exchange will soon disappear. Indian political leaders, long absorbed in purely political questions, have now suddenly been brought face to face with the appalling problem of feeding 400 million people on a territory no longer self-sufficient in food supply even at the lowest possible level. But the problem is not for India alone or for any of the Asiatic countries individually. It must ultimately be attacked on an international level. The existence of FAO is a recognition that the feeding of the world is the world's business, and half the inhabitants of the world live in Asia.

to evade this necessity for the lowest possible selling prices, neither a devaluation of the pound sterling nor an exploitation of any bargaining power that may accrue to Britain with the return to a world-wide buyer's market. Both of these things—both cheaper pounds and tougher bargaining—will help to get an increased volume of trade if the sterling prices are right. Neither will create markets if the prices are wrong.

The main concern of this series is with the external relations of the British economy. But the discussion can hardly be brought to a close without some brief indication, in this final article, of some of the consequences for the internal economy of the country that flow from these two conditions, even though space will not permit of more than a few of the more obvious and superficial points being made.

The condition that the volume of imports should be reduced to something like 85 per cent of the 1938 level does not, at first sight, seem to be a particularly stringent one in view of the very much larger reduction that was made during the war, without driving the economy *in extremis*. Indeed, it is true that if the country were willing to accept an extreme state of siege as its normal condition, imports could be substantially and permanently cut. But manifestly it is not so content. Apart from the desirability of it, an economy that required the permanent

application of rationing and allocation schemes would either degenerate into a police state or else cease to function at all. Whatever there may be to say for or against the principle of the state exercising control over the economy, it would be universally agreed that the sort of controls that arise from physical shortage of supplies are thoroughly noxious. They are very difficult to administer, particularly with any regard to the need for progress and enterprise, and they disrupt and dislocate the smooth functioning of the economy.

The requirement that imports shall be cut to 85 per cent of the 1938 level ought therefore to be taken to mean that they shall be so reduced without the necessity for rationing or allocation schemes. And that, in its turn, means that the imports that come under the ban must either be such dispensable luxuries that the demand for them can be killed by stiff import duties or else that they must be capable of being replaced out of home production. To cut a long argument short, this means that the cut to 85 per cent can be achieved only if there is a big increase in the volume of food production in this country. If we were still in 1938, it is just conceivable that the cut could be made by eliminating unnecessary imports of manufactures. But with full employment and a sharp emphasis on the need for capital development, the cut could not be made without a heavy reduction in food imports. And that, in its turn, can be made consistent with a free unrationed market in food only if the vanished imports are replaced by home production.

But if the logical analysis of the problem of the balance of payments thus provides a justification for the target of the Government's new agricultural programme (and it is to be hoped that the agrarian interest will accord a little credit to a free trade journal for willingness to accept the conclusions of its logic), it also underlines the very grave dangers implicit in the method that the Government proposes to adopt in the pursuit of its target. An increased dependence on home-grown food involves, in any case, a national standard of living lower than it would otherwise have been. The British people will have to accustom themselves, by one means or another, to paying out a higher proportion of their incomes for food and having less left over for other things. This is at once a danger signal for the export trades, for one of the supreme advantages that the people of this island have hitherto enjoyed as converters of imported raw materials into exported manufactures—as one of the world's workshops—has been that they got their food at the world's cheapest prices. But when the Government decide, as they apparently have done, to obtain the necessary increase in agricultural production by the impossibly lavish method of simply inflating farmers' incomes and hoping that the increased output will appear, the dangers to the export trade are being raised to a maximum. The level of costs in the export industries ought to be the very first consideration in any policy that bears upon the price of food. As it is, it does not seem to enter into the matter at all.

The means by which British exporters can be enabled and persuaded to win the competitive battle in the world's markets is, of course, only one facet—though perhaps the most important one—of a much bigger problem. British industry, on both sides of the management-labour fence, has grown alarmingly "soft" in the last quarter-century, and the health of the national economy in all its aspects, not only in those that affect exports, depends on a return being made, by some means, to the policy of producing as much as possible, of the highest possible quality, at the lowest possible costs. The philosophy of output quotas, restriction agreements, trade union feather-bedding and wide margins of profit must be abandoned for the philosophy of high turnover and low profits, of premiums for

efficiency and sanctions against high costs. Whether industry is privately or publicly owned, the criterion of enterprise must be re-established, and nobody has yet discovered any means of doing so that promises to be half as effective as the re-establishment of competition.

This is a familiar general argument to readers of *The Economist* and there is no intention of developing it here. What is relevant to the present purpose is to point out that, even within the framework of a general policy designed to increase the efficiency and lower the costs of British industry, there would almost certainly still be need of some special measures to ensure that the costs and prices of exporters were even lower than the average. The direct and obvious way of achieving that end would, of course, be the payment of subsidies to exports. But it would be a clumsy and dangerous weapon, likely to lead to as much trouble at home as retaliation abroad. It should be used only with great discretion and as a last resort.

Without going so far as an open subsidy, however, there are other and perfectly legitimate ways in which the export industry can be relieved of some of the burden of the overhead costs of the national economy that they now bear. The nationalisation of the fuel and power and transport industries provides an opportunity for some differential fixing of charges to the benefit of exporters. Moreover, there are ways in which industrial firms can be encouraged to do export business at a lower margin of profit than they require in the domestic market. An example of this has been given this week in Mr Wilmot's statement that a firm's steel allocation for the whole of its business will depend on how closely it attains its export target. When the weapon of material allocations disappears, the fiscal weapon could take its place. Exporters could be granted partial or complete exemption from any sort of tax that enters into costs of production; they could be given an incentive by concessions within the orbit of the income-tax. There is clearly material for a strong commission of inquiry to go right through the list of items that enter into costs of production and suggest means whereby they could be differentially reduced.

It will thus be necessary to do unorthodox things as well as difficult things if the two conditions are to be met, if the national economy is to run smoothly on a reduced volume of imports and if British exports are to be made attractive to the world. But unorthodoxy must not be rejected, any more than difficulties must be burked. For the need is very great. The problem of the balance of payments is not a temporary one that will be blown away by a shift in the trade winds. It will be with us for at least a generation. And the penalty of failure to solve it is that Britain will not recover self-reliance and self-respect, that the humiliations that come to the pensioner and the dependant will have to be endured for many long years, and that one of the oldest, proudest and staunchest pillars of the society of free men will begin to crumble.

Change of Address

The address of *The Economist*, for all purposes, is now

The Economist,
22, Ryder Street, St. James's, London,
S.W.1.

Telephone: WHITEHALL 1511
Telegrams: ECONOMIST NEWSPAPER, LONDON.
Cables: MISTECON, LONDON.

NOTES OF THE WEEK

Reconstruction of the Cabinet

The first instalment of the Prime Minister's reconstruction of his Administration was announced at the beginning of the week. Sir Stafford Cripps becomes Minister for [sic] Economic Affairs, constitutionally a Minister without Portfolio. Mr Arthur Greenwood resigns, at the Prime Minister's request, his office as Minister without Portfolio. Mr J. H. Wilson succeeds Sir Stafford Cripps as President of the Board of Trade and is to become a member of the Cabinet.

The changes in responsibility are more extensive. Hitherto, general responsibility for home economic affairs has rested upon a committee of Ministers headed by the Lord President, overseas economic affairs upon another committee of which the Prime Minister is chairman. The two committees, and their functions, are now to be merged and reconstituted as a smaller policy committee with the Prime Minister still as chairman but with Sir Stafford Cripps, in his new role, as his deputy and, no doubt, largely responsible for the work falling within the committee's province. To assist him he will have a personal staff, the services of the Cabinet Office's economic units, but no formal department. In general, the sway of the Minister for Economic Affairs will extend over the Board of Trade and the Ministries of Labour, Supply, Fuel and Power and Transport.

From the point of view of the machinery of Government, the changes have a great deal that is commendable. They are a step towards the freeing of what might be called the Inner Cabinet from day-to-day departmental duties and towards the grouping of the departments of state on a functional basis. Further, in creating a new Minister, the Prime Minister has resisted the temptation to create a new Ministry. Perhaps "temptation" is not the right word; it is inconceivable that any Prime Minister could find the prospect of establishing a new Ministry, with all its attendant problems of personnel, precedence and procedure, at all attractive. None the less, it is understood that at one stage in the deliberations which preceded Tuesday's announcement it was proposed to revive the wartime Ministry of Production.

But there are criticisms to be made. What stands out from the new scheme is that once again the Treasury has slipped out of anyone else's care. If economic planning is to make sense, finance must be a part of it. Yet the Treasury is still aloof. The Chancellor of the Exchequer is to be a member of the new economic committee, but that will still leave him—and his Department—free from any compelling need to adjust Treasury finance to economics instead of trying to adjust economics to Treasury conceptions of finance. The ideal arrangement would be to separate the ancient office of First Lord of the Treasury from that of Prime Minister and to make the First Lord the economic chief of the country, with a Chancellor of the Exchequer as one of his departmental subordinates.

But, even if that were not to be done, it is again a pity to create what is virtually a new Minister without Portfolio. Since 1940 the office of Lord President of the Council has acquired increased status and a useful accretion of duties. Now that development has been cut short. The Lord President will be little more than Leader of the House. It would surely have been better to make economic affairs a function of the Lord President and to make the Minister without Portfolio Leader of the House.

Direction of Ministers

The new appointments and the resulting effect on the general policy of the Government cannot be fairly judged until the full list of changes in the administration is published. For example, the effect on events of the appointment of the new Minister for Economic Affairs is bound to be influenced by whether Economic Affairs is bound to be influenced by whether Mr Isaacs or another will, this time next week, be Minister of Labour. But one thing is reasonably clear. The course in which national effort will be expended over the next few months is set. Sir Stafford Cripps, it has been said, has all the power of dynamic forward motion possessed by a singularly efficient and powerful tram-car—but no human agency can determine whether he shall proceed along the right lines or the wrong. Most interesting will be the relations between Sir Stafford Cripps and the Trades Union Congress. The TUC have shied violently away from even the thought that the Prime Minister meant what he said when he declared last August that wages must not rise any further; they have hardly taken in the further suggestion that

restrictive practices in trade must be deliberately renounced. But Sir Stafford has the kind of mind that appreciates very accurately the importance of these two propositions. His work on propounding them has hardly begun.

Men of all parties will see Mr Arthur Greenwood leave the Cabinet with regret. He has always been a very human figure, in office and out, both in his loyalties and in his reactions to events. In his own way he has some of the qualities possessed by Mr Maxton; enough humanity to make his sincerity shine all the brighter. Mr Harold Wilson joins the Cabinet at a remarkably early age. He has given promise of great ability both as a politician and as an administrator, and he carries with him into the Cabinet Room the ardent good wishes of a whole generation.

A Plan to Sell the Marshall Plan?

Since the publication of the Paris Report ten days ago, two factors have become increasingly relevant. The first is the fact that some of the sixteen nations cannot wait on the normal and leisurely methods of Congressional legislation. Both France and Italy are almost at the end of their dollar reserves. The Italian Government has been forced to cancel its orders of coal for delivery this autumn, and Count Sforza, whose estimate of Italy's needs before Christmas is some \$250 million, warned the Americans in Paris last week that their help might be "too little and too late." In France the bread ration has been cut (to an accompaniment of strikes and protests), and M. Bidault has flown to Washington to find out France's chance of securing some \$120 million a month "until the coming into operation of the Marshall Plan." Otherwise, the French are likely to face three breadless days a week and a halving of their industrial production.

Unhappily, the other factor which has come to the fore in the Washington news—the inability of the United States to meet Europe's needs without sacrificing some of its own consumption—makes the problem of securing any aid, either interim or long term, increasingly difficult. The Harriman Committee of 19 have urged on the President the need for rationing and for the allocation of scarce supplies. The President himself has said that Europe may collapse before the Marshall programme can come into operation. Yet neither he nor the Congressional leaders he summoned to the White House last Monday have really grappled with the problem of rationing and cut in American consumption. At present reliance is to be placed on appeals to voluntary abstinence and on a campaign to make the American people conscious of the urgency of Europe's need. But reports from Washington do not encourage the belief that this campaign, even under the energetic leadership of Mr Charles Luckman, will be enough to do the trick. As one observer put it: "Here in Washington we need a Marshall Plan to sell the Marshall Plan. But so far there is no sign of a thought-out and concerted strategy."

Paris Report Under Fire

Since the attitude of the American people and through them, of Congress, towards aid to Europe, will be largely determined by the "saleability" of the Paris Report, one of the most important points to establish is whether or not it is the kind of report America will find to its liking. The sixteen nations were given a foretaste of the likely American reaction when Mr Clayton arrived in Paris early in September and insisted on a reconsideration of the Report to make it more attractive. It will be recalled that his criticisms were formulated in six points, and one obvious test of the final report is the extent to which it has been possible to meet the American objections.

The first and the fifth points raised by Mr Clayton concern the internal policy of the Sixteen. They had failed, he complained, to give adequate guarantees that they would restore their financial and monetary stability, nor had each given "a formal pledge to deliver an all-out effort to achieve its production target." It cannot be said that the final report gives much satisfaction on these scores. A whole chapter (the fourth) has been introduced to express the nations' determination to stabilise their financial position and they conclude their report by repeating their determination to meet the crisis "by their own exertions." But all this is no more than a repetition of promises which so far,

most of the nations have been unable to fulfil. The unsuccessful efforts of the Italian Government to induce deflation in the course of the summer are described elsewhere. In France, *l'expérience Blum* represented the wreck of similar hopes. In Great Britain, where a coal target of 250 million tons a year has been accepted, output obstinately refuses to reach even the 200 million mark. The truth is that the Americans are asking something of which the only proof is performance. Pledges in the report will remain pledges until the countries can point to success. But in certain fields—the field of financial stability, for instance—success can only follow the securing of American aid. This dilemma does not apply, however, to what may prove the crucial clause of the whole report—the British pledge to increase coal. On this point, the Americans can and will demand performance.

