Mid-Century

THOUGH by some it was celebrated prematurely (and with rather more reason for cheerfulness) a year ago, on a correct chronology the second half of the twentieth century began this week. Phases do not often coincide with centuries, and there is little unity to be detected in the past fifty years. The sharpest turning-point was the 1914-18 war, and everyone who was adult before 1914—in the age of Liberalism triumphant—is now more than middle-aged. With the deaths last year of Field-Marshal Smuts and Mr Mackenzie King, there are few active survivors except Mr Churchill of the statesmen who mattered before the Russian revolution. Intellectually, it is, perhaps, in this that the chief significance of the turn of the century is to be found. The men of the fifties have, at most, adolescent recollections of the Edwardian world. The thoughts and attitudes of our times are now the creation, so far as direct experience goes, solely of the twenties, the thirties and the forties. That explains, and perhaps it can be held to excuse, a great deal.

What the twentieth century has not yet done is to provide reason for real despair. Its dispiriting quality consists in disappointment to the high hopes of progressive advance that the century inherited from its predecessor. That is not catastrophic or even, on an historical view, surprising. The Victorian optimism was the product of conditions that must be counted unusual. The disappointment is to a particular concept of progress; it is not the end of human advance as that exists in history as a whole. Certainly the world of 1951 would be far better if it had achieved what was confidently expected fifty years ago—the steady, almost automatic proliferation, horizontally through the world and vertically through society, of the standards of the educated Victorian middle class. For very good standards, on the whole, they were, expressing far more of human truth and tolerance than any other crust of civilisation has done.

But the confidence that has been lost was of the boundless sort plainly too good for this world. *The Economist* of January 4th, 1851, greeted "the new half-century, which will, no doubt, surpass its predecessor as much as that surpassed all that went before it." When hopes used to be so high it is hard now to distinguish between failure to progress and retrogression. But, on a detached view, it is surely no more than a failure to progress that has marked the past forty years. It is a failure, above all, to expand the area of Western civilisation. After brave experiments representative government has been stifled or has withered in almost every country where it had not gained firm hold before the twentieth century began. At some points the frontiers of the free world have been pushed back. At others, ground has not yet, compared with the opening of the century, been lost. If one can manage to look a few years ahead, there is no certainty that the Chinese revolution will follow the totalitarian pattern of the Russian. It may be that a permanent advance to democracy will be achieved in

The Russian Reply

Japan. All the difficulties to which the new governments of the Indian continent are exposed, it may be too soon to say that liberalism there has failed. There are still, in spite of Malan, liberalising movements afoot in Africa, and movements not yet captured and turned into the hands of Communists. It may be, indeed, that in these lands the speed of possible progress is being misjudged and that liberalisation will again dissolve into anarchy and tyranny. But the important point is that the result is not yet determined. There remains some scope for western initiative and advance. A decisive contraction of the area of freedom does not have to be taken for granted.

This is one, and the less favourable, side of the account. The other is that almost all the established centres of freedom have more than survived the past forty years. They have been weakened by, but they have withstood, the two onslaughts of German militarism. They have not fallen, and they need not fall, to the cold war of Soviet Communism. And—in this is the ground for hope—where free institutions have survived men have continued, since 1914, to make large advances—in material wealth, in understanding of man and society as well as of physical science, in tolerance and in decency. Within the western world, the sum of human misery is surely smaller now than it was when Queen Victoria died. That this has been achieved in spite of two world wars is sufficient answer to those who despair of western civilisation. A limited optimism is possible now and will remain possible even if the effort to secure peace by strength should fail.

It is, indeed, a limited optimism. For several years ahead, the West can concentrate on the necessities of physical defence only at the cost of severely thinning all the fruits—mental as well as material—of the free society. But it is important to see this sacrifice in proportion. Even war itself can be fought, as was shown in 1939-45, without a catastrophic surrender of the basic personal liberties or the rights of criticism. A cold war is not one whose frosts are, in this respect, more killing. Nor are the material sacrifices of adequate rearmament so great that they must involve either severe hardships or sharp social strains for communities both free and rich, and united in their aims. And, for all the postwar poverty of Europe, the West as a whole is richer than ever. It is necessary in this, as in other things, not to confuse the problems of the free world with the secular shift of the centres of power and wealth away from Europe. What Europe lacks in economic strength the United States possesses in abundance. Against all the losses of the twentieth century must be set the fact that the United States has come of age. It has come to a heritage far different from anything anyone expected. The leadership to which the United States has succeeded has turned out to be that not of a gloriously expanding world economy but of a half-world on the defensive, and, therefore, imposing more in responsibilities than it provides in privileges. Those responsibilities the American people have accepted—with doubts and hesitations and even now inconsistencies, yet on the whole with remarkable foresight, courage and energy. Three years ago the United States came to see, and one must assume will continue to see, that it could not have security in the postwar world until the Russians were convinced that Western Europe would not be left either to succumb to invasion or to be so weakened by cold war as to fall under Communist dicta-

torship from within. It will be time to despair for the free world if ever this partnership of its two halves should dissolve.

Union of effort, however, is not in itself enough. It is union in a defensive posture, and in that posture much of what matters most in western civilisation must tend to stagnate or to deteriorate. Any real confidence in the future rests on the belief that somehow these tendencies can be resisted. The free world cannot just go on preserving itself by being strong enough to deter aggression. At some point, where the Russian decision on peace and war, there has to be a break in the international tension. At some point in the twentieth century the success of the free world will consist not in its self-preservation but in its ability to advance—which means, in democratic terms, its capacity to offer both for its own people and for the poor communities of Africa and the East rising standards, both material and moral, that dictatorship cannot provide. For this capacity, two things are necessary now. In the sphere of defence against Communism, the West has to maintain, through perhaps a decade or more of acute mental and physical strain, as much as possible both of its freedoms and of its economic progressiveness. Without freedoms, the heart would be gone out of the defence; but economic progressiveness is hardly less important.

Many oligarchic communities have combined poverty for most of their people with the finest flowerings of civilisation. The distinction the West, to outside eyes even more than to its own, has in the past hundred years its unprecedented income of wealth, making economic democracy possible, a tragedy of the thirties was that the free society failed by its own standards: it came to believe, and now more than in Britain, that production did not matter: a use only the problem of distribution remained to be solved. In this, postwar experience has already forced us to move full circle: they are back now to as fervent belief in the importance of production and capital accumulation as ever the Victorians held. What is necessary for the second half of the twentieth century is to show the world that the West is still capable of practising its faith. The superiority of western society is not that it is just and free but also that it is rich. It fares well enough in the next fifty years if it can concentrate on those essentials. The economic problem at the beginning of the half-century is to combine efficiency, flexibility and self-restraint necessary for effective defence and sustained economic progress.

That an essentially similar problem has gone unsolved since 1945 is no reason for thinking it insoluble; at least the welfare economy in Britain has survived the postwar trials better than at moments seemed likely. The difficulty is chiefly one of fiscal will: have the statesmen of a world turning so differently from their expectations the flexibility of mind, and the courage, to lead public opinion through more fears of tension, of sacrifice, of living for a moment for butter tomorrow? The one certainty about the turn of this century is that the pattern of the future is more than usually undecided. It is, for this generation more than for many generations to come, a time of despair of making those lives richer will require iron nerves and

THE Russian reply to the western powers' proposal of wide-ranging talks leaves the door to negotiation ajar—but only so much ajar as to make it a question of some subtlety whether they should now squeeze their way in or first ask that the door should be opened a little wider. This is something gained, but not much. For the Note itself, although by Moscow standards polite in tone, shows that mixture of dishonesty and wordy legalism that has caused so much mischief in the past.

Russia remains—so the argument runs—the one genuine defender of the Potsdam Agreement and its supervision by the Council of Foreign Ministers; that is why it proposed on November 3rd that they should talk specifically about the demilitarisation of Germany. Russia is always ready to talk about German problems—on the basis of the one-sided Prague proposals drawn up with its satellite governments in October. Russia somehow knows that those proposals "met with great sympathy among broad circles of the German population" and is full of "legitimate perplexity" because the West pretends to see in them no basis for discussion. "Nobody has threatened or is threatening" the western powers; they have therefore no excuse for "creating a regular German army." Their allegations that Germans in the Russian zone have been rearmed are "devoid of any foundation." But their own negotiations with the Adenauer Government reflect "the striving of certain aggressive circles to place before the peoples of Europe a *fait accompli*."

In short, this reply, delivered in Paris, Washington and London last weekend and broadcast from Moscow on Tuesday, evades three main points in the western case. It glosses and quibbles over the fact that powerful and fully trained formations of Communist SS have actually existed for two years past in eastern Germany and diverts attention to proposals for a "regular German army" and the "restoration of war industry" in the west—neither of which has reached the stage of formal discussion. It refuses to admit—that everybody knows—that the Russians cannot give a straight answer to the western proposal for free elections throughout Germany under international supervision. Most important of all, it refers nowhere to the suggestion of the Americans, British and French, in their Notes of December 22nd, that the four governments should consider

the principal problems whose solution would make possible a real and lasting improvement in the relations between the Soviet Union, and the United States, Great Britain and France and the elimination of the causes of present international tension throughout the world.

Those Russians who rely on Moscow newspapers and radio still have no means of knowing that the western powers had expressed a desire to go to the roots of present suspicions and disagreements.

These omissions are significant. They suggest some uncertainty behind the drafting of the reply; one hears a stick being tapped over the ground on to which the Russians have been invited to advance. Germany is familiar, carefully reconnoitred and prepared ground on which to negotiate; the international situation as a whole is a vaster terrain, with uneven and treacherous stretches. It would be a grave blow to the peace campaign if the

Russians were got into the position of refusing a broad discussion of obstacles to peace. It would blunt the point of the wedge that they are trying to drive between France and America if they were got into the position of refusing to disarm Communist Germany. It would kill what little political influence they can exert on Western Germany if they said in so many words that they dare not allow free elections all over the country. All this and more can be fairly read into the omissions; and even if nothing else comes of these negotiations, here are three weak points in the Stalinist position that can be hammered at day after day by the free world's propaganda.

But there is no reason to believe that this is yet the end of the story. If the Russian Note suggests uncertainty, it also betrays curiosity. It is dominated—as is Moscow's whole European policy—by the anxious wish to nip German rearmament in the bud and so prevent a decisive addition to the strength of America's allies in Europe. It specifically—and accurately—refers to the demilitarisation of Germany as "the most acute problem for Europe," and the same thing has been said by the Russians more or less emphatically three times in three months.

It is being said that this Note leaves Moscow's intentions obscure; yet it is perfectly clear what they are. The Russians believe that Paris and London are less determined, more nervous about the present tensions than is Washington, and are therefore the prime movers behind the proposal for wide-ranging talks. The French are singled out in the Note for quite special remonstrance. If America's allies can be encouraged in these hopes by the absence of any Russian refusal of general talks, then there might be a chance of their bringing America into conference to discuss German demilitarisation. Once at the table—and once the old, inevitable differences over Germany had cropped up again—it would be easy for Mr Vyshinsky to say or imply "no progress on Germany, no progress on peace." That is precisely the Russian line in Germany now; as is explained in an article on page 25; they insist, day in day out, that divided Germany means war, united Germany means peace.

The Russians certainly overrate these differences in the western camp; and, in any case, the trap is far less formidable than it might seem. If the Russians refused to talk peace because they could not get their own way in Germany, that refusal would strengthen western determination to rearm as few other things could. If they refused to discuss Germany save in terms of the grotesque Prague programme—a united Germany, with no occupation troops to hold the ring, brought together by an assembly in which 50 million western and 17 million eastern Germans had equal representation—they would achieve much the same result.

In fact, however one looks at it, the diplomatic initiative already taken is worth following up. If the Russians intend nothing more than another round or two of the propaganda to which discussion of German problems lends itself, then the Americans, British and French can enter it with confidence, for they are now leading on points. If, on the other hand, the Russians intend to talk business about Germany—and they have taken immense

trouble over their case—then it would be unwise for the Western Governments to turn everything down in advance. But if any advantage is to be drawn from playing the game any further, the three western powers must be quite clear in their minds, and quite clear in their public statements, about what they expect from them. They must not entertain anything more than the very faintest hope of any real *détente* coming out of further talks. But the faintness of the hope has three important consequences. First, it should be made clear that, whatever happens, the Western Germans are not going to be abandoned to Communist vengeance. That does not exclude the possibility of a bargain with the Russians on the “demilitarisation” of both Germanies, East and West; it does not exclude the possibility of a single German Government on the Austrian model; but it does completely exclude the possibility of any evacua-

tion of the western occupation troops—and that should be made clear. Secondly, if there is very little prospect of a settlement, there is equally little reason for any lack of speed or resolution in the rearming of the western countries. And thirdly, for the same reason, there should be the fullest and most immediate exploitation by the West of the propaganda points that the Russian Note provides. The whole world, and especially the peoples behind the Iron Curtain, should be told that the Russian rulers dare not admit to their peoples that the West has offered discussions over the whole range of the threats to peace; that they dare not face free elections in Germany; that they dare not tell the truth about their “Red Nazis” in Eastern Germany.

Diplomacy has its part to play in a policy of firmness; but it must be absolutely clear about its objectives and its chances.

The Struggle in Malaya

THE suspension of the night mail train between Kuala Lumpur and Singapore this week may be looked at in two ways. It can be regarded—and very rightly—as a serious admission by the authorities that the war with the guerrillas has been going badly. The clockwork regularity and efficiency of Malayan Airways has, it is true, meant that for some time many people have adopted air travel inside the country as the routine method of getting about—also thereby avoiding the dangers of guerrilla attack; but that there should be no more night mail for an indefinite period is like stopping the night expresses between London and Scotland. On the other hand, this suspension can be regarded—as some people do regard it—as a welcome though belated recognition by the Malayan authorities that the country has reached a critical point in an alarming war; for months, many private individuals have deplored the official attempt, however well-intentioned, to preserve the attitude of “business as usual.”

It is difficult to sum up the present state of the emergency in Malaya, but these two views reflect two equally possible approaches to it. No one can claim that the emergency has been brought under control when attacks on life and property are almost as frequent as they have ever been. Yet the measures taken by the government show a great advance on those of a year ago. This is because of the progress which is being made in re-settling the Chinese squatters into village areas, where they can be given police protection—and also prevented from helping the guerrillas. Speaking in October, Lieutenant-General Sir Harold Briggs, the director of operations against the guerrillas, suggested that if all goes well most of this resettlement will be completed in the early part of 1951—70,000 out of about 100,000 have now been moved. Then, he said, a rapid improvement might be seen in the campaign, since the guerrillas could be cut off from the bulk of their food supplies; several have already been found dead from starvation in the jungle. He compared the operation to the clearing of mosquito breeding places; at first, results seem to come slowly, but as the later stages in the scheme are reached the curve of success goes up progressively.

In itself, this is cheering news. It is being accompanied by increasing evidence that the Malayan Federal

Government is determined to make a supreme effort to bring the state of emergency to an end. Partly in consultation with the home government and partly on the initiative of Kuala Lumpur, several important new measures have been taken during the past few months. These include the appointment of a director of manpower, Mr Foster Sutton; the calling up of men of all nationalities for service under the new Home Guard regulations; the strengthening of the executive War Council, created last year, by the addition of new representatives from the Malay, Chinese and planter communities; the introduction of selective conscription for the police and the creation of special jungle squads to take over from the army; the control of building materials needed for the squatter resettlement projects and for new military accommodation; the reduction of inessential government services and the curtailment of leave in order to fill the desperate need for more administrators to cope with the resettlement scheme; and the decision to take the drastic step of imposing collective punishment, by fines and other means, on areas which prove especially unco-operative towards the government—this will certainly require tactful handling. The High Commissioner has also announced Britain's gift of ten million Malayan dollars towards the cost of raising two more battalions of the Malay regiment—a difficult thing to do until the present four battalions have sufficient fully trained non-commissioned officers to throw off as a cadre for the new units.

All this makes an impressive record of new resolve, showing that, particularly since the arrival of General Briggs last March, the administration has shaken off some of the apparent inertia of which many who have been facing the endless daily danger of estate life certainly accused it. But the effect of the new measures has yet to be felt on the emergency itself. Behind all that is being done lies the inescapable pressure of a decline in public safety and a mass of Malayan Chinese doubters who, as Mr MacDonald said recently, expect to see Mao Tse-tung arrive in Malaya any day now. It cannot be said that Malaya has yet turned the corner.

The number of incidents has fallen slightly from the peak reached in October, but it is still nearly 500 a month, which is about double what it was a year ago. If deterioration continues, the normal economic life of

Malaya must gradually come to a standstill, with serious results not only to the whole anti-Communist position in the rest of eastern and southern Asia, but to the industrial strength of the western world through shortages of tin and natural rubber. If, on the other hand, the present slight tendency towards improvement can be maintained, the day has probably been saved.

*

What are the chances? And what more should be done? The kernel of the matter now is that the emergency has become a police problem. This in itself is good, in so far as it implies that even now the army is not faced with the kind of large-scale movement that exists in the Viet Minh of Indo-China. The army—and the air force, though its effectiveness except in the vital tasks of supply-dropping and evacuating wounded is open to serious doubt—has exhausted the possibilities of “jungle bashing.” Military pressure must certainly be kept up, but an increase would serve relatively little purpose. The need now is to defeat the Min Yuen, the organisation which helps the terrorists, and which exists in the towns as well as the squatter villages. This means creating a more effective police force, particularly in the criminal investigation department and the special branch. Unfortunately, as was found in Palestine, it takes time, a matter of years rather than months, to build up a good special branch. Although the reorganisation and expansion of the Malayan police force began two and a half years ago, in order to meet the emergency, it had a very weak special branch to start with and has only recently begun to make up for lost ground. There is still, moreover, considerable difficulty in securing the right sort of officer recruits from the United Kingdom; out of an extra 190 required last year, some 40 vacancies still remain to be filled.

On the broad field of events in the Far East as a whole, especially the development of Chinese aggression, the position is less promising. The morale of the guerrillas in Malaya—nearly all of them Chinese—fluctuates very considerably; but it has now received another noticeable boost from the Chinese victories in Korea. In addition, the Peking government has lately turned its own propaganda directly on to the so-called grievances of the Malayan Chinese community, its asserted exploitation at the hands of the British imperialists and the supposed torture of its leaders in concentration camps. One reason for this flare-up, however, is undoubtedly that more Malayan Chinese are now being deported back to China than at any time since the present regime assumed power in Peking.

The result of these outside influences, as well as the traditional division of the Malayan population into distinct racial groups—Malays, Chinese, Indians and Europeans—is to deprive the country of almost any feeling that a single community exists or that it has any common responsibilities. Although rather more information about guerrilla movements is once more being obtained by the police, the Chinese community is still gravely lacking in public spirit; when, for instance, a terrorist throws a bomb into a crowded shop, nobody can be found even to say that he saw a man do it. Many of the Chinese, although quite well disposed towards the authorities, look on the emergency merely as an alien struggle between the government and a group of desperadoes, in which they have no part themselves except to guess correctly which side will win in the end.

A primary task of the Malayan government is, therefore, to break down this apathy. It is far from easy to do, but done it must be. Fortunately, two recent developments are likely to help. Among the most important of the new steps taken by the government are the assumption of the twin powers to direct labour and to conscribe men for part-time service in the Home Guard. Surprisingly enough, the Chinese are entirely willing to accept these provisions; they will gladly do what they are told, so long as they are told to do it and are not required to volunteer. The government is continually being begged to be ruthless by those most exposed to danger of assassination. Its “ruthlessness” must, therefore, take the form of using its new powers of compulsion, sparingly but fully wherever necessary. The other new development has been the expansion of the government's own publicity and propaganda department. For a long time this had been something of a one-man show. Now, an expert on Communist tactics and psychological warfare, Mr Hugh Carleton Greene, has been appointed from Britain and has arrived in Kuala Lumpur to create a new department. It is only by such methods that Malaya can meet its Communists on their own ground.

In spite of the emergency, Malaya has had one of the most prosperous years in its history, owing to the high prices of rubber and tin. The federal budget is balanced—thanks to the very high export duty on rubber—and the economic outlook is good. Besides this the constitutional reforms which were planned some months ago will be taking effect in the early part of 1951. In particular, municipal elections will be held for the first time in Kuala Lumpur, Penang and Malacca, leading “unofficial” citizens chosen from the leading communities will be appointed to assume responsibilities for departmental administration—on the lines of Cabinet Ministers—and a new law is likely to be passed in February expanding the federal citizenship. All these factors not only show that Malaya has a success story to tell, but promise a freer and better life for its people, if they will only reach out for it. The government is to be congratulated on much that it has now done, but it cannot succeed without winning greater confidence from the country. This in turn depends on pushing resolutely ahead with the plans it has made and on creating a sense of leadership as well as of merely military or administrative competence.

We regret

to announce that the first printing of THE ECONOMIST DIARY 1951 is sold out. A second printing is now in preparation and copies will be available shortly.

We suggest

that those who have been unable to obtain diaries should apply for copies from the second printing. Post-free price: U.K., 37/6d.; Overseas, 32/6d. THE ECONOMIST DIARY, 22 RYDER ST., LONDON, S.W.1.

The Ice Cream Industry

ANYONE who thinks that ice cream is an unsuitable subject for an article appearing in midwinter is obviously unaware of the extent to which it has grown, in comparatively few years, from a hot weather speciality to an article of general consumption the whole year round. Of all the manufactured foods that have become popular during the last thirty years, none has adapted itself to so many different uses as ice cream. It can be made into a treat for children at the street corner or an elaborately decorated centre-piece at a banquet; it lends itself to endless trimmings and—so it is said—a hundred and fifty different flavours; it can be mixed into milk drinks and in America it is even fried. It seems probable that only the lack of household refrigerators prevents it from establishing itself on Britain's conservative domestic menus as a staple article of diet. The adoption of a minimum food standard for ice cream, which it is safe to assume will be in force by next summer, will make very little difference to the quality of most of the ice cream now being made, but it will certainly constitute a first-rate advertisement for the industry.

Manufacturers, however, regard the prospect of a progressively higher standard with some misgivings. Ice cream, plain and unadorned, has an air of simplicity which is quite deceptive. It may still look like nothing more than frozen cream—which was the rare luxury on which the infant Mozart overate at court—but since the eighteen nineties, when mechanical refrigeration transformed ice cream into an article of commerce, it has become a very sophisticated product indeed.

It was first introduced into Britain as "hokey pokey," a penny treat for children sold from little carts in the street. Immigrant Italians made these one-man businesses a speciality; they put their natural talent for confectionery to work upon the crude formula for frozen milk, and by enriching it with cornflour and eggs and energetically beating air into the mixture as it froze, they produced a soft creamy food which became popular with people of all ages. The Neapolitan ice held the field until after the first world war when the growing demand stimulated a few big food manufacturers to copy American methods. In America, ice cream has always been a purely dairy product; the same warm summers produced cheap and abundant milk and a mass demand for ices. Factory production was in full swing there from the early nineteen hundreds. Complex machinery was used to break down large quantities of cream and butterfat into a stable solution in the milk, and so produce a heavy ice cream with more fat and less protein than the Italian variety. Machinery suitable for large-scale production also enabled the heaviness that resulted from all this cream and butter to be offset by beating in air as the mixture froze. This air might constitute as much as half the finished product. It not only kept the ice cream light, but cushioned the palate against the shock of extreme cold. The American type of ice cream was begun in London in the twenties and has since established itself over most of England. In Scotland and the North of England, however, there has survived an obstinate attachment to the older variety. All sizes of refrigeration equipment improved and most ice cream making became mechanised before the second world war; but the Italian-type of "mix," as it is called in

the trade, has remained to this day the typical product of the small trader. Since it has a low fat content, its behaviour while freezing is fairly predictable, and the individual shopkeeper can use a good deal of initiative in preparing it. When eggs were available, 6 or 8 of them often went into a gallon of "mix"; custard powder or fresh cream could be varied with the seasons.

Readers whose childhood was spent between the two wars will remember the two types of ice cream distinctly. There was the penny delight made in the local shop—soft yellow stuff smeared into cornets with a wooden spoon—and there was the hard white twopenny brick which cautious mothers always favoured because it was hygienically wrapped and made by a well-known firm. It is those smaller manufacturers of the older type of ice cream who feel apprehensive about the Government's intention to interfere with its composition; ices with a minimum fat content of 5 per cent, as proposed to begin with, can be supplied by all manufacturers without drastic reductions in quantity or a break with traditional methods. But the suggested increase in this figure at some future date will mean the end of "Italian type" ices which have, it is claimed, a respectable protein content, and a considerable demand from that section of the public which prefers them. The few well-known brands of ice cream, on the other hand, have a fat content varying around ten per cent, and are not likely to be affected by any standards officially laid down, now or in the future. The small manufacturers are also very critical of a standard which threatens to put a further premium on the proportions of air blown into the ice cream by powerful machinery.

During the war, the manufacture of ice cream was prohibited for several years, but in 1944 manufacturers were allotted a small fraction of the raw materials they were consuming in 1939. Margarine was substituted for butter and skimmed, dried milk for the fresh milk or full cream powder. The smaller manufacturers, who before the war used only liquid milk, not powder, complained that since they had previously used a low proportion of fat to milk solid for the Italian type of ice cream, their allocation of fat was microscopic, especially as they were now prevented from using liquid milk for which skimmed milk powder, that is with the fat removed, was no adequate substitute. A variety of "fillers" have since been pressed into service; lactose, cornflour, wheatflour, or even barley flour, but all except the first lack the nutritive value of milk proteins, while the wear and tear of wheat and barley flour on elaborate equipment makes their use expensive.

The decisive factor in limiting quantity would have been the meagre allocation of sugar, an indispensable ingredient, had it not been for free purchases of imported and extravagantly priced sweetened fat. This constitutes in effect an international black market in sugar, and it has more than quadrupled the possible supplies of ice cream. But all this juggling with ingredients was more than a question of expensive substitutes. It was also a chemist's problem. Ice cream must not taste of fat, but the fat in it is always trying to con-

geal into large globules during freezing, and the mechanical processes for preventing this are useless without the stabilising properties of a nicely balanced set of ingredients. Another common ailment is "sandininess," which is also due to quite small miscalculations in composition, while a product which avoids both these pitfalls may still not achieve the required combination of flavour, texture and appearance.

Dairy materials will produce a palatable ice cream by rule of thumb methods, but unscientific experiments with sweetened fat, and cornflour and whatever other likely-looking ingredients are available may produce many near misses to every one saleable batch of ice cream. Ready-made ice cream powders have been one answer to this difficulty. In the 'thirties dried milk was gradually replacing the liquid form as an ingredient, partly because it simplified storage, partly because its exact composition made it more dependable. The drying of milk into powder form, however, needs elaborate equipment and the number of plants is limited. A handful of large powdered milk producers and between thirty and forty other food chemists had, before the war, developed as a sideline ice cream powders which the small shopkeeper or restaurant could mix with water or milk and freeze to form a rather indifferent kind of ice cream with very little trouble. Wartime improvements in the technique of dehydration enabled these ready-made powders to be improved and varied, and their use has greatly extended. There are now several hundred ice cream powders on the market containing varying amounts of fat and milk; they are often used as a make-weight among seven or eight other ingredients, or as a stand-by for emergencies.

But the chief impetus to the use of ice cream powders has arisen not from the shortage of other ingredients, but from the hygiene regulations. Concern, on the part of both the public health authorities and of the trade itself, about the ease with which ice cream can harbour bacteria has led to very stringent control since its manufacture was resumed after the war. The registration with local authorities of all premises where ice cream is manufactured or sold has been compulsory since 1938. Pasteurisation—long the practice of the medium-sized and larger makers—has now also been made obligatory. This belated, but far-reaching regulation, has been energetically enforced and has driven the back-room makers out of the trade. Indeed, the cost of a pasteurising plant would have eliminated anything on a smaller scale than a small factory were it not that the regulations permit ice cream powders that have already been pasteurised by their makers to be dissolved and frozen without further heat treatment, provided that only water, colouring and flavouring are added. This has enabled the small restaurant or the isolated village shop to preserve "our own ice cream" as a sideline for hot days.

A great many smaller manufacturers, however, have re-equipped their plant and overhauled their premises at considerable outlay to comply with the new regulations, and since this was done in a boom period, there is a general impression in the trade that far too many of them have "done themselves proud." Far more capacity has been installed, it is claimed, than can be used in present conditions by the small operator, and the

resulting overcapitalisation has caused a small shrinkage of profits in the last few years.

The present level of output of ice cream in Britain is not known; it is certainly far lower than in the United States, where the national average consumption is nearly a pint per head per week. British output is estimated to be three to four times as big as before the war, and if ingredients were available to make more ice cream at present prices it would be sold—certainly if there were rather more enterprise in offering a variety of flavours. This is as far as the experts will venture to guess. There may be anything from ten to twenty thousand manufacturers. These include the three national giants, each of whom produces some tens of thousands of gallons a day, several hundred wholesale manufacturers, with a regional custom for a few thousand gallons a day, and a very large number of small local makers, who, besides supplying restaurants, and hospitals, fairs and fetes, also retail by tricycles or through local shops. The perishable nature of ice cream, combined with the very slow change in taste towards the mass-produced variety, has been the reason for these great differences in the scale of manufacture. It remains to be seen whether the small manufacturer will continue to hold his own against his larger competitors when the ingredients are again freely available.

Endless Progression.

When we refer to a few only of the extraordinary improvements of the half century just elapsed—such as the 35 years' peace, so far as morals are concerned; such as the philanthropic and just conviction that the welfare of the multitude, not of one or two classes, is the proper object of social solicitude; the humane direction which the mind has received towards the abolition of slavery; the amelioration of all penal systems, and the doubts that have been generated of their utility; the advances in religious toleration, and in forbearing one with another; and such as the application of steam to locomotives on water and land, and the consequent vast extension of communication all over the world, so far as physics are concerned;—such as the invention and general introduction of gas; the use of railroads and electric telegraphs; the extended application of machinery to all the arts of life, almost putting an end to very severe injurious bodily toil, except in agriculture, in which, though the labourers are speedily doubled up with rheumatism, and become, from poverty and excessive labour in all kinds of weather, prematurely old, great improvements have nevertheless been made:—when we refer to a few events of this kind, we become convinced that the half century just elapsed is more full of wonders than any other on record. Of that wonderful half century the Great Exhibition is both a fitting close and a fitting commencement of the new half century, which will, no doubt, surpass its predecessor as much as that surpassed all that went before it. Those who have lived through this wonderful era will lose all regret at not being suffered to witness the yet more wonderful things that are in store for their predecessors, in the bright hope that they will be the produce and the reward of the ingenuity and virtues they have been permitted to behold. All who have read, and can think, must now have full confidence that the "endless progression" ever increasing in rapidity, of which the poet sung, is the destined lot of the human race.

NOTES OF THE WEEK

Commonwealth Conference

The Commonwealth Conference meets under a cloud created by the absence of Pakistan's Prime Minister, Mr Liaquat Ali Khan. He has deliberately missed the last plane which would get him to London in time for the opening of the conference, though it is not yet known, at the time of writing, whether he may attend the later stages. The original plan was that the conference should discuss foreign policy and the defence of the common interests of the members of the Commonwealth. It was never intended that a dispute between two members, such as the Kashmir issue between Pakistan and India, should form part of the agenda—and this has been the stumbling block for Mr Liaquat Ali Khan.

The subject of external defence has also proved difficult. It was not to be taken for granted that Mr Nehru's intention to be present at the London conference would be readily accepted in India. But it has been—though only on the general assumption that he would not do anything to commit India to a common defence policy. Indian opinion has been gratified to learn how seriously Delhi's views on world affairs have lately been taken, not only in London and the rest of the Commonwealth but also in Washington and other western capitals. This does not mean, however, that there is as yet any discernible tendency for Delhi to align itself more closely with any anti-Communist bloc of world powers, whether members of the Commonwealth or not.

This is a pity. It can be no secret to Delhi, or to anyone else, that the absence of any Indian commitment to the common pool of military and industrial strength poses graver questions for the rest of the Commonwealth than had to be faced in either of the last two world wars. Nowhere is this more important than in the Middle East. The Persian Gulf area, for instance, with its huge oilfields, used to be a defence responsibility of the British headquarters in India. As it is, the members of the Commonwealth have come together on the eve of what seems bound to be a period of grave international tension; and the older members are expected to discuss what contributions they can make to the common effort. At present, events in Asia will form the main theme of the talks on foreign policies. In these, Mr Nehru will have a vital part to play. But it would be a serious omission if either he or the other prime ministers did not speak very frankly in private on the widest issues of Commonwealth defence and planning.

* * *

Kashmir Barter

Time is doing nothing to heal the Kashmir wound. The Indian attitude to discussion of the dispute with Pakistan is rather like that of the western powers on the subject of negotiations with the Soviet Union over Germany—it is no use trying to reach a settlement which does not include other issues as well. In Pakistan, on the other hand, it is strongly felt that Karachi's claims to Kashmir have sufficient validity to warrant an independent settlement in their own right. Pakistan was indignant about the tone of the report drawn up some months ago by the UN mediator, Sir Owen Dixon; but it feels that, even in this report and in hearings at the Security Council, the moral rightness of its claims has shone through. There is, therefore, much bitterness not only at the Indian attitude, but also at the lack of support in Britain and America for the Pakistani point of view that a settlement should be pressed on India at the earliest possible moment.

The trouble with this Pakistani attitude is that it is asking for the moon. More than ever now, since the Dixon mission failed, India and Pakistan will have in the end to settle Kashmir between themselves; the rightness of much of

India's case also emerged from the Dixon report. In order to settle direct, both Delhi and Karachi will have to leave themselves room for manoeuvre, for making concessions. This means that Kashmir cannot be settled on its own. To attempt to do so is to ask for another deadlock, and each new deadlock only makes all the old sores fester more.

The only possible deal is a barter of India's predominant position in Kashmir for a settlement by Pakistan of the Indian claims for compensation for evacuee property left behind by refugees at the time of partition in 1947. These amount to considerably more than Pakistan's similar counter-claims, since the Hindus and Sikhs who left the Pakistani Punjab were much richer than the Moslems who fled from India; the value of property left behind in the Bengal migration last year is by no means as great as that abandoned in 1947. The Indian claim, before any Pakistani counter-claim is set off against it, is for about £1,000 million; there is, of course, a vicious argument about this total, apart from the validity of the claim or possible methods of settlement, since values in places like Lahore fell precipitately after partition. But, unless a substantial offer is made towards the full claim, it would not be realistic to expect Delhi to surrender its hold on so much of Kashmir.

* * *

How Far Up?

Wages really have thawed at last. Psychologically, the doctrine of restraint broke down a year ago; the consequences have now worked through the barriers of negotiation and arbitration machinery, and were reported in the *Ministry of Labour Gazette* last week.

The index of weekly wage rates had been stationary from the beginning of the year until September. At 110 (June, 1947 = 100) it had risen by only five points in the two and a half years since the wage policy began. There has followed a rise of three points in two months. The figure was 113 for November, with the certainty of a further increase as soon as the effect of the new engineering wages is calculated. In November alone, excluding the rise in engineering, aggregate wage increases amounted to £450,000 a week for about 1,936,000 workers. Since November, there have been several other wage settlements and claims: Civil Service clerical salaries, which are discussed in a later note, have been substantially increased; London busmen were on Wednesday granted rises of 7s. to 9s. 6d. a week; railwaymen's wages, provided the dispute with the Railway Executive on other conditions is settled, may go up by as much as 7 per cent; 150,000 Post Office workers have lodged a claim for a general rise of 10s a week; fresh claims are being prepared by the miners and dockers.

The only question now is how far the general level of wages will rise. No faith can be put in the effectiveness of any sort of direct control. Naturally enough, the TUC's economic committee has failed to find any solution to the dilemma which was posed by the wages resolution passed by the unions at Brighton last September. The demand for a reduction in the cost of living was hardly to be successfully combined with the demand for formal abandonment of the restraint on wages. Similarly, the recent floundering attempts of amateurs and experts alike to formulate a clear-cut wages policy have done little but demonstrate its impossibility. Some of the schemes might work well enough if they were unnecessary—if the starting-point were a rational wages structure generally accepted as fair. When the structure is so disjointed and full of anomalies it is impossible to expect any type of voluntary planning for wages to succeed. A general round of wage increases (and consequent price increases) is now unavoidable: the important thing is to limit it to one round—and to have a Budget that will stop further inflation.

Productivity

What will happen to production in 1951 is anyone's guess, but it is a guess the planners have to make as the economic survey is prepared during the next two months. There should be no illusion that a continuing increase in production will make the burden of defence easy to bear. The real burden consists in the shift of particular resources (at this stage, of equipment and materials, rather than of men) to armament production, and the consequent specific shortages of pots and pans for the home market or of civilian investment goods or of exports. There is no possibility of such an increase in engineering output alone as would greatly cushion this impact. What the general level of production does determine is the extent to which the unsatisfied consumers of pots and pans will be able to spend their money on new clothes instead; it determines, that is to say, the extent of the inflationary problem, and consequently the proper shape of the Budget. That is important enough.

There must be strong temptations not again to take too pessimistic a view of production. Last year's "splendid" increase, which the Chancellor of the Exchequer surveyed lyrically at Birmingham last week, has confounded all prophets. Instead of slowing down, the growth of industrial output (as measured by the interim index) has risen from 7 per cent in 1949 to 9 per cent in 1950. Supplies of zinc, sulphur, copper, cotton and the rest are certainly going to be too small to support anything like the same increase again. In Whitehall it seems now almost to be taken for granted that coal shortage will close some factories before the next two months are out. If that can be avoided it is conceivable, though it is far from certain, that the current level of production can be maintained; that would imply an average for 1951 some 3 or 4 per cent higher than for 1950.

The reasonable expectation is probably of a smaller increase than this; it must be remembered that the rising output of the last two years reflects chiefly the sharp increases in a few industries—particularly vehicles—whose supplies of raw materials have expanded greatly but are now more likely to contract. Any large further increase of production during the next twelve months would be the mark not of success but of failure. Nothing can prevent current production from falling in industries that are being re-tooled for armament work. If the indices for 1951 are superficially "splendid," it will mean that the transfer to defence work is going too slowly.

Withdrawal in Korea

The withdrawal of the Eighth Army in face of a full scale attack by the Chinese army and the abandonment of Seoul have finally dashed the vanishing hope that the United Nations forces might have been able to prevent the Chinese from entering South Korea. The departure of Mr Syngman Rhee and his government for Pusan instead of for some town such as Taegu, in the centre of South Korea, makes it seem that there is not much optimism in General MacArthur's command about the possibility of creating a strong defensive position except in the south. It is unlikely that General Ridgway, the commander of the Eighth Army, will take up a new position until he has very clear indications that he can defend it for good. The intervening days or weeks will not be pleasant; the United Nations forces will undoubtedly inflict very heavy casualties on the Chinese without being able to deny a good deal of the soil of South Korea to them. In carrying out a withdrawal they must pursue a "scorched earth" policy and thus do enormous harm to the land and homes of the South Koreans, on whose behalf they originally took up arms.

During this coming period it will be essential to keep the long-term objectives of the fighting very much in mind. The original political decision to intervene in Korea was taken at the United Nations in order to try to enforce collective

security. It has not been possible to achieve that object. This does not mean, however, either that the principle was wrong or that it should be abandoned. In the light of the massive Chinese intervention which has now taken place, the original objective must be sought in a rather different way. The aim must be to wear down the Chinese so that they will in the end consent to talk peace—they have rejected every attempted approach during the past month.

This military task is vital to the anti-Communist cause in eastern Asia. The question may well be asked how best to achieve it. It may be that General Ridgway placed his troops in a line across the peninsula for a mixture of local political and military reasons—for instance, to take the maximum toll of the Chinese armies. If he cannot hold the line—and he may never have expected to do so—he will now have to retire to a position with a small perimeter. If the logistics of the matter are not decisively against it, this would seem better up at Inchon than down at Pusan.

* * *

MIGs and Sabres

It is apparent that the air superiority of the United Nations forces in Korea can hamper and retard but not prevent the renewed advance of the Chinese forces. Paradoxically, the action which has the greatest significance from a European point of view is one that has least effect upon the course of the Korean battle—the deliberately staged duels between Russian MIG-15 fighters and American F-86 Sabres. It is difficult to understand the reasons that have prompted the Russians—for it must be a Russian decision—to commit their very latest type of fighter to engagements which could in no way affect the course of the battle. Presumably they hoped that with an inviolable "home base" in Manchuria, it would be possible to test their fighters against the latest American types under very favourable circumstances. Purely on the basis of operations it is clear that the test has been a triumph for the Americans, a fact that can probably be ascribed to the superior training of their pilots. There have been several minor engagements and two major ones during the past fortnight in which it is estimated that 17 MIG-15s have been destroyed without the loss of a single American aircraft.

But from the scanty information that is available about both the MIG-15 and the F-86 Sabre it would appear that technically they are very evenly matched, and that there is no other allied plane in production except the Sabre—and possibly the British Vampire—which is a match for the MIG-15. The Sabre holds the official world speed record at 670 mph, while it is thought the speed of the MIG-15 is about 640 mph, although it apparently has an after-burning or rocket device which enables bursts of higher speed. Whether the engine has been developed from the Rolls Royce Nene engines which were sold to Russia after the war or from the German ME-163 cannot as yet be decided for certain. It has a swept back wing with generous control surfaces, and is obviously designed for great manoeuvrability and a rapid rate of climb. It is probably inferior to the Sabre only in its range and in its operational ceiling.

The contrast between the MIG-15 and the American aircraft which have joined battle with it emphasises a perpetual problem of air strategy: the tactical superiority of the fighter designed to defend from home bases over the fighter escort which has to fly long distances. The Russians—and the British—can concentrate on the former, the Americans must concentrate on the latter. If the American superiority in the atom bomb is to continue to act as a deterrent to the men of the Kremlin, it should be remembered that bombers must penetrate fighter defences to reach their targets, relying very largely on the skill and success of their escort fighters. The lesson of the Korean air battles is clearly that the American lead in the quality of pilots and training must at all costs be retained.

Rearm Japan

General MacArthur says on New Year's Day that "international lawlessness" may make it necessary for Japan to "mount force to repel force," the world assumes that it is American policy, cut and dried, to rearm Japan. It may be said, with allowance made for their difficulties, that American representatives abroad cause their best friends embarrassment and difficulties by their liking for beating the diplomatic gun. Before the prospect that the ex-enemy of five years ago may have to be rearmed, democratic public opinion—notably in Australia—needs some time to prepare itself; and General MacArthur showed by his cautious choice of language that he understands the delicacy of the issue. Minds are in fact not made up; but facts are being allowed to form policy.

The strategic importance of Japan has been vividly shown up by its use as a base for Uno operations in Korea. Before they began it was under the military occupation of four under-strength American divisions. Now the military strength available there is at a dangerously low level. The problem for the United States is how to provide against any sudden seizure of Japan from the mainland of Asia without locking up there a substantial part of the all-too-scarce American armed forces. In any case, an American defending force—certainly over four divisions—would need much co-operation from the Japanese people and civil authorities, and Washington recognises that a continuation of the occupation will be likely to reduce their prospective willingness to co-operate. There being no Soviet troops or Communist administration on Japanese soil, the Communist menace is less immediate for Japan than for West Germany or Berlin, and there is correspondingly less inclination to accept the presence of foreign troops five years after the end of the war.

American official opinion is now apparently in favour of withdrawing American garrisons southward to Okinawa and the Bonins, and leaving Japan itself to be defended by its own ground forces with American naval and air cover. Without a navy Japan could not again be a threat to such countries as the Philippines or Australia, and in its potential danger to other nations Japanese rearmament would involve much less risk than German. Japanese ex-officers are reported to be talking of an army of eighteen divisions. Many Japanese cling to the notion of an "unarmed neutrality," and this attitude is naturally encouraged by the Communists; but the Government is apparently prepared to go ahead with rearmament if Japan is granted an acceptable peace treaty.

Pay in the Public Services

The Government's weakening in its own wages policy is indicated by last week's award of the Civil Service Arbitration Tribunal, providing higher pay for some 71,000 clerical officers. The tribunal is, of course, independent, but it is naturally very sensitive to Government policy and has until recently done its utmost to keep civil service salaries steady. This is not the first increase the tribunal has granted since the policy of freezing wages was introduced, but it is the first given in favour of a large section of Government workers and on grounds of the rising cost of living. A similar claim was rejected by the tribunal in 1949 and there appears to be little inherent difference between that claim and the one accepted by the tribunal last week. The difference lies in the changed climate of Government policy towards wage restraint.

The increases range from £20 to £35 a year: there is also one additional step in the incremental ladder at the top, so that the new maximum is £500 for men and £400 for women, instead of the previous £450 and £360 respectively. In 1939, the maximum for men was £350 a year and for women £280, so that the new award brings the total increases at the top of the scale up to 43 per cent—which cannot be said to be excessive.

The repercussions of the award are likely to be widespread within the public services. Other civil service unions are in the middle of negotiations with the Treasury, and the National Association of Local Government Officers has recently launched a campaign for higher salaries which will be greatly strengthened by the favourable verdict on the Civil Service Clerical Association's claim. It will be strengthened even more if the tribunal makes an award on the association's second claim, for Government typists. Outside the public services the repercussions are more doubtful. It is unlikely that the industrial unions in general pay much direct attention to the success or failure of civil servants' wage negotiations; but once the argument of the rising cost of living has been conceded by the Government to its own employees, the door to wage advances is opened wide.

The Landowners' Prospects

Agricultural rents are proverbially sticky. Landowners as a class have not shared in the great increase of farming profits during the last decade. An article in *The Economist* of September 17, 1949, traced the movement of farm rents up to 1946. Another sample enquiry, conducted by the Ministry of Agriculture and the Country Landowners Association, now takes the tale a year further. It suggests that gross farm rents in 1947 were still no more than 10 per cent above the 1938 level—although actual receipts were rather higher because of the cancellation of remissions.

The analysis of the average landowner's expenditure shows that maintenance and fixed charges took about half his income in 1938, but about two-thirds of it in 1947. Nevertheless, the actual work done was probably less in the latter year, by which time costs had more than doubled. The landowner in 1947 had, in consequence, a much smaller

profit available for reinvestment; but it is significant that, despite this fact, he was much more willing to spend money on improvements than in prewar days.

There are several reasons for this change of attitude. Taxation reliefs are now highly favourable to agricultural investment, and Government subsidies are available for schemes of drainage and water supply, for building new farm cottages, and for reconditioning old ones. Many tenants are anxious to expand production and the Agriculture Act requires that their reasonable requests should be met by landlords. The landowner may find that fresh investment is his best way of participating in the general prosperity of

farming—assuming that this will continue. He is thus in a paradoxical position. His net rent has rarely if ever been smaller, yet opportunities for fresh investment have seldom been brighter. It is not yet certain that the smaller and poorer landowners (who have less financial inducement) will be able or willing to invest the fresh capital which agriculture requires.

The Private School Boom

The new pattern of education—the distribution of children among the various types of school—will not be accurately known until the Ministry of Education completes its inspection of all private schools. In reply to a Parliamentary question, Mr Tomlinson has, however, recently given an interesting estimate that there are about 500,000 pupils in independent schools, of whom some 50,000 are over the age of 15.

In time it will be known how many of these 500,000 pupils are receiving an education worthy of themselves and of the fees their parents pay—the two criteria are not synonymous, since private school fees are often much too low for efficiency. The competition for free grammar school places is known to have created boom conditions for the private schools. But in 1949 only 1,041 independent schools with 189,000 pupils were recognised by the Ministry as efficient. This number includes the well-known public schools, which must account for a particularly large proportion of the estimated 50,000 children over the age of 15. There remain, however, 300,000 pupils in schools some of which will, but many of which will not, pass the tests of efficiency.

Mr Tomlinson's figures imply that the independent schools are playing a sizeable part in all education beyond the age of 15. In 1948-49 195,000, or 3.5 per cent, of the pupils in local authority schools were over 15; in direct grant grammar schools 21,000, or 26 per cent, were over 15. Those in the independent schools thus form nearly a fifth of the whole school population of this age. The quality of their education ranges from an apex in some of the first-class public schools, through a wide belt of "progressive" and experimental schools and hum-drum dull ones, to (one suspects) a nadir of inefficiency at the bottom. Inspection will remedy some of the worst defects, but, unless parents are prepared to pay fees which cover the costs of a proper education, it is no fault of the private schools that many will be unable to satisfy the Ministry's standards. In 1948-49 the average cost per pupil per year in primary schools was nearly £20 and in secondary schools round about £30. The costs of a grammar school education are much higher: in Middlesex, for example, they average £51. Local authorities can reduce costs by bulk buying and by other economies not open to private schools. A parent who is paying at an unendowed school fees lower than the costs of a state education can almost certainly assume that the education his child is receiving is less good.

Moscow on 1950

At the turn of the century most of us tend to look back with regret at opportunities lost and resolutions broken. But in Moscow there is so much satisfaction with the achievements of 1950 that resolutions for 1951 are largely discarded as superfluous relics of the decadent bourgeoisie. The press and the radio gloat over the socialist triumphs of the past half-century and show flamboyant optimism over a future in which "all roads lead to Communism." Inside the Soviet Union it is possible to observe

the outline of the majestic edifice of Communism which the Soviet people is enthusiastically building under the leadership and according to the plan of the brilliant architect, Comrade Stalin.

But in the western world the "rot-infested capitalist system" is doomed to "total bankruptcy." The "sharp-nosed dwarf of the White House" and the other American "imperialists," although completely defeated in the Far East, are trying to start a third world war because they realise that capitalism cannot survive without wars and crises. Working people everywhere are beginning to turn to Moscow and to reject capitalist domination. The events of the last fifty years have decisively confirmed "the brilliant Marxist-Leninist teaching on the decisive role of the mass of the people in history." With the example of the Soviet Union and the "people's democracies" before them, "all honest people," according to *Pravda*,

cannot but come to the irrefutable conclusion that only a genuine people's power can ensure the progressive development of society and save humanity from the catastrophe . . . of war. . . . The future belongs to Communism.

In all this there is nothing new. What is conspicuous by its absence is any hint of a spirit of compromise.

On their home service Russian listeners heard a certain Boris Polevoy say the following on behalf of the Soviet Peace Committee:—

Like hungry dogs, the transatlantic generals are scavenging in the garbage of history, finding in it Hitler's half-rotten plans for world domination, translating them into English and adopting them as their own guide. The fascist war criminals, who by a miracle have escaped the noose, are already beginning to order about Italian, French and British generals. They, the experts in bloody banditry, the heroes of Majdanek, Auschwitz and Mauthausen, have been enlisted by the new American boss in Europe, Eisenhower, for the planning of new seizures and new wars.

With such hate propaganda rising to a new level of ferocity it is not surprising that the Russian people had not been told anything up to January 2nd about the western suggestion that there should be talks about the deeper causes of world tension. Moscow Radio is one of them.

Paying for French Arms

The French National Assembly has given M. Pleven four votes of confidence in the course of the passage of the credits for armament expenditure during the coming year. The Assembly seems to have responded handsomely to criticisms from some of its allies that France was reluctant to shoulder the burdens of rearmament.

In 1950 the French Government spent some 420 billion francs on the armed forces. The vote for the coming year raises the total provided by France itself to 600 billion, and to this will be added another 140 billion francs furnished by the United States, bringing the total military budget to 740 billion francs.

Part of the military expenditure was met last year by borrowings in the form of short-term Treasury loans. The Government, resolved to avoid this method of finance as far as possible, has insisted this year on segregating out of the total of 740 billion francs a special rearmament fund of 355 billion francs. This will be financed by the 140 billion francs received from the United States, a national defence loan of 50 billion, 140 billion from new taxation and 25 billion to be found by economies in the operation of the public services and nationalised industries. The last of these represents a concession made by the Government to the Assembly, whose Finance Committee had originally asked for greater dependence on such economies. The Government has agreed to the attempt to produce 25 billion francs of economies only on the understanding that if such pruning fails, it will be able to meet the balance by simply decreeing increased duties.

The new taxes approved by the Assembly are not likely to be popular. They include an increase in the company profits tax from 24 to 34 per cent, a 20 per cent rise in many

stamp duties, an increase in the production tax and a 15 per cent increase on miscellaneous duties such as wharfage charges and certain luxury foods from the colonies.

The proposed allocation of the military funds for 1951 is as follows: armed forces of metropolitan France, 400 billion francs; gendarmes, 20 billion; armed forces in Indo-China, 194 billion; and armed forces in the overseas territories, 26 billion.

It has to be borne in mind that so far only one financial hurdle—admittedly the most difficult—has been cleared. The new measures are also subject to the approval of the Council of the Republic which is at present objecting to some of the new taxes. M. Plevin, moreover, has still to obtain the Assembly's approval for the remainder of the national budget and its agreement to any methods he may devise for financing the basic 385 billion francs of the rearmament programme.

* * *

From Pensions to Production

When the Atlantic Council decided in Brussels to set up a new Defence Production Board it did so "desiring to simplify the structure of the North Atlantic Treaty organisation in order to make it more effective." Now, as the Deputies are meeting in London to discuss the status of the new board, it appears that the British representative will be the permanent Secretary to the Ministry of Defence, Sir Harold Parker. The appointment is regrettable.

If simplicity and effectiveness are ever to be attained in the twelve-power organisation, the first requirement must surely be that the twelve representatives on the functional bodies of the organisation should have the knowledge, experience and status necessary to take decisions which they know can be implemented. It is just for this reason that the Military Committee has all along appeared to speak with more confidence and precision than its production opposite number.

The second requirement must be that these same people carry sufficient authority with their own government to ensure that decisions taken will be implemented. On this score there has been some well-founded criticism of the Deputies—not of personalities but of inadequate status.

The appointment of Sir Harold Parker as British representative on the Defence Production Board is clearly a well-meaning attempt to meet this criticism. But those responsible for it appear to have forgotten that there are some functions—and this is clearly one of them—which demand executive rather than administrative qualifications. Is it fair to expect a senior administrator, whose career can be traced in a narrow path from Treasury to Ministry of Pensions, and thence two years ago to his present post, to assume overnight the functions of industrialist, economic planner and chartered accountant? This is one of the occasions where the contrast between the American practice of employing the man for the job and the British of allocating the job to the man tells in the American favour.

* * *

Students' Referendum

One of the saddest happenings of the last two years has been the gradual collapse of useful and enthusiastic international organisations under the pressure of Stalinist infiltration. There were once high hopes of what trade unionists, lawyers, intellectual workers and students could achieve together by regular meetings; those hopes have been dashed by such occasions as last year's world student congress in Prague, when all but a staunch British minority from the National Union of Students spent their time in drumming out slogans of hate, adulation of people's democracies, and incite-

ments to colonial revolution. The International Union of Students, which was founded in 1946 with 1,500,000 students from 38 countries, has now been inflated into a propaganda organisation claiming 5,000,000 members from 71 countries, even though students in most leading countries of the free world have either disaffiliated from the IUS or refused to join it.

There is some prospect that British students will now recognise how they have been duped in the past—not for lack of warnings by their own officers. In a recent referendum on the question whether the National Union of Students should remain affiliated to IUS 18,806 were against and 15,632 for. It is true that some 21,000 students expressed no opinion—owing to apathy, refusal or technical hitches—but the fact remains that 147 universities and colleges took part in the voting. Assuming that the idealists of the NUS, its fellow travellers and Communists voted to a man and woman, as is their habit, this result is a pretty clear indication that the British student is disgusted with the political uses to which a promising movement has been put. What brought discontent to a head was the brutal and unconstitutional manner in which the IUS expelled the Yugoslavs for the sin of deviation.

Police Squads

The new police methods which are being tried out in three London areas from this week onwards should not be regarded as a simple administrative experiment. They introduce a new principle of policing which contains the seeds of an unwelcome and unnecessary reform. In brief, the new method amounts to the substitution of a team of constables under the command of a sergeant for individual constables on the beat. The sergeant has a wireless patrol car, which he uses to move his constables from one part of his area to another and to keep in touch with the information room at Scotland Yard where the emergency "999" calls are received. The theory behind the new method is that it should enable a patrol area to be covered with less men and greater efficiency, that it ensures a closer control over constables who can be more quickly assembled in the event of an emergency, and that it should relieve the monotony of straightforward beat work. The method was first introduced by the Chief Constable of Aberdeen, who reported enthusiastically in its favour, but its trial in London is the first time it has been used in any thickly-populated area with a fairly high rate of crime.

The chief objection to the new method is that it offends against a fundamental principle of the British police: that each constable is an individual and responsible civilian who, except on rare occasions, does not and should not operate in a paramilitary squad. Any tendency towards military methods must be deplored, for it is bound to decrease the individual responsibility of constables and to increase the risk of an abuse of police powers. More important still, it might lead to the diminution of the liability in law of each constable for his own actions, since, in the event of a constable exceeding his duties, it could presumably be argued that he was acting under the orders of a more senior police officer on the spot. The more senior officer could, of course, be sued in his stead, but it would be a dangerous and unwelcome innovation if constables were allowed to transfer the responsibility for their actions to other shoulders.

Apart from matters of principle, there are a number of other doubts about the new scheme. It remains to be seen whether it will in fact be as economical in manpower and as efficient as has been claimed for it. Policing Aberdeen is a very different problem from policing London; the rate and proportion of police incidents—by no means all are crimes—is very much higher in London, and the effect of concentrating policemen in teams, in spite of their greater mobility, will probably be that less rather than more policemen will be available to help the public.

Shorter Notes

It is reported that American experts much admire the French bazooka and consider it superior to their own. When the French broached the question of selling their bazookas to the United States they were told that it would be better if the French improvements were grafted on to the much more expensive American model. It is true that France is tremendously indebted to the United States for free deliveries of arms. But it is surely one of the principles of the Atlantic Pact that weapons should, so far as possible, be produced where they can be made best and cheapest.

The Treasury has just published its reply to the criticisms made in the Fifth Report of the Estimates Committee on the control of expenditure of the Government information services. The Treasury has resisted what appears to be a suggestion of indifferent worth that the cost of the services performed by the COI for other departments should be borne by those departments, on the ground that it would destroy such economies as exist in having a central information agent. The committee was obviously worried by the possibility that enthusiasm for films and publications may lead to their production without any real concern for their effectiveness or saleability, and in this the Treasury and the departments concerned have promised to carry out more media research before launching on a new project. But the Treasury has quietly refused to permit its economic information unit to be absorbed into the COI or into the information divisions of the various trading departments; however, to avoid any suspicion of empire building, it has recently changed the word "Unit" into "Division."

A point of particular interest in the report of the Permanent Central Opium Board is that the United Kingdom is the only country which, in the last few years, has substantially increased its consumption of diacetylmorphine (heroin). In 1948, its consumption per million inhabitants was 2.18 kg., compared with 1.1 kg. in 1936; in 1949 consumption further increased to 2.71 kg., and in 1950 it is estimated at 2.88 kg. Since the Board's report urges that the drug should be dispensed with as far as possible, because, from the addiction point of view, it is the most dangerous of the morphine derivatives, and less harmful substitutes are now available, this increased consumption might at first sight cause some concern. It is therefore reassuring to learn that it is not due to the British people's increased addiction to their drugs, but to their bottle habit; for the British Government explains that the increase is considered to be due entirely to the increased rate of prescribing under the national health service. Heroin is a common ingredient of cough mixtures.

Last week the State Department announced the allocation of the first dollar aid to India under President Truman's Point Four Programme. This is for the relatively small sum of \$1,200,000; but it is of considerable significance in starting direct American aid to India—previous assistance has come from the World Bank—and in being designed to promote five specific projects which have now been approved, two of them agricultural. The agreement covering the aid is similar to one recently signed with Ceylon.

Correction.—In *The Economist* of December 30th it was stated in a leading article, "The Tasks for Eisenhower," that General Eisenhower's command would cover "the whole of continental Western Europe while leaving the existing North Atlantic Treaty organisation to cover both Scandinavia . . . and the Mediterranean." While no cut and dried plans will be available until after General Eisenhower's arrival, it is possible that this sentence may convey a false impression. It is now clear that these two areas will be within his zone of responsibility, although the exact relationship of command is not yet defined.

January

Good resolutions come with the New Year: why not resolve to open an account with the Midland Bank? You will receive a friendly welcome at your nearest branch and at once enjoy the advantages of a banking service second to none. A booklet entitled "Midland Bank services for you", which you can obtain at any one of the 2,100 branches of the Bank, tells you how simple it is to open an account and of the many advantages which will follow.

MIDLAND BANK LIMITED

Letters to the Editor

Transport in Trouble

Sir,—Although the formerly railway-owned docks are now under the aegis of the Docks Executive, I am sure Mr Cadbury would find that the current costings to which he refers contain assumptions in regard to such matters as the "through" transport charges and the services performed by the "railway" for the "dock," and vice versa.

On the question of dock improvements, it was the poor financial returns rather than the lack of capital which hampered development, but it would be right to claim that the Railway Executive (given sufficient allotments of "capital investment" moneys) would have tackled this problem through its docks experts with the same energy as the Docks Executive.

With the nationalisation of the railways, the Railway Executive would have similarly been in a position to deal appropriately with canal dredging, etc., and that Executive has also effected "quite remarkable" economies in staff and other railway costs.—Yours faithfully,

GEORGE MORTON

Chorley Wood.

Sir,—I read with surprise the third paragraph of Mr Cadbury's letter in your issue of December 23rd in which he states categorically, but without affording any evidence, that the port of Hull has been hampered by lack of capital due to the ownership of the LNER company and that it will take years to catch up arrears and raise the port to standards commensurate with its importance. It is unwise to state as facts opinions which are incapable of proof, but I think I may say that it might be easier to sustain the opposite proposition, that the resources of a powerful railway company made it more practicable to provide capital for the port of Hull, than might have been the case under other ownership.

I do not know how intimate is Mr Cadbury's knowledge of Hull, nor whether he is unintentionally attributing the ravages of war to neglect on the part of the railway company. Has he overlooked the very substantial improvements made in the decade preceding the war to the facilities for dealing with two of Hull's great businesses—timber and fish? He cannot be unaware of the survey of postwar requirements of the port carried out jointly during and after the war by the industrial leaders of the port and the railway company's officers; nor of the complete agreement reached between them in 1947 as to the work to be done at a cost of some £4,000,000, and the means for financing such a capital outlay, the necessary powers being obtained in the LNER Act of 1947.

No doubt the railway company would have had the same difficulty as the British Transport Commission in the last three years in making substantial progress towards the agreed goal, but the condemnation of the company so

definitely made by Mr Cadbury would not, I think, have been endorsed by the Hull Chamber of Shipping and Commerce in 1947.—Yours faithfully,

C. M. JENKIN-JONES

York

Mutual Confidence

Sir,—The concluding two paragraphs of your leading article "Mutual Confidence" suggesting that the British contribution to General Eisenhower's Western European defence force should be fixed in exact terms and publicly proclaimed, coupled with your other leading article "Back to Diplomacy," advocating a return to international conference behind closed doors, do in my opinion indicate the right procedure in the new technique—still not fully appreciated—of planning to prevent a war rather than planning to fight one.

This technique demands much more publicity over military matters and much more privacy over diplomatic conversations between nations. International conferences held in a full blaze of publicity suffer from all the disadvantages of bulk buying. To the inherent difficulties of arriving at satisfactory agreement is added all those feelings of national pride and prestige which world publicity accentuates.

Neither the first nor second world war would have taken place had the aggressor nations been aware beforehand exactly what combination of nations, forces, weapons and war potential they were going to have to face.

The old ideas of arming to win a war did, of course, demand extreme secrecy and large reserves of partially trained manpower which, after a period of time, could be put into the fray. The new idea of arming to prevent a war—though, of course, secrecy as regards the actual "know-how" of weapons is even more important than ever—demands a much more dynamic and open approach. Let the big powers get together and play their hands in private. But where military measures are concerned it must be "cards on the table" if the world war which is threatening is to be stopped before it starts.—Yours faithfully,

J. G. SMYTH

House of Commons

Boom in Prisoners

Sir,—The reports of the Prison Commissioners are traps for the unwary. In your note on the latest volume, the figures you give for the reception of "convicted prisoners" in 1947 and 1948 include trials, remands and civil process prisoners. The actual numbers received on conviction in those years were 34,597 and 37,811 respectively. (To be on the safe side, I will add E. and O.E.)

Referring to the "reconviction" of prisoners as a whole you quote percentages obviously extracted from Appendix 10. But this refers to a

selected group, and includes only prisoners who have been sent to prison for the first time for fingerprintable offences. It comprises only about one-third of all prisoners received on conviction.

Anyone who has attempted to extract information from the prison reports of other countries will realise how far superior are our own. They are, indeed, the best in the world. But they could be better, and that they should lead *The Economist*, of all papers, into error, should convince the Prison Commissioners that their lucidity might be improved.—Yours faithfully,

GEORGE BENSON

House of Commons

The Covenant Clamps Down

Sir,—In your issue of December 9th you take a somewhat critical view of the new scheme designed to bring equity into the distribution of cars.

You evidently think that by speaking of "stamping out abuses" we have in mind the high price of second-hand cars. What, of course, the industry is aiming at is to control a situation where some people without any real need have managed to acquire several postwar cars and others whose need is just as great have not had one at all. If you are against that effort being made, perhaps you would say so outright.

In your evident hankering after 19th century *laissez faire* in conditions where demand so greatly exceeds supply, you do not give any praise to manufacturers who have for four years kept down the prices of their new products to levels often 100 per cent. below what they would fetch if put to auction when coming out of the factory. That, in an inflationary world, is surely something to be noted with approval.—Yours faithfully,

R. GRESHAM COOKE

Society of Motor Manufacturers and Traders, London, W.1.

Without Blinkers

Sir,—Your edition of December 9th refers to Mr Attlee in Washington. Perhaps you are not yet aware of how many Americans both from grass-roots areas and other groups regarded and still regard Mr Attlee's visit as an appeasement step. They are not those who formerly were called isolationists, or America Firsters, but the very opposite. I personally hate the word "liberal" since it has so long masked so much ambiguity, but for the sake of convenience will quote one liberal newspaper which remarked, "Whereas Mr Chamberlain carried an umbrella, Mr Attlee came with the ribs." I choose this bit out of many comments, because it sums up what the more serious and troubled editorials have had to say.—Yours faithfully,

PRISCILLA A. B. HENDERSON

Princeton, New Jersey, USA

AGA BAKES

Regd. Trade Mark

HOW MANY DIFFERENT kinds of cake do you know? The index to Mrs. Beeton's classic cookery books lists 94, ranging from Almond Cake to Yorkshire Ginger. Also mentioned are 55 sorts of pies and 179 varieties of pudding, mostly baked. Perfect baking is easy, however, when you have the perfect cooker. All good cooks agree that the name of the one perfect cooker is the three-letter word — Aga.

AND ONLY **AGA** GIVES YOU

ALL THESE **9** ADVANTAGES
in one combined cooker and water heater . . .

- 1 Burns *unrattled* coke and thus serves you independently and at full efficiency every day and at all times.
- 2 Fuel consumption *guaranteed* not to exceed 3½ tons a year; costs less than £4. 7. 6 a quarter for all your cooking and bath water, or less than 1/- a day.
- 3 The largest true boiling and simmering plates of any cooker on the market. Two large ovens (one roasting; one simmering).
- 4 Thermostatically controlled to maintain hotplates and ovens at the required cooking temperatures, automatically, without knobs or switches.
- 5 Gives you 3 *piping-hot* baths a day and lots of washing-up water all day long.
- 6 Stays in all night to give you a cosy kitchen and *immediate service* from first thing in the morning till last thing at night.
- 7 The shiny vitreous-enamelled surfaces are cleaned in a moment with a damp cloth. *No moving parts to remove and scrub.* No flames to blacken utensils. No smoke or fumes. Nothing to burn out. Absolutely *safe*.
- 8 Every Aga is *guaranteed for 10 years*. In fact the Aga, with its massive chrome-steel fire-unit, lasts a lifetime.
- 9 Available on *Hire Purchase* over periods of up to 5 years, but, by saving of fuel, in most households it creates its own instalments.

Books and Publications

Books About Britain

The Britain We Saw. By Herbert and Nancie Matthews. Gollancz. 317 pages. 18s.

Crisis in Britain. By Robert A. Brady. Berkeley and Los Angeles: University of California Press; London: Cambridge University Press. 730 pages. 37s. 6d.

The Cautious Revolution. By Ernest Watkins. New York: Farrar Strauss. 456 pages. \$5.00.

There is something of a coincidence in the appearance, so close to each other, of three books, all patently written for an American audience, on the record of the Labour Government. All three have something of the air of having been intended for the General Election of 1950 but of having missed that particular bus, either through Mr Attlee's forehandedness or through the delays of authorship or publishing. All three, in spite of the differing national origins of their authors—two American, two British (Mr and Mrs Matthews have identified their respective chapters)—and their very different styles, have a strong similarity in verdict. They are all anxious to insist, for the benefit of their American readers, that there is nothing very drastic or unreasonable about the Labour Government's measures, that it is a very "cautious revolution" indeed (though none of them, curiously enough, sufficiently emphasises that such revolution as has been achieved in Britain since 1938 was almost entirely achieved before the Labour Government took office). And all three books are at one in concluding that somehow an opportunity has been missed in these postwar years, that the British people, in spite of their fortitude and moderation (or perhaps because of those qualities) have not grappled with their real problems and are therefore still living "in a fool's paradise" (Mr and Mrs Matthews) or "on borrowed time" (Mr Brady).

Mr Brady's book is a piece of academic research—that is to say, it is very fully documented, with admirable footnote references, full statistical appendices and a fair index. He has one or two chapters on each of the nationalisation schemes, on social security, on town and country planning, on agriculture, etc. As a result, the book will serve as a most useful place of reference for facts and dates. One cannot help wondering, however, whether, with all his facts, Mr Brady has succeeded in capturing the truth about Labour Britain. There is a "man from Mars" touch about some of his thought which leads him to some very curious conclusions. He seems, for example, to have swallowed whole the Labour Party's election propaganda about the "bad old times" before the war—to judge by this book, Mr Brady himself had no knowledge of Britain before 1948—and though he is ready to be very critical about traditional British attitudes, he never re-examines his own Californian preconceptions. The result, of course, is that he is quite unable to understand colonial policy, to which he applies ready-made stereotypes, and he is so outraged by class distinctions (which are more openly accepted in Britain than in California,

though they are hardly more real) that he is led, at one point, to ascribe the whole lack of productivity in the British economy to the number of domestic servants, shop assistants and estate agents (of all things). Valuable though it is as a reference book, Mr Brady's work cannot be recommended for its judgments, which are often curious and sometimes merely silly.

Mr and Mrs Matthews's book is at the other extreme. Mr Matthews was for four years the Chief London Correspondent of the *New York Times*, and the purpose of their book is adequately revealed by its title "The Britain We Saw." It is an example of the fact-laden reminiscence that American correspondents do so well, and so frequently. Mr and Mrs Matthews shared the chapters between them, he writing those with titles such as "Money and the First Crisis" or "The Welfare State," she those called "The New London," "Women in Britain" and "Travelling About." Mrs Matthews's chapters are closely based on her own experiences. An Englishwoman by birth, it was clearly a shock to her to come back to London in 1945 after years in America and Italy. Prewar days, it is clear, are to her the good old days, and many British readers will be a little surprised to discover what dreadful physical hardships they put up with. But it is all brightly written and informative. Mr Matthews's chapters, however, are a bit of a disappointment. He has evidently felt it incumbent on him to depart from his *New York Times* style to match the personal chattiness of his wife's contributions. This was a mistake; it would have been better to have accepted a sharp contrast between the two sets of chapters.

Mr Watkins's book is the most likely of the three to succeed in the task of engaging the American reader's interest while also giving him a properly balanced judgment of the subtleties of British affairs—subtleties that he finds all the harder to grasp because of the misleading blacks and whites to which they are all too often "simplified." Somebody has told Mr Watkins that what interests Americans is personalities. Without obtruding his own, he has kept almost every chapter on a personal note, with thumbnail sketches of politicians (back benchers as well as the leaders), of trade unionists, of the "cases" at a rehabilitation centre and the like. But he has also conveyed a great deal of information, and though one may quarrel with this conclusion or that, and even catch him out in errors of fact, the general picture that the reader will get is balanced and comprehensive. It is to be hoped that the book will be published in this country.

1851

The Great Exhibition 1851. By Yvonne French. Harvill Press. 297 pages. 18s.

The story of the Great Exhibition has been written before, but not always with accuracy nor always without malice. Miss French is neither inaccurate nor malicious. Justice is done both to the genius of Paxton and to the executive labours of men such as Cole, Playfair and Reid, though Miss French has perhaps underestimated the decisive authority of the main Royal Commission, which gave them their orders and took all major decisions. Its leaders, the Prince Consort and Lord Granville, are given their due, but the Commission, with a membership including Gladstone, Labouchere, Peel (until his death), Lord John Russell and Cobden, met forty times before the Exhibition opened and was no mere "rubber stamp." Certainly, however, the book recaptures some of the suspense of these preliminary days. Few peaceful enterprises on such a scale have come so near defeat, and it is not surprising that the Prince, who took responsibility for matters great and small, was worn with anxiety when success was finally achieved.

Miss French's valedictory reference to the Exhibition's result is interesting. It brought no millennium, but it gave a real impetus to education in science and art. On the South Kensington Estate, which the Prince and the Commissioners bought with the surplus funds, arose with their aid the great museums and teaching colleges which now stand on or close to Exhibition Road. Many readers will be surprised to know that the Commissioners still expend a large income on scholarships for science and art, and number six Nobel Laureates among their "alumni."

Altogether this is a just, comprehensive and diverting book, which has also the merit of being well illustrated and produced.

"Planning" in Germany

Germany: An Experiment in 'Planning' by the 'Free' Price Mechanism. By T. Balogh. Basil Blackwell. 1s. 32 pages.

Considering how many of the facts which Mr Balogh cites are correct, it is remarkable how many of his conclusions are fallacious. He has, it seems, relied for his data too much upon the propagandist material put out by the German Trade Union Federation's economic research organisation, and is himself inclined to remove damaging facts to a safe place where they do not disturb his argument.

Mr Balogh cannot bear disinflation and abolition of state controls, and hates them all the more when, as in Western Germany, they are supported by the majority of the people, and have undoubtedly contributed to the extraordinary economic recovery of the last

two years. From a complete standstill at the time of its collapse in 1945 Germany has reached a point where production exceeds the peak peacetime level of 1938, and is paying for 4/5ths of its imports—while the workers are less Communist than ever.

Allied policy certainly went far astray in Germany, though it is surprising to find Mr Balogh championing the Russian thesis that Germany could pay reparations from current production. The Allies should, perhaps, as he claims, have wiped out the German bank balances in 1945, like the Russians, but they would still, like the Russians, have been forced to have another currency reform later—with disastrous psychological results. It is true that the Allies and the German Government have made a bad mistake in delaying the *Lastenausgleich*, or equalisation of war losses, which was intended to accompany the currency reform and mitigate social injustice. It is true that the Government is far too lenient to the rich tax-evader, and that a vast proportion of taxable income escapes fiscal control; Mr Balogh might even have paid more attention to the extent to which German firms are able to build up hidden reserves by way of writing down assets. It is true that too little is done against unemployment, though the remedy is to be found in training and housing, not in inflation.

But when all the faults are granted, Mr Balogh still remains a misleading and misled exponent of the German economic and social scene. He underestimates the simple fact that the social inequality of Germany was created by the war, that the nation's impoverishment must be reflected in a lower standard of living, and that, of all people, the Germans are most unsuited for experiments in controlled inflation. Like the German Trade Union leaders, he blames the currency reform for social inequality, which is like blaming the operation that lays bare a disease for the disease itself. He fails to see that the only way to create a cake to divide was, for a start, to leave the way free for managers to build up their factories. The author points to the extraordinarily high proportion of the national income which was invested in Germany in 1949, and to the fact that most of it went into industry and little into housing. He admits that there was a rapid increase in productivity as a

result and that "all this was highly desirable." But, he continues,

the consumption of the rich also expanded conspicuously. A more reactionary development in the distribution of the national income has hardly ever happened in a highly industrialised country. The social ravages of the Great Inflation were less terrible than this.

The first part of this statement is true, but not the second.

Whatever the merits of inflation *cum* controls in Britain, they would not work in Germany, where they would create panic among the masses. The Nazi controls were highly successful because they were administered by trained civil servants and had behind them the spur of patriotism or of the gallows. They were utterly unsuccessful—and would have been even after currency reform—in occupied Germany because none of these conditions existed. A limited number are now being reintroduced to meet the temporary crisis in Germany's balance of payments and the world shortage of raw materials. Some of the other abuses in the German taxation system are also being remedied at the same time, in response to the recommendations of the European Payments Union, and wages are being raised. The Union's experts have, however, found that credit needs tightening, rather than expanding. The situation has changed completely since last winter, when a temporary excess of deflation seemed to justify Mr Balogh's arguments.

Ever since the war, Germany has been a laboratory for the experiments of economists, and an impartial assessment of the results would be valuable. But its circumstances are too peculiar for the country to become suitable material for dogma.

The Silver Lobby

Morgenthau, the New Deal and Silver. By Allan Seymour Everest. King's Crown Press; Columbia University, New York 1950; Oxford University Press. 209 pages. 22s. 6d.

This little book, based on Secretary Morgenthau's private papers, tells the story of silver during the Roosevelt administration. Silver mining directly employs only about 8,000 people; 80 per

cent of its output are by-products of twenty-five large base-metal concerns. But by controlling the votes of fourteen to sixteen Senators, it has been able to hold the United States and almost all silver using and silver producing countries to ransom. The votes of these Senators had to be bought for passing most measures of national importance through the Senate, and they were not to be had without legislation raising the price of silver. Their naïve arrogance is sometimes almost fascinating. One Senator explained his policy to Morgenthau as follows:

"My boy, I was brought up on my mother's knee on silver, and I can't discuss it any more with you than you can discuss your religion with me."

In the early days of the New Deal, the President had favoured the silverites, who backed his inflationary policy. Though Morgenthau had some doubts, he fell easily into line. It took him and his master very nearly ten years before they fully grasped the futility of their silver policy. In the meantime, they had raised the silver price from 27 to 90.5 cents the ounce, and had spent \$122 million on subsidising domestic silver purchases, without satisfying the appetite of its supporters. They had driven Mexico, China and all countries using it off the silver standard. By hoarding most of their purchases, they had caused a terrific silver shortage during the war, which sometimes endangered the Allies' war efforts. They finally forced them off using silver coins by demanding the return of lend-lease silver. Secretary Morgenthau who had to carry out the Congress's silver legislation, strove valiantly to make it less disastrous by helping foreign countries after they had been badly hurt by it. His excursion into foreign affairs led to frequent clashes with the State Department. He overruled or even by-passed it, thanks to his personal standing with the President. In some instances, he may have been wiser than the State Department. But the fact that the nation's foreign affairs were over and over again handled by two sparring agencies, which did not even try to come to terms, explains better than anything else the disastrous outcome of President Roosevelt's lighthearted experimentalism. No student of American affairs should overlook this unassuming study.

ECONOMICS—Postal Tuition

• Founded in 1887, U.C.C. provides tuition for the B.Sc. Econ. Degree of the University of London, open to all without residence or attendance at lectures. The College is an Educational Trust, not conducted primarily as a profit-making concern, and has a staff of highly qualified Tutors. Fees are moderate, and may be paid by instalments if desired.

• SELF-EDUCATION COURSES are available in Economics, Economic History, Statistics, Foreign Languages, etc.

AMERICAN SURVEY Limitations of Controls

(From a Correspondent)

Washington, D.C.

THE initial approach to the problem of imposing controls on the American economy was "hysterical, imitative and masochistic," in the acid words of Mr Beardsley Ruml, the well-known economist. Now, six months after the Korean outbreak, some of the hysteria has diminished, but the urge for self-immolation and for reviving the techniques of control used during the last war continues unabated.

The hysteria found its clearest expression last summer in the demand of Mr Bernard Baruch for complete and immediate wage and price control. Although this is now necessary and inevitable, it was not then, when Mr Baruch, half the Congress, and most of the people, demanded it. The danger was not merely that the economy would have been forced into a strait-jacket a year or so before the volume of military contracts required it, but even more that price freezes probably would have been accepted as a substitute for, rather than a complement to, the other measures which attack the roots, and not the manifestations, of inflation.

The danger has not been avoided completely. Some of the steps needed to deal with the real sources of inflation have been taken and some more are coming. But it is clear that they have been and will be insufficient, particularly in the field of taxation. Meanwhile, popular opinion clings to the belief that price and wage ceilings—if only they are applied at once and to everything—will hold the cost of living at its present levels.

Some realistic action has been taken in the area of credit control. With the passage last autumn of the Defence Production Act of 1950, the Board of Governors of the Federal Reserve System reinstated its wartime "Regulation W" on the extension of credit for instalment buying. The first set of regulations was woefully inadequate, but they were quickly amended to prescribe minimum down payments considerably higher, and maximum maturity periods considerably shorter, than those which had previously prevailed for the hire purchase of motor vehicles, all heavy electrical household appliances, furniture and floor coverings. A sharp constriction in the booming second-hand car market, and anguished wails from dealers in the other products affected, are evidence that Regulation W is having a proper effect.

The FRB also prescribed high down payments and a

uniform maturity period for housing credit extended by conventional lenders and by government agencies. The regulations were designed to reduce the building of new homes, running at an annual rate of 1,400,000 during the summer, to 800,000 or 850,000. Builders claim the effect will be to cut the rate to 600,000 or less before long.

The National Production Authority, set up in the Department of Commerce, has the operating responsibility for seeing that materials and plant facilities are available for military orders. At the moment, this is child's play because defence contracts are flowing at an unhappily slow and low rate. The NPA has issued the simplest sort of priority regulation, entitling the Defence Department and the Atomic Energy Commission to give their contracts a Defence Order ("DO") rating. The producer is obliged to fill these orders first and may himself use the rating to require priority delivery to him of the necessary materials and components.

The NPA has supplemented the priority system with some general limitation orders on inventories and some specific limitations on the use in non-military production of certain scarce materials. The following table shows their extent. The base period against which the cuts for early 1951 were measured is the first six months of 1950, when production was running, for the most part, at considerably lower rates than in the third quarter.

As the volume of military contracts grows, existing restrictions will be intensified and limitations will be placed on the number of automobiles and other articles that use a great deal of metal, which may be produced. By next summer or autumn, a

Herblock in the Washington Post

Material	Per cent of Base Period Consumption allowable for Non-Military Production		
	January	February	March
Tin	100	80	80
Copper:—			
Brass and wire mill products	85	85	80
Foundry products	100	100	100
Aluminium	80	75	65
Rubber:—			
New (natural and synthetic)	85	80	Not fixed
Nickel	65	65	65
Cobalt	33½	Complete allocation	
Columbium	None	None	None
Zinc	80	80	80
Cadmium	Use limited to specified products		

controlled materials plan will be established, allocating the whole supply of steel, aluminium and copper.

The application of price and wage ceilings on any reasonable and useful basis is rendered impossible by a monstrosity of a law. The Defence Production Act permits the imposition of individual price ceilings, but it provides that, whenever a ceiling is set, the wages of the workers in the industry concerned must also be fixed. But while selective price control is a theoretical possibility and even a desirable preliminary step to general control, selective wage control is not only unjust, but also unworkable, as long as there is mobility and freedom of labour.

The law also makes general price and wage controls impossible. In the first place it contains no authority for controlling rents, which account for about 13 per cent of the average citizen's living cost. In so far as these are regulated at all, it is under another authority. In the second place, it prohibits the fixing of ceilings on agricultural commodities at a price less than "parity" (a level for each farm product based on a ratio, very favourable to the farmer, with the prices of industrial products). Except for meat, cotton and wool, farm prices are far below parity at present. If the government attempted a general price-wage freeze, the worker would find his wages fixed while the future course of his rent would be in doubt and the future price of food, which accounts for about 40 per cent of his expenses, would be free to rise from perhaps 10 to 50 per cent before it could be stabilised.

Obviously, the Administration must go to Congress for an amendment to make the law workable, and it is preparing to do so early this year. Meanwhile, partly in response to public and Congressional roars for action and partly because it helps recruit and train the necessary staff, the Economic Stabilisation Agency is starting with some selective controls, of which those in the automobile industry were the first. Given a modification of the law, the Agency will attempt to develop with labour a wage stabilisation plan, a 1951 version of the wartime "Little Steel Formula," and in a few months, for better or for worse, prices and wages will be controlled, as the current word has it, "over-all."

Southern or Democratic?

[FROM A CORRESPONDENT IN VIRGINIA]

THE South comes to the new Congress ready and able to make its weight felt in the Democratic Party. Almost half of the Democratic seats in the House and Senate are held by Southerners. They provide the chairmen of key committees in both Senate and House. Unwilling themselves to take the responsibility of acting as spokesmen for the Administration, they have exercised an effective veto on the choice of a Senate majority leader to succeed that election casualty, Senator Lucas of Illinois. Senator McFarland of Arizona has won the post, not because of any particular ability or, indeed, energy on his part, but because he pleased the Southerners last spring by obstructing the passage of the Bill for a compulsory Fair Employment Practices Commission, which would be particularly welcome to Negroes. It was understood that he hoped for reciprocal sympathy from Southern Senators for the reclamation project pending in his own state; Mr McFarland must run for re-election in 1952.

Southern strength in Congress is even greater than is indicated by the bare statistics. The Democrats who retained their seats on November 7th are not, from President

Truman's standpoint, the most reliable members of the party. The shift that reduced the Democratic majority in the House from ninety to thirty-six and balanced the Senate on a knife edge removed a very high proportion of the members who were accustomed to go down the line for Fair Deal measures. One out of every four of them has now been retired to private life.

*

But the South's place in the Congress is not the same as the South's place in the Democratic Party. In 1952, at the convention that nominates the party's candidates for President and Vice-President, the votes that count will be electoral votes, based on population, and particularly the electoral votes of the northern and western states, whose political allegiance is doubtful. The South will hardly be in a position to name the party's candidates. But, if Mr Truman is nominated again, it takes small gift for prophecy to predict that many Southerners will be looking for some other candidate to support. Yet what other candidate? The South, with its historic devotion to the Lost Cause, may get greater satisfaction than other regions out of a magnificent gesture, but magnificence is hard to keep up in the absence of political patronage. There is no adequate substitute even in the oil interests which those who have taken sample drillings insist are to be found under the States' Rights, or Dixiecrat, movement of the 1948 election. Southerners would prefer to go where they may do themselves some good. And as yet they have not discovered where that is.

Emboldened by the fact that for the first time in many years a large turnout in the November election proved to be conservative, and by the further fact that the most significant of the Republican victories was that of Senator Taft, whose Southern connections are firmer than those of any other outstanding member of his party, Republican leaders are convinced that now is the time to summon Southerners to overcome their historic repugnance to a name. After all, there are only thirteen years to go until the centenary of the battle of Gettysburg, while Southerners have now been restive in the Democratic Party for a quarter of a century. Moreover, Texas, for the first time since the War Between the States, sent a Republican to Congress in a by-election earlier this year and there was an unprecedented Republican sweep in Pinellas County, Florida, in November. An even happier omen is that this autumn Maryland Republicans followed their 1948 success in the presidential contest by winning the governorship and breaking the Democratic Senator Tydings' long tenure of office. In North Carolina and Oklahoma, also, new Republican strength was shown in certain districts.

So, as its first major move in the 1952 campaign, the national executive committee of the Republican Party, early in December, appointed a committee to help Southern Republicans expand their organisation. Special emphasis is to be given to Virginia, Florida, Tennessee, Oklahoma and Texas—in the first three of these states, the combined Republican and Dixiecrat votes, in 1948, outnumbered those of the successful Democrats. With a Republican candidate such as General Eisenhower, or even Senator Taft, opposing

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Mr Truman in the presidential fight, the number of Southerners who would slip across party lines and vote Republican is probably very considerable. But there is a difference between slipping across a line and openly lining up behind another party. And what is easy for a relatively anonymous voter is impossible for the party leaders to whom dissident Southern Democrats look. They must declare themselves.

The top men in the state organisations have to choose their path with care. Today, they are nationally recognised as the Democratic Party in the South, with the emoluments, seniority, committee chairmanships and patronage which go with that position, and have much more than a name at stake. The tie with the northern and western sections of the party can be stretched only so far and could hardly stand combination of a permanent nature with the Republicans.

Just what Mr James Byrnes, the new Governor of South Carolina, and like-minded Southerners are planning for 1952 is not yet clear. It is probable that, under his guidance, they will act on a regional rather than a state-by-state basis. With the elimination of the liberal Senators Graham of North Carolina and Pepper of Florida the south-east is very like-minded, and it may not have been only the pressure of the national emergency that prevented the Speaker of the House, Mr Sam Rayburn of Texas, from attending the National Democratic Party's annual fund-raising dinner in New York. There is little doubt, too, that conversations are going on with northern stalwarts, industrial and political, who are at odds with the present Administration—men like Mr Baruch and Mr Farley. The hopelessness of another venture along Dixiecrat lines seems to have been

adequately demonstrated. If the Southern leaders could induce the states to pass laws allowing them to send to the electoral college spokesmen who were not committed to a particular presidential candidate in advance, the South might hold the balance of power in the college in 1952; it might then be able to bargain over the choice of President and Vice-President even though it could not itself choose them.

*

There is a specialised group of Southerners who will always support any party which takes a stand that they approve on the race issue. And when the issue is raised in national form, the South solidifies around that nucleus. Otherwise, the South's conservatism is much more general. It is compounded of three little related elements: the conservatism of the sea coast, that traces a proud ancestry to eighteenth-century feudalism and its ritual of family, station and calling; the conservatism of the mountains, with its pioneering individualism; and the conservatism of the industry that has recently arrived and is only slightly counterbalanced by organised labour in the factory centres.

So far, in the states where a liberal wing of the Democratic Party is sufficiently well organised to compel attention, conservatives of all persuasions have tended to work together, crossing party lines in both directions. In the gubernatorial campaign of 1949 in Virginia, for instance, an open offer on the part of the state's Republicans to help in the primary election in which the Democrats were choosing their candidate, openly welcomed by the nominee of the conservative Byrd machine, provided the margin necessary to beat the liberal Democratic candidate. With the successive

abandonment of the poll tax by Southern States—South Carolina is the latest to repeal it—the number of adult citizens who exercise their vote is growing larger. But up to a certain point a larger vote may very well remain a conservative vote and, if its various elements get together, such a vote is likely to exercise a prolonged period of control.

Since, especially in the cities, the Negro as well as the White vote is growing, the historic basis of the one-party system in the South, dating in most States from the turn of the century, is wearing away at a time when most of the policies the Republican Party favours are more congenial to the articulate part of the South than the Administration's Fair Deal. That is why the Republicans think they see a golden opportunity in 1952. But the leaders of the conservative Democrats, though sorely tempted by the possible fruits of extending their collaboration with the Republicans beyond the floors of Congress, still cannot find either a home or a name in the Republican Party.

American Notes

Lame Duck Sitting

The Eighty-first Congress paid the penalty for deserting Washington over Christmas by having to sit on New Year's Day, in order to complete its work before the Eighty-second Congress took over on January 3rd. But the departing "lame duck" members, who included such faithful Administration supporters as Senators Lucas, Tydings and Elbert Thomas, have the satisfaction of having hatched out an unprecedented number of Bills during their last session, one that is traditionally expected to be sterile. Their success is a measure of the heat generated in Washington by the international crisis.

When Congress settled down to business after the election, it found five Administration eggs in its nest. The Senate quickly threw out the Bill giving statehood to Hawaii and Alaska, but the other four have all been satisfactorily dealt with. Rent control, due to expire on December 31st, was extended until April, to give the new Congress an opportunity of deciding what should be done about it, now that building is once more restricted. Hungry Yugoslavia was sent \$38 million, out of funds already appropriated for Marshall aid to other countries, in order to strengthen its resistance to Russian pressure. In order to strengthen the United States' own resistance to the same pressure, \$20 billion was appropriated in supplementary funds for the current fiscal year, bringing the total budget to \$72 billion, of which almost \$43 billion is for defence. Nearly \$2 billion of the new appropriation is for stockpiling, over \$1 billion is for atomic energy expansion and the rest will be used to build up the armed forces. Finally, Congress earned a special pat on the head from the President by approving an excess profits tax, which will bring in about \$3.3 billion in additional revenue, nearly as much as Mr Truman had hoped for from this source, but by no means all the new revenue that will be needed.

The lame ducks also hatched out a few Bills for which the Administration had given up hope, notably one closing loopholes in the anti-trust laws and another banning inter-state shipment of gambling machines. More important, the Eighty-first Congress decided that civil defence measures were too urgent to wait for its successor, and rushed through legislation authorising both the powers and the money (\$3.1 billion) which the federal government needs if it is to help state and local authorities prepare for atomic attack. One double-yolked request that the President sent to Congress as an after-thought, to supplement his emergency powers, was half addled. Congress has allowed him to negotiate military contracts that have been affected by rising prices, but has refused to permit him to reorganise government

departments without consulting it. Had the Eighty-first Congress not ended its career so characteristically, by rejecting Mr Truman's last request, the new Defence Production Administration might have been a real merger of the emergency agencies now scattered through various departments instead of only the co-ordinating body that it appears to be.

Republicans to the Rescue

Mr Acheson assured the world in his New Year message that the United States would not desert its friends, whatever Mr Hoover and Senator Taft proposed, and he was seconded by the President. But the striking feature of the battle over "retreatism" this week is that the initiative in rebuking Mr Hoover has passed to Republicans, to Mr John Foster Dulles, the Republican assistant to Mr Acheson, to Mr Dewey, who would have made Mr Dulles Secretary of State had the Republicans won in 1948, and to Senator Morse, who attacked his party's isolationist with characteristic vigour. They lack the Congressional influence wielded by Senator Vandenberg in his great days, but their speeches suggest that the fault which runs down the centre of the Republican Party on foreign issues may split wide open on Mr Hoover's Rock of Gibraltar.

Mr Dewey appealed to the "stark necessities of self-preservation" which demand strong allies, and to the need for bases overseas from which to launch the atomic bomb. It was Mr Dulles who delivered the most reasoned, if unsensational, reply to Mr Hoover's argument though, like Governor Dewey, he tactfully refrained from mentioning its author. One of his great services was to revive American confidence by recalling the massive record of achievement since 1945; by pointing out the weaknesses which underlie the apparent solidity of Communist conquests; and by drawing attention to the great superiority of resources, both material and moral, possessed by the free nations, a superiority which would no longer hold if the United States abandoned its allies and made the Russians a gift of European industry and Middle Eastern oil. The mood that would plan a retirement behind a new Maginot Line, he said, carried within it the seeds of its own collapse. He agreed with Mr Hoover, however, that it was impossible to erect strong static defences everywhere and that there must be no more Koreans; the power to retaliate was, he said, the ultimate deterrent.

This is the debate on foreign military commitments which should have taken place in the Senate when the Atlantic Treaty was discussed. Then, it would have caused no surprise; now it creates the very defeatism abroad of which Mr Hoover complained, and of which, it must be admitted, many Americans seem convinced. The debate is certain to be taken up by the new Congress. A number of Congressmen are ready to criticise the sending of troops to Europe, either on the score that the West must first prove its determination to save itself, or because it would leave the United States defenceless. On this issue, General Eisenhower's views will be decisive, and in his recent statements there is nothing to suggest he will not be a tower of strength to the Administration. But his duties do not lie in Washington and, however great his personal influence, he will not be able to fight many of Mr Acheson's battles with the critical Congress which assembled this week.

Defending the Dollar

The Federal Reserve Board, in raising reserve requirements for members of the system to the legal limit (except for banks in New York and Chicago), has reluctantly fired almost the last shot in its present locker. Banks in central

reserve cities must now maintain reserves of 24 per cent against demand deposits, those in reserve cities 20 per cent, while country banks must hold 14 per cent. These member banks are only about half the total number of banks in the country, but they hold 85 per cent of the deposits. Increasing their required reserves by \$2 billion in theory prevents the extension of some \$12 billion in bank credit.

The target of the new offensive is those bank loans which cannot be restrained by restrictions on mortgage or consumer credit. The loans of all member banks have increased by an estimated \$7 billion since the Korean attack, raising demand deposits to a peak of over \$100 billion. The weekly reporting member banks (that is, the larger of the member banks) alone, as the accompanying chart shows, have increased their total loans since the end of June by \$5.6 billion, of which business loans accounted for \$4.2 billion. Perhaps a quarter of this is due to the return of the cotton trade to private hands, now that the government need no longer support the price. But the rate of expansion is still unprecedented and the source of most of the recent expansion in the money supply. The federal budget, for the moment,

is innocent; so far this year the government has been taking in more money from the public than it has been paying out.

Both the effectiveness and the fairness of raising reserve requirements are disputed. It is a crude credit weapon, which affects banks unequally; and, to the extent that it tightens credit at all, does not discriminate between loans which serve the national interest and those which undermine it. Moreover, Mr McCabe himself, the chairman of the Federal Reserve System, when asked earlier last month why reserve requirements were not raised, if the situation was so alarming, replied that most banks could easily meet the demand for more reserves by selling government securities. The recent slight increase in short-term rates will make this a more costly operation, but as long as the commercial banks hold over \$60 billion of government obligations, and the central bank must support the market for them, the reserve requirements weapon is blunted. Most banks had already set aside the necessary cash and bonds without restricting their loans.

The decision of the Federal Reserve does, however, underline the serious view it takes of "private deficit financing" and of the banks' failure to respond to its appeals to apply the brakes. For several months Mr McCabe has been urging the banks to restrict their loans and in particular to refuse those requested for the building up of inventories or expansion of non-defence production. But it is hard for a bank to refuse, on national grounds, a loan which is sound in itself, when it knows that the bank across the street may

not be so high-minded. The Federal Reserve Board is now urging all financial institutions to come to an agreement on the kind of loan which ought to be refused. Such an agreement, which otherwise would violate the anti-trust laws, is authorised by the Defence Production Act.

McCarthy's Victims Fight Back

One of the unexpected reverses of the election was in normally Democratic Maryland, where an unknown Republican, Mr Butler, defeated the well-known and respected Senator Tydings. Mr Tydings had headed the investigating committee which castigated Senator McCarthy for his unsubstantiated charges of Communist influence in the government, but even so, because of the complications of Maryland politics, it is by no means certain that the Tydings defeat was a McCarthy victory. It is, however, certain that Mr Tydings was smeared with the McCarthy brush, notably by his opponent's use of a faked "composite" picture, showing him in apparently friendly conversation with Mr Earl Browder, the notorious Communist. On this evidence that Mr Butler fought an unfair campaign, attempts have been made to prevent him taking his seat by Democrats who fear that they may be victims of the same type of misrepresentation in 1952.

Mr Tydings has held aloof from this argument, but Mr Drew Pearson can be counted on to smear as good as he gets. His long-smouldering duel with Senator McCarthy came to a head recently in comparatively private combat at an exclusive club and was continued publicly on the Senate floor and in Mr Pearson's newspaper column. Many agree with Mr McCarthy that Mr Pearson is "an unprincipled liar," "fiendishly clever" and "a prostitute of journalism," but his anti-Communist record seems clear. After Mr McCarthy had said that

any store that stocks Adam hats . . . is unknowingly contributing . . . to the cause of international Communism by keeping this Communist spokesman on the air,

the Adam Hat Stores, who sponsored Mr Pearson's news broadcasts, allowed his contract to lapse. The company maintains that it had already intended to do this but, once the principle of freedom of the press and the air appeared to be involved, Mr Pearson's newspaper and radio colleagues, like Mr Tydings's Senatorial ones, sprang to his defence to protect their own skins.

The McCarthy touch can also be traced in the attempt to prevent the confirmation of Mrs Anna Rosenberg as Assistant Secretary of Defence, on the grounds that she had once been a member of a Communist club. Mrs Rosenberg, however, came through the Senate committee's hearings with her reputation even brighter than before, and the case has since been proved to be one of mistaken identity. The Senate is much less happy about the five members appointed to the Subversive Activities Control Board, set up under the Internal Security Act to decide what is, and what is not, a Communist organisation. It is thankless work, especially since it will be carried on under the ever-critical eye of the Senate Judiciary Committee. If the Senate refuses to confirm the present nominees, the President will have difficulty in finding others ready to sacrifice themselves.

Point Four's Second Birthday

It is almost two years ago that President Truman, in the "fourth point" of his inaugural address, lined up his plans for aid to the under-developed areas of the world alongside those for improving social conditions in the United States. Since then this "bold new programme" has had a less spectacular, but no more successful, career than its domestic counterpart. Now, however, the prospects for

the Fair Deal abroad, where it is a basic weapon against Communism, are better than those for the one at home, which will have to be drastically modified to make room for the rearmament programme.

There are two main roads along which the Fourth Point is supposed to work towards its goal. First, it is intended to encourage private investment in backward regions. Second, and of more immediate importance, it is to supply technical assistance, especially in the fields of health, education, agriculture and transport. The first standard Point Four agreement, with Ceylon, was signed at the beginning of November. These agreements cover the general terms on which technical assistance will be given, and provide for the training of nationals of the country concerned as well as for the loan of American experts; at present no funds are available for capital equipment, apart from the absolute minimum needed for demonstration purposes. Another general agreement was concluded with India last week, of special importance since it carried the programme into South Asia, and similar arrangements have been made with Brazil and Haiti.

The agreement drawn up earlier with Iran was for specific projects for rural aid, amounting to \$500,000. Two of the first five projects under the general agreement with India are agricultural, and the others are concerned with child welfare and the development of water and mineral resources. The sum allotted for these and other possible Indian schemes during the current year is \$1,200,000. Part of the \$800,000 given to Brazil will be used to set up a Joint Commission for Economic Development; altogether \$11 million of Point Four funds have been set aside for the Western Hemisphere. The United States is contributing about \$19 million this year to various Inter-American and United Nations technical assistance programmes. This comes out of the \$34,500,000 appropriated by Congress for Point Four and allied schemes during the current year, but the Economic Co-operation Administration is using some of its money for similar work, for example in Siam and various colonial dependencies. Both the Export-Import Bank and the World Bank also provide a certain amount of technical assistance to those applying for loans.

When all these dispersed activities are gathered into the net, Point Four's catch is more substantial than appears at first sight. But if it is to provide the maximum amount of nourishment for the under-developed areas, it is desirable that it should be more closely integrated than it is at present. This was recommended in Mr Gordon Gray's report on foreign economic policies and his proposals in this field are now being considered, at the President's request, by the new Advisory Board on International Development, headed by Mr Nelson Rockefeller.

Shorter Notes

Governor Dewey has kept his promise, made much of during the election campaign, to provide a state position for the Republican Senatorial candidate, Mr Hanley, should he fail to win one in Washington. Mr Hanley resigned his gubernatorial candidature, in which he might have been successful, to allow Mr Dewey to keep the place. Mr Hanley's reward is the post of special counsel to the State Division of Veterans' Affairs, at an annual salary of \$16,000. In addition he will have a pension of about \$4,000 a year for his past work as Lieutenant-Governor.

The US Government has increased its expenditure on stockpiling sevenfold compared with the 1950 fiscal year and has nearly trebled it during the current year. Congress has just added \$1.8 billion to the 1951 appropriation for this purpose, bringing the total to over \$3 billion.

THE WORLD OVERSEAS

Russian Tactics in Germany

DR. ADENAUER is at this moment considering in what manner to reply to the letter sent to him on December 1st by the Premier of the Soviet German Republic, Herr Grotewohl, proposing talks on the subject of German unity. It is almost certain that he will make some reply after examining all the data on the policy of the Eastern German leaders. In itself there seems nothing remarkable in the fact that one German politician may reply to another. Nevertheless, if Dr. Adenauer should do so, it would be a landmark in the history of postwar Germany. The Federal Chancellor would be admitting the authority of the renegade Socialist in Eastern Berlin; and he may be giving the Communists a foothold which they will make every effort to enlarge.

The first reaction of the Chancellor was to ignore this latest attempt by the government of the People's Republic to assume equality with the Federal Republic. There is ample justification for doing so. The Federal Chancellor is the head of a freely-elected Government, now representing 50 million Germans, living in one-third of German territory, together with Western Berlin. In spite of all the limitations on the sovereignty of the Federal Republic, no one can justly claim that Dr Adenauer does not conduct an independent policy which represents the wishes of the majority of his people. What can be said of Herr Grotewohl? The most that can be conceded is that the organisation he represents is in effective control of the People's Republic. In that sense it is a government; but it exists solely to execute the orders of the Politburo of the Socialist Unity Party, which is in turn the instrument of the Central Committee of the Bolshevik Party in Moscow. The territory over which it rules is not all of the country outside the Federal Republic, but only one-third of the present boundaries of Germany. The rest of Germany lies beyond the Oder-Neisse line, and the sole function of Herr Grotewohl in respect to this area is to affirm from public platforms that its frontiers are fixed for ever in the interests of peace.

After a year during which the People's Republic established itself by the customary methods of Communism, elections were held last October on a single list of candidates. It is quite possible that an overwhelming proportion of voters really did, as alleged, mark their crosses against the names of the approved candidates. Few are willing senselessly to make martyrs of themselves and their families when they are forced to vote openly in small factory or office units. "A man must live" is the precept upon which Communist election organisers successfully work in all countries where the power to withhold jobs—and the rations which go with them—is in their hands. It remains a fact, however, that Herr Grotewohl's rule rests solely upon fear, and he has no right whatever to claim equality with Dr. Adenauer. Nor is there any justification for his proposal—an echo of the Note sent by Moscow to the Western Powers—that an All-German Constituent Assembly should be set up consisting of equal numbers of representatives from West and Eastern Germany.

A few months earlier, a proposal of this nature would have met with contemptuous rejection by the Bonn Government and with indifference by the people of the Federal Republic. It would in all probability never have been made. Russian policy has changed to meet the new circumstances since Korea. Until the Prague conference laid down a revised

strategy for Germany, the Soviet German "National Front" had been trying to foment a resistance movement among the apathetic Western Germans. Dr Adenauer and Dr Schumacher had been threatened with a violent end as traitors and war criminals. This campaign, like its predecessors, was a complete failure. At that time, the strongest appeal in the Soviet-sponsored propaganda for German unity was the offer of secure, long-term markets in Eastern Europe and in China, made to industrialists who were faced with the problem of selling surpluses in highly competitive western markets. To all Western Germans, the idea of unity—unity, that is with the Pieck Republic alone—had little attraction. Daily reports, and the constant stream of refugees from the Soviet Zone told a forbidding tale of increasing terror against the capitalist bourgeoisie, arbitrary bullying by local party bosses, and a miserable standard of living for all but the privileged few. Only the young, neglected in the West and fostered in the East, felt drawn by Soviet German propaganda for limited unity of the two zones. To all Germans, and the millions of refugees in particular, the real meaning of "unity" is the return of Germany's lost territories east of the Oder-Neisse. And, as innumerable revisionist organisations make clear, the areas which would be comprised in a Germany reunited in accordance with their hopes would be Hitler's "Warthegau" in Poland and the Sudetenland, as well as Silesia, East Pomerania, Danzig and East Prussia. In the period before Korea, however, even the revisionists had quietened down. About 2,500,000 of the 3,500,000 refugees of employable age had found work, leaving an unabsorbed mass of farmers, professional men and servants of the Hitlerite regime. An extraordinary number had enriched the West by setting up new factories and crafts.

Two Nations

So the cleavage between the two Germanies became real; instead of being an artificial barrier imposed by foreigners, the Elbe had become the dividing line between two countries, inhabited by people who were increasingly strange to one another. The urge for unity between the two rump Germanies lived on chiefly among the two groups who had their chief strength in the Soviet Zone—the Protestant Church and the Social-Democrat Party—and of these, the leadership of the Social-Democrat Party were immunised to Communist blandishments by the fate of their colleagues in the Soviet Zone.

Korea and its aftermath, western rearmament, have completely changed this situation. Now, for the first time, Soviet German propaganda can offer a straightforward alternative with a specious ring of truth about it: "Unity and peace—or division and war." With Russian-made tanks invading the territory of an American protectorate, and Americans pressing for the rearmament of Western Germany, fear of war makes the Germans listen more attentively to the Russian talk of peace. Like the French, the Persians, and all other peoples who are resisting Communism with American aid, they hear that all they need do for salvation is to force the Americans to withdraw. Constantly, they heard the famous message from Stalin to President Pieck in which the leader of the nation which had (according to Moscow) beaten them single-handed, had affirmed that, together, the Germans and

Russians could safeguard peace for ever. The Americans, so Soviet propaganda runs, are the only aggressors now and in the future; but without the Germans as cannon-fodder they cannot lift a finger in Europe. Franz Dahlem, one of the Socialist Unity Party leaders, has directly replied to Western Germans who oppose remilitarisation but fear the Russians. The Soviet Union, he has declared, will never enter Western Germany "unless it were itself attacked." But, for Moscow's purpose, German neutrality is not enough. The Germany from which American troops have departed must be linked by a treaty of friendship and mutual economic aid with the Soviet Union, and must carry out the basic political programme of the Soviet Zone. Moscow cannot depart from the principle: "Who is not for us is against us."

Dahlem, in an appeal, addressed specifically to the middle classes, professional soldiers and future conscripts of Western Germany, dealt with the "many nationally-minded officers who hold the fanciful idea that, as remilitarisation could not be stopped in any case, there might in the event of war be another Tauroggen." There have, indeed, been many references of late to the example of Yorck von Wartenburg, who in 1812 led his army over to the Russians against Napoleon on the eve of battle. But, said Dahlem with irrefutable logic, "to think of a future Tauroggen means to indulge in a fateful passivity and to forget that by that time Western Germany would have become a graveyard."

The threats and promises which issue from the Soviet Zone contain a large element of bluff. It is, moreover, much more simple to separate the bluff from the serious threats in this section of the Russian sphere than elsewhere, for the Elbe forms no effective iron curtain. Germans can contrast the grandiose talk of the Communist leaders with the acute poverty of their Eastern German compatriots. Percentages of production can be set against eye-witness accounts of a life bare of the simplest necessities. It is, however, possible that, while the bluff about Eastern German prosperity may fail in the West, the efforts to intimidate the Western Germans may not be without result. As in Czechoslovakia, or Nazi Germany, the Communists benefit from the ordinary citizen's argument: "If I keep in with the Communists and the democracies win, nothing will happen to me. But the other way round, and I may be hung." For this reason, despite its bluff, the law against "warmongers" pronounced recently from Eastern Berlin may have some effect. This outrageous measure, which threatens ruin, imprisonment or death to anyone in Western as well as Eastern Germany who opposes the "peace campaign," or who even prepares to oppose it, has been proclaimed for the purpose of impressing the citizens of the Federal Republic with the might of Russia's German satellite. The series of executions and life sentences which is now starting in the Eastern Republic is intended to drum home the lesson of what would happen once the Communist writ were to run in the West.

It is small wonder that friends of Western Europe in Bonn are filled with forebodings about the effect of making even the smallest concession to Herr Grotewohl. In the background there lurks the fear that the Western Powers may one day offer up Germany as the price of agreement with Moscow in the rest of the world. At the same time, it is impossible for German ministers to refuse to meet other Germans, to discuss an objective on the face of it so patently desirable as unity and a peace treaty, when the main antagonists are prepared to sit down together at a round table.

Fresh Start in New Guinea

[FROM A CORRESPONDENT]

LAST week the conference at The Hague between the Dutch and Indonesians to settle the question (primarily one of prestige) of New Guinea's future finally broke down—although Mr Rum, the Indonesian Foreign Minister, had

flown all the way back to Jakarta for two days in the middle of the month to consult his government. This means that Western New Guinea remains, at least for the time being, entirely in Dutch hands. It means, too, that the Dutch are under a strong moral obligation to develop this large and primitive country and to assist its people.

The western half of New Guinea—the eastern half is Australian—has been under Dutch administration since 1897, as part of the Netherlands East Indies. Up till the end of 1948 very little was accomplished, principally because the Government did not see its way to making the necessary extensive survey of a country which looked so unpromising and unprofitable. Now circumstances have changed and, since December, 1949, when New Guinea became an autonomous territory within the Kingdom of the Netherlands, Holland has seriously undertaken to develop its 151,789 square miles of territory and to push on with assisting its 1,000,000 native inhabitants. The Government frankly admits having more or less neglected this part of its colonial empire up till now.

With this new purpose in view the budget for current expenses, which did not exceed 18 million Indonesian guilders during the years 1948 and 1949, was raised to some 48 million Netherlands guilders for 1950. Of this sum 25.8 million are intended for technical and economic purposes

and 4,000,000 for public health and social services. The autonomous government of New Guinea is able to meet part of these outgoings from its own revenue; a deficit of 23.3 million guilders will be made up by the Dutch Treasury. Apart from this, however, special expenditure is still necessary for reconstruction and renewal, as a result of damage done during the Second World War. The Netherlands Government has in principle decided upon the sum of 30 million guilders for the construction—within the next three years—of a modern seaport at Hollandia, the capital, and the building of houses and offices there. At present the little town only consists of a miserable collection of old Nissen huts. The Governor, Dr Van Waardenburg, lives in the only decent house—a wooden building erected for General MacArthur during the war.

Although the Dutch budgetary position is far from happy, it may reasonably be expected that the Netherlands will substantially increase its contribution to New Guinea for 1951, and that the budget for current expenses will be over 60 million guilders for the coming year. If the new development of the country is to be a success, large private investments will also be needed.

A very great difficulty, however, is the shortage of labour, administrative, technical and manual. To begin with, education will have to be extended. In 1949 there were only 531 schools, attended by 25,883 pupils, that is, 10 per cent of the registered population—although this compares with only 4 per cent in Java itself in 1938. The problem of manual labour is the most serious. In order to open up this country roads must be built; at present there are hardly any. Transport is largely by river, which is limited owing to the many rapids, and by air, which is too costly.

It has already been proven that no more than 10 to 20 per cent of the native population can be employed. As soon as more than this number is removed from the villages the local economy, based on the family, is apt to disintegrate; besides, although the Papuan is intelligent and quite skilful, he has not yet adapted himself to regular work. Nor are there any artisans. The Chinese inhabitants do not amount to more than 1 per cent of the population and are mostly concerned with trade; in most other parts of the eastern world there are always Chinese carpenters, cobblers, blacksmiths, launderers, and so on. Hence there are great possibilities for immigration, which indeed the Governor hopes to begin within the next five years. But here, too, there is a vicious circle owing to the housing problem.

Another difficulty in the building of roads is the nature of the soil and the vegetation; along the coast, where there are extensive swamps, the vegetation consists mainly of the sago-palm, which provides the indigenous staple food. The roots of these trees are so tough that even a bulldozer crumples up on them like a sardine tin. The great rainfall, too, necessitates most intensive upkeep. If there were a good road system, New Guinea could now be self-supporting in rice production.

The first attempt at agricultural and horticultural colonisation in 1928 entirely failed owing to a surprising lack of planning and organisation. Now there are regulations for immigration with the result that there are already several settlements which are a paying proposition, although some authorities are of opinion that better results might be obtained by a co-operative system. New Guinea provides many other possibilities. Already the Netherlands New Guinea Petroleum Company (a subsidiary of Shell) is in full production. Of minerals, several may be mentioned: coal, nickel, bauxite, probably some gold and a possibility of uranium. Prospecting is now being undertaken by regular expeditions organised by the Government, while a systematic exploration of the whole territory is shortly to be carried out in order to expand agriculture.

New Zealand Government's First Year

[FROM OUR NEW ZEALAND CORRESPONDENT]

A SERIES of critical but friendly editorial reviews has marked the completion of the first year of office of the National Party Government in New Zealand. The fact that the end of the first year has coincided approximately with the end of the first Parliamentary session under Mr S. G. Holland's leadership as Prime Minister has enabled the reviewers to fortify their comments with actual comparison of election promise and legislative performance.

A digest of these opinions shows that some observers believe that Mr Holland has been over-inclined to claim mandates for numerous unrelated legislative acts during the session, and that he may have attempted too much in the first of the three sessions of about five months each into which each New Zealand Parliament is customarily divided. One critic reminds him that "the bulk of the electors do not vote on the details of an election campaign; they concentrate rather on a few principles or have private grudges which they work off at the ballot box."

But in some matters for which a definite mandate could be claimed Mr Holland has been obliged to modify his pre-election intentions. When he made his successful bid for office in November, 1949, after Labour had been in power for 14 years, he based his financial and economic policy on forecasts of falling world prices. The war in Korea, the still rising cost of living, and high wool prices with their inflationary dangers have made Mr Holland and his party realise that their policy must be flexible—that it is being

shaped almost daily by new events, internal and external, which were not foreseen a year ago. Already the party has had to modify its views on subsidies, and, in spite of considerable progress, it has not yet been able to remove all import controls.

Some of the election policy has proved to be impetuously conceived apart from these considerations of changed world conditions. For instance, the Government has had to abandon its election promise to "reorganise the National Airways Corporation into a public corporation by offering a portion of the capital, not to exceed 49 per cent, for public subscription." The actual decision has been to sell the corporation "lock, stock and barrel." And the election promise to "make the pound go further" has frankly had to be abandoned.

The Government has been criticised in some quarters for its decision (effective from the end of 1950) to abolish the Legislative Council and to reintroduce capital punishment. Although legislation on the latter subject was passed by what was claimed to be a free vote of the House, there is a suspicion that, in effect, the vote was disciplined because the Labour Party opposed the re-innovation, but the National Party, with the exception of one member, voted for it.

However, by and large, the Government is being credited with a useful record of achievement in its first session. Many of the Bills have been of minor departmental importance. But on the whole the trend has been to clear the way for an order in which enterprise and self-reliance will be encouraged. As for foreign and Commonwealth services, Mr Holland can be confident that he fully represents the country's opinion on the questions likely to arise.

Indian Motives in Nepal

[FROM A CORRESPONDENT]

MAJOR constitutional reforms have just been announced for Nepal, after pressure from India and protracted negotiations in Delhi. These reforms include a constituent assembly to be elected by adult suffrage before the end of next year and a change in the composition of the government meanwhile. Pandit Nehru, the Indian Prime Minister, has also had his way in securing the return of King Tribhuvana to the Nepalese throne. This was not what the King originally wanted. He had long schemed and endeavoured to live outside Nepal, and there is little probability even now that of his own accord he desires to go back. He is at present living *incommunicado* in the New Delhi palace of the Nizam of Hyderabad.

It is not yet quite certain how these measures will affect an invading army which is still in control of Biratnagar and has the open use of a lateral railway in Bihar State, whereby it can bring up men and arms against the Nepalese, who have to march on foot. This army is under "General" Mahabir who, together with another exiled Rana, has bought jute interests in Calcutta at well above the market price. (Biratnagar possesses a hydro-electric plant and jute, cotton and sugar mills.) Owing to the autonomy of Indian states, except in a few matters—which, however, include communications—it is easy for India to turn a blind eye to events in Bihar; and it is notable that in the early stages of revolt Bihar state lorries were used and frontier officials appeared to co-operate with the invaders, at least until the Bihar Finance Minister appeared upon the scene.

India's apparent toleration of an invasion from its own soil and its keen desire to return an unwilling King to an unwilling country may possibly be attributable to Delhi's active concern in the affairs of all states on its frontiers. How far it will go in ensuring its own security is open to doubt, but there is certainly no possibility that a democratic system can suddenly be instituted in a land where communication between village and village scarcely exists. The observable happiness of the people of Nepal is almost certainly due to

their archaic, or arcadian, unconsciousness of any government at all. More logical motives for India could be found in a desire to create in Nepal conditions that would provide excuse before the world for yet another occupation of territory. Such motives need not be limited to the strategic, although there is obvious advantage to India in being established in the fortifiable foothills of the Himalayas, with a surrounding population of potentially excellent soldiers who might prove loyal to Tribhuvana upon finding such employment.

Another and possibly stronger set of motives are economic. There are, as is no secret, 6,000 square miles of forest in Nepal containing not only valuable timber for pharmaceutical and other uses, but also natural indigo and even natural jute. The latter is an obvious temptation to India instead of the jute areas lost to Pakistan. Quantities of rice and vegetables are also grown in Nepal which would assist in solving India's food problem. There are sulphurous springs, and oil has been seen on lakes and rivers, if not at Biratnagar, more certainly north and north-west of Katmandu. Continual gold-

washing from the Naraini river has provided a livelihood for many and may indicate the presence of workable gold deposits. Other suspected minerals may include cobalt, antimony, silver, manganese and, possibly, jewels. The Ranas have permitted no exploitation by outside capital and no real exploration has been undertaken. Nepal, in fact, has much, and may have more, that India wants. India's eventual aim may be to gain strategic control and to promote the economic development of Nepal, Sikkim and Bhutan. Strategic control over the latter two has already been effected.

Nepal has an especial pride in its sovereignty, in the undoubted achievements of the Rana regime within their limits and in the voluntary aid given over a long period to the sub-continent's defence. India could not, in many ways, have desired a better neighbour, and, apart from Tribhuvana's return, the Ranas themselves have recently expressed willingness to take practical steps towards constitutional reform. Some of Delhi's apparent high-handedness may ultimately be explained by the argument that the King descends from a family of Rajput, and therefore of Indian, princes, whose senior branch still rules in Udaipur.

Sharing-out Europe's Coal

[FROM A CORRESPONDENT]

UNTIL seven months ago, the main task of the coal committee was the allocation of West German coal exports, and of such other European coal as the producers had not already disposed of. By the spring of 1950 it seemed that the period of shortage was over. The producing countries were frightened of a return to prewar conditions of violent fluctuations of demand and price and would have preferred the continuation of some form of international control; on the whole, the consuming countries had little objection to this, provided that it was done openly. But the Americans

were hostile to any scheme by which producers might get together to maintain a high price and under strong American pressure, all countries, including Germany, returned to a free market.

With the apparent dawn of a coal surplus and the end of control, the consumers sat back and waited for prices to fall lower. They waited so effectively that the producers, seeing stocks piling up at the mines, restricted production, and by the end of the summer, some 3,000,000 tons had been lost. Korea brought about a transformation with intensive stockpiling at a time when the stocks which had been deliberately run down would have to be replenished in any case.

The November meeting of the coal trade subcommittee (the body which has succeeded the old allocations subcommittee and allocations working party) in Geneva showed European import requirements of nearly 19.5 million tons of coal and coke for the first quarter of 1951, and export availabilities of about 14 million tons, while these were no rules as to how obvious inequities in distribution should be corrected. The problem was then discussed by the OEEC in Paris, whence, after some stormy and unhelpful meetings, it returned to Geneva just a week before Christmas—by which time the protagonists were even stiffer and crosser than they had been before. The unseasonable atmosphere was not improved by the receipt of a telephone message that the British Cabinet had decided to curtail exports for the first quarter of 1951 by 1,000,000 tons. Despite the fact of British imports of American coal and British fuel rationing, the cry of perfidious Albion went up.

Some countries with strong bargaining powers, such as Sweden, already had contracts and did not appreciate attempts to make them surrender coal to the weak and possibly foolish, such as the Greeks, the Yugoslavs and the Italians, who had none. However, some sort of order was eventually produced, mainly as a result of the personal efforts of the British chairman, Mr John Brook, who used bludgeon methods with great success and more or less refused to let the subcommittee go until some kind of agreed solution had been found. At least for the next three months the Luxembourg railways will continue to run, industry will be possible in Yugoslavia and Italy and the Greeks will not freeze to death.

Of the 13.5 million tons of coal and coke which will make up the European trade for the first three months of 1951, Germany is supplying about 50 per cent, Poland about 20 per cent, France about 11 per cent, Britain about 7.5 per cent. Despite German mutterings about the impossibility of increasing production under the Ruhr Authority, production is rising, but the bulk of the 3,600,000 tons, which are now required to bridge the gap until April, must come from the United States, although shipping difficulties make it obvious that this quantity cannot be moved.

The ECA is now negotiating with the Maritime Commission of the USA for the chartering of American Government "mothballed" merchant tonnage. It is estimated that something like 135 ships would be needed, and about 70 are in sight. With a rough cost of \$25,000 per ship for "demothballing," charterers must show that they have orders for at least three round trips to Europe. It is also probable that the jump in shipping rates from about \$4.50 a ton to \$9 will bring in other miscellaneous tramp shipping, but there does not seem to be the smallest chance that all the 3,600,000 tons can be moved.

Meanwhile, a tug of war is going on between Geneva and Paris as to which shall deal with coal allocations in the future. OEEC has only its commodity committee to deal with the matter and is hamstrung by its rule of unanimity and the fact that the commodity committee's recommendations are subject to review. Geneva has the machinery which worked smoothly in the past, and there is the additional advantage that Polish coal will continue within the scheme if it is run from Geneva.

An Annuity

will offset reductions in income

For a man aged 65 (or a woman aged 70) the gross income for life from an annuity is over 10% of the purchase money.

(For residents in some countries payments are exempt from U.K. tax.)

Over 10,000 work in this

"IDEAS DEPARTMENT"

The "Ideas Department" of the Hoover Organisation numbers over 10,000 men and women — for the entire staff is eager to improve efficiency, and ideas and suggestions are always welcomed from any source, down to the youngest apprentice.

Suggestion boxes are placed in each section of each factory, and every week large numbers of suggestions are received. Contributions also come, of course, from members of the sales organisation and others whose work is away from the factory.

All suggestions which are put into effect — a very considerable number — win awards for those who submit them. Sugges-

tions are of many kinds. Some are of a technical nature — for improving Hoover products or methods of manufacture; some deal with organisation and administration; some are concerned with staff activities, and so on.

The suggestions are not only valuable in themselves but are a further indication of the friendly and intelligent co-operation that has always existed between Hoover staff and management.

The Sudanese and Their Future

DURING the current Anglo-Egyptian conversations, the question of the defence of Egypt has almost exclusively filled the headlines. The second item on the agenda—the future of the Sudanese—has, of course, stirred greater attention in Khartoum. The Sudan is often cited, aptly enough, as a happy land that is making its way by reasonable and efficient stages towards a future of its choice. But the visitor during December was sharply reminded that even a land so well insulated by deserts is not immune from mid-20th century fevers. He witnessed its Legislative Assembly at sixes and sevens over the right course to independence. And in Christmas week, he was compelled by strikes to make his own hotel bed and to fly when he would have liked to travel by train. Manifestations of uncertainty and unsettlement prevail both on the political and on the labour front.

The political scene presents much the brighter of the two pictures. The British are practised at teaching the pattern of responsible government to under-developed peoples, but less well versed in introducing them to trade union rules. The Sudan Legislative Assembly set up in 1948 has on the whole worked well. It consists of 75 members, only ten of whom are nominated, and only five of whom are British. Its debates suggest that a quite considerable number of the elected members base their judgment on common sense, not prejudice—a refreshing change from the practice in most Middle Eastern parliaments. Unfortunately the members themselves, not to mention the local public that crowds the gallery, know too little of kindred countries to realise the extent of this blessing. They are unaware of the pitfalls that they ought to strive to avoid. The sobriety of their proceedings so far is due largely to the fact that one large group—the National Front that favours some sort of link or union with Egypt—boycotted the 1948 elections and so holds no seat in the Assembly. It is also helped by the example unobtrusively set by one or two sage and tactful British debaters.

Nevertheless the Assembly is as yet ill-equipped to stand up to the buffets of real controversy. In November, as a result, primarily, of King Farouk's abrupt demand for the end of the Anglo-Egyptian condominium, the Umma party (which is the anti-Egyptian body that provides the bulk of the Assembly members) laid its plans for lodging a claim to complete self-government by 1952. The principal sponsors of the move were also inspired by the news from Lake Success of imminent independence for Libya and self-government for Eritrea. But the proposition they put forward in the Assembly on December 13th was too vaguely

conceived to command universal approbation even among party members. Did they mean complete independence, or self-government subject to retention of the Anglo-Egyptian condominium? Even the urban representatives from the Northern Sudan seemed unsure. The rural and southern members—the latter of whom are not Arab, and are often not Moslem either—declared that the country would not be ready for such a step for years, and that they could not accept a regime in which the educated northerner would govern tribal lands of which he knew nothing. After hot debate, reason prevailed and the problem was deferred until members could consult their constituencies. The issue is postponed; but the incident is proof that the country is divided not only as between the Umma and the National Front—which is, broadly speaking, a cleavage between the followings of its two great religious leaders—but upon the issue of affiliation with Egypt. It is also divided as between the urban protagonists of independence now, and the rural advocates of independence only in good time.

Flimsy Pretexts for Strikes

The current labour troubles are serious because they are more difficult to diagnose and to prescribe for. During 1950, strikes have been a national pastime. Their most distressing manifestation has been in schools, where the Egyptian habit of turning students into political rowdies has made some alarming strides. In November, the country's 45 trade unions, formerly the "Sudan Workers' Congress," set themselves up in Khartoum as the "Sudan Trade Union Federation." But this newly named body has unfortunately begun its career with attempts to further causes that have nothing to do with industrial disputes. For instance, it gave support to a mutiny which started in Kordofan province over the quality of secondary school dinners; it also threatened an attempt to obstruct the amendment by the Assembly of the Defence of the Sudan Ordinance which provides the Government with exceptional powers in the event of emergency. Only one recent strike—by railway firemen—has had to do with conditions of work.

The flimsy pretexts upon which the workers are downing tools has caused much questioning as to whence the impetus comes. Is it from Russia? This is unlikely. Or from Egypt?—which affords no good example of the way to behave. Pro-Egyptian papers openly support the strikers, pro-Egyptian lawyers are ready to defend them in court; some Egyptian largesse is certainly entering their pockets. But part of the impetus undoubtedly comes from the heady effect of receiving new rights without understanding their purpose. The prospect for 1951 is not all plain sailing. For disagreements inside the Sudan tend to exacerbate the differences that emerge during Anglo-Egyptian conversations. They give Egyptians cause to complain that Britain is engineering independence movements, and Britons cause to suspect Egyptian stimulus to grumblers.

A machine to cut non-productive time

It tackles a hundred-and-one jobs of handling all along the production-distribution line. It's a hoist, a truck, a loco and a "conveyor belt". It is mobile, powerful, dexterous, versatile. It is a whole handling system in one.

It will carry and tow like a loco, at 12 m.p.h., indoors and out. It will hoist like a hydraulic lift, as much as 6000 pounds at a time, through 12 ft. in 20 seconds. It will turn almost on

its own axis, pick up and lift down like a mechanical arm. It will climb a ramp with a two-ton load. It will lift or tow, or stack and stow, tons in a few minutes, like a whole gang of stevedores.

Its name is the Coventry Climax fork lift truck—expert store-keeper, space-saver, gang-of-all-work. And there are models, Diesel or petrol, of the size and capacity to fit your problem and your layout.

THE BUSINESS WORLD

Sterling Area and Defence

THE agenda for the current meeting of Commonwealth Prime Ministers in London is reported to be predominantly political rather than economic. It will be surprising, however, if the emerging problem of maintaining the cohesion of the sterling area—a problem that is likely to assume considerable importance during 1951—does not cast some shadow across the conference table. For the rearmament economics of 1951 are likely to heighten difficulties that were already causing concern in Britain even before the invasion of Korea.