Mr Clayton's other criticisms concerned rather the relations of the states with each other than their internal policies. One criticism—the third, that the nations had failed to explore alternative methods of financing—has been met. The Sixteen now propose to ask the International Bank and other international agencies to finance their requirements for equipment to the extent of just over \$3 billion for the four years of the plan. But the other points have proved more intractable. Mr Clayton criticised the Sixteen for "lacking a sense of Continental or pan-European approach to the recovery plan" (Point 2), of ignoring the possibilities of increasing prosperity by a reduction of trade barriers (Point 4) and of failing to set up a permanent organisation "to review the economic co-operation effort on a continental scale at regular periods" (Point 6). He insisted with particular emphasis upon America's interest in permanent machinery for European co-operation.

On these points, the Report does little to satisfy American criticisms. A few examples of genuinely super-national planning—the scheme for generating more electricity, the proposal for an international freight car pool, the possibility of standardising types of cars and machinery, the promise to "exchange information" on the various steel programmes—have been taken from their context and scraped together in a new chapter on "Economic Co-operation" together with an undertaking to study a customs union and declarations by the French and the Italians of their readiness to enter customs unions which would work. On tariffs, there is little or nothing save an admission that the present almost universal policy of cutting imports is suicidal. Yet efforts to aid inter-European trade by working out a European plan of convertibility have so far proved unsuccessful. The only point upon which Mr Clayton received any real satisfaction was the decision, reached unanimously after painful debate, to set up a permanent organisation for overseeing the development of the various separate national policies, "if the [American] means are made available."

It is impossible to avoid the conclusion that here, in its failure to recommend new and courageous methods of international co-operation and mutual aid, the Report is at its weakest. Yet it is on this point that American imagination is most ready to be fired. And who shall say that this Report can be passed without some touching of American emotions?

The Frenchman's Bread

Desperate hopes are behind M. Bidault's personal effort in Washington to ensure that President Truman will somehow provide France and Italy with the \$580 million of which he has spoken to tide them over the winter. This sum is thought of in Paris as the bare minimum to forestall total disruption—political as well as economic. For the government's failure to feed the people is the main theme of the opposition parties in the campaign now being waged for the coming municipal elections. Higher prices (another 30 per cent rise in the last few weeks) and interminable queueing have had their effects on popular support for the centre parties. Results of a poll of public opinion published this week show the three parties of the Ramadier coalition receiving between them only 25 per cent of the prospective vote, the Communists alone 22 per cent and the De Gaulle Rally 17 per cent. French election results are notoriously hard to predict; but M. Ramadier and his colleagues are very worried about their parties' prospects.

The French public resent the idea that their bread ration may be fixed by what President Truman does or fails to do. So they

turn their irritation against the *inefficacité* and *incurie* of the government, refusing to be impressed by figures and facts illustrating the effects of drought and frost on the harvest.

Nevertheless the government is making a serious effort to overhaul food production, and is using both stick and carrot on the farmer. The target is a great revival of arable farming: immediate restoration of pre-war wheat acreage (5,000,000 hectares) and extension of the present barley acreage by 25 per cent. Particular importance is attached to the barley target, because this crop can be harvested earlier and would help France to squeeze through the crisis ahead. It is claimed that the seed stocks for this expansion exist, but there remains the problem of making producers surrender them.

This drive to revive cereal production is, of course, part of the original Monnet plan; it is also taken for granted in the Paris report to Mr Marshall, which estimates that by 1951 France will be not only self-sufficient in bread grain but able—in good years—to export. In 1938 there were 5,050,000 hectares under cultivation, and this was below the average of the 'thirties; at the liberation the area was 3,694,000 hectares, now it is 4,770,000. To meet the justifiable demand of Washington that France should export wheat is as important for the French Government as is for the British Government the demand that Britain should export coal.

By-Elections to Date

The results of the Islington by-election surprised nobody. It is a safe Labour seat and the majority, though reduced, is still comfortable. The Government's unique record of no seats lost after more than two years stands. The Liberal candidate did rather better than his colleague at Edge Hill but not so well as entirely to still the doubts about the wisdom of putting up Liberal candidates everywhere.

The Government's unbroken record is visibly giving them comfort, to which, indeed, within the rules of party politics, they are fully entitled. But, by-elections, unless very carefully analysed, can be a very unreliable guide to the trend of public opinion. For example the unbroken record owes not a little to the accident that, with the exception of Edge Hill, Labour has not yet had to defend one of its doubtful seats. The old party regulars who die, retire or get appointed to fat jobs all have safe seats; it was the young men who won the doubtful seats two years ago. Nor can much be read into the size of majorities, which are usually smaller at by-elections than at General Elections.

The only test that has any validity at all is to compare the proportion of the total vote going to each party at the by-elections with the proportion that each party secured in the same constituencies at the General Election. This is done in the following table, which is extracted from a much more complete analysis of by-election statistics which appears in this week's issue of the *Records and Statistics* supplement to *The Economist*.

PERCENTAGE OF TOTAL VOTES CAST				
(Omitting University Seats and Seats where there was an unopposed return either at the General Election or at the By-Election.)				
	At General Contests	At By- Election	Change	
LABOUR				
General Election, July 1945		%	%	
July to December, 1945	9	41.9	43.8	+ 1.9
January to June, 1946	6	33.5	45.7	+12.2
July to December, 1946	9	62.5	57.3	- 5.2
January to June, 1947	2	75.1	67.6	- 7.5
July to September, 1947	2	68.8	54.2	-14.6
CONSERVATIVE				
General Election, July 1945		%	%	
July to December, 1945	9	48.0	47.2	- 0.8
January to June, 1946	6	51.6	44.5	- 7.1
July to December, 1946	9	32.4	33.7	+ 1.3
January to June, 1947	2	25.0	29.5	+ 4.5
July to September, 1947	2	31.3	35.9	+ 4.6

In reading this table it should be realised that it is not the absolute size of the percentages that matters, since that depends on the nature of the seats where vacancies happen to occur, but on the change shown between the General Election and the by-election—i.e., on the pluses and minuses in the last column. This shows that the usual anti-Government trend has been in evidence, though it did not begin to show itself until a year after

the General Election. On the other hand, it is not yet clear how significant it is. In the four seats that have been contested this year, the Labour poll has fallen from 72.9 per cent to 62.5 per cent, while the Conservative poll has risen from 27.1 to 31.9 per cent. If the votes at the General Election were to alter in the same way, they would put the Conservatives in the lead by some 1,400,000 votes out of a total of 25 million. But this calculation is based on only 4 seats. If the period is extended to the fifteen months since July 1, 1946, when 13 seats have been contested, the two parties would be at an exact theoretical equality. The political game is thus an open contest, with the trend, as usual, away from the Government. But by-elections are only by-elections.

Joint Consultation in Industry

The Government's decision to encourage joint production committees is a logical development of the policy, of which Sir Stafford Cripps is the most ardent exponent, of consulting the two sides of industry on all production matters. The machinery for joint consultation operates very fully at the top, and the Government hardly ever moves without first seeking the advice and approval of its various employer-union committees. Since the announcement of the new export targets was made to a joint conference of employers and union representatives, it is only logical that the same process should be applied in the factories which actually have to carry out the programme.

No one will deny the psychological importance of joint consultation, or the need for keeping the workers informed about production plans and enabling them to contribute their suggestions for carrying them out. Their value was clearly shown during the war, and the need for joint consultation is equally great today, but production committees have tended to lapse or have ceased to be of much value. The intention is, accordingly, to encourage their establishment and to assist them to function effectively. There is no intention of making them compulsory, as the engineering unions have frequently urged. But each industry will be asked to reach a national agreement on the most appropriate form of joint consultative machinery.

The main difficulty is to translate the excellent principles underlying joint production committees into practice. All too often, they just add to the time spent in committee work and discussion, and since wages and conditions are outside their terms of reference, they frequently find little that is useful to discuss. There are still employers who regard a joint production committee as an infringement of managerial functions, while there are often among the workers' representatives men whose main object seems to be to put the management in its place or to air trivial grievances. However, if each industry and each firm is given a precise target to reach, a production committee should be of value in acting as a kind of "progress chaser" for the whole factory. The position of foremen, and of technical and scientific staffs, who are as closely interested in the progress of production plans as the workers, sometimes gives rise to difficulties. Mr Isaacs's suggestion that they should be brought into the committees in their own right as a third party, certainly has advantages, although it might tend to make the committee somewhat unwieldy. The Government, while laying down the general principle, has had the good sense to recognise that no hard and fast rule can be drawn up and that it is for each industry and each firm to work out its own methods.

Fewer Houses Than Ever

Any ordinary person might have supposed that the sunniest August for years would have created a boom in the number of houses completed during that month. The fall in output last February and March was accepted with resignation and understanding; the difficulties of putting bricks together under conditions of frost, snow and flood are well known. But with weeks of unbroken sunshine it was reasonable to expect a steep increase in the number of houses made ready for occupation over the succeeding months. In fact, 11,293 permanent houses were completed in July and only 10,168 in August.

This failure is startling. If there was no improvement in August it is difficult to see why things should be any better in September or October—except perhaps that fewer builders will be on holiday; and at this rate it will be nearly two years before the 230,000 houses at present under construction will be completed. The last time any statement was made about housing targets was in May, when it was hoped that "as many as possible" of the

218,000 houses then under construction would be completed by the end of 1947. To achieve this would have meant completing an average of more than 30,000 houses a month, and this aim was already well below the target announced last January on the eve of the fuel crisis. Any discussion of these targets would be academic but for the fact that during August there can as yet have been no alterations in the distribution of building labour, and therefore the fall in the number of houses completed must have been caused by lower output per man. This makes the negotiations on output bonuses discussed on page 575 all the more urgent.

Complete silence still envelops the re-revision of the housing programme 1947 model, Mark III. It is to be hoped that the

new version is already prepared and is only awaiting its cue from Sir Stafford Cripps. Presumably houses already under construction will be allowed to be finished, although even more slowly in areas where there are no miners or agricultural and other key workers to be given priority. The main cuts will have to be on new building with the corresponding adjustments in the building materials industries. It is from these rather than from building labour on the site that assistance for the export drive will mainly be found.

Wigs on the Green at Uno

Everything heard or read about Uno in the last ten days has been disturbing and bewildering. The proceedings in the General Assembly have been farcical: the debates have shown no sign of leading to action, still less of influencing listeners. In fact—despite the manoeuvring over Palestine and the vote trading of the Latin American members—there are now no disinterested spectators of any dispute. The line-up is complete and the result of any given match predictable. Delegates who have been boggling at the budget of nearly £9 million presented by Mr Lie, or raising their eyebrows at the skyscraper designs for their new headquarters, have in mind the question—how long can the farce go on without a violent and tragic ending?

The Greek question is at the heart of the confusion. Uno, having taken it up, investigated it on the spot and come to broad conclusions that are beyond dispute, finds itself impotent. The Security Council has failed and now the Political Committee of the Assembly is failing. Mr Gromyko has fought phrase by phrase an American resolution designed to make the Assembly act: it calls on Greece's northern neighbours to cease their interference in its affairs and demands establishment of a commission to supervise happenings on the Greek frontiers. The British have supported it, so have the French, but with reservations about the language to be used about the Albanians, Yugoslavs and Bulgarians. Mr Gromyko, unable to use the veto which won him the battle in the Security Council, has used effectively a resolution which is substantially the same as one he offered on July 8 in the "other place." He proposed that British troops should withdraw from Greece, that the Assembly should supervise the financial aid being given, that the Greeks should be branded as instigators of the troubles. And for full measure he threw in the warning that "American policy may cause the collapse of Uno." That is of course his way of saying that Mr Marshall's present diplomatic offensive, designed to make Uno effective against the Russian veto, might make it ineffective by forcing the Russians to withdraw from Long Island.

A Feast of Rudeness

These particular arguments only make sense, because so long as the Russian-American duel continues à outrance Uno can be nothing but an assembly of partisans. What does not make sense is the extension of hostilities to every debate that takes place. How, for example, can Dr Lange of Poland pretend that it is either useful or plausible to invite the economic committee of the Assembly to denounce the Paris economic conference, or to suggest that all relief and aid schemes should be supervised by the Economic and Social Council? What could be more grotesque than to hear delegates from eastern Europe questioning the legal right of South Africa to refuse a trusteeship arrangement for South-West Africa? Or to have it suggested that Italy can only be admitted to Uno membership if and when Bulgaria, Hungary and Rumania are accepted as well? Yet this feast of multilateral rudeness is to go on for another month or six weeks while the Foreign Ministers put off till the end of November their vital talks on Germany. Mr Vishinsky provided the richest dish when he said, in his uproarious press conference:

I myself prefer to be polite; but if one is rude to me, I am rude in return three times as much, without distinction of male or female.