The essence of the emerging threat to sterling area cohesion lies in the extraordinary improvement of the external payments accounts of nearly all the Dominions in the last eighteen months. Up to the time of sterling's devaluation in September, 1949, the independent overseas members of the Commonwealth, taken as a group, benefited very greatly from the operation of the two cardinal principles of the sterling area club—the principle of pooled hard currency reserves and the principle of free capital movements. Since devaluation, however, these two principles have imposed sacrifices upon them and benefits upon Britain. According to estimates in the current issue of *The Banker*, the overseas sterling area had a net deficit of £752 million in the three years between January, 1947, and December, 1949; this was financed as to £632 million by an outflow of capital from Britain and as to £120 million by net drawings on sterling balances. The accompanying table shows how sharply the trend had altered by the first half of this year.

Moreover, this table underestimates the extent of the turn-round in the fortunes of the independent members of the area. In the three years to the end of 1949, the Colonial Empire was a net lender on sterling balances to the extent of £32 million and a net contributor to the central dollar pool to the extent of \$250 million; it increased this creditor status in the first half of 1950, when its sterling balances ran up by £46 million and its dollar surplus amounted to \$151 million. This improvement, though impressive, was not of the same startling order of magnitude as that recorded by the independent members of the sterling area. In the three years to December, 1949, these independent members had shown a dollar deficit of \$2,088 million, and had run down their sterling balances by £159 million despite the outflow of sterling capital towards them; in the first half of 1950 they ran a dollar surplus of \$28 million and increased their sterling balances by £154 million. It would not be surprising if this sudden change of role from borrower to creditor brought with it a change of the Dominions' attitude to the advantages of sterling area membership in its present form.

The problem is accentuated by the fact that the current volume of sterling area aid to Britain, and the expected volume of that aid in 1951, is likely to be much greater than the volume shown for the first half of 1950 in the table. The first and most obvious reason

for this is, of course, to be found in the trend of commodity prices. In 1949 five commodities alone—wool, jute, rubber, tin and cocoa—accounted for over 55 per cent of the overseas sterling area's exports to dollar countries; they must have accounted for an even greater proportion of the exports to the dollar area in both the first and second halves of 1950, for American purchases of all of them, except tin, have increased. The weighted average price of these five commodities was about 65 per cent higher in the second half of 1950 than in the first half. If it can be assumed that the volume of trade between the overseas sterling area and dollar countries remained unaltered in the second half of 1950 and that prices of both imports and exports rose by 65 per cent, then the overseas sterling area's surplus with the dollar area since June would have increased from £65 million in the first half-year to fully £105 million in the second. The likely increase, however, must have been larger than this; first, because prices of primary products have risen more sharply than prices of manufactured goods (that is, the terms of trade have moved in favour of the overseas sterling area) and, secondly, because a bigger volume of primary products has been exported. The actual dollar surplus of the overseas sterling area in the second half of 1950 may well have been nearer £120 million.

The overseas sterling area's pattern of trade with continental Europe is broadly similar to that with the dollar area. Europe's purchases of sterling area tin have perhaps risen more steeply in 1950 than those of the United States. Commonwealth sales of wool and jute to European countries, however, were smaller in the second half of the year than in the first half and even smaller than in the second half of 1949. In wool, the sharp rise in prices will have more than offset the decline in volume, but in jute the total value of sales may have been no more than in the first six months of 1950. In contrast, exports of rubber and tin to Europe have been much larger in the second half than in the first half of the year; indeed, purchases of rubber from Malaya have more than doubled. If trade experience with Latin America and other areas has been similar to that with Europe, the overseas sterling area's balance with the "rest of the world" (as defined in the table) is likely to have been of the order of £150 million in the second half of 1950, compared with £95 million in the first half. As some offset to this, however, the overseas sterling area's deficit with Britain probably increased from £80 million to over £100 million. If these estimates are of the right order of magnitude, net lending to Britain by the overseas sterling area may have risen from £145 million in the first half of 1950 to over £230 million in the second half.

Comparable estimates for 1951 can clearly be no more than guesses. Much will depend upon whether inter-

national allocation schemes are introduced promptly for sterling area products, upon the nature of such schemes, and also upon how effectively the civilian use of these goods is restricted in Britain, the United States and Western Europe in the coming months. This doubt overlays other doubts about the future of prices and of production. Wool prices might conceivably surpass even the new records established last month, whereas rubber prices—at least in the second half of 1951—are likely to be much lower than in the second half of 1950. But for the purpose of this article perhaps the best assumption is that commodity prices in general will not rise significantly above their current levels during the coming year. On that basis, the overseas sterling area's trading balance would depend mainly upon the volume of its exports. The volume of wool exports will decline somewhat now that the stocks accumulated during the war years have been liquidated. Rubber production in the sterling area may expand—but not very sharply, for the major increase in world supplies will come from Indonesia—while tin production is also unlikely to show any marked change. On the other hand, larger jute and cocoa crops can be expected. These conjectures suggest that, unless the value of imports changes markedly, the balance of trade for the overseas sterling area might continue during 1951 at approximately the same rate as in the second half of 1950.

The course of imports is particularly hard to foresee. On the one hand, although prices of primary products may not continue to soar as they have done during the past six months, prices of manufactures are likely to begin to reflect the higher cost of raw materials. In other words the terms of trade may tend to move against the overseas sterling area. On the other hand, there may be some enforced reduction in the volume of sterling area imports. There may be a complete drying up at the source of supply of a large proportion of the goods

that the overseas sterling area normally buys from America and also of the heavy industrial equipment and other engineering products that it normally buys from Britain. The prospects for Britain's own balance with the overseas sterling area in 1951 depend partly on the extent to which Britain can fill the gap left by a diminution of the volume of United States exports and partly on the extent to which the overseas sterling area is willing to switch from purchases of British capital equipment to purchases of British consumer goods. The latter factor depends, in turn, very largely upon how far these Commonwealth countries decide to seize the present opportunity to expand their own (and in ordinary

times uneconomic) secondary industries—and also upon how far such countries as Japan, Germany and Belgium implant themselves in Commonwealth markets.

Another problem that deserves to be considered at the Commonwealth conference arises from the European Payments Union. Even if the Commonwealth countries do allow their sterling balances to run up, and thus, in effect, lend to Britain in 1951, this lending will do the British people little immediate good. Much of this Commonwealth lending will probably be passed on by Britain to Europe through EPU credits (which in turn will finance European purchases from the Commonwealth); most of the rest of it will merely be, in effect, the counterpart of the greater scale of the defence effort in the mother country than in the Commonwealth. It is also difficult to see exactly how the Colombo Plan will fit into the pattern now emerging. Under the Colombo Plan, Britain has a theoretical maximum lending obligation of between £40 and £50 million a year to India, Pakistan and Ceylon. It may be that lending on this scale will not be necessary in the new circumstances created by defence programmes (causing some of the capital equipment necessary for the development programme to be unobtainable). But it is at any rate possible that Britain will be called upon to lend this £50 million a year (and to send a large proportion of its available export potential of heavy machinery) to South Asia, while Dominions such as Australia and New Zealand are likely to be called upon to lend still larger sums to Britain on their sterling balances.

Even if these Dominions do not grow restive at this result, the piling up of these outside sterling balances will bring with it a heavy contingent liability to Britain. It is as well, even among present pressing troubles, to cast a wary glance at the dangers of the distant future. If a world recession returned, an intolerable burden could be placed on Britain if policies of full employment and immigration in Australia and the other Dominions were financed by drafts on sterling balances (in which the hot money component might be entrapped by a veto on outward capital movements). The higher the balances of Australia and other Dominions mount, the greater this contingent danger will be.

★
The threats to sterling area cohesion now emerging should not be exaggerated. It is well to remember that the sterling area is not only a worldwide financial bloc; it is also a family club—and a club for whose members Britain is by far the biggest market. For this reason, emerging difficulties can often be smoothed over before they reach the point of danger—provided they are recognised in time. But the moment certainly seems to have come when Britain should put two points very plainly before the independent members of the Commonwealth whose representatives are now gathered in London. The first point is that the sterling area mechanism, through which Britain accorded substantial aid to the Commonwealth in 1947-49 (and through which Britain would have to accord substantial aid again if a recession hit commodity prices), can only function on the principle that reverse aid flows back to Britain when commodity prices are booming. The second point is that the peculiar conjuncture of events in 1951 is likely to make sterling area lending to Britain this year much larger than would be normal in an ordinary boom time year—and it is likely that the counterpart of that aid will be a bigger defence contribution by Britain in the interests of the Dominions

as of all free nations. For that reason, if the dollars in the central pool mount more slowly than do Britain's debts to the sterling area (as may very well happen), would it be wholly fair to allow Britain's future repayment obligations to mount *pari passu* with the sterling area's current trade surplus? The answer depends upon

Fear of Figures

BY function, tradition and professional background the accountant in an industrial concern is often somewhat apart from its productive activities. His primary duty is to record the firm's financial transactions, to assist the board in financial policy and to present information to the shareholders who own the company. His power to advise upon financial affairs or to control them may vary, but his duty of accurate historical reporting is unvarying, and his activities throughout the financial year, in form as well as in conduct, are aligned towards its discharge. This tends to separate him from managerial staff whose main concern is with current and future business and who are responsible directly to the chief executive or board of directors. This division of responsibilities is not precise, but it partly explains the distant regard with which accountants and managers (particularly engineers and those concerned with physical production) sometimes eye one another across the balance sheet. Counting-house and factory have developed as watertight compartments in British industry and each tends to attract different psychological types with very different professional training. Though the accounting department's function is in practice usually divided between finance and costing (which ought to provide financial information for the control of current operations), foremen and even works managers are apt to lump both types together as bloodhounds and spies; latent conflict may exist up to the very boardroom between men whose boast it is to see things big and men whose career is based upon grinding figures small.

Managers usually express more outspokenly their vigorous resentment of statistics. They cost money; they may delay production; and often they seem to serve no useful purpose (though some businessmen suspect darkly that figures supplied to Government departments might later or sooner serve a sinister one). These objections have substance—though secretiveness may sometimes be the mark of a manager who is not confident of his own efficiency. But statisticians and accountants sometimes wonder if they do not mask another unexpressed motive—the fear of figures.

*

One of the more paradoxical contrasts between British industry and American is the virtual absence of this suspicion across the Atlantic. American industry makes greater use of accounting information than does British industry; its accountants are closer to "top management" and work more closely with plant managers; and American industrialists have far less objection to providing information for all and sundry. It has always seemed a little odd to see visiting American industrialists who, having commiserated with British businessmen "trussed with red tape and overburdened with formfilling" then fly off to their own companies which as a matter of

whether any approach to a sharing of the Commonwealth's defence effort is worked out at the present London conference. If not, more may be heard of the argument that some of the sterling area's aid to Britain in the coming year should be by way of grant rather than of loan.

course provide the American Government, and perhaps a couple of private research groups who care to ask, with a plethora of statistical information that no British civil servant would ever muster the audacity to seek.

A productivity team of British accounts and managers who early last summer visited industrial firms in the United States have brought back an informative and enthusiastic account* of this contrasting approach to accounting in American industry. They find that to achieve and maintain its high efficiency American management makes far-reaching use of the techniques of accounting and costing, for the "mainspring of its action" is the belief that unit costs must ever be reduced. Managers look continually forward and demand that accountants should do the same, holding that the definition of an accountant as "one who classifies and organises accounting data in an orderly fashion" applies only to book-keepers. Managers demand of their accountants (and in particular of the chief accountant or "controller") forecasts and budgets for current and future activity, together with explanations of variance from those forecasts. An "industrial accountant" has the single aim of serving management, and he designs his systems to that end. Record keeping then becomes a check on performance and not merely a means of producing an annual report.

*

This empirical approach to the needs of each firm explains why costing systems are not standardised. The productivity team found that forecasts and budgets were in general use as a guide to efficiency, with quick compilation of periodical returns to monitor performance. Yearly financial accounts, in the form required by the Securities Exchange Commission, provide far more copious information than is customary in Britain, while boards are presented at their monthly meetings with elaborate tabulations of figures up to twenty pages in length, often without any written report. American industry's attitude towards what some corners of British industry denounce as "formfilling" is typified by one instance: twice when the Department of Commerce's appropriations were reduced and it had to curtail the collection of figures for business statistical series, industry through its trade associations paid the Government to continue the service. Five Government bureaux collect business data, as do some 400 of the 1,400 American trade associations and several private and semi-public bodies—yet "industry is prepared to support in every way the compilation of figures" (and is also consulted about their form and collection far more than is British business). In its forward planning it makes constant use of the

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
Manchester Branch: 52 Mosley Street, Manchester 2.
Liverpool Branch: 27 Derby House, Liverpool 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

Not all the gold is in Kalgoorlie

The many opportunities open to business men in Australia and New Zealand are far richer than the famous "Golden Mile" of Kalgoorlie, Western Australia gold mining centre.

The Bank of Australasia offers up-to-date information on prevailing market conditions to business men interested in trade in Australia or New Zealand. Write for our booklet "The Answers To Your Questions" which may be obtained from the Bank on request. It contains not only information concerning the commercial world but also more personal details about life in these two Dominions.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter 1835)

MANAGER: G. C. COWAN

Head Office: 4 Threadneedle Street, London, E.C.2

Strand Branch: 263 Strand, London, W.C.2
(opposite Australia House)

Producers—and buyers, too!

Queensland, New South Wales and Victoria, rank high among the world's producers of beef and dairy products. But the people of Australia are consumers as well as producers, and the Australian market is therefore full of opportunity. British business houses, seeking information for planning, are invited to make use of the services of the Commonwealth Bank of Australia. For the Commonwealth Bank *knows* Australia. Its branches are widespread; its activities touch upon every aspect of life in Australia and New Guinea. Its sources of information are unrivalled. Please address your enquiries to the Manager.

COMMONWEALTH BANK OF AUSTRALIA

London Office: 8 Old Jewry, E.C.2. Also at Australia House, Strand, London, W.C.2

EVERY CLASS OF BANKING BUSINESS
THROUGHOUT THE WORLD

indices provided, and whenever possible it makes comparisons with other firms in the industry, either through trade associations or by using statistics produced for some twenty industries by the American Government.

Though the team displays here and there a tinge of mild scepticism (might some of the tabulations produced for directors' meetings be included merely to keep the punched-card machines busy?) they were tremendously impressed by the use made by American firms of accounting information, and they want more used here. Their recommendations include the fullest use of budgets and forecasting, greater detail in financial reports, the extension of institutes for business education, closer collaboration between the Government and industry concerning statistics and more interchange of information between companies. Above all, they want better understanding between accountants and managers in British industry, so that each would learn the language and requirements of the other.

So far, so efficient. The management accounting report has aroused some open controversy, but its authors, who have been stumping the country arguing its case, sensibly welcome this. In these arguments of detail, the team have certainly had the better of it. They reply to the occasional mistrust of cost accounting—as something vaguely associated with considerations outside simple profit and loss in a free market—by citing the high value placed upon it in the world's freest economy; they can also point to their own strongly expressed dislike of restrictive practices (a recommendation on this appears in the report, but for technical reasons two civil servant members of the team do not support it). They have also asked the obvious question whether such tailor-made information, produced so fast, needs more "non-productive" paperwork. They think not. American office organisation, they find, displays the same creative destruction of craft skills as American mass production: the "office force" generally contains a higher proportion than in Britain of very highly trained staff, directing a body of semi-skilled workers who can shift from one job to another at a moment's notice. This flexibility, combined with a ruthless abolition of unnecessary minor written reports (much is done verbally), internal office auditing, and lavish provision of minor and major accounting machinery, gets more work done with fewer workers. Such fragmentary comparisons as have been made support the team's impression that the administrative tail in U.S.A. tends to be smaller than in Britain; estimates are not directly comparable, but at any rate it seems that American industry is using fewer "non-productive" staff per operative than before the war, while British industry uses more.

*

It may be that certain criticisms have not been entirely disposed of. The collection of cost data for firms in an industry by central bodies could no doubt be used for valuable inter-firm comparisons; but it cannot be forgotten that in practice "uniform costing" in Britain, in the United States and most of all in Weimar and Nazi Germany, has much more often been used as an instrument of price-fixing and cartel operations. Again, the team can justifiably explain that the provision of the better and quicker accounting information such as they recommend has not in America led to extra clerical employment; but they might also agree that in the likely absence of such a revolution in office technique as they

describe, it probably would need more clerical labour here. It is not too hard a judgment on the organisation of British clerical offices (which in productive efficiency and tea consumption can sometimes compare with a parish sewing-bee) to conclude that to rationalise their operations would be a lengthy process needing a considerable adjustment in outlook from clerks, accountants and managers. Improved information must be worth more than getting it would cost.

It is possible to regard the team's report as a persuasive contribution to a general discussion without regarding their central argument as wholly proven. This rests upon the assumption that managerial effectiveness is the greatest single factor in American industrial supremacy; this is plausible but even if it is stretched to include other hypotheses about investment per worker or horsepower per worker, its only virtue as a generalisation is to put the onus on managers, not on romantic notions of "ideological climates." The team associates this effectiveness with the intensive use of comprehensive financial, cost, and statistical data by American management. In this judgment they are giving their view on the use of such techniques in American industry in general; their argument thus depends partly upon establishing how intensively American industry as a whole uses that technique. With great assiduity the team managed to visit sixty-six firms; the report contains such phrases as "the majority of firms" and "most American companies," that might encourage the assumption that these sixty-six might form a representative cross-section of American industrial practice. This seems doubtful. There is some reason to question whether the special techniques of cost accounting, at any rate, are quite as widely used in American industry as might be gathered from reading the report. In 1946, the Office of Price Administration, reporting on experience from 1942 to 1945, commented:

It is difficult to judge exactly the percentage of all companies in all industries that can supply cost data on a product basis. The only completely accurate statement is that many of them cannot. Probably 85 per cent of all industrial companies do not allocate cost on a product basis and 15 per cent are readily able to supply such information.

Effective cost accounting does not necessarily include product costing, and in 1950 it may be, to quote the report, "safe to say that companies using some form of standard as a guide to efficiency predominate in number, even though only a little more than half use systems of standard cost accounting"; but more and better evidence seems desirable. It is fair to rejoin that the sample may be representative of the "best" American firms, which are responsible for a high proportion of the nation's production, but higher productivity is usually measured for American industry as a whole, not merely for the few firms considered "best" by any criterion; and if particular costing practices are used intensively by only a minority, the importance of their contribution to higher total productivity obviously becomes more a matter of question. There is certainly a great deal in the report which British managers and accountants might profitably consider and adopt, even if the full case argued in it may not be finally established. Fear of figures is obviously a weakness that British managers should guard against; but in buying better figures or any other tool of production, managers are entitled to demand from accountants only such as are unquestionably useful and to regard the cost.

Business Notes

opping the Coal Gap

It is difficult to put much confidence in the Government's hope that by appealing to the miners over the heads of their employers they can raise an extra 3,000,000 tons of coal during the next four dangerous months. Exclusion of the National Coal Board from this week's meeting between Mr Attlee, certain of his colleagues, and the National Union of Mineworkers raises certain questions. It doubtless assisted the Government to give the union leaders such assurances as may be veiled in the official communique by expressed confidence that negotiations between the NUM and the NCB "will be considered in a sympathetic spirit"; it would have been embarrassing, no doubt, to Coal Board representatives to have to listen in person to statements that appear to concede in advance the case for higher wages. It is reasonable enough for the Government to feel that the immediate shortage can now be resolved only by men at present in the mines producing more; but the absence of the Minister of Labour as well as the NCB raises some doubt whether practical measures concerning manpower are being given sufficient priority. Stop-gap measures, though tardy, are obviously vital, and may enable the country to limp gingerly through the next few months; but nothing in the communique suggested any really resourceful attack on the continuing problem—that the British fuel and power industries as now constituted cannot stand a cold winter.

This week's arrivals of American coal, and the diversion of cargoes now on the high seas to Merseyside, may relieve the salient danger of the immediate situation—that coal stocks at power stations in the North-West might dwindle to nothing. A fortnight ago, when the electricity industry as a whole had 4½ weeks' supplies in stock, this area's stations had only 2½ weeks' stocks; at the end of last week the stocks at all power stations declined to 3.8 weeks' average winter consumption. Electricity can be moved through the grid more easily than coal along the railways, and other stations have in off-peak hours recently been assisting the North-West to economise in coal use; but the situation remains critical. Industries in this area are complaining that present coal supplies have been cut by half—the NCB is operating an unofficial scheme of priorities in allotting its available coal—and some have a very low margin between them and having to close down.

Bad weather conditions early this week fortunately did not cause any special loss of output through shortage of wagons to receive coal at pitheads; the mines had plenty of wagons in hand after the Christmas week. By the end of January the NCB hopes to bring into British ports some 200-250,000 tons of imported coal; and if the miners should raise the extra 250,000 tons a week which Mr Attlee has asked for in the next two months, bad weather may mean no more than inconvenience to industry through insufficient coal stocks and load-shedding of electric power.

* * *

Planning and Output

Last year's coal failure, which brought about the present emergency, can clearly be seen from the year's provisional output figures, and it is possible to guess how blame for it should be divided: but the issue is one of larger policy. The NCB since its inception has constantly based its plans upon long-term assumptions which were apparently reasonable, but has failed to supplement these with the short-term action required. Its readiness to accept a wastage of mining manpower which would reduce the industry's labour force to 700,000 by the end of last year, for example, seemed sensible enough (as did its recent 15-year glance ahead to a

not much smaller labour force); but thereafter the Board appeared to accept complacently wastage at a much more serious rate in the hope that when the industry's manpower reached exactly the level it had decreed, some providential force would then arrest the decline. It still does not seem to have been practically accepted in the industry that to bring about a smaller labour force at some distant date requires active recruitment of manpower in the meantime.

Nor have the Board's hopes from mechanisation, which seemed to assume some "natural" growth in output per manshift, given present investment, by the 3½ per cent achieved in 1949 been realised; in fact, individual output has been rising, but by much less than was hoped, so that last year's average turns out to be little above the level reached by the end of 1949. The rise in coal consumption, which the Ministry of Fuel and Power is perhaps too ready to quote as the most important cause of this crisis, is not much greater than had been assumed, and even granted greater fuel economy and slightly reduced demand from certain industries encountering other material shortages, it cannot be expected to cease; the onus rests upon coal production, and in the uncertainty of further substantial rises in productivity, upon raising coal manpower. Even if the NCB makes coal dearer by conceding higher wages for miners, these will probably mean only slightly less absenteeism, a little more Saturday morning work, and next winter another shortage and another wage demand. Mr Horner's insistence at this week's meeting that the key problem is manpower is correct; but his assumption that some higher level of wages will do the trick of persuading miners to stay in the industry, attracting newcomers or bringing back men who have drifted to the light engineering factories is hard to accept. The NCB's absence from this week's Whitehall meeting may at least give the Board the hint that even this Government's confidence in a management which remains inactive in the complex task of getting and holding its workers (a task that other managements in Britain have had to meet in recent years) may not be much more long-suffering than the nation's.

* * *

Dividend Thaw

Hearts beat faster this week among ordinary shareholders. One increased dividend does not make a thaw, but two of the importance of Shell and Associated Portland Cement have shown that the temperature is rising. The Shell interim of 5 per cent tax free doubles the interim of a year ago, and it sets a pretty problem for yield calculations. Does the 5 per cent tax free interim betoken a final at the same rate (as last year) or more? Should one take the presumably safe line of assuming a 10 per cent total tax free distribution or think in more appetising terms of more—perhaps 12½ per cent? Royal Dutch has declared its first interim since 1938, at 4 per cent; in recent years a single dividend of 9 per cent has been paid. Here, too, stockholders have been encouraged to look forward to the final dividend.

The Associated Portland Cement case is free of these intriguing questions and satisfactory in itself; the directors are raising the total distribution from 22½ per cent to 27½ per cent for 1950. They have chosen not to wait, as formerly, until the end of the second quarter of year (that is, after the worst is known about the Budget) before reaching their decision; this week's announcement is of a "second interim" with no final dividend to follow. An announcement in identical terms has been made by the directors of British Portland Cement.

These announcements have spread their stimulating effect beyond the shares concerned to the ordinary share market

as a whole. On Wednesday the *Financial Times* index of ordinary shares rose nearly a point to 116.3; this is a point and a half higher than on June 23rd on the eve of the Korean invasion, and about the same amount lower than early in November when the campaign seemed to be going well. Thus does inflation and an easier dividend policy exert an effect. It is, indeed, a small one, but it has encouraged the search for equities showing a large margin of earnings over their recent dividends. One can easily discover good shares with a four or six fold cover and yields in the 4-5 per cent range. Coats, Courtaulds, Leyland, Austin, General Electric, Hawker Siddeley, P and O—these are only a few of a large group of shares within these definitions. But are they bargains? There are two main reasons for caution. First, restraint will not be thrown to the wind; the problem of capital replacement has become more, not less, acute in the past year. Secondly, even if the Chancellor does nothing about profits in the Budget—and that is an “if” that deserves the printers’ largest type—the cost of extra dividends in profits tax (and hence at the expense of reserves) is already high. It would be surprising if it does not become higher. Perhaps the more prudent course for investors is to confine their studies to companies whose dividends are expected during the next three months. That still leaves a fair range of choice.

Nine Months’ Revenue

The Exchequer returns covering the first three-quarters of the current fiscal year suggest, at first glance, that the task that will confront the Chancellor next April might be somewhat less formidable than has been generally supposed. This, perhaps, is too facile a conclusion; it is based simply on the fact that, whereas the Chancellor expected a deterioration of nearly £70 million in his overall balance for the full year, there has so far been an improvement of some £160 million. As the accompanying table shows, this improvement has been due mainly to a rather unexpected reduction in expenditure. Total ordinary revenue, which

was expected to decline by £26 million in the full year, has fallen by nearly £15 million in the first nine months. Nearly all the major tax revenues have been well maintained, and there seems a good prospect that, in the aggregate, they will surpass estimate. Income tax, the yield from which was expected to drop by £50 million in consequence of a reduction in rates applicable to the first slices of income, has so far fallen by only £14 million. Profits tax and E.P.T., expected to fall by £27 million, have so far dropped by £22 million. Surtax has gained rather more than one-third of the additional £6,000,000 envisaged, but death duties have dropped by

nearly £7,000,000, in contrast with an expected gain of £5,000,000 for the year. Customs receipts, however, have already contributed the additional £57 million envisaged last April, having presumably been fortified by the ending of petrol rationing. Among special sources of revenue, it is noteworthy that receipts from trading services, which were expected to contribute an additional £37½ million, have so far fallen fractionally; this may mean that a substantial special credit has still to be brought in under this head.

Above-line expenditure, which was expected to rise by £79 million over the year as a whole, has so far declined by £104 million—despite the fact that supplementary estimates for £13 million were presented earlier in the year. This is a rather surprising movement, even though it is known that the rising outlays for defence have so far had very little effect on the published accounts. Large supplementary estimates for defence, perhaps totalling up to £100 million, are due to be presented in the course of the next few weeks; and cash disbursements for defence will certainly rise steadily during the remainder of the financial year. Such big cross-factors are now at work that it would be rash even to hazard a guess at the probable outturn of the year. But it seems certain that defence expenditure will extinguish much of the gain shown in the accounts to date. If, however, the experience is no worse than that, the Chancellor might find that his budgeted above-line surplus was still intact, despite the first impact of the defence burden. In that event, the “overall” account might still be virtually in balance. As the accompanying table shows, net “above-line” expenditure for the past nine months has fallen £72 million short of the corresponding figure for 1949-50, or nearly twice the decline that was envisaged for the full year—despite the fact that the account has been burdened with an additional £17 million of expenditure for cotton purchases (an amount that may possibly be refunded to the Exchequer before the end of the year).

Thin Time for Galvanisers

The clarification this week of one anomaly in the Ministry of Supply’s list of prohibited uses for zinc (which comes into operation next month) promises greatly to reduce the effect of these prohibitions upon the “general” galvanising trade as a whole. As originally set out, the list forbade the use of zinc for galvanising buckets as well as dustbins; prohibition of the use of zinc for both would have reduced consumption of zinc by this branch of the trade (recently running at nearly 40,000 tons a year) by nearly a quarter, and forced perhaps a third of galvanised hollow-ware firms to close. The Ministry’s statement that galvanising of buckets will not be affected entirely alters the picture; hollow-ware manufacturers should be able to meet the present high demand for galvanised buckets, by using almost all the zinc they have recently been using to coat dustbins, while the remainder of the list of prohibitions amount to a tiny fraction of the trade’s work. This more publicised part of zinc allocation, in fact, is of practically no importance to galvanising; the trade is much more concerned with the 50 per cent cut in allocations of ordinary grade zinc (for it uses little scrap and cannot use higher grade zincs without debasing the quality).

Since the total prohibitions will effect only a small saving of zinc, the effects of the cut in zinc will fall upon the mass of products that firms may still galvanise; among these, domestic water tanks, metal windows, ship’s fittings, structural steelwork, and “pole line hardware” for electrical transmission are some of the most important. A cut in water tank production will present difficulties for the Ministry of Health, since at present about half the industry’s production goes into replacements and the other half into new houses; so will the lack of galvanised dustbins (which instead are likely to be japanned or enamelled). Of about one hundred and

fifty firms in the industry, perhaps fifty are small undertakings with only one or, perhaps, two galvanising baths, and the degree of the cut might make it impracticable for some of these to operate, even by economising in the thickness of zinc deposited; but the larger firms, which often make the product as well as galvanise it, will be able to close down a proportion of their galvanising baths and turn to different finishing processes for different items.

“General” galvanising, which employs only about 3,000 people, uses only about three-eighths of the zinc consumed each year in galvanising. The largest producer of galvanised products in the country is the iron and steel industry, which turns out some 250,000 tons of galvanised sheet a year and considerable tonnages of galvanised wire and tubes, using nearly 60,000 tons of zinc in the processes. Sheet galvanising, which recently has been consuming nearly 2,000 tons of zinc a month, is to stop, save for exceptional purposes, and the galvanising of scaffolding tube, which accounts for a fair proportion of the 1,500 tons going into tube processing, will also largely be suspended; galvanised wire will continue to be made, though the zinc coating will probably be thinned. This is merely a finishing process for the steel industry, which will be affected to a very limited effect; but the absence of equally effective and economical anti-corrosion coatings may present difficulties for those of its customers not classified as “essential.”

Paint Trade’s Colour Problem

In making any paint, a manufacturer who is short of one pigment can generally find another; if not, he can try to sell a different colour of paint. Diversity at both ends of the production process thus gives the industry a certain resilience to absorb fluctuations in material supplies. But this is unlikely to be very effective in the case of zinc oxide, the major pigment for decorative white paints and enamels, which is already scarce and seems certain under the Government’s zinc allocation scheme to become more so. No alternative material is sufficiently plentiful to make good this shortage. Lithopone and titanium oxide are already scarce and do not seem likely to become less so; both require sulphuric acid, lithopone contains zinc and titanium oxide production is limited by manufacturing capacity. White lead can be obtained fairly freely, but its uses are ordinarily somewhat restricted and any considerable switch towards its use would probably quickly bring about a shortage here, too.

The industry, therefore, knows that shortage of zinc oxide will mean difficulty; but it is not yet sure how far its supplies will be restricted. The allocation scheme limits supplies of virgin zinc for oxide production to 50 per cent of usage in the first half of last year, which means a rather lower percentage of usage in recent months; total consumption of zinc for oxide has been rising, and, in addition, less remelted zinc, scrap and zinc residues have been used by the oxide makers, who a year ago were using this secondary material for more than 50 per cent of their output. Scrap zinc has now disappeared from the market, partly because merchants are holding on to it and partly because metal-using firms are tending to use it more economically; certain galvanising firms, for example, are proposing to recover the zinc content of their dross, which is normally a useful material for zinc oxide. Zinc oxide production has recently been running at about 6,000 tons a month; output this year will depend upon the extent to which the Government are able to control supplies and prices of zinc scrap. Even this does not complete the list of uncertainties for the paint trade, for the Board of Trade is instructing oxide producers to supply “essential users,” such as rubber manufacturers, pharmaceuticals and ceramics, in preference to paint manufacturers.

This is only the latest, though perhaps the most serious, of material shortages for the trade. Apart from linseed oil,

which was the industry’s most intractable difficulty a few years ago and is now freely available, supplies of most materials for paint (and of tinplate for containers) are tight, and prices are high. These the industry has not wholly been able to pass on to its customers, since in 1949 it had a temporary recession and even today conditions are fairly competitive. Prices are hampering its traditional ingenuity in switching materials in paints; and retail paint prices seem likely to increase shortly. But the flexibility of its processes may transform this into a marketing problem: how to get people to accept darker paints instead of the pastel tones (needing white pigments) to which most recent design and colour propaganda has helped to divert their taste.

American Experiment in Bulk Purchase

The United States Government has decided that in present conditions the mechanism of the market cannot be expected to secure an adequate supply of rubber for both defence and commercial needs; accordingly, it has prohibited the private importation of natural rubber and latex as from December 29th and it has itself become the sole importer, with responsibility for allocating supplies to American consumers. Certain specialised types of rubber such as guayule, balata and gutta percha are excluded from the new regulation because the quantities involved are small and because the firms that use them have long-term contracts with the producers.

The immediate effect of this experiment in bulk purchase both on the rubber market and on American consumption is likely to be negligible. American consumption of natural rubber for the first quarter of 1951 has already been drastically curtailed. Only 40,000 tons a month may be used in this period compared with 60,000 tons a month between January and September, 1950. Nor are total imports of rubber into the United States likely to decline. Civilian consumption was restricted in order to increase rubber supplies going into the stockpile, and stockpile purchases will presumably be maintained at their projected level. The main effect of the order will be to prevent private hoarding of rubber in the United States, but there is little evidence to show that private hoarding has occurred on any significant scale. Indeed, commercial stocks at the end of September (87,000 tons) were 20,000 tons lower than at the beginning of 1950.

The United States Government will sell rubber at a fixed price which it hopes to vary at only infrequent intervals. In other words it will gamble on the market. Presumably it has studied the experience of the Ministry of Supply in its pursuit of the same policy in non-ferrous metals, and is not discouraged. American manufacturers are apparently quite content to be sheltered from day to day price fluctuations and they expect the American Government’s selling price to be fixed below the current market level of 60 cents (4s. 3d.) a lb, on the grounds that the price of rubber is likely to fall during the year rather than rise. It is well known that the American Government would like to see the price of rubber at a “reasonable level,” and it can no doubt depress the price by keeping out of the market for a time. While it is staging its own version of the buyer’s strike, there will be more rubber available for other countries, not excluding Communist countries.

Where is Rubber Going?

Exports of rubber from Malaya show a startling trend in recent months. Since July they have been much higher than in the first two quarters of the year and considerably larger quantities have gone to countries other than the United States and Britain. There were big exports to Russia in July

and August though they declined sharply in September and October; shipments to China and Hongkong (which also find their way to China) have been much greater in the second than in the first half of the year. Germany and Japan as well as certain South American countries have also increased their purchases appreciably since June.

Exports from Indonesia began to recover in April after the currency reform and they, too, have been much larger in the second half of the year than in the first. Much larger quantities have been going to Malaya for transshipment, and direct exports to the United States, Britain and Germany have also

TOTAL	29,262	62,589	71,085	67,212	63,254	76,353	...

increased. But the surprising fact is that the United States has been taking a smaller proportion of total exports of rubber from Malaya and Indonesia than in 1949, though the absolute quantity has increased.

If, then, the United States wants to force down the price of natural rubber, it must first prevail upon the rubber producing countries to restrict exports to other countries, particularly the Soviet Union and China. That would be difficult in any conditions short of war, or short of imposing sanctions on countries which have not yet been legally labelled as aggressors. The price of rubber is admittedly very high and out of relation to current costs of production. But that is also true of other commodity prices and it is the result of panic buying and general inflationary conditions.

The Railwaymen's Dispute

The opening last Thursday of the inquiry into the dispute over railway wages revealed little that was not already generally known. The three unions concerned, in spite of signs of differences between them, are as determined as ever to reject the *quid pro quo* agreement that the Railway Executive has proposed. The Executive, for its part, is equally determined to refuse any increase in wages unless the railwaymen make some concessions—not, on the face of them, particularly far reaching—towards improved efficiency and reduced costs in the railway service. Yet the unions regard the Executive's proposals as an attempt at intimidation; this they bitterly resent, and regard it as an attempt to bypass the machinery of joint consultation. They maintain that they are willing to discuss the new conditions of work that the Executive is trying to introduce, but only as a separate negotiation. The attempt to join the question of conditions with the discussion of wage increases is, in their view, arbitrary, high-handed, and contrary to "Labour principles." They refuse to take the two matters together. There are clear signs of syndicalism in their case. They insist on the right to an equal voice in deciding their conditions of work; they call for a greater measure of joint control; and they reject out of hand the principle—common enough in other industries—that wages and conditions of work should be negotiated together.

Thus, the technical issue of the dispute is itself a reflection of the widespread dissatisfaction among railway workers about the way in which the industry is being run. This attitude is not confined to the railways. Industrial workers presumed—and were encouraged by Labour speakers to do so—that nationalisation would mean a greater share in management for the workers. Joint control, in fact, was assumed to be an integral feature of nationalisation. There are powerful objections of principle to this conception. But even if it were allowed to prevail, in practice it has proved impossible to wed the slow processes by which a union makes up its collective mind with efficient administration of leviathans, as the nationalised industries have now become. The appointment of trade union leaders to positions of authority within nationalised industries has failed to satisfy the demand for joint control, and a sense of frustration has inevitably resulted—all the more bitter because it rests on a dangerously sentimental idea of the part that labour could play in management. It is unlikely that the inquiry into the railway dispute will attempt to pronounce on this broad issue, though this is in a real sense what the dispute is about.

Bank Salary Disputes

Bank staffs, like many other black-coated workers, have fallen so far behind in pay increases since 1939 that it is not surprising that many of them are increasingly dissatisfied with their lot. One sign of this dissatisfaction has been the organisation of a "petition" for higher pay by the National Union of Bank Employees. The NUBE, however, is experiencing some difficulty in finding anybody to whom it can present this petition. Most of the English banks negotiate their salaries separately with their own internal staff associations (which still represent a higher proportion of English bank staffs than does the NUBE).

One of these staff associations, however—that of the Midland Bank—has recently reached a crisis in its affairs, following a dispute with the management. This dispute springs from the Midland Bank's decision, at the end of last year, not to follow the other large banks in the rate of Christmas cash payments to staff. In 1946, after some years of annual cost-of-living bonuses, the large banks "consolidated" their salaries into new scales—and indicated that there would be no more bonus payments. Almost at once, however, new half-yearly cash payments were made. These amounted to 5 per cent of basic salaries in June, 1947; they rose to 6½ per cent in December, 1947, and to 7½ per cent in December, 1948. Throughout this period all the "Big Five," and some of the other banks, had increased their cash payments in step with

BASIC BANK SALARIES
(£ Per Annum)

	1939	1946	NUBE "Petition"

20 " "	...	...	640

* These claims are minima for unqualified clerks. Extra pay is claimed for qualified clerks, and further additions for special work, from cashier upwards.

one another (though one of them, while paying the same percentage of the total salary bill, until last year distributed it by reference to the family responsibilities of the staff. Towards the end of last year Lloyds Bank announced that it would pay in December 10 per cent for the half-year plus a retrospective 2½ per cent, making 20 per cent for the year. All the other big banks followed Lloyds' lead except the Midland, which announced that it would pay no more than a flat 10 per cent, making a total of 17½ per cent for the year. After protest at this decision, the negotiating delegates and the Grand Committee of the Midland's staff association resigned

en bloc and recommended to the local branches of their association that they should disband. If this recommendation is acted upon, there will no longer be any regular channel for negotiation between the staff and management of the bank.

At the root of these problems, of course, lies the lag in bank salaries in relation to the cost of living since 1939. The accompanying table shows an approximate average of salaries of the Big Five banks at various points in the scales obtaining in 1939, together with comparable averages for those under the consolidation scales of 1946 and those claimed under the NUBE's petition. The 1946 scales relate to basic salaries, which are supplemented by the cash payments and by special allowances for employees in London and other large towns and also, in some banks, by children's allowances ranging up to £25 per annum per child. Salaries beyond the figures here shown are, of course, earned by "overscale" and "appointed" staff and there are some variations between bank and bank; it is claimed, for instance, that salaries paid by the Midland are above the average for the clearing banks as a whole. It is clear enough that it must be impossible for many bank officials on the scales to keep up their pre-1939 standard of living. But it is also clear that the banks are increasingly disturbed by their salary bills—and, still more, by the rising burden of pensions; it is significant that, at the same time as the Midland's decision was announced, one of the other big banks announced that children's allowances could not be paid for children born after the end of this year.

Subcontracts for Defence

The Ministry of Supply is returning to the practice of spreading large defence orders among a number of manufacturers. The most recent decision has been to place part of an order for de Havilland Venoms with the Bristol Aeroplane Company, although it is probable that de Havilland has sufficient capacity to handle the entire order. Subcontracting has been going on for some time on a small scale. But the tendency of current defence contracts is to place large orders for a few fully developed types of aircraft, and since this would mean large commitments for a handful of firms and no orders for others, the Ministry has had to consider seriously whether contracts cannot be divided to distribute employment more evenly over the industry. Orders for the English Electric Canberra bomber have already been subcontracted to Short Brothers and Harland, A. V. Roe and Handley Page. Orders for some types of Rolls-Royce engines have been given to the Bristol Aeroplane Company, D. Napier and Son, A. W. Hawksley and to Austin Motors—but in rather different circumstances, since Rolls-Royce is already working to full capacity and can expand production no further until the new factory is complete. The order for Venoms may present problems to Bristol Aeroplane, for much of the company's assembly space at Filton is occupied with jigs for the 175 airliner ordered by BOAC and for the company's successful freighter.

Such subcontracts have special features. In the great majority of cases, military equipment is developed under contract from the Ministry of Supply. A customary, if not an essential stipulation, is that the Ministry retains user rights if the prototype is put into production. Thus, although the firm developing the prototype usually has its own patents to protect the equipment that it develops, the Ministry can give the design to other manufacturers without any royalty being due to the developing firm. Under these arrangements, neither English Electric nor de Havilland will receive royalties from the companies building their aircraft.

Royalties and Development Charges

When no public money has been used during development, the developing firm retains its right to royalties. The

CARBON

CARBON is one of the most widely distributed of the elements, for it is an essential constituent of all living matter. Carbon appears in the crystalline form as diamond and graphite and in the amorphous form as charcoal. Combined with other elements it gives innumerable chemicals all of which are vital to our existence. Carbon atoms readily join with each other, and with those of other elements. They will link up into rings, form long chains of atoms like strings of beads, and even branch out to make complex three-dimensional molecules. The study of carbon compounds is so important that it has become a specialized branch of science known as Organic Chemistry. Hundreds of thousands of different molecules have already been made from carbon atoms in conjunction with those of two or three other elements, such as hydrogen, nitrogen and oxygen. An almost infinite number of new ones remain to be discovered by the organic chemist.

Since 1856, when Sir William H. Perkin made the first synthetic dye, mauve, the manufacture of dyestuffs has been a focal point of the organic chemical industry. The dyestuffs made by I.C.I. are carbon compounds, and recent I.C.I. research into carbon derivatives has resulted in such epoch-making discoveries as new anti-malarial drugs, new textile fibres like 'Ardil', and 'Gammexane', a revolutionary insecticide.

Rolls-Royce engines being built by Austin Motors provide one of the rare cases where this has happened. They are a range of four road engines that have a high percentage of standard parts and were developed by Rolls-Royce during the war to simplify the problems of supplying spare parts for Army lorries. Rolls-Royce are not asking for royalties so long as the engines are used for defence orders, but it was recognised when the order was negotiated that the company had a right to do so. Private venture developments of this kind are expected to become increasingly rare, because development charges, particularly on aircraft, now involve astronomical sums. Therefore since the war, the Ministry has evolved a method for recovering some part of the sums paid out to firms for development. There is no point in demanding a proportion of the money received for production orders for the Forces, since this is handing it from one government department to another. But when aircraft, or aero engines, or tanks are sold abroad, or licensed for manufacture abroad, then the Ministry demands a percentage of the revenue. In this way considerable sums have been recovered from de Havilland, who have sold the Vampire fighter to many foreign countries, from Gloster, whose Meteor fighter is also used abroad, and from Rolls-Royce, who build the engines for the Meteor and who have also licensed their engines to foreign firms, including Pratt and Whitney in the United States. Other firms who have made licensing agreements abroad (although the engines and aircraft are not yet in production) are English Electric, the Bristol Aeroplane Company and Armstrong-Siddeley and Hawker Aircraft. The Ministry also expects to recover some of the development charges that it paid for civil aircraft, the most important exception being the de Havilland Comet, which is a private venture.

The conditions governing gas turbine aero engines are complicated by the fact that the basic patents are held by another public body, Power Jets (Research and Development) Ltd. Firms which are not having their development costs paid out of public money, like those building gas turbines for electricity generation, pay royalties direct to Power Jets. So do foreign firms who hold direct licences. In this country, so long as the Ministry of Supply paid development charges, any royalties are a matter for private settlement between Power Jets and the Ministry, which is the company's sole shareholder.

Changes in Ship Design

Twelve years have elapsed since Lloyd's Register of Shipping published an annual report, and in that period great changes have taken place in the design, construction, powering, ownership and employment of merchant shipping. The report now published, for the year ending June 30 last, shows that the world fleet on that date totalled 30,852 ships, of 84,583,155 tons gross, including an estimate of 14 million tons for ships laid up in the American reserve fleet. This world fleet constitutes "a far more efficient instrument of commerce" than did the 29,763 vessels of 68,509,432 tons gross that existed in 1939. The German, Japanese and Italian fleets are now only a fraction of their prewar size, while 33 per cent of the world tonnage is now American, compared with Britain's 21.54 per cent. If the American laid-up fleet is excluded, however, Britain takes the lead with 25.8 per cent, while America has 15.9 per cent. The percentage of oil tankers is now higher than it has ever been, the 1950 figure being 21.3 per cent (16,865,894 tons gross) compared with 18 per cent (11,436,880 tons) in 1939. The most striking change, perhaps, is in the age distribution of the world's merchant ships. Nearly 50 per cent of today's tonnage (40 per cent if the US reserve fleet is excluded) comprises ships built between five and nine years ago, compared with only 10 per cent of the 1939 total. Despite the scale of replacement shipbuilding since the war,

however, only 14 per cent of the total is under five years of age, compared with 15.5 per cent in 1939 (although the tonnage figure is 1,200,000 tons greater).

During the twelve years there has been a noticeable increase in the average size, speed and efficiency of merchant ships, particularly in the case of tankers, where vessels of 16,000 to 18,000 tons deadweight are replacing the prewar standard of 12,000 tons, while vessels of 30,000 tons and over are now under construction. Even more striking is the decline of coal as marine fuel. In 1939, 55 per cent of the world fleet used oil, but by 1950 this proportion had risen to 81 per cent. Oil-burning steamships rose from 21 to 47 million tons, and coal-burners declined from 31 to 16 million tons; no ships are now built with coal-burning equipment alone. The motorship, however, has by no means ousted the steamship, since motorships now account for only about one-quarter of the total tonnage. There are 21 million tons of motorships (17 million tons in 1939), and 63 million tons of steamships (52 million in 1939). Nearly half the world fleet still uses steam reciprocating machinery (more than in 1939), while turbine steamships have increased from 9,000,000 to nearly 16 million tons, and turbo-electric vessels from 500,000 to over 5,000,000 tons. The postwar trend towards the use of geared steam turbines, particularly for powers in excess of about 8,000 shaft horsepower, has been made possible mainly by the great advances which have been made in gear-cutting technique. As for the design of hulls, the old "three-island" type, with poop, bridge and forecastle, has been almost completely superseded by the shelterdeck design, and in order to obtain large cubic capacity and low tonnage under existing regulations, there is a tendency to increase the height of the tweendecks, while there are signs that the ballast capacity of cargo vessels is rising.

Record Bank Clearings

As expected, the annual statistics issued by the Bankers' Clearing House show that the total value of cheques, bills, etc., handled at the Town and General clearings in 1950, rose to a new high record. They amounted to £94,241 million, compared with £86,060 million in 1949. This figure, of course, does not give any accurate measure of the total volume of funds shunted through the banking system last year. It excludes the £2,076 million that was handled at the principal provincial clearings (when turnover was 10 per cent higher than in 1949); it also excludes cheques passed between customers of the same bank (which amount to a substantial proportion of the whole) and cheques handled under various local clearing arrangements outside the main centres.

For what they are worth, however, the figures suggest that the velocity of circulation of bank deposits was between 4 and 8 per cent higher than in 1949 in each quarter of 1950 except the second, when the ratio of clearings to deposits (at an annual rate of about 16.2 against an annual rate of 13.6 for the same quarter of 1949) was some 19 per cent higher. The rise in money turnover between April and June of last year, however, was wholly due to an increase at the Town clearing, which handles cheques and bills paid into and drawn upon bank branches in the City of London—and is therefore heavily dependent on the volume of Stock Exchange and other financial business; turnover at both the General and the Provincial clearings actually declined slightly between the first and second quarters of the year—although it rose steadily thereafter. This last movement is not surprising, as the volume of bank deposits, which in the first six months of 1950 was running at much the same level as in the first six months of 1949, has risen by between 4 and 5 per cent since June. It would be rash therefore to draw any general conclusion from the clearing figures other than one that has long been deducible from ordinary observation—namely that there was more money chasing

rather more goods in 1950 than in 1949, and that it was chasing them slightly faster.

Exchange Control and Cocoa Dealing

Since the beginning of November a wide measure of freedom has been restored to the London Cocoa market. An open general licence has been granted for the import of raw cocoa and the Ministry of Food has stopped bulk purchasing, though it retains elaborate domestic price controls. The Bank of England has now published details of the machinery through which private dealing in cocoa will be reconciled with exchange control. The scheme follows very closely the arrangements made when free dealings were resumed in tin, rubber and coffee, except that cocoa that is purchased from the dollar area will still require an import licence. Buying and selling of cocoa in any other part of the world is now permitted, but only on the part of persons and firms recommended to the Bank of England by the Cocoa Market Executive Committee. The authorised dealers must make monthly returns of their operations and positions to the Bank of England. These returns will be regarded as strictly confidential, though the Bank will be allowed to aggregate the figures and supply the totals to the Cocoa Market Executive Committee. Provision is also made for checking undesirable speculation and for divulging to the Executive Committee the name of any participant who is deemed guilty of abuse of the facilities provided under the scheme.

£500 million will be comfortably exceeded. The figures so far available are given above: they are not strictly comparable between different offices as the practice regarding the inclu-

sion of group life assurances (both new and additional to existing schemes), deferred annuities and some other types of contract is not uniform. So far the increase recorded on the 1949 level is over 11 per cent. This is yet another indication that the life offices have become the largest medium for collecting personal savings; last year's new sums assured stand out in marked contrast to the National Savings figures.

Substantial sums assured were again written in "income benefits," which give substantial life assurance cover for a relatively small premium, and a large contribution to the total was again made by new business under group pension and life assurance schemes. Some companies that have set out to attract non-participating business by quoting reduced and competitive premium rates have been markedly successful. In so far as it is yet possible to draw conclusions about the new ordinary business of the industrial-cum-ordinary offices (and the results of the Prudential which accounts for nearly one-fifth of the total new business are not yet available) there seems to have been a continued movement against the general trend. This was probably due to the proposals of the Labour Party, first to nationalise and later to "mutualise" these offices, and perhaps, the pressure of the rising cost of living on the income groups for which they largely cater may have played some part.

The Week in Commodities

The steady rise in commodity prices has reached the point of monotony. American grain and cotton markets remain very firm and Cuban sugar has again risen during the past week. Some weakening in the American grey market prices for copper and zinc has been reported, but these prices are still nearly 50 per cent higher than the official quotations. Tungsten, quicksilver, shellac, cement, and castor oil,

Note: Monthly prices taken at last day of the month except those for wool which are monthly averages.

have all risen during the past week. The price of tallow last June was below its prewar level—an exceptional situation for any commodity. This week it was quoted at 16½ cents a lb. or more than three times the price of seven months ago.

Rise in Semi-Manufactures

Annual price reviews have led to a number of increases in the New Year. The individual impact of these changes is not drastic, but their cumulative effect may be significant. The Cement Makers' Federation has raised the price of

cement by 4s. a ton (the price in the London area goes up from 73s. a ton to 77s.) to provide funds for equalising the prices of home-produced and imported cement. Shell Mex and BP have followed other oil companies and increased the price of lubricating oils by between 8d. and 1s. a gallon on a wholesale price of about 5s. 6d. a gallon; these changes follow movements in world oil prices which, in comparison with other prices, are staying remarkably steady. The Ministry of Supply has raised the price of virgin aluminium from £120 to £124 following this year's annual price review with its suppliers—aluminium consumers are said to be relieved that the increase is so small. The Ministry has also raised the maximum prices for nuts and bolts and similar fasteners after discussions with the trade and has raised the price of special shapes of copper by as much as £2 17s. 6d. a ton to bring British prices in line with the recently increased prices of fabricated copper imports from Canada. The biggest change is in the retail price of tyres, which go up 20 per cent after a fourfold increase during the year in the prices of basic materials.

Manufacturers of end products may be able to absorb these price increases for a time, as they have absorbed a number of similar price increases during the past year; but the stage will come when they have to be passed on to the consumer. The new tyre prices provide the clearest example. The retail price of the tyres used on a large lorry have risen from just over £20 each to about £24 5s. and six are used on one vehicle. The Road Haulage Association has estimated that this increase in costs, in addition to the higher prices of lubricants, has raised haulage costs by between 1½ to 2 per cent. Costs had already risen by 5 per cent since the last increase in rates was made in May.

Shorter Notes

The steel industry has opened its expected "National Scrap Drive," appealing by letter to 15,000 users of iron and steel throughout the country and supplementing this by advertising. Negotiations for supplies of German scrap during 1951 are not yet completed; but these imports, which at the beginning of 1950 were arriving at an annual rate of 2,000,000 tons, are now down to half that. The industry appears hopeful that the present rate of German supplies may be maintained, and confident that its drive will be sufficient to bring out the scrap from British factories. This confidence is being questioned by some steel users; but it is a point on which since the war the industry has generally been right.

The Inland Revenue Commissioners deserve congratulation on the prompt publication of their report for the year to March 31, 1950. This is a break with tradition, for the report was usually issued in March before the Budget. Prompt publication involves postponing until a year hence the trade group figures for profits and wages that formed such a valuable section of the Commission's centennial report last October. But there are compensations—in particular an appendix where, for the first time, accountants and patient taxpayers can consult the "extra statutory concessions" that inspectors of taxes regularly apply in practice. These concessions can be of great importance, and it is entirely proper that they should be publicly disclosed.

The Treasury has approved a provisional agreement for the amalgamation of the British Mutual Bank with Martins Bank. The agreement provides for the issue of 155,054 £1 fully paid shares of Martins Bank for the issued capital of £257,000 of the British Mutual, whose capital, published reserves and profit and loss account amounted to £470,000 at the end of 1949; at the current market price of 77s. 6d. for Martins' £1 shares, this indicates a purchase price of approximately £600,000. The British Mutual Bank, whose origins date back to 1857, has increased its turnover more

than five times since 1940; its shareholders will gain considerably, both in capital value and income, from the proposed amalgamation.

Martins Bank—the first of the clearing banks to announce its results for 1950—shows a further small increase in net profit, from £725,170 to £732,895. After paying the customary dividend of 15 per cent and after allocations to contingencies reserve and for premises redemption, the carry forward is increased from £377,968 to £392,660.

The first two discount houses to publish profits figures for 1950 have both enjoyed a good year. The National Discount Company shows a profit of £301,522 compared with £286,465 for 1949; after allocations to pensions fund and to reserve the carry forward is £250,912 against £212,890. Alexanders Discount Company shows a net profit of £165,100 compared with £150,400 for 1949; the carry-forward is £452,000 against £409,000. Both companies maintain their usual dividends.

The agreement to use the ECA counterpart fund for "retirement of debt," which was reported in *The Economist* recently, has been implemented by the expected, painless bookkeeping transaction. The Bank return for December 20th recorded a fall in the H.M. Treasury Special Account by £266 million to £414,123, and a corresponding decrease in the Bank's holding of interest free notes (and thus in the National Debt).

The National Union of Manufacturers this week protested that the notice given to metal-using industries of the prohibition of a range of products containing copper and zinc was too short to enable a changeover to substitute materials, and asked for exceptions to be made for firms having stocks of manufactured goods containing prohibited materials that had been made to their specifications and could not "easily be used for any other purpose." While the prohibition order has not yet been issued, and may cover special cases, these should be few; there would be no justification for giving managers with insufficient talent for improvisation any "case" that their more ingenious competitors are not allowed to enjoy.

The British insurance companies and Lloyd's Underwriters have negotiated, through an advisory committee of insurance brokers, the insurance of over 36,000 vehicles operated by the Road Haulage Executive. Cover will be provided under one policy for the usual motor risks and also for carriers' liability for the goods transported, at an annual premium of about £1,000,000. Country-wide service arrangements have been made. The important principle that insurable risks of nationalised undertakings should continue to be carried by the insurance market, established last June by the British Electricity Authority, has thus been reaffirmed. No doubt now, as then, the premium rates have been finely drawn.

The National Research Development Corporation, which was set up in June, 1949, by the Board of Trade, has published its first annual report. The purpose of the corporation is to hold, and if necessary to help to exploit, patents on developments made in Government research organisations. It can also help in patenting and exploiting the work done by individuals or by firms which might not have the resources or the experience to do so alone. The report says of the limited work which the corporation has been able to do in its first year: "in a number of cases patent costs have been incurred and in six instances decisions to incur development expenditure have been taken." Because the negotiations are not complete, no details of the developments are given. It must be hoped that the next report will be more forthcoming.

Company Notes

Arthur Guinness, Son and Company.

The slight rise in group trading profits from £4,770,994 to £4,834,606 in the year ended September 30, 1950, suggests that Arthur Guinness have been able at least to retain their share of the market in a year which has been disappointing for the brewing industry. The company have been able to increase the ordinary dividend from 29 per cent to 32 per cent, but the earnings cover has fallen slightly. This fact suggests that the directors do not intend to stint the ordinary shareholders. The apparent fall in earnings may be attributed largely to the rise in the pension provision from £245,000 to £500,000.

An impressive sum of £1,388,000, as compared with £575,000 in 1948-49, has been allocated to reserves. Moreover, the sum of £400,000 for contingencies is intended in the main to meet costs of replacement.

	Years to September 30, 1949	1950
Consolidated earnings:—		
Trading profits	4,770,994	4,834,606
Total profit	4,940,610	4,959,376

Share capital	9,500,000	9,500,000

(a) Including £857,490 taxation relief on pensions contributions written back.

In the autumn of 1949 the directors proposed to capitalise £5 million of reserves by a scrip bonus of £2 ordinary stock for every £3 held. The chairman comments on the Capital Issues Committee's refusal to sanction this proposal: "It is difficult for the ordinary business man to understand the logic or the justice of this decision."

The price of the £1 ordinary units, which touched a high of 136s. at the end of November, has recently remained firm at about 130s., giving a yield of £4 18s. 6d. per cent.

Hawker Siddeley Group.—The fall in group trading profits of the Hawker Siddeley Group from £5,602,897 to £4,846,786 in the year to July 31, 1950, was not unexpected, for the chairman emphasized a year ago that the 1948-49 results reflected "the outcome of exceptional circumstances." The main-

	Years to July 31, 1949	1950

Share capital	3,455,587	3,455,587

(a) Excluding £185,453 profits of previous years.
(b) Excluding £506,310 profits of previous years.

tenance of the Ordinary dividend at 32½ per cent—a rate which has been paid since 1939—disappointed more optimistic market expectations.

The drop in group earnings from 194.7 per cent to 168.8 per cent still leaves an earnings cover of five times for the dividend. The

need for large sums to meet high replacement costs has presumably reinforced the directors' decision to continue "to follow the policy of dividend restraint." As usual, the company has only drawn off sufficient profits to meet its own immediate requirements; the large sum of £1,676,665, against £1,526,825, is retained by subsidiary companies, and of this £750,000 (against £500,000 in the previous year) is transferred to replacement reserves.

The board intends, when permission can be obtained, to bring issued capital into closer line with the real capital employed by the capitalisation of reserves. Capital reserves stand at £7,526,983, revenue reserves at £5,488,701, and current assets at £2,658,942—(nearly double the current liabilities and provisions of £13,646,958)—so that the justification of this step would be hard to question. Stocks have increased by some £2,725,000 to £15,938,797.

At the current "middle" price of 30s. 3d., the 5s. Ordinary units yield £5 7s. per cent.

Lancashire Cotton Corporation.—Excellent progress has been recorded by the Lancashire Cotton Corporation since the war and the results for the year to October 31, 1950, are indeed impressive.

Trading profits have jumped from £2,599,286 to £3,808,816, after providing £958,281, against £832,374 in 1948-49, for repairs and maintenance. The Ordinary stockholder enjoys a modest bite at the fruits of this expansion, for the dividend is increased from 10 per cent to 12½ per cent, covered four times by earnings.

The book value of fixed assets bears little relation to their replacement value, for they now stand at £4,227,120, although some £3,200,000 has been expended on them since October, 1945. The directors have decided accordingly to allocate £500,000 to a fixed assets replacement reserve.

Although yarn production reached a post-war record last year, output is still below productive capacity. Restrictions on raw cotton exports by the American Government have given the Corporation much concern, which fears that dislocation of production and the compulsory substitution of one type of yarn for another will have to be faced.

	Years to October 31, 1949	1950
Earnings:—		
Trading profit	2,599,286	3,808,816
Total profit	2,632,571	3,853,899
Depreciation and replacement	450,000	500,000
Taxation	1,100,000	1,685,000

	Years to July 31, 1949	1950
Ordinary capital:—		
Earned	960,821	1,548,537
Paid	161,421	274,465
Earned %	46.7	53.9
Paid %	10	124
General reserve	1,125,000	1,025,000
Carry forward	438,603	683,010

	Years to July 31, 1949	1950
Balance sheet:—		
Fixed assets less w.o.	4,013,009	4,227,120
Net current assets	6,511,936	8,057,956
Reserves	4,948,326	6,841,931
Loan capital	1,943,528	1,920,000
Share capital	4,058,526	4,058,526

Fortunately, the Corporation's first aim since the war has been to increase its technical and financial strength. General reserves now stand at £5,000,000, against £3,875,000. Although the burden of carrying adequate stocks of raw materials—when they can be obtained—is heavy, the Corporation's liquid resources have increased from £4,904,380 to £5,811,662.

The question for the future is whether difficulties about cotton supplies will affect output appreciably. If not, the maintenance of the 12½ per cent dividend should present no difficulty, for at the moment the order book is fully extended. At the current price of 41s. 3d. the £1 Ordinary units yield just over 6 per cent.

NYASALAND RAILWAYS, LIMITED

INCREASING TRAFFICS

MR W. M. CODRINGTON'S STATEMENT

TRAFFIC ON LAKE NYASA

The nineteenth annual general meeting of Nyasaland Railways Limited was held on December 28th in London, Mr W. M. Codrington, C.M.G., M.C., chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to December 31, 1949:—

After paying the interest on our first debentures, the sum of £23,951 remains for the 5 per cent. Bridge debenture stock (soon to be replaced by consolidated income debenture stock) and is derived from the receipts of the Bridge and its south approach. Of this sum of £23,951, £19,743 is in respect of the receipts of the Zambesi Bridge and compares with £8,000 in the previous year when, as I explained last year, tax adjustments were necessary as a result of the Finance Act, 1947.

You will notice the new item on both sides of our revenue account relating to the operation of our road motor service. This has resulted in a small operating profit and has undoubtedly provided a much needed facility for our customers. Our Lake service, which has been carried on under considerable difficulties, resulted in an operating loss of over £5,000. Only when our new ship, the *Ilala II*, starts earning money can we hope for much improvement in this department of our activities.

INFLATIONARY TENDENCIES

Food costs must continue to rise as greater allowances of rationed foodstuffs are made available and subsidies are unloaded; the full effect of devaluation on prices of imported goods essential to the industry is still to be experienced; rents demanded for new premises and for the renewal of existing leases are higher than ever before; local rates are still climbing; negotiations are even now under discussion for increases of rates of pay for catering establishments, and claims for increases in wages in other industries, which, if granted, are bound to increase costs in the catering industry, are being made in increasing numbers.

The problem of how to offset these rising costs is common to the catering industry as a whole, and is not one that faces your company alone. But your directors are alive to the problem and, while exercising the most rigid economy in every direction they can effectively control, are taking all possible steps to widen the scope of the business and increase sales.

The Festival of Britain is expected to attract many tens of thousands of visitors from overseas. Apart from the effect this influx of visitors will have on the trade in our branches, we expect to take a direct part in the Festival activities through a catering concession for the Festival Gardens which, in conjunction with another well-known London caterer, we have had under negotiation with the Festival authorities, and have provisionally agreed to accept.

The report was adopted.

BRAZILIAN WARRANT

LARGER OPERATING PROFIT

The annual general meeting of the Brazilian Warrant Company, Limited, was held in London on December 29th, Mr A. K. Graham, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:

The year under review, 1949, commenced with an appreciable advance in the shipments of coffee to Europe as compared with the previous year.

Our own sales, while not sharing to the full in this increase, did maintain their position with sales of Santos coffee principally to Antwerp and Norway. Then followed a short-lived dull period from which onwards the main feature was an almost vertical rise which took place when it was thought that the prolonged drought would prejudice the flowering of Brazil's next crop. It was then that the devaluation of sterling, followed as it was in varying degrees by other European currencies, made coffee a luxury article for Europe, and it would appear that consumption in that direction must be restricted until supplies become more plentiful and prices reach lower levels.

The salient features for the year's operations were the enhanced value of the commodities in which the trade of the group is carried on, and the devaluation of sterling. From these flowed not only the large increase in the net operating profit, with a consequential increase in the balance of profit carried forward, but also a large exchange surplus and considerable increases in the current assets and liabilities. The exchange surplus being unrealised has been transferred to a new exchange reserve.

The chairman, addressing the meeting, announced that the Board had received a firm bid through Messrs S. G. Warburg and Company, Limited, of 70s. for each Ordinary 10s. Stock Unit and 14s. for each 12s. 6d. Preference Stock Unit, which would shortly be put before the shareholders with the Board's recommendation to accept.

The report was adopted.

MCDougALLS TRUST, LIMITED

SATISFACTORY TRADING RESULTS

MR KENNETH MOORE'S REVIEW

The seventeenth annual ordinary general meeting of McDougalls Trust, Limited, was held on December 29th at 3, Thames House, Queen Street Place, London, E.C.

Mr Kenneth A. E. Moore, the chairman, who presided, said: Ladies and gentlemen, —Since the rationing of flour and bread by B.U.s was abolished, the consumption of flour in the United Kingdom has fallen by a full 10 per cent. from just over 100,000 tons a week to just under 90,000 tons a week. These figures are taken from the official Monthly Digest of Statistics and cover the overall consumption of flour, whether used for home-cooking or in the bakery trade for the making of bread, biscuits, confectionery, etc.

INCREASED DEMAND

Throughout the year covered by the accounts before you today—namely, the year ended September 2, 1950—the housewife has been entirely free to buy the self-raising flour of her choice. I am glad to say that in this period, so far from declining, the sales of McDougalls self-raising flour, under conditions of full competition, have increased substantially to a new all-time record. It is for this reason alone, in spite of a lower margin of profit, that we are able to lay before you such satisfactory trading results.

Our experience in this connection has been shared, as is common knowledge, by the producers of the leading branded goods in other trades—the well-known, well-advertised branded article which the public knows it can trust, be it soap, gin, marmalade, cigarettes or what have you, as soon as it is in free supply is insistently demanded by the discriminating buyer who, in his or her new freedom, positively resents being offered any substitute. Of course, it is not quite so simple as that; as you can imagine, there lies behind our figures a very considerable effort by management, staff, technicians, travellers and workpeople to maintain unflinching quality and service and to meet production demands in spite of periodical shortages of key materials of one sort or another.

As a matter of history, we have never been short of wheat, even in the darkest days of the war; it has often been comparatively minor things which have threatened to slow down production—such as shortage of adhesive gum or stitching wire. Today, as you may guess, our biggest worry is the acute shortage of paper and packaging materials. For example, to maintain production, we require many millions of paper bags every month and supplies on this scale are hard to obtain and are a constant source of anxiety.

Apart from shortages such as this, our other principal worry at the present time is the rising tide of costs in the shape of wages, transport, fuel and electricity, packing materials, plant replacements, etc. Meanwhile the retail selling prices of self-raising flour remain frozen by Statutory Order at maxima which are rapidly becoming obsolete and unremunerative owing to the rise in costs.

While problems such as these are bound to affect our fortunes, those of us who have been responsible for the management of this business have always had, in every year, bogeys of one sort or another to face, and you may rest assured that, as always, no effort is spared to overcome them.

DIVIDEND OF 10 PER CENT. MAINTAINED

But to return to last year's report and accounts—you will see that we are recom-

mending the maintenance of the ordinary dividend at 10 per cent., the same rate as has been paid for the last 15 years. There has been some light-hearted comment in the press at our failure to increase the dividend in a good year, but the fact is that, quite apart from any question of dividend limitation, taxation is taking such a toll of our earnings that, in our view, and particularly having regard to the inflated replacement cost of plant and machinery, it would be imprudent to increase the dividend.

In this connection it is of interest to note that of the earnings brought to credit in this year's consolidated profit and loss account, while the shareholders receive £109,927 by way of dividend, the Government takes by way of taxation no less than £273,480, leaving only £81,094 to be ploughed in for the maintenance and development of the business—little enough in present times.

I need hardly remind you that on the amount distributed to the shareholders very substantial further sums are subsequently collected by the Government in some cases in the form of surtax and, in all cases, in the form of indirect taxation such as purchase tax, excise duties, etc.

These figures are an example of the fact that the Government now takes nearly 60 per cent. of industrial profits by way of direct taxation and, indirectly, a much higher percentage. That is how, to a large extent, the Welfare State, as we have come to know it in this country, is being financed.

EFFECT ON INDUSTRY OF HIGH TAXATION

Taxation on this scale is already seriously impairing the ability of existing industry to keep its house in order and to maintain the progress and virility essential in the national interest; it is becoming a fatal deterrent to the foundation of new industrial enterprises in this country and is even driving abroad some overseas enterprises which formerly found it convenient to have their administrative headquarters over here, much to the advantage of the Exchequer.

If, as the long-term result of excessive taxation or as the result of political action, industry becomes enfeebled and unprofitable, the Welfare State will be heading for bankruptcy. No doubt this is well recognised in Treasury circles—let us hope that it will also be grasped in political circles.

To return to our domestic affairs—you will have gathered that, so far as public demand for our product, McDougalls Self-Raising Flour, is concerned, our affairs have never been in better shape. We have spared no expense since the war in restoring our mills and organisation to a high state of efficiency out of the profits ploughed back into the business, and from the same source the financial position, as you will have observed from the consolidated balance sheet, has been kept thoroughly sound.

If, when we meet in a year's time, we have to report reduced earnings, it will be, I am sure, for reasons beyond our control, of the kind I have indicated earlier in my remarks. I hope, however, that the account which I have given you today has been a reassuring one in that, apart from extraneous influences, the company's affairs are in excellent order.

I am sure you will wish to join with your directors in expressing our very best thanks to our staff and employees throughout the organisation for their contribution to the work of a strenuous and successful year.

The report and accounts were unanimously adopted.

MITCHELLS AND BUTLERS LIMITED

RESULTS OF A DIFFICULT YEAR'S TRADE

LARGE INCREASE IN CHARGES

MR ROBERT H. BUTLER'S REVIEW

The sixty-third annual general meeting of the Ordinary stockholders of this company was held at the White Horse Hotel, Birmingham, on Thursday, January 4, 1951, under the presidency of Mr Robert H. Butler.

The chairman, in moving the adoption of the report and accounts, said:—

Ladies and gentlemen,—It is with regret that I have to report a further decline in your company's profit and a reduction in dividend. This was not unexpected, as I warned you last year, but at the same time you will see from the balance sheet that your company is in a very sound financial position. Although there is a drop in the trading profit, the increased charges which your company has been called upon to meet have been considerably higher than this figure, but these have been to a great extent offset by substantial economies which have been made over the last two years.

On the subject of profits, I would remind our Ordinary stockholders of the crippling effect of the difference in profits tax between "distributed" and "non-distributed" profits.

But for this unfair imposition our net profit today would be almost £70,000 higher, and this amount would obviously have been available either for increased dividends or for ploughing back into the company as reserve.

EFFECT OF INCREASED CHARGES

The increased charges I have referred to include a full year's charge of the extra 3s. per barrel imposed in the Budget in April, 1949, compared with only six months last year. Charges for materials, salaries and wages, together with such items as railway freight, gas and electricity, glasses, bottles and corks, and general furnishings, to mention only a few, and over all of which we have little control, have increased by about £720,000 since 1948.

A further contributory cause is a slight decline in output, but I am pleased to say this has been appreciably less than the average fall for the whole country.

In the last few years we have spent large sums on maintaining our plant at the highest pitch of efficiency; we have also taken every opportunity of adopting the latest development in design and efficiency in modern brewing plant, and substantial work is taking place in this direction.

LARGE INCREASE IN FIXED ASSETS

You will see from the balance sheet that our fixed assets are up on 1949 by about £690,000, and although this increase seems large, I should like to assure you that in addition to a substantial sum spent on plant, it also includes expenditure on what, in the opinion of your board, are important key purchases, the chief ones being Thatcher's Brewery in South Wales, the Priory Hotel, Walsall, the Bull's Head at Wootton Waven, the Bell, Tewkesbury, and a number of valuable licensed premises in South Wales. I am pleased to say that these purchases have proved very useful additions to your business, and in their first period of ownership have shown a satisfactory return on capital. The sum also includes an appreciable amount for the consolidation of our interests in existing properties by the purchase of freeholds.

I have referred earlier to increased costs of all kinds, including maintenance. Notwith-

standing this, however, we are actively pursuing in our brewery reconstruction programme various projects which will not only result in economy in production, but will ease labour problems, improve working conditions and in that way contribute to the economic use of manpower from a national point of view.

You will recall that the Budget last April did not give us any relief in taxation and it may interest you to know that through the operations of this company during the year the Exchequer has received in taxation £12,350,000.

DIMINISHING RETURNS FROM BEER DUTY

Some 40 years ago this sum represented almost the total amount of beer duty for the whole country. Last year the national figure was about £270 million, but already there is ample evidence there will be a big drop this year. Obviously the burden being carried by the beer drinker has become unbearable, and the Chancellor may well reflect that the duty has now reached the point of diminishing returns. It is unfair that this important item in the daily budget of the working man should be so heavily taxed at a time when the country is calling for a still greater effort from him in the stern days which lie ahead.

In the last Budget an adjustment was made in the scale of duty which enabled us to increase the strength of all beers by three degrees without any increase in price. While it is a good thing that this improvement in strength has taken place, the public have not the available spending power, owing to greatly increased costs of all other commodities, to purchase their full requirements at present prices. The only way to check the fall in output, with its consequent effect on revenue, is to reduce substantially the price of beer to the consumer.

Brewers have loyally carried out their undertaking to increase gravities as from April 19th last, but experience has shown that the arrangement has reacted harshly against some companies because of differing conditions existing on the date fixed. The control now in operation should be lifted as soon as possible, and the trade given the same freedom as ordinary business men to make whatever adjustments are necessary.

SATISFACTORY PROGRESS OF SOUTH WALES COMPANY

With regard to our South Wales company, it is progressing satisfactorily and, as anticipated, has been a great saving in costs to us. The acquisition of licensed properties in South Wales is rapidly advancing the popularity of our products in this area, and in spite of poor trading conditions, I am pleased to say the trade is steadily increasing. I am sure this will be accelerated as conditions improve, for our products have no equal for quality and value for money.

A scheme has been introduced which allows some relief in purchase tax on equipment for premises designed to serve visitors from the United States. We shall take advantage of it in appropriate cases. The heavy incidence of this tax is still a serious burden and handicaps our efforts to re-equip for the benefit of the travelling public.

We are taking full advantage of the encouragement afforded to the trade for the provision of up-to-date facilities to cater for

overseas visitors, having in mind especially the activities connected with the Festival of Britain. This is entirely in line with our own policy of improvement of our residential hotels up to the standard expected by such visitors.

During the twelve months we have made further progress in overtaking the deferred repairs which accumulated during the war years. Whilst it has not been possible to overtake all arrears, we anticipate that we shall have dealt with most of them by the end of 1951.

REDISTRIBUTION OF LICENSED PREMISES

In connection with the redistribution of licensed premises which is now under consideration in various areas throughout the country the system of the tied house is invaluable. Brewers, working through their associations, are co-operating with licensing justices, licensing planning committees and local planning authorities, to assist in the preparation of schemes of planning improvement in a way which would be impossible were it not for the brewer-owned houses. Indeed, without the existence of so many brewer-owned houses I feel it would not have been possible to produce fair and equitable schemes for the redistribution of licences. Further, I feel it is no exaggeration to say that the good work of this generation in sweeping away structurally deficient and redundant licensed houses, and their replacement by well-built comfortable houses which cater for all classes of the public and provide amenities of all kinds, would not have taken place if the tied house system had not come into operation towards the end of the last century.

TOWN AND COUNTRY PLANNING ACT—ASSESSMENT OF DEVELOPMENT CHARGE

You may have observed recently a number of criticisms of the Town and Country Planning Act, one of the most serious being that the compensation to be paid to an owner of property for the loss of the development value in that property is likely to be only a small portion of the true value, whereas should the owner desire to develop his property beyond its existing use he would have to pay development charge at the rate of 100 per cent. This explains why one of the basic principles of the Act, namely, sale by the owner of his property at existing use value, is not being achieved.

Our experience of the working of this Act from the point of view of obtaining planning permission is that it has operated fairly satisfactorily, but when we have come up against the question of assessment of development charge we have found that this has resulted in delay in carrying out permitted development, owing to the necessity of protracted negotiations with the inland revenue valuation department in agreeing a figure. Further, from our trade point of view we do feel that in the case of licensed premises we are paying, and always have paid, development charge, either under the designation of monopoly value or by the provision of licences for removal and for surrender. We consider that the development charge system really amounts to an instrument of taxation and is not a means for securing good planning.

Another grave defect in the Act is that the inland revenue valuer's assessment of development charge must be accepted by the owner, and if the owner does not accept such assessment he has no alternative but to drop his proposed development. We consider that provision for an appeal to an appropriate body should be made.

Mr D. Davey Cole seconded the adoption of the report and accounts, which were carried unanimously.

WANKIE COLLIERY COMPANY, LIMITED

PLANS FOR INCREASING OUTPUT

MR ROBERT FOOT'S SPEECH

The twenty-seventh annual general meeting of the Wankie Colliery Company, Limited was held in London on December 28th.

Mr Robert Foot, O.B.E., M.C., the chairman, in the course of his speech, said:—I will deal first with the accounts. The successful issue in May of an additional 3,293,750 ordinary shares at a price of 12s. 6d. per share, provided the company with the sum of £2,004,579 after meeting the expenses of the issue. This amount is now being used to meet the cost of the capital expenditure for the immediate expansion of the output of the company.

The output of coal sold during the year was 2,142,355 tons, including a tonnage of 197,834 used by the company for its coke ovens, brickworks and boiler plants. The saleable output represents an increase of 238,280 tons over the previous year and an increase of well over 1,000,000 tons as compared with 1939. At the present time (December, 1950) the monthly production for sale is equivalent to an annual total of about 2,400,000 tons and the curve of increase is progressively upwards.

The total operations of the company during the year resulted in a profit balance before taxation of £337,869 which compares with a figure of £288,050 for the previous year. Of this amount taxation absorbs £156,000 as compared with £165,281 last year, leaving a balance being profit after taxation of £181,869, as compared with last year's figure of £122,769.

The directors propose to create a taxation equalisation reserve of £60,000 which will enable the company to keep some reasonable form of balance between the annual depreciation provided in its own accounts and the allowances granted for taxation purposes.

Of the balance of £121,869, the interim dividend of 3½ per cent., paid in May last on the old capital, i.e. before the new issue cost £34,289. The payment of a final dividend of 3½ per cent. will, if the directors' recommendation is accepted, absorb £68,256 thus leaving £40,440 to be carried forward into the year 1950-51 as compared with £21,116 brought into the present account from the financial year 1948-49.

THE NEW MANAGERS

I now come to the special matters of importance. First the decision taken by the board to appoint Powell Duffryn Limited managers of the company under a long-term contract. This appointment became effective as from May 1st last.

At the time of their appointment as managers, Powell Duffryn were invited and agreed to subscribe a substantial amount of the new capital required for the development of the company's properties. Following this appointment and investment, Mr E. L. Hann, Mr R. L. Lechmere-Oertel and I joined the board. At the extraordinary general meeting on April 26th Sir John Chancellor reported that Major A. J. Darby, who had been general manager at Wankie for the past 16 years, had decided to retire from that position on the 30th June last, and Mr T. A. J. Braithwaite, a highly efficient and well-trained mining engineer, was on the recommendation of the managers appointed to take his place.

I wish to mention the recent resignation of Sir John Chancellor as chairman and

joint managing director. Sir John's resignation is due to his own desire to be relieved of the increasing responsibilities which under present conditions are attached to the positions which he held. It would have been his personal wish to retire from the board at the same time as he retired from the chairmanship and it is only at the express desire of his colleagues that he has consented, subject to his re-election today, to continue as a director until the end of our present financial year.

The board have done me the honour to invite me to occupy the positions of chairman and joint managing director of the company previously held by Sir John and I have accepted the invitation.

DEMAND EXCEEDS PRODUCTION

If I may now refer to the position of output in relation to demand, I would call your attention to the fact that the demand for coal in the territories dependent upon Wankie has, since the end of the war, outstripped the pace of the increase in the output of coal, and our immediate and permanent problem is to overtake the total demand and then to keep ahead of it. In accomplishing this we feel sure that we can look to the Rhodesia Railways, upon whom we are dependent for the transport of our coal to our customers, for complete support and co-operation.

Our measure of the total present and anticipated demand has been taken from the estimates given by the Southern Rhodesian Government which are based upon the figures arrived at by a government committee specially appointed by the Cabinet. It is clear to the board that this is the proper measure to be applied to the output capacity of the company in order that it may be equipped to meet the total requirements of all its customers including, of course, the holding by the latter of full and ample stocks. It is upon this basis that the directors have committed the company to an immediate capital expenditure of over £2,000,000. Plans for raising the output still further in order to be ready for the anticipated demands up to 1955-56 are now being discussed, and one of the principal reasons for the recent visit to Wankie of Mr Lechmere-Oertel and Mr G. W. Alexander, the chief engineer of Powell Duffryn Technical Services, Limited, was to examine fully with the general manager the planning and the capital cost of this further expansion.

Some publicity has been given recently to the position of the copper companies in relation to the deficiency in the supplies of coal which they require. At the present time the copper companies are each month short of something like 21,000 tons of coal and this shortage is being made up, so far as it is humanly possible to do it, by bringing in timber from increasingly greater distances. We are doing all we can to rectify this position as soon as possible.

PERSONAL CONTACTS

The managers, at the request of the board, arranged for Mr Keith Hogan, a commercial director of Powell Duffryn Group, to visit the Rhodesias and the Belgian Congo, to establish direct personal contact with all important industrial customers, to study the service given by the company or its distributors both to these larger consumers and to the domestic consumers, and to make recommendations for any improvements in the producer-consumer relationship in order

to bring Wankie into line with the best modern practice in this respect.

We have also arranged for Mr I. F. G. McVicker, a senior combustion engineer on the staff of Powell Duffryn Technical Services, to visit the Rhodesias to make personal contact on a technical level with the principal consumers of Wankie coal and to give them expert advice on its more efficient and economical use.

I am very glad to be able to report from my personal observations that the morale of the whole Wankie community is high, and that those in responsible positions from the general manager downwards understand completely what they have to do.

It would be very wrong of me if I conveyed the impression that everything is smooth going at Wankie. It is not, and they have an uphill climb in front of them, but I am satisfied that with the help which they are getting and will continue to get from the managers they will come through this difficult period with success and with credit.

CAPITAL EXPENDITURE PROGRAMME

There are three matters of special importance in connection with the programme of capital expenditure which I should mention:

1. At a cost of over £450,000 a special water supply is being laid to Wankie direct from the Zambesi river. This is a difficult engineering project of considerable magnitude, but is absolutely essential not only to support the increased output of coal and the other technical operations of the company, but also to provide the whole community, with its population of 1,000 Europeans and 15,000 natives, with an adequate supply of water during the rainless months of the year.

2. The next special matter I would like to mention is the mechanisation of the production, handling and underground transport of the coal. It should be appreciated that the successful introduction of machinery for this purpose is by no means an easy matter, and involves the necessity for the most careful preliminary training, both of the European and the native employees. Considerable teething troubles were experienced with the first mechanised units, most of which I am glad to say have by now been successfully overcome.

3. The expansion of the output which I have described, including, of course, the supply of electric power for the Zambesi water scheme entails a very considerable expansion to the electricity generating plant at Wankie and this is being undertaken in stages under the specialised advice of the managers. I am glad to say that the work is well in hand.

OTHER ACTIVITIES

I can only briefly refer to our other activities at Wankie which include the production of coke and tar and the manufacture of bricks of various descriptions. These important matters, which are, of course, an essential part of our technical and commercial progress, are at the present time the subject of close study by the general manager in collaboration with the managers, and I will refer to them more fully on a future occasion.

I can with first-hand knowledge tell you that Wankie is a happy and healthy place, with a loyal hard-working and efficient staff, well and enthusiastically led by Mr Braithwaite, with the loyal and able co-operation of Mr D. D. Martin, the assistant general manager.

The thanks of the shareholders are due to them all, and I am sure that it would be the unanimous wish of us all that we should record our thanks as part of our proceedings here today.

The report was adopted.

HECTOR WHALING LIMITED

INCREASED FLEET EXPENDITURE

The twenty-second ordinary general meeting of Hector Whaling Limited was held on December 28th in London.

Mr R. de B. Trouton, the chairman, presided.

The following are extracts from his circulated statement.

Our fleet has been increased during the year by expenditure of over £1,100,000, which consists almost entirely of payments in connection with the tankers "Biscoe" and "Powell" and our six latest whale catchers, of which two are for delivery next year; these will bring our new-built powerful catchers up to eight in number.

In spite of the reduction from £90 to £80 in the price at which our whale oil was sold, our trading profit showed a substantial increase on that of the previous year. Last season "Balaena" made 206,000 barrels (about 34,350 tons) of whale oil and sperm oil. It is very satisfactory to note that "Balaena's" production of oil during the four seasons in which she has operated is more than 10 per cent. above that of the next most successful expedition. We have sold all our whale oil to be produced in the coming season at £100 per ton, and we have again made a forward sale of meat meal at an advance in price.

Sperm oil has for three years been a very difficult market, so we were pleased to clear all our stocks during July and August. Sales of frozen meat have been disappointing. We have not yet succeeded in overcoming public prejudice—partly created by the poor quality and appearance of much of the early importation, but mainly due to innate conservatism. However, we met with a very encouraging interest at the British Food Fair in September, 1950, our new canned corned whale meat being particularly well received. We are hopeful that this product may yet be established with a wide market. As we have found such difficulty in selling frozen meat we have decided this year not to send out any freezing ship. Modifications have been made to "Balaena's" plant which we hope will not only compensate for the need to cook an additional amount of whale meat but may also result in a substantial increase in our meat meal production.

"Balaena" will operate this season with 12 whale catchers, two towing vessels, two ferry boats, and three tankers, all in the ownership of our group. We feel that without freezing whale meat we shall be able to use our ferry boats more than previously for towing so that our effective daily whaling capacity should not be noticeably different from last year's.

"Balaena" sailed with her 16 attendant small vessels from Cape Town on November 6th, which is nearly three weeks earlier than last year, and has already started sperm whaling.

Our operating costs in the coming season show increases due to the general rise in prices throughout the world. Against these increases we have three important economies; our new tanker "Powell" will save us from an expensive chartered vessel; we shall save the cost of sending out a refrigerator vessel and there will be one fewer whale catcher in operation. On balance we look to a further moderate reduction in our operating costs.

Supplementing his printed statement, Mr Trouton reported that further sales of whaling products held at July 31, 1950, had been made in the past few weeks, that all the "Balaena" production of sperm oil in the 1950-51 season had been sold forward at a satisfactory price, and that arrangements had now been made for the raising of a mortgage loan of £300,000 on the security of the tanker "Powell."

The report was adopted.

TURNER AND NEWALL LIMITED

DEMAND STIMULATED BY DEFENCE REQUIREMENTS

HIGH LEVEL OF EXPORTS

MR W. W. F. SHEPHERD'S REVIEW

The annual general meeting of Turner and Newall Limited will be held on January 25, 1951, at the Chartered Accountants' Hall, Manchester, when it is expected that Mr W. W. F. Shepherd, the chairman of the company, will preside.

Mr Shepherd's statement to the stockholders has been circulated to them with the report and accounts and, after dealing with the accounts of the company, it contains a detailed review of the company's operations during the year to September 30, 1950, both at home and abroad.

The following are extracts from the statement as regards certain matters referred to therein:—

MINES OPERATING TO CAPACITY

Our African mining companies have operated during the year to the maximum capacity of their milling and grading plants but under continuing difficulties arising from shortages of labour and materials. Notwithstanding these difficulties the production programme was largely achieved, and this reflects considerable credit on the mine managements. There is no indication of a slackening in the world demand for raw asbestos, and it is anticipated that our mines in Africa will be operating to capacity and under difficulties due to the above shortages for some time to come.

Bell Asbestos Mines Limited at Thetford Mines, P.Q., has also operated to capacity during the year under review. The preparations for the transfer from a "quarrying" basis of ore recovery to the "underground mining" form of operation have reached an advanced stage, and it is expected that this change will be made either during or shortly after the end of 1951.

Turner Brothers Asbestos Company Limited has for long past enjoyed a sustained and steadily increasing demand for the wide range of its asbestos manufactures, which consist, in the main, of products technically essential to almost the whole field of industry. This favourable experience still continues, and at the end of the last financial year a very high level of demand had been reached. Similar conditions apply in the case of the company's various belting products.

During the year now reviewed, the transfer of belting production from Rochdale to the new Hindley Green factory has been effected. The considerable problems in making this transfer and in building up the operation of the new factory have been successfully overcome, and an important stage in this company's major development programme has been achieved.

"FERODO" BRAKE LININGS

The large building programme at Chapel-en-le-Frith, to which I have referred on previous occasions, and the installation of additional modern plant are enabling Ferodo Limited still further to expand its business. With the end of petrol rationing in this country, a very substantially increased demand for "Ferodo" brake and clutch linings and fan belts was experienced. The company's exports are not confined to replacements for British cars, but are utilised in large quantities for vehicles of foreign origin. There is no make of vehicle in the world for which suitable "Ferodo" material cannot be supplied.

It may be of interest to mention that, in addition to its main business in brake and clutch linings, Ferodo Limited has developed a significant trade in two other fields. The "Ferodo" stairtread is now a well-established product, which is being used in constantly growing quantities in buildings, ships, omnibuses, etc. The other field is that of technical plastics, where "Ferobestos" products are making steady progress, though to some extent still on a pioneering basis. The successful applications of these materials are many and diverse, ranging from railway vehicles to roller skates, and from chemical plant to aircraft.

Turners Asbestos Cement Company Limited has experienced a heavy demand throughout the year from both the home and the export markets. In the light of this demand it was unfortunate that it should have been hampered by a lack of suitable grades of asbestos fibre which rendered impossible the full operation of all available plant. In spite of these difficulties, the export allocation was well maintained, resulting in some deficiency in the home market.

The post-war requirements of building materials have served to emphasise the demand for asbestos fibre against a large but nevertheless limited world supply. This has led Turners Asbestos Cement Company Limited to make intensive investigations into methods of conserving these fibres, and I am glad to say that the results are promising. Success in this field of research would have a helpful effect in maintaining the present high level of production of our asbestos cement products.

CUSTOMERS' SATISFACTION

Orders, both at home and from abroad, for the products of The Washington Chemical Company Limited have increased beyond even the very high level at which they were received last year. This augurs well, not only for the underlying buoyancy and permanence of demand for the company's goods, but indicates the satisfaction given to customers by the consistently high quality of the output of the sea-water dolomite process, the final establishment of which was referred to last year.

During the year under review Newalls Insulation Company Limited has been very actively engaged in its normal sphere of contract work for heat, cold and sound insulation, both on land and afloat. Many large contracts have been completed and even though the recession in the building of large passenger ships, which was forecast last year, has materialised, the company's position as regards marine work has been fully maintained by contracts obtained on large oil tankers and cargo vessels.

Our export trade has continued at a high level, and while currency restrictions have almost excluded us from certain markets, the demand experienced from others has been sufficient effectively to maintain the export volume of previous years. Nevertheless, we much regret that shortage of sterling in some countries which have been good customers for many years has resulted in drastic reduction of their current purchases, and we hope that this rather unfortunate position will not continue for very long.

DIVIDEND AND BONUS

Your board this year recommend a final dividend of 13½ per cent. on the ordinary stock, making, with the interim dividend already paid, a total dividend of 17½ per cent. for the year. On this occasion, the board also recommend the addition of a special bonus of 2½ per cent. on the ordinary stock, in respect of the past financial year. The year contained the thirtieth anniversary of the formation of the Turner and Newall Limited Group as such, and the twenty-fifth anniversary of its becoming a public company, and it is pleasing to your directors that earnings permit them to recommend that these anniversaries be marked in this way. The increase in the dividend on the ordinary stock is also a matter of satisfaction to your board, in that the rate of ordinary dividend (disregarding the special bonus on this occasion) is now restored approximately to the average level obtaining during the five years immediately preceding the recent war.

The need for conservation of liquid resources still remains, however, and the retention in the business of a substantial portion of our earnings will continue to be necessary if we are to maintain our progressive outlook and policy without raising additional capital. The cost of replacing old fixed assets and the acquisition of additional

assets for new projects remains very high and is still increasing, and your directors see no likelihood of any reversion to the vicinity of pre-war price levels.

IMMEDIATE PROSPECTS BETTER

Long term forecasting remains impossible so long as world conditions continue in their present chaotic state. Taking a short term view, however, the prospects for the immediate future are better, in terms of volume of demand for our products, than was the case when my statement of last year was issued. Demand has undoubtedly been stimulated by defence requirements in various parts of the world, and it appears likely that throughout the current financial year a high level of production will be required for most of our markets throughout the world.

Costs, however, are continuously increasing, and cannot always be reflected quickly in selling prices. Broadly, therefore, we expect during the current year to produce the maximum volume obtainable from available supplies of raw asbestos, which are not as adequate as we should like them to be, but the somewhat increased volume of production which we expect will not necessarily be reflected in increased profits.

vision during recent months, although export of components, particularly to South America, is hampered to an increasing extent by local currency problems.

In general, and subject to the usual seasonal fluctuations to which some branches of the business are subject, we do not foresee any great difficulty in securing sufficient contracts to keep us fairly fully engaged. The more serious impediments against which, in these days, we have to struggle concern production.

LABOUR AND MATERIALS

The difficulty of maintaining an adequately balanced labour force remains great, and has been the source of constant anxiety to us. When we met a year ago I told you that it was becoming easier to obtain materials, but the position has deteriorated since then. The increasing shortages of materials, and the consequent delays in obtaining deliveries, are forcing us once more to carry higher stocks, and we can see little hope of substantial improvement in this direction so long as the international outlook remains as grave as it has been over recent months. At the same time rising costs of material are absorbing more of our working capital.

On October 1, 1950, Mr Eric Earnshaw was appointed to the Board. His wide experience, particularly of the aircraft industry, will be of considerable value to us.

You have received notice of a special resolution. The purpose of this resolution is to amend the article, in order to enable us from time to time to appoint senior members of the staff as executive directors. In no sense, of course, will these executive directors be regarded as directors of the company.

Apart from advantages in the way of administrative convenience, the experience of those concerned will be widened. We believe that the course proposed will strengthen the deep sense of responsibility and loyalty to the company which is invariably shown, and for which I would like to take this opportunity of expressing our appreciation.

The report was adopted and the proposed final dividend of 10 per cent., making 20 per cent., less tax, for the year was approved.

The special resolution for the alteration of the articles of association having been passed, the proceedings terminated.

MERLIMAU PEGOH, LIMITED

DIVIDENDS RESUMED

The forty-first annual general meeting of Merlimau Pegoh, Limited, was held on December 29th in London. Mr J. L. Milne (the chairman) presided.

The following is an extract from his circulated review:—

This year we have been able to pay a dividend of 10 per cent.—the first since 1941. While this marks an improvement in profits it has not been necessary to make any charge for tax in this year's accounts except the small amount of £1,500 for Malayan Income Tax. Another matter of "historical" importance was the redemption in July last of the 7 per cent. convertible first mortgage debenture stock and the issue of £200,000 7 per cent. convertible unsecured loan stock 1960/70 at par.

It will be seen that the working profit for the year to March 31, 1950, amounted to £85,812, as compared with £17,429 in the previous year.

Last year I referred to our replanting programme and said we had decided to take in hand another 500 acres, making a total of some 600 acres on our Merlimau Estate. It has since been decided to replant in 1950 a further 512 acres on Merlimau Estate and 509 acres on Pegoh Estate, and also in 1951 some 1,000 acres on Merlimau Estate. This is a large programme but I feel sure you will appreciate the importance of ensuring that a rubber estate is steadily renewed by planting up areas with the latest high yielding material. Failure to do this will mean that a time will come when economic returns cannot be obtained.

The report and accounts were unanimously adopted.

MARCO REFRIGERATORS LIMITED

INCREASING OVERSEAS DEMAND

The twenty-first annual general meeting of Marco Refrigerators Limited was held on December 29th in London, Mr A. E. Leach, M.Inst.R., chairman and managing director, presiding.

The following is an extract from the chairman's circulated statement:—

The financial year ended on September 30th last was one in which serious production problems had to be faced. Arising from a rapidly increasing demand from overseas markets for our major products which far exceeded expectations, your directors had to decide to switch supplies from the home market and at an unfavourable time to undertake further schemes of reorganisation for expansion of productive capacity in all main departments.

Your directors propose to pay a final dividend of 10 per cent. (less tax), making 17½ per cent. (less tax) for the year.

As a result of many years of design and revision by our engineering and experimental staffs, the production stage has been reached with a highly specialised and efficient hermetically sealed refrigeration unit for use particularly in domestic refrigerators. The initial deliveries will reach both home and export markets early in 1951. All sales outlets have been keenly anticipating the event and I feel assured that this product will meet a ready reception and will promote an expanding demand.

Other new lines introduced during the year, although delayed for reasons I have already stated, have already met with considerable success; this is particularly notable in the cases of the new "Fridgeette" 3 cubic foot Domestic Refrigerator and the "Carlton"

Commercial Service Cabinet. Overall, the prospects for the current year appear favourable and encouraging although the uncertainty of the steel position naturally causes some concern.

The report was unanimously adopted.

INTERNATIONAL COMBUSTION AFRICA

ENHANCED ORDER BOOK

The twenty-first ordinary general meeting of the shareholders of International Combustion Africa Limited was held at the company's office at Neave Township, Port Elizabeth, on Wednesday, December 13, 1950.

Sir George Usher, the chairman of the company, presided, and in his address to the shareholders, said: Gentlemen,—I have pleasure in presenting to you at the second annual general meeting of this company, since its conversion into a public company, the directors' report, balance sheet and accounts for the financial year which ended on September 30, 1950.

In my last year's speech, I referred to the new machine shop and foundry which have been constructed at Port Elizabeth. Both these shops are at present engaged on large important contracts for the new power stations which are being built by the Electricity Supply Commission at Vierfontein, OFS, Umgeni, Natal, and Zwartkops, near Port Elizabeth, and in addition to these contracts we have received several important export orders and further orders for other electricity supply undertakings in this country. During the year under review, we have successfully completed large contracts for the Bloemfontein Municipality's new power station and for the Electricity Supply Commission's power station at Congella, Durban. Your directors decided, during the past year, to more than double the area of the existing engineering works, to cope with the large amount of business we have on hand and to still further increase and augment the amount of work which the company can undertake in this country, and thus make your company, to an even greater extent, more independent of overseas supplies.

PROPOSED CAPITAL INCREASE

It is our intention, in the near future, to increase the capital of the company to cope with the largely enhanced order book. Our unfulfilled orders, at the present time, amount to nearly £5,000,000 and several important additional contracts are confidently expected in the near future.

The importance of the establishment of this large works in the Union of South Africa at this time of international crisis cannot be over-emphasised. I hope at the next annual general meeting to include in our balance sheet, photos of the Port Elizabeth works and pictures of the products which are manufactured there. This year's trading account shows a considerable improvement on last year's and from my knowledge of the business which we have on hand, I feel convinced that next year's figures will show an even greater improvement and I can only endorse the wisdom of your board in proceeding with the establishment of our works at Port Elizabeth.

We are very fortunate in having a very close association with International Combustion Limited, and we are grateful to them for making available to us the services of engineering experts and highly trained personnel.

I am sure you will join me in extending your thanks to the staff and personnel who have worked so hard to achieve the excellent results we have placed before you.

The report and accounts were adopted.

AGAR, CROSS AND COMPANY

SALES CONTINUE AT A HIGH LEVEL

MR V. C. FISHER ON THE OUTLOOK

The forty-fourth annual general meeting of Agar, Cross and Company, Limited, was held on December 28th in London. Mr V. C. Fisher, C.A., chairman and managing director, presided. The following is a summary of the statement by the chairman circulated with the report and accounts:

I record, with great regret, the recent death of Mr Stuart Colquhoun Sheppard, who served on your Board for thirty years—some seven of which he was chairman. Mr Sheppard's intimate knowledge of your business and his clear-sighted judgment are greatly missed by his colleagues.

Your director, Mr Walter Woodbine Parish, is retiring at the forthcoming annual general meeting and is not seeking re-election. Mr Parish's extensive knowledge of Argentine affairs has been of great benefit to your company during the last thirteen years.

THE ACCOUNTS

The balance sheet at June 30, 1949, was prepared by converting fixed assets at the rates ruling at dates of acquisition, and net current assets at 17.00 pesos to £1 and 4.02 U.S. dollars to £1. The difference in exchange between the rate of 17.00 and the "free market" rate of 19.37 was shown as a provision of £442,733. At June 30, 1950, however, net current assets have been valued at 25.26 pesos to £1 and 2.80 U.S. dollars to £1, thus absorbing the provision of £442,733 and giving rise to a further loss of £706,070.

To facilitate comparison, the 1949 figures shown in the accounts have been adjusted to this different method.

It will be noted that the balance of U.S. dollars on hand in Argentina has been reduced to \$4,318,919; certain transfers have been permitted, and some 32 per cent. of our liability to U.S. deferred creditors has been paid. We are hopeful that we shall soon be in a position to settle in full.

Due to difficulties of supply sales for the year are down, and costs are steadily rising; the result is that profits before taxation have dropped by £679,734 to £779,152, but after deducting the exchange loss, Argentine taxation, contingencies reserve and preferred dividends, and adding a net credit for U.K. taxation, there is a surplus of £58,352 to be added to undistributed profits, which now amount to £303,484.

No financial remittances have been received from Argentina during the year and while this state exists, and we are unable to pay the large sum due to the Inland Revenue, your directors greatly regret that it is impossible for them to recommend a dividend on the Ordinary stock.

THE CURRENT YEAR

The Argentine sales prospects for the current year may be considered good for the following reasons:

Sales for the first four months are in excess of the same period last year. Existing stocks of merchandise and the ability to replenish them assure adequate sales for the remainder of the year. There are favourable reports on the state of the coming harvest.

Last year I reported to you on the severe restrictions on imports. With the notable exception of agricultural machinery and repairs from U.S.A., these restrictions have continued. I am glad to tell you, however, that as a result of the strenuous efforts of your Argentine management your company received a substantial quota of agricultural

machinery permits and large shipments have been made and are continuing to come forward.

Further, to counter the contraction of imports, many new locally produced lines have been added to the long list already handled. Thus, even if there be a complete ban on imports—an unlikely event—your company should be able to maintain satisfactory sales for some time to come.

Sales should be adequate but the rate of gross profit on certain lines will be less, and operating expenses continue to rise. We should be able to absorb such additional charges as derive from the new increases in Argentine tax rates or an increase in interest rates, but it will be appreciated that your company's main operating expense is caused by wages and salaries and any large increase in this already heavy item could quite easily turn a profit into a loss.

GENERAL REMARKS AND EXCHANGE

You will appreciate from the review of the accounts for the year to June 30, 1950, and the forecast given above, that your company's assets and business are principally in Argentina and, in consequence, your fortunes are tied up to the fortunes of that country. The prospects of a substantial peso profit for the year to June 30, 1951, are good, but this is a British company with sterling capital, on which sterling dividends must be paid. There is no knowing what the conversion rate of pesos to pounds may be at June 30, 1951. Argentina further devalued her currency on August 28th last, and on September 1, 1950, the "free market" rate closed at 38.72 pesos to £1. Should this rate rule at June 30, 1951, then your company is faced with a further exchange loss on the net balance of Argentine current assets of some £1,045,000 and the profits for the year to June 30, 1951, will produce much less sterling than if the June 30, 1950 rate of 25.26 were applicable for conversion. This further exchange loss, when and if it arises, is chargeable for U.K. taxation, therefore the whole burden would not be borne by the company.

Although your company's main sphere of operations is Argentina, a limited amount of business has been done in the neighbouring countries of Uruguay and Paraguay. The Board consider that this dependence on one area for sterling returns is not in the interest of stockholders, and they have, therefore, plans under consideration for entering new markets.

No early results can be expected from these plans, therefore stockholders' hopes of a resumption of dividends must be based on:

(a) the successful conclusion of the negotiations shortly to take place whereby remittance of past profits from Argentina may be effected at the earlier promised rate of 19.37 pesos to £1;

(b) the fulfilment of Argentina's recent promise to permit remittance of profits at the rate of 5 per cent. per annum on the foreign capital invested in Argentina;

(c) an improvement in the present Argentine "free market" rate of exchange.

I wish to tender the thanks of your Board to Mr George S. Houlgrave, your Argentine general manager, for his outstanding work during this last difficult year, to Mr H. Wilfrid Lilly, your New York manager, for his tact and drive in obtaining such excellent shipments from our North American friends and to all the loyal and energetic members of the organisations in London, Argentina and New York.

THE PLESSEY COMPANY

(Manufacturers of Components for Electrical and Engineering Trades)

The twenty-sixth annual general meeting of The Plessey Company, Limited, was held on December 29th in London. Mr A. G. Clark (chairman and managing director) presiding.

The following is the chairman's circulated statement:

The accounts for the year to June 30, 1950, which are now submitted to you, cover a period in which trading conditions were somewhat more difficult than during the preceding year. However, as between the commencement of the year in July, 1949, and its close in June, 1950, there was a considerable measure of improvement, and I am glad to say that, down to the present time, this improvement has been maintained.

For the first five months of the present year profits have been running at rates well in excess of those for the corresponding months of last year, and we therefore anticipate that the current year will prove altogether more satisfactory than that now under review. It is for this reason that, although our profit was somewhat lower than for the preceding year, as will be seen from the profit and loss account, we are recommending the maintenance of the dividend at the rate of 20 per cent., which was paid last year. We have been the more ready to make this recommendation since we consider the long-term prospects of the company to be most encouraging.

EVER-WIDENING FIELD

The programme of research and development undertaken by the company over recent years is proving of great advantage to us, and as some of the projects on which we have been engaged come to the stage of commercial application, we are finding it possible to secure a satisfactory volume of contracts covering an ever-widening field.

Those branches of the business particularly concerned with the aircraft industry are very busy and would seem likely so to remain for some time to come. We have experienced a heavier demand for domestic radio and tele-

THE CHAIRMAN'S REMARKS

Addressing the meeting the chairman said: You have already received my statement on the affairs of your company. Although dated December 4th this statement was prepared during the early part of November. Even now I find that there is little useful information I can add. Then, we had prospects of successful negotiations between the Governments of the U.K. and Argentina—today we are unable to report any marked progress, but sales continue on the high level predicted, and while a serious strike in several of the factories of our principal supplier in U.S.A. has held up deliveries, I am glad to say that this has now been settled and we are hopeful of an early resumption of shipments from this source.

Prospects of additional import permits for goods from U.K. and U.S.A. are perhaps brighter, but the rearmament programme in these countries may restrict deliveries.

The amounts due to our U.S.A. creditors and bankers on deferred account still remain unpaid, although we are promised that we shall be in a position to settle by the end of January.

I confirm that trading prospects for the current year are good; but stockholders' main interests are:

- (1) what are the Argentine trading profits going to be worth in sterling;
- (2) what are the prospects of a substantial profits remittance;
- (3) and at what rate of exchange are we to convert the Argentine net current assets at June 30, 1951.

These are three imponderables, the answers to which I cannot predict. I can only say that today's "free market" rate of exchange is some 39.17 and comparing this with the 38.72 pesos to £1 quoted in my statement, the additional exchange difference on the net balance of Argentine floating assets now becomes £1,067,000, an increased adverse difference of £22,000.

The report and accounts were unanimously adopted. The retiring director, Mr Donald Moir, M.Inst.C.E., M.I.Mech.E., was re-elected a director of the company, and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

FIRST GARDEN CITY

EFFECT OF NATIONALISATION

The forty-seventh annual general meeting of First Garden City Limited was held on January 4th in London, Sir Eric Macfadyen, M.A., J.P., the chairman, presiding.

The following is an extract from his circulated statement:—

The year has been one of internal reorganisation necessitated by the contracted scope of our activities following the nationalisation of electricity and gas. Negotiations with the authorities over details of compensation were completed. The management and development of these utilities had for years been a large part of our business: we now retain only our water undertaking, the latest pumping station for which—Fuller's Well—was all but completed during the year. We can now supply a population of 35,000 with all the water they may require, if past experience can provide guidance as to the requirements of a population of that size.

We have not during the year made much advance towards that population target: the development of Letchworth continues to be held up by the difficulty in overtaking the housing shortage. The U.D.C. was able to make a start on 217 council houses and to complete 60 of these and to secure permission for 60 prefabricated aluminium bungalows. Private housing has been limited to no more than 10 new houses, 7 of which are completed.

In the accounts you will see that property is higher by £32,967—owing to improve-

ments of a capital nature. On the opposite side of the balance sheet we now show the net surplus on expropriation of gas and electricity. The excess of current assets over current liabilities is due to a settlement with the revenue in this connection.

The report was adopted.

THE AVON INDIA RUBBER COMPANY

TURNOVER INCREASED BOTH IN COMPANY VOLUME AND VALUE

FULL ORDER BOOK

MAJOR R. F. FULLER'S STATEMENT

The sixty-first ordinary general meeting of the Avon India Rubber Company, Limited, was held on December 29th at the company's offices, Bath Road, Melksham, Wiltshire.

Major R. F. Fuller, D.L. (the chairman), presided.

The following is his statement which was circulated with the reports and accounts:

The sixtieth annual report and accounts submitted to the shareholders of the company show that the net profit for the year, before providing for taxation, amounted to £222,045, compared with £166,936 in the previous year. After making provision for all requirements, including taxation on the profits for the year, the net profit remaining is £102,045, which compares with £67,936 in the previous year.

I am pleased to report that our turnover has increased both in volume and value, but the cost of our raw materials continued to rise steadily throughout the year. The necessary corresponding increases of the selling prices of our products were, however, only introduced when it was seen that no amelioration of conditions in the raw materials markets could be considered possible. Towards the end of the year the rise in commodities, particularly raw rubber, created some uncertainty in respect of the future outlook. In consequence your directors have deemed it prudent to set up a reserve to take care of any future violent fluctuations. This is shown in the balance-sheet. We believe the uncertainties to be short term and as we have a full order book covering us for many months ahead we can look forward to a steady turnover.

The report was adopted.

ADDITIONAL BORROWING POWERS SOUGHT

To cover the higher cost of inventories and to provide funds for expansion, additional finance is required, and your directors are taking the necessary steps to increase the company's borrowings. In this connection an alteration to the articles of association is necessary to clarify the powers of the company and an extraordinary general meeting has been called for that purpose. Opportunity has been taken at the same time to seek amendment of the articles governing the number of directors and their remuneration and a separate notice covering these recommendations has been sent to each shareholder.

Current assets exceed liabilities by £689,993. Further additions to our fixed assets to the value of £98,781 have been made during the year. Our capital commitments at the end of the financial year were £75,030.

Our relations with all our employees continue to be completely harmonious and I should like to take this opportunity of expressing our thanks to all workpeople and staff for their loyal support throughout the past year.

The report and accounts were adopted and the retiring directors, Mr E. H. F. Fuller and Mr F. W. Hinde, were re-elected.

At a subsequent extraordinary general meeting resolutions amending the articles of association were approved.

LONDON AND RHODESIAN MINING AND LAND

POSITION STRENGTHENED

The annual general meeting of this company was held on December 28th in London.

Sir Joseph Ball, K.B.E. (the chairman), said that there had been a substantial strengthening of the balance sheet position during the year and there was every indication that that improvement would be carried still further during the current year. The Board had found it possible to increase the dividend, having declared an interim dividend of 6 per cent., less tax, in respect of current year as against one of 5 per cent. for the past 11 years.

Reverting to the company's balance sheet, the position was, in fact, a good deal stronger than that indicated by the actual figures. For example, under "Fixed Assets," farms, ranches, town stands and buildings, were of considerably greater potential value than the figure at which they appeared, while the company's mining properties also, in the opinion of the Board, stood at a figure well below their intrinsic value.

The company's valuable land holdings and buildings comprised over a million acres of land and 27 town stands and buildings situated in Salisbury, Bulawayo and other important developing centres in Southern Rhodesia. Of that acreage, 547,951 acres were represented by their ranches, Wiltshire and Lochard. The present-day value of those assets was known to be very much in excess of the figure at which they appeared in the balance sheet and they intended to pursue a forward policy with regard to any of the company's land which was ripe for development.

The report was adopted.

ALLIED RETAIL TRADES (LONDON) LIMITED

IMPROVED TURNOVER

The third ordinary annual general meeting of the Allied Retail Trades (London), Limited, was held on December 29th, in London, Mr W. H. Martin, chairman and managing director, presiding.

The following is an extract from his circulated statement:

The trading profits from our branches amounted to £101,337 (£105,098). The net profit of £62,973 (£70,611), has been appropriated as to £40,000 (£41,000) for taxation, £6,050 (same) for the net preference dividend, £15,139 (£16,653) for the net ordinary dividend of 15 per cent. which it is proposed to pay for the year, £362 (£3,619) for special repairs carried out during the year and the balance of £1,422 (£3,289) is carried forward.

The result of the newspaper and tobacco group reflects a healthy and virile condition—both turnover and profit from the shops already held by the company at the beginning of the year showing satisfactory improvement. The total branch profits of the group advanced from £86,181 to £96,705.

The result of the bakery group has been disappointing. Both trade and profit margins have been affected. There were variations in the subsidy and in the prices imposed by the Ministry of Food which have affected the year's results. Trade has improved and savings of expenditure have been made. We thus look with confidence to a considerable improvement of the bakery results.

Our gross turnover for the year was £1,511,366, as against £1,395,646 for the previous year, showing an increase of £115,720, or 7.6 per cent. This increase is in part due to the sales from the shops purchased during the year and in part due to slightly increased sales from the old shops.

The report was adopted.

GASCOIGNE (READING)

(Mining Machine Specialists)

AGGRESSIVE RECORD

The fifth annual general meeting of Gascoigne (Reading), Limited, was held on December 28th at Reading.

Mr Geo. H. Gascoigne (chairman and managing director), who presided, in the course of his speech, said: Again we report to you that the turnover for the year 1949-50 was a record in the history of the company. The export turnover particularly has shown a marked improvement and the profit earned is a record.

Our net profit for the year at £107,915, after provision for all expenses, including directors' fees and full depreciation, compares with £80,623 for the year 1948-49, £45,066 for 1947-48, £30,609 for 1946-47 and £22,504 for 1945-46—a truly progressive record over the past five years. We have provided for taxation in the sum of £60,000, which represents over 55 per cent. of our net profit.

The continually increasing taxation on the profits of industry creates a load on the administration of a business which hampers the full development of resources and depletes the funds which should be available for additional capital expenditure.

I am definitely of the opinion that progressive companies like ours should have the maximum assistance from the State and not be forced to pay the high percentage in taxation which is now demanded from us.

Your directors recommend a dividend and export bonus at the same rate as for the year 1948-49, giving the total distribution to shareholders of 30 per cent.

The total of our share capital, undistributed profits and reserves now amount to £210,751, or more than 110 per cent. over our issued capital.

The financial position of the company is very satisfactory. There is a surplus of assets of £110,751 and a share capital of £110,751.

PROSPECTS

At previous general meetings I have expressed hopes for the future which have each year been fully fulfilled. It is, however,

difficult to foresee the results of the coming year. I am convinced the demand for your company's products will continue but, with the present political and international uncertainties and the restriction in materials, together with the menace of the nationalisation of the steel industry, I hesitate to make any definite prognostications.

I fear that production of steel will decline and prices rise. Our intensive export drive has borne good fruit, and, subject to our overseas connections being able to obtain permits and currency for their needs, will, in my opinion, continue to increase. You can rest assured that your directors will do all in their power to meet the demands of the dairy farmer, both home and overseas, and that your company, which is a good example of free enterprise, will continue to flourish in spite of all State interference and the tendency to nationalisation.

The report was adopted, and at a subsequent extraordinary meeting resolutions increasing the company's capital and for an issue of bonus shares were approved.

JOSHUA TETLEY AND SON, LIMITED

The fifty-fourth annual general meeting of Joshua Tetley and Son, Limited, was held on December 28th at the registered office of the company in Leeds. Mr C. H. Tetley (chairman of the company) presiding.

The chairman, in the course of his speech, said: Our gross income for the year was £5,810,070 and this amount was absorbed in the following manner:

Beer Duty and Licence Duty	65.2
Income Tax and Profits Tax	4.9
Materials and Production Costs	10.2
Wages and Salaries	5.0
Trade Expenses	8.3
Depreciation and Reserves	4.0
Interest	0.4
Dividends	7.0
	100.0

As regards the profit and loss account, I have certain comments to make. First, as

regards depreciation: we charge each year what we regard as an adequate amount for depreciation but this charge is greater than the wear and tear allowances granted us by the Inland Revenue. The difference is accounted for by the fact that we charge depreciation on our properties but this charge is disallowed for tax purposes. We have thought it right this year to transfer £100,000 to general reserve as against £50,000 last year and hope the stockholders will approve of this appropriation as being a prudent one in order to retain a greater proportion of our profits in the business. Property Improvements Reserve receives £25,000, which is the same amount as was allocated last year.

We propose to pay a final dividend on the Ordinary stock of 7 per cent., less tax, plus a bonus of 4 per cent., less tax, which is at the same rate as last year.

In the chairman's statement which was circulated with the notice of this meeting reference was made to negotiations then in hand for the acquisition of licensed properties in Lancashire. I am glad to be able to inform you that these negotiations have now been brought to a satisfactory conclusion and the company has agreed to purchase from Messrs B. Cunningham, of Warrington, a total of 52 licensed properties of which 34 are on-licences and the remainder off-licences, for the sum of £550,000. Having regard to our established position in Lancashire, I feel sure that these properties will prove a valuable and profitable acquisition. The Capital Issues Committee has now consented to the issue of £800,000 4 per cent. Debenture Stock in order to finance this purchase and to strengthen the company's working capital position. Your directors have resolved to create this stock and issue it as soon as the necessary detailed arrangements can be completed. It will be offered for subscription to the holders of the company's Ordinary, Preference and 3½ per cent. Debenture Stock and underwritten in the usual way. You will be receiving circulars with full information in the course of the next few weeks.

The report and accounts were adopted.

At the conclusion of the annual general meeting an extraordinary general meeting was held at which a Special Resolution was passed adopting a new article increasing the borrowing powers of the company to 1½ times the nominal amount of the issued capital.

NOTICES

MINISTRY OF LABOUR AND NATIONAL SERVICE

Applications are invited from men and women for appointment as Personnel Management Advisers in Scotland, East and West Ridings, Eastern (centred on Cambridge) and Southern (centred on Reading) Regions. Candidates must have had extensive experience as Personnel Officers (whole time) in industrial undertakings. They should be able to advise firms on matters of personnel policy, on the organisation of personnel departments and the technique of personnel management. In particular, knowledge of modern employment and training methods, joint consultative procedure and industrial welfare is essential. A degree in sociology, economics or some cognate subject, or a social science diploma is desirable. Salary ranges for these posts are:—Scotland and East and West Ridings, £855 x £25—£1,021 (men), £710 x £25—£880 (women); Eastern and Southern, £835 x £25—£997 (men), £695 x £25—£860 (women). Starting salary according to qualifications and experience. These posts do not carry any pension claims.

Written applications, giving date of birth, full particulars of education, qualifications and experience (including a chronological list of appointments), together with present salary, should be addressed to R. C. S. London Appointments Office, Ministry of Labour and National Service, 1-6, Tavistock Square, London, W.C.1, to be received not later than seven days after appearance of advertisement. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

Information bulletins, Journals of Societies or Institutions: Editing, design, layout, and finalization of text for printer. Moderate fees. Inquiries from Embassies, literary, social and industrial bodies.—Box 561.

Do you believe the Economist? Then see final paragraph page 53. The better firms of insurance brokers alone offer reasonably disinterested and knowledgeable service.—Insurance Consultants Limited, 61/2, Lincoln's Inn Fields, London, W.C.2. Telephone: Holborn 3392.

MARKET RESEARCH. Competent economist with thorough knowledge of statistical method required to take charge of market research department of a large company with factories in various parts of Great Britain. A salary commensurate with experience and ability will be paid. Minimum age 30. Box E 775, L.P.E., 116, St. Martin's Lane, W.C.2.

ASSISTANT SECRETARY.—British Nylon Spinners Limited have an immediate vacancy for an Assistant Secretary at their Head Office at Pontypool, Monmouthshire. Candidates, aged over 30, should be Barristers or Solicitors of outstanding ability with a commercial flair and previous experience in industry—in a manufacturing concern with overseas interests for preference. This is a senior appointment which is pensionable and will carry a salary and prospects in keeping with the rank and responsibilities of the position. Write to Personnel Manager, Pontypool.

THE Wellcome Foundation Ltd., invites applications for the post of Manager responsible for a Division of the Wellcome Chemical Works, Dartford. The post entails responsibility to the Works Director for pharmaceutical manufacturing and packaging departments, together with the Production Control Office. It involves co-ordination with the specialist service departments in the works and liaison with the central purchasing and sales organisations. Candidates should possess managerial experience in the industry, coupled with technical qualifications and qualities of leadership necessary to direct the activities of a highly qualified technical staff. The post is a new one; it has been previously advertised but no appointment was made from the candidates who presented themselves. Applications, which must be received by 31st January, 1951, should be made on a standard form which will be supplied on request to the Works Director, Wellcome Chemical Works, Dartford, Kent.

SECRETARY Leading Public Corporation seeks return high level appointment under private enterprise. Age 40, qualified lawyer secretary. Wide experience business administration, banking, commerce and assistant legal adviser international oil group. War service Regimental and staff officer Brigadier's appointment.—Box 551.

though increasingly determined, is fatalistically so. There is a sinking feeling that the whole horrible business that this generation has known twice before is beginning again, a conviction that, however mildly it starts, it will inevitably cumulate until the burden is intolerable. If full war comes, this will indeed happen. But if war does not come—and the object of the policy is to prevent it—then what is now planned is only a fraction of what the country went through between 1939 and 1945. At the height of the war, in the middle of 1943, there were 10,206,000 men and women in the Forces, in civil defence and in war production. A specific programme of re-armament could be turned into a similar figure of manpower required; one may guess that it would come out at about one-quarter of the 1943 total. This is still an enormous waste of effort. But how much more rational it seems to ask the people to make the effort of a quarter-war to ensure their safety than to allow them to believe that there will be a steady drift back to all the home-front miseries of total war.

Priority

The programme once drawn up, it is very easy to declaim that nothing shall be allowed to stand in its way. Most people are now ready to say that; but very few of them realise what is meant by it. An article on a later page illustrates some of the hurtful things—not really important in the national life as a whole, but distinctly inconvenient and unpopular—that will have to be done to get the needed number of men into the armed forces. At the other end of the scale, it is equally clear that sacrifices of wealth will have to be made, and it follows that the largest sacrifices will have to be made by those who are still comparatively wealthy. But those who make their sacrifices in person and those who make them in money have a right to ask two things of the politicians. The first is that nothing shall be asked beyond what is necessary and useful. There is perhaps little risk of too many men being called up. But there is a very great risk of too much wealth being conscribed. A capital levy is a prime example of a device that would squeeze an ounce of real benefit to the community out of a ton of sacrifice by capital-owners. Giving defence priority means abjuring acts of class warfare such as that. The second thing that the public has a right to ask of the politicians is that they, too, shall sacrifice something. There are already hints that it is “impossible” to reduce other forms of Government expenditure to meet the rising cost of defence. This means, of course, that the citizen is going to be asked to make all the necessary cuts in his own personal expenditures, the reduction of which seems fully as impossible to him as cuts in grants and subsidies seem to Mr Gaitskell. The Budget will be a very clear test indeed of whether the Government is really determined to give defence an effective first priority.

Personalities

The burden even of a quarter-war will not be borne unless the people have confidence in their leadership. The figures of the latest Gallup Poll published in the *News Chronicle* on Tuesday are most illuminating. Mr Attlee's personal popularity has risen since October by two points; he enjoys a clear majority of approval. But the stock of the Government as a whole has slumped in the same period by no less than 7 per cent, and is now at its lowest ebb.

Unfortunately, it is precisely in the most crucial departments that confidence is lowest. Public opinion has been very kind to Mr Bevin, since it admires the gallantry of his fight against illness. But the safety of the realm is involved. Mr Bevin, to put it bluntly, is no longer equal to his work, and it is imperative that in these critical months the country should have a Foreign Secretary who is fully alive and awake and capable of inspiring confidence both at home and abroad. The quartet of defence Ministers also inspire the reverse of confidence. Mr Shinwell has done very much better at the War Office and the Ministry of Defence than he did at the Ministry of Fuel and Power. But he is a controversial figure, an embittered and embittering man; his “tinker's cuss” speech is not forgotten; and it is not for him that sacrifices will be made beyond the call of duty. Lord Hall and Mr Arthur Henderson are nonentities; and Mr Strachey is perhaps the most distrusted figure in the Government. Taken together, it can be said of these four that they may not frighten the enemy, but they certainly frighten the British public.

No Prime Minister has ever had a clearer duty than Mr Attlee has to replace these five of his colleagues by men who will inspire real confidence, not only in the Labour Party but in the country as a whole. If there were in the Parliamentary Labour Party reserves of talent to be drawn on for the purpose, the Prime Minister's task would be easy. But there are not; one needs only to listen to the names that are put forward for the Foreign Office in current speculation to realise how very restricted, how almost non-existent, is the choice. It is therefore necessary to go outside the ranks of the party. Even this, however, does not by itself make a coalition of the parties strictly necessary—certainly not a coalition in the ordinary sense, a sharing of the patronage of office among the stalwarts of both the major parties. There are strong personalities among those servants of the state who are not active politicians. There is among the ambassadors at least one who would make an admirable Foreign Secretary; there is among the retired service chiefs at least one excellent Minister of Defence. But it is not to be supposed that personalities of this sort would take office in a partisan Cabinet still bent on such spasms of doctrinaire spite as the nationalisation of steel. At the very least, a party truce is necessary if there is to be real leadership. And if the best men are to be sought for the job, it would be wrong to exclude active Conservative politicians just because they are active Conservative politicians—and just as wrong for them to exclude themselves.

We shall be told that this is not practical politics. But if practical politics is to continue to be the order of the day, the writing on the wall is clear. Labour's popularity is slumping, and with a fuel crisis added on top of the burdens of defence, it will clearly slump further. Is it really in Labour's interest that it should limp on, steadily losing its moral authority, until in the end it is forced into an election which, after such a performance, might well be another 1931? Can it conceivably be in the country's interests? Is it not far better to admit that the British nation is once again in grave peril, and that not only its manpower and its wealth need to be called upon without exemptions, but also all its resources in the art of government? The three Ps—Programme, Priority, Personalities—will not combine with Party; they will with Patriotism.

The Framework of Alliance

THE machinery of the Atlantic Pact, now nearly two years old, remains for the layman as mysterious, incoherent and confusing as ever. “There was a time when no one outside the organisation could understand what went on inside,” so a distinguished adviser at the Brussels meeting of the Atlantic Council was heard to mutter. “But,” he continued sadly, “now no one inside can understand either.” Comforting as this is for the outsider to hear, it unfortunately does not relieve him of the obligation to try to understand. For, with the appointment of a Supreme Commander for the integrated Atlantic force in Europe, with the need to get things done, the treaty nations face the alternatives of achievement or failure. This is the moment for as many people as possible to know what kind of an organisation has been created, what functions it must perform and what jobs it cannot do.

Though its primary concern was with the defence of Western Europe, the North Atlantic Treaty also contained an ambitious Article 2 which implied that new economic and political relations might also grow under its auspices. When it was signed in April, 1949, some important questions in connection with this Article rose to the lips of its signatories; but there they have remained, so far as the public are concerned, suspended and unanswered. Will the treaty organisation replace the purely European association of the OEEC as the framework for America's economic relations with free Europe and for free Europe's economic associations within itself? And can it be so expanded that ultimately it becomes the international organisation to end all such organisations, the main and adequate focus of international co-operation in the western world? Though many of his European colleagues were of a different persuasion, Mr Bevin for one would have liked to say Yes to both questions; British opinion has always looked beyond European association to the wider Atlantic community. But, as committee begets committee and organisations multiply, experience seems to point the other way.

The last eighteen months have seen the North Atlantic Treaty Organisation absorbed in the business of planning defence, while its relations with existing organisations and its own internal structure seem to have grown more, rather than less, confused. Until last September, its outward and visible signs of activity amounted to little more than many meetings and several plans. The Foreign Ministers had met twice to consider “principles and objectives,” and two similar meetings of their Ambassadors had been held in Washington. Then, realising their own inadequacy, they appointed a standing committee of deputies. The military committees made some prompt and detailed analyses of how much was needed and how little was available in the way of men and materials. The production committee amassed a great deal of information about what could be produced where, and how efficiently. There were three meetings of the Defence Ministers to take note of these findings at various stages. And there had been some considerable, though apparently haphazard, shipments of arms across the Atlantic. As early as May last year the Foreign Ministers admitted that the strategic concept of the Treaty had been adopted and a defence plan drawn up,

but nothing had been done to put plans into practice. The same is very nearly true today.

But since September there have been new stirrings in Europe and America which are beginning to suggest a more effective line of action for the future. Perhaps, equally important, the scope of the organisation is beginning to appear in a colder, clearer light.