* * *

Discordant Dominions

The theory of Dominion status in the Commonwealth has been considered compatible with the neutrality of one Dominion while another is at war, because freedom of decision on peace or war is one of the essential rights of a Dominion. But the possibility that two Dominions might go to war with each other is one which has not hitherto been seriously considered. A cynical observer might contend that the units of the Commonwealth have been prevented from flying at one another's throats by the great sea spaces which divide them, but even where there is close geographical contact, the conventions of non-violence in mutual relations have been strong enough; when the dispute between Canada and Newfoundland over Labrador was dragging out its weary course, nobody expected an attempt to settle it by blood and iron. But the conflict in which the new-born Dominions of India and Pakistan now confront one another is of a much more serious kind than any dispute over territory or economic interests; it concerns the extermination or survival of millions of people on both sides of the new frontiers and it is inevitable that the massacres which have taken place should have worked up communal feelings to fever pitch. There is now open talk of war, and also in India a strong movement for transforming India into a Hindu state in which Moslems would be deprived of citizen rights. These tendencies are abhorrent to Mr Nehru and his friends among the Congress leaders whose concept of the unity of India was framed in terms of modern secular nationalism; he has courageously admitted in a public speech that India must share the blame for what has happened and has declared that India will never be turned into a Hindu state while he is at the helm of affairs. But he is under strong pressure from those elements of Congress who are under the sway of communalism and whose communal bias in the period of the Congress provincial governments between 1937 and 1939 was one of the main causes of the growth of Moslem adhesion to the Moslem League. Mr Gandhi has unfortunately given an impetus to Hindu extremism by a speech in which, though reaffirming his own belief in non-violence, he said that if there was no other way of securing justice from Pakistan, the Indian Government would have to go to war against it; for many Hindus his suggestion that a war against Pakistan would be a just war as wars go is more likely to carry weight than his ideal pacifist teaching.

*

Meanwhile Pakistan, as the weaker party in the conflict, has made an appeal for aid and advice to the British and Dominion Governments which has caused no little embarrassment. The British Commonwealth is not a collective security organisation for the protection of its members against one another, and there is nothing they can do in such a situation except to use their influence for peacemaking and to provide urgent relief for the refugees on both sides. Both India and Pakistan are members of the United Nations and either can appeal to the Security Council if threatened with, or subjected to, armed invasion. But within the limits set by the Commonwealth's lack of any supreme executive authority it would be of value if the concern felt by Britain and other Dominions at the turn of events in India, and their will to give whatever assistance is in their power to both

India and Pakistan as soon as they can compose their differences, should find expression in some joint declaration. There may be dangers in even verbal involvement in such an explosive quarrel, but they are less than the impression of indifference and apathy which would be given by a failure to manifest any interest in what is going on.

* * *

The Tudor Controversy

The Minister of Supply has acted promptly in appointing a committee to investigate the dispute between British Overseas Airways Corporation and Messrs A. V. Roe over the merits of the Tudor I airliner, and it would be improper to attempt to prejudge the issue. But in any event this is one of those puzzling matters in which the outside observer finds it very difficult to form an opinion, since so few of the facts are public and the authoritative opinions are so much at variance.

The issues involved are of great importance for public policy—they are far more important than a squabble between a corporation and a company—and the Committee will be doing no less than their duty if they insist on reaching the underlying truth. One of the issues involved is the familiar one of whether British civil aviation should use British or American aircraft. At the moment, there is no doubt that American aircraft are the best available, and BOAC, whose job it is to fly in competition with air lines of other nationalities (all of whom, virtually without exception, use American aircraft), naturally insists on being put into a position to compete. But the opposite argument is that it is essential for Britain to have an aircraft industry, that there is no reason why it should not, in time, be able to build just as good aircraft as the Americans, or even better, but that it cannot do so unless it can have actual operational experience to guide design. British aero-engines are the best in the world; but British fuselage design has some leeway to make up, and it cannot be made up on the drawing-board. Therefore, in the national interest, and in their own long-term interest, the British civil aviation corporations must be put under the obligation to use British aircraft whenever possible.

Hitherto, the balance of argument has seemed to be in favour of this second view. But this judgment would have to be altered if it became apparent that the system by which new designs of British aircraft were worked out, developed and produced was so costly that no new design could ever be expected to be flown in time to be up to date. That is the second big issue before the Courtney Committee. The timetable of the Tudor I is certainly suspicious. When the design was first evolved some four or five years ago, the idea was to combine the wing of a Lincoln bomber with a new fuselage in order to have a stop-gap civil air liner ready soon after the war ended. It is understandable that an aircraft that might have been very acceptable in 1946 is much less so in 1948 and it is a temptation to the layman to say that the system by which the user and the manufacturer are not in direct contact but are separated by two distinct Government departments must be responsible for at least part of the delay. This may be so—the Committee will have to satisfy itself on that point. But it is not only a passion for interference that creates such a cumbersome channel of communication. If the aircraft industry is to be healthy it is imperative that production for civil aviation and for the Services should be co-ordinated and that there should be the fullest cross-fertilisation of ideas between them.

The Universities Miss a Chance

Rarely can so golden an opportunity have been missed as was dropped through the fingers of the universities last week-end. The occasion was a conference called by the Vice-Chancellors to review university affairs; at it, one session was devoted to a discussion of the expansion of the universities, and Sir Alan Barlow, chief instigator of the Government report on the nation's demands for scientific manpower, which has done more than any other document to encourage a doubling of university numbers, was in the chair. The session, which was planned some months ago, was given a special topicality because of the economic crisis and the necessity for reviewing all plans for capital expenditure. The universities very naturally fear that their plans of development are threatened.

But where was the vigorous defence of the universities' claims? Where was the passionate zeal to persuade the authorities that the benefits to the country are out of all proportion to the twenty million pounds of capital expenditure involved? There was Sir Alan Barlow sitting in the chair, a senior official of the Treasury,

In the distribution of textile products the wholesaler eliminates risks for both manufacturer and retailer. His bulk purchases enable the manufacturer to plan ahead. The variety and constant influx of merchandise into the wholesaler's warehouse enable the retailer to keep abreast of changing demand with a minimum of capital outlay for stock. The manufacturer benefits in simplified administration and the elimination of costly and highly competitive direct selling. The retailer benefits in freshness of stocks, reduced risk of slow-selling items, and saving of time in making his purchases.

and close at the heart of the present financial discussions. Could any opportunity have been plainer? It was handed on a platter. Yet it was received gingerly and with a marked lack of unanimity. Fears were expressed about the effects of cutting expenditure on standards and on the numbers of students which could be admitted to this university or that, but there was no real defence of university expansion as a whole. It was all too apparent that the universities are as yet unaccustomed to thinking of themselves as a group, or as a single force in the life of the country; their attitude is still parochial, and even when faced with a major threat to their growth they prefer to face their problems independently of one another.

This is extremely unfortunate in the present instance, for there is an urgent need to defend the plans for expansion boldly. It is certainly true that the Chancellor of the Exchequer's generosity to the universities has encouraged some extravagance in planning—for instance for residential accommodation—and that such comparative luxuries can be postponed without serious loss; but by and large, the yield from investment in university expansion is out of all proportion to the initial cost, and nothing should be done to hamper the increase of teaching facilities or of the number of students who are clamouring for entry. At the same time every pressure should be put on the universities to make the best use of their existing resources, and to expand on austerity standards.

Death Knell of Examinations

When a body as representative and authoritative as the Secondary Schools Examinations Council recommends* the abolition of external examinations for the secondary schools—that is of the School Certificate and Higher School Certificate examinations—it is impossible not to be deeply impressed. But the Council is wise to suggest that an opportunity for the widest discussion should be given before the Minister commits himself either way.

Examinations are almost universally unpopular both with the teachers and the taught. The reasons for the pupils' dislike are self-evident; that of the teachers arises from their claims that external examinations penalise the bad examinee, lead to undue pressure on the boys and girls, cause cramming, unhealthy competition, a standardisation of subject matter and methods, and narrow the range of study. The new proposals go a long way to meet all of these objections except the last.

The Council proposes that all examinations should be abolished except for two special categories of pupils, and that in their place every child should be provided with a comprehensive school report based on internal tests. These reports would be available to employers, university authorities and the like. The two classes of pupils for whom external examinations are considered appropriate are those competing for university scholarships and those who wish to establish competence in certain subjects—for instance, to secure exemption from professional examinations. The external examinations would be organised at three levels, roughly corresponding to matriculation, higher school certificate and scholarship standards.

Before a decision is reached on these proposals there are a number of questions which should be publicly discussed. Criticisms of the present examination system arise as much from bad teaching and preparation as from the examinations themselves; the abolition of the external examinations will not automatically make the teaching better. How far will pupils and employers be content with the school record? Schools can successfully place their own pupils in an order of merit, but school recommendations have been found to be valueless in assessing the relative merits of pupils from different schools. Will not competition in the new examinations repeat itself? What guarantee is there that the abolition of external tests for the great majority of children will not lead to any number of "soft options" and the lowering of the standards that the existing system, for all its defects has slowly built up?

New Salary Scales

Increases in salaries both for nurses and for teachers were announced on Wednesday of this week. For nurses the new scales mean for the most part a higher minimum salary, the increase varying from £20 to £30 a year, and a reduction in the number of years it takes to reach the top of the scale.

* Report of the Secondary Schools Examinations Council, 1947. HMSO. 2d.

The increases in teachers' salaries are on a different basis. Non-graduate qualified assistant teachers will have the same minimum salary, if the new Burnham scales are approved, as they do under the present—that is, £300 a year for men and £270 for women. But their maximum salary will be raised by £30 and £24 to £555 and £444 respectively. What, however, has been the subject of most concern is the salaries for graduates, for the wastage of graduates from the teaching profession and the reluctance of the present generation of university students, especially women, to take up teaching as a career can hardly fail to affect the quality of secondary school education. Under the present scales a graduate teacher starts at £315 a year for a man and £282 for a woman; that is, they receive one additional increment—which, however, barely compensates them for the fact that, being graduates, they start teaching at a later age. At the maximum they receive an additional two increments, thus rising to £555 and £444 respectively. Like non-graduates, they may also be eligible for allowances for a post of special responsibility or for special qualifications. Under the new scale they will have two increments throughout the scale, and if they obtained a first-class honours degree they will receive one additional increment at the minimum and two at the maximum (for men the scale for first-class graduates would thus run from £345 to £615).

Clearly an attempt has been made to meet the graduates' objections to the old scales, and any increase in their salaries is welcome. But will the new scale arrest the departure of the graduate from teaching—or at least from teaching in state schools—for in public schools the salaries, above the starting level, are much higher, rising to £1,000 or even more? The difficulty is that, in a profession so largely staffed by non-graduates, much heart-burning and discontent would be caused if graduates were paid salaries at all comparable with what they can earn elsewhere. And to put the whole profession on a much higher level of salaries would, it will be said, be more than the country can afford. Must we then face the fact that the standard of teaching in state schools will decline?

* * *

German Communists Look West

If the Russian Zone of Germany is not yet "Sovietised" the propaganda of the Socialist Unity Party is doing its best to make it appear so. It is depressing to read the speeches made and the resolutions carried at the congress of the party held last week-end in Berlin. Colonel Tulpanov, head of the Russian information control in the zone and a political adviser to boot, set the tone with a bitter fighting speech. He called western Germany an agency of Anglo-Saxon monopoly capitalism and accused its rulers in so many words of preparing war. He summoned the Germans of the Russian zone—"the second Germany of peasants and workers"—to battle for the triumph of their party's ideas in the western zones. As the Socialist Unity Party is dominated by Communists, Colonel Tulpanov was in fact inviting Germans to take part in the infiltration of western Germany with Communist and "anti-Anglo-Saxon" activities. So ideological war has been declared even before it is known whether Germany is to remain divided or not; and the nationalism of the German Communists—some of them former Nazis—is being deliberately stimulated by an occupying Power.

The party's German leaders showed pride in their membership, which has increased in a year from 1.3 million to 1.8 million, or under ten per cent of the total population. Their control is also exercised through the Free German Youth Movement and the Free German Trade Unions, both totalitarian organisations in which criticism is dangerous and the representation of other parties quite nominal. But reports on the social and economic conditions in the zone showed less confidence. Walter Ulbricht, reputed to be the real brain of the Central Committee of the party, presented a programme of economic construction for the next three years, which was quite inadequate to cover up the discrepancy between fact and theory. Figures and targets were absent, and explanations of the decline of production in the factories and brown coal mines, of continued dismantling of equipment and railways, of arrests and deportations were hardly plausible. Yet they were accepted in the best party style, together with the suggestion that mansions of expropriated Junkers should be pulled down to provide bricks for new peasant cottages.

Whatever the result of the November conference, the occupation authorities in the west have to reckon on a sustained and clever attack from eastern Germany, which seems destined to keep the flame of nationalism alive. What its leaders really fear

is the successful inclusion of eastern Germany in a Marshall plan, which they will represent as directed against the interests of the German workers.

* * *

Access to the Countryside

The special committee on Footpaths and Access to the Countryside, under the chairmanship of Sir Arthur Hobhouse, has now presented Mr Silkin with a detailed report (Cmd. 7207. HMSO 1s. 3d.) which, if acted upon, will greatly clarify and strengthen the legal rights of the open-air public to wander where they will. To give the public right of access to all uncultivated land—"mountain, moor, heath, down, cliff, beach or shore"—seems a desirable and simple enough proposition; but the first major attempt to secure it, the Access to Mountains Act, 1939, suffered from the defects that it could be applied only piecemeal by a costly process of designating individual areas, and not then if the rental value of the land suffered in any way. Moreover, it created the gross legal anomaly of making trespass a much more serious offence on a bare mountain-top than on a rich pasture.

New legislation is now proposed, under which local planning authorities would have the duty of mapping the uncultivated land in their areas and designating the whole of it (subject to the hearing

of objections at a local inquiry) as freely accessible for the enjoyment of air and exercise. The designated access area would exclude woodlands and would be subject to revision in line with agricultural requirements. The planning authorities would also have the duty of ascertaining and maintaining all public rights of way, an intricate and necessary task in view of the many footpaths that have recently been obscured or diverted. Public funds would be made available for the creation of new footpaths and other facilities—in particular for continuous coastal paths and walkers' highways such as the proposed "Pennine Way"—and also for the payment of compensation to owners of sporting rights, which would not, however, be allowed unless loss could be proved after the lapse of five years. The public cost should not be great.

The committee appears to be convinced that complete freedom of access need not interfere seriously either with the requirements of water gathering or with grouse-shooting. A majority suggest, however, that there should be power to suspend access to an area where serious or recurrent damage is being caused. The ways of Service departments will be a much tougher nut to crack, although the putting of these duties on the local planning authorities should get closer attention to local wishes. All in all, the report's proposals should be bitten off with ease by the new Town and Country Planning Machinery. The only snag is the difficulty of getting new legislation.

Letters to the Editor

Policy for the Development Areas

SIR,—In your Note in your issue of September 27th you suggest that "only 11,000 jobs have been created" in Development Areas by the distribution of industry policy. This is rather seriously misleading, since it confuses the total of jobs at a certain date in completed new factories with the results of the whole policy.

The distribution of industry policy aimed at: (1) stimulating industry already in the Areas, (2) reconverting new war factories quickly, (3) building new factories through both the Government and private enterprise. It also recognised that much of the new work and output would come through "multiplier" effects. Naturally the third part of the programme must show its fruits last; and the only true measure of the productive employment created is, therefore, to compare the unemployment figure in a very good prewar year with that of today. Total unemployment in all the present Development Areas was 410,000 in July, 1937. In August, 1947, it was 109,000. Allowing for the "multiplier", and the fact that general recovery could not have shown itself very far in these areas with the extreme prewar shortage of factory space, I believe 200,000 is a fair measure of the net national gain in employment (and therefore output) so far achieved, by deliberate policy. Employment today in adapted wartime factories in the Areas alone is 60,000. But surely the really outstanding fact is that unemployment on the North-East Coast today is down to the Beveridge full employment definition of 3 per cent—and in all the Areas to 4.5 per cent.

As there is not space to discuss this whole issue, may I briefly suggest that some of your other comments rather overlooked the following facts:—

1. In conditions of full employment and general shortage of housing and accommodation, the overall economic efficiency and production of any area will immediately depend on the ratio between the demand for labour and housing accommodation in that area; and a guided adjustment of one to the other is therefore vital if national output is to be maximised.

2. In these conditions, since industrialists cannot know each other's forward labour requirements by areas throughout the country, the supply of official advice and information to them on the availability of labour is as valuable to them as to the whole economy (as the study of company chairmen's speeches in your own columns frequently illustrates).

3. Development Areas have never had an "over-riding priority," in the sense of a ban on building elsewhere. You yourself point out that half the building now going on is outside these areas—and mainly in districts already short of labour.

Yours faithfully,

House of Commons, S.W.1

DOUGLAS JAY

The Death of Petkov

SIR,—I find it strange to see such widespread indignation expressed at the execution of Mr Petkov in Bulgaria while almost complete silence is maintained concerning the execution in Greece of nearly 500 Resistance fighters since July of last year. I cannot

help feeling that the difference lies in the fact that the Government of Greece is supported by British troops, whereas the execution of Petkov has been carried out by a Government of the Left.

At the present time the General Secretary of EAM, Mr Partsalides, is being tried for his life in Corinth. Can we hope that the British Government and the British Press will show at least the concern for this great Resistance fighter as they have done for Mr Petkov?—Yours faithfully,

TH. DOGANIS,

EAM Press Correspondent, London
12 Michvelham Gardens, Twickenham

The Export Drive

SIR,—I should like to tell you of some of my experiences as the bi-lingual correspondent of a big Swiss concern, hoping that my observations may be of some value in connection with the new export drive. While my first loyalty must naturally be with my employers, as a British subject I am, of course, keenly interested in helping to promote British exports.

(1) Very few British manufacturers or their agents speak either German or French, and while most Swiss business men have a working knowledge of English, it would obviously be an advantage for exporters to speak the customer's language. The same applies to correspondence.

(2) Owing to the great labour shortage in this country, there just is not the staff to cope with the conversion of British measurements. It is desirable that offers be made in accordance with the metric system.

(3) Except for very few goods there is no "seller's market" here. Swiss firms are being inundated with offers from all over the world, and the standard required, both as regards quality and workmanship, is exceedingly high, even for medium-priced goods. Long deliveries are not granted, and delivery dates should be strictly adhered to. Prior permission should be obtained in case of intended partial shipments.

(4) American competition is very keen. In the course of my work I see many American trade journals and know American advertising carries much weight. In many cases, prices are low and deliveries quick. Many German manufacturers receive orders because, among other things, they study the Swiss market and do everything to meet their customers' demands. I know of many instances where British manufacturers insist on their packs, for example, even at the risk of losing the order. Also, German manufacturers supply "directions for use" in German, whereas British firms supply them in English or in faulty German.

(5) Catalogues issued by British firms are usually poor, both as regards paper and lay-out. I have just seen one from a German firm in the American zone (where I know great efforts are being made to increase exports). That catalogue is printed on good paper and contains beautiful photographs. Many British manufacturers calling here say they cannot have visiting cards printed in England.

(6) While it is understandable that British suppliers should wish to prove that delays in delivery are not their fault, I know an unfortunate impression is created by letters such as these, actually received here:

... "the fact is that the position in the textile industry in this country today is worse than it has ever been. . . ."
... "the export licence has been obtained only after very prolonged and difficult negotiations with our Board of Trade. . . ."

(7) It is certain that the wild stories some of the British manufacturers calling on Swiss customers tell do not help to create confidence in Britain's ability to overcome her present difficulties.
Yours faithfully,

Zürich

I. COFFEE

Oil Reserves

SIR,—The leading article in *The Economist* of January 14, 1947, entitled "Oil Politics," contained the following statements.

... of the world's present proven [oil] reserves 42 per cent are in [the Middle East] as against only 46 per cent in the Americas. . . . With about 86 per cent of the world's proven oil reserves in American, British and Dutch hands other countries have some excuse for nervousness. . . . The chief of these . . . is of course Soviet Russia . . . [which] has about 9 per cent of the world's proven oil reserves.

These figures were substantially reaffirmed a week ago (September 14th) in an article in the *Observer* by Mr Jon Kimche:—

PROVED OIL RESERVES (in million tons)

Western Hemisphere	4,400
USSR and Zones	1,000
Middle East	4,000
Rest of World	300

An article in *The Economist* of September 20th, "South of the Caucasus," is based on what seem to be quite different figures, and consequently draws a different conclusion.

An American official mission estimated the actual reserves in 1943 at 27 billion [barrels in the Middle East] against the 20 billion of the United States and the 22.5 billion of the Soviet Union. Hence there seems to be no reason to suppose that, in the long run, it is a vital interest of the Soviet Union to have exclusive access to large quantities of oil in Persia or elsewhere in the Middle East.

The policies of the great powers today admittedly depend as much on current output as on reserves, but the long term problem is clearly of ever increasing importance. I should therefore be grateful if you could comment on the difference between the two estimates quoted above. What is the difference between "proven" and "actual" oil reserves and which estimate gives the more reliable data for studying this problem?—Yours faithfully,

46 Newlathes Gardens,
Horsforth, Leeds

EDWARD HUGHES

[Estimates of oil reserves are necessarily very hazardous. Proved reserves are those which have been located by drilling and estimated by the best available methods. They do not account for more than a fraction of the total reserves, as is shown, for instance, by the fact that the proved reserves of the USA up till now have increased year by year despite a high rate of exploitation. The latest quoted figure for the proved reserves of the Middle East is 16 billion barrels; the figure of 27 billion barrels (3,850 million metric tons) quoted in our articles was given by Mr. E. L. de Golyer, US oil expert, and head of the mission of investigation sent out by the Petroleum Reserve Corporation in 1943. It is an attempt to arrive at an estimate of actual reserves by inference from what is already known of the fields under exploitation. It is almost certainly a good deal less than the total reserves.

The figure for the USSR (22.5 billion barrels) is quoted from a recent French official publication, and may be nearer to the truth than the figure quoted by Mr. Kimche.

The emphasis, in our reference to the USSR, was on the word "exclusive." We do not question the need of the USSR for oil from the Middle East. But we believe that the distribution and exploitation of Middle East oil should be a matter for international agreement.—EDITOR.]

Anglo-Danish Trade

SIR,—I was interested in your Note on the Anglo-Danish trade negotiations in *The Economist* of September 6th. I think it might interest you to know that on the Danish side we do not regard the comparison with Dominion prices as reasonable. Our main point is that the Danish export prices should be compared with those of the British producers in which case you will find that the British prices are about the level which we are asking for, and in some cases even higher. You know from your own country that it is impossible in Europe to produce at the

same prices as in the Dominions especially since foodstuffs have to be paid for by the European importers at very much higher prices than those available overseas. Another point of great importance to us is that we are getting today only half the weight of coal for each pound of butter compared with before the war.—Yours faithfully,

WILLIAM MELBYE

14 Graabrodetorv, Copenhagen K

Synthetic Rubber Consumption

SIR,—May I correct probable conclusions which will have been drawn from the statement in your Note of September 6th that "Chinese rates [of pay on Malayan rubber estates] are double the Indian rates."

It is perfectly true that until recently, when the Chinese, who are realists enough to appreciate the costs which the rubber plantation industry can stand, accepted cuts, the pay packet of the Chinese contained approximately double the money received by his Indian opposite number, but for a true comparison it is essential to bear in mind that the Indian labourer on a rubber estate, unlike the average Chinese, is provided free, for himself and his dependants, with accommodation, medical benefits, maternity benefits, creches and schools for his children, etc.

I have looked up the figures for a medium-sized estate and find that during the current financial year the wages of the Chinese labour force are expected to average \$1.85 against the Indian earnings of \$1.22. The net revenue cost to the estate of the services enumerated above works out at 36 cents per head of the Indian working population per day, so that the true comparison for this estate is \$1.85 to \$1.58—very far from "double."

You rightly go on to say that Chinese labour has a higher productivity. To take tapping as an example, it frequently happens that a Chinese can cope with a "task" of 400 trees compared with the Indian's 300.

From the point of view of the producer's cost on wages such as I have quoted, it is obvious that Indian labour is at present paid as much as the industry can stand, and I most heartily agree that under existing conditions it would not be financially possible for the industry to accede to the Indian Government's conditions, which have no regard to the ability of the industry to pay or to the true economic relationship of the two types of labour.—Yours faithfully,

K. M. G. ANDERSON

From *The Economist* of 1847

October 2, 1847.

THE melancholy disasters which have recently occurred among some of the most eminent mercantile houses in this country, involve reflections and considerations of the most important character with respect to the future prosperity, political stability, and social happiness of this country. These are events of no ordinary kind. When we see commercial houses sinking beneath the immediate consequences of sanguine and rash speculations—of some sudden, unforeseen, but evident and irresistible calamity . . . or waning into decay through an old age of imbecile management . . . —we pity or blame according to the particular circumstances of the case; but as we clearly recognise the cause, it becomes an easy task to discriminate between such houses who have fallen and those who still remain, but who are not chargeable with the like errors or follies. . . .

But such is not the case with regard to some of the most extensive and eminent firms which, during the last three weeks, have been declared incapable of meeting their engagements. The suspension of the houses of Messrs. Reid, Irving and Co., Messrs. Cockerell and Co., and Messrs. Gower, Nephews and Co., forces upon us reflections of a much more extensive character, and is calculated to cast a doubt upon the soundness of a large portion of our commercial system itself. These houses are known to have been possessed . . . of prince-like capitals. . . . These houses, moreover, up to the last, have maintained the same eminent position they ever held. Men distinguished for their honour and integrity have remained at the head of their direction. . . . The same steady, careful, painstaking and vigorous management which have marked the progress of these houses for nearly half a century were visible to the last. . . . The failure of such houses under such circumstances involves considerations of a public character far more important than the direct losses and inconveniences . . . which are inflicted on those who immediately suffer by or through them.

AMERICAN SURVEY

Station on the Tough Line

(From Our US Editorial Staff)

TWO questions dominated public thinking at the time when Mr Truman's request for immediate aid to Greece and Turkey gave public notice of a sharp change in American foreign policy. The first, asked of the State Department by the Senate Committee on Foreign Affairs, was, "Does this new policy mean war?" The second, asked even more anxiously by the interested public, was "Does this mean that the United States intends to by-pass the United Nations?"

Both questions were, of course, two facets of the same problem. If it was the business of the Senate Committee to find out whether war lay ahead, it was even more painfully the business of the public to find out how war could be avoided, and to cling with deep anxiety to the organism which had been devised for the express purpose of preventing it.

The Foreign Affairs Committee of the Senate was assured that the new policy did not mean war, and public alarm was soothed in a speech by the then head of the American delegation to the United Nations, who told his international conferees with almost indignant warmth that no slight had been intended. Nevertheless, the spectre would not lie quiet. In the week of thunder and great winds which ushered in the second session of the United Nations Assembly, Secretary Marshall undertook to furnish a reply which, answering one question in a manner which should satisfy both the American public and the world, underlined the other. No one yet knows whether the policy toward Russia which some people have called the "cold war" and others the "tough line" may ultimately lead to war or to peaceful containment of the Soviet within reasonable boundaries. What Mr Marshall has made abundantly clear is that the United States desires to make its moves not as an independent force but within the framework of the United Nations. Far from intending to by-pass that organisation, as the well-wishers of UNO feared last spring, the American desire is that of a man confronted with a recalcitrant motor-car—to open up the works and get the thing going.