★

In October it was finally decided to take the bold step of recognising the necessary connection between the activities of the OEEC and the comparatively new defence organisation, rather than that Nato should set up its own economic division. A joint economic and financial group was instituted in Paris. At least on the financial side it was thus accepted that OEEC had access to facts and men which it would be vain as well as foolish to duplicate. The marriage was arranged without prejudice to the question of whether OEEC would be ultimately absorbed by Nato or retain its individuality. Again, on the financial side, the Americans are gradually drawing the tangled threads of their foreign aid through the eye of a single needle in the person of Mr Thomas D. Cabot in Washington. In future there is to be one foreign aid programme presented to Congress, the administration of this aid is to be centralised, and a broadly uniform criterion applied to its distribution. “This is what you need and deserve for your capacity to resist Communism” will replace the old label of “for your economic recovery or development.”

There can be only one logical conclusion to these developments: the duplication of recipient organisations will have to be brought to an end. There is no longer any room for, or sense in, the system whereby one European organisation receives and administers aid for recovery and another aid for defence. And, as Mr Gordon Gray foreshadowed, the organisation with which the United States has the relationship of an external patron will have to surrender to the new concept of “mutual” aid. Where economic recovery is still considered incomplete it will have to figure merely as one of the factors which condition the contribution each country can make to the Mutual Aid programme of the Atlantic Pact. This would leave a few neutrals, now members of OEEC, out in the cold; but they draw little or no aid, and it should not be difficult to make *ad hoc* arrangements for them. The staff of OEEC will, of course, be needed. And there are still certain important functions, such as the administration of the European Payments Union and the progressive relaxation of import restrictions, which must be performed by some primarily European organisation. But as the executor of American aid to Europe, and the interpreter of Europe's economic relations with America, OEEC's functions will, from now on, inevitably tend to pass to Nato.

The North Atlantic Organisation itself is faced with the difficult transition from planning and preparation to executive action. In the planning phase, it has not been unduly hampered by having to work in twelve-man committees. But when it comes to action, the taking of decisions and seeing to their execution, some more cohesive organisation is clearly needed. On the military

60

side, a solution to the problem was ready to hand. There is a precedent for a Supreme Headquarters and there is a popular and trusted Supreme Commander available. It does not follow that the road is quite clear for General Eisenhower. He will have to seek his major political instructions—such as were provided between 1941 and 1945 by the conferences and correspondence of the President and the Prime Minister—from somewhere. And he will have to seek means of securing the fulfilment of his demands for men and material. But, on the military side, at least the pattern of the organisation is clear.

The Brussels meeting of the Atlantic Council, which asked for the appointment of General Eisenhower, also set up a Defence Production Board, and Mr Acheson added that it should also have a Supreme Commander to match, in production of arms, the position of General Eisenhower in their use. The need is certainly there; some unifying and executive force is clearly needed before the twelve nations will effectively take the common action that is required. But the problem of organisation is more difficult. Not only is there no one with General Eisenhower's prestige available, the nature of production is also more complicated. It depends on questions of labour supply, plant capacity, raw materials, designs and the like; it does not lend itself to Supreme Commands, but rather to an elaborate process of comparison and co-ordination of programmes and requirements. In the war, in spite of the existence of a Combined Production Board, production was never run as a single programme; the very useful work that was done was more in the nature of marginal adjustments between two large (and a number of small) national production programmes. But this work was useful and essential, and its equivalent will be needed in Nato now. The major difficulties are two: first, that there are twelve participants this time, not three (Canada was a member of the Combined Production Board); and, secondly, that this is still a period of phoney peace, when war production, though it may now be given an effective first priority, does not have an exclusive priority. There is a great difference between preparing for a contingency and facing a reality. The proper form of organisation

THE ECONOMIST, January 13, 1951

remains to be worked out. Two guesses, however, are possible. The most effective organisation will probably be found to take the form of a central staff rather than of a Supreme Command; and the twelve members of the Treaty will have to be content to delegate the major part of the work to three or four of their number.

Raw materials raise similar, but subtly different problems. For one thing, they can hardly be discussed within a North Atlantic framework alone. And for another, what is needed here is considerably more executive in function. Production must be organised, in the main, on national lines, but the allocation of raw materials can only be done internationally. It is known that discussions on the best form of organisation for dealing with raw materials have been going on since Mr Attlee was in Washington, though the outcome is still uncertain. Here, again, it is a question of creating a body small enough for effective action, but large enough adequately to represent a number of governments no one of which can be coerced.

Thus the outlines of an effective organisation for the great alliance of the free nations are beginning to emerge. But the crown is still missing. In the last war, the combined machinery derived its authority and its impelling drive from the periodical conferences of President Roosevelt and Mr Churchill. This supreme organ will also, in some form, have to be reconstituted. Quite inevitably, too, its core will have to be American and British. Not only are these two the strongest partners in the North Atlantic Treaty, they are also the only ones whose world-wide responsibilities enable them to fit Europe into its proper place in the world picture. From the British point of view, of course, the ideal would be the continuance of the wartime two-nation association, and Mr Attlee's visit to Washington in December, which had full French blessing, might seem to provide a new precedent. But it is unlikely that quite such an exclusive partnership would be agreeable, for long, either to the Americans or to the Europeans. Some broadening of the basis will be required; but the warning should be given and heeded that too wide a divergence between formal and real responsibility will lead straight to ineffectiveness.

Manning the Army

THE military planning of the British Government has until recently been proceeding one step behind the march of events. When war broke out in Korea official planning was still, in all important respects, based on the necessity to be ready for an emergency in 1954 or 1957. In the intervening six months the plans have been overhauled in order to take some account of the urgencies of the international situation. In August the decision to increase the defence budget by about £350 million a year was announced. In September, the period of national service was raised to two years and the scales of service pay considerably increased. It is generally understood that, following on the meeting of the North Atlantic Council in Brussels before Christmas, the scale and speed of expenditure on armament production have again been revised and that a much expanded programme will be announced when Parliament reassembles.

It is not possible to make an accurate assessment of

the new British defence preparations until the revised programme has been announced or to make any detailed judgments on future plans until this year's White Paper on Defence has been issued. But it is clear that Britain now has a considerable military establishment, and that if it is not adequate to the task in hand, it is less inadequate than that of any other European nation. No member of the Atlantic Pact at present imposes a longer period of national service. If in the past the production of new aircraft and weapons has been too slow, no other nation, except the United States, is taking swifter steps to repair its mistakes. During 1951, Britain will dispose of ten, and possibly more, divisions, and four of these divisions will be in Western Europe. When the British contribution in Korea, the responsibility for containing Communism in South East Asia, and the almost single-handed responsibility for the safety of the Middle East are taken into consideration, four divisions

will be proportionately a higher contribution than that of any other North Atlantic Treaty nation.

Britain has no reason for self-reproach, but even less reason for complacency, for the increased defence measures that are being taken only postpone and do not solve a very grave problem of military manpower. The truth is that the increase in the number of army divisions now taking place represents not the beginning of a gradually accelerating build-up of force, but something very near to the maximum increase that, on present organisation, can occur in time of peace. Even with the addition of the 55,000 extra national service men that the army is acquiring as the result of the extra six months' service, even if the increased rate of regular recruiting overtakes the present rate of wastage and eventually brings the regular army to something near a quarter of a million men, and even if the present changes in the organisation of the army's rear echelons yield their full dividend, it is difficult to see how more than ten or twelve divisions can be formed. The skilled, responsible, experienced men, without whom a modern battalion or division is merely a crowd of men, do not exist in the army in sufficient quantities to enable any further expansion of formations.

But it is upon just such a steady expansion that the security of the West, during the next few years, depends. The problem is seen at its clearest in considering the defence of Western Europe. There are at the moment rather more than ten divisions in Europe. On present plans there will be some twenty by next autumn, including four from Britain. But it is generally accepted that there can be no certainty of deterring a Russian attack in Western Europe without a force of between 35 and 55 divisions. Quite aside from the question of the German contribution, it is clear that every North Atlantic country has to be prepared to increase its forces over the next two or three years to double or more than double what it now has in Western Europe. It is conceivable that a relaxation of pressure in Asia might enable Britain to increase its contribution to European defence without raising fresh formations, but it is equally likely that more troops will be needed elsewhere, for example in the Middle East.

The problem is not an urgent one, in the sense that it has to be settled within the month. Too rapid a mobilisation, either in the army or in the RAF, would outstrip the mobilisation of industry and the production of equipment, causing harm to the economy and demoralising the troops. The difficulty is to find a way to effect a peacetime build-up of the forces at all, since despite the emergency measures that have been taken recently, the British Army is organised for only two contingencies, a mild policy of containment and an all-out war at a future date. The British Government has taken measures to meet both these contingencies, but it has not yet provided—and appears to have little thought of providing—for the third and most likely contingency, a period of partial mobilisation aimed not at fighting, but at preventing a war.

It is not easy to arrive at any solution. One method of approach would be to apply with even greater vigour the methods which have recently been used to bring the army up to its present position. Service pay could be raised again in, say, another twelve months, and if the

response produced a satisfactory increase in regular recruiting, it could be followed by raising the period of national service to two and a half years. This would be coupled with less drastic measures, such as increasing the period of regular engagement. But there are obvious objections to this course of action. In the first place, the result of further pay increases would be unpredictable, especially if civilian wage rates go on rising. Without a significant increase in the size of the Regular Army there would be no point in extending the period of national service.

The other course is to fall back upon the reserves of military manpower, the Territorial Army and the Class Z reserve. At the present moment, the Territorial Army is growing, and when the intake of national servicemen, who are committed to three and a half years Territorial service, reaches its peak, the force will consist of 50,000 men, the bulk of whom are, of course, committed to Anti-Aircraft Command. The Class Z reserve has now been roughly classified by the Service ministries, and it is possible to contemplate a call up, or at least, the registration, of the whole or part of it.

The obvious way to secure a steady expansion in the number of formations is to follow the American procedure—that is, to fill the gap between the capacity of the Regular Army and the dictates of strategy by mobilising three or five Territorial divisions. The great advantage of calling up a complete division rather than a mere number of men is that it is a balanced organisation which can be trained to battle efficiency in a relatively short space of time. These divisions would be called up in rotation for a definite period—say a year or eighteen months—for service in Western Europe only. The gaps in their existing ranks would be filled by mobilising selected Class Z reservists for service with these divisions, not merely, as has been suggested, for a short refresher course. Thus the year 1954 might call for the mobilisation of a Territorial division in the West Country, one in the Midlands, and one in Scotland; in that year the area, say, Plymouth, Exeter and Bristol would be rather short of lawyers, garage mechanics, country gentry and building labourers, who would be concentrated as a division in the Ruhr or the Ardennes. The American Army has called up a number of national guard divisions and, in the areas from which they have been drawn, experience has shown that a great deal of inconvenience but no chaos has ensued.

It would be idle to pretend that the use of Territorial divisions would not conflict with the manpower requirements of the civil economy. It is true that three Territorial divisions add up to only about 55,000 men and that a great deal of their supply overheads behind the lines could be borne by the existing regular establishment. It is also true that there is a great deal of manpower which could be wrung out of the economy without impairing its efficiency. But it would be hard to mobilise the right kind of men without conflicting with civil needs. Elderly railway porters and dog race track attendants cannot form the basis of military expansion; the responsible intelligent man who was, say, a troop sergeant or REME fitter in the last war, and who is essential if fresh formations are to be made, has, in all probability, created an important place for himself in industry. Any system which aims at creating a class of men who are soldiers and civilians by turn must work on an intelligent

and up-to-date classification of essential and non-essential occupations.

One objection to this system is that it would mean recalling the young ex-national service man, in his capacity as a compulsory Territorial, to do another stint of military duty. But since only a proportion of the Territorial divisions would be mobilised at any one time, it would not seem to be beyond the wit of the authorities to organise the posting of national servicemen in such a way as to ensure that a young man was re-mobilised only in the last year of his Territorial service, that is, after two and a half years in civil life. In any event, if the case were properly presented to them, most young men would agree that it is better to do a total of three and a half years peacetime soldiering than, as did most of their older brothers, four to six years of wartime soldiering.

Finally, it can be objected that a partial mobilisation of the Territorial Army would destroy the element of

voluntary enthusiasm which inspires its central core of officers and NCOs, whose services are needed in far greater numbers than at present to make the Territorial Army efficient; that men who will go cheerfully to total war will hang back from making sacrifices which are not demanded of the rest of the community. But, as a matter of logistics, it is probably impossible to devise any system for augmenting Britain's military strength of which the burden will fall equally on the whole country. The system of equality, that is, of compulsory national service, can provide only part of the forces required, and even the incidence of this system is not equal since it exempts the coal miner and the agricultural worker. The second answer is that no system devised since the origin of society can ensure equality of sacrifice: the intelligent, the patriotic, the responsible, must always bear more than their share of the burden because they possess those qualities, and the rest of the community, "the summer soldier and the sunshine patriot," do not.

The Role of India

THE tide of Indian opinion about foreign affairs seems to be on the turn. During the past few weeks the ebb towards independence and neutrality has slackened sharply, and in some places interest is already flowing quite strongly in the opposite direction, towards a positive determination to oppose Communist aggression. As yet, however, Mr Nehru, who is both Prime Minister and Foreign Minister, is not actively riding this new movement himself—and it is still he, as indeed it has always been these last three and a half years, who is the sole arbiter of Delhi's foreign policy. As a result, several questions arise. Will Mr Nehru himself readily change his mind about India's role in the world? If not, will public opinion in favour of the western democracies be strong enough to compel a shift in foreign policy? And what direction might or should it take?

Mr Nehru has more than once in the past shown himself capable of admitting mistakes and changing his mind quite readily, in matters that he regards as of only ephemeral importance or where he does not claim to be expert. But this is not so in matters over which he has thought long and carefully; and these certainly include foreign affairs. There, his attitude is based on a moral conviction which can easily be mistaken for obstinacy.

Mr Nehru's guiding principles in handling foreign affairs are few and simple: a passionate hatred of war, tempered by a realisation of the dangers of pacifism; belief in the right of nations, untrammelled by alliances, to decide their own course of action in a given set of circumstances; an old-fashioned aversion from anything that smacks of nascent imperialism or lingering colonialism; and a certainty that the poverty and low standard of life of a large proportion of the world's population, so much of it in Asia, are real dangers to world peace and stability. These principles mean that the Indian Prime Minister believes deeply in the United Nations, but not—as yet—in collective security, that he understands and trusts the western powers but will not—as yet—support them, that

he abhors Communist imperialism but does not—as yet—see India itself threatened by it. He has suffered a sharp rebuff in his dealings with China, but has not relaxed his efforts to build a bridge between Peking and Lake Success. On his way to the Commonwealth Conference he wisely suggested to the astonished Egyptians that it was folly, at a time like this, to try to get rid of the British troops in the Suez Canal Zone; but he will not undertake any formal commitment with them himself. Mr Nehru, in fact, tries to stick to his principles, paradoxical as they often make his actions. Nor are they principles which he is at all likely to change easily. On the other hand, his interpretation of them could alter quite quickly.

*

This being so, the amount of pressure which Indian public opinion may now exercise on Delhi's foreign policy becomes increasingly important. The origin of Mr Nehru's ascendancy goes back to the days of the nationalist struggle when he was the Congress Party's sole expert on foreign affairs. Since then, he has reinforced his position by virtue of what is regarded as the amazing influence he has built up in the outside world. Last October, when the Korean war seemed to be won, his stock had fallen a point or two, partly because his own political position at home had weakened as a result of the swing to the Right in the Congress Party's presidential election, and partly because he was running into deep water in world affairs. He was criticised abroad, and therefore also at home, for his correspondence with President Truman and Marshall Stalin, for his advice against crossing the 38th parallel, for refusing to join the UN commission that was formed to run Korea, and for befriending a country which launched aggression in neighbouring Tibet. Since then the pendulum has swung back the other way. Delhi's warnings have proved tragically justified in Korea, the Chinese have halted in their advance on Lhasa, and there has been a rush to support the Prime Minister in his

brave words about defending the McMahon line on the Himalayas, in his firm dealings with Nepal and in his assumption on December 5th of a protectorate over the strategic little principality of Sikkim.

These events of the last few weeks have removed some of the unreality from the world in which part of the Indian intelligentsia lived. The parliamentary debate on foreign affairs last month, discussions within the Congress Party, and public statements by Right wing leaders such as Mr Purshottamdas Tandon, the Congress President, show that new efforts are being made to impress on Mr Nehru the dangers in which India stands. There is not, as he recently suggested in parliament, an undefined conspiracy of geographical and political circumstances in India's favour. The world does not owe India security, which can be attained only by India's own efforts and those of her friends. Foreign affairs were the one department which the late Mr Vallabhbhai Patel left entirely to Mr Nehru; accordingly, the loss of the Deputy Premier is not directly felt there. But, indirectly, it will be keenly felt when there comes a clash of opinion between the Prime Minister and the Right wing party caucus, since it was Patel's self-appointed task to restrain his own followers when they wanted to overrule Nehru.

What does the Right wing want? And how may its desires affect India's relations with Pakistan, with the Commonwealth and with the free world? If Mr Patel had directly exercised his own possible influence on foreign policy—as he did not—India would undoubtedly have been more closely aligned with the non-Communist powers than it now is. Pro-western feeling, however, only seriously exists among the top level of government servants and businessmen. While there has been a swing in public opinion, it is not yet strong enough to mean abandoning neutrality as a formal policy; so long as this formula has the aura of Mr Nehru's personal support, it is likely at least to take some time to die. This means that, above all, relations with Pakistan are crucial. For those who wish to stand alone must be strong, and India, weak in terms of military power and an overburdened economy, cannot do more in the world until it has brought the struggle with Pakistan to a satisfactory conclusion.

*

From the point of view of the western world, therefore, it is a prime interest that the Commonwealth Conference, meeting in London, should do all in its power to help settle the Kashmir dispute now that a compromise about the agenda has enabled Mr Liaquat Ali Khan, the Pakistani Prime Minister, to attend. Both countries have an invaluable role to play, India predominantly in eastern Asia and Pakistan in the Middle East. Neither can play it with full effect until their mutual disagreements are healed. And the Commonwealth certainly cannot afford to take sides, accepting the friendship of one if this means rejecting the other. At the same time, although the value attached to the link with the Commonwealth rises and falls from time to time in both Karachi and Delhi, there is a basic fund of great good will and respect in both capitals; this is, moreover, one of the few positive factors that they have in common. There could be no better way in which a settlement between India and Pakistan could be reached than through Commonwealth mediation. Mr Attlee has been

wise to hold back from trying to mediate for Britain alone; but neither he nor any of the other eight conference ministers can afford to ignore the problem; they should rather put their full effort into trying to solve this deadlock together before they leave London. Its solution is a key to the future of the Commonwealth in Asia, and to the security of the whole Indian Ocean area.

The quarrel with Pakistan apart, India—as by far the biggest purely Asian power after China—has an inescapable responsibility. It is useless for Delhi to believe and hope that it can detach itself from the world. The very speed with which India has established its great new international reputation is proof that it has an important part to play and that detachment is merely wishful thinking. The influence which India now wields carries with it heavy responsibilities—in dealing with China and the new nations in South East Asia. Alongside Pakistan, India has a common interest with the western world in preserving peace and freedom from Communism in all these areas. These interests and responsibilities are likely in the end to face Delhi with difficult decisions over its role both in the common defence of the Indian Ocean and in any pact which may arise to cover the western Pacific.

The answer must surely be to recognise that the two trends of present Indian policy are not incompatible. Delhi's place is at the head of free Asia, alongside the western world and in step with the rest of the Commonwealth; indeed, this is the direction in which Indian public opinion is now moving. At the same time, the events of the past three years show that India possesses unique qualities for acting as a conciliator and a mediator, for being, as Mr Nehru himself has put it, "the West's window on the East." In this task, it should strengthen, not weaken, Delhi's hand to be sufficiently associated with the anti-Communist powers to fall back in their ranks if conciliation fails. It has been part of the function of the Commonwealth Conference to explore these realities. If Mr Nehru—and Mr Liaquat Ali Khan—leave London with a clear view of them, the gathering will have been worth holding on that score alone.

Binding Cases

Binding cases for THE ECONOMIST and RECORDS & STATISTICS can now be supplied. These cases, made by Messrs. EASIBIND LTD., are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding. The case for THE ECONOMIST will hold 26 issues and the half-yearly Index; that for RECORDS & STATISTICS will hold 52 issues. The year can be stamped on the spine. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.,

(Dept. E), Pilot House, Mallow St., E.C.1.

A binding case can be sent on approval, if required.

NOTES OF THE WEEK

Commonwealth Conference

External danger used to bring members of the Commonwealth together more quickly than any other common interest. Whether that is still true remains to be seen; so far the pressure of the cold war, whether in its western or Asian manifestations, has not been sufficient to produce in the younger members the reaction that could be counted on in the older. The Commonwealth system is so elastic as to allow India to take its own line about Korea, Canada and Australia to refuse to follow Britain in recognising Peking, and for all to come together in London this week to see where divergent ideas about common interests meet. Out of this apparent confusion good may come; but it is no use pretending that it does not strain belief in the solidarity of the world's largest group of free nations. Diversity can be healthy in a club; but the club is a peculiarly British institution that is imperfectly understood abroad, where disunity is generally interpreted as weakness.

The London meeting of Prime Ministers has been making fair progress with Mr Attlee as the skilful and soothing host. The atmosphere is such that a measure of common viewpoint is being reached on a number of topics, and that fact alone makes the meeting worth while and strengthens the influence of the members at Uno. Most of the discussion has been about eastern Asia—particularly relations with China and a peace treaty with Japan—and on defence of the Middle East. About Kashmir there have been talks of the most informal kind, some in Downing Street and some almost at Mr Menzies's bedside. Every Prime Minister recognises that this—properly regarded—is the gravest problem of all; it is unique in Commonwealth experience and its persistence leaves the defence of the Indian Ocean in a ramshackle state.

Mr Nehru is said to have been adamant that China is a new great power, and must be treated as such; and the Indians seem still to believe that the Chinese advance has no more than a defensive design. Mr Pannikar in Peking, the source of their information, proved right when he warned London of Chinese determination to resist Uno troops if they crossed the parallel; it is just possible that he is right now, and that Commonwealth support for a fresh cease-fire proposal has some chance of success.

Cease Fire and Sanctions

It is now a month since the United Nations three-man committee began trying to negotiate with Peking a cease-fire in Korea. Nothing in the military operations has shaken the Chinese conviction that they can win a glorious revolutionary victory; nothing in the diplomatic comings-and-goings (retraced in an article on page 84) has shaken the belief of most Americans that conciliation is hopeless. Hence the curious anomaly that, while there is to be another attempt at getting the cease-fire, the State Department circulates to 22 governments a document urging them to brand China as an aggressor and to take economic and diplomatic steps against it. The power that is doing most of the fighting in Korea has no part in negotiation; and most of the powers that are keenest on negotiation are doing no fighting. This may be logical, but it is not collective security against an aggressor.

How keenly Americans feel that this is the point of principle at stake is not properly understood in Europe, where there is plenty of enthusiasm for armed action by Uno when it succeeds and none when it does not. There is probably better understanding in this country, although brilliant efforts of dialectic have been made to confuse the issue.

A fair statement to Uno of the British attitude would probably be this. By all means let one more attempt be made to negotiate a cease-fire, since if it were by chance to succeed, that would be by far the best thing that can now happen. The chances are, however, that it will fail. There will then be a clear case in logic for proceeding to pin the label of aggressor on Mao Tse-tung. We have no objection to that on the score of morals; manifestly, he is an aggressor. Nevertheless, we dislike very much the proposition of applying sanctions to China. The harm it would do is very apparent—not least the risks it would involve for Hongkong—but we cannot see the advantage. We really do not believe that sanctions would make Mao reverse his policy or do him any particular harm, and as our bitter experience has proved in the past, it would in the end do more damage to Uno's prestige to apply ineffective sanctions than not to apply them at all. We therefore hope very much that the Americans will not push the idea of sanctions. But this is not due to a wish for appeasement or any lack of realisation of the world situation—quite on the contrary, the unrealistic attitude seems to us to be that which would concentrate all attention and resources on the Far East. Nevertheless, the maintenance of the partnership with America being the very foundation of our policy, if the American Government, having listened to all the arguments, insists on having sanctions voted we will act as a loyal ally should. But we shall not pretend that we like it.

Mr Strachey's Past and Present

Politics have come to a pretty pass if Mr Strachey can remain a member of the Government after its formal decision to wind up the East African groundnut scheme. The decision was announced in a White Paper (Cmd 8125) issued on Tuesday. The Overseas Food Corporation has proved to be an almost fruitless investment of £36½ million of public money. The extent to which a public corporation should be free from ministerial control and from parliamentary criticism is still unsettled. In this particular instance, however, Mr Strachey was personally responsible for the speed with which the groundnut scheme was launched and which consequently involved the corporation in such heavy expenditure. Much more than this, he was also responsible for the attempts to hide from Parliament and the public the extent of the mistakes and to give a falsely optimistic impression of what was happening.

The facts that made this week's decision inevitable must have been known to Mr Strachey and the corporation more than a year ago. Outside observers had a shrewd enough idea of them in spite of Mr Strachey's attempts at reassurance. It was already plain, when the corporation's first report was published early in November, 1949, that things had gone badly wrong. By then the corporation had already spent the £23 million which the original White Paper had estimated as the scheme's capital cost, but which had proved to be nothing like enough for its actual needs. It was also becoming plain, by November, 1949, that it was not only the finances of the scheme that were wrong but its whole concept. The concept was that the productivity of African agriculture could be raised by large-scale mechanisation. By the autumn of 1949 the Overseas Food Corporation had learned, or should have done, that the indiscriminate use of machines in Africa creates far more difficulties than it removes.

At last the Government has faced the true facts of the groundnut scheme, and proposes to write off the £36½ million which will have been advanced to the corporation by the end of March. But this belated confession should underline,

not hide, the fact that the Minister upon whom rests the blame for persisting in costly blunders now shoulders the heavy responsibilities of Secretary of State for War.

The Scheme's Future

Although it can no longer be called a scheme for the mechanised production of groundnuts in East Africa, the Overseas Food Corporation's project in Tanganyika is not being abandoned altogether. The Government has accepted the corporation's proposals for a seven-year programme costing about £6,000,000. Instead of the 3,210,000 acres of bush that the original White Paper envisaged could be cleared by 1953, instead of the 600,000 acres to be cleared by 1954—the target that Mr Strachey announced in November, 1949—a total acreage of 255,000 is now to be cleared by 1957. But the most significant statement, in this context, is that the tractor force for clearing will be drastically reduced and that hand labour will be substituted for part of the work now done by machines.

The bubble of mechanisation has been pricked, and the corporation seems to have taken heart the report, published last autumn (HMSO, 4s. 6d.), of a mission which concluded that mechanisation has a place in native agriculture, but that in a great many instances it is only a small place because of its heavy cost. The groundnut scheme has thus become, in the words of the new White Paper,

a scheme of large-scale experimental development to establish the economics of clearing and mechanised or partially mechanised agriculture under tropical conditions.

Since its true nature, an aspect of colonial development, has now been officially recognised, responsibility for the scheme is to be transferred to where it should always have been—on the Secretary of State for the Colonies.

This transfer of responsibility, however, raises fresh questions. The Colonial Secretary cannot appropriately oversee the Overseas Food Corporation's other venture in Queensland; but as this project has always been run by a subsidiary in Queensland, its future need not cause any difficulty. What is more questionable is the retention of the Overseas Food Corporation at all. The logical step would be to transfer the new activities in Tanganyika to the Colonial Development Corporation were it not for the doubts that are held about that organisation's efficiency. It is certain, however, that if the Overseas Food Corporation has to be retained to administer the seven-year scheme, its organisation should be a mere fraction of what it is at present. The reductions in staff proposed by the corporation itself hardly go far enough.

Fishing for Trouble

The Sea Fish Industry Bill represents another Government attempt to cope with the manifold problems of the white fish industry, which since the decontrol of prices a year ago has been reverting to prewar conditions of depression and instability. The demand for fish fluctuates considerably, according to changes in such things as the availability of eggs and vegetables and the size of the meat ration. So does its supply—although the main problem here is the wasteful way in which international competition (now renewed after a wartime interlude) has depleted the main fishing grounds. These economic problems are aggravated by costly and wasteful marketing methods, which make the worst of a difficult job and appear indifferent to the elementary facts of consumer psychology, which is of particular importance where fish is concerned.

The trouble with the Bill is that it pulls out all the familiar stops on the organ of Government planning, without indicating which are to be played. It sets up a White Fish Authority, to be appointed by the Ministers of both Agri-

culture and Food, and to be financed partly by a levy on the industry, partly by advances and a research grant from the Government. The authority can participate in many branches of the industry without any need for compulsion. It might, for instance, find new outlets for unwanted fish by financing the erection of processing plants or by developing exports; or it might enter the market in order to break the undesirable monopoly of a single wholesaler which exists at some small ports. It may use compulsion for such purposes as improving the quality of fish and "staggering" the landing of catches.

If it were left at this, the Bill might well prove a modest success. Unfortunately, the Authority is also empowered—subject to the weak check of Parliamentary confirmation—to establish a compulsory scheme of regulation for any branch of the industry. What is the purpose of these further powers? There is plenty of recent evidence to show that administrative regulation is no cure for inefficiency. Its effect is much more to ossify an industry—defects and all—and thus enable its prosperity to be guaranteed at the consumer's expense. This Parliament ought not to be willing to give another "doctor's mandate" to another public body.

Schuman Plan Paralysis

Very little has been heard in recent weeks of the Schuman plan, which was to form the economic basis of a *rapprochement* between France and Germany. In Paris the attitude until the past few days has been one of determined optimism; but voices from Bonn have been speaking less certainly. The Germans insist that the Ruhr Authority, and the controls it exercises over the German economy, must be abolished before they consent to join the Schuman plan—a demand that the French resist with equal vigour. Another tender spot is the limitation on the Ruhr's steel production; the Germans want the curb lifted immediately (in fact, last year's production exceeded the set limit), while the French will agree to talk about it only when Bonn has signed the Schuman plan.

Still a third difficulty has cropped up with the failure of the Allied High Commission and the German Government to come to terms over the reorganisation of heavy industry in the Ruhr. To date the Ruhr industrialists, backed by Dr. Adenauer, have opposed the plan submitted by the Commission last month. It would end the ownership of coal mines by German steel concerns, and would split the steel companies into a larger number of units than the Germans favour. Unless a reorganisation along lines suggested by the Commission is pushed through, the French negotiators see little prospect that the free market envisaged under the Schuman plan could become a genuine one.

The Schuman plan is suffering from the paralysing doubt that seems to affect all western plans when talks with Moscow are in the offing. Sizeable groups among both French and Germans long to see the establishment of a neutralised Germany, and their hopes have been warmed by the Kremlin's latest Note. If this should happen, they argue, the entire basis of the Schuman plan would have to be reconsidered; therefore it is safer to wait. This is not only defeatism but nonsense; for the only "neutralisation" of Germany that is remotely possible and acceptable is the kind that exists in Austria. There the Russians find no difficulty in reconciling the existence of an Austrian Government with a close grip on the economic life of their own zone. It is this kind of perverse French logic that makes the Americans turn recklessly and in despair to the Germans.

German TU Leaders' Dangerous Move

The leaders of the West German Trade Union Federation are not Communists; but they are pursuing a course as undemocratic and destructive as Moscow could desire.

To force their demands for the so-called *Mitbestimmungsrecht*, the Metal Workers' Union has called upon all its members to stop work from February 1st until the Federation's claim for equal representation on the boards of the iron and steel companies is granted. In a referendum the workers previously agreed to strike for this purpose. The coalminers may join in later. In some works the vote was not secret, and may not represent the real attitude of the men as a whole. Nevertheless, the Federation leaders would undoubtedly find their strongest support among the metalworkers. The men have been roused by a suggestion from the Minister of Economics, Dr Erhard, that the trade union directors whom the British introduced to the boards of decartelised steel companies would be dropped when the industry is finally reorganised. Dr Erhard has since assured them this is untrue.

The Federation does not deny that its demand for a fifty per cent representation of union officials (not works council representatives) in all organisations of economic control from top to bottom, and in all enterprises but those of negligible size, would amount to a syndicalist revolution. They realise that the workers would be content with far less, but will throw in wage demands as a bait for unionists' support. They have no intention of abiding by the democratic decision of Parliament. For that reason the employers' side can hardly be blamed for the fact that, after long negotiations, no draft law has yet been presented to the Bundestag. Nor, indeed, is it clear why the government of a non-totalitarian state should force private firms to fill half their boards of directors with representatives of trade union headquarters. Most employers in Germany, reactionary and rapacious though they are on questions of wages and profits, are ready to agree that a delegate from the works council should join the board of managers; but they will fight against outside interference by union officials in policy-making. If industry is paralysed by a strike in the Ruhr next month, a few men with a lust for power will have thrown away Western Germany's greatest asset—the devotion of the German worker to his firm, undisturbed by class consciousness.

Illegal Rearmament

There would be perhaps some diplomatic—and certainly some propaganda—value in arranging that the signatories of the Peace Treaties with Hungary, Rumania and Bulgaria should protest against the rearmament now going on in those ex-enemy countries. Rumania is entitled by treaty to an army of 120,000 men, Bulgaria to 55,000 and Hungary to 65,000; instead, the Communist government in each country has increased its forces to two or three times these numbers. Indeed, as an article on page 85 describes, these three satellites now have between them 660,000 instead of 273,000 trained men under arms. And there is increasing evidence that they are receiving types of weapons forbidden to them by the treaties, which laid it down that their armament should be "closely restricted to meeting tasks of an internal character and local defence of frontiers."

Here is a clear case of illegal and unjustified rearmament. Nobody has in any way threatened these countries; they have ample police forces for internal security; and if there is a warlike and tense situation in south-east Europe, it is caused by the Cominform's effort to coerce Jugoslavia and stamp out Titoism. To trumpet the word "illegal" at them will have no effect on their governments, although if it were done long and loudly enough it might provoke the kind of explanation that makes even Communists look foolish. But it would help to draw attention to the safeguards of public discussion, integrated planning and honest avowal with which the mere proposal of a west German defence contribution is being hedged around. And to hear the Bulgarian government explaining how its rearmament contributes to "peace" would bring a little light relief into international exchanges.

Putting the Lid on It

Last June Mr Noel Baker[†] was promising domestic consumers at least a million tons more coal in the twelve months ending March 31, 1951, than they had in the previous year. When he now finds it necessary to come personally into the kitchen via a loudspeaker and instruct housewives in the proper management of saucepans, planning may be said to reach its nadir. Planning is supposed to make possible a swift, realistic and equitable adjustment of all the main forms of economic activity, in the light of centrally available information and democratically determined policy, to changing technical circumstances, stringencies and opportunities. Even if scarce coal were to be charitably regarded as a natural datum, for which planners bear no responsibility, that does not exonerate them from the charge of having shirked their essential job of adjusting the economy to that datum.

Their greatest weakness has been unwillingness to use or even to draw attention to the instrument of price. Few people know just what it costs to hear a wireless set drivelling to itself all day, or what actual savings in hard cash would reward them for consistently putting on the saucepan lid. To inform them, area by area, would probably be much more effective than to go on wallowing the by now rather battered patriotic drum. The more obvious weapon of actual price increase is one which the authorities are naturally loth to use at a time when the cost of living is climbing in any case—though a regularly available electricity supply, sparingly used so as to keep household light and power bills at or near their present level, would be vastly better value for money than one that is precarious and unpredictable.

The fundamental error was made long before Mr Noel Baker's term of office. It was built into the planned structure of British industry during the years of Daltonian "suppressed inflation," when, with other channels of spending closed by controls and prohibitions, the public was encouraged to purchase a torrent of electrical gadgets and was misled by unduly low electricity prices into thinking it could afford to run them. Whether in power cuts or in higher prices, the housewife will go on paying for a long time for these vagaries of pseudo-planning; and ministerial lectures on what to do with saucepan lids, though they have their humorous side, are cold comfort in a cold kitchen.

Keynes Behind the Curtain

The review of Keynes's "General Theory" by an anonymous Russian economist, reproduced on page 84 of this issue, is of considerable psychological interest; not least because its actual economic interest is so small. The "General Theory" and the corpus of economic thought derived from it have been attacked, especially in America, as a step towards totalitarian Socialism, as an ideological poison threatening to paralyse the nervous system of the free economy, distort its reflexes, and eventually kill it. It has also been criticised from the Left as a belated and wrongly-based recognition of the inherent contradictions of capitalism and a foredoomed attempt to cure what is past curing.

These criticisms have shared, besides their conclusion that capitalism cannot be saved by such methods, a genuine truth-seeking analytical quality; what they lack—and what might really enlighteningly have been supplied from Russia—is an assessment of Keynesian theory and policy in practical political terms as the Marxist sees them. "Commodity fetishism," in Marxian terminology, is merely the screen for a system of power relationships; Keynes, it might be held, ignored this system in favour of an altogether too automatic, too exclusively commodity-minded balancing of considerations of profit and loss, security and insecurity, a too cut-and-dried psychology. He prescribed measures which, however compatible they might appear on paper with the maintenance of capitalist economic relationships, would in

practice disintegrate capitalist power-relationships and bring the community applying them face to face with a revolutionary situation. On these lines much could be said—and said, by a skilful debater, in a way not easy to controvert. The chance, one would think, would be worth taking; considering how important politically is the current faith in the possibility of stabilising high employment through Keynesian techniques, its destruction would be a notable ideological victory.

The author of "Keynes's Pseudo-Theory" does not, to put it mildly, take that chance. No reader of his review could derive from it the remotest notion of what the "General Theory" actually is, let alone what impact Keynesian policies might have on a capitalised society. He does not analyse, he inveighs; and how he inveighs! No doubt translations from Russian to English may blunt some fine linguistic points and slip into some inadvertent absurdities; but no blurring in translation could account for the extraordinary irrelevance, the effect as of ineffectively flailing fists, purple-faced fury and slaverling inarticulation, which this polemic conveys.

There is a place in debate for invective, though other weapons are apt to be more lastingly useful; even patently unfair invective may, when pungently phrased, provide a certain æsthetic satisfaction and, however unjustly, score a point for its author. But it is puzzling to know what manner of mind is expected to be convinced, swayed, or strengthened in its convictions by this piece of epileptic incontinence. Presumably it is the Russian mind, and the educated Russian mind at that; presumably it is to such stimuli that the countrymen of Tolstoy can now be counted on to react. *Le style, c'est l'homme*. Those kindly souls who are sure that the only thing needed for peace is an open-hearted,

cards-on-the-table, man-to-man approach to the Soviet should study the style, and draw their own conclusions as to the men with whom the West must deal today.

London Planning in Theory and Practice

A recent issue of *Town and Country Planning** contains a summary of progress in the new towns over the last year; a tailpiece to the same issue makes it clear that it is the LCC which has done nearly all of the building in the London region since war ended. The LCC is developing twelve main estates, at distances of from 10 to 20 miles from Charing Cross, mainly in the green belt. Half of these "quasi-satellites" are now almost complete. They have rehoused over 17,000 families, whereas little more than 300 dwellings have been finished in the eight new towns serving London. Altogether, the present LCC programme will provide over 40,000 dwellings in out-county estates. But what is to happen afterwards? The number of Londoners in need of houses is many times this figure. There is strong pressure already on London local authorities to "modify"—which means to sacrifice—the London plans and to build to higher densities in their own areas or in the nearby green belt.

The theoretical and official solution is to disperse three-quarters of a million Londoners to the new towns and to existing towns within a wide radius of the capital. Experience with the new towns has amply demonstrated that such a policy will not work, save with careful preparation well in advance, and with strong and concerted action by Government departments. The case for dispersal is social and strategic; whereas natural economic trends and political interests (including that of the Minister of Health in maxi-

missing the output of houses) run counter to it. It has taken the new towns several years to get a special housing allocation from the Ministry of Health, which may even now prove inadequate. It will be a harder and slower task to get existing towns in the region to build large numbers of houses for Londoners. Local incentives are lacking. The financial means and the drive must come from the centre, or from some special authority set up to cope with the London region; and they must be provided quickly, or else the LCC programme will tail off before the development of these reception towns has begun.

The Minister of Town and Country Planning must be aware of these problems. But he cannot get the co-operation of his colleagues—in particular the actions of the Board of Trade suggest that it has not heard of the Government's official policy for London. This is an absurd situation. Fumbling and contradictory planning will get for London the worst of all worlds.

Ambassadors to Spain

The appointment of Sir John Balfour as ambassador in Madrid has hardly evoked a flicker of animation from the British Left wing. It is true that the appointment has been made by a Labour Government and in conformity with a resolution passed at the United Nations on November 25th—on which, incidentally, Britain abstained from voting. But this appointment marks the end of an epoch of estrangement between Spain and other Western Powers, which began for Britain on Christmas Day, 1946, when the last ambassador, Sir Victor Mallet, was withdrawn as a protest against the existence of General Franco. The struggle now seems to be over between the common sense which said that ostracism was doing no good to the Spanish people and the conscience which said that there must be no truck with tyranny—of the Right. Mr Bevin's decision also shows in some degree both the mounting sense of realism which Russian pressure has forced on the country, and the way in which the non-Communist Left has consequently lost much of its sense of direction. In the nineteen-thirties support for Republican Spain was the touchstone of the Left; it was the cause which united and fired them. Today the approaching crisis of the world has produced no similar rallying cry—very few volunteered for Korea—and it is characteristic of the extent to which new dangers have brought new times, that the old ban on Spain has now been dropped with scarcely a whimper.

The question now is: What next? The Americans re-appointed an ambassador just before Christmas; the French—after considerable heart searching—are likely to do the same. This does not mean that Madrid will necessarily be included automatically in the economic and military consolidation of Western Europe, over which so many efforts have been made. But it does mean that it would be unrealistic in the future not to treat the Spaniards as possible allies and the whole Iberian Peninsula as a positive factor in western strategic planning. General Franco and many Spaniards have reacted against the previous hostility, and this will take time to die. But the community of interests should now be apparent on both sides and it will be the task of statesmen to remove, so far as is practicable, such inhibitions as may still remain.

Ibn Saud Lights a Candle

The new oil agreement, so quickly and smoothly reached at the New Year by the Arabian American Oil Company (Aramco) with King Ibn Saud of Saudi Arabia, looks so simple that it will stir the cupidity of every other lessor of an oil concession in the Middle East. In response to the

King's demand for a larger share of the takings, Aramco has agreed to waive the tax exemption clause included in its original concession valid until 1993. It has agreed to pay Saudi Arabia, in addition to royalties at the present rate of 34 cents a barrel, an income tax of up to 50 per cent on its net profits after deduction of American income tax. The formula is not so simple as it sounds. How are these profits computed? Most of the companies in the area pass their crude oil to other concerns at an early stage in the long series of transactions that take place before it is marketed. The Iraq Petroleum Company, for instance, sells to its holding companies and others at only a very small profit. The ultimate profit on every ton sold would be difficult, if not impossible, to trace. The Anglo-Iranian company is alone in handling some of its products all the way from well to consumer. The basis upon which local net profit could best be computed would seem to be the price of crude oil at seaboard. But this price is bound to be a matter of arrangement between interested parties—the great oil companies.

The hopes of Middle Eastern governments for quick and profitable new agreements on the basis of Aramco's offer should not, therefore, be pitched too high. But there is more than one possible basis. The agreement is bound to lead to demands for a greater share in profits. News that it was in the wind was no doubt a part cause of the Persian government's rejection of the Supplemental Oil Agreement on offer from Anglo-Iranian. It is likely ultimately to result in a number of new arrangements that may raise the price of oil to consumers the world over. The old days of the Persian Gulf price of three rupees a ton (roughly 12 cents a barrel) are numbered in the very few places where they survive.

Three Shifts for the Czechs

Last week Prague radio devoted several bulletins to describing the joyful enthusiasm with which Czechoslovakia's workers started the third year of their Five-Year Plan. They will, indeed, need all the enthusiasm they can muster. Although their achievement during the past year has been described as satisfactory, and although the plan is said to have been in many sectors over-fulfilled, they are now being exhorted to work still harder and to produce still more. The official explanation is that all the resources of the economy are not yet being fully exploited. According to Mr Kliment, the Minister of Heavy Industry, "hundreds of thousands of machines are idle many hours each day"; although there are "considerable reserves of raw materials" in the country, "much criminal waste still goes on."

The remedy is sought in an intensification of the drive—which has been going on for months—to recruit more labour, especially women, and a more determined effort to introduce second and third shifts into the factories. "We are facing the task," said Mr Kliment last week, "of introducing two and three shift production . . . and of getting workers to mind several machines simultaneously." In his New Year message, President Gottwald complained that the workers were not yet displaying sufficient "socialist élan"; second shifts in heavy industry, for instance, were only being worked to the extent of 8 to 12 per cent. It is, in fact, the needs of heavy industry that are as usual particularly worrying Ministers. Mr Erban, the Minister of Labour, is now urging women to go into the heavy industries; last September he was more circumspectly asking them only to undertake "all jobs with which women can cope."

The Czech leaders know that this continuous and persistent pressure is resented by the workers. But they are merely passing on the Soviet pressure to which they are subjected to extort growing contributions from the output of their heavy industries.

On sale now - History TODAY

On sale now is the first number of HISTORY TODAY, a new and engrossing half-crown illustrated monthly magazine. HISTORY TODAY is edited by Peter Quennell and Alan Hodge, and will be concerned with history in the very widest sense. The articles are written by experts but are designed for the general reader and they will be profusely illustrated with prints and photographs.

The first number includes articles by G. M. Young, C. V. Wedgwood, Eric Linklater, Charles Seltman, and others.

HISTORY TODAY costs 2/6 and is obtainable from your usual newsagent or bookseller, or by annual subscription of 30/- from HISTORY TODAY, 72, Coleman Street, London, E.C.2.

HOTELS

personally and independently recommended by

Ashley Courtenay

"Here is quiet, free from care."

See my "Shop Window" below, or for other districts, write to me enclosing stamped-addressed envelope. I may be able to provide the solution for your particular problem. Quiet or gaiety, seaside or country, honeymoons, convalescence, homecoming. I have them all catalogued in my mind. Next week's address: 68, St. James's Street, S.W.1.

BERMIDGE, LOW. for your holiday. **ROYAL SPITHEAD HOTEL** offers comfort and good food. Direct access to beach. Sports. Family parties welcomed. Fully licensed. Brochure on application. S. C. Selwyn, resident Managing Director.

BROADWAY, WORCE. **THE LYON ARMS.** Always in season, though there are many who feel its mellowness is enhanced on a winter's night—the curtains drawn, log fires, cooking in the best English tradition, plus a pleasantly warmed bedroom complete in its comfort. Tel.: 5.

HAWKHURST, Kent. **COLLINGWOOD HOUSE HOTEL.** In this historic and lovely Georgian home, the art of gracious living is still practised. Warmth, unusual comfort and a high standard of catering will be your lot. For Brochure write, N. Allan-Smith. Tel.: 3350.

HYTHE, Kent. **HOTEL IMPERIAL.** A first-class hotel, where every room is centrally heated, enclosed, air-conditioned sun-deck. Games room. Billiards (full size), Ballroom. Fully licensed. Special week-end terms including Golf on own course. Furnished suites and flatlets available. Tel.: 67411.

JERSEY, CL. **ST. PIERRE'S BAY HOTEL.** (the Regency). Winter economically at Britain's most southerly point. A spacious, well-heated bedroom and sitting room, all meals and full hotel service from 6 gu. per week. Facing south and overlooking the sea. Tel.: St. Aubin 1.

MINEHEAD, Somerset. **NORTHFIELD.** Situated in 3 acres of grounds, aims at high standards of catering and comfort AT ANY TIME OF THE YEAR. Convalescence? A honeymoon? Or just in holiday mood? Exmoor, the sea, and Northfield make a happy combination. Tel.: 364.

NR. NEWQUAY, Cornwall. **GLENDORAL.** Nigel Tanya offers you the perfect holiday by the sea. Private steps to Atlantic surf-bathing and golden sands. 10 acres of private coastline grounds. Own farm produce; cream milk. Children's paradise; comfort and rest for adults. Tel.: Newquay 2949.

NINFIELD, Sussex. **MOOR HALL HOTEL.** (Gooden Beach 4 miles), has the Country House atmosphere you may be seeking. Riding Stables; Saturday Dances; Harl Tennis Court; Golf; Cocktail Bar, and always someone genial to meet. Tel.: Ninfield 530.

SALCOMBE, S. Devon. **TIDES REACH HOTEL.** What a lovely address for a seaside holiday! Here, on the edge of a sandy beach with boats, fishing, sunbathing and fine walks, are added the finishing touches of comfortable accommodation, good fare and ample garage space. Tel.: 285.

SIDMOUTH, Devon. **BELMONT HOTEL.** A.A. Appointed. A first-class luxury hotel noted for its excellent food, and occupying the finest position extending to the sea front. Through coaches daily from Waterloo. Private Suites. Gas fires. Private bathrooms. Lift. Fully licensed. Tel.: Sidmouth 1261.

RAVENSCAR, Scarborough.

RAVEN HALL HOTEL

A completely self-contained, fully licensed holiday hotel. Heated sea-water Bathing Pool, 9-hole Golf Course, Putting, Hard Tennis, Bowls, Billiards, Dancing (Orchestra)—all free to residents. Riding available. Fully inclusive terms 25/- to 47/6d. per day. Tel.: Cloughdon 233.

SCARBOROUGH,

ROYAL HOTEL

Planning a sunny, bracing holiday this year? Write Tom Langston, Resident Director of this superbly situated hotel, providing excellent food, delightful surroundings, light music, dancing and comprehensive holiday amenities. Early application is essential. Terms 25/- to 39/- per day. Tel.: 1046.

Progress in Agriculture

The second report of the Agricultural Improvement Council (H.M.S.O. 1s.) is a heartening document. The Council's task is to co-ordinate the progress of scientific research with the problems of practical farming. The actual supervision of research work is in the hands of a different body—the Agricultural Research Council; and the job of persuading farmers to use the latest scientific techniques falls to the National Agricultural Advisory Service. But the traffic between scientist and farmer needs to move in both directions. It is just as important, and at least as difficult, to bring the current problems of farming to the attention of the scientist as it is to get the results of laboratory research applied in the field. The trouble is that the farmer's problems vary from area to area, and change with the economic climate, while he cannot usually formulate them in scientific terms. To help the understanding of regional problems the Council has sponsored pilot surveys of fen farming, chalk land farming, the intensive dairy farming of industrial Lancashire, and other specialised types of agriculture; while a more important method of testing the interaction of scientific theory and local practice has been the establishment as part of the advisory service of a chain of experimental husbandry farms and horticulture stations.

The most welcome fact reported by the Council is the changed attitude of farmers. Their traditional reluctance to adopt new techniques seems to have disappeared; and the problem today is said to be one of getting the results of scientific research to them "in the quickest possible time." Credit for the new attitude is given to the system of guaranteed prices and markets. A farmer's prosperity now depends much less on his business acumen, much more on his actual skill; and, with the forward fixing of prices, he can now calculate with some accuracy the financial result of applying a new method. The Agriculture Act was passed from other and less worthy motives than this; but at least—if the Council's picture is not overdrawn—it has had one useful by-product.

This Little Pig Stayed at Home

The Minister of Food last week told 3,000 school-children that the extra food needed by the growth of the Asiatic peoples was bound to affect British habits of eating. He might also have said that these habits are already affected by the operations of his department; he might have told the story of the Dutch bacon contract. The quantity of Dutch bacon delivered here in 1950 was only four-fifths of the agreed minimum. During the first part of the year, shipments were well above the minimum rate. But in May came the London dock strike. The Ministry of Food hesitated to take delivery at any other port, for fear of being accused of strike-breaking, and was driven to ask the Dutch bacon factories temporarily to stop manufacture.

As this fantastic request was made when the pigs were coming to market in large numbers, the Dutch government lifted its prohibition on the export of pigs and pork, both of which found a ready market in Germany at rising prices. By the time the dock strike was over, the Dutch farmers were finding that it paid them better to export to Germany. To prevent the British contract fizzling out altogether, a levy of 1s. per lb was then imposed on exports of pork, and some pigs were thus led back to the bacon factories. But not all, for in the autumn other meat was scarce in the Netherlands, and the Dutch ate their own pigs. Add to this the farmers' dissatisfaction with the bacon price, which was not increased to allow for the higher cost of imported feedingstuffs, and the failure to reach the minimum export target is not surprising.

The story illustrates the chief fault of centralised buying—its entanglement with politics. Private trade could have

shipped the bacon to other ports without fear of political criticism. When higher prices were necessary to re-direct supplies from the German and Dutch markets to Britain, the private importer's only criterion would have been the public's willingness to pay. The Government has to remember that bacon figures in the cost of living index, and that the food subsidies must not be increased.

Shorter Notes

The Civil Service Arbitration Tribunal has now made a further award giving increases in pay to the typing and clerical assistant grades in the civil service. For shorthand typists and typists the maxima are raised from 116s. to 130s. a week and from 102s. to 115s. a week respectively (apart from proficiency allowances). Arguments based on the rising cost of living were used and were presumably accepted by the tribunal. The tribunal also made an award in the professional grades in favour of legal assistants. Here the cost-of-living was one among several reasons advanced.

*

The great lack of clothing among Middle East refugees—referred to in an article on "Arabs in Dire Need," published on December 23rd—is a matter of particular concern to the British Red Cross Society. In response to an appeal from the United Nations Relief and Works Agency it has despatched clothing from its own stocks to Jordan for distribution by UNRWA through Red Cross channels. Gifts of clean used clothing sent to the British Red Cross Store, 88A, High Street, Lewisham, S.E.16, will be packed and despatched to the official relief agencies.

One People

The Mayflower, with her burden of nineteen families, whose landing at Plymouth 230 years ago the Americans celebrated, took them on board in England, and, in an historical point of view, the shores they left being associated with all the affections and memory are as important as the shores they arrived at. Their astonishing progress from that time to this, which was also ably and beautifully described by Sir Henry Bulwer, is all in America; but their whole previous history, more extensive in time, rich in great events, and great deeds, and great men, belongs to England. Their lives and memories of 230 years are American; but for many centuries before that their lives and memories were English. Their principles, as was truly said by Mr Webster [American Secretary of State] are English. "The great principles of Magna Charta, the principles of the American revolution, the English language, so that our children may recite Shakespeare and Milton on the shores of the Pacific," are what Mr Webster devoutly hopes the Americans may carry over the whole continent. If a community of language, a community of intellect, and a common interest, constitute a people and not a political Government—which may be an odious tyranny or a mere imbecility—then are the Americans and the English far more one people than are the latter and their Celtic fellow-subjects. They have the same origin, and for nearly two thousand years the same history. Though the broad ocean rolls between the lands, the people have grown together, have gathered strength and greatness from one another, have prospered reciprocally and mutually, have emulously learned to rival each other in improvement, have had a common property in all the sciences and arts, in all knowledge and skill; they have had a common literature and a common intellect, a common origin, and are, in all except Government, one people.

The Economist

January 11, 1951

Can you tell me if any there be

Who will give to me employ

For to plough and to sow, to reap and to mow

And to be a farmer's boy?

The Farmer's Boy. TRADITIONAL

THAT FINE OLD SONG was bellowed at Rent Suppers and Harvest Homes long before Marshalls of Gainsborough were ever heard of, and Marshalls have been going for over a century. And in that century Marshalls have been largely responsible for changing the face of British agriculture. Gone or going are Dobbins the Percheron or Blossom the Suffolk Punch. We plough, sow, reap, mow, harrow, roll and bulldoze by tractor and crawler. The thresher has out-moded the flail, and the combine harvester is fast displacing the thresher.

Sentiment bids us sigh for the past, but reason and economics make us more than thankful for the products of Marshall's skilled teams of agricultural engineers. Not that Marshalls are specialists in agricultural implements alone. Industry knows well their Fowler diesel locomotives wherever, up and down the world, there is shunting to be done. Road rollers from Gainsborough smooth the roads of five continents. Marshall boilers and lofty steel chimneys cluster in the grimy manufacturing belts which are the backbone of Britain.

Again, in Crook, County Durham, the Marshall Richards Machine Company continues to meet today's requirements of producers everywhere for a wide range of Wire and Tube Drawing Plant. The Marshall Organisation has stamped its name indelibly on the map of the world.

THE MARSHALL ORGANISATION

THE SECRETARY YOU NEVER HAVE TO RING FOR...

TIME-MASTER—the electronic dictating machine

THE SCIENCE of electronics is revolutionising many of our concepts. And your ideas about the time and place for dictation will be revolutionised by the Dictaphone Time-Master—the new, *electronic* dictating machine.

First, the Time-Master is so compact, streamlined and lightweight (4½ inches high) that you can take it anywhere and everywhere: and dictate to it whenever you wish.

Then, its recording medium is the unique plastic Memobelt. Each Memobelt takes 15 full minutes perfect dictation. Each is so flexible that it folds flat for filing. So light that up to ten can be posted in an ordinary envelope for 2½d.

Crystal-clear recording. No waste of your secretary's time because she "didn't quite hear that." Memobelt recording is outstandingly clear from beginning to end because the Memobelt still carries on the famous Dictaphone principle of cylindrical recording.

Rapid transcribing. Your secretary can adjust volume, tone and speed—by the simplest of controls. There is a pedal to back-space or repeat as often as she may wish—all instantaneous and uniform in action.

Write for TIME-MASTER literature to Dictaphone Co., Ltd.,
Dept. O, 107, Kingsway, London, W.C.2.

Letters to the Editor

The Sardines Return

Sir,—With reference to statements in your issue of December 30th, such as "the sardines have this year begun to come back" . . . "since sardines normally supply over 50 per cent of the total catch," etc., etc., . . . "There are lots of good fish in the sea," but there is *not one single sardine* in the sea off the Portuguese coast, or in any other sea. May I point out:

1. There is a fish caught off the Portuguese coast which is of the pilchard variety (Sardinia Pilcharda). This fish is canned in Portugal, mainly in and around the town of Setubal, and when the fish itself is in the tin, complete with olive oil (and perhaps a bay leaf or two), then, and only then, does it become a sardine. The same type of fish is, of course, canned in France in the towns of Nantes and Concarneau. This type of fish (Sardinia Pilcharda) alone may be sold in this country as a sardine, but in America, Sardinia Pilcharda and Clupia Haringus are sold as sardines, the latter being one of the herring family.

2. The Norwegian sardine is not a sardine in this country! This matter was decided, in the year 1913 I think, in the famous sardine High Court case. The Norwegian brisling (Sprattus Norvicus?) really belongs to the sprat family, and here again, in America and in the British Commonwealth (excluding the British Isles), the Norwegian brisling may be sold and described as a sardine.

3. There is another type of fish which reaches us in this country canned à la sardine, namely Norwegian sild. This fish is canned in tomato sauce or in olive oil, and belongs to the herring family—it is, in fact, a baby herring.

To sum up: There are "lots of good fish in the sea" but there are no sardines. The fish becomes a sardine only when it is packed in a tin.—Yours faithfully,

ERNEST H. TAYLOR
Joseph Lingford & Son,
Bishop Auckland

German Deflation

Sir,—Professor Bonn's second letter adds nothing to his earlier and misleading analysis. He does not (and, of course, cannot) show that the loss of \$400-450 million of reserves by Germany can be accounted for by the worsening of the visible balance of trade, and not, as I have maintained, by unregulated speculative forward buying of goods and currencies. He does not show why general deflation is a preferable corrective instrument to selective controls (which would, incidentally, also keep luxury imports down without distress and unemployment).

There is a grave danger that the German case and especially the Cairncross-Jacobsson recommendations, which have been accepted by the representatives of the British Government, will constitute a precedent. The Americans are already pressing for the abolition of our controls

over foreign trade and payments. The EPU agreement provides for their abandonment over a growing proportion of European trade and payments, without any assurance that investment and employment policies of the members of EPU will be co-ordinated to achieve full employment. I have no doubts about the efficacy of controls—if well handled. I have grave doubt about their abolition.

Mr Bonn asks us to wait and see the results of the deflationary policy. Unfortunately we waited when British and German economists advised Brüning to deflate and saw Hitler's rise to power. We waited when the same policy was adopted by the present German Government, and have seen Western Germany wasting about 30 per cent of its productive capacity for over two years by unemployment. In the present international position it is no longer safe to wait for more of this sort of mistake.—Yours faithfully,

T. BALOGH
Balliol College, Oxford

Afghanistan on the Frontier

Sir,—An article in your issue of December 23rd states that a loan of \$21 million has recently been made to Afghanistan by the World Bank. The International Bank for Reconstruction and Development has not made any loans to Afghanistan. Afghanistan is not a member of the Bank, and so is ineligible to receive loans from it.—Yours faithfully,

HAROLD N. GRAVES
International Bank for
Reconstruction and Development

The Wrong Premises

Sir,—In your issue of December 30th you comment unfavourably on "the proposal to build a new Foreign Office in the place of Carlton House Terrace" and inquire "why should there be a new Foreign Office at all—or rather, what is the case for building it now?"

Having worked at various times in the Foreign Office for a total of over twelve years between 1918 and 1945, I can certify that it would be hard to find a more inconvenient and wasteful office building. The rooms, especially on the first floor, are ridiculously high, with the result that all heat rises well above the level of the officials who remain frozen at their desks or typewriters. Experience of the grotesque waste of space and the inordinate time required to get from one department to another would, I think, convince you, if you had to work there for long, that there is a good case for a new Foreign Office.

I do not know whether the present building was suitable for the Foreign Office as staffed prior to 1914, but I can vouch that since that date it has become more and more inadequate and unsuitable. At the present time the Foreign Office occupies its own original building in Downing Street, most of the old India Office in King Charles Street, many houses in Carlton House Terrace, 3,

Cleveland Row, and the Old Stationery Office in Princes Street. I leave out the premises occupied by the German Section at Norfolk House in St. James's Square and Princes Gardens, as I presume these will soon be vacated. This dispersal must lead to a loss of efficiency and to the necessity for a larger staff than would be needed if the Foreign Office were operating in an up to date and compact building especially constructed for its requirements. A new Foreign Office would thus free a large number of buildings for other purposes, and the future use of the original building in Downing Street might form the object of an architectural competition meriting a handsome prize.

You accuse the civil service of pushing the new doctrine that any activity of Government is *ipso facto* more important and deserving of higher priority than any private activity. The civil service follows the directions of the Government. Surely your chiding should be addressed not to the civil servants but to their masters, and to the electorate for returning them to power at two consecutive elections.—Yours faithfully,

V. CAVENDISH-BENTINCK
London, S.W.7

[This quite misses the point. We do not doubt that the Foreign Office is very inconvenient. So are many other offices in private and public occupation. But what is the case for saying that, of all such, the Foreign Office is the most intolerable? Who has even asked this question?

We do not believe that civil servants only do what they are told to do by Ministers. They have to get Ministers to take the responsibility for what they do—but that is a very different matter.—EDITOR.]

How to Pay for Defence

Sir,—No consideration has been given to one practical means of spreading the load of defence finance as equitably as possible without disturbing too much the economy of the country and the will of the people to work by direct taxation of their incomes.

Local authorities are necessarily very finance-conscious because their proximity to the taxpayer engenders a keen sense of responsibility. Every year these authorities receive large Government grants for services administered locally. There are no returns of the total amount of Government grants made to local authorities throughout the country for last year, but it is safe to say that the total amount is of the order of £300 million. Surely this figure could be very severely cut and the responsibility for bridging the gap so caused be fairly and squarely put on the local administrations. Because of the direct interest of these authorities in keeping local rates as low as possible, economy would be the order of the day and such economy would, of course, be in the field of public expenditure. The additional rates which would have to be raised would be fairly distributed without any great dislocation of business or effect on personal effort.

It will, of course, be argued that

Government grants to local authorities are means of controlling these bodies and therefore that any reduction in such grants would have the effect of lessening their dependence on Whitehall. Without going into the advantages or disadvantages of this, it is at best a doubtful and specious argument and with the advent of the art of statutory regulation there are no less sound means of controlling local authorities than there are of controlling individuals. At the same time, the effect of such a drastic cut would be a salutary reminder to all tax payers, regardless of their politics, of the burden of public expenditure at the point where they could protest most volubly.

It would also have an important anti-inflationary effect, challenging the comfortable feeling most of the larger authorities have about increased public expenditure, because of the fairly general buoyancy of total rateable value.—Yours faithfully,

GORDON MCLACHLAN
London, W.8

The Encroaching Corporations

Sir,—From his letter of December 9th, Mr Stuart Bowes apparently knows of only one part of the functions of the ATAC—that of a consumer council. In addition he may perhaps be misled by confusing Lord Terrington's Air Transport Advisory Council with the regional Civil Aviation Advisory Councils.

The ATAC is an independent body set up by the Minister of Civil Aviation with two separate duties, first that of hearing views of the travelling public towards air services provided and, secondly, to advise him on the granting of licences for the operation of scheduled air services by private companies under associate agreements with British European Airways.

The Civil Aviation Advisory Councils, in Scotland, in Northern Ireland, in Wales and in the Channel Islands, are also consumers' councils which make recommendations, not to the Minister, but to the airways corporations.

Mr Bowes's letter is, I'm afraid, based on a complete misunderstanding of the position. Clearly there is a need for a licensing authority. And the ATAC is it. The private companies have, I

understand, appeared before it and have made their case in detail.

The directive to the ATAC contains the following:—

It is Government policy in accordance with the Air Corporations Act 1949 that the scheduled and external air services of the United Kingdom should normally be undertaken by the British Airways Corporation.

The Minister is satisfied, however, that it is desirable to continue for a further period the arrangements under which the Corporations have appointed independent operators as associates under Section 15 (3) of the Act to help them to discharge their responsibilities.

The application from independent operators for Associate Agreements will be considered by the Air Transport Advisory Council, who will make recommendations to the Minister.