The proposed cure is directed at the most obvious trouble. The Charter put the keeping of the peace into the hands of the Security Council. Two years' experience has shown that the effectiveness of the Security Council is severely hampered by the voting process provided for it. Because that voting process was agreed on only after long and difficult negotiation, at home as well as abroad, the United States (which bears its share of responsibility for the sticky veto) would not undertake at this moment to seek its revision. It can, however, gain the same effect if additional machinery is set up within the larger Assembly.

The reception accorded to this proposal at home, where most people seem to have forgotten that the veto was not a Russian invention, was greatly aided by Mr Vishinsky's violent indictment of Britain and the United States, which followed close on

its heels. For the purposes of the State Department the timing could scarcely have been improved. On Wednesday Mr Marshall proposed a way whereby the existing machinery for settling such disputes as those concerning Greece and Korea could be supplemented and the whole process of peace-keeping rendered more effective. On Thursday Mr Vishinsky said that the United States and Britain were plotting war. He also, and as an addition to a speech clearly planned before he left Moscow, indicated that Mr Marshall's proposal would be unacceptable. On the face of it, and the face is what most Americans see, the country rejected the charge and decided that if the Russians did not want the new plan, there must be value in it for the United States. That panic-stricken hysteria which *Pravda* professed to detect among those named as "war-mongers" was not visible to a native eye. The *Chicago Tribune*, which has some difficulty in deciding whether Britain, Russia or Wall Street is the great enemy, protested mildly that it would not be wise to discard the veto. The left-wing *Nation* reported concern lest the proposal merely freeze the Western nations into "a UN within the UN, thereby undermining the organisation as a whole without appearing to do so." Otherwise comment on the Marshall speech was approving, and on the Vishinsky indictment restrained.

*

It is too early to tell what may be the effect on the young structure of the United Nations of Mr Marshall's new plan, or of any derivative or substitute that may be adopted. The organisation was born and bred in crisis, and its success in surmounting trouble thus far is perhaps not so much a tribute to its inner strength as to an imperative recognition on the part of delegates that they dare not for their very lives rest content with pessimism and failure. Memories of the past both hamper and help. Some have feared that the United States, which took no part in earlier international action, would find the process too trying; others fear that it would be Russia which, walking out too often in the past, would depart in the present.

So far as American patience is concerned, such fears should now be set at rest. Mr Marshall gave every indication that the United States is determined to work for a more effective UNO even if such action has the effect of pushing Russia out. The Russians, for their part, show every sign of intending to stay and fight the battle along the lines Mr Vishinsky laid down. They have the world gathered in open forum before them to hear their complaints, and if their linking of Britain and the United States as political partners in aggression seems strange at a moment when those nations might conceivably be driven apart on economic lines, it must be remembered that if the two can be linked as culprits in the Near and Far East, it may profit the Soviet more than though they were divided in the West.

As for the effect of the Marshall proposals on other nations, it was New York's most conservative newspaper which borrowed Mr Churchill's phrase to say, after the Vishinsky diatribe, that their delegates

do not seem to be oppressed by fears that this is the beginning of the end, or that man's most ambitious bid for international peace must lead inevitably to even more destructive war than man has seen. They seem to believe that in its development the United Nations has reached the end of the beginning, rather than the beginning of the end.

The Secretary's new proposals mark a stage in American foreign policy hardly less important than the shift they seem to indicate in the affairs of the United Nations. If they give the Assembly added responsibility and make of it something more substantial than a debating society, they also provide a high point from which to survey the extraordinary change which has taken place in the conduct of American foreign affairs. Mr Marshall has been in office only eight months. During that time one constructive move after another has so engrossed the State Department's habitual critics that they have almost forgotten to complain that no American foreign policy exists. Acts are still called "fumbling," but "indecisive" as descriptive of the United States seems to have been dropped in favour of "clumsy giant." Such bits of fence-mending as the new policy toward Argentina, distasteful though they may be to liberal minds, are recognised to be part of a policy that is at least resourceful, resilient and determined. This does not mean that the present leadership is accepted without complaint, or that the American people, fond though they are of action, are completely sure that they are being led in the direction they most desire. In spite of such outbreaks as Representative Eaton's recent article

calling for a "show-down with Russia" most people emphatically do not want war. They worry about it, and thereby shock European visitors who have forgotten that they themselves were under a similar cloud not so long ago.

Yet in spite of those most concerned about the possible result of the "tough line" technique, there is a feeling that, the world being what it is, there is now no other way in which the game can be successfully played. Happily for those who are of that mind, the Soviet seems bent on reinforcing that feeling. When Mr Henry Wallace said most recently that Russia would gladly co-operate if only given the chance, Mr Gromyko invoked the double veto in the Security Council. When Mr Taft indicated that not all had been done which might have been done during the last fifteen years to keep the peace, Mr Vishinsky screamed open agreement, and added that Mr Dulles, a distinguished and influential member of Mr Taft's own party, was one of the worst of the war-mongers. While Soviet officials are refusing to let the brides of English soldiers leave Russia, Soviet diplomats are travelling to the United States on England's best ships. The comedy may be being played on the edge of a volcano, but the spectators are still able to find wry humour in the lines.

Changing Monetary Policy

(From Our US Editorial Staff)

THE current frantic search for an actor to play the villain in the price piece has consistently ignored the obvious choice. This is not strange; the far-reaching potentialities of that subtle kind of change in the supply of money which is bound up with the technical mysteries of interest rates and money markets have never been comprehended by the popular mind. In the present case, the barrier to understanding is even higher because the effects of the change in the supply of money have been so long delayed. The warnings issued at the time the first step was taken upon this road have by now become so stale that many people fail to recognise these effects now that they have arrived. The first step was taken more than five years ago, when the United States entered the war. Several important financial decisions were taken in 1942. The first was that it was too slow and too difficult to finance the needs of total war solely through tax receipts. The second was that the next most desirable method was to finance the largest amount possible by borrowing the real savings of the people. But, above all (and it was not necessarily compatible with the second decision), Treasury and Federal Reserve policy was to aim at low and stable interest rates.

In pursuit of this objective, a structure of interest rates was agreed upon which ran from $\frac{1}{4}$ per cent for 90-day Treasury bills and $\frac{3}{8}$ per cent for one-year certificates up to $2\frac{1}{2}$ per cent for long-term bonds. It was the responsibility of the Federal Reserve to maintain this pattern. The means were simple: the Federal Reserve Banks agreed to buy bills from the commercial banks, with an option to the latter to repurchase, at a fixed rate of $\frac{3}{8}$ per cent. Furthermore, they agreed to lend to the banks on short-term government paper at a preferential discount rate of $\frac{1}{2}$ per cent. Thus commercial banks could at any time replenish their cash reserves without loss, and if they borrowed on $\frac{3}{8}$ per cent certificates, could obtain an interest spread on their borrowings to boot. The technique worked perfectly until early 1945. It worked so smoothly that it went beyond its original purpose of insuring that commercial banks always had sufficient reserve to enable them to stand by to purchase the volume of securities not absorbed by other investors. The banks found themselves in the enviable position where (in contrast to Say's Law) demand for funds created its own supply—and a supply upon which a multiple credit expansion could be based. As might have been expected, the banks broke out of the passive role which had been assigned to them and actively used this means of obtaining reserves, on the basis of which they entered the market to bid for higher-yielding intermediate and long-term bonds. The risk of price

fluctuation on long-term bonds had been virtually eliminated by government policy, and traditional considerations of bank liquidity lost their restraining influence.

During the war period, the consequences of these tendencies were not serious. The worst that could be said was that the monetary authorities overshot the mark in reducing rates on intermediate and longer-term obligations. It is true that black markets for goods were more of a problem, because of the pressure of surplus purchasing power, than would otherwise have been the case, but price controls and patriotic discipline tended to sterilise the excess.

But these restraints were greatly weakened during early 1946. And it became apparent that the monetary authorities, by giving hostages to a rigid interest structure, had tied their own hands when it came to their traditional peacetime objective of influencing business conditions by varying interest rates and the supply of bank cash. Any attempt to use these instruments seemed necessarily to involve a reduction in government bond prices and to place correspondingly greater obstacles on the already thorny path of debt management. The Board of Governors of the Federal Reserve System, caught on the horns of its dilemma, did the only thing possible in a situation where two incompatible objectives were equally necessary. In June, 1946, the Board asked for authority to exercise direct controls over the volume of both long-term and short-term government bonds that the commercial banks might be allowed (in the first case) or compelled (in the second case) to hold. This would have enabled the Federal Reserve System to remove the strongest incentive of the commercial banks to borrow (although increasing business demands for funds began to lift their heads at that time), and at the same time to freeze into bank portfolios short-term government paper which might otherwise have been used to obtain reserves. The request, reiterated a year later, has never been granted or even seriously considered by Congress. The removal of price controls on goods in November, 1946, further meant that the country has had the worst of both worlds—neither consistent controls and rigidities nor free prices and free interest rates to produce balance out of unbalance.

Since the luxury of consistency was denied them, both the Treasury and the Federal Reserve for the last year and a half have made a noble attempt to ride their incompatible team of objectives—and with surprising success in view of the utter impossibility of achievement. The chief brake on inflation in this period has been the sizeable cash surplus that the Treasury has built up, amounting to \$8.4 billion in the fiscal year 1946-47.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

These funds, together with the excess proceeds of the Victory Loan Drive, have been used to retire (since March 1, 1946) more than \$31 billion of the marketable debt whose "monetisation" was serving as the basis of the inflation.

The second brake was a mild one, achieved by eliminating the preferential which actually made it pay the banks to borrow for the purpose of obtaining reserves. This action was taken in late April, 1946.

These measures had very little effect, though to the extent that the debt retired was held by the Federal Reserve, bank reserves were restricted, and short-term rates to customers were raised in late July of 1946. The price of long-term governments also retreated from the high levels of early April, 1946. But the effect on reserves has been offset by a gold inflow and further complicated since the start of 1947 by a slow return flow of currency from circulation. To the extent that the debt that was retired was held by investors other than the banks, retirement merely put them in possession of more funds; private deposits have risen over the period as a result of a shift from Government account, and as a result of borrowing by private businesses and by consumers. The incompatibility of aims showed up most clearly, however, in the fact that the banks, losing earning assets, resumed their bidding for higher-yielding long-term securities, exercising constant pressure tending to drive yields on these down and thus destroy the pattern of rates.

The continued progress of the inflationary boom is now fed chiefly by increased borrowing from the banks by the public, and it has seemed to many observers that the structure of interest rates would have to give way. The retreat started in July, 1947, when the fixed buying rate on Treasury bills was abandoned, and the rate on these has now risen to 0.82 per cent. The retreat was only nominal up to this point, however, since by that time the bulk of all bills had already found their way into the hands of the Federal Reserve Banks and were, therefore, no longer an important source of reserves.

In August and September, however, the pace has been accelerated. Short-term rates have been pulled up gradually by several devices. Successive exchange offers have been made by the Treasury to holders of securities maturing on August 1st, September 1st, September 15th and October 1st, of an 11-month $\frac{7}{8}$ per cent certificate, a 10-month $\frac{7}{8}$ per cent, a 12 $\frac{1}{2}$ -month 1 per cent note and a 12-month 1 per cent. Thus by the process of shortening the maturity for a given rate, rather than by a change in the rate itself, the structure of rates has been moved away from the wartime pattern. At the same time, a new long-term non-marketable issue is being offered to absorb savings which have been pressing down the long-term rate. This does not represent a complete abandonment of the interest rate position. It still represents a policy of compromise, with an attempt to secure limited freedom to vary short-term rates. At least one certificate issue has also been allowed to slip slightly below par in the last few weeks as further indication of this intention.

The success of this further compromise remains to be seen. To date it has produced no marked results, apart from some increases in short-term commercial rates. The banks, after halting to await developments, have resumed buying longer-term issues. Apparently, short-term rates have not risen sufficiently, or the risks of the market increased enough, to offset the attractions of higher long-term yields. And there are no effective controls on private borrowing. Meanwhile, inflation proceeds apace; the Bureau of Labour Statistics index of basic commodity prices reached 326.9 per cent of its August, 1939, level on September 25th, after a temporary recession to 295 last May. The total money supply of the country, consisting of demand deposits and currency, at the end of June

THE ECONOMIST BY AIR

was 24 times its level at the start of the war, and 7 per cent above the volume at the time debt retirement started in March, 1946. It is evidently not enough to stop any further debt from being turned into money; it will be necessary to put the machine into reverse and start funding money into long-term debt.

American Notes

Battle of the Winter

The battle to win Congressional appropriations for winter relief in Europe has begun with an Administration retreat on all fronts. The Congressional leaders summoned to the White House at the beginning of this week were told that only \$580 million was needed to keep Europe alive from December 1st until next March. This feat of budget-paring has been achieved only by confining relief to France, Italy and Austria, where the Communist peril can be painted blackest; by assuming that even these countries can be kept going until December 1st by using what is left of the post-Unrra relief funds; by accepting a near-starvation standard of relief; and by assuming that the Marshall plan will be in full operation by March. This is a dole, pure and simple, with the most stringent of needs tests, rather than a first instalment of the Marshall plan. It was designed that way, in all probability, in order to short-circuit the exhaustive Congressional debate that is inevitable on any measure drawn on the Marshall model.