The Associate arrangements should be in respect of services which do not overlap or compete with existing services and planned programmes of services of the Corporations, except that services may be recommended on routes which the Corporations are not operating but intend to operate in the future, for the period up to the planned date of the introduction of the services of the Corporation concerned.

Our objective in BEA is to eliminate as soon as possible our operating deficit. Possibly that may squeeze out some charter companies from certain scheduled airline operations. If so we regret it. But such a result is not our design. In fact the only new route which will be taken up to the exclusion of charter companies in 1951 is between Manchester and the Isle of Man. Our intention to do this was made known before the private operators began services on it. On the other hand BEA has wound up its charter section and we are not setting out to compete with the charter companies in this field. Indeed, during the past year we have passed over to the independent operators some £90,000 worth of charter business.

So that there may be no doubts on the position, may I say again that our purpose is:

- (a) To eliminate our deficit by developing economic scheduled operations in the public service.
- (b) To avoid placing the charter companies in an unfair situation by making clear our plans for future services.
- (c) To develop interline traffic through agreements with private operators for an

integrated pattern of connecting services. (d) To pass on to the private companies enquiries for charter business which we cannot accommodate on our scheduled services.

Yours faithfully, PETER G. MASEFIELD
British European Airways,
Ruislip, Middlesex

Controls for Father Christmas

Sir,—Mr James Rootham's letter shows a keen economic-analytical approach and his suggestions are pregnant with possibilities. I cannot, however, agree with his last sentence.

I do not doubt his statement that advanced penological thought would approve his suggestion of disabusing a child of his belief in Father Christmas as a penalty for kicking the mundane individual in a department store. Penologists are a race apart and, like psychoanalysts, there is no one outside their ranks who can understand them, explain them, or appreciate them.

From a psychological viewpoint, the proposed punishment would irrevocably lead to a compulsion neurosis. The shock of finding oneself deprived of the reality of such an important personality in the course of ordinary education is great enough. But, to lose this all-powerful Father as a punishment for demonstrating one's Oedipus complex, would cause irreparable mental trauma. For, the culture compulsion, after transformation into ego compulsion, is in deathly struggle with the organ compulsion. The ego accepts the demands of culture, but it remembers and seeks revenge. A compulsion neurosis is almost inevitable.—Yours faithfully,

LEON M. SHIRLAW

Books and Publications

American Economic Policy

The Economics of Freedom, The Progress and Future of Aid to Europe. By Howard S. Ellis. New York: Council on Foreign Relations; London: Royal Institute of International Affairs. 549 pages. 35s.

All the publications of the Council on Foreign Relations enjoy exceptional authority, but none can be more authoritative than this. It appears as the report of a Committee of the Council of which General Eisenhower was Chairman and economists and publicists as eminent as Mr Hamilton Fish Armstrong, Mr Hanson Baldwin, Professor Viner and Professor Williams were members. Dr Howard Ellis was the chief draftsman, and he was assisted by a staff of equal quality. In short, the book should be regarded as the American equivalent of the report, not merely of a Royal Commission, but of an unusually well-chosen Royal Commission, in Britain.

The disadvantage of the committee, or Royal Commission, procedure is that it takes time—in this case, the best part of two years. The result is that events sometimes overtake the deliberations. This book contains ideas and proposals which two years ago would have seemed to most Americans to be very radical. But ideas have been moving fast in those two years, with the result that much of what the book has to say will now meet with almost placid acceptance. Indeed, in many respects, Mr Gordon Gray's recent report—an official document written under political pressures—is prepared to go further.

As a solid, documented exposition of the case for American aid to Europe, however, "The Economics of Freedom" could hardly be bettered. It is divided into four parts—first a general account of ERP; second, a series of unusually penetrating "country studies" of the United Kingdom, Germany, France and Italy; third, a discussion of "regional problems and plans" (which is very well balanced on the question of "integration"); and finally a section on American policy for the future. It is this last part which is naturally of greatest interest. It goes without saying, by this time, that the approach is consistently liberal. But it is also Liberal in the sense that often seems to Europeans to be somewhat old-fashioned. This can best be conveyed by a quotation—"the economic welfare of Western Europe is served better by consistent adherence to the principles of the International Trade Organisation than by emphasis upon Western European integration." In short, the approach is that of the State Department—and especially of those parts of it that came under Mr Will Clayton's influence—rather than that of the Economic Co-operation Administration. But it is significant to notice that, as in the Gray report, the old attitude towards currency discrimination is softening, and the Sterling Area gets a hearty pat on the back. *Eppur si muove.*

This book has been described as authoritative. So it is—in the sense that

it reflects the views of the best authorities on the subject. But, in the United States, the question must always remain whether it is the best authorities who decide policy. It is a question in any democratic country; but in European eyes the American constitution sometimes seems specially designed to exclude the best authorities from any practical influence. This can be illustrated from "The Economics of Freedom." A great deal is made, in the later chapters, of the desirability of distributing Marshall aid not according to needs but according to performance.

On general economic, political and military grounds, a country would get some ECA aid regardless of performance. But part of its aid would be made proportional to the increase of a favourable balance, or to the reduction of an unfavourable balance, in its foreign accounts.

But we now know that, when the case arose, the view of Congress was the exact opposite of this; as a favourable balance appeared in the United Kingdom's accounts, its receipts of ECA aid were entirely suspended. The British reader of even as authoritative a work as this will do well to remember this incident. He will be very glad to learn that the best authorities in the United States are so enlightened, so far-sighted, so liberal. But he will remember that what happens depends on the politicians.

Decline of Islam

The Arabs in History. By Bernard Lewis. Hutchinson's University Library. 196 pages. 7s. 6d.

The Middle East. A Physical, Social and Regional Geography. By W. B. Fisher. Methuen. 514 pages. 27s. 6d.

Why do civilisations decline? Why have the Arabs, who were in former centuries conquerors, scholars and scientists, fallen so far behind in our age of machinery and equality and zeal for social welfare? The smaller, cheaper and very much the better of these books makes an interesting attempt to explain their rise and decline.

Hutchinson's University Library has lately enhanced its good name for instructive and readable books. Professor Lewis will add to this. He is able to compress his scholarship so as to leave himself room for stimulating conjectures, and for vivid pictures of men and their habits. In this book, he divests the Prophet of the web of prejudice that has been woven round him by all medieval and some modern western historians. He leaves for our scrutiny a person of "essential historic humanity," as well as of a capacity for organisation that is rare in the Arab world today. He ascribes the vigour of the Arab conquests and

the liveliness of the resultant Arab empires largely to adaptability and to an immense capacity for assimilating elements out of other civilisations. For instance, the Arabs were "quick to react" to sea power when they met it. Only ten years later they won a crushing naval victory. They borrowed the works of art, and even the artists of other civilisations, then imitated them, and "finally fused them into something new, original and self-reproducing." Their assimilative power and their tolerance caused them to expand both eastward and westward, spreading a language which through its very vigour caught on, and outlasted their political dominion. Most people know that they reached Pottiers in the West and the Indus and Oxus in the East, but few that "the Archbishop of Seville deemed it necessary to translate and annotate the Bible in Arabic, not for missionary purposes but for his own community."

Their decline and fall was due to internal as well as external factors. Professor Lewis gives as the chief of these, extravagance and lack of organisation at the centre. Another was transition from a monetary economy, which suited the Semitic genius, to a feudal one which did not; yet another, a loss of flexibility which grew to a superiority complex that made them think Europe an "outer darkness of barbarism from which the sunlit world of Islam had little to fear and nothing to learn."

Dr Fisher claims for his book that it is a specimen of the French technique of mingling history and geography. So it may be, but he mingles them in chapters so water-tight that they give the impression of skipping from one subject to the other, much as a Victorian novelist runs two unconnected plots at once. His information on physical geography and geology is readably given and is not quickly accessible elsewhere. His economic section provides, between two boards, much information that has hitherto only been available in a number of books.

Tortured Medievalism

The Peasants' Revolt of 1381. By Philip Lindsay and Reg Groves. Hutchinson. 184 pages. 18s.

The Peasant's Revolt of 1381 is at once one of the most fascinating and most puzzling features of later medieval English history. There is undoubtedly a need today for a straightforward account of the revolt, set against the background of the political, economic and social history of the fourteenth century as revealed by the specialist researches of the past 30 years. It is this task which Mr Lindsay and Mr Groves attempt to tackle.

We are told on the dust-cover that this book is "intended not for the scholar but for the intelligent man in the street." The authors might, therefore, dismiss as mere clerkly quibbles the objections that in a bibliography of 34

Ready Shortly

THE INSTABILITY OF A DEPENDENT ECONOMY

Economic Fluctuations in New Zealand 1840 to 1914
By C. G. F. SIMKIN Probable Price 18s. net.
This book describes and explains the economic fluctuations that occurred in New Zealand from the beginning of systematic European settlement up to the outbreak of the First World War. It is based primarily upon an analysis of available statistics; in particular, those relating to external trade, banking, and public finance. But the provisional conclusions which emerge from the statistical analysis are revised and considerably extended by using a wider range of historical material. In this way a connected account is provided of the course of fluctuation in a dependent, and rapidly developing, economy.

THE LISTENER TALKS BACK

The full resources of the Gallup Poll have been called upon by the "News Chronicle" to find out what the people think of the B.B.C.—its programmes, its policy, its organisation and other important questions.

Before the results of this nation-wide inquiry are made known the "News Chronicle" invites YOU, the listener and the viewer, to answer some of the same questions by letter.

You may be asked, for example, to say if the B.B.C. monopoly is a good or bad thing — and why. A selection of these letters will be published and a guinea paid for each.

THE MAN ROOSEVELT

What the President wrote to King George VI, to the Pope, to Mr. Churchill.

These intimate wartime letters to the famous and the unknown are published for the first time in this country exclusively in the "News Chronicle"

Both these features begin Jan. 15 in the

NEWS CHRONICLE

During this period the Beveridge Report on the B.B.C. is expected to be released and its findings will be all the more significant in the light of the most extensive survey of viewing and listening

opinion ever conducted by a national newspaper.

works two are wrongly cited; that they appear unaware of the work of the two greatest experts on this period, Tout and Maud Clarke; or that they regard the 14th century *Chronicon Anglie* and the 16th century translation of it as independent, contemporary authorities.

The authors might even argue that no great disservice is done to their main purpose by the fact that they are ignorant of the causes, the course and even apparently the date of the Great Schism; or by such extraordinary statements as that "the need continually to gather armies had forced [Edward III] to accept money payments instead of . . . conscripting men to fight, so that he could purchase foreign troops. . . . Avoiding conscription by money payments, the lords could remain at home"—poor Froissart. But when we turn to the section on the authors' chosen field of study, the medieval manor, and read that the origin of the strip system of cultivation lay in subdivision through inheritance, or that "the lawyers were pushing ecclesiastics out of the [manorial] courts" (is this a fantastic caricature of Professor Levett's work on St. Albans?), then we must conclude that the introductory third of the book is quite untrustworthy.

The narrative account of the revolt itself is the best part of the book, though it achieves unity by ignoring altogether the many discrepancies in the sources. Even here, however, numerous minor inaccuracies mar the text, dubious interpretations of scanty evidence abound, and there are internal contradictions: the authors, for instance, assert first that the peasant armies were trained soldiers, and later, with equal assurance, the exact opposite. The point is, after all, of some importance.

Apart from the question of accuracy, however, the whole book is vitiated by two tendencies. First, the authors are tilting the whole time against the romantic conception of medieval England, which went out of fashion about the time of the Golden Jubilee. Second, they view the whole affair in the simple light of "the people's cause," a revolt against intolerable oppression. This does credit to the authors' emotions, but it does little to elucidate what that highly complex affair, the Peasants' Revolt of 1381, was about. Incidentally, it will hardly help to start a new Peasants' Revolt today.

Information and Advice

Non-self Governing Territories. Summaries and Analyses of Information transmitted to the Secretary-General during 1949. Vol. I. United Nations. 254 pages. 15s.

Active international interest in the problems of Colonial territories is a fact of present-day politics. The United Nations Organisation does much unobtrusive good work in making possible a well-informed interest. The Charter makes obligatory the transmission of "up-to-date information relating to economic, social and educational conditions" in the non-self-governing territories of the Administering Members of

the United Nations; since 1947 summaries of this information have been annually published. The present volume, besides giving a useful account of social and economic progress during 1949, makes it possible to compare between conditions in different territories by presenting much of the information in tabular form. For British territories alone, material otherwise scattered through many sources is made concisely available. The editors show a welcome caution, not always present in United Nations publications, in accepting at their face value statistics supplied by member Governments.

An appendix contains the Resolutions passed by the General Assembly in 1949 concerning non-self-governing territories. Of these, the most interesting provide for a special Committee not only to examine information received but also to "submit substantive recommendations relating to functional fields generally," though not to individual territories, it invites Administering Members to aim at establishing equal treatment in educational matters between inhabitants of their Territories, and to make the indigenous language the normal teaching language. Material originally submitted "for information purposes" is thus being increasingly used as a basis for proffering advice in administration, a tendency which, as the debates at Lake Success show, is causing the Administering Members some apprehension.

Wrestling with Figures

Statistical Inference in Dynamic Economic Models. Edited by Tjalling C. Koopmans. New York: John Wiley and Sons. London: Chapman and Hall. 438 pages. \$6.00. 48s.

The science of econometrics occupies an intermediate position between economics and statistics. Its fundamental aim is to quantify the structural relations which economic analysis suggests as the basis of the system under study; and it does so by an examination of the statistical facts. The economist proposes the model; the econometrician says whether it is the sort of model which is capable of statistical study and proceeds to develop procedures for estimating its constants from observation. Econometrics in this sense has been intensively studied over the past ten years by a number of writers working for or with the Cowles Commission at Chicago. This school has been much concerned with models specified by linear equations in the variables (linear because this is the simplest case and a good deal of economic data can be transformed to approximate linearity) and with the identifiability thereof, that is to say, with the conditions which a model has to fulfil in order that the estimation of its individual constants may be possible.

Apart from Marschak's Introduction, the book consists of three parts: on Simultaneous Equation Systems, on Problems Specific to Time Series and on the Specification of Hypotheses. Part I contains a long paper by Koopmans, Rubin and Leipnik on measuring

the equations of dynamic economics. This is, as it were, the basic memoir. It is followed by nine papers on more detailed aspects of some of the questions raised in it, such as Haavelmo on Confluence Analysis and its Use in Econometrics, Hurwicz on Prediction and Least Squares and T. W. Anderson on the Estimation of Parameters of a Single Equation by the Limited-Information Maximum-Likelihood Method.

Part 2 consists of six papers on Time Series; two by Hurwicz on Trend and Seasonality and on Least-Squares Bias; one by Mann on Nonparametric Tests against Trend; one by R. L. Anderson on Tests of Significance; one by Rubin on the Consistency of Maximum Likelihood Estimates in the Explosive Case; and one by Koopmans on Models involving a Continuous Time Variable. Part 3 include papers by Koopmans on the completeness of equation systems and Hurwicz on systems with non-additive disturbances.

This book was not intended as an introduction to the subject—we are promised a simpler expository version later—and it will not be found easy to read. To some extent this difficulty is due to the complexity of the subject and the novelty of the treatment; but some of it is assignable to the tendency of most of the authors to attempt the maximum generality in the statement of their results. The essential ideas of econometrics are quite accessible even to those with no mathematics in advance of a matriculation standard; but they are here presented in a proliferation of symbols which may repel the economist and arouse disquiet even in a hardened mathematician. This is a pity, because the book enshrines an immense amount of valuable work and many fruitful ideas. Anyone who sets out to read this book will have to wrestle with it; but on the whole the effort will have been worth while.

What's in a Name?

The Twentieth Century. January, 1951. Edited by Michael Goodwin.

The Nineteenth Century, founded by James Knowles in 1877, would have changed its name in 1900 if the title *The Twentieth Century* had not been patented by an unscrupulous rival publisher who made no subsequent use of it. Mr Michael Goodwin has chosen the occasion of the half-century to make good the lapse of years by changing the title and improving the format of the magazine. As his editorial points out, the purpose of this change is not only to remove an anachronism but to emphasise that "we have, all of us, lived too long by the exhausted standards of the nineteenth century. In so doing, we have left largely unexplored the central problems and potentialities of the twentieth." At a time when the position of the monthly journals is not an easy one, it is refreshing to see one of their company embarking with such confidence on a fresh lease of life, and it is to be hoped that Mr Goodwin (or his successor) will have better luck in 2000 than did James Knowles in 1900.

AMERICAN SURVEY

The Great Debate

Washington, D.C.

PRESIDENT TRUMAN, in the most outspoken Message on the State of the Union that America has ever heard, said:

Even if we were craven enough to abandon our ideals, it would be disastrous for us to withdraw from the community of free nations.

It is now evident that it would take a lot of words to refute this conclusion directly. But the great debate has already shown that, on the fringe of the neo-isolationist camp, newly astir in response to Mr Hoover's bugle call, there are a number of commanders who, while disclaiming any intention of withdrawing from the community of free nations, profess to believe that the free nations would benefit from a contraction of American military commitments.

Senator Taft, whose overwhelming victory in the recent election and long-standing reputation for honesty ensure him a large and respectful audience, says that America should fight if Western Europe were attacked and should furnish military aid in the meantime. But he would not have any more American troops sent to Europe unless Congress says they are to be sent, and he thinks the United States should take the relatively economical course of maintaining the peace of the world not with a large land army, but by the exercise of sea and air power—just as Britain did with her navy in the nineteenth century, he told his National Press Club audience in Washington this week.

Senator Taft's policy is almost certainly easier to explain than are some of the truths it neglects to take into account. It is the constitutional prerogative not of Congress, but of the President, to order troops abroad, a prerogative that, as Mr Arthur Schlesinger, Jr., has pointed out in a letter to the *New York Times*, was employed by the White House forty-two times during the century after 1812—and on three of these occasions troops were sent to Korea. Quite apart from this constitutional fact, the absence during the nineteenth century of any power with 170 army divisions at its immediate call and of any doctrine comparable in its contents and methods to Soviet Communism could conceivably have a bearing on Senator Taft's policy. So, as some of his listeners quickly perceived, could the failure of sea and air power to prevent the present defeat in Korea.

Senator Taft says he is no isolationist and the disciples of Mr Hoover repudiate the label just as indignantly. How, they ask, could anybody describe as isolationism a programme which, though it would let continental Europe and Asia go, would stretch the defensive area of the United States to include all the Western Hemisphere and would push out as far across the Atlantic as Britain ("if she wishes to co-operate") and as far across the Pacific as Japan, the Philippines and Formosa?

Perhaps it is an indication of progress that nobody in America now is willing to call the political uniform he wears an isolationist one. Perhaps it comes under the heading of "Good Things" that the neo-isolationists are not against fortifying the island of Guam, as the "olde-tyme" isolationists were twelve years ago. In January, 1939, there was

published the report of a Naval Board recommending, among other things, that Guam should be developed into a strong advance base for the fleet; but a Bill to carry out this recommendation at a cost of \$5,000,000 was voted down in Congress and, when the humbled navy came back in February, 1940, with a modified plan for Guam costing only \$1,000,000, Congress rejected that too.

Guam was captured by the Japanese two days after the attack on Pearl Harbour, so that the lesson which the isolationists are now, in effect, claiming with such pride to have learned cannot, with the best will in the world, be regarded as a particularly difficult one. It is wise to have a strong navy and air force and to provide bases off the coasts of the United States. Beyond that the case for isolationism that is being made now offers parallels so close to the case for isolationism that was being made until ten years ago that it is explicable only in terms, on the one hand, of public forgetfulness and, on the other hand, of a deep and lasting American yearning to be left alone to live and let live.

Statements made by leading isolationists in America a little before the attack on Pearl Harbour revealed a state of mind which is uncannily reproduced by the current state of mind of Mr Hoover and his followers. Then it was passionately and positively held that Europe was not worth saving because the war was one of "rival imperialisms." Now it is as passionately and as positively held that Europe is not worth saving because it is "confused with fears and disunities." Then Mr Hoover himself said:

Certainly, if the United States joins in this war we would inevitably become a totalitarian dictatorship ourselves.

Now Mr Joseph Kennedy says that the Administration's foreign policy has "solidified Communism," sapped American strength and taken a "politically and morally bankrupt" course.

★

Mr Hoover is, as the *Baltimore Sun* recently observed, "by nature something of a despairing man." In the present circumstances he has been able to secure the ear not only of those Americans who despair rather readily and those who have been moved to uncharacteristic despair by the defeat in Korea. He has also attracted some proportion of those who have been alarmed at the money it has been costing to pursue the Administration's policy, of those who have wanted to see the money spent in the Far East and—perhaps the largest company—of those who never trusted "those foxy foreign nations" anyhow.

But this is not to say that Mr Hoover and his friends are having or are going to have things their way. Those whose instinct is not to retreat but to advance are against him—notably Governor Dewey of New York, a fellow Republican who wants to see a United States army of 100

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

divisions and a full-strength navy double-quick. So are those who are appalled at the idea of handing to the potential enemy the industrial capacity of continental Europe, and those who are appalled at the idea of repudiating the moral obligations of the United States.

The retreat in Korea, as much of the talk and many of the letters to the newspapers show, has left the country with a feeling of nakedness and vulnerability. The realisation that the United States is still strong, rich, productive and in the last analysis still on top of the cock-eyed world has yet to dawn in the great reaches beyond Washington. And General Eisenhower has yet to report on his exploratory tour of Western Europe. The press conference he held at the Pentagon just before he left was a model of energy and common sense. He left the impression that he could be relied on not to fool anybody into believing what was untrue. Nothing was beyond the power of the free nations if they wanted it enough: if they were prepared to sacrifice and to unite they could have security and peace; if they were not prepared to sacrifice and to unite neither he nor anyone else could get security and peace for them.

There is nothing at the moment to convince even Mr Hoover that the present revival of isolationist doctrine can survive an unambiguous report by General Eisenhower that he has been to Europe to see for himself, that he has assessed the will to sacrifice and to unite for the purpose of saving the peace, and that he has found it adequate for the job in hand. And what is not in the least in doubt is that the genuine proofs that will lead General Eisenhower to that conclusion cannot be furnished in America. It will be on what Western Europe now proves to the General that the immediate outcome of the great debate on isolationism and the further course of American policy will largely depend.

Organised Farmers

[FROM A CORRESPONDENT IN IOWA]

ALTHOUGH the farmers today form a smaller fraction of the American population than ever before, and are not organised in one pressure group, but are divided among four major farm associations, they nevertheless dominate many State legislatures and force both national political parties to treat agriculture as a sacred cow. The federal Department of Agriculture remains completely untouched by the reforms recommended by the Hoover Commission on the machinery of government, because the organised farmers have not agreed to approve them. Under the new Defence Production Act, agricultural prices may not be fixed below "parity," a level for each commodity designed to give the farmer the same real income that he enjoyed in a base period. This makes any effective control of the cost of living difficult.

This political influence reflects the great strength of the farm organisations, especially the Big Four—the American Farm Bureau Federation (1,250,000 families), the National Grange (850,000 men and women), the National Farmers Union (450,000 families) and the National Council of Farmer Co-operatives (111 co-operative associations with 2,500,000 members). One of these co-operative associations, the National Milk Producers Federation, is sometimes considered one of the major groups on its own account. Nearly half of the 6,000,000 farm operators in the country belong to one or more of these organisations, including most of the more prosperous commercial farmers. All four have been growing in membership and increasing their staffs in recent years, and are represented regularly at Congressional committee hearings, where they carry great weight.

For a long time national farmers organisations were a cyclical phenomenon in the United States, expanding in hard times and contracting with good times. Their continued growth, after the depression of the nineteen-thirties had given way to the war and postwar booms, has been something new. The Grange saw its great days in the eighteen-seventies, the Farmers Alliance in the eighteen-eighties and nineties, the Farmers Union shortly before the 1914-18 war, and the Farm Bureau just after it. Although three out of the four still survive, not one approached its earlier membership until recently, and only the Farm Bureau has surpassed it. The Grange, which has revived and grown lately, is a conservative, somewhat isolationist body, strongest in the Northeast and the Pacific Northwest—and quite different from its radical Midwest self of the eighteen-seventies. The Farmers Union of 1913 was concentrated in the States washed by the Gulf of Mexico, and devoted itself primarily to organising co-operatives to by-pass "middlemen." In the past twenty years it has become a vigorous political pressure group, latterly of the New Deal and Fair Deal persuasion, concentrated in the wheat areas of the High Plains instead of coastal Texas, but continuing its interest in co-operatives, though not in the same ones.

Only the Farm Bureau has retained its original habitat—the maize-hog midwest and the cotton-tobacco south, with outlying strong points in New York and California and wherever commercial farming flourishes. Its connection with the county agricultural extension service helped it to survive the lean years of the twenties. This link with a tax-supported educational system is older than the American Farm Bureau Federation itself, and has been the making of it—much to the indignation of the other farm organisations. The tie is

only beginning to be loosened now that the Farm Bureau has enough staff and revenues of its own not to need it.

The original "farm bureaux" were organised independently in agricultural counties from 1914 onwards to take advantage of the federal grants-in-aid for the education of farmers in modern methods. These bureaux paid part of the salary of the county extension agent, who brings the latest knowledge directly to the farmer; they often engaged and directed him, with some supervision by the state agricultural college. By 1920, they had combined to form strong state and national organisations, to provide their members with additional services and to influence legislation. But to this day, county farm bureaux affiliated with this national lobbying association are the official sponsors of the county extension service in 14 states.

The employment of professional staff has been the rule in all the farm organisations during the present generation, and is one of the reasons for their greater stability in spite of the ups and downs of the business cycle. Mr Allan Kline, president of the American Farm Bureau Federation, both Mr Albert Goss, the late master of the National Grange, and his successor, and Mr James Patton, president of the National Farmers Union, all came to their present posts after running state branches of their associations. The farm organisations now maintain a bureaucracy of their own to guard their interests, to provide services to members, and to cope with the maze of rules laid down by the United States Department of Agriculture. In this way farmers have also solved the problem which defeated the old-time farm organisations, that of running their co-operatives and farm service companies efficiently and yet keeping some sort of control over them.

Because farmers are so dependent on national legislation, which since 1933 has provided subsidies and price supports on a generous scale, they are forced to put their arguments on the plane of general public interest. But that has not prevented them from taking some narrow, unpopular stands, such as the National Milk Producers Federation's long battle to preserve discriminatory taxes on margarine. The American Farm Bureau Federation in the nineteen-forties persuaded Congress to try to curtail the power and independence of the Department of Agriculture, in the fields of research and aid to low-income farmers, and favoured consolidating these and the Soil Conservation Service in the state extension departments, where they would be more directly subject to Farm Bureau influence. Before 1941, the National Grange went through a phase of America-Firstism and "chemurgy" (carrying to extremes the advocacy of agricultural autarky through industrial use of farm products). It has usually fought the Reciprocal Trade Agreements programme and any importation of competitive agricultural products.

The National Farmers Union, with a reputation for being the most progressive of the farm organisations, opposed the Truman Doctrine and the North Atlantic Alliance as bypassing the United Nations and unnecessarily offensive to Russia, but it has supported United Nations armed action in Korea. Senator Bridges's sensational charges in September that the Communist Party had infiltrated the Union were based primarily on wild boasts by Communist officials themselves, and on complaints of disgruntled employees. However, some officers of the weak Farmers Unions of Iowa and the northeast have followed the Communist line with fair regularity. But where the Farmers Union is strong, it is definitely anti-Communist. Senator McCarthy himself gave the Wisconsin Farmers Union a clean bill.

American Notes

State of the World

President Truman could not this year begin his annual Message to Congress with his customary assertion that "the State of the Union is good." This was not because he thinks there is anything wrong with the health of the United States itself, but because "American soldiers are fighting a bitter campaign in Korea," and even more because today "the state of our nation is in great part the state of our friends and allies throughout the world." All free nations, said the President, are exposed to the threat of world conquest by Soviet Russia, and their only security lies in banding together. The President begged the Congress to debate the issues constructively, not destructively, to put country before party (as has certainly not been done recently), to match with its own sense of responsibility the overwhelming responsibility of the United States to lead the free nations of the world.

President Truman outlined his practical programme for meeting the challenge to freedom. First, economic assistance must be given: in the case of European countries such aid would in future be specifically related to building their defences, but in other parts of the world it would be for general economic development. Mr Truman's Republican listeners showed little enthusiasm for this proposal, but received more favourably the second part of the programme, the continuation of military assistance to countries that want to defend themselves. Thirdly, the United States will go on working for the peaceful settlement of international disputes and is still willing to negotiate "honourable settlements" with the Soviet Union.

Alongside this programme for building up strength abroad, Mr Truman also outlined one for building up strength at home, so that the United States will be ready for full wartime mobilisation if it becomes necessary and able to maintain the preparedness effort for as long as needs be. The

Fair Deal can be seen in Mr Truman's references to the desirability of rounding out the system of social insurance and for assuring equal rights to all citizens. But it can only be faintly heard in his ten requests for specific legislation, although its voice may be more audible when Congress is given details of the most controversial proposals, such as those for improving the agricultural and labour laws, for housing and training defence workers, for increasing the supply of medical personnel and for meeting educational needs. The present Congress, however, as Mr Truman knows very well, will not hesitate to put his Fair Deal child back in its place. Nor is Congress likely to see eye to eye with the President on other points in his legislative programme—the extension and revision of the Selective Service and Defence Production Acts, military and economic assistance to foreign countries, and a major increase in taxes. But Congress is as certain to take some kind of action in these fields as it is to give the President all that he asks for in military appropriations.

* * *

Tidying Up the Mobilisers

Administrative agencies have been created in such numbers during the six months since the Korean war began that President Truman already has a large job of spring-cleaning in prospect. Last week he began to put the Government organisation for a half-war economy into reasonable shape. In effect, Mr William Harrison's production authority has been taken out of the Department of Commerce and given a higher status, in which it is subordinate only to Mr Charles E. Wilson's Office of Defence Mobilisation. It is Mr Harrison who makes the actual move, while his former agency—the National Production Authority—continues to exist but becomes in fact as well as in form parallel to other specialised authorities like the Defence Transport Administration within the Interstate Commerce Commission. NPA will still issue the orders dealing with production, such as those restricting the use of copper. But Mr Harrison's new organisation, the Defence Production Administration, will stand above it as the central body for settling programmes and supervising most of the priority-fixing, allocation and requisitioning done by the regular departments and their various agencies. DPA will correspond fairly closely in function and powers to the War Production Board directed by Mr Donald Nelson in the last war.

The point of Mr Harrison's elevation is to centralise authority more clearly in the hands of Mr Wilson, who will now be chairman of a Defence Mobilisation Board, whose members are the relevant Cabinet ministers and chairmen of independent agencies like the Federal Reserve Board. This will, or should be, the policy-making body, and Mr Wilson becomes in effect a deputy-President to whom Mr Truman has delegated fairly full responsibility for the economics of the home front. The establishment of DPA theoretically, at least, makes Mr Wilson's job manageable by reducing to two the authorities reporting directly to him—Mr Harrison's DPA and Mr Valentine's Economic Stabilisation Agency; a third, regulating production for civilian needs, may be added if scarcities become acute.

Here, however, the clarity of the new administrative structure for the time being ends. DPA's broad authority for industrial priorities and production includes only hazily defined powers over the military buying on which other government decisions depend; the Pentagon will continue to make its own plans, and in practice conflicts between it and DPA will have to go up to Mr Wilson, or even higher, for settlement. (This was the defect in organisation which was never cured in the last war.) Mr Wilson will also have to deal directly with the Department of Agriculture about food, which DPA's control powers do not cover. DPA takes over authority to approve government

loans and tax reliefs (by faster amortisation) to companies expanding defence production from the National Security Resources Board. The future tendency must be to concentrate authority more firmly along the lines of command emanating from Mr Wilson, and in the process many of the smaller agencies will probably be absorbed into DPA. But further administrative reform is probably best left until after the more urgent task stressed by the President's Council of Economic Advisers in their annual report—that the armed forces should formulate their expected demands on materials, services and manpower definitely enough to give the economic administrators something to go on.

South in the Saddle

The South has lost no time in exerting its new dominance over the shrunken Democrats in the Senate and displaying its ability to rule the House by making common cause with the Republicans. Four hours after the Eighty-second Congress assembled in its bright new redecorated chambers, the House voted, by 244-179, to return to the Rules Committee the veto power it enjoyed over legislation until two years ago.

One of the first acts of Congress after Mr Truman's victory in 1948 was to tear down this legislative Bastille in which so many liberal measures had languished at the pleasure of conservatives of both parties. The 21-day rule adopted provided that if a measure had lain before the Rules Committee for that period the chairman of the committee originating the Bill might call it up for debate by the full House. In the past two years this has been done eight times, and on each occasion the Bill has passed the House, although several died in the Senate.

The aim, in the words of the Republican Mr Halleck, is to change a Congressional traffic policeman into a "road-block to unwise, ill-timed, spendthrift, socialistic measures." The immediate practical effect is not likely to be great. Few of the Fair Deal measures so eloquently described by Mr Halleck are likely to make more than a token start in a session dominated by rearmament and the world crisis. It is still possible for the House, by majority vote, to demand the production of Bills in which it is interested. But the step is unquestionably a return to less representative government and particularly objectionable when swift decisions may be needed.

In the Senate, the choice of Senator McFarland as majority leader—though he lacks an effective majority and is said to lack, as well, most of the qualities of leadership—and of Senator Johnson of Texas as whip guarantees a bleak prospect for legislation repugnant to the South. The Republicans have as yet reached no final decision as to whether the coveted extra place on the Foreign Relations Committee—a recognition of their increased Senate strength—should go to a supporter or critic of the Administration. The Administration itself might not be altogether sorry if Senator Taft were appointed, for responsibility and access to confidential information might temper his opposition. But he has apparently turned the post down and, on the simple grounds of seniority, there is a strong hope that it may go to Senator Aiken of Vermont, one of the five Republicans courageous enough to vote for the resolution demanding Mr Acheson's resignation. As a counterweight, however, critics are heavily represented on the new Republican policy committee in the Senate.

BRUSSELS

the settlement to which the railways hurriedly agreed, after an alarming outbreak of "sickness" among yardmen in 15 cities in December held up both war goods and Christmas parcels. It gave the yardmen a wage rise of 25 cents an hour, compared with the 31 cents they sought, and the 18 cents a Presidential board thought would meet the case. It also introduced a cost of living clause into the industry for the first time and held out the hope of a yearly "improvement factor." In return, there was to be a three-year moratorium on demands for higher wages and changes in the rules.

The pattern was clearly that of the automobile industry's five year "peace treaty" with its workers and, because the negotiations were carried out under the supervision of Dr Steelman, an Assistant to the President, seemed to give official blessing to the very escalator clauses which are causing so much anxiety to the stabilisation authorities. In addition Congress, though reluctant to appear to reward the wildcat strikers, passed a Bill amending the Railway Labour Act to authorise union shop agreements permitted elsewhere.

The disgruntlement of the rank and file is due, in part, to the way the dispute has dragged on, and the knowledge that wage stabilisation is just around the corner. The railwaymen, once the "aristocrats of labour," have not had a rise for two years and feel this may be their last chance. In addition, though the 40-hour week they sought was granted in principle, it was postponed in practice because of the shortage of manpower. It rankles that engineers and firemen should be denied the leisure already enjoyed by a majority of the non-operating workers, clerks and so forth. Furthermore, the unions have no faith in Dr Steelman as an arbitrator in disputes over the rules.

But it is doubtful whether the unions can hope to wring a much more favourable settlement out of either the companies or the government. As long as the army is running the lines, which it took over in August, strike action is certain to be met by court orders, and there is no limit on the fines which may be imposed for contempt. Moreover, although the railroads' net income in the first 11 months of 1950 was \$662 million, thanks to rearmament, compared with \$352 million the year before, the non-operating unions are putting forward fresh claims which must be added to the \$130 million a year which it is estimated the Steelman agreement would have cost. The major railways are already asking for a 6 per cent increase in freight rates.

Electrical Storm

Sparks flew a few weeks ago when Mr Chapman, the Secretary of the Interior, publicly doubted whether there will be enough electric plant, existing and planned, to provide the power needed for the defence effort. Generating capacity, at the peak of the last war, was about 40 million kilowatts; it is now 65 million; by 1953 it is expected to be 86 million. The private companies, who in eight postwar years will have spent \$15 billion on expansion, suspect Mr Chapman of crying wolf to avoid any Congressional cuts in his department's public electricity schemes. Only a small reserve of capacity, about 10 per cent, is necessary, they say, with present pooling of power.

Even on the industry's figures, however, the 20 per cent reserve, which existed for the country as a whole at all times during the war, will not be reached for three years. At present it is 12 per cent and in the view of the National Security Resources Board this would prove an inadequate margin if war broke out. The position is, of course, much easier than it was just after the war, when the reserve fell to 5 per cent and "brownouts" had to be ordered; and infinitely easier than it is in Britain, where the "reserve" is a negative quantity. But the danger will not be entirely removed so long as demand keeps pursuing supply. At the end of the year weekly production reached 7 billion kilowatt hours for the first time, a full billion higher than a year

earlier, thanks not only to increased industrial consumption, but also to farm electrification, television, the inroads of electric cookers and water-heaters on the gas industry, and a multitude of other home appliances. Electric power is still perilously short in the north-west, which must supply the Hanford atomic installation and vital aluminium factories, and in the south-east, where the Tennessee Valley Authority is expected to need more steam facilities to supply new atomic developments. The regional needs for aluminium and magnesium expansion and for atomic projects, coupled with the belief that, under the stimulus of rearmament, the whole economy will continue to grow at a phenomenal rate, are behind the fears of government officials that the spectre of a power shortage—which has never quite materialised—may do so in the next year or two.

During the last war, when power in the north-west was so short that electric clocks ran slow as far east as North Dakota, new generating plant had to be sacrificed to war production. The industry can hardly count on escaping similar restrictions if war should break out again. But for the moment, it is being sheltered from all cuts in materials. Its requirements for aluminium conductors are to be met for the next three months without regard to the general reduction in supplies, and it may also be granted priorities for copper.

* * *

Money for Music

The Korean invasion, dashing the well-founded hopes that Congress would at last repeal the wartime excise tax on entertainments, also dashed the hopes of America's musical impresarios that they would no longer have to beg for their suppers. Both opera companies, which are few, and symphony orchestras, which are many, since no self-respecting city wants to be without one, are regarded as charitable institutions for the purposes of other kinds of taxation, yet they must all turn over 20 per cent of their receipts to the Federal Government. This brings the Treasury only about \$2 million a year, a sum that is hardly a ripple on the national budget, but on the musical sea would be a wave almost large enough to carry both operas and orchestras over the reef of their regular deficits.

In its 1949-1950 season New York's Metropolitan Opera Company showed a loss for the third year in succession and for the record sum of \$400,000, almost exactly the amount it paid in excise taxes, on a gross income of \$3,500,000. Its directors have just launched an appeal for \$750,000, three times as much as they wanted last year, to cover the costs of maintenance during the season now in progress and of new productions next autumn. If Mr Rudolf Bing, the new general manager, goes on as he has begun, those costs will be high, but his productions seem to be giving both musical and dramatic value for money. Many of the seasonal subscribers have made donations as well as buying seats and the latest appeal for funds was directed to those who listen to the Metropolitan Opera on the wireless.

The "Met" is not the only musical organisation which is trying to spread its losses among a large number of subscribers, now that there is a scarcity of the wealthy patrons who used to keep opera companies and orchestras as pets, and little sign that local governments can be induced to step into their shoes. In Seattle recently a "24-hour marathon appeal" was conducted from a shop-window amongst passers-by, to raise \$15,000 to keep the wolf from the local symphony's door. Louisville, Kentucky, has found a different remedy for the chronic hand-to-mouth complaint of its local orchestra. Instead of the big name and big fee soloists who are customarily engaged in order to attract audiences, new works are commissioned from contemporary composers, a policy which costs less and has turned out to be worth more in prestige. The money comes out of the Louisville Fund, which is a joint collection for the benefit of all the city's cultural activities.

THE WORLD OVERSEAS

Latin America and the Sinews of War

(By A Correspondent)

IN the heady political climate of South America *coups d'état* have blossomed as readily as bananas and revolutions as casually as coffee beans for 130 years. But so rapidly has peace gone to seed in the rest of the world that South America, for all its chronic political instability, has now emerged as the one area which is free enough from the threat of annihilation to be developed as a dependable source of the strategic raw materials which the western allies need so much.

Within the borders of the 13 South American countries lie hidden enough proved deposits of raw materials to keep the allies armed to the teeth, sheathed in aluminium and bristling with radar antennae for generations. During the last war South America, plus Mexico and Central America, supplied 100 per cent of United States' imports of antimony, bauxite, vanadium, and crude petroleum and more than half of its imported beryllium, copper, lead, manganese, molybdenum, tin, tungsten and zinc.

The mines of South America were first opened by the Conquistadores, who shipped gold and silver back to Spain as proof of the riches of the New World. But the base metals of the sea-roving sixteenth century are the precious metals of the industrial twentieth, and none are more precious than the reserves of copper ore, over 40 per cent of which are in the Republic of Chile. In one vast Chilean ore body alone, the Chuquibambata, there are thought to be 1,000 million tons of ore, averaging 2.16 per cent copper. In 1949 Chile produced 409,055 tons of copper in ore form and 386,611 tons on a smelting basis, second only to the United States. No less important are the tin reserves of Bolivia: when the Japanese over-ran Malaya during the second World War, Bolivia, with the aid of Nigeria and the Belgian Congo, provided the United Nations with all their tin. Bolivia mined 34,123 tons of tin in 1949. And the present frightening shortage of non-ferrous metals, which has forced the Ministry of Supply to restrict their use in the manufacture of some 200 articles, from the beginning of next month, focuses attention on Peru, which in 1949 mined 78,734 tons of zinc ore, as well as 72,043 tons of lead. Peru is also the world's largest producer of vanadium, used in the manufacture of steel.

For bauxite, the raw material of aluminium, the world has long come to Dutch and British Guiana, which produced 3,891,614 tons in 1949, about 45 per cent of the world's output. Brazil is making serious efforts to produce its own

primary aluminium, and an integrated aluminium plant with a high-speed rolling mill has been reported in the state of Sao Paulo. The mill can depend on assured bauxite deposits of 100 million tons. As for manganese, Brazil has as much as any other country in the world: in 1949 the Republic produced 149,896 tons. Bolivia is a major supplier of wolfram, source of tungsten, exporting 1,526 tons in 1949. And in the output of wool, certainly a vital war material, Argentina ranks second only to Australia, producing 475 million pounds in 1949-1950. During the same season, Uruguay, Brazil and Chile clipped another 237 million pounds between them.

Lack of Rubber and Coal

However, South America lacks at least two of the sinews of war, rubber and coal. Although natural rubber was first cultivated in Brazil the industry declined steadily, and all Latin America produced only 27,300 tons in 1949. South American governments are now spending about \$2,000,000 a year to encourage small farm production of rubber as a cash crop supplement to foodstuffs. Of the world's coal reserves, South America has about 1 per cent and that is of poor quality. But the continent makes up at least part of this deficiency with abundant supplies of oil; in combination with Mexico, it provides 20 per cent of world supplies, and Venezuela, which produced 69,012,000 metric tons in 1949, is the world's biggest exporter of crude petroleum. Some day the continent may be the world's biggest supplier of iron ore, for geological surveys have indicated rich deposits of ore in Brazil, perhaps as much as 25,000 million tons. Large scale exploitation of South American ore began last year, when the United States Steel Corporation announced the discovery of its fabulous "Iron mountain," Cerro Bolivar, 50 miles south of Ciudad Bolivar, in Venezuela. The mountain contains 1,000,000 tons of iron of almost theoretical purity, which the US Steel Corporation will use in its new mill, to be built this year on the east coast of the United States.

But the likes of Cerro Bolivar are not to be had for the asking. To put its ore on the ocean the US Steel Corporation will have to lay several hundred miles of railroad track, dredge river channels and build port facilities, at a cost of many million dollars. Such an outlay must be regarded as a matter of course in a continent where communications are still primitive and natural obstacles are overwhelming. Almost barren of coal, South America lacks the cash to develop hydroelectric power, for native capitalists have but lately been turning from the traditional practice of putting their money into real estate or conspicuous consumption. And a revival of intense nationalism has made it unlikely that any Latin American government will ever again offer its natural resources to the highest bidder: investment and development by foreigners are governed by a myriad of employment and currency restrictions, some prudent, some unreasonable. Just how this may be adjusted to provide for the maximum development of the continent as well as the defence of the western world will probably be a priority item on the agenda of the American Foreign Ministers when they meet in Washington on March 26th.

Three in Search of a Cease-Fire

WHEN the General Assembly of the United Nations adjourned for the holiday season last month, it entrusted its faint hopes for a Christmas peace to the care of a three-man committee, which was told to find some method of arranging a cease-fire in Korea. Last week, Sir Benegal N. Rau told the Assembly's Political Committee how, in the course of ten frantic days, these hopes had grown fainter, and were now at the point of death.

The committee was created by the Assembly on December 14th following a resolution by 13 Asian and Arab countries. Its members were Mr Nasrollah Entezam of Iran, Mr Lester B. Pearson of Canada and Sir Benegal Rau of India. After handing a copy of the Assembly's resolution to General Wu, the representative of the People's Republic of China, who was then in New York, the committee went to work on the unified command of the Uno forces in Korea. Within a day's time, the committee and the command had hammered out eight points which they both thought could be the basis of a satisfactory cease-fire. Among the more important points were: a 20-mile demilitarised zone extending across Korea north of the 38th parallel; withdrawal of all armed forces north and south of this zone; enforcement of the cease-fire by a United Nations commission.

Swiftly the committee moved on. To General Wu in New York and to his government in Peking, it sent identical notes, offering to meet the Chinese in any spot they chose, for a discussion of the conditions for a cease-fire. At the same time, the committee asked the People's Government to instruct General Wu to prolong his visit in New York. When he dismissed the cease-fire proposal as "a trap of the U.S. ruling circle," the committee tried to keep its foot in Peking's door by sending one last cable on December 19th promising that a successful cease-fire order would be followed immediately by a conference which would include the People's Republic and which would attempt to settle "existing issues in the Far East." After that, there was nothing left for the committee to do but wait.

It waited two days. On December 21st, Peking replied that the three-man committee was "illegal," because the People's Republic had had no hand in selecting it, and that its representative could therefore not deal with it. Two days later, Mr Chou En-lai, Minister of Foreign Affairs in Peking, slammed the door in the committee's face for good and all. The People's Republic, said Mr Chou, will "carry on no negotiations with the illegal" committee. As far as Mr Chou was concerned, the price for a cease-fire was no less than the removal of the United States Seventh Fleet from Formosan waters, withdrawal of "foreign" troops from Korea and a seat in the United Nations for Peking.

That finished the hopes for peace in 1950. Last week, Sir Benegal Rau read the committee's report to the Assembly, concluding with its regretful statement that "no recommendation in regard to a cease-fire can usefully be made by it at this time."

The cease-fire resolution now being put forward by the Israelis is not much different from previous proposals. It provides for an immediate cease-fire and for the gradual withdrawal of all foreign troops from Korea. It proposes that Korea should be united under a single government to be set up after free elections have been held throughout Korea under United Nations supervision. It also proposes that a new United Nations Korean Commission should be set up, with the Soviet Union and also Communist China amongst its members; that Peking's claim to membership of the United Nations should be favourably considered; and that a general pledge of non-intervention in the affairs of Korea should be taken.

A Russian View of Keynes

THE period of general crisis in capitalism inevitably shows itself even in the ordinary bourgeois political economy. The present reactionary bourgeoisie assigns a task to its hired scientific stooges, the basis of which is that the bourgeois economists, apart from their usual glamorising of the capitalistic order, have to invent and provide a variety of "remedies" and "improvements" of the capitalist system. Under the slogan of "fight against unemployment," crisis and other inevitable concomitants of capitalism, defenders of imperialistic bourgeoisie in fact try by various means to strengthen the shaky pillars of present capitalism, to strengthen the rule of a handful of monopolists over the people, and to increase the profits of the financial oligarchy at the expense of the workers' standard of living. . . .

This line of contemporary bourgeois political economy has appeared most clearly in the activities of the English bourgeois economist Keynes, author of the book under review*. It caused a lively reaction and became a typical gospel of the shameless defenders of imperialism, propagating the ludicrous idea of "directed" capitalism. Keynes's "work," which consists of false and considerably confused judgments presented in a charlatan manner as a so-called "general theory," is based on old, well-known, vulgar idealistic economic ideas. The complete ignoring of the political and economic realities of imperialism, the monetary conception, the corroboration of the supremacy of psychological factors over economical ones, the conscious twisting of the role of the bourgeois state—all these stupid and shabby ways of defending capitalism are lavishly used by Keynes.

Fraudulent Explanations

Keynes in his effort to "clarify"—but more likely to confuse—the problem of the causes of unemployment, stresses the thesis that unemployment is caused through lack of demand for products of personal consumption on the one hand, and lack of demand for productive goods or capital investment on the other. As far as the shortage of demand for consumer goods is concerned, Keynes explains it with his own invention, the "fundamental psychological law" that men are disposed, as a rule and on the average, to increase their consumption as their income increases, but not by as much as the increase of their income. . . .

If it is justified in bourgeois circumstances to ask how to make use of the increasing income, then it is clear that for the workers and all other working categories of the capitalistic society the problem of what they should spend their incomes on does not exist, because their incomes do not increase but on the contrary decrease, and are not sufficient to satisfy the most elementary needs. . . .

In the same fraudulent way Keynes "explains" the cause of the shortage of demand for productive goods or capital investments. The author's intentionally complicated and confused thoughts result finally in the statement that the shortage of demand for capital investment is caused by different dynamics of the development of profit rate and interest rate. According to Keynes the demand for capital investment decreases in the same ratio as the difference between the profit rate and the level of interest decreases, and this demand disappears totally when the profit rate reaches the level of interest or falls below it. . . .

An important place in Keynes's system is taken by interest. The basis of his "general theory" on money and interest is the statement that interest arises from the property of money

* A number of Russian economists have recently been rebuked in the Moscow press for an insufficiently critical attitude towards bourgeois economic thought. This article consists of extracts from a review of Keynes's *General Theory of Employment, Interest and Money*, which throws some light on the kind of view that is expected of a theoretical economist in Moscow. The article appeared in *Economic Questions* of January, 1950.

as such, without any connection with its function as capital. Keynes thus places the origin and essence of interest in an entirely wrong light. . . . He is carefully concealing the corruption and parasitism of contemporary capitalism which are leading to a lowering of demand for manufactured goods, because otherwise the false scheme which is the basis of his "explanation" of the cause of failing demand for capital investments and the increased unemployment which is connected with it would collapse. Keynes also "explains" crisis with psychological causes. . . . He explains the beginning of a crisis as due to a change from a mood of over-optimism by businessmen into a different mood of over-pessimism. . . . In the book under review, which was written shortly after the catastrophic shock which capitalistic economy suffered through the world economic crisis of the years from 1929 to 1933, Keynes had to admit that it was impossible to maintain one of the main principles of bourgeois political economy—the principle of *laissez faire*. He grudgingly admitted the inevitability of unemployment and economic crisis in so-called "uncontrolled capitalism"; giving a wrong explanation of the causes of their origin, Keynes at the same time maintained that unemployment as well as economic crisis can be removed by shifting over to so-called "controlled capitalism."

"Remedy" For Capitalism

Having explained this basic thesis, supported by a number of bourgeois economists and politicians from Fascists to Labour leaders, Keynes suggests a complete range of regulations, leading to a so-called "remedy" for capitalism, by the activation of the bourgeois state and its increased interference in economic life. Thus Keynes appears in the role of a convinced defender of state monopolistic capitalism.

It is important to note that interference in the economy by the bourgeois state can be carried out only on the basis of the laws of economic development peculiar to capitalism. Because, as explained by Comrade Stalin, the economy in conditions of capitalism is not in the hands of the state but, on the contrary, the state is in the hands of the capitalist economy, which is based on private ownership of means of production; the exploitation of one man by another cannot, therefore, develop otherwise than according to spontaneous natural laws. Interference of the bourgeois state, therefore, not only cannot alleviate capitalistic defects, as Keynes asserts, but on the contrary, makes them worse. . . .

Measures suggested by Keynes for the "liquidation" of unemployment and crises by direct government "control" of the demand for consumer goods, are of an abstract and extremely obscure nature. Not giving a thought to the raising of the standard of living of the working masses, because an orthodox bourgeois is only interested in constant lowering of this level, Keynes elaborates at great length the theme that the only source which could increase the demand for consumer goods is the support of unproductive consumption of any sort—as for instance the parasitic consumption of the ruling classes, increasing expenditure for armaments, keeping up of the redundant police bureaucratic state apparatus, etc. He cynically states that earthquakes, even wars, can lead to an increase of wealth. . . .

Keynes's programme of "improvement" of capitalism, which represents a masked attack on the standard of living of the working masses, was a very suitable theoretical basis for the pseudo-socialist theory and practice of the Labour Party. "Nationalisation" of individual branches of industry carried out by the Labour Government can serve as a good illustration of the real contents of Keynes's thesis, which says that it is desirable that a government should take on the complete responsibility for direct organisation of investments. It is known that such activity of the Labour Government is generally advantageous for monopolists because it brings about an increase of their profits at the expense of further attacks on the standard of living of the working masses.

The Labour Government eagerly carries out Keynes's idea that the most elastic way of increasing the exploitation of the workers is an automatic reduction of real wages by using inflationist methods widely; it announced the policy of "freezing" nominal wages while the prices of everyday needs increase systematically.

The Labour Government, repeating Keynes's demagogic prattling that it is desirable to reduce some inequality of wealth by carrying out an appropriate taxation policy, actually applies such a policy, which causes a considerable increase of indirect taxation, falling most heavily on the backs of the workers. . . . "Democratic socialism" of the Labourists is fundamentally a variety of "reactionary socialism" which Marx and Engels pilloried a hundred years ago as bourgeois.

It is quite clear that when Keynes entered the lists as defender of monopolistic capital, he had no intention of showing either the real causes of economic crisis and unemployment or the way in which they could be removed. It is known that the only way to get rid of crises, unemployment, poverty of the masses and all the concomitants of capitalism is: liquidation of capitalism itself.

But Keynes's programme of measures for the "fight" against crisis and unemployment is not only a Utopian dream. Though they are helpless against crisis and unemployment, this programme is of a practical value to the imperialists, for it shows a concrete way to strengthen the supremacy of monopolistic capital through increasing its profits at the expense of the standard of living of the workers. Further, Keynes's theory is suitable for the monopolistic bourgeoisie in so far as it can be used to distribute among vast masses of people illusions about the possibility of peaceful reforming ways, to show how to remove "shortcomings" of capitalism by the change to "organised" and "planned" capitalism.

The successes of the Soviet Union, a country of victorious socialism, and of the countries of people's democracy, refute Keynes's ideas better than anything else. Their experience proves convincingly that the cause of crisis and unemployment lies definitely not in people's "psychology" and "nature," as stated by Keynes, but in the intrinsic laws of capitalism itself. The socialist system of economy is a vivid proof that the only means for the liquidation of crisis, unemployment and the hardships of the masses is not the "improvement" of capitalism but the destruction of it and its replacement by socialism through a revolution.

Soviet Satellites Re-arm

A CHANGE in the relative strength of the armed forces of Yugoslavia and its Communist neighbours has taken place in the past six months. Up to July of last year it was almost certain that Tito's armies could withstand a simultaneous invasion of the armies of Hungary, Bulgaria and Rumania; today this is no longer a certainty. During the past six months satellite armed forces have been considerably increased; they have been trained and armed by the Russians, and their arms are being standardised. During the same period the Yugoslav forces have been engaged in more intensive training than usual, but no extra classes have been called up or retained with the colours.

In a speech to the Yugoslav parliament on December 28th Tito warned his own people about the extent of this satellite rearmament. He said that the total armed forces of Hungary, Rumania and Bulgaria now amounted to 660,000: 165,000 in Hungary, 300,000 in Rumania and 195,000 in Bulgaria. This figure is nearly 200,000 more than were under arms six months ago.

These numbers are obviously meant to cover total armed

forces—that is including security troops and armed police as well as air and (in the case of Bulgaria) small naval forces. It is probable that Tito quoted the outside estimates, but there can be no doubt that his figures are substantially correct. This rapid increase in satellite armies has been achieved by calling the normal classes (1928 and 1929) to the colours, plus an additional selection from other classes; at the same time the class that would normally have been demobilised this autumn has been retained in service. This means that their armies at present contain an unusually high proportion of trained men.

These figures do not include numbers for Albania, which has armed forces—army, security troops, frontier guards and militia—of between 40,000 and 50,000. The training and quality of these troops may not be high, though in the event of war with Yugoslavia they could probably be counted on for irregular mountain warfare and the invasion of the Kossovo region. They have considerable supplies of arms captured from the Italians during the war and are known to have received some Soviet equipment recently.

Jugoslav Weaknesses

Neither in his speech to parliament nor in private interviews recently has Marshal Tito shown any lack of confidence in Yugoslavia's ability to hold these satellite armies, even if they attacked simultaneously. Its total armed forces are still as they were last year about 400,000 (including army, security troops, militia, and the smaller navy and air forces), but about 800,000 to 1,000,000 men could be put into the field fairly quickly in case of an emergency. Reserve officers and men have been put through special refresher courses this summer and winter, and there is no doubt of the fighting quality of the Yugoslav army. The problem is their armament. Marshal Tito has revealed that he had insisted—and against opposition—on the expansion of Yugoslavia's war industries as far back as 1947, when the Five Year Plan was started. These have presumably been developed since then, but it is most improbable that they can do much more than equip the country's fighting men with small arms. Tanks on the model of the Russian T34 are now being produced, but it is certain that Yugoslavia's industry, working under great difficulties, cannot compete with the Soviet industries that are arming the satellites. Some arms have been ordered from firms in the west, but only on a very small scale. Even if the large amounts of heavy armament needed to guarantee security could be paid for, it is unlikely, in view of the rearmament that is going on in the west, that delivery could be got for some time to come. Tito is still refusing to accept arms from Britain and the United States. His view, echoed by most Yugoslavs, is that an invasion of all the satellites could be held, provided they were not aided by Russian troops.

Even those who are not quite so confident point out that, against invasion from the north and east the Yugoslavs can first hold the frontiers, then if necessary the line of the Danube, and finally the Dinaric Alps, where Tito and his Partisan army waged successful guerrilla operations against the Germans for the greater part of the war. But this would mean giving up the whole of the Danube plain and the breadbasket of the country; in short, it would be tantamount to defeat.

With the turn of the year toward spring come the usual speculations as to the possibility of a Soviet-inspired satellite "liberation" of Yugoslavia. Is that the purpose of the recent increase in satellite armies? Or is it just part of the war of nerves against Yugoslavia? It may be part of a general policy to keep up political tension in Europe—or even just another example of rearmament in a dangerous situation such as now exists all over the world. It appears to be Moscow's policy to keep people guessing. Meantime, Tito has given his answer: no appeasement and, if invasion should come, a fight to the last ditch.

Agriculture in the Bahamas

[FROM A CORRESPONDENT]

ONE of the last schemes approved by Lord Trefgarne before he left the Colonial Development Corporation was one intended to increase very considerably the agricultural output of the Bahamas. The Bahamas, the Corporation points out, are still largely dependent on the United States for their food supply. Too many, it hints, of the dollars earned from the tourist traffic run back again in the purchase of food. If the Bahamas could be made self-supporting, so much the better for the sterling area. With this end in view the Corporation has purchased, for £470,000; an 8,000-acre estate on the island of Eleuthera. Its future plans include even more considerable developments on the island of Andros, the largest island in the colony, now having a population of no more than 7,000 (compared with 30,000 in New Providence). Soil experts report that these lands are likely to be as productive as similar areas in Florida, that they could provide crops for both the home and the United States market and enough maize, for example, for the whole of the Bahamas.

Optimistic forecasts of this kind are, today, bound to be received with reserve. The Colonial Development Corporation is not the Overseas Food Corporation. In its first annual report it was at some pains to make it clear, politely of course, that it shared neither the identity nor the methods of its sister corporation. Yet the development of food production in the Bahamas does raise all the problems of large-scale agriculture in tropical and sub-tropical lands with quite a few peculiar to itself.

The first is soil. The rock structure of the islands is somewhere between limestone and coral and exposed surfaces become very hard. They are also corrugated and the soil tends to collect in the shallow pockets between the corrugations, with the result that agriculture has either to be entirely a matter of hand work or must rely on some use of rock-crushing plant. Moreover, fertile as the soil may be, its fertility is soon exhausted. These problems may not be insoluble, but only with the expenditure of considerable capital.

The supply of labour should not be a problem, provided housing can be provided where needed, but its cost may be. With the decline in the sponge fishing industry, the coloured Bahamian has tended to seek mainly seasonal employment in the United States, and with success. But in the islands, the cost of living still tends to rise—even in 1949 it was 300 per cent of its 1939 figure—and wages have risen just as sharply. The Bahamas have now the highest cost of living in the West Indies. A third difficulty is transport.

There are no refrigeration ships plying between the islands and perishable crop must be sent by air.

By the standards of any European country—indeed, of any country ever likely to think in terms of self-sufficiency—the economy of the Bahamas is hopelessly out of balance. Here is a community of some 75,000 people, more than three-quarters of them coloured, scattered over some 700 islands spread over some 700 miles, and yet, in 1948, they imported goods and supplies to the value of £4,720,151 and exported no more than £551,920. In 1949 they had a revenue of £1,329,967 against an expenditure of £1,509,778, and yet they had finished the previous year with a surplus of £910,845. They have no fuel, no natural power, extremely few mechanical industries. Not only must they import all manufactured articles; they must also import flour, rice, milk, fats and beef, and yet, having no direct taxation, they raise three-quarters of their revenues from customs duties. The answer to the enigma is that the Bahamas, particularly New Providence island, is a tourist centre drawing its visitors from all over North America.

Income From Tourists

It is doubtful if anyone can calculate what the tourist business brings to the Bahamas. Since there is no direct taxation on income, a great many of the traders do not keep books. And, in so attractive a climate, why should not the Bahamian continue to believe that, as long as there is money in the world, an appreciable quantity of it will come his way? So far his fortune has held. The last thirty years began with the Bahamas as the centre of the trade in running liquor into a large area of the United States; the profits were considerable. When the war ended the tourist trade for the moment, the United States poured millions of dollars into the construction of an air base at Windsor Field in New Providence. Then the tourists returned, and provoked a housing boom. When that slackened, seven American companies began prospecting for oil. The British people have made a contribution through Mr Butlin and now the Colonial Development Corporation is picking up the cornucopia.

There are a great many Bahamians who think in those terms. They do not worry about dollar dependence for a great deal of what they buy from America they sell back to Americans at a vastly improved price. There are, of course, others who would be glad to see their islands made much more self-supporting by any realistic means. If it is economic to grow maize on Andros island—economic, that is, against the price of American maize c.i.f. Nassau—then they would agree that it is worth while. But the legislators of the Bahamas are never likely to tax imports of maize to keep its price in the island up to the Colonial Development Corporation's level of costs, nor are they ever likely to vote any subsidy to the Corporation out of their own revenues.

And there is no possible reason why the United Kingdom taxpayer should subsidise the untaxed Bahamian by footing any losses that the Corporation may make.

If large-scale agriculture in the Bahamas is to pay, it must produce a crop that can be exported and command a high price when exported, for a great deal of it will need to be flown to its markets. The Bahamas, free from frost, can sell to the United States and Canada fruits that those countries habitually eat, provided they deliver them at a time when the nearer or cheaper sources of supply are not available. A great part of the economic future of the Bahamas clearly depends on the air services available, and it is to be hoped that the Development Corporation will co-operate closely with BOAC, which controls the local Bahamas Airways as well as providing direct services to Miami and New York.

But the question remains; is, say, the large-scale production of maize in the Bahamas worth while when they lie so close to the American mainland and when the only barrier to the import of a full supply is the dollar shortage? There are those in the Bahamas who expect to live to see the day when the Governor and the Colonial Secretary are appointed by Ottawa, not Whitehall. Canada, they say, would like a place in the sun. They are anxious to remain within the Commonwealth, but very many Bahamians regard their inclusion in the sterling area as a gesture not intended to interfere with their habits and customs. Is it really necessary, they would say, to spend millions on drainage and the like just to grow maize, just to divert a few more tourists' dollars into the Bank of England? But, then, the climate of the islands is incapable of producing anything but a negative response to any suggestion of austerity.

Rumania Conforms to Communist Pattern

[BY A CORRESPONDENT]

IN Rumania the second year of state planning is drawing to a close. The report on industrial output during the third quarter of last year was in the usual percentage form and reveals little. But, like the end-of-term report of an indulgent schoolmaster, it conveys a soothing impression of progress. The first, grandiose, five-year plan, which begins this year, has been drawn up. The temporary period of the "new economic policy," when private and state enterprises coexisted, has passed. This east European country is now set on its course towards the Communist state. Although the Prime Minister, Dr Groza, is nominally still a member of the Ploughmen's Front, a small radical peasant party, the Communist walrus and carpenters have effectively con-

sumed the socialist members of the governmental coalition. The policy which the Rumanian Government is now pursuing is almost precisely the one laid down in the programme of the Sixth Communist International in 1928.