It is a sum and a timetable which allow not the slightest margin for error; and which by their very modesty may confirm suspicions that the need is not so desperate as it has been painted. In addition, while conceding that the charters of executive agencies forbade the use of their resources for foreign relief, Mr Truman delegated discussion of whether and when to call a special session to the four relevant committees of Congress which can hardly meet until the middle of November. He did not even convey sufficient sense of an emergency to prevent the sailing for Europe this week of the Senate Appropriations Committee. Not only are appropriations to be postponed until the twelfth hour, but also the possibility of reviving those restrictions on the use of grain which in the critical winter of 1945-46 were so much more effective than "voluntary rationing" in saving grain for export.

For allowing all sense of the crisis to evaporate, the President is being severely berated by the responsible press; and certainly in practice bi-partisanship in foreign policy is coming close to complete abdication of leadership. The President fears, and with reason, that a special session might get completely out of control, like an historic predecessor in 1919, opening the flood-gates of controversy on the need for cutting exports, lowering taxes, and developing a price policy. At present even Senator Vandenberg is disposed to insist that stop-gap aid as well as the Marshall plan proper require "comprehensive Congressional consideration" covering American resources as well as foreign needs. If this insistence is maintained, Mr Truman's attempt to differentiate so clearly between his present request and the Marshall plan will come to nothing. It must be his hope that by December the consequences of inaction will be so clear that even Congress will realise that it cannot afford to fiddle while Rome starves.

* * *

"Gamble in Wheat"

The estimates submitted last week by President Truman's Special Food Committee provide yet another grim reminder of the precarious position of the wheat importing countries in their utter dependence on the North American continent for the bulk of their requirements over the next few years. The Committee, in fact, although consisting of such high-ranking Cabinet officials as the Secretaries of Agriculture, State, and Commerce, seems to have done little more than to attempt some sort of rough-and-ready working balance between the domestic claims of the Department of Agriculture and the demands of the State Department which has for long been thoroughly frightened by the desperate nature of overseas shortages. In trade and commercial circles, it is regarded as evidence of a situation which may yet demand exceedingly drastic remedies, unless the crop situation changes beyond the imagination of most agricultural experts.

In the year 1946-47, with a domestic yield of 1.2 billion bushels of wheat, and 3.3 billion bushels of maize, US grain shipments were no less than 575 million bushels, of which wheat and wheat-flour accounted for 400 millions. Now, with the wheat crop extended to an all-time peak of 1.4 billion, but with the basic feed

Keep abreast of the WORLD'S TRADE ACTIVITIES

Attend the Canadian
International Trade Fair
IN TORONTO, MAY 31 - JUNE 12, 1948

The finest goods from every part of the world will be on display in Canada in 1948. You can see them . . . compare them. You can meet the representatives of many manufacturers, from many nations . . . exchange ideas and establish contacts.

Canada's first International Trade Fair—sponsored by the Canadian Government—will bring buyer and seller together on an international scale. There will be exhibits representing hundreds of industries, from a score of countries.

Plan NOW to attend the Canadian International Trade Fair in 1948. If you cannot attend personally, send a representative. Full details, including information on transportations and accommodation, are available from—

LONDON: R. P. Bower, Commercial Secretary, Office of the High Commissioner for Canada, Canada House, Trafalgar Square, S.W.1.
LIVERPOOL: M. J. Vechler, Canadian Govt. Trade Commr., Martins Bank Building, Water Street.
GLASGOW: G. F. G. Hughes, Acting Canadian Govt. Trade Commr., 200, St. Vincent Street.

DEPARTMENT OF
TRADE AND COMMERCE
OTTAWA - CANADA

THE Catarole

PROCESS

Petrochemicals Ltd. announce that their plant is expected to commence operations in mid-1948. Production will include:

PURE GRADE and NITRATION GRADE BENZENE and TOLUENE

3° C. and 5° C. XYLENES

ALKYL BENZENES (heavy naphtha)

PURIFIED WHITE NAPHTHALENE

METHYL, DIMETHYL and TRIMETHYL NAPHTHALENES

High Purity: ANTHRACENE · PHENANTHRENE · PYRENE

CHRYSENE · ACENAPHTHENE · FLUORENE

PITCH FOR ELECTRODE COKE

ETHYLENE and ETHYLENE DERIVATIVES and INTERMEDIATES, including:

ETHYLENE CHLORHYDRIN (ANHYDROUS) · ETHYLENE

OXIDE · ETHYLENE GLYCOL · ETHYLCHLORIDE

ETHYLENE DICHLORIDE

PROPYLENE and PROPYLENE DERIVATIVES and INTERMEDIATES, including:

ISOPROPYL ALCOHOL and ACETONE

BUTADIENE, BUTENES and DERIVATIVES

Contracts may be negotiated now. Enquiries should be addressed to:

PETROCHEMICALS LIMITED

ADELAIDE HOUSE · LONDON BRIDGE · LONDON, E.C.4

TELEPHONE: AVENUE 4794 · TELEGRAMS: PETRICALS, BILGATE, LONDON

crop of corn reduced at least to 2.4 billion, the Food Committee holds that wheat exports can be allowed to a total of 400 millions, with corn and other coarse grain shipments at 70 millions. Of the wheat crop, it is estimated that rather more than 500 million bushels will be used for domestic foods, and 350 millions for farm feeding-stuffs, while almost the whole of the maize crop is scheduled for farm feeding. In grains as a whole the programme would reduce stocks from 780 million bushels to 580 million bushels, the corn stock would be reduced from 350 million bushels to 170 million, with a very modest increase in the wheat carry-over at 147 millions, against 83 millions. The Committee holds that Argentina and Australia can provide substantial amounts towards meeting a world deficit which it estimates, on a minimum basis, in terms of grain alone, at 160 millions, or to about 15 per cent of the requirements of importing countries.

The President's reaction to the report has been the establishment of yet another committee of citizens charged to consider the immediate food problem and to advise "on ways and means to carry out the necessary conservation effort." Acting on a non-partisan basis, this Citizens' Food Committee will be in the extremely capable hands of Mr Charles Luckman, president of Lever Brothers' American organisation. In the meantime, Mr Truman is asking for the greatest possible voluntary efforts to conserve foodstuffs and to avoid waste.

Crops and Consumption

Though it will begin its task with the blessing of every American consumer, and with the specific reminder by the Cabinet Food Committee that legislative measures must be considered apart from all voluntary controls, no one is likely to envy Mr Luckman in his new task. The natural and well-justified clamour against rising food prices has culminated quite recently in a strong demand by members of a joint Congressional committee for stronger control of the commodity markets, and for a complete ban on margin facilities, with the exception of deals recognised as necessary for hedging operations on the part of milling interests and other *bona fide* trade interests. And no one can deny that the tremendous increase in futures trading on the Chicago market within recent months has carried all the elements of a dangerously speculative movement which should surely be submitted to controls as stringent as those now covering Wall Street.

None the less, it is impossible also to believe that the position will be altered basically by revision of the rules now covering the Commodity Exchange Administration. Farming interests, no less than grain speculators, are fully aware of the potentialities of the position, and the fluctuations in recent weeks on the Chicago market are no more than a reflection of the confusion and uncertainty brought by almost daily reports and denials of crop shortages which have emanated from official sources no less than from interested parties in the Chicago wheat pit. The Administration will no doubt sustain its powers over grain allocation contained in the recently revived Export Control Act, and it may well reinforce this authority by a successful appeal to Congress for a similar revival of powers formerly held under War Emergency Powers Acts, by which grain could be refused to distilleries beyond specified limits, and the wheat extraction rate could be increased in milling. But such effective measures as rationing and price control are now further away than ever—more especially with 1948 electoral contests in sight—for however much organised labour and unorganised consumers may press for "roll-backs to 1945-46 prices," they have not begun to consider the long list of controls and regimentation which would certainly have to accompany a retreat to the conditions prevailing before V-J Day.

Another year of bad crops could easily result in far more drastic measures; indeed, something will have to be done in such an event, unless a large proportion of the importing world is to collapse simply because of food shortage. But for some way ahead President Truman has shown how carefully his Cabinet must tread.

Trade quarters in the United States are now, indeed, taking a decidedly gloomy view of the position, and there are many forecasts of an ultimate return to the most stringent of food controls. In such forecasts, the experts point, not only to the precarious basis of the Cabinet Committee's estimates, but also to the possibility of a serious reduction in the wheat crop in 1947-48. On the first count, they allege that an official estimate of 350 million bushels for wheat used as feeding-stuffs is an entirely unrealistic assessment, pointing out that a maize crop deficiency of 900 millions, compared with 1946, is assumed to demand no more than 170 million bushels of extra wheat for feeding-stuffs. And they note that while the record wheat crop of 1946 was based on extremely good subsoil conditions, the 1948 harvest must be

assessed on soil conditions which are becoming increasingly adverse because of prolonged drought. They consider, therefore, that even the reduced grain exports now scheduled, with their heavy reduction in stocks, represent a quite unjustified gamble with food and seed supplies. It is, of course, impossible to assess 1948 crop prospects at this stage, and comparisons with prewar years of crop shortages usually take no account of the immense efforts made by the American farmer to boost his acreage and crops. But the 1947 corn crop is an all too prominent reminder that acreages alone cannot govern crops, and that the bumper yields of American grains throughout the war years have probably tested the utmost capacities of the farming belts.

Taft at Tacoma

Senator Taft's long-heralded foreign policy speech at Tacoma rounds out the political menu which he has been spreading before the voters of the West. If he is plainly less at ease in this field than in discussing labour, inflation, tariffs and reclamation, it was none the less essential that so plain a candidate for the Presidency should have a foreign policy. It is almost entirely negative. Senator Taft's interpretation of bi-partisanship extends only as far as Senator Vandenberg, of whom he had many polite things to say, otherwise he repudiated any joint responsibility for foreign policy, in which he insisted the Administration had enjoyed virtually a free hand—except for dollars, a significant exception. In Senator Taft's view, outside the actual conduct of the war, "we could not have made a worse mess of our foreign policy than we did," at Potsdam, in Germany, in foreign loans, in pursuing expediency and security rather than law, justice, peace. Ideals as well as resources have been dissipated.

Senator Taft believes that the maintenance of peace should be the keystone of American foreign policy, with the United Nations reorganised around the concept of "justice." The "present Russian attitude" he dismisses in a few sentences, as certainly making this path difficult; he is happier in insisting that the world does not want American busy-bodies arranging its affairs; that "America cannot save the world with dollars. We can only help the world to save itself if it wishes to be saved"; and ending with the comfortable illusion that

if we can maintain freedom and the highest standard of living in the world under the American system, it will not be many years before the example set will be followed by every other nation.

No amount of lip-service to the United Nations and the Atlantic Charter can conceal the fact that Senator Taft is still a "Little American" at heart. He really resents the necessity of having a foreign policy at all. The charge of American imperialism comes as easily to his lips as to those of Mr Vishinsky. This speech, with its pious and unrealistic platitudes about peace, justice and law, is twenty years out of date. It is reported that the *Chicago Tribune* has built the first atomic bomb shelter in Chicago. Senator Taft is not only behind the times, he is behind the *Tribune*.

Shorter Notes

Mr William Benton, Assistant Secretary of State in charge of information and cultural affairs, has resigned. In the long, acrimonious debate in the last session over continuing the American foreign information programme, it was bluntly suggested to Mr Marshall that Mr Benton himself was a major stumbling-block in the way of Congressional approval. The last session closed without committing Congress to support of an information programme, and only about one-third of the funds requested were appropriated. A Congressional committee is now abroad investigating the need for "projecting America." A candidate to succeed Mr Benton, acceptable both to the State Department and Congress, and willing to take on this ungrateful job, will be hard to find.

The Archbishop of St. Louis recently abolished the Jim Crow line in the Catholic schools of St. Louis by announcing that Catholic negro children would be allowed to attend parochial high schools as well as elementary schools. In the past they have gone to the all-negro schools maintained by the city. When white parents threatened to secure an injunction against the Archbishop, they were warned that such action would result in automatic excommunication. This is the first such general warning issued in the history of the diocese, and it appears to have been effective.

THE WORLD OVERSEAS

False Alarms in Rome

(From Our Special Correspondent recently in Italy)

ON September 20th, a day chosen specially to annoy the Catholics since it is the seventy-seventh anniversary of the overthrow of the Papal States, orderly crowds, shepherded by the parties of the Left, paraded in the cities of Italy to protest against the rising cost of living and the policies of Signor de Gasperi's Christian Democrat administration. The rumour had been spread beforehand that these demonstrations would be the tinder of revolution, that the Communists were determined to attempt the seizure of power by violence, that their armed partisans were only waiting the signal to link themselves with the Yugoslav army at the frontier in a general march on Rome. In fact, most of the demonstrations might have been protest meetings in Hyde Park—sunshine and colour apart—and next day, commentators could write "no revolution nor sign of revolution is impinging on this lazy day. Yesterday's day of protest has been succeeded by utter calm."

The policy of inducing industrial paralysis—also attributed to the Communists—seems to have been similarly overplayed. It is true that in the last three or four weeks there has been considerable agrarian unrest and one or two industrial strikes. In the north, the farm workers—the *braccianti*—were on strike for more than a fortnight and for a time the rice harvest seemed in danger. Later, strikes broke out in Arezzo and Viterbo, and round Rome groups of farm workers "squatted" on various landed properties and did a little symbolical ploughing. Even so, the whole movement appears to have been exaggerated by the newspapers, particularly those of the Right, which see the hand of Moscow if a worker only takes a day off to visit his mother in the country. The metal workers' strike lasted exactly two days. As Count Sforza pointed out in Paris, the *braccianti* struck for normal economic reasons—for a sliding scale to adjust their wages to rises in the cost of living, and for longer hours and more days of employment (a standing grievance with the perpetually under-employed farm workers of the Emilia and the Po Valley). Observers also noticed that after striking during the day the workers tended to do a fair amount of harvesting in the evening, and the discipline of the strike was very ragged. Even the occupation of the estates seems to have been a relatively languid affair. Where the workers found *carabinieri* on guard they are reported to have "conducted long arguments" with them and then to have withdrawn.