The present plans for the industrialisation of Rumania, although doctrinaire and reckless, are, in many respects, sensible. The problem of agricultural overpopulation in a country where three-quarters of the total population live by the land is an old one. As a result of the small size of the average holding and of inadequate capital investment, Rumanian agricultural practice has, generally, been inefficient. Among east European countries Rumania is also exceptionally well provided with natural resources. Oil, methane, gas, coal, lignite and timber are all to be found as well as gold and non-ferrous metals in smaller quantities. Hydro-electric power can be cheaply won from the many rivers which run through Rumania. The vice-Premier, Mr Gheorghiu-Dej, recently announced ten-year plans for constructing 24 hydro-electric stations with a capacity of 764,000 kilowatts as well as 13 thermo-electric power stations with an output of over a million kilowatts. Before the war some progress had been made in exploiting these resources. But the present plans are a different matter. The reckless speed at which they are being pressed demands a phenomenal rate of capital investment. Official figures show that if the 1948 rate of capital investment equals 100 the present rate is 450. The 1950 budget claimed 145,000 million lei for capital purposes compared with the 210,000 million lei devoted to the supply of consumer goods.

With such a programme of industrialisation only foreign capital in considerable quantity could prevent an immediate depression in the standard of living. But Russia's help of this sort has been negligible. Instead of capital equipment its contribution to the joint Rumanian and Russian holding companies—the Sovroms—has been the provision of former German assets in Rumania and equipment claimed from the Rumanians as reparations and then forgone. In return the Soviet Union is securing substantial dividends and, in some cases, a monopolistic control over Rumanian industry.

Foreign Trade via Moscow

Since Rumania's foreign trade is equally tied to Russia's apron strings it is unable to export its normal surplus of oil and grain in return for capital equipment. Both bread and petrol are rationed inside Rumania. Details of the country's foreign trade are shrouded in secrecy but a large part of its production is reported to go to the Soviet Union for re-export. Grain, perhaps, finds its way to the west by this route. Oil—that lubricant of power politics—is urgently required by the Cominform countries. So, regardless of cost, the declining Rumanian oil wells are being exploited and new fields feverishly explored. Apart from the 1,500,000 tons retained for domestic consumption, all the annual production, now running at about 4,500,000 tons, goes to the Cominform countries. Except for Czechoslovakia and Eastern Germany they are in no position to supply Rumania with capital equipment.

Thus, deprived of its potential advantages and hampered by the loss of skilled technicians as a result of political purges, Rumania has faced the same problems during this second year of state planning as the other agrarian countries of eastern Europe. The problems are obvious enough. They are how to found and enlarge industries by drawing labour from the countryside while maintaining and increasing agricultural production; how to train the new industrial workers quickly so that there is no drop in productivity; and how to keep the working population co-operative, if not enthusiastic, in the face of the severe shortage of consumer goods that such a programme entails.

The policy of collectivising agricultural holdings has obvious advantages for Communist governments. It reduces the labour force required on the land, enables mechanical

methods to be introduced and increases the government's control over the peasants. During this year collectivisation, which began relatively late in Rumania, has quickened in pace. At the end of last year there were under two hundred collective farms. Now there are a thousand, excluding the 364 state farms which control two million acres. The pressure on the poorer peasants to join these collective farms seems, so far, to have been economic. What political compulsion there has been has come largely from the zeal of local Communist Party committees. The Government appears, at the moment, to be relying on the appeal of the tax exemption, credit facilities and other privileges enjoyed by the collective farms. The richer peasants have, of course, received no respite from the difficulties heaped upon them. Nevertheless, the bulk of the three million holdings in Rumania still remains in the hands of the small farmers and the Government has recognised the need to maintain their interest in selling surplus produce by increasing the amount of consumer goods available to them.

One inducement to rural workers to forsake the land is the higher wages and preferential rations granted to workers in the oil, steel and mining industries. But, since the Government's labour legislation in the summer, workers even in these industries have to work long hours to maintain a modest standard of living. For, in order to reduce the excessively high costs of production brought about by overtime payments and the payment of unskilled workers at skilled rates, the Government raised the normal number of working hours per week and prohibited payment for overtime. Extra wages are now given only to the record-breaking piece-workers. At the same time the accounting systems at the state factories, hitherto unbelievably slapdash, were overhauled and a tight central control is now exercised.

In order to be certain that the central economic plans are scrupulously followed, as well as for political reasons, a wholehearted weeding out of unreliable members of the Communist Party was recently completed. In the course of a year about a fifth of the membership was jettisoned. But the co-operation of the average non-communist worker is also required and the voluntary, unpaid, labour schemes need encouragement. So a theoretical extension of the powers of local governments is being planned. In the absence of material incentives the worker must be emotionally interested in the success of the state plans.

Whether this propaganda campaign succeeds or not it would be idle for the West to suppose that these plans for a Communist state will be discontinued or greatly modified. If persuasion fails force will be used. Decrees envisaging the compulsory direction of labour and penalties for inadequate work have already been drafted. Neither can the West expect any great disturbance because of dissatisfaction at the present standards of living. If conditions become dangerously onerous, Russia is likely to produce emergency supplies as it did when the Rumanian harvest failed for two years after the war. In any case, since the country has at least some industrial foundations on which to build, the plans may well succeed. Military considerations apart, the defection of Rumania from its position as a Soviet satellite is barely on the cards. It does not enjoy the geographical or emotional advantages of Yugoslavia. But if the tremors of revolt ever shake the outer marches of the Soviet empire they are likely to be caused less by economic discontent (many peasants were as badly off during the 'thirties) or by a hankering for the more polite forms of parliamentary democracy (which have not always shown to advantage here) than by a revolt against despotism and by chauvinism. The keen weapon of nationalism has always formed part of the Balkan armoury and, from dubious motives, many governments gave it a fine edge before the war. Temporarily hung on the wall, it may yet be taken down. To many Rumanians the loss of Bessarabia and Northern Bukovina, and Russian exploitation are greater mishaps than acceptance of the moral evils of Communism.

Aspects of enterprise

No. 6.

In Canada two large and complete new Simon flour milling plants were recently built for the same firm. The first was completed in 1948 and the second in 1950. Both were designed, manufactured, shipped, installed and set to work in nine months. Of the first mill the client wrote: "It incorporates the last word in milling equipment and facilities to be found in any Canadian plant." And of the second: "The most modern flour mill ever erected in Canada or the United States."

Gold Snowball

THE improvement in the United Kingdom's gold and dollar reserves goes from strength to strength. In the last quarter of 1950 these reserves rose by \$544 million, a figure never exceeded in any comparable period in the past. Of this growth of reserves, \$398 million was the actual dollar surplus of the sterling area while \$146 million was the counterpart of ERP receipts. At the end of 1950 the reserves stood at \$3,300 million, a level that compares with \$1,688 million at the beginning of the year and with the low point of \$1,340 million touched on September 18, 1949—just before the devaluation of sterling that set in motion the train of events mainly responsible for the more permanent causes of this astonishing recovery in the reserves. As the accompanying table shows, the recovery has been both remarkable and progressive.

BRITAIN'S GOLD AND DOLLAR RESERVES

The progressiveness of the record from quarter to quarter, extending to the very end of the whole period of fifteen months, might not be sustained, however, if the figures were shown from month to month. If the \$398 million surplus in the past quarter could be segregated into monthly parts, it would probably be found that October provided the lion's share of the gain—perhaps about \$290 million—and that in November and December the rise, though continuing, was at a rate of something less than \$60 million a month. This declining trend results mainly from the fact that October saw the peak of that late summer madness, the expectation of an upward revaluation of sterling. The bulk of the consequential inflow of funds from North America and Europe—some of it speculative, some in anticipation of future commercial needs—was compressed within that month. The Treasury estimates

that, over the quarter, the net inflow of semi-speculative funds from North America may have accounted for one-third of the sterling area's net gold and dollar surplus of \$398 million, namely about \$130 million. This estimate does not necessarily contradict the impression of London bankers that in October alone some £100 million of funds, either in the form of "hot money" or in anticipatory commercial transfers, may have entered the London market—from all quarters. The reconciliation of the two estimates would be provided first, by the fact that some of the £100 million represented funds flowing in from non-dollar countries; secondly, some of the sterling acquired by overseas interests during October—advance of needs was used up to pay for imports during the last two months of the year. If that be so, then the deceleration in the rate of gold and dollar receipts during November and December can in large part be explained and no unduly pessimistic deductions need be drawn from that phenomenon—except, of course, that a similar influence may be at work in the current quarter.

The real rise in the sterling area's dollar reserve in the last quarter of the year was slightly greater even than the remarkable figure of \$544 million revealed in the Treasury statement. Over this period the amount of outstanding claims for dollar reimbursement by ECA of expenditure previously incurred by the British Government rose by some \$10 million to about \$77 million. The hidden dollar reserve represented by this lag between ERP expenditure and reimbursements has thus grown with the increase in the published reserve. The total of ERP aid allocated to Britain and not yet received—or, if allocated not yet reimbursed—amounts to about \$170 million. This will help the United Kingdom balance of dollar payments until well into 1952, but at a rapidly diminishing pace.

Until the detailed 1950 balance of payments figures are published, it will be impossible to determine exactly how the task of earning the sterling area's surplus of \$398 million was apportioned between Britain and the overseas members of the sterling area. Nor will it be possible before then to measure the rise in the gold and dollar reserve against the increase in Britain's sterling liabilities. The Chancellor of the Exchequer has, however, given rough indications of orders of magnitude on some of these points. The sterling area's net gold and dollar surplus for 1950 was \$805 million, compared with a deficit of \$1,532 million in 1949. Of the improvement of \$2,340 million, the Chancellor estimated that roughly two-fifths was attributable to reductions in dollar expenditures, one-third to increased earnings and the remainder to other factors, especially the reduction in gold and dollar payments to non-dollar countries—Europe has recently been losing gold to Britain through EPU and not taking it, as in 1949—and the already mentioned semi-speculative inflow of overseas funds. The Chancellor added that about half the improvement in

1950 was attributable to the United Kingdom. Of the balance, roughly three-quarters was accounted for by the rest of the sterling area and one-quarter by the reduction in payments to non-dollar countries (these last attributable both to the United Kingdom and to the rest of the sterling area).

Any suggestion that the rest of the sterling area had been doing more than its share in pulling the balance of payments of the whole area "out of the red," would, in any case, be invalidated by the Chancellor's intimation that the overall balance of payments of the United Kingdom in 1950 closed with a surplus of between £200 million and £250 million. The surplus for the first six months of 1950 was £52 million (actual) so that the surplus in the second half must have been running at an annual rate of between £300 million and £400 million. These are astonishing figures. They show that a considerable cushion has been built up against the further deterioration of the terms of trade and the loss of exports—in consequence of defence production—that must be expected in the coming year. The substantial overall surplus achieved by Britain suggests that if sterling liabilities have risen during the second half of the year—and such figures as are available indicate that they have risen—the increase in these liabilities has been much less than the accompanying increase in the gold and dollar reserves.

Needless to say, the uncertainties that lie ahead make

it difficult to project into the future the full optimism suggested by the 1950 achievements. Last year saw the culmination of the postwar recovery in Britain's overseas finances. Now we plunge into a new phase in which account will have to be taken of the impact of rearmament on industry and exports, of the continuing rise in the prices of imports, of the scarcity of raw materials and of the service of the American and Canadian loans—these loans, from the end of 1951, will be calling for annual payments of about \$170 million. In facing that prospect, the Chancellor of the Exchequer adopted a sombre, dour, bull-doggish mood. It is just conceivable, however, that this attitude may be proved a year hence to have been a shade too pessimistic. Sufficient weight may not have been given yet to the considerations that exportable dollar goods are likely to become much scarcer in 1951; that high commodity prices will weigh heavily on one part of the British balance of payments but, as in the past year, they will bring powerful reinforcement to Britain's invisible income; that the terms of trade may deteriorate less rapidly as British exporters learn to shake off the traditional sluggishness with which they adjust their selling prices, whether upward or downward. If due allowance is made for these possibilities, the prospects for the dollar balance of payments of the sterling area or for the overall balance of the United Kingdom do not appear quite as menacing as the Chancellor tried to paint them.

Steel in 1951

THE announcement by the Society of Motor Manufacturers and Traders that the production of cars might be cut by 15 to 20 per cent this quarter and that from Monday next "many companies would be able to work only a four-day week" seems to contain a note of alarm that had not, when the announcement was made, communicated itself to the bigger car makers. There are no doubt some things that can be done to ease the blow of a reduction of 15 to 20 per cent in deliveries of sheet steel to the industry. But imports of steel sheet have now dried up; there is no more sheet to be got from the United States or elsewhere. And the new mills at Margam will not begin to turn out their half million tons or more of motor sheet a year until the middle of this year. At the moment, the company mainly hit by the cessation of imports is Pressed Steel, which will have to go short by 1,000 tons (equal to 2,000 car bodies) a week until supplies of sheet can be increased from home production.

This is not a good start to 1951 for steel users, though it may still be questioned whether, if there had been abundant supplies of sheet, motor output would not have been affected by shortages of other things. It seems possible that 1950 will bring to an end, for the time being, the impressive expansion of steel output since the war. For 1947—the first year to witness the formality of an economic plan—the steel plants produced 12½ million tons of ingots and castings, thus exceeding the planned figure by a quarter of a million tons despite the fuel and power crisis in the early months of that year. Output last year was expected to be between 15½ and 16 million tons; the industry has surpassed the lowest estimate by a comfortable half million tons. The steel

industry has got into the habit of doing this and the country of expecting it. Now, it is virtually certain that when the British Iron and Steel Corporation takes up its shareholdings in the industry on February 15th it will be buying up an industry whose total output is no longer increasing.

This is a plain technical fact that has nothing to do with the merits of the case against nationalisation. If, by a last-minute conversion to supreme wisdom, the Government were to postpone the steel take-over, steel output this year would still be about half a million tons lower than it could be. Such a check to steel supplies may not be a fatal hindrance to the defence programme or to most of the export trades, but it adds another instalment to the tale of shortages that this year threatens the even flow of industrial production. The industry itself sees few signs of a positive shortage of general steels—though there are persistent shortages of particular products, including sheet and tinplate, that will begin to be remedied only when new plants come into service. There appears to have been a fall in orders for steel in 1949 and the first half of 1950 by about one-third. Thus by the time that steel allocation was at long last abandoned in the summer there was no doubt whatsoever that supply and demand were in reasonable balance. But steel has since been affected, like every raw material, by forestalling and stockpiling. A big increase of more than 50 per cent has become evident in orders for steel; in the industry's view, this increase has not been matched by an increase in the use of steel, but rather by a desire for increased stocks. Delivery dates are being pushed to six months and there are signs here and there of shortage and difficulty.

The prospect that home production of steel in 1951 is unlikely to exceed last year's output will have unfortunate consequences. It already means that exports of steel will have to be cut by half a million tons; as in coal, the immediate shortage is to be exported. If imports could be maintained (at about 700,000 tons), exports cut by 500,000 tons and 500,000 tons added to output by bringing in new capacity, there would be no great difficulty. But the British economy is witnessing, as it did in 1947, how shortage begets shortage in a period of hyper-inflation. Because too little coal is being raised, coal has to be imported from the United States; there is a sudden demand for a million tons of shipping sailing twenty-one days in ballast across the Atlantic; the iron ore trade from North Africa and Sweden is the first to feel the effect. By the end of 1950, the steel industry had been unable to obtain the shipment of 600,000 tons of iron ore; these shipments have been cancelled and lost, and there are bound to be further lost cargoes in the early months of this year. It has been difficult enough to place contracts for the 9 or 10 million tons of imported iron ore that the British steel industry needs, for German requirements are increasing (Germany has only one-third of the iron ore it could use) and the United States is taking 3,000,000 tons from Europe and North Africa. Indeed, iron ore seems to be oversold, and if shipping is not available to take cargoes when they are ready, the shipments are lost. Thus if the industry gets along by using up its stocks of iron ore now, it will have little or no chance of making up its ore stocks later in the year.

Thus a fall in pig iron production is expected fairly soon in certain centres, and there is little hope of any compensating expansion of pig iron output later in the year. This is inevitable if the threatened cut in ore imports reaches—as it threatens to reach—the best part of a million tons. But if iron ore is one of the worst headaches of the industry, it is not the only one. A shortage of iron ore and pig iron might in large part be made up by larger supplies of steel scrap. But instead of the 2,000,000 tons of scrap imported from Germany last year, the steel industry is expecting 1,000,000 tons in 1951; even that is not certain, for the only contracts placed are for rather less than half a million tons in the first half of the year. The loss of ore supplies means that this deficiency cannot be made good by an increased output of pig iron. Thus the campaign for larger collections of home scrap is a very necessary part of the industry's strategy in 1951. There are some odd contrasts in scrap policy. A high level of activity in

engineering and the steel-using trades automatically means an increase in circulating scrap, such as turnings and offcuts. But it does not automatically increase the amount of old scrap recovered—out of date machinery or demolished steelwork. That, so the industry believes, can best be got to the steelworks for remelting by public appeal rather than by price incentives. At first sight this belief seems to flout economic laws, yet the industry has done well in the past in getting its home scrap cheaply—at about £3 10s. a ton, compared with a delivered price of over £11 a ton for German scrap today.

To round off this tale of difficulty in obtaining steel-making materials, there is a shortage of coke (with stocks down to a week's supply) and in some iron smelting centres a shortage of labour. And there is an obvious threat of rising costs. In the past year, the industry has absorbed some heavy cost increases, particularly in respect of railway rates, ore prices and freights, and imported scrap. Now the cost situation is getting out of hand; in a mere six weeks ore freights from North African ports have more than doubled—45s. a ton against 21s. earlier this winter. Thus the coal crisis and the emergency shipments of American coal are having a serious effect on the assurance and cost of supplies of steelmaking materials, at a time when the pressure of defence orders is starting to make itself felt. To some extent these effects will be temporary—in the sense that the summer will ease some present difficulties, even though it may not prevent their recurrence next winter. But in large measure output of steel and of steel manufactures that is lost in the first quarter of 1951 will be output permanently lost.

★

It is fantastic that to this crisis of production there must be added a crisis of organisation. What attitude will the Steel Corporation take towards the industry? It will have plenty to do in the technicalities of the take-over without sparing itself much time for a vigorous policy about the industry. It is not known to have such a policy, though individual members of the Corporation may well have ambitions as "reformers" of an industry of which they know little enough at present. Perhaps the best guess is that nothing very important is likely to happen to the industry this year apart from the transfer of securities on February 15th. In outline, the industry's structure is likely to remain what it is until the Corporation has acquired staff and ideas of policy—or until a change of Government radically alters the whole conception of public ownership of steel. Undoubtedly the

Corporation as it exists at present cannot undertake the same range of functions as the British Iron and Steel Federation; it could not, for instance, be expected successfully to handle the allocation of steel if that step were to become inevitable. The relations between the two bodies have yet to be worked out. So has the question—not absent from the industry's mind at this late stage—of unscrambling the steel industry's eggs when

they are broken on February 15th. That it should be necessary to distract able minds from the urgent tasks of production in order to consider political issues of this kind is in itself the most drastic criticism that could be levelled against nationalisation of steel. There was never a more unnecessary political act, and it could not have been worse timed to add further confusion to the country's economic difficulties.

Business Notes

Britain's Overall Surplus

The trade figures for December, released almost simultaneously with the Chancellor's statement on Britain's economic experience in 1950, make it possible to attempt a provisional analysis of the overall payments surplus that the Chancellor announced. As an earlier article records, the Treasury experts estimate provisionally that the overall surplus in 1950 was between £200 million and £250 million, compared with a deficit of £38 million in 1949. During the first half-year, as the detailed White Paper issued a few months ago showed, there was an overall surplus of £52 million—comprising a visible deficit of £108 million and a net invisible surplus of £160 million. Comparable figures for the second half of the year will not be available for at least two months, but it is possible to make certain estimates from the published trade returns. There is a statistical difficulty in reconciling the trade figures with those given in the balance of payments since the two sets are computed on entirely different bases—the most notable difference being that imports are valued c.i.f. in the former but f.o.b. in the latter. But if it is assumed that the margins between the two valuations, both of imports and exports, were the same in the second half of the year as in the first, then it can be computed that visible trade between July and December showed a deficit of only £20 million. Indeed, between July and November, on the same assumption, visible trade was in balance and probably showed a slight surplus; the deficit balance and probably showed a slight surplus; the deficit in December alone amounted to some £23 million. For two if not three months in the second half of the year, Britain's visible trade earned quite an appreciable surplus.

Similar calculations indicate the approximate trend of the "invisible" items. A total surplus of £200-£250 million for the year implies an overall surplus of £150-200 million for the second half. If the deficit on visible trade was £20 million, as estimated above, this would mean that the surplus of invisibles in the second half-year was of the order of £170-£220 million, compared with £160 million in the first half. These calculations can be summarised as follows:—

	Jan.- June	July- Dec.	Year 1950
	£ mn.	£ mn.	£ mn.
Exports	1,042	1,170	2,212
Imports	1,150	1,190	2,340
Visible balance	— 108	— 20	— 128
Invisible balance	+ 160	+ 170/220	+ 330/380
Total balance	+ 52	+ 150/200	+ 200/250

The result is indeed encouraging; but for the record cost of imports in December, the year's surplus might have been over £20 million more. The December figures of imports, however, give an indication of things to come.

* * *

Worsening Terms of Trade

Devaluation necessarily worsened British terms of trade, and the sharp and almost continuous rise in world commodity prices since June has accentuated that deterioration. The Chancellor said that "practically all the increase of

some £400 million in our import bill in 1950 compared with 1949 was attributable to higher prices"—in terms of sterling. The rise in export prices during the year added only about £100 million to Britain's receipts, so that the deterioration in the terms of trade has cost Britain something around £300 million during the year. In 1951, the volume of imports will certainly have to be expanded—if the supplies are physically available. Last year the volume was almost the same as in 1949, and a high level of industrial activity was maintained only by running down stocks. It is evident, therefore, that the total bill for imports is likely to rise very steeply during the current year, since the full effects of the recent rise in world prices of primary commodity prices have not yet been felt in the balance of payments.

Much depends, therefore, upon whether the total value of exports can be raised above its present high level—despite the impact of defence orders upon Britain's principal export industries. Vehicles contributed nearly one-fifth of the increase in the value of exports last year; machinery brought the proportion to one-third; and these two groups, together with iron and steel, non-ferrous metals and electrical goods, accounted for no less than one-half. Exports of wool textiles increased significantly and so did the sales of whisky and refined sugar, but exports of cotton yarns and manufactures actually declined. Coal exports earned slightly more than in 1949, but are likely to be quite drastically reduced in 1951.

If the prospects for expanding total exports this year are not very bright, those for developing Britain's export trade with North America are certainly better. Total British exports to the United States and Canada last year amounted to \$669 million, a rise of 34 per cent compared with 1949. In fact North America took 11 per cent of the total against 8 per cent in the previous year. Exports in December to both countries were slightly lower than in November and October, but the total for the fourth quarter, \$211 million, was well above the average of \$153 million for the preceding three quarters. Over the year, exports to Canada rose by 19 per cent, while those to the United States rose by over 50 per cent. This experience has at least shown that if British exports can maintain their present price advantage, they can enjoy an expanding market in North America.

* * *

Bank Profits in 1950

To judge from the published figures, 1950 was a distinctly more profitable year for the big banks than 1949. As had been expected, each of the seven largest banks has maintained its dividend, and all save one report larger earnings. The exception is the Midland Bank, which this year, as last, shows a decline in published profits by roughly 1 per cent; it is known this bank has recently set up an internal fund to provide for future pensions, and it seems reasonable to suppose that this explains the absence of an increase in the disclosed profit. As will be seen from the accompanying table, aggregate profits of the seven banks rose in 1950 by £207,000 to £9,893,000, and about half this increase was attributable to Barclays Bank, which gained 5.7 per cent. In 1949 the aggregate gain was only 0.5 per cent, but in 1950 it

rose to 2.1 per cent. The relative profitability of the two years is probably better indicated by this comparison than by the absolute figures, for there is little doubt that earnings in 1950 must have permitted larger transfers to inner reserves—quite apart from the fact that in 1949 those reserves had to face substantial strain for the purpose of providing for depreciation on investments.

Although in 1950 the clearing banks experienced an even smaller expansion than in 1949 in the resources at their disposal—net deposits over the first eleven months of the year averaged only £30 million more than in the similar period of 1949—they benefited substantially from a further rise in the average level of loans and advances, always their most remunerative asset. These showed an average increase of £166 million over the eleven months—a

BANK PROFITS, 1947-50

Bank and Dividend	1947	1948	1949	1950	Change in 1950
Barclays (14%)	1,637,706	1,879,943	1,866,279	1,971,834	+5.7
Lloyds (12%)	1,635,612	1,674,329	1,709,276	1,761,603	+3.1
Midland (16%)	2,002,570	2,025,728	2,006,414	1,987,320	-1.0
National Provincial (15%) ..	1,347,929	1,383,387	1,413,126	1,454,811	+2.9
Westminster (18%)	1,391,076	1,431,532	1,460,557	1,471,031	+0.7
"Big Five" Total	8,014,893	8,394,919	8,455,652	8,646,599	+2.3
District (181%)	503,796	525,432	504,880	513,168	+1.6
Martins (15%)	711,931	719,520	725,170	732,895	+1.0
"Big Seven Total"	9,230,620	9,639,871	9,685,702	9,892,662	+2.1

gain of 11.5 per cent compared with one of 9.1 per cent in 1949. Against this, the Treasury's policy of switching its floating debt borrowings from Treasury deposit receipts to Treasury bills (which yield $\frac{1}{8}$ per cent less) and the reduction in the total of these borrowings involved the banks in a moderate loss of income. It is evident, however, that the net increase in asset earnings, combined with the increase in revenue from commissions (in consequence of the greater activity of bank accounts in general) must have comfortably covered the increased payments to bank staffs and pensioners. If, therefore, it can be presumed that the growth of miscellaneous revenues—from overseas business, stock exchange and trustee work and the like—was sufficient to provide for the rising tendency of all general charges, there must have been a perceptible increase in true net trading profits. The banks are clearly wise, however, to be increasing their provisions at this time. The high level of commodity prices clearly increases the risk of eventual bad debts; there may yet be new shocks in the gilt-edged market, despite its present buoyancy; and there looms ever nearer the shadow of very large liabilities for staff pensions when the "bulge" in age-distribution begins to exert its inexorable effect upon retirements.

* * *

Psychology and Candles

Although impressively equipped with figures showing the potential savings of coal if consumers turned out one light in ten or put the lids on boiling saucepans, Mr Noel-Baker last week was unable to give any estimate of the fuel saving that would be brought about by the one measure he had himself taken—banning the use of all forms of fuel (down to candles) in shop windows and advertising signs. Neither the Ministry of Fuel and Power nor the British Electricity Authority is prepared to guess at the material value of this ukase (concerning which the *Daily Herald* had shown significant prescience). The official view is that some saving, however small, is effected, and that in any case general appeals for economy would not be taken seriously if the one form of unessential electricity consumption that can practically be stopped by regulation should not be. A cruder example of this "psychological approach," Sir Patrick Dolan's blustering ultimatum suggesting that if Englishmen were allowed to see midweek races Scots might

waste fuel, had already passed without the snub it deserved.

More positive measures to reduce fuel consumption during the next few months are now being decided upon. These include general cuts in coal allocations (rough priorities are already being observed in supplying public utilities and industry), that involve reduction of marginal railway services and may mean reductions in street lighting and lower supplies to domestic coal merchants.

Publication of the year's provisional figures, meanwhile, has made it possible to trace the pattern of 1950 consumption, which in total was 219,543,000 tons, five million tons greater than in 1949 and a million and a half tons higher than the 1950 *Economic Survey* had estimated. The largest absolute and proportional increase in consumption was by the electric power industry, which took nearly 10 per cent more coal than in the previous year (to meet a total demand that during part of 1950 was rising at an annual rate of 12 per cent, or twice the normally assumed rate). Industrial consumption rose by about 4 per cent compared with 1949, a conspicuous exception being the iron and steel industry, which consumed no more coal than in the previous year. Domestic coal disposals by merchants rose by 5 per cent to 30,190,000 tons, some part of the increase being possibly due to last year's official encouragement to householders to stock their cellars early and to prompt purchasing once the alarm about coal started. The debit side of the equation is seen in final export figures for the year; after all the hopes and promises of the spring, and the confidence placed in a large financial return from them, exports amounted to 17,082,000 tons, much below those of 1949 and five million tons lower than the original bounding estimates.

* * *

Washington and Raw Materials

The negotiations in Washington about allocations of raw materials have produced a plethora of plans and counter-plans sufficient to bewilder even the negotiators. When this issue of *The Economist* went to press, every effort was still being made to reach an agreed formula that could be presented to the Council for the Organisation for European Economic Co-operation when it meets this week-end. So far, it has apparently been agreed that a small executive group, consisting of Britain, the United States and France, should be set up in Washington, and that a series of commodity groups should be set up under its wing. There was, however, no agreement about which countries will be represented on these commodity groups, though it has now been accepted that producers and consumers will sit jointly on them. There is no suggestion at this stage of an international allocating body, but it is hoped that some organisation will be set up that will ease bottlenecks as they arise, and that will use powers of cajolery rather than of control to ensure that adequate supplies of vital materials are available for the combined defence programmes of the North Atlantic powers.

An indirect result of the Washington talks is the United States' decision not to purchase any more zinc for its stockpile in the next six months. The immediate effect of this action is unlikely to be startling. The stockpile authorities have already purchased substantial tonnages of zinc for delivery in the first half of 1951, and these contracts will not be affected. But the decision does mean that no spot purchases will be made by the stockpiling authorities before July and that no new contracts for delivery in the second half of the year will be signed during this period. As civilian consumption in the United States has already been cut back by 20 per cent, the squeeze in supplies should be lessened for a time at least. Unfortunately, however, the chances of Britain's getting appreciably larger supplies may not be great, unless the United States Government takes special action. Stocks of zinc held by American smelters at the end of December amounted to less than 9,000 tons compared with 94,220 tons at the beginning of 1950. It is true that American manufac-

turers are now forbidden to hold stocks of zinc in excess of the "reasonable demands" of their business, but if supplies become freer, it would not be surprising to find that "the reasonable demands of business" increase with them. If Britain wants zinc from America, it may, therefore, have to compete not only with other foreign buyers but with American consumers, and it may have to pay grey-market prices. Some reports have suggested that the Ministry of Supply hopes to buy 15-20,000 tons; purchases on this scale would improve the Ministry's stocks but they would certainly not be enough to permit a rescinding of the cuts on civilian consumption already announced.

* * *

Chilled Beef from Argentina

Argentina's latest offer to overcome the meat deadlock was a sensible one, and deserved more serious consideration than it seems to have received from the Ministry of Food. Argentina suggested that it would be willing to accept £97 10s. a ton for frozen beef—the last offer from Britain—on condition that Britain also took a substantial proportion of chilled beef at a much higher price. The presumption was that chilled beef might be handled by private trade and sold off the ration at the full price. The British authorities have neither rejected nor accepted the offer. They have merely asked, rather diplomatically, for further clarification, though they have made it clear that if chilled beef were purchased it would have to be sold on the ration.

Before the war British imports of Argentine beef were almost entirely in the chilled state. The quality of this beef was claimed to be almost as good as home-killed beef, but it could not be stored, and the whole Argentine meat trade was organised virtually on the basis of sending prime chilled beef to the British market for quick distribution. During the war when shipping was subject to serious delays, the British Government had to demand frozen rather than chilled beef from Argentina, and it has continued this preference since the war. It would not be easy to sell chilled beef off the ration, since once cut up it could not be readily distinguished from, say, home-killed beef. But it would seem possible for the Ministry of Food to adapt its system of distribution to include chilled beef in the ration; delivery could be made ex-ship if necessary, a method often used in time of emergency for various commodities.

If the principle of reverting from frozen to chilled beef is accepted, the main point of disagreement between the two countries will again be the price. Chilled beef will undoubtedly cost more than frozen, but even at £140 a ton Argentina would still be receiving much less than British farmers. Bulk buying and selling, food subsidies and pre-occupation with the cost of living are combined in a fiendish way to prevent trade and to deny the British consumer (who can afford to pay for what he wants) an addition to his food. The British Government, quite rightly, thinks that it should not increase the cost of the subsidies; it also thinks, quite wrongly, that the British public should not pay more for its meat. The British housewife is at present being grossly overcharged for inferior—not to say inedible—ewe mutton; if she were given the opportunity, would she not jump at the chance of paying extra for prime chilled beef? The meat ration was originally designed to allow higher prices to be charged for better quality. But nowadays the doctrine of fair shares has been stretched to mean that everybody must be able to buy chilled beef as cheaply as ewe mutton or that everybody must do without.

Sellers' Strike in Silver

The last ten days have been eventful for the world silver markets. On Friday of last week the New York market was faced with what amounted to a sellers' strike. The usual Mexican and others sellers in the market refused to part with

their silver at the price of 80 cents per ounce that has ruled in New York since the last week of October, and asked for the privileged domestic price of 90 cents per ounce instead. The New York market was apparently unable to deal with this situation as it arose; there was some uncertainty whether an increase in the price of silver could be reconciled with the Stabilisation Board's edicts against increases in commodity prices. No price was fixed on Friday and no business was transacted on that day. After a week-end of study, the sellers gained their point. Last Monday, therefore, the New York price for imported silver was raised to 90 cents, the figure that, by existing legislation, must be paid for domestically produced silver sold to the United States Treasury. It remains to be seen how long the powerfully entrenched silver bloc in the Senate can tolerate a situation in which imported silver is quoted at the same price as domestic silver. It may be only a matter of weeks before fresh legislation is introduced into the new Congress, in the hope of securing another increase in the price paid to the highly subsidised and protected domestic industry.

In London the official price fixed by the Bank of England was automatically adjusted to the rise in the New York price. Since Tuesday it has, therefore, been maintained at 78½d. per ounce for spot and forward, compared with the previous quotation of 70d. There was, however, an awkward hiatus on Monday when the official price in London had to be left at 70d. pending receipt of news about New York's second thoughts. The incident illustrates the shortcomings of the present practice under which London delegates all power of initiative in fixing the price of silver to a market that does not always respond immediately to the challenge of unexpected or out-of-the-way events.

Rise in Free Gold Price

The rise in the free market price of gold, which set in last July, has also gathered momentum recently. The price in Beirut, which was still around \$38½ in the early part of December, has now risen over \$44 per ounce. Beirut is now the principal market; it is from there that gold makes its way throughout the Middle East and begins its perilous journey, via the shores of the Persian gulf, to the forbidden markets of India. The striking feature of the recent rise in price has been the market's ability to absorb considerable offerings. The main sources of the increased supply have been the so-called "fabricated" South African gold, production from the Belgian Congo (sold through the open market in Brussels), sales by the Bank of France (which are difficult to reconcile with International Monetary Fund regulations) and the usual trickles of gold from South American republics.

Against this, however, European demand for gold for hoarding purposes has increased considerably with the growing international tension and the prospect of further inflation and currency depreciation. And Communist China, which disgorged a great deal of gold during the first half of 1950, is beginning to show some signs of absorbing the metal again, despite import embargoes and compulsion to disclose private stocks; some gold has begun to flow back to the mainland through Hongkong and Macao. The rise in demand for gold as a hedge against inflation accords oddly with the fact that while most other commodity prices have been soaring, the official price of gold has necessarily remained stable.

"C" Licence Vehicles

The noise about the increase in the number of "C" licence vehicles and the fears of Labour members of Parliament that the growth was undermining the road transport provisions of the Transport Act ought to be much diminished by the latest figures issued by the Ministry of Transport. It has been commonly alleged that, in order to avoid

'BARCLAY'S NEW CLERK, 1786'

After a watercolour now in the Institute of Bankers

History records that even in 1786 this "new clerk" appeared a little overdressed in his "embroidered waistcoat reaching nearly down to his knees." It is pleasant to be able to add, however, that he "remained in the house many years, and died at a very advanced age, much respected by his employers."

Much has changed since 1786, but it is still the aim of our staff to provide the same high standard of personal service which the old private bankers offered in the days of "Barclay's New Clerk."

**BARCLAYS BANK
LIMITED**

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of the I.C.F.C. I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Admission Free. Open 10 a.m. — 7 p.m. daily.

Issued by the London Office of the Corporation,
11, Old Jewry, London, E.C.2.

using the services and contributing to the revenue of the Road Haulage Executive, many companies have set up their own transport fleets of "C" licensed vehicles. These licences are issued without restriction to traders solely for the carriage of their own goods, and the large increase in their numbers has been cited by many political supporters of transport nationalisation as a direct cause of the failure of the Road Haulage Executive to develop its long-distance road haulage business as fast as had been hoped.

The facts and figures issued by the Ministry of Transport last week show in fact that "C" licensed vehicles barely compete at all with long-distance traffic. A sample survey covering one-sixth of the total number of "C" licence vehicles in selected areas throughout the country revealed that more than 50 per cent were engaged wholly in retail delivery and other local work within a radius of 25 miles. The survey also showed that 82.4 per cent operated wholly within a radius of 40 miles. It is pointed out that a number of factors have affected the growth of "C" licences. Retail deliveries, for example, which largely stopped during the war, were revived; horse-drawn vehicles have been replaced by lorries and vans; and all kinds of small tradesmen have given up their barrows and tricycle carts for light vehicles. The introduction of red petrol also led to many applications for "C" licences for converted private cars and utility vans. The increase in "C" licences—708,000 in September, 1950, against 487,000 in December, 1947—very largely represents the change and expansion of local delivery methods and only to a small extent is it the result of any growth of private, long-distance traffic.

* * *

The Strike at St. Pancras

The unofficial strike of about 1,000 goods workers at St. Pancras station is an unpleasant foretaste of the troubles that the Transport Commission's plans for integration are already beginning to meet. The men struck because goods that used to be sent from London to Glasgow by road are now collected and delivered by employees of the Road Haulage Executive and sent by rail from St. Pancras. They say that if this practice continues, they are likely to become redundant, and they are threatening to spread the strike to other depots where similar schemes have been introduced.

There are obviously no grounds for the redundancy argument. The traffic concerned did not previously go by rail, and the railway goods workers are not being deprived of any work that they had before. The National Union of Railwaymen, to which the strikers belong, is, fortunately, against the strike—it has come at a bad moment for them in the railway wages enquiry—and they have tried to persuade the strikers to return to work, but so far without success. It is this sort of baseless and irresponsible action on the part of the workers that is perhaps the largest single obstacle to any integration schemes in the transport industry today. The unions were consulted about the new schemes and consented to them before they were started; there was no excuse for striking. Is it impossible to enforce some measure of discipline, some adherence to agreements that have been fairly and properly negotiated?

United States, the Largest Importer

A major change in the pattern of world trade took place in 1950: for the first time in history, the United States ousted Britain as the world's largest importer. Imports into the United States (reckoned in U.S. dollars) have been larger than imports into Britain in each month since October, 1949, except last April, and even in that month it is probable that American imports were actually higher than British, since American import figures are given on an f.o.b. basis whereas British imports are shown c.i.f. The prime cause for this change was the devaluation of sterling.

The trend in 1950 has been significant. American imports in the third quarter (the latest for which figures are available) were exceptionally large and there is reason to believe that this rate was more or less maintained during the last three months of the year. In August, imports into the United States actually exceeded total exports; that was an isolated example, but the general trend of rising imports and declining exports is unmistakable. For the year 1950 as a whole, American imports may well have exceeded \$8.5 billion compared with \$6.6 billion in 1949 and \$7.1 billion in 1948. On the other hand, exports from the United States may

TRENDS IN BRITISH AND U.S. TRADE
(millions of U.S. dollars)

have been no higher than \$10 billion against \$12 billion in 1949 and \$12.7 billion in 1948.

It remains to be seen whether this development can be regarded as a permanent feature of world trade. The United States will no doubt in future be a larger importer and a smaller exporter than in the past. But the high rate of imports in the past six months has been largely due to American stockpiling of raw materials and semi-manufactures. The United States will remain a large importer as long as it maintains a high level of industrial activity, but the impact of defence on the present level of output must not be minimised. In the past six months large American imports have alleviated the dollar problem and have created further problems in turn, including a world wide shortage of raw materials.

Helping Hand to Germany

Britain has acceded to the request made by the Organisation for European Economic Co-operation to help Germany solve its critical deficit with the European Payments Union. The Federal German Government has already taken certain emergency steps to check the rapid depletion of its foreign exchange reserve, but it was recognised by OEEC that German measures alone would not be adequate and that other member countries must buy more German goods. The British Government has thus decided, first to allow Germany to extend for a further three months up to March 31, 1951, the six-monthly period for licensing imports from Britain and the colonies, and secondly to increase by 50 per cent the quotas granted for import of German goods in the six months July 31st to December 31, 1950, allowing any unfulfilled quotas to be carried forward into 1951.

This 50 per cent increase is temporary, but it represents an addition to any quotas agreed for 1951. British importers, it seems, have already placed fairly large contracts for cheap German textiles and they are also expected to buy pianos (apparently only a few), chemical, and certain metal goods, including toys. German sausages, ham and ducks are also

OUTSTANDING VALUE IN LIFE ASSURANCE

ESTABLISHED 1844
EQUITY & LAW
LIFE ASSURANCE SOCIETY
20 LINCOLN'S INN FIELDS, LONDON, W.C.2.

said to be on the list of increased quotas, but a proposal to send fresh mutton to Britain fell through as the meat did not conform to the strict hygiene regulations enforced by the Ministry of Health.

On the face of it, the bargain seems to be rather one-sided. During the past six months Germany has been buying large quantities of sterling area raw materials, particularly rubber and tin, and has not found it unprofitable to build up stocks of raw materials. To assist in the financing of these unusually heavy purchases, Britain has agreed to import more German manufactures. But if the deal enables Britain to get, as certain reports have suggested, at least 600,000 tons of steel scrap with a possible additional quantity to be agreed later, it would be worth the cost.

* * *

Castings for Cars

Since it uses high-purity zinc which is less scarce than any other grade, the zinc-alloy die-casting industry is for the moment less severely affected by shortage of material than are most other direct consumers of zinc. Nevertheless, the Ministry of Supply is allocating to the die-casters 15 per cent less than average deliveries of high-purity zinc in the first nine months of last year, and the industry, which has recently been using more than that average, has little scope for technical economies. It would be impracticable to substitute aluminium for zinc while still retaining an alloy suitable for use with the industry's present equipment; in any case, aluminium is no more abundant than zinc. Therefore the full extent of the reduction in zinc will presumably be reflected in its supplies to customers—of which the most important, taking some 70 per cent of its output, is the motor industry.

The industry has grown considerably since the mid-thirties, when it first began to make full use of the improved die-casting alloys developed a few years before. These offer quick production of fairly intricate shapes that need little subsequent machining; since zinc die-castings became available, the motor industry has increased its use of the metal, partly at the expense of brass, for radiator grilles, handles, and other external fittings often later plated, as well as for carburettors, dynamos and other small, intricately-formed components. Other important products of the industry are electrical fittings including switchboxes and conduits, parts of domestic equipment such as wringers and lawnmowers, hardware, and light engineering parts such as gears for lathes. Most of the items are small, a great majority of them weighing less than a pound; few machines are designed to cast products weighing more than 20 lb., and the largest currently being turned out is a 17 lb. radiator grille for a popular mass-produced car. Die-casting itself is a mass production technique; owing to the fairly high cost of the steel dies or moulds, it is seldom worth using for an item of which less than five to ten thousand are needed.

Some 450 firms have die-casting machines, but many of them use the equipment only occasionally. Rather more than half by number produce entirely for sale, while most of the remainder, including several motor component makers such as Joseph Lucas, produce the castings for their own finished motor parts. In 1938 the industry was using 13,000 tons of zinc a year, while in 1942 this rose to 52,000 tons; in 1950 the consumption was just over 30,000 tons, of which two or three big firms used 3,000 to 5,000 tons apiece, while a fringe of nearly 300 used less than 10 tons a year; in fact, some 5 per cent of the die-casters use 80 per cent of the total alloys the industry consumes. Their customers, rather than die-casting firms themselves, may in coming months be seeking substitute materials; with brass equally short, these are not easy to adopt, since plastics may be restricted in their applicability, while cast iron, which cannot be formed so accurately and requires considerably more machining, is itself scarce.

Cotton and Rayon in 1950

Final figures for the output of the cotton and rayon industries in 1950 will not be ready for some weeks, but preliminary estimates for both industries show increases on 1949. The combined output of continuous filament and staple fibre will probably be between 370 and 375 million pounds compared with 288.8 million in 1949. In the cotton industry, the output of yarn is likely to be between 5 and 6 per cent higher than last year, when production of single cotton, spun rayon and waste yarns was 989.8 million pounds. Production of cloth is likely to show an increase of 7 to 8 per cent above the 1949 total of 2,591 million linear yards. Much of this increase is due to the extra 10,000 workers recruited during the year, while the rise in rayon production comes from new capacity. Extensions to a number of plants were completed during the year and Courtauld's new plant in Northern Ireland, where the American continuous spinning process is being used, started to come into production during the summer.

It seems unlikely that either industry will maintain its present rate of output for long. Supplies of cotton are said to be rationed unofficially to the American mills and the British mills can hardly escape similar restrictions. Then there has been a 15 per cent cut in the allocation of sulphuric acid to the rayon industry. It is not clear how far this will affect output, but deliveries of viscose yarn and staple are to be reduced by 15 per cent over the first eight months of the year. At the same time, the price of utility rayon cloths made from continuous filament is to be increased. The Board of Trade recently changed its specifications for these cloths and instead of laying down the types of construction that the weavers could use, has given them freedom to produce what cloth they like within the permitted price margin and without reducing quality below a certain minimum standard. Price margins have been increased by about 12½ per cent, partly to offset the 12 per cent increase recently made in yarn prices and partly to give the weavers scope to improve the quality of the cloth.

* * *

The Golden Fleece

The second half of the wool selling season opened in Australia this week and prices rose above the record levels reached in December to new fantastic heights. Wool is no longer a dear commodity, it is a precious one; and there is little indication that prices might ease to any significant extent in the near future. In the next few months not only will manufacturers be stocking up to tide themselves over the summer months (because this year there will be no large offerings from the Joint Organisation's stocks to help them), but the full weight of purchases for defence purposes will also be felt. British manufacturers are more than a little anxious about consumers' reactions to prices of finished textiles when they reflect—in six or nine months' time—the present high cost of raw wool. People have already been stocking up their wardrobes in anticipation of these higher prices so that some reduction in consumer demand later on is more than probable.

There is no doubt that a world wool shortage exists. Three months ago the International Wool Study Group estimated that supplies in the current season would be sufficient to maintain consumption only at a level some 10 per cent below that reached in the first half of 1950. That is still true. The only question is whether prices have already risen sufficiently to achieve such a reduction in demand and, if not, how much further they must rise. The fact that prices of lower count wools have risen much more sharply during the past twelve months than those of higher counts shows that manufacturers are reducing quality in an attempt to lessen the rise in retail prices. In most countries the use of mungo, shoddy, rayon and other fibres has also increased steadily in recent months. In October, for example, the British wool textile industry

We've solved some problems in our time!

TIME—1939 : PROBLEM—the magnetic mine. The answer came quickly: sweep with a loop of cable carrying heavy impulses of direct current, thus generating a magnetic field to detonate the mines. But the means? Every available mine-sweeping trawler must be fitted *at once* with batteries capable of enormous output—3,000 to 4,000 amperes at 150 to 200 volts. That was Chloride's part of the problem.

¶ The trawlers got their equipment. Car batteries by thousands, with new connections hurriedly burned in to put the cells in series-parallel, provided each ship with a fearsome make-shift battery of 1,134 cells. Later, our special 400 volt mine-sweeping batteries, designed for the job and produced in very great numbers, made sweeping safer and more certain. But the magnetic mine, as a decisive weapon of war, was already beaten—by brave men and a battery that looked like an 'electrician's nightmare.'

¶ For over 50 years we have been designing & making special types of Chloride, Exide and Exide-Ironclad Batteries for every branch of industry, transport and communications. Our battery research and development organisation, the largest & best equipped in this country—if not in the world—is at industry's service always: ready at any time to tackle another problem.

What is scrap? It is obsolete machinery, disused farming and other equipment. It is the bits and pieces left over in making articles from steel. All of it is valuable raw material which the steel industry must have if our manufacturers and exporters — and our defence services — are to meet the country's needs.

There is still a lot of scrap not coming back into production quickly enough.

The British Iron and Steel Federation appeals now, in the national interest, to all industrialists to speed the return of iron and steel scrap through scrap merchants who can assist in dismantling and collection however difficult. Steel is serving you well — now is your chance to help steel to help you.

EVERY EXTRA TON
OF SCRAP RETURNED

Incentive

THE SHAREHOLDERS of John Laing and Son Limited are working members of the firm. You will find them driving cranes or mechanical shovels, laying bricks or leading a gang, costing contracts in detail, managing or directing — active in some way as part of the team at home or overseas.

Not every member is a shareholder. It is a privilege reserved for long service, loyalty, ability to lead and to set an example.

So at key points, from head office to the remotest site, are men to whom the firm belongs. That is the finest incentive in the world, and the surest guarantee of good work for those who entrust their construction to John Laing and Son Limited.

For speed and efficiency in building and civil engineering

JOHN LAING AND SON LIMITED • Established in 1848
London, Carlisle, Lusaka, Johannesburg

In the field of human labour and man hours alone, the Banda is saving tens of thousands of hours of arduous work every week. It speeds the flow of commerce . . . its benefits in cash saved and increased business efficiency are incalculable. For Banda is no ordinary duplicator. It needs no stencils. It uses no ink. There is no setting or distribution of type. You just type, draw or write, put it on the Banda and turn the handle. It's as simple as that . . . and you can print in seven colours in one operation if need be.

BLOCK & ANDERSON LTD.,

used 9,250,000 lb of these other materials compared with 6,000,000 lb in October, 1949. Yet the consumption of raw wool has not declined. The increased use of alternative materials has helped the output of wool textiles to expand without yielding an economy in the amount of raw wool used. As the Commonwealth Economic Committee has pointed out in its recent survey of world wool consumption,* if defence requirements are to be met, a substantial reduction in civilian consumption is inevitable.

Should Mixture Cloths be Labelled?

The use of alternative materials in the manufacture of wool textiles raises an awkward question of definition — at what point does the cloth cease to be wool? The Board of Trade regulations have an odd effect that is certainly open to commercial exploitation; it is that any cloth containing not less than 15 per cent of wool comes under the price regulations for utility woollen goods. Many weavers, including most of the firms represented by the Scottish Woollen Weavers Association, feel the term "wool cloth" should not be used for mixtures containing less than 90 per cent of wool.

Unfortunately, the term "wool cloth" has a more precise meaning for the public: i.e. cloth that is made of wool and of no other fibre. Most of the big retailers, and a number of manufacturers, are members of the Retail Trading Standards Association, and one of the functions of the association is to see that the goods sold by its members are accurately described. The Board of Trade has shown some ingenuity in wording its orders so that they avoid any definition of "wool cloth," but the RTSA has always maintained that this rule of thumb method does, however unintentionally, mislead the public. When there is so marked a difference between the meaning which the public and the trade attach to the same term, the solution would appear to be some form of descriptive labelling, but it has so far not been possible to find a formula which both sides can accept. The effect of nearly 20 years' campaign by the International Wool Secretariat has spread the impression that mixture cloths are of inferior quality to pure wool cloths. This is not inevitably true, but it is possible to argue, as the wool industry has done, that informative labelling alone does not go far enough, since the consumer could still buy a very poor quality cloth under the cachet of a pure wool label. Labelling regulations which are ostensibly in the interests of the consumer can also be used as a protectionist device. There are some grounds for believing that the labelling regulations introduced in New Zealand, Australia, and South Africa had a strongly protectionist colouring and it is only recently that representatives of the Wool Textile Delegation have induced the authorities in South Africa and New Zealand to change these regulations so that it is easier for British exporters to comply with them. Talks are still going on with the Australians.

For more than two years, a committee of the British Standards Institution has been trying to draw up wool standards acceptable to producers and consumers alike, and is no nearer to agreement. The Clothing Industry Development Council has the same object in mind in asking the groups concerned to submit their views on labelling. Recent statements in Parliament by the President of the Board of Trade have made it clear that there is no prospect of raising the minimum wool content of utility cloths, so retailers will probably increase their pressure for a more precise description of the wool mixtures. The prospects of an agreement with the wool industry are improving. Much of the cloth made here is being labelled to meet the local regulations in export markets and at home, high prices make it easier for

the Wool Textile Delegation to reassure its more apprehensive members that descriptive labelling will not lead to a sharp drop in the sale of mixture cloths which some of them seem to expect.

Profits in Lombard Street

The discount market unquestionably found good opportunities for profit-making in 1950. Unfortunately, its experience in that period cannot be traced with any precision from available figures — first, because only the "Big Three" of the nine public companies make up their accounts at the end of the calendar year (the remaining accounting dates being widely scattered) and, secondly, because published discount profits, like those of the banks, are strongly subject to inner reserve policy. Each of the three companies shows for the year an increase of approximately £15,000 in its published profit, raising the aggregate for the three from £747,700 to £793,600. It seems reasonable to assume that undisclosed allocations to contingency or other inner reserves have been at least as large as in 1949. Chiefly in consequence of the substantial conversion operations staged by the Treasury during the year, there has been much activity in the short bond market, offering good scope to shrewd dealers who get quickly off the mark when conditions change. A corollary of these operations, however, is that the Treasury policy of repaying or converting the shortest bonds before their final redemption date must inevitably tend to increase the average life of the discount market's portfolios, and thus may dictate some decline in the total of bonds that can prudently be held. In these conditions, the longer-term prospect for profits from bond business may become less favourable; but for the time being, and especially in view of the recent firmness of gilt-edged values, the dominant influence has been rapidity of turnover.

Lombard Street's bill business — which is by far the greater part of the whole but contributes only a small part of the profits — has also been greatly extended in the past year, thanks to the Treasury's further switching of its borrowings from Treasury deposit receipts (which are allotted direct to the banks) to Treasury bills (which mainly pass to the banks through the discount market). The total allotment of bills to the twelve houses in the market at the weekly tenders in 1950 was in the region of £6,950 million, an increase of some 36 per cent on the allotments in 1949 and one of more than 60 per cent on 1948. The expansion of earnings from bills, however, will have been less than proportional: as a technical consequence of last year's standardisation of the life of the bills at 91 days, the tiny margin secured by the market between the discount earned and the cost of borrowing to finance the purchase has been further whittled down. On the other hand, during the past year, the discount houses have had the full benefit of the further increase, effected just before devaluation in 1949, in discount rates on commercial bills.

Freight Rates Still Stronger

After a Christmas lull, the trend of tramp shipping freight rates has continued its steep upward curve. When business was resumed at the end of the year, rates were higher in every section of the market, but charterers were still unable to satisfy their requirements in full, and a further considerable advance has occurred this week in all trades. Black Sea grain cargoes had been taken at the end of the year for 75s. a ton, but two ships were fixed this week at 81s. 3d.; when these grain shipments started in early November owners were accepting about 50s. Grain chartering from the River Plate to India has advanced by 7s. 6d. a ton recently, while rates for grain from the United States to India have advanced by as much as 25s. There is a strong demand for vessels on time charter, where for the time being

the British Government's chartering agencies seem to have taken over from the liner companies. The Timber Control, for example, has fixed a motorship for two round voyages to the North Pacific in early February, while charters for New Zealand round voyages and for returning via the North Pacific for lumber have been arranged at markedly higher quotations than before. Forward chartering is also strong, one vessel having been fixed for grain from the North Pacific in March at 150s. a ton, an increase of 25s.

Focal points of pressure on tonnage appear now to be the American North Pacific and Atlantic trades, where charterers are bidding high for ships to carry grain, coal and lumber to Europe, India, Japan and many other parts of the world. It is apparent that they have not yet covered their commitments. Nor do they seem disposed to await a sign of relief in the demand for tonnage; they recognise that shipments of coal and lumber to Europe, in particular, are matters of some urgency. Cuban sugar chartering has not been particularly active, but ships have had to be taken at 80s. a ton, which compares with 57s. 6d. not very long ago. The higher rates that are being offered are intended to have, and are having, the effect of drawing tonnage off other markets in other parts of the world, and already tonnage is becoming

scarce in Far Eastern waters. Ships are beginning to sail in ballast to the North Pacific instead of taking cargoes elsewhere from Australia, and an advance of 12s. 6d. a ton to 92s. 6d., was necessary to induce a vessel to take a cargo of flour from Australia to Ceylon. Longer hauls everywhere are reducing the carrying capacity of tonnage, and the preference of India, for example, for importing grain from the Plate and the U.S.A., rather than from Pakistan or even Australia, has played a particular part in the rise in freight rates. British and other European imports of American coal, of course, add to the pressure: a recent typical, but bizarre, fixture was that of a small vessel to carry coal from Nigeria to the U.K., at 80s. a ton.

Such influences have caused the pressure to spread into every market, and even ore chartering from North Africa, which usually is the slowest to respond, has followed suit. Two vessels were chartered this week at 45s., which compares with about 30s. a month ago and only 19s. at the lowest point in 1950. Some commodities are scarcely being shipped at all, and British exports are in danger of being held up.

Price or Quantity?

The Ministry of Food's battle with various supplying countries on supplies, and prices is now in full swing. Arduous negotiations with Denmark about this year's bacon prices have been finally brought to a successful conclusion. The Danes had asked for a rise of 7½ per cent on last year's price (the maximum rise permitted under the long-term contract) and Britain offered only a 3½ per cent increase. Compromise was reached on 5½ per cent, and this year Britain will pay 229s. a cwt., compared with 217s. in 1950. The Prime Minister of Denmark made it clear in his New

Year's speech that the British policy of attempting to hold down prices is having serious repercussions on the economies of supplying countries.

The fact that these higher prices have been secured by producers is no reflection on the negotiating powers of the Ministry. It is indeed something that the Ministry has at last realised that the world is in the throes of inflation, and that supplies can be obtained only if realistic prices are paid for them. Farm costs in Denmark, and in other countries, too, have risen since devaluation because most of the feeding-stuffs have to be purchased from non-sterling countries, and if agricultural output is to be sustained at a high level, farmers must be offered a return which at least covers their costs. It is not a question of paying inflated prices to secure some small addition to supplies; it is a question of paying sufficient to secure a steady expansion in output. The British offered the Dutch last summer a price for eggs which was lower than the pre-devaluation price. The Dutch refused and, despite the existence of a long-term contract, no Dutch eggs have since been sent to Britain.

But the lines of the Ministry's agreement with Denmark offer no guide to its bargaining with other countries. No agreement has been reached with Canada over bacon exports for this year because Britain offered only 29 cents a lb. for a quantity of 130 million lb.—as in 1950. Last year the Canadian Government paid a subsidy of 3½ cents a lb. to bring the price up to the minimum of 32½ cents a lb guaranteed to the Canadian farmer. This year Canada is no longer willing to pay such a subsidy, particularly as Canadian hog prices have often been higher than 32½ cents a lb. Britain, according to report, refused to pay a cent more than last year, though if it were to make to Canada the same offer of a 5½ per cent increase as it did to Denmark—raising the price from 29 cents to 31½ cents a lb.—the Canadian Government might perhaps have been prepared to find the remaining cent.

Prospects for 1951 thus seem far from bright. Rations may be reduced rather than increased and, even so, either the cost of the food subsidies or the retail price of certain foodstuffs must be raised. The latter is the more proper course and perhaps more likely. The index of retail prices is at long last reflecting, in its own modest fashion, the rise in world commodity prices. It rose by one point in November, for the second successive month, to 116 (June, 1947 = 100), compared with 114 in June, and 113 at the beginning of 1950. The four points conceded by the TUC are almost used up.

International Bank More Active

The International Bank for Reconstruction and Development is now taking up the role that was originally intended for it. It is becoming one of the major channels for the export of capital from the United States. In 1950 it granted sixteen loans of a total value of \$219,145,000—the largest amount for a single year since the Bank's big "reconstruction" loans to war-devastated European countries in 1947. The projects for the past year included loans to Colombia, India, Mexico and Brazil for power development, to Iraq for flood control, to Turkey for harbour development and grain storage facilities, to Uruguay for power and telephone facilities, to Ethiopia for road construction and to Thailand for railway and port development and for irrigation. The largest loan of the year was the \$100 million loan to Australia to assist in the large capital programme involved in the Commonwealth's ambitious immigration scheme. Besides providing capital, the Bank has played a useful role in giving technical assistance; it has given its expert advice on the establishment of the Industrial Development Bank of Turkey and the Agricultural and Industrial Development Bank of Ethiopia and has helped in the flotation of a local bond issue in El Salvador, which was designed to mobilise the domestic capital required for the construction of a local hydro-electric project.

The loans granted by the Bank now exceed \$1 billion. Its operations are marked by considerable conservatism; the motto of the Bank is still that propounded by a former President, Mr McCloy: "We are not in the stop-gap business." This caution and adherence to sound banking principles are made necessary by the Bank's dependence on private investors for the resources it makes available to borrowers. Since its inception the Bank has raised \$250 million through the sale of bonds to investors in the United States and the equivalent of about \$10 million in Swiss francs through bond issues in Switzerland.

* * *

The Week in Commodities

Once again the general run of commodity prices during the past week has been upwards. Rubber became 11d. a lb. dearer under the pressure of Russian buying and closed on Wednesday at 5s. 4d. a lb. Russia apparently fears—and not without cause—that some form of international allocation will be instituted shortly that would drastically reduce the

	COMMODITY PRICES

Shellac (s. per cwt.)	320	237½	325	320	400	412½	392½	
Rubber, RSS spot (d. per lb.)	15	24	45½	59½	55	53	64	
Tallow (cents per lb.)	6	4½	12	14	16½	16½	17	

Note: Monthly prices taken at last day of the month except those for wool which are monthly averages.

quantity of rubber available to it. Tin rose by £105 to £1,262 a ton. Tungsten has continued its sharp rise and is now 440s. per unit against 265s. at the end of November. Sugar, too, has been rising steadily despite the prospects of a record world crop. Britain bought 11,000 tons from Puerto Rico at

5.55 cents a lb. and 5,000 tons from Cuba at the same price; by Wednesday the Cuban price had risen to 5.65 cents a lb. Wool prices have again jumped and crossbreds (56's) were quoted this week at 202d. a lb. against an average of 167d. for December. Jute, too, has risen sharply, from £122 a ton to £129, while linseed oil, castor oil and tung oil have all become appreciably dearer.

Shellac is the only commodity to show a decline during the past week. The official quotations for copper and zinc remained unchanged, but the price of electrolytic zinc rose by ½ cent to 19 cents a lb. Now that stockpile purchases of zinc are to be suspended for the next six months, some weakening in the grey market price must be expected.

Shorter Notes

The latest Bank return reveals that the fiduciary issue has been reduced from £1,375 million to its pre-Christmas level of £1,350 million; in the last two weeks nearly £44 million of notes have returned from active circulation, compared with just over £41 million in the first two weeks of 1950. The Bank return also shows that small ERP allotments granted before the suspension of Marshall Aid are still being shunted through H.M. Treasury Special Account.

*

The first deliveries of crude oil from the new Arabian pipe-line have reached the Anglo-American Oil Company's Fawley refinery. This pipe-line, which links the Abqaiq oilfield in Saudi Arabia with a newly-built port south of Sidon, more than 1,000 miles away, has a present capacity of 300,000 barrels of crude a day. Its ultimate capacity will be 100 million barrels a year (nearly 15 million tons). This is equivalent to the capacity of 65 tankers, and its use will immediately increase the amount of tanker capacity available.

*

A considerable proportion of hydrochloric acid, of which supplies are now being restricted by manufacturers, is produced by treating common salt with sulphuric acid; this latest industrial scarcity is thus another consequence of the shortage of sulphur. The acid is used in industry almost as diversely as is sulphuric, though in smaller quantities, but in engineering and metal-using industries, where its major use is for cleaning metals, its scarcity is unlikely to limit production; that has already been done by shortages of metals themselves.

Statistical Summary

EXCHEQUER RETURNS

For the 6 days ended January 6, 1951, total ordinary revenue was £101,165,000, against ordinary expenditure of £50,551,000 and issues to sinking funds £592,000. Thus, including sinking fund allocations of £13,063,000 the surplus accrued since April 1st is £104,041,000 compared with a surplus of £33,705,000 for the corresponding period a year ago.

Company Notes

Turner and Newall.—Every particular in the Turner and Newall report is as remarkable as the increase in group trading profits from £7,737,870 to £9,551,092. This company has long been recognised as a most efficient and strong organisation and stockholders are now getting a moderately increased reward after years of patience. Despite labour and material shortages, the group was able to meet a very high level of demand for asbestos products and the end of petrol rationing substantially increased the demand for "Ferodo" linings. Lack of suitable asbestos fibres caused some difficulty in the asbestos building materials branch.

A cautious reserve policy has again been pursued; £2,400,000, against £2,370,000 is appropriated to reserves, of which £1,000,000, against £500,000, is allocated to replacement reserves. Even, on the most stringent calculation, excluding all ear-marked reserves from earnings, the increased ordinary dividend of 17½ per cent and the anniversary bonus of 2½ per cent is amply covered by earnings of 63.2 per cent.

	Years to September 30, 1949	1950
Consolidated earnings:		
Trading profits	7,737,870	9,551,092
Total profit	7,923,013	9,719,590
Taxation	3,574,426	4,455,552
Depreciation, etc.	1,175,008	1,594,395
Group earnings for ord. sh.	3,173,579	3,669,643
Paid	440,435	587,247
To reserves and carry forward	2,742,678	2,623,372
Cons. balance sheet analysis:		
Fixed assets, less depreciation	7,303,166	7,801,410
Net current assets	17,379,505	21,679,105
"Quick" assets	15,644,723	19,089,684
Stocks	7,969,615	10,250,497
Reserves	16,479,150	20,904,184
Ordinary capital	5,338,609	5,338,609
£ ordinary stock at 85s. 7½d. yields £4 13s. per cent.		