Restive—Not Revolutionary

The truth is that Italy at the moment—whatever it may become—is restive, not revolutionary, and roughly the same may be said of the leadership of the Left. To be revolutionary implies the possession of a clear driving purpose coupled with a political strategy capable of realising it. There is no sign of either on the Left for the time being. It remains divided between the Communists and the Nenni Socialists with the Labour Democrats and the Action Party on the fringe. The Saragat Socialists hold aloof, so do the Republicans. Without them the Left (from centre to extreme) has no majority in the Chamber and cannot constitutionally overturn Signor de Gasperi's Christian Democrats, who can count on the votes of the Right—the Liberals and the *Uomo Qualunquisti*—in any serious clash with the Left. Thus in this week's debate in the Assembly on a vote of censure of the Government proposed by the Left, the attitude of Signor Saragat has been crucial. If the Saragat Socialists had joined the Left, the vote of censure might have passed. But, after a further attack on the power-seeking tactics of the Communists, Signor Saragat denounced the attempt to form a Left-wing united front, and it is possible that he may bring his group into the Government.

To find the way to power is precisely the dilemma of the Left. At present, any talk of armed revolt can be discounted. The Communists are numerically probably stronger than ever before, but only a minority are more than fair-weather friends. The alternative is power *via* the ballot box in the April elections. But

here an awkward choice has to be made. If the Left were to enter the Government now they would share the responsibility for what must be, in any circumstances, a winter of discontent. On the other hand, if they do not enter the Government they fear that the Christian Democrat hold on the Ministry of the Interior will have its "influence" on the April voting. Last week's manoeuvres suggest that Signor Togliatti has decided that to re-enter the Government would be the lesser of two evils. Equally, however, Signor de Gasperi (and Signor Saragat?) are determined to keep him out, and for the time being can almost certainly do so.

Nevertheless, any estimate of the tug of war in Italy must be provisional, because economically the worst has yet to come. At the moment the Government still lives in the afterglow of the economic recovery achieved in the spring and early summer, when industrial production rose to over 70 per cent of prewar; coal deliveries reached nearly a million tons, month after month; agricultural output stood above 80 per cent of 1938 and there were signs of strong revival throughout the building industry. But this fine productive recovery has not been sufficient to overcome the two dragging evils of the Italian economic system—its internal financial instability and its inability to balance its foreign accounts.

Uncontrollable Inflation

The value of the lira has declined continuously throughout the summer; the cost of living has risen steadily over the year and sharply in the last three months. In Milan, for instance, taking 1938 as 100, the figure for March was 4,242, for June 4,972, for July 5,433 and for September about 6,500. This fact, as much as any political pressure, helps to explain the wave of strikes after a period of relative quiet which began with an agreed truce on wage claims negotiated in June. Unemployment has increased and the need to spend large sums of public money to counteract its effect is one of the reasons for the Government's continued inability to balance the budget. The estimates for 1947-48 are: 520,560 milliard lire revenue and 831,771 milliard lire expenditure. But this deficit is almost certainly too small. As Senator Einaudi, the Minister of the Budget, pointed out to the Assembly, the estimates for 1945-46 based on an expenditure of 114 milliard lire rose to 501 milliard. In 1946-47 expenditure rose from 341 milliard to 932 milliard. The same uncontrollable increase is likely this year. The Government hopes to meet the gap by heavier taxation, including two extraordinary taxes on capital, designed to bring in some 90 milliards, but the habit of paying taxes in Italy is not so well developed as to encourage optimism. The bulk of taxation remains indirect and inevitably bears most heavily on the poor. High hopes were pinned on the deflationary effect of Signor Einaudi's decision in the early summer to restrict credit drastically to all industrial concerns. But since the Government has proved apparently quite unable to cut down its own expenditure—much of it totally unproductive—the actual effect of the cutting of credit has been to increase the velocity of inflation. Industrial concerns doing productive work are being obliged to cut back and the resulting increase in unemployment increases the political compulsion on the Government to extend unproductive public works. Other methods of fighting inflation—such as reducing the vast appropriation for defence*—have not been considered and Senator

*SOME FIGURES FROM THE PROVISIONAL ESTIMATES, 1947-48

	Milliard Lire
Finance, Treasury	357,175.2
Justice	11,215.6
Education	48,423.2
Interior	56,136.2
Public Works	155,082.5
Defence	153,544.8
Agriculture and Forests	28,375.0

Einaudi has said specifically that the Government will maintain the state-controlled armament industry, which is certainly the most wasteful section of IRI (*Istituto per Ricostruzione Italiana*—the large Government holding company).

The worst problem facing the Government is, however, the exhaustion of its reserves of foreign exchange, to which the British decision to suspend convertibility was the final blow. The Government believes that to maintain the vestigial flour and *pasta* ration it must import 2,200,000 tons of grain in the next year—an increase of 600,000 tons on last year, owing to the bad harvest and, the Communists claim, the Government's tenderness with the farmers. This grain, together with the 800,000 ton monthly imports of coal, must be paid for almost entirely in dollars. In all, about a billion dollars are needed in the next year and 250 million of them are most urgently needed before Christmas. The Government has already cancelled some of its coal orders for the next months, and, since Italy's entire industrial revival depends next month, mass unemployment seems inevitable in late November. At the same time the Government estimates that the food ration covered from indigenous supplies will only carry them to Christmas. In other words, Signor de Gasperi is convinced—not without reason—that the survival of his government depends upon getting dollars and getting them quickly. Italians without bread and without work may listen to Signor Togliatti and his Communists and to Signor Giannini and his *Uomo Qualunquisti*. They are most unlikely to listen to the moderate voice of parliamentary democracy.

Eire Faces the Dollar Crisis

[FROM OUR DUBLIN CORRESPONDENT]

CONSIDERABLE interest was aroused by the recent visit to London of Mr de Valera and three of his colleagues. It was the first time that Mr de Valera had visited London since 1938, when he negotiated an important agreement with Mr Chamberlain, which transferred the Irish ports to Eire and terminated the dispute over the land annuities. In the same year, an Anglo-Irish trade agreement was concluded. Since then the war and its aftermath, in spite of Irish neutrality, have taught many lessons regarding the mutual dependence and economic relations of the two countries.

Irish Ministers have become much more extravert in their outlook. Participation in the Paris conference on the Marshall offer has brought home the grim realities of the situation in Europe. Mr Lemass, the Minister for Industry and Commerce, has clearly recognised Eire's responsibility in the international sphere. He has said, for example:

It would be foolish to think that we could maintain in this country a tolerable way of living if all our European neighbours go down in a welter of disorder. Anything that promotes the creation of a workable European economy is a direct benefit to ourselves.

He further stated that Eire would take part in discussion of a European customs union in spite of her vital interest in industrialisation. He described the idea of a customs union as "unattractive at first sight," and stated that "the best contribution we can make to European recovery is by developing our own economic resources to the utmost." Mr Lemass also referred to the common interests between Eire and the rest of the sterling area. He said, for example:

We have an interest in preserving the exchange value of British money. Various official funds, banks, insurance companies and private firms here own about £400 million sterling. If the exchange value of these assets should be reduced, then our ability to pay our value abroad, while preserving our present standard of living, will be reduced also. We are, therefore, very ready to co-operate in any measures to protect sterling. The obvious method is to develop the resources of the sterling area, to expand its exports and reduce its imports. A plan must, however, be designed to benefit all countries in the area, to develop all their production resources equally and not merely for the benefit of Britain.

The End of Isolation

These quotations show that the Irish Ministers visited London, realising that their old dreams of self-sufficiency and economic isolation have melted away. The need of economic co-operation with the other countries in the sterling area will lead, almost unconsciously, to the growth of common interests with the

members of the British Commonwealth, which may have desirable political reactions. The emphasis of the present conversations, however, is on economics and finance rather than on political relations.

The immediate occasion of the negotiations was the dollar crisis. Eire, like other countries in the sterling area, obtains its dollars from the London dollar pool. Its balance of trade with the dollar area is exceedingly unfavourable. In January-May, 1947, Eire's imports from the United States and Canada amounted to £8,423,383 and its exports to only £117,746. Only a small part of this yawning gap was bridged by invisible exports. Eire urgently requires many imports from the dollar area: wheat, petrol, and tobacco. Even if the greatest possible austerity is practised, an irreducible minimum of these will remain necessary. It also requires considerable imports from the sterling area, such as coal and agricultural machinery. Imports of coal are only one-sixth of the pre-war normal amount, and coal is now being imported from the United States instead of from Britain. The present negotiations will doubtless deal with how these imports are to be obtained and paid for. Payment for sterling imports should present no difficulty in view of the vast accumulation of sterling during the war. The limiting factor will be supplies rather than means of payment. Great Britain will, however, expect some exports from Eire in furtherance of the policy of increasing imports from the sterling area. The question arises what goods Eire is in a position to export.

In the present year it is expected that imports will amount to about £90 million as against exports of only £30 million. In spite of the existence of valuable invisible exports, an increase in visible exports is necessary if this gap is to be bridged. The fundamental problem in Eire is to raise agricultural production with the object of producing a greater export surplus. During the war consumption of home-grown food increased, and at present no butter or bacon is being exported. Exports of cattle have declined, and cattle are being diverted to continental markets owing to the low price paid in Great Britain. Moreover, the volume of agricultural output has decreased owing to the shortage of fertilisers. The numbers of livestock declined because of lack of feeding stuffs. The land has been overcropped and the country has been living on capital. As Mr Lemass has stated, "with a ten per cent expansion in agricultural output we could increase our bargaining power in foreign trade and greatly strengthen our economic security."

Four Hard Years Ahead

The wartime decrease in output took place in spite of a sharp increase in prices. The curves of agricultural prices and agricultural output have moved in opposite directions. There is great disagreement amongst students of Irish agriculture regarding the possible scope of expansion. Some experts are of opinion that an almost indefinite expansion is possible, while others take a more modest view of the prospects. It is generally agreed, however, that a substantial increase in the short run could soon be obtained if fertilisers and feeding stuffs were available, and if the price offered in the British market was satisfactory. The expansion of production in the long run depends on technical education, improvements in marketing and other developments of agricultural policy which need time to produce their full results.

If it were not for its large invisible exports Eire's external balance would be dangerously unsatisfactory. Considerable revenue is derived from external investments, emigrants' remittances and the tourist traffic. There is a good deal of public discontent at the large number of tourists who have visited the country this year; their presence drives up prices, particularly of food, and has an inflationary effect. This upward pressure of prices is partly responsible for the recent outburst of labour troubles. Since the repeal of the standstill order, demands for increased wages have been incessant. All road passenger transport has been suspended by a strike, a bank strike is expected, and a general strike is threatened if the rise in the cost of living is not arrested. But the tourist trade is much too valuable a source of external currencies to be discouraged, and the rise in the price level is the result of other causes as well—for example, rises in agricultural prices and in the price of imports, especially of fuel and raw materials. Moreover, it must be remembered that the rise of prices in Ireland has been slight compared with that in many other countries; the increase in the cost of living last year was six per cent. The Government has recently promised to institute a stricter system of price control.

In spite of all that can be done in this direction the outlook,

remains rather bleak. Mr Lemass courageously summarised the position as follows:—

If there is an idea that we are facing an easy time, in which we can have more pay and less work, it is very desirable to kill it quickly. We are entering four years of most acute difficulty, in which economic disaster will threaten on every side, and our only weapon of defence is our capacity to work hard. If that weapon fails us we are finished.

Does India Face Famine?

[FROM A SPECIAL CORRESPONDENT IN DELHI]

THE margin in many parts of India between existence and starvation is so narrow that even slight communal disturbances can have widespread repercussions. The recent disturbances have been of unparalleled severity and they have occurred at a time when the whole machinery of administration, central as well as provincial, has been seriously impaired. It is not easy yet to gauge the precise effect of the disturbances on the food situation, but officials of the food department of the Central Government are very worried. They do not see how the rationing system in many parts of India can fail to break down in the near future.

The East Punjab has now become a responsibility of the central food department, but no requests for assistance have yet been received from the provincial government, presumably because the latter are preoccupied with the refugee problem and have not yet had time to take stock. The East Punjab will almost certainly be a deficit province, for the main surplus areas of the Punjab are the rich canal colonies of Montgomery and Lyallpur, which are now included in the West Punjab (Pakistan). Such is the momentum of the transfer of populations now taking place that there should be no difficulty on either side of the boundary in reaping standing crops, especially the secondary autumn wheat crop. But there is bound to be a considerable drop in production when it comes to sowing new crops, for only a small proportion of the migrants have been able to bring their beasts and implements with them and it will take time to redistribute all the apparatus of agriculture.

After the Rice Crop

The main danger areas appear to be in south India, Madras presidency, and the states of Travancore and Cochin. Owing to the lateness and inadequacy of the monsoon this year, the main rice crop, due to be harvested in November, is 15 per cent below normal. Although the monthly requirements of Madras are 160,000 tons, the stocks on October 1st were only 85,000 tons. Travancore and Cochin, which produce only 40 per cent of their needs, require 35,000 tons monthly, and on October 1st had stocks of only 7,000 tons. Moreover there are difficulties over procurement. Last year was also a bad one in the south, and the peasant, who started this year with very small stocks, is certain to hold back more after the coming harvest. Last year the Madras government, against the advice of the central government, which has steadily refused to countenance any rise in prices, set an unfortunate precedent by offering bonuses to the peasant and this year he will undoubtedly demand bonuses again. Furthermore, owing to the general political uncertainty, hoarding has already begun on a fairly considerable scale. The next three months are the danger period. Once the rice crop is harvested, there will be no immediate danger of starvation in south India. But it will be a breathing-space, no more.

The rationing system in Bihar is stated to be already on the verge of collapse, the province having a monthly consumption of 30,000 tons and stocks on October 1st of only 5,000 tons. The daily cereal ration in the city of Patna has already been cut to 6 ounces. Considerable anxiety is also felt for Calcutta, with a monthly consumption of 60,000 tons and stocks on October 1st of only 28,000 tons. Recently Calcutta, with its densely congested population of 4,000,000 people, has been miraculously free from communal disturbance, but it might easily start again if there was trouble over food. The cereal ration at present is 10 ounces daily.

From other parts of India the position according to the latest reports is as follows. In Delhi the ration has been reduced from 12 to 10 ozs. The United Provinces are all right for the moment but floods over a wide area have affected the rice crops. Bombay is all right for September and will probably pull through. In Hyderabad collapse is said to be imminent with no stocks in

reserve at all. Mysore will want help from this month onwards. West Bengal has been all right for September but a breakdown soon is considered inevitable. Orissa, a rice exporting province, is causing no anxiety.

Two Million Tons of Imports

Imports during the month of October are expected to total 220,000 tons and will include wheat from Australia, wheat and millet from the United States, wheat and maize from Argentina, and millet from the Middle East. India is importing about 2,000,000 tons of food this year, compared with 2,200,000 tons last year, about 1,000,000 tons in 1945 and about 500,000 tons in 1944. In view of the drop in production inside India and the running-down of the machinery of procurement and distribution, the current rate of imports is regarded by officials of the food department as being insufficient to ward off severe local shortages in the near future. The only actual food riots that have taken place so far have occurred in Gujerat and Kathiawar, on the west coast of India.

Pakistan is self-sufficient in food, provided communications and administration are up to the task of distribution. The West Punjab and Sind have more than enough with which to meet the deficits of the Northwest Frontier Province and Baluchistan. East Bengal with the inclusion of the rich rice-producing region of Sylhet is thought to be just about self-sufficient.

Food is a subject about which the cry of "Woif!" has been too often raised. It is perhaps too early to say that famine is imminent or inevitable in any particular part of India, but the situation is certainly graver than at any time since the summer of 1942 and it can only become worse as the full effects of this disastrous communal war make themselves more widely felt.

Mexico Holds to Its Programme

[FROM OUR CORRESPONDENT IN LATIN AMERICA]

THE "reconversion" of Mexico is firmly tied to the country's programme of revolution—a genuine social and economic process begun in 1910 and not to be confused with overnight *coups d'état*. This is the basis from which Mexicans approach their post-war problems. Their eager sponsorship at the Petropolis Conference of economic discussions, which, as one of their delegates said to the writer, "Mexico cannot afford to postpone indefinitely," reflects their feeling that present plans must not be upset at Bogotá. It also underlines the fact that, whereas other Latin American countries may have hopes of financial aid, Mexico has a programme to which to pin its hopes. How far it can quickly become practical politics is the basic preoccupation of President Alemán.

Cardinal objectives that have thrust themselves into the foreground of "reconversion" are the redistribution of the land (the earliest and the fundamental promise of the revolution), the promotion of secondary industries, and the development of hydro-electric power. Ambitious schemes in these directions have achieved momentum since President Alemán took office in December, but progress depends on the success with which serious short-term financial problems are tackled.

Mexico, like other countries, is short of dollars. More than 75 per cent of its imports come from the United States, and a great increase in these imports since the war has been accompanied by a decline in the real value of its customs receipts (since prices have risen and Mexican duties are levied on volumes, not values). The tourist trade brings some \$90,000,000 a year, equivalent to almost a quarter of last year's visible exports but silver output fell by a third last year, and silver exports are unlikely, at least for some years, to regain their former importance. Oil production, though rising, is still lower than before the expropriation of foreign interests in 1938; an increasing proportion of the yield is being refined in Mexico, but domestic consumption has also risen because of the post-war influx of American cars. Indeed, Mexico is now said to be a net importer of petroleum.

These are salient features in a trade situation that is draining the substantial reserves of \$376,000,000 which Mexico had accumulated by September, 1945. By the end of last year they were reduced to some \$250,000,000, and in August the Bank of Mexico's gold and foreign exchange holdings represented only 31 per cent of the currency (the legal minimum is 25 per cent). The crucial index is the Mexican import surplus. This was \$54,000,000 in 1945 and \$145,000,000 in 1946; it is now running at about \$175,000,000 a year.

Will the Peso Hold Its Value?

Steps have been taken to meet the immediate problem. Severe import restrictions were introduced in July and are being enforced. Customs duties—an important source of revenue to all Latin American Governments—have been raised. They may be yet more effectively raised by a switch to the *ad valorem* basis for which Mexican industry is pressing. While the demand for dollars has shrunk drastically, the full effect of the import cuts will not be seen until October, when "transit" shipments, exempted from the ban, should cease.

Meanwhile, Mexico faces the consequences of currency inflation. The danger of runaway inflation was at one time very real, but the circulation has receded from its 1946 peak of over 4,000,000,000 pesos (against 900,000,000 pesos in 1939), and bank credit restrictions have produced a very mild deflationary trend. Acute deflation, however, which might strangle industrial growth, has no place in the Government's monetary programme. The real urban cost of living is perhaps three times as high as in 1939, and the credit director of the Ministry of Finance estimates that the peso, pegged at 4.85 to the dollar, might fall, if left to find its own level, to rather more than seven.

The prospects that this "internal depreciation" may eventually be reflected in exchange rates—in short, that the peso may fall—cannot be lightly dismissed. As a signatory to the Bretton Woods agreement, the Mexican Government has declared its intention of maintaining the actual rate. There are signs, however, that it regrets, having committed itself on this point, and that, while hoping to avoid devaluation, it regards it as a contingency that may arise in the near future. In five months' time, it is understood, Mexico proposes to seek from the United States a substantial development loan. If, in the words of an authoritative Mexican spokesman, "the Americans do not provide the means for our development, we shall have to make our own by printing more money and letting the peso go."

It is easier to gauge Mexican pretensions than to foresee the outcome of this approach. In 1944 a mixed United States-Mexican Commission found that, for an agreed development programme extending over several years, comprising mainly irrigation and power projects, Mexico would need \$383,000,000. Against this, Mexico has still some \$50,000,000 to its credit with the Export-Import Bank. By January and the Bogotá Conference

IN THE WORLD

it will probably have little else, if anything, in the way of dollars for development.

Fair Terms for Foreign Capital

As a desperate remedy, an inflationary policy would certainly have critics: in the United States, which supplies the bulk of Mexican imports, and in Mexico itself, where a deliberate reversal of the deflationary process would necessarily raise many new problems. As recently as April, the Minister of Finance told American bankers that Mexico would welcome foreign capital on fair terms, "although, of course, no Government can guarantee investments." In the sense that an inflationary policy would discourage them (as the Minister recognised by pledging his Government to do all in their power to avoid exchange fluctuations) it would obviously shut out the private risk capital which Mr Truman at Petropolis plainly indicated as the major, if not the chosen, instrument for Latin American development.

Mexicans, however, continue their search for capital. Their argument that Latin America is a "secure region," and therefore offers safer and more lucrative possibilities for dollar investments than Europe, is already being applied in a direction which shows that the Mexican Government has the courage of its convictions. Talks with American interests have been started with a view to securing "substantial new investments" in the oil industry, in which no appreciable capital has been sunk since its expropriation. The terms offered are that the Government should retain sub-soil rights and pay operators a royalty on each barrel—a broad reversal of the old system. Domestic consumption, as already indicated, has increased heavily. It was recently announced that, of this year's estimated output of 55,000,000 barrels, only 12,000,000 would be exported. At this rate of production, Mexico's estimated reserves of 900,000,000 barrels would be exhausted in less than 18 years. A higher production rate would, of course, raise exports to the extent that it would exceed domestic needs; but these are increasing, and experts hold that, in fact, further exploration is urgently needed if present output is to be maintained. Their verdict is a significant reminder that efficient operating means constant drilling, which in turn means a constant capital outlay.

(To be concluded.)

"Scarcity alone, Sir, never made anything desirable. After all, Dictators are scarce, but who wants one!"

If you find White Horse Whisky hard to obtain, it is partly because so very many people want what little there is.

THE BUSINESS WORLD

Industry's New Tasks

THREE weeks ago, British industry took its first measure of the 1948 export targets. Now it has to study the new target set for it and for Western European industry by the Paris report of the Committee of European Co-operation. Quite soon it may have to make its contribution towards the promised cut of £200 million in the capital investment programme. Industry has not yet fully seized the importance of filling more than half of the British trade gap by a 50 per cent increase in exports over the rate at the end of 1946, and of doing so by the end of next year; but it has not even begun to think about its major responsibilities in closing Western Europe's dollar deficit by 1951. The export drive is a desperate attempt to balance the British external account at the level of extreme austerity. But the proposals in the Paris report are designed to make Western Europe viable by 1951 by programmes of expanded food and basic industrial output, supported meanwhile by imports of food and feeding stuffs and some capital equipment from the rest of the world. The one is hopefully based on the willingness of the world at large to take a great increase in British exports, despite the prevailing tendency of most countries to cut their imports. The other seeks salvation through a great increase in the essential ingredients of economic recovery—more coal, steel, electric power and transport. The export targets deal in the formal arithmetic of razor blades and lawn mowers, but dare not look beyond 1948. The Paris report attempts to write "the history of the next few years which is still veiled from human eyes" in the more fundamental terms of basic industries and services.

The responsibilities which the Paris report (if it is accepted by the United States as a basis for further aid to Europe) will impose on Britain will be heavy. This country will have to do more than any other to restore the European coal economy; it is the biggest steel producer among the participating countries, and it will still be the biggest after the restoration of French, Belgian and (perhaps) Western German steel production in 1951; it is making a great effort to rebuild its merchant fleet, which will be available for the service of other countries; a high proportion of Europe's expanded oil refining capacity is to be laid down in Britain, under schemes already approved before the sixteen countries met in Paris; nearly one-third of the projected increase in electric generating plant is accounted for by extensions (including 24 new power stations) already put in hand by the Central Electricity Board for completion by 1951.

Until the reports of the technical committees are published in ten days' time, the exact part which British industry is expected to play in the programme of European self-help will not be known. But the summaries of these reports published with the Paris report (these are included in this week's *Records and Statistics* supplement) give a fair amount of detail, particularly for coal. With the aid of imports from Poland, Europe's coal requirements and supplies should be balanced by 1951. The sixteen countries and Western Germany are expected to increase their net pithead production from 439 million metric tons this year to 584 million metric tons in 1951. For Britain, this involves an increase in output, which the report confidently puts at 199 million metric tons for this year, to 249 million tons

in the space of four years. Can it be achieved? The Paris report has provided more hopeful evidence than anything which has lately come from the National Coal Board or Mr Shinwell—an expanded labour force, extensive capital development (including 20 new sinkings), intensified use of modern mechanised methods, new washing plants and improved underground haulage. It commits the British coal industry to resuming exports of coal to the participating countries, beginning with 6,000,000 tons next year (a good deal better than Mr Shinwell's "trickle") and rising to 29 million tons in 1951. Almost the whole of the capital cost of £250 million will be spent on mining machinery and supplies produced in Britain.

Comment on any of the targets, and particularly on the coal target, should be reserved. It is for the American authorities to satisfy themselves that the objectives have been realistically framed and can be attained. Yet it will not escape their notice that the projected British coal output appears to rest on an annual increase in productivity of the order of 5 per cent and also, it would seem, on an increase of mining manpower to about 750,000; after allowing for wastage during the four years and for the recent slackening in recruitment, this will be a formidable undertaking. Unless the promised output is forthcoming by 1951, the entire European recovery programme will be imperilled. But it is probably expecting too much of the coal industry, given its present labour supply and technical handicaps, to provide 15 million tons more coal next year. Exports to Europe must certainly be resumed, but it is all too probable that next year at least, they will absorb pretty well the whole of the possible expansion of output.

The increase in raw steel output set down in the Paris report amounts to 60 per cent of 1947 production and 25 per cent above the best pre-war year. These figures are complicated by the problem of Western Germany, but the British contribution is clear and definite. Output this year is put at 12.7 million ingot tons; next year's target is 14 million tons, which is certainly within the bounds of achievement, given sufficient coal; and output should rise to 15 million ingot tons by 1951. This is not a spectacular increase, compared with the targets which Continental steel producing countries have been set. But recovery in Continental output has been dogged by fuel shortage and has been painfully slow compared with the comparatively high and steady rate of output achieved in Britain. Modernisation rather than expansion is the keynote, with greater emphasis on pig iron and ingot steel capacity than on finishing plants. That is in line with the British Iron and Steel Federation's plan, submitted to the Government nearly two years ago, which contemplated an increase in ingot capacity from 14 to 16 million tons, of which nearly 6,000,000 tons was to be provided by newly built plants over 7½ years. The emphasis in the steel programme is not on the hasty creation of new capacity, but on improved efficiency and a better technical balance between the different sections of the European steel industry to avoid over-expansion.

In steel (apart from special items like continuous strip mills which can only be supplied by the United States) as in coal, the participating countries will provide an impressively high proportion of the new equipment which is needed. Indeed,