The financial strength of the company is indeed impressive. Capital and revenue reserves of nearly £19.1 million compare with an ordinary capital of £5.3 million. The greater volume of stocks held and the increased price of raw materials have made the book value of stocks higher by nearly £2.3 million to £10,250,497. "Quick" assets of £19,089,684, against £15,644,723, represent 45.7 per cent of total assets.

Demand for the company's products will be further stimulated by defence requirements in the current year. The maximum output obtainable from the available supplies of raw asbestos is forecast by the chairman; but costs continue to rise and raw asbestos supplies are not as adequate as the company would like.

The chairman warns shareholders that the increased volume of production may not necessarily be reflected in higher profits. Such a warning will be heeded, but shareholders will not expect it to affect the maintenance of a 20 per cent dividend and some will still hope for a little more.

Carreras.—For a period of rising manufacturing and distributive costs and of higher leaf prices, the increase in group net profits of Carreras Ltd. from £1,178,045 to £1,428,504

	Years to October 31, 1949	1950
Consolidated earnings:		
Total profit after all charges	1,206,232	1,526,074
Group net profit	1,178,045	1,428,504
Taxation	1,257,970	1,536,116
Group earnings for ord. sh.	1,136,215	1,395,410
Paid	41.6	51.2
To reserves and group c/f	420,057	679,252
£ "A" Ordinary stock at £5 16s. 3d. yields 6 per cent.		

is impressive. The dividend of 35 per cent on the "A" and "B" ordinary stock, which has been paid since 1945, is comfortably maintained for earnings have risen from 41.6

per cent to 51.2 per cent. Retentions by subsidiary companies appear to be of the order of £225,000, against £200,000.

Reserves have been further strengthened by the allocation of £96,785 to general reserves, raising the total to £1,000,000. The need for providing adequate sums from revenue to maintain fixed capital as costs continue to rise is recognised by the transfer of £119,279 to a fixed assets replacement reserve. Tobacco shares are among the Budget risks, but unless demand is reduced by further taxation on tobacco, Carreras results in the current year should not be less encouraging than in 1949-50.

Burnley Building Society.—The Burnley Building Society has marked its centenary year with a rise in shareholders' accounts by nearly £3.5 million to £20.4 million. Surplus fund investments and cash at £3.8 million represent over 12 per cent. of the total assets of £29.6 million. Mortgage advances totalling £6,793,404 were made during 1950; there are 41,424 mortgages outstanding for £25.6 million compared with 39,723 mortgages for £22.9 million a year earlier.

Hadfields Ltd.—Group net profit, after all charges including taxation, has fallen in the year ended September 30, 1950, from £332,092 to £221,546. Taxation absorbed £104,638 (£115,498). Net profit includes profits on ordnance contracts and Iron and Steel Prices Fund claims both in respect of previous years amounting to £124,948 (£161,206). The ordinary dividend is maintained at 17½ per cent., which absorbs £103,778.

Life Assurance

Last year's new life assurance business of a further twelve leading offices has been published since last week's issue of *The Economist* went to press and the figures are tabulated below in £ million:

MARTINS BANK, LIMITED

CONTINUED PROGRESS—INCREASED PROFIT

DISINFLATION THE RESPONSIBILITY OF GOVERNMENT AND CITIZENS

STATEMENT OF MR A. HAROLD BIBBY, D.S.O., D.L.

The one hundred and twentieth annual general meeting of members of Martins Bank Limited will be held at Head Office, Liverpool, on February 13th.

In his statement circulated to members, the chairman, Mr A. Harold Bibby, D.S.O., D.L., writes:—

During the year changes have taken place both on the general board and local boards of the bank.

It is my sad duty to refer to the passing in November last of Mr J. H. B. Forster, D.L. He had served on the General and North Eastern boards for 25 years and had been chairman of the latter board since 1936. His great knowledge of industry in the north-east was of inestimable value to the bank and we greatly deplore the loss.

Mr E. R. Bowring, who has served with distinction on the General board since 1936 and has been a deputy chairman since 1947, has reluctantly found it necessary to resign on his removal from Liverpool to London. I am happy to say that we shall not lose the benefit of his wise counsel as he has accepted a seat on the London board.

Mr T. H. Naylor has succeeded him as a deputy chairman.

Owing to advancing years Mr H. M. Walton has indicated that he is not seeking re-election at the forthcoming annual meeting. His association with the General and Manchester boards extends over a period of some thirty years and the directors record their high appreciation of his valued and unremitting services.

Mr J. A. Holt, M.B.E., has been elected to a seat on the General board. Mr Holt is chairman of the old-established Liverpool business of John Holt and Company (Liverpool) Limited and we are glad to have his assistance.

We are also pleased to welcome to our deliberations Sir William Gray, Bart., D.L., who is closely identified with the shipbuilding industry, being chairman of William Gray and Company Limited, of West Hartlepool. He has served on our North Eastern board since 1940 and has recently accepted the chairmanship of that board.

I also record with pleasure that the Hon. Angus D. Campbell, C.B.E., who comes to us from the Manchester board with a high reputation, has joined the General board.

Mr P. Woodhouse has recently retired from the Manchester board. He joined that board in September, 1938, after signal service with the bank and its predecessors in the Manchester area in an executive capacity, a total service of fifty-nine years. We regret the loss of his valued co-operation.

Mr W. D'Arcy Madden, Air Vice-Marshal G. H. Ambler, C.B., C.B.E., A.F.C., D.L., and Mr P. H. Muirhead have been elected to the Manchester, Leeds and North Eastern boards, respectively. They have extensive interests and their advice will be of great value to their colleagues. These appointments will maintain the high standard of our local boards, upon the merits of which we lay much stress, not only from the bank's standpoint, but also from the advantages accruing to customers throughout the country.

CHIEF EXECUTIVE OFFICERS

During the year Mr James McKendrick, the chief executive officer of the bank, retired after an arduous and distinguished career extending through fifty years. Mr C. J. Verity, hitherto deputy chief general manager, has succeeded him as chief general manager and has been appointed to a seat on the London board. Mr M. Conacher, formerly a joint general manager, has been made deputy chief general manager. Both have held many positions of responsibility and, having spent the whole of their careers with the bank, have wide experience of the bank's affairs.

PROGRESS OF THE BANK

I trust that the balance sheet and accounts will afford shareholders the satisfaction my fellow directors and I feel in the continued progress of the bank.

Net profit for the year is £732,895, which is £7,725 higher than the previous year due to further expansion in our business generally.

After paying the dividend of 15 per cent. it is proposed to make the following allocations:—

Reserve for contingencies ...	£250,000
Premises redemption ...	£125,000

As I mentioned last year, provision for pensions has, in conformity with the general practice of banks, been made before arriving at the net profit. A further sum of £169,000 has been allocated from internal reserves to place the contributory pension fund upon the sound actuarial basis recommended in the quinquennial valuation submitted during the past year. This, I am sure, will give the greatest satisfaction to our staff in securing their future pensions without any additional call being made on them.

Customers' funds and other accounts now stand at £303,348,987, which is a small reduction on last year's figures.

Advances at £74,809,980 are £6,141,410 more than twelve months ago.

Resultant changes in other assets are to be noted in the comparative figures given in the balance sheet. The ratio of our more liquid assets to deposits stands at 52.3 per cent., a high figure compared with a little more than a decade ago and reflects the nation's floating debt carried substantially in the combined figures of the British banks.

Constant vigilance and a loyal regard primarily to the nation's interests rather than to forced profit-making must be, and is, the watchword of the board and the executive officers of the bank. Disinflation (not to be confused with deflation) is the responsibility of government and citizens alike.

The increase in advances is spread over all the fields of industry, commerce and agriculture and amongst the largest borrowers are some of the nationalised bodies. The banker has an onerous task in combining an anti-inflationary policy with the carrying of much of the risk attached to the greatly advanced cost of many of the primary commodities, caused by world-wide conditions including the Korean events, and this is daily brought home to us.

The past year has, by elimination or partial elimination of some of the wartime commodity-purchase controls, opened the door again to more enterprising buying and merchanting and has entailed new calls upon us for finance, not infrequently from customers of long standing whose former financial status has been jeopardised by heavy death duties, or from others who by reason of high taxation have not been able to build up their capital requirements to meet current needs. Old direct connections of our customers have been re-established and new ones vigorously sought; and practical experience dormant over a decade has had to be re-born and quickened at a precarious juncture. Here I pay tribute to the good work being done by the Government's Export Credits Department in facilitating exports by sharing risks.

Our programme of steady expansion of branch representation throughout the country is subject to the limiting factor of obtaining building licences.

The executor and trustee departments situated in the various districts of the bank continue to render their invaluable services and on an ever increasing scale as the many advantages of a corporate body in a fiduciary capacity become a matter of general knowledge and acceptance.

The growing work of our foreign branches is again a subject of comment and congratulation and I take this opportunity of recommending them to our friends needing advice on matters relating to international trade and finance or on foreign travel.

STAFF APPRECIATION

From many contacts with branch managers and other members of the staff, I can speak with knowledge of their high quality and keenness for the good and advancement of the bank. I notice, with pleasure, that many are taking advanced courses of study and so reaping the advantage of the offer of a substantial contribution from the bank towards their expenses.

ECONOMIC PROBLEMS

The serious occurrences in Korea confounded much of the hope the earlier part of 1950 seemed to hold for the mitigation of some of the graver economic problems facing Europe, this country and elsewhere and we must be eternally grateful that our ally, the U.S.A., grasped the Korean situation with the same resolute vigour and determination she has previously shown in her efforts to resuscitate the world.

Once more there is another twist to the inflationary spiral and methods of keeping it in some sort of control are exercising everyone's attention.

Surely the basic truth, which has been stated so many times in varying degrees of emphasis, must be appreciated by all except those who apparently refuse to face up to the realities of the position. Wealth cannot be created just by taking off the ticker on a pair of shoes valued at £2 and substituting one marked £3.

Similarly in the world of salaries and wages it is no possible solution to give an additional increase unless there is a corresponding increase in production. This, in the majority of cases, can be done without any increase in hours, by stepping up the output per hour, by giving full play to the ever growing mechanisation of industry and by greater personal effort by each and every individual.

It is no solution for one section of the community which feels that it may be lagging behind other sections to claim and secure an advance, as this merely gives a very temporary easement by putting that section slightly ahead of their fellows who at once make a claim to restore the previous position.

This method of advancement is short-lived for, when generally applied, it merely raises the costs of the goods or services and up goes the cost of living once more for everyone.

The fallacy that must be exposed is that full employment can be guaranteed by spreading the job out over as many hands as possible and over as long a period as possible. To carry full employment to its logical conclusion in the face of diminishing foreign orders for shipbuilding, machinery, textiles and the multiplicity of our products would mean direction and the movement from one area to another of labour to such an unpalatable degree as to be politically inexpedient whilst any spark of freedom pervades our constitution. I doubt whether all the implications are fully realised by the many who only see the advantages but close their eyes to the inevitable disruption in the private lives of others and maybe their own.

RESTRAINT IN WAGE CLAIMS

In my annual report to shareholders last year, I ventured the belief that these problems of inflationary effects and high costs of production could be overcome given certain co-operation and I commend to all the closing sentence in the Economic Survey for 1950, presented by the former Chancellor of the Exchequer to Parliament in March last, as follows:—

"Reasonable restraint in our personal claims upon production, increased efficiency and lower costs in industry, the elimination of all waste in the private and public sectors of our economy alike, are the necessary price with which to attain our objectives of economic independence and improved standards of living."

The new Chancellor has reiterated this statement of his predecessor with a plea for a general understanding in industry, and in the country generally, of the need for moderation in income claims, for a willingness to see the other man's point of view and an appreciation that the pursuit of purely sectional interests in an irresponsible manner without regard to the effects on the rest of the country can be disastrous.

This demand for continued restraint may appear to have lost some of its force in view of the almost spectacular improvement in the gold and dollar reserve position of the sterling area. This improvement is the outstandingly welcome feature of the year that has closed, but it should be remembered that the major contribution to betterment of the sterling group came from outside the United Kingdom, from the areas such as Malaya which have proved potent earners of dollars. If we here can preen ourselves it is on the buoyancy of our so-called invisible earnings, the importance of which tends to be overlooked.

INVESTING ABROAD

It is of particular significance that the improvement in our external sterling position should have come about by larger earnings from rubber, tin, wool, and such commodities, because these reflect the pioneer work in overseas investment done by this country in the past. Our sacrifices in two great wars have rendered us incapable for the time being of investing overseas on the former scale, and it is essential that the lead in this respect should be taken by the one country capable of assuming the role, namely, the United States. I am glad to note that a sense of this responsibility is very evident both in the pronouncements and policy of the leaders of that great country.

GREATER PRODUCTIVITY NEEDED

Nevertheless, I must conclude by reiterating my conviction that the persistence of inflation, world-wide in its incidence, is an occasion for the gravest disquiet and it can-

not be too strongly emphasised that with continued high demand, intensified as it is by the requirements of rearmament, the remedy is greater and still greater productivity hand in hand with careful productive spending. In this country the national production had increased by 9 per cent. up to September last compared with the previous year, and this factor combined with the wide support given by the Trades Union Congress to the policy of wage restraint affords considerable satisfaction as a demonstration that higher reward can only follow on higher effort.

The urgent need for greater productivity raises in acute form the problem of the supply of the necessary capital for trade and industry. I have already alluded to the increasing demands for working capital, demands of immediate concern to the banker, but the requirements for fixed capital are equally insistent. It is computed that each new arrival in Australia sets up a capital requirement of £1,000 and I cannot believe that the corresponding figure in this country for capital per worker is much less. Our living standards are in direct relation to our capital resources, and these must be maintained, developed and expanded out of the savings of the community. Can one doubt that the growth of capital is in surer hands when private thrift is encouraged and private enterprise carefully fostered?

BASS, RATCLIFF AND GRETTON, LIMITED

64TH ANNUAL GENERAL MEETING

The sixty-fourth annual general meeting of the ordinary stockholders of Bass, Ratcliff and Gretton Limited was held today at the registered offices of the company, High Street, Burton-on-Trent.

Mr C. A. Ball (deputy chairman) presided, and the following members of the board were also present:—The Rt. Hon. Lord Gretton, O.B.E., Mr A. G. Manners, Mr W. P. Manners, and Mr P. D. Manners, with Mr I. D. Pugh (secretary), and Mr I. M. Taylor, representing Messrs Whinney, Smith, and Whinney (auditors).

The secretary read the notice convening the meeting and the auditors' report.

The deputy chairman, in moving the adoption of the directors' report and balance sheet for the year, said:—

It is with regret I have to apologise for the absence of our chairman today, who is unfortunately indisposed.

I have to submit for your consideration, and adoption, the report of your directors, together with the audited balance sheet and statement of accounts, for the year ended September 30, 1950.

These were sent to you on December 12th, and have, therefore, been in your hands for the statutory period, and with your agreement, I propose to take them as read.

You will have noticed in the accounts, a taxation credit of £126,000, and which is explained in your directors' report; as this item is of an exceptional nature, we have transferred it to the contingency reserve.

The improved results for the year enable us to recommend an increased payment of 1 per cent. tax free on the ordinary bonus paid last year, and of which you will no doubt be pleased to approve.

RIISING COSTS

Rising costs still continue adversely to affect the additional revenue obtained from increased sales.

At the conclusion of the ordinary business, we propose to submit to you a special resolution to alter the Articles of Association as regards the qualifying holding of a director, and which is also explained in your directors' report.

I am sure that stockholders will join with the board in thanking all those members of the executive staff and other personnel, who, in their various occupations, have continued their loyal and efficient service to our group.

I now propose that the report of the directors, and the balance sheet for the year ended September 30th last, be adopted; that the half-yearly dividends paid on December 31, 1949, and June 30th last, on the 5 per cent. preference stock of the company, and the interim dividend of 5 per cent. on the ordinary stock paid on June 17th last, be approved; and that a final dividend be and is hereby declared, of 15 per cent., and a bonus of 5 per cent. on the ordinary stock, making with the interim dividend of 5 per cent. paid on June 17th last, a total dividend of 25 per cent. for the year, all free of tax, such final dividend and bonus to be payable on or after January 17, 1951.

Lord Gretton seconded the resolution, which was carried unanimously.

RETIRING DIRECTORS RE-ELECTED

The retiring directors were re-elected—Mr Arthur Manners, on the motion of Mr C. A. Ball, seconded by Lord Gretton; Mr W. P. Manners, on the proposition of Mr S. C. Robotham, seconded by Mr R. I. Tooby.

The remuneration of the auditors, Messrs Whinney, Smith and Whinney, was voted on the proposal of Mr E. C. Walters, seconded by Mr F. Hanson.

At the conclusion of the ordinary business of the meeting, a special resolution altering the company's Articles of Association, by substituting £200 for £2,000 ordinary stock, as the qualification of a director, was submitted to the meeting, on the motion of Lord Gretton, seconded by Mr A. G. Manners, and passed unanimously.

CASTLEFIELD (KLANG) RUBBER ESTATE

DIVIDEND OF 15 PER CENT.

The forty-fourth annual general meeting of this Company was held on January 4th at Asia House, Lime Street, E.C.

Mr Jack Addinsell, the chairman, after paying tribute to the courage and loyalty of the Estate staffs, said in the course of his statement:—

Although the full effect of the rise in prices was not felt in the year under review, the profit, excluding rehabilitation and before deduction of taxation, was £77,357, which is very gratifying considering the conditions under which our estates have had to operate. To cover taxation on the year's profit £38,392 is set aside.

Having regard to the programme of replacement and modernisation, we appropriate £10,000 to general reserve. For replanting, and upkeep of replantings, we transfer £7,500 to Replanting Reserve. During the current year we are replanting only 78 acres, with 24 acres of old rubber accidentally burnt out, but we expect to undertake approximately 150 acres next year. Yield per acre will attain increasing importance when the price of our commodity falls, and we cannot expect it to remain for long at the present very high level. The competition of synthetic must be a constant reminder of the necessity for improved yields and competitive costs.

For the current year a crop of 3,332,000 lbs. has been budgeted for but the output is to date running rather below the estimate. We must expect costs to rise as a result of a further increase in labour rates and in prices of materials. There is also the prospective increase in the export duty. There is therefore obvious need for prudence, but your directors feel justified in recommending a dividend of 15 per cent. for the year.

MALAYAN TIN DREDGING, LIMITED SOUTHERN MALAYAN TIN DREDGING, LIMITED

MR H. ASHWORTH HOPE ON
SOCIALIST POLICIES

The adjourned annual general meetings of these companies were held on January 10th in London.

The following are extracts from the statements of the chairman, Mr H. Ashworth Hope, circulated to shareholders:

MALAYAN TIN DREDGING, LIMITED

Why should 10d. have been considered good enough for Malaya when the price fixed by Ceylon was 1s. 6d. and every pound was eagerly purchased? In 1945 and 1946 Malaya produced 412,000 tons of rubber and had that country been paid only 1s. 6d. per lb. as was paid for Ceylon rubber, its producers would have received an additional £30,000,000. It is problematical just how much the Socialist Government lost between 1945-1949 by selling rubber to the U.S.A. at prices bearing no relationship to those America charged us for her surplus commodities.

SOUTHERN MALAYAN TIN DREDGING, LIMITED

Malayan and U.K. taxation together amount to 240 per cent. or nearly 2½ times the amount received by shareholders.

There would appear to be at least four policies the Socialist Government intend to carry out if again returned to power, each and all of which directly and adversely affect our group of companies and the tin industry as a whole: 1, Another capital levy; 2, statutory limitation of dividend; 3, a "curb on profits"; 4, more nationalisation—a red light to the tin mining companies.

Regarding a capital levy, Sir Stafford Cripps gave a solemn undertaking in Parliament that the levy he then proposed would be a "once for all" levy. With regard to statutory limitation of dividend, Mr Calligan, Parliamentary Secretary to the Admiralty, has recently urged that shareholders should be compelled to have their dividends limited by law.

With regard to "curb on profits," Mr Griffiths accepted a composite resolution at Margate, on behalf of the Party Executive, which spoke of "high profits received by employers," carrying the implication that these profits were responsible for the high prices. Why did not Mr Griffiths at once state the truth by pointing out it is not high profits that cause high prices, but that high profits are the result of the fortuitous rise in the price of commodities?

SINGAPORE AND FEDERATION OF MALAYA

At a time so fraught with menace to our country, useless, unreasonable, unpatriotic, strikes should be suppressed by the Government, as this virus of indiscipline and lack of responsibility could easily, by example, spread to Malaya.

Private enterprise free from irritating and unnecessary interference by governments both British and Malayan, will be the salvation of Malaya in the future.

There are still serious doubts concerning the ambiguous "assurances" given by Mr Attlee as to how long the British will remain in Malaya.

What is required is a clear and unequivocal statement by the Prime Minister not only that Malaya is and will remain a protected country as long as the treaties endure, but that Singapore is and will remain a British colony, and there is no question of withdrawing from either.

The reports were adopted.

SUNGEI BESI MINES AND AYER HITAM TIN DREDGING

MR G. W. SIMMS' STATEMENT

The adjourned annual general meetings of these companies were held on January 10th, at 73, Cheapside, London, E.C.

The following are extracts from the statements of the chairman, Mr G. W. Simms, circulated to shareholders:

The Secretary-General of the United Nations, in accordance with the provisions of the Havana Charter, convened a United Nations' Conference on October 25, 1950, to discuss a commodity control agreement on tin.

The leader of the British Colonial and Dependent Territories delegation referred to the dangers that might result from unemployment in consequence of a surplus of production in tin-producing countries and stated that the scheme was calculated to bring stability to the tin industry. As far as Malaya is concerned, this is in direct conflict with the facts established by experience under the last restriction scheme. The labour force employed in the Malayan mining industry varies with production.

RESTRICTION AND UNEMPLOYMENT

In Malaya the sale and transfer of quota which was permitted under the last restriction scheme was a direct incentive to the mine owner to close down, dismiss his labour force and sell his quota. It created a condition of affairs where one party was paid for not producing tin while the other party, by reason of the purchase price for quota, accepted what is equivalent to a lower price for his product. Price fluctuations were also greater during restriction than before it.

The estimates of production and consumption formulated by the Statistical Committee of the International Tin Study Group show an estimated surplus of production over consumption of 45,000 tons, 55,000 tons and 59,000 tons for the years 1950, 1951 and 1952.

There is no hope of any significant increase in terms of world production for some time to come. The possibility of a material increase in production from the Malayan tin industry can be ruled out and it is unlikely that production there will exceed 62,000 tons in 1951 and 65,000 tons in 1952.

WORLD CONSUMPTION

World tin consumption for commercial purposes in 1950 is unlikely to be far short of world production and during the last quarter of the year it has been running at a rate in excess of production. Looking further ahead it is of interest to consider the population figures and tin consumption per head for important countries. Generally speaking, the greater the degree of industrialisation the greater the tin consumption per head. The natural increase in population should result in a substantial increase in the consumptive demand.

As regards the future, it is much easier to visualise a material increase in the consumptive demand for tin than a material increase in its production. The most urgent problem before the tin industry is that of under-production not over-production. Tin, like any other commodity, is subject to competition from possible substitutes and if it is to hold its own the tin-producing countries would be well advised now to concentrate on developing their tin resources and increasing production to meet the demand.

The reports were adopted.

BANGRIN TIN DREDGING COMPANY, LIMITED WAR DAMAGE SETTLEMENT

The adjourned thirtieth annual general meeting of the Bangrin Tin Dredging Company, Limited was held in London on January 8th, Mr Kenneth O. Hunter, the chairman, presiding.

The following is an extract from his circulated statement for the year 1949:—

After making the usual provisions for depreciation of dredges, plant and equipment and amortisation, £50,832 is carried to Eastern revenue account. After adding interest, etc., received in London and deducting expenditure, we are left with a balance of £61,328 representing the profit for the year 1949 before providing for taxation. The relative estimated charge for profits tax and income tax is £36,654 and tax on depreciation and amortisation, etc., in excess of allowances for taxation takes a further £4,717 making £41,371.

Addressing the meeting the chairman said that he was very glad to be able to report that he had received the following communication from the Foreign Office via the working committee:—"I have been informed by telephone from the Foreign Office this morning that the exchange of notes with the Siamese Government has been completed and the claims have been finally agreed. It is expected that machinery will shortly be set up to deal with the distribution of the awards to be made." He did not think that they were likely to receive all that they had claimed but he thought it would be a fair amount and that they would receive it before the stockholders met again.

The report was adopted and the proposed final dividend of 5 per cent., making 8 per cent. for the year, was approved.

SIAMESE TIN SYNDICATE, LIMITED

DIVIDEND 25 PER CENT

The adjourned forty-third annual general meeting of the Siamese Tin Syndicate, Limited was held in London on January 8th, Mr Kenneth O. Hunter, the chairman, presiding.

The following is an extract from his circulated statement for the year 1949:—

Three more dredges were in operation. This resulted in increasing the output of tin ore from 921 tons in 1948 to 1,445 tons in 1949. After adding to the net revenue in the East, interest, etc., received in London and deducting expenditure, we are left with a balance of £94,183, representing the profit for the year 1949 before providing for taxation. The relative charge for taxation on the profits for the year is £61,700 and on depreciation, etc., in excess of allowances for taxation £3,580, making a total of £65,280.

Addressing the meeting the chairman said that he was very glad to be able to report that he had received the following communication from the Foreign Office via the working committee:—"I have been informed by telephone from the Foreign Office this morning that the exchange of notes with the Siamese Government has been completed and the claims have been finally agreed. It is expected that machinery will shortly be set up to deal with the distribution of the awards to be made." He did not think that they were likely to receive all that they had claimed but he thought it would be a fair amount and that they would receive it before the stockholders met again during the summer.

The report was adopted and the proposed final dividend of 5 per cent., making 25 per cent. for the year, was approved.

HECHT, LEVIS AND KAHN, LIMITED

WIDESPREAD IMPROVEMENT

The twenty-fifth annual general meeting of this company was held on January 9th in London, Mr. Walter Fletcher, C.B.E., M.P. (the chairman), presiding.

The following is an extract from his speech:—

As I ventured to point out to you last year, a change for the better had then taken place, and this has resulted in a very considerable improvement in the figures now before you. This applies not only to the profits made by the parent company and its subsidiaries and associates but to the expansion of the volume of trade in rubber and other commodities and articles in which we deal. The trading profit, less losses for this year, is £241,930, compared to the trading loss of the previous year of £23,613. We have, as a result of these improved figures, thought fit to bring up to date the payments due to preference stockholders and to reinstate the annual redemption of the normal percentage of the preference stock.

INCREASED SHARE OF FACTORY BUSINESS

The improvement in trading was widespread. At home we have increased, through the strenuous efforts of our market squad, our share in the home and foreign factory business. In France, which has been conspicuously successful, Alcan and Company remains easily the leading distributing agent for raw rubber, latex and sole crêpe, to which they have added rubber chemicals and other closely allied lines.

In the United States there has been a good deal of tightening up and reorganising. The jute importing business of our American subsidiary has expanded on satisfactory lines, and is starting to operate in certain European countries.

In the Far East our Singapore subsidiary had had to contend with the added worries arising from banditry and the Communist effort, yet it has managed to maintain a leading position as a shipper.

CURRENT YEAR'S TRADING RESULTS

You will, no doubt, wish me to say something about trading results since the date of the balance sheet. The steady, though sometimes sharp rise in the price of rubber, and the feverish movements of the last month or two, affect the merchant trader quite differently from the producer. They certainly provide good opportunities, but the great premiums that we have seen paid on spot or near rubber, as against rubber for forward delivery, are not healthy signs. Nevertheless, using as much prudence as possible, the results are a good deal better than those of last year and we hope will continue so for the rest of the financial year.

We feel that the policy of trying to establish a steady and regular profitable business is preferable to the vast profits that correct judgment of a rapidly moving market may provide at one moment, but which are so often prone to melt away with something added to them at the next. Many schemes that are put forward to deal with the inflationary effects of the rise in price of important primary commodities, including rubber, would, if adopted, inevitably affect the future of this business, but businesses established in the main markets of origin and consumption have always found a place where their services are needed and rewarded in all the varying circumstances of peace and war. I am confident that we shall adapt our world organisation to whatever circumstances we may have to face.

The chairman, addressing the meeting, said he was pleased to state that an interim dividend of 10 per cent., was being paid for the current year.

The report and accounts were adopted.

CHARTERHOUSE INVESTMENT TRUST

25 YEARS OF GROWTH

The twenty-sixth annual general meeting of this company will be held on January 31st in London.

The following is an extract from the review by the chairman, Mr H. Nutcombe Hume, C.B.E., M.C., circulated with the report and accounts for the year to November 11, 1950:

The accounts represent the culmination of 25 years' work. The Trust started with an initial capital of £300,000 and now controls a group, the total resources of which in capital and reserves attributable to the Trust, amount to approximately £2,411,000. The Trust has paid a dividend in every year since its inception and including the dividend now recommended will have distributed in the aggregate 169½ per cent. to the holders of its ordinary stock.

It is with great pleasure that we present yet another satisfactory record of trading and are able to recommend the maintenance of our dividend at the same rate as for the past four years. Our reserves have been increased, in the aggregate, by £32,786 and the current worth of the assets is substantially above their book value.

If we are allowed to carry on our business without interference and if foolish, or even deliberate, political policies do not further injure or destroy the capitalistic system which has served this country so well, I see no reason why the next 25 years should not witness a growth of our group of companies comparable with that which I am able to report today.

Despite the inherent difficulties of the times our Finance Corporation has again rendered a good account of itself and has obtained its full share of such issue business as has been available. Our Industrial Development Company has had another successful year.

Its investments, amounting to over £3½ millions, are now spread over more than fifty companies.

MENACE OF DEATH DUTIES

Britain's aptitude for colonisation derives in very large measure from the willingness of its people to adventure and their skilful use of capital for the development of more backward countries. The smaller units of production and employment are the backbone of the trade of this country; their flexibility and their preparedness to take risks, coupled with a relationship between management and employee based on affection and loyalty, are an asset the country cannot afford to lose. The present system of taxation, however, is, in fact, doing this very disservice to us all. The private company is in course of being destroyed. Not only is the splendid habit of building up out of retained profits rendered impossible by Income and Profits Tax, but the very fabric of these concerns is being torn to pieces by death duties.

When the proprietors of a concern have tried their best to attract outside capital and failed, their enthusiasm for development turns into a desire to cut down and become liquid. Nobody should be more concerned to see this process reversed than the employees and their trade unions.

As to the outlook, the Finance Corporation has completed three issues since our year closed and has at least eight more good profitable deals under active negotiation. The portfolio of investments we believe to be sound, and the holdings in the 50 or more companies in which the Industrial Development Company has an interest are worth considerably more than the figure at which they stand. But over all hangs the awful spectre of world political failure and instability.

LAKE GEORGE MINING CORPORATION, LIMITED

LARGER OPERATING PROFIT

SIR GODFREY FELL'S REVIEW

The fourteenth annual general meeting of this company was held on January 9th in London, Sir Godfrey Fell, K.C.I.E., C.S.I., O.B.E., the chairman, presiding.

The following is an extract from his address, circulated with the report and accounts for the year to June 30, 1950:

The group operating profit at £498,813 was £173,970 more than in the previous year, when operations suffered owing to prolonged strikes. After writing off preliminary expenses and share capital reduction expenses, providing for the interim dividend and for the proposed final dividend, making a total distribution of 2s. per share, less tax at 9s. in the £, the amount carried forward, £85,954, is £6,435 more than last year.

Diamond drilling to a total of 2,239 feet was carried out on the surface, while a further 7,079 feet were completed underground for the purpose of geological investigation, delineating and sampling the ore-bodies, and for engineering and other purposes.

In a recent letter, Mr W. H. Tyler, the general manager, comments as follows on the subject of "gossans": "I would like to draw your attention particularly to the section on gossans in the report accompanying the regional geological map. These outcrops are very widespread and we are really dealing with a region of base-metal deposition and not with isolated occurrences of lead-zinc-copper lode. This region extends to the south and north, and we now have a large area protected which we hope to survey in the next field season. In such a large area it is difficult to believe that the Elliott's and Keating's lodes are the only ones worth exploiting, and further detailed work on the gossans should bring out some interesting facts."

RIISING COSTS

Operating costs, the report indicates, continue to rise, owing to increases in basic wages and new awards made by the Arbitration Court for higher rates of pay, which in turn have seriously raised the cost of plant, equipment and stores. For these reasons and owing to the fact that in the previous year the mill only operated for 80 days and the mine for 67, owing to labour troubles, comparisons of operating costs are valueless.

Operations at Captain's Flat are continuing at a satisfactory level, and for the 20 weeks ended November 19, 1950, 75,335 tons of ore were milled, an average of 15,067 tons for each four-weekly period. The output of concentrates for the same period amounted to 5,914 tons of lead concentrates, 10,776 tons of zinc concentrates and 1,757 tons of copper concentrates.

Shipments of lead and zinc concentrates to the Continent and to the U.K. are being made to the fullest possible extent by Lake George Mines Pty. Ltd., in order to take advantage of the present high prices for lead and zinc. Given a continuance of these prices and stable labour conditions, the subsidiary company should show considerably enhanced earnings in the current financial year.

The chairman, addressing the meeting and referring to the question of transferring control of the Corporation to Australia, said that taking the long view, it was the unanimous opinion of the directors that it would not be in the best interests of the shareholders to upset the existing organisation at the present time.

The report was adopted.

Arms and Diplomacy

IT is said that Parliament will shortly hear from Mr Shinwell a speech of great frankness and urgency. Let us hope so. Some such statement on defence policy is already long overdue if public bewilderment about the rate and purpose of rearmament is to be overcome and a mood of intelligent determination built up. Now that General Eisenhower has made his bow in London as Supreme Commander, and now that President Truman has presented the bill for the tremendous effort that the United States is to make, such a declaration from a British Minister is essential. Moreover, it should be made with enough spirit and determination to carry the conviction that something is going to be done—not like one of the Prime Minister's broadcasts, where every sentence seems to begin with the word "unfortunately."

Mr Shinwell must by now have had plenty of opportunities of realising what the strategic and political purposes of the Atlantic Pact require of this country—which is no less than, jointly with America, to stand in the front line on the Continent of Europe if any attack comes in the next year or so, before the continental countries themselves are ready. Mr Shinwell must remember the time, not so long ago, when the Cabinet refused to accept this principle, in spite of all the pleadings of Lord Montgomery as chairman of the Western Union commanders-in-chief. Since then time-tables and estimates of danger have changed; the lesson of Korea has been studied; and the need to save Europe by exertion as well as by exhortation has become clear. An unmistakable acceptance by Britain of the commitment to fight on the Continent is the essential keystone of the whole alliance; without it neither the American nor the continental contributions will be forthcoming.

So much is needed of British policy if the allies, both to the east and the west, are to be kept together. But something else is needed if the British people are also to be carried along in agreement—an expression of equal confidence that the purpose is to prevent, not to precipitate war. It has to be explained to the public that there is nothing unreasonable in advocating at one and the same time rearmament and negotiation with Moscow, in preparing against war while hoping for peace. Indeed, it has to be explained that the one is the condition of the other. Many people—both here and in Europe—will not put their backs into soldiering or civil defence or factory production until they are satisfied that a serious attempt has been made to get out of Moscow a wide or limited agreement. Others, on the other hand, take the same view as many Americans: that it is useless, indeed dangerous, to attempt negotiation until Europe is strong enough to face the consequences of a breakdown. No negotiation, they say, is better than futile negotiation. In short, two wings of public opinion, both wanting peace but disagreeing about the way to get it, have to be brought together; and that can be done only if defence measures and diplomacy march together. To the Russians

this is clearly the normal way of conducting affairs of state; to them it seemed a normal precaution not to disarm extensively after the war until an acceptable post-war settlement was in sight. The British and the Americans—despite the warnings of history and Mr Churchill—thought otherwise. Thus, to get into a posture for what Mr Acheson calls negotiation from strength, they now have to go through all the alarms and excursions which accompany the rearmament of a democratic country. In the process of doing so statesmen may forget what the object of rearmament is, and the public is apt to decide that rearmament makes war inevitable.

It is necessary that these things should be explained, not only to the British but also to the Americans. For there are two great risks in the present state of bewilderment and alarm. The one is that the Russians, believing the free world to be both strong and aggressive, may get too frightened. The other is that, believing the free world to be both weak and divided, they may get too over-confident. To see the risk of such a misunderstanding one has only to compare the tone of a speech by the isolationist, Mr Hoover, with the tone of a "neutralist" leader in *Le Monde*; or the impeccable platitudes of the statement issued by the Commonwealth Prime Ministers last weekend with the warnings which accompanied President Truman's budget. The free world must often look very odd when watched from Moscow.

★

Let it be admitted frankly that these and other serious differences exist. Some Americans clearly expect war next summer; the majority of informed opinion in this country does not. Both behave accordingly. Many Frenchmen fear the Germans more than the Russians, and will go to almost any lengths to stop a German contribution to Europe's defence. Others are quite clear in their minds that it is Russian domination of Germany which is to be feared. Both act accordingly. Some British and more French would go a dangerously long way with concessions to bring the Russians to the conference table. Others, and certainly most Americans, would not. In short, a quite artificial division has sprung up between those Europeans who profess to fear that the Americans will precipitate a world war by dropping an atomic bomb and those Americans who profess to fear that the Europeans will surrender to the Soviets. Both fears are monstrous exaggerations; they magnify tiny fractions of opinion into serious trends of government policy. If the Atlantic Pact is to work, this mutual incitement of disunity must be overcome. And it must be overcome where it originates—in intellectual confusion and lack of courage.

For what is the purpose of the policy now being pursued? It is to convince a small number of men in the Politburo that it is safer and wiser to leave the free world alone, to persuade them that the possibilities of frictionless expansion in the postwar world have been exhausted. However passionately people may feel about the ideological conflict and Moscow's obsession with a theory of inevitable capitalist collapse, it is not Communism but the Soviet Union's imperialism that is at the root of the trouble. Communists can be fought on their merits in each individual country, according to its traditions and by its accepted political methods. They have already suffered notable defeats all over Europe—neither by force nor by diplomacy—but just by vigorous politics. But Soviet imperialism can be checked only by the Soviet

Government which, when it comes to the point, behaves even more cautiously than other great powers have behaved in the past when confronted with strength and determination. It is on the realism and caution of Moscow that the policy of the West must concentrate with all the skill at its command. And in doing so both military strength and diplomatic skill have their parts to play, the one as the fulcrum, the other as the lever.

★

What can be hoped of diplomacy? First, that time will be gained—time that has brought the breach of Tito with Stalinism, the ascendancy of De Gasperi in Italy, the decline of mass support for Communism in France, the astonishing economic recovery of Europe, and the rearmament of America. Second, that Stalin can be prevented from making mistakes. Mr Eden has reported the Generalissimo as saying that the trouble with Hitler was that he never knew when to stop; he, Stalin, would not make that mistake. But we do not know what carefully sifted evidence reaches his desk, how far the caricature of American policy and personalities that appears in Soviet newspapers is what his representatives abroad report. It would be worth any amount of trouble to break through the curtain and make sure that Stalin himself heard straight from the mouths of the heads of the free governments both of their determination to be strong and of their desire for peace. On this point the Commonwealth ministers were right to say what they did. And before—even after—that is done, it would be worth while for the Foreign Ministers to come together and discuss not just one, but half a dozen of their differences.

To do this and at the same time to insist on a rapid tempo of rearmament is logical and necessary. No concessions that the Russians are likely to make would justify accepting any longer the disparity of strength that has existed between the free world and the Soviet Union since 1945. And no settlement made in the present state of the world could be maintained for a year unless there were the resources available to enforce its observance. These are revolutionary times in which the free world cannot afford to remain on the defensive, clinging nervously to the United Nations and the paragraphs of treaties.

These are the things that need to be said by Mr Attlee and his colleagues if they are to fill the role of leadership that the cold war has thrust on them, and if the British people are to understand why they are rearming. They need also to be said in France if Europe is to have a loyal and effective leader. And they need to be said in the United States if its diplomacy is not to degenerate into political warfare and its foreign policy into an impatient demand for quick results. Nothing is certain about the course of events in 1951; and anyone who questions this should ask himself frankly what he was prophesying for 1950 just a year ago. The die is not cast for war or peace; events can still be controlled and minds influenced, but only if the leaders of the Kremlin can be convinced that they have equally little to hope from pressing an armed attack on the free world and to fear from withholding it. Neither strength alone nor peace alone is an adequate cry for the West—neither rearmament alone, which is the means of the one, nor negotiation alone, which is the means of the other. The only hopeful policy is Peace through Strength, Arms and Diplomacy.

Monopoly in Radio?

LORD BEVERIDGE and all but one of his colleagues on the Broadcasting Committee have brought in a highly conservative report.* This verdict is not in the least upset by the fact that the Conservative politician on the committee is the one dissident unconservative enough to want to experiment, for such is the topsyturviness of philosophies these days. The majority report makes a great many suggestions for alterations in the constitution and practices of the BBC; but though some of them can hardly be dismissed as minor, none of them affects the main structure of broadcasting as it exists in this country today. The committee recommend that there should continue to be (with very small exceptions) a monopoly of all kinds of broadcasting, visible and audible, in the hands of a single corporation financed by licence fees on receiving sets. Indeed, so sure are the committee that this is the proper form of organisation that they recommend the grant of a permanent licence, which has never been done hitherto. There would continue to be quinquennial reviews; but it is made clear that they would not be expected to re-examine the fundamental constitution of the BBC.

The most far-reaching question that the committee had to consider was whether or not broadcasting in this country should continue to be, as it has been from the start, a monopoly. That this question is in the forefront of the report is in itself a highly significant fact. British broadcasting became a monopoly almost by accident, but for most of its lifetime the results of the accident were almost unanimously approved, and the last previous full-scale enquiry into British broadcasting, that made by the Ullswater Committee in 1935, mentioned the issue of monopoly only to the extent of commenting on "the remarkable absence of general criticism" of it that had been submitted to them. This time there was a body of opposition in principle to a monopoly which, though it did not bulk large in the evidence, was enough to persuade the committee to take the subject very seriously.

The most obvious alternative to monopoly is the American system of competing broadcasting companies financing themselves by "selling time" to advertisers. The committee investigated this, not only in the abstract but by sending out subcommittees to listen and to look

in America. The reports of these embassies make very interesting reading, and it is possible to deduce from them that the envoys found American broadcasting not nearly as bad as it had been painted. One of them, Mr Selwyn Lloyd, was so far converted that, in his minority report, he proposes the licensing, alongside the BBC, of one or two national companies to run commercial programmes, as well as local stations which would be allowed to take advertising. None of the other members was prepared to contemplate commercial broadcasting as an alternative to the BBC's monopoly. None of them, in fact, approves sponsored programmes (that is, the choice and presentation of programmes by advertisers) even as a means of financing the monopoly, though the Chairman and two others suggest, very tentatively, that experiments should be made by the BBC in accepting paid advertising without giving the advertisers any control over the programmes between which their announcements would be sandwiched.

But advertising is not the only alternative to monopoly. It would also be possible to have several broadcasting corporations, each financed out of licence revenue. There are several variants of this proposal. The Fabian Research Group, for example, suggested four corporations, one for a national programme, one for regional and local programmes, one for overseas broadcasting and one for television; a Liberal Research Group made a similar proposal. And there is the proposal, which was first advanced in these columns, for three separate public-service corporations, each operating over the whole range of radio, each assured a certain fraction (say a quarter) of the licence revenue, but competing for the balance, which would be distributed in accordance with the votes of listeners.

The report discusses these proposals at some length. The committee do not ignore the dangers of monopoly; but they do not rate them high enough to justify destroying the monopoly; they prefer to guard against them by arrangements within the monopoly itself. Their objections to the proposal of "three BBCs instead of one" are not very clearly argued, and are curiously fragile. Since competition with only three competitors is very imperfect competition, they imply that it obviously has no value: "when discussions of the issue of monopoly in broadcasting has reached this stage, the practical answer to be given is clear." (Would they say

that there is no practical difference between having three political parties and having one?) Their only other reasons are that the particular proposal for three BBCs put before them did not "ensure in right measure both the regional devolution and the functional devolution that are needed" or the necessary safeguards against abuse of the broadcasters' power—although every one of the proposals that the committee themselves make under these heads could, if it were thought necessary, be applied to three corporations as easily as to one.

Clearly this is not nearly enough to conclude the argument. Indeed, it is very strangely weak coming from a committee of which Lord Beveridge, who has one of the liveliest and least conventional minds in the country, was the chairman. One must conclude that the idea of monopoly in broadcasting has become, in a single generation, so deeply embedded in national attitudes (it does indeed correspond to much else that has been happening in the country in the last thirty years) that a proposal to upset it, at the admitted cost of considerable disturbance, comes up against very strong instinctive resistances which will not be removed until there has been a long period of softening them by public discussion. The idea of diversity in broadcasting will have to become much less novel before it will be accepted. The resistance to it, however, exists only in what may be called the articulate classes, the leaders of opinion, of whom the socialists like monopoly in principle, and the remainder tend to take a superior attitude, in cultural matters at least, towards "the people." As it happens, the *News Chronicle* published on Tuesday of this week the results of a Gallup Poll on exactly this issue. The question was whether the BBC's monopoly was a good or a bad thing, and of those who expressed one opinion or the other, 52½ per cent said that it was bad. To the further question whether the programmes would be better or worse if the BBC had a competitor, 65 per cent of those expressing an opinion said that they would be better. This is clearly a matter on which the people and the Best People think differently, and the trend is in favour of the people. The argument about monopoly in radio is not ended; it is just beginning.

★

The Beveridge Committee were sufficiently aware of the dangers of monopoly to propose a variety of internal safeguards against them. There are quite a number of these. The functions of the Governors of the BBC, as trustees for the public, are to be strengthened *vis-à-vis* the officers. National Broadcasting Commissions, appointed by the Government, are to be set up in Scotland, Wales and Northern Ireland, with considerable powers over the regional programmes in those countries devolved upon them by the BBC. The Regions in England are to have greater powers. Television is to be administratively and financially autonomous; Overseas Broadcasting is to be more independent. There is to be a Public Representation Service, which will not only put greater weight on what is now called "audience research" but will organise a great volume of prior and *post hoc* consultation of "experts." There is to be a network of advisory committees.

Some of these proposals, taken individually, have great merit. But when they are taken together they will all be found to point in one direction—towards weakening the authority of the Director-General and the central organisation of the BBC. They would prevent the BBC

from being a dangerous monopoly by making it an ineffective one. But this is to misconceive wherein the danger of monopoly lies. The real danger is not the melodramatic one that a monopoly corporation will deliberately build an empire over men's minds for its own, or someone else's, fell purposes. It is rather that monopoly broadcasting is timid, conventional, unadventurous, dull, that it works out "in complacency, lack of imagination and deadly uniformity of public opinion." To weaken the power of responsible decision, to insist on checks and balances, to surround the executives with advice and consultation, to set up a network of committees through which every decision has to force its way—all these things will make the BBC even more bureaucratic than the system forces it to be at present. The analogy with industry is valid at least to this extent—that a broadcasting service, if it is to be really alive, requires the crisp effectiveness of decision that comes from the concentration of responsibility. Committees are as ruinous to artistic and cultural matters as they are in industrial. To concentrate responsibility within each functioning unit, and to guard against monopoly by multiplying the number of independent units, is as sound a principle in broadcasting as in industry. In broadcasting, as in industry, to set up a monopoly and then, in the name of "safeguards," to force it to operate inefficiently, is foolishness. The office of Director-General of the BBC—the present occupant of which is so justly commended by the committee—will, if their proposals are adopted, be no more than a seedbed for frustration.

★

On the main issue of broadcasting policy, the Beveridge Committee's report is thus an opportunity sadly missed. But this article, in concentrating so completely on this one issue, has certainly done the report as a whole much less than full justice. It is, as might have been expected, informative, thorough, clear, vigorous and reasonable, and it deals, in a spirit of robust common sense, with a variety of topics which have here received no mention. Lord Beveridge and his colleagues have performed a public service, and their report deserves a very wide reading, outside the United Kingdom as well as within it.

The bulk of their recommendations will no doubt be accepted by the Government and embodied in the new Licence which will come into effect on January 1st next. It would certainly be quite unrealistic to expect the present Government to disagree with the committee on the question of monopoly. There is, however, one other recommendation which the Government can reasonably be asked not to accept; this is the proposal that the new Licence should be a permanent one. The question of the BBC's constitution is not a closed one. The Gallup Poll figures quoted above show that there is a very large body of opinion in the general public that dislikes monopoly. Even apart from this, the next few years will be a period of very rapid technical change. Television is developing, and the use of very high frequencies, as the report itself shows, may before long revolutionise the technical basis of broadcasting.

The proper place for broadcasting in a democracy is a very wide question to the importance of which public opinion is only just beginning to wake up. It would be wholly contrary to the spirit of free government to prejudice this discussion before it has hardly begun. This is no time to fix patterns.

The Place of Spain

IT is difficult for people in England to appreciate how isolated Spain has become in the past few years. Spanish foreign policy is traditionally neutral. But the effect of the recent international ostracism has been to push the Spaniards further out of the ranks of the western nations than any policy adopted in Madrid alone could have done; Spain has never even had the opportunity of joining the OEEC or the Council of Europe, like other traditional neutrals such as Switzerland and Sweden. As yet it is impossible to tell just how much difference the return of western ambassadors to Spain may mean; Sir John Balfour will be the first British Ambassador in Madrid since 1946. But the chances are that it will mean a good deal. Their return—and the circumstances which give rise to it—certainly marks the end of the period of intense Spanish isolation which began on the morrow of the allies' victory over Fascism. How important this landmark may become will depend on the statesmen of both sides, in Madrid and in the rest of the western world. It is in their common interest and it should be their common task to see that the new relationship starts a new period of Spanish history.

No liberal can support the totalitarian state which still exists in Spain. The appointment of ambassadors does nothing to alter that fact and there is no use mincing words about it. But the boot is on the other foot too; neither General Franco nor any of his immediate associates in the Spanish Government want to be liberals—strange, and indeed almost inadmissible, as that may seem to many in the democratic world. They have their own philosophy of life, and this fact must also be recognised before any serious thought can be given to the question of how future relations with Madrid should be developed. Once these two attitudes have been recognised, however, it is legitimate to accept the lesson of the past, to lay down certain principles for the present and to list the hopes for the future.

The lesson is simple. If the western world was right to ally itself with Russia during the war with Germany, it would be wise to try to enlist the help of Spain in the supreme struggle with Soviet imperialism today. Spain is, of course, not Russia, in terms either of size and power or of doctrinal influence with peoples outside its own borders. But it has much to offer—not least an invaluable strategic position and a trained army. And just as the failure of preliminary attempts to come to terms with the Russians was not allowed to affect the alliance once the crisis of the war had been reached, there is no reason why, at this grave hour in the cold war with a common enemy, past hostilities and antipathies should now prevent a working partnership with the Spaniards on the basis of live and let live. Throughout the world, democracy is having to compromise with systems which are alien to it—in Yugoslavia, in the Middle East and in Asia. There is no real reason why Spain should be different, now that the North Atlantic alliance has fully established itself.

Two principles must certainly govern any serious rapprochement that may now be attempted with Spain. First, the western democracies cannot have their cake and eat it; they cannot urge the downfall of General Franco and also expect assistance from him. Spanish exiles themselves have just abandoned the pact between

socialists and monarchists over which Mr Bevin was originally consulted; Señor Prieto has given up the chairmanship of the socialist party and Señor Robles, the monarchist leader, is reported to have returned to Madrid as a private citizen. Secondly, on both sides, there will have to be an attempt to appreciate the limits of criticism. On the side of the democracies there can, of course, be no thought of censorship. But the critics of Franco should also stop to think whether they really wish to sabotage the policy of mutual assistance. The Spanish Government, on its side, will have to appreciate that, where the expression of opinion is not controlled, criticism is both more inevitable and has much less significance than where it is a deliberate expression of official policy. Just because their press is highly controlled, they will not be able to go on affording the luxury of saying that the Atlantic Pact is merely a "paper treaty," and that the "appeasement" policy of the British "neo-Marxists" towards China is a "betrayal of the United States." Unless there is a clear understanding on these things, they will cause endless trouble.

★

These are the facts of the present situation. What are the reasonable hopes for the future? The first is that if the contact with the democracies is sufficiently close it will gradually soften the outlines of totalitarian rule. For some time many have hoped that General Franco's very security in power would enable him to relax. To some limited extent he has done so; he recently claimed that there were now fewer people in prison than at almost any time for twenty-five years, either under his own dictatorship, the Republic or Primo de Rivera. It may indeed be reasonable to hope that in time Madrid will come to give practical effect to articles 12 and 18 of the *Fuero de los Españoles*—the Spanish Bill of Rights—which was passed in July, 1945. On paper, these articles provide for the basic human rights of full freedom of expression and association and of legal security. It should, in fact, be the object of western diplomacy to help the Spanish people eventually to break out of the present political stalemate—in which many Spaniards accept Franco unwillingly but will do nothing to turn him out. General Franco himself is worried about his own succession, as any man in his position is bound to be. It should be the hope that, when in the inevitable course of natural events the moment comes to form a new government, Spain will be ready to set in motion a progressive political evolution rather than another blood-thirsty revolution.

To achieve this, however, will require some pressure from events, more indeed than they have been able to exert during the past five years. The hope, therefore, is that the increasing dangers, which are militarily uniting Western Europe, will also gradually bring about some working military arrangement between the North Atlantic Powers and Spain. Portugal has already seen the need to join the North Atlantic Treaty Organisation, and Dr Salazar, the Portuguese Prime Minister, is in a strong position to represent the immediate views of Madrid and the west to each other; he last met General Franco for political and military talks at Corunna as

118

recently as September. Portugal and Spain are bound by a military treaty, and relations between them are close; General Franco's brother is the Spanish ambassador in Lisbon. In reality the Iberian peninsula is a single military unit.

It is questionable how willing General Franco would be at this stage to join the western defence group. Many Spaniards are unwilling to consider sending forces abroad; at the same time the Spanish army is under few illusions about Russian military power, and the offer of a bilateral alliance or security pact by the United States might be tempting. This could, in fact, be the best way in which to broach the whole question of Spanish military association with the west. The Americans are already reported to have sounded Madrid on the possibility of a Spanish expeditionary corps of 60,000 men.

Progress in matters such as this depends on how much the west needs Spain and how much Spain needs the west. What then does Spain have to offer? Apart from its strategic position, can its economic and military contribution help to offset its political liability to the democratic camp? Economically, Spain is still in a poor way. How poor is shown by the fact that on the basis of calculations made by the Economic Commission for Europe, it takes an unskilled Spanish worker about 83 hours to earn a month's food for his family, compared with equivalent figures of 58 even in impoverished Italy, 49 in France, 26 in Switzerland, 15 in Britain and 13 in the United States. Although Spain exports several raw materials of direct warlike value and has a modest industrial development, it could, in fact, contribute little that would not be equally available from normal trade, if it

THE ECONOMIST, January 20, 1951

remained neutral. The Spanish standing army, on the other hand, numbers something over 15 divisions—more than that of any other non-Communist country. The maximum strength on mobilisation, according to the Spanish Ministry of War, is 2,057,000 men, mostly of tough quality and already trained. Small arms supplies are fair, but every other equipment aspect is weak—old-fashioned artillery, antiquated French and German tanks, and a negligible even if well-trained air force.

This is not in itself enough to make a formidable contribution to Western European defence in the immediate future; and it is just as well that the western powers are not at once called upon to try to re-equip the Spanish forces, since they could not do so without sacrificing their own well-nigh desperate needs. But, although a period of quiet and tough bargaining almost certainly lies ahead, it would be quite wrong to leave Spain out of all longer-term calculations. If fate has decreed that 1951 is to be civilisation's crucial year, then Spain has little more than a peripheral role to play; it would be a tragic farce to repeat there the vast muddle which has taken place over German rearmament. But in the long run, say over the next two years, it should be the task of western diplomacy to bring about a genuine rapprochement, so that Spain is able as well as willing to throw in its lot with the rest of Western Europe. Peculiarly difficult as this task will undoubtedly be for the British and French after all the ill-feeling of the last fifteen years, that is the goal to which the efforts of all the returning ambassadors should now be directed. For nothing less will ensure either the maximum preparedness of the non-Communist world or the eventual attainment by the Spanish people of the peace and freedom they desire.

Assistance and Welfare

SINCE 1948 less has been heard of the new poor law established by the National Assistance Act than of any other of the social services. It may be because the Act itself was only the culmination of a process that had been going on for some years; it may be because, as things go today, the new poor law is not costly. Nevertheless, the change that has taken place in the last two and a half years is important enough to deserve mention. The fundamental change is that the stigma, which was formerly attached to the receipt of poor relief whether indoor or outdoor, has gone. So, too, has the liability, which dated from the Poor Relief Act of 1601, of relatives to maintain each other. What is still not certain is whether the new system is not too generous for a nation which, in one way or another, is going to be forced to curtail its social services.

The National Assistance Act had two main provisions: it completed the process of transferring the responsibility for granting outdoor relief from the local authorities to the Assistance Board, and it placed on the local welfare authorities (the public assistance committees renamed) a duty to provide residential homes for all old or disabled persons in need of care and attention, no matter what their income.

It is the first of these provisions that is most widely known, for outdoor relief, or national assistance—that is, the giving of grants in cash or kind—affects far more people than indoor relief—that is, the reception of the poor or unfortunate in institutions. Already by 1948, the household means test had been abolished and

replaced by a test of personal needs. The Assistance Board, that is, undertook to pay the difference between the amount that was laid down as necessary for subsistence and the amount that the applicant for relief possessed on his own. What the Act of 1948 did was to extend considerably the system under which some of the applicant's resources were disregarded in the assessment of his needs. An assisted person can now possess a house, £375 of war savings and £50 of other capital before the full assistance payment is reduced by as much as a penny. In addition other allowances from private sources are disregarded up to a total of £1 a week. In brief, assistance does not exist solely for the poor.

The argument behind the system of "disregards" is this: why should the thrifty, who have made private provision to safeguard themselves against the hazards of life, forfeit the fruits of their thrift by having the assistance payments reduced or refused, whereas those who have made no such provision are allowed to profit to the full from the state's bounty? This argument is by no means wholly justifiable. For one thing, it is pertinent to ask why people make provision against the risks of life at all if not to prevent themselves from having to ask for help from public funds. In the past people strove hard to protect themselves from the stigma of pauperism. Has this pride in their independence deserted them now that their financial help comes from the taxpayer at large instead of the ratepayer near at hand? Furthermore, the fact that a person has no savings to fall back on in adversity may mean nothing more shameful than that he

prefers to spend on his children's present rather than to save for his own future.

It is the rising cost of living which makes the policy of disregards particularly important at present. Rising prices are making the basic assistance payment more and more inadequate. But so long as there is any limit on the cost of national assistance, the more generous the disregards, the smaller that basic payment can be.

How to avoid the discouragement of thrift and yet secure an adequate income for those without savings may be the biggest dilemma facing those who have inherited the old poor law system of outdoor relief. If the cost of living had been kept stable, as in 1948 the Government assumed would be possible, the compromise then reached might have been successful. As it is, the Assistance Board is likely to be faced with demands for an increase in its allowances, on grounds of undeniable hardship, at a time when they can least be afforded.

*

Rising costs are also troubling the local welfare authorities. In London, the weekly cost of maintenance in a large institution has now risen to about £3 5s. per head per week, and in the small homes to about £4 10s. But the welfare authorities are also having to face the fact that another assumption made by the framers of the National Assistance Act has proved to be mistaken. The chief criticism of the old institution was that it housed too many people and too many different sorts of people, and that inadequate provision was made for the chronic sick in the infirmaries. The main purpose of the new provisions for indoor relief was to oblige all local authorities to do what the progressive authorities were already doing within the restrictions imposed by the old poor law—to sort out the different classes of inmates and to provide for the old, who made up by far the biggest single class, small homes where they could end their days in decency and dignity.

The framers of the Act did not make the mistake of assuming that the shelter provided by the old poor law institution for persons suddenly and urgently in need of accommodation was no longer necessary. The provision of this statutory roof is still an obligation of the welfare authorities. But the legislators did assume that in the main this sudden distress would be caused by fire or flood or some other unforeseen circumstance. They did not see the extent to which, two and a half years after the Act came into force, the housing authorities would fail to deal with homelessness. Yet families, for whom the housing authorities should be responsible, find their way to the institutions, and it is the welfare authorities who have to decide how to deal with them.

Another mistaken assumption was that the hospital authorities would be able to fulfil their responsibilities towards the chronic sick. So much was this taken for granted that the local welfare authorities were precluded by the Act from providing anything in the nature of hospital treatment in their institutions and homes. In some places, the regional hospital boards have taken over the sick wards of an institution, which becomes thereby a "joint user" establishment. Yet although in theory this arrangement should facilitate the transfer of a person from welfare accommodation to hospital bed and back again, in practice it raises difficulties of its own. In London, although the Act has been formally complied with, the institutions have been able to retain their old sick wards for the use of their residents. What the welfare authority cannot do, however, is to take into

these sick wards old people living at home who have become in need of hospital treatment, however simple. Deprived of the services of the former relieving officers, who could order a hospital bed, these old people are often in a most pitiable condition.

Yet although the welfare service, like the assistance scheme, is still a residual service, particularly for the housing and health authorities, it should not be thought that the large institutions are still the dreary places that were so rightly condemned in the past. As Sir Edward Bligh, Chief Welfare Officer of the London County Council, emphasised in a recent address, they are not mass *oubliettes* of the unwanted. The erstwhile house of correction may now have a television set, which the residents watch from easy chairs. The old rules have gone, and the punishments with them. The residents are paupers neither in fact nor in name. They are required to pay a minimum charge of 21s. a week, which if necessary will come from an assistance payment. They may be asked to pay the full cost if they can afford it; but they must all be allowed to retain at least 5s. a week pocket money, which they can supplement by helping in the running of the establishment.

Anyone who has seen one of the small homes for the aged, which it is official policy to encourage, will be impressed by its cheerful atmosphere and by the alertness of its residents compared with the apparent apathy of the institutional resident. Yet it is a fact that many of the present generation of old people prefer the bustle and variety of the large institutions. It is also a fact that, because of physical and financial shortages, for a long time to come the great majority of old people needing care and attention will have to be accommodated in them.

*

The new welfare service has its darker side. Like national assistance it has weakened the sense of individual pride and of family unity. Whereas, in former days, great hardships were tolerated by a family rather than that an aged parent should enter the institution, he is now often urged to go there. His children are no longer legally responsible for maintaining him, and when he dies they will cheerfully accept his accumulated pocket money, which may amount to as much as £50. But this weakening of family ties does not date from 1948, and in spite of the greater willingness to enter the institution now that the stigma has gone, about 95 per cent of old people still live independently in their own homes.

The real danger facing the new welfare service is the same as the danger that faces the Assistance Board—and, indeed, the welfare state as a whole—the danger of being too lavish, of letting the best spoil the good, of making some people so comfortable or well off that there is less available for those who have nothing at all. As a welfare official put it, when speaking of the other social services, "everything is now done much better for half the number of people." So far, welfare authorities have, on the whole, resisted this temptation—a temptation, it should be pointed out, which is strengthened by the Ministry of Health's absurdly high standards of accommodation—and they should continue to do so. The great virtue of the old poor law was its comprehensiveness, the fact that it covered everybody who was poor and destitute. It would undo much of the reforms of the past two years if the new homes were so luxurious and costly that their doors had to be shut to large numbers of those who sought admission.

NOTES OF THE WEEK

Moving the Pawns

Mr Attlee's reshuffle of ministers leaves the possibility of a coalition open. If the Prime Minister were quite determined to stick to power with a party administration he could hardly have restricted himself to three changes confined to the departments concerned with domestic affairs. The government weaknesses that matter most are at the points of greatest strain, in foreign affairs and the defence departments. Changes there before very long are inevitable. That Mr Attlee has chosen still to delay them, while making at last the long-expected change at the Ministry of Labour, must mean that his mind is not entirely closed to the idea of some type of coalition. Moreover, with an important and burdensome department to absorb his energies, it will be easier for Mr Bevan to forget his hatreds and to work with the Tories; he may even see himself as the Bevin of the next coalition.

Whether Mr Bevan will be a successful Minister of Labour, in either a party administration or a coalition, is another question. The transfer of Mr Isaacs can be taken to mean that the Government has some new manpower policies, possibly including the direction of labour, very much in mind. At least Mr Bevan will avoid some of the previous mistakes of timidity and inaction in dealing with unofficial strikes, and if he chooses he can provide the sort of vigorous leadership for which the trade union movement has in the past five years looked to the Government in vain.

The Prime Minister has dealt cleverly with the problems Mr Bevan leaves behind at the Ministry of Health. The colourless Mr Marquand should be able to remove some of the extravagances and bitterness from the health service without anyone losing faith. Administratively, there is everything to be said for the transfer of the Ministry of Health's responsibility for local government to the Ministry of Town and Country Planning. Dr Dalton's department will no longer be beating its wings in the air; it seems possible, indeed, that in the more realistic planning now open to him a sphere has at last been found in which Dr Dalton's particular political gifts can be happily exercised. It must be doubted, however, whether the Prime Minister was right to throw in housing as well. If he was right he ought, logically, to have taken the opportunity to merge the Ministry of Works also in the new giant of "Local Government and Planning." It would probably have been better to carry further the separation of the Ministry of Health's old functions, by shifting housing to a Ministry of Works retaining its identity.

These, however, are minor issues. What matters is that Mr Attlee has strengthened his government at one point—labour; in other posts the men have still to be better matched to their responsibilities.

* * *

Parliament and Defence

When Parliament reassembles next week, it will be clear how greatly the political preoccupation of its members has changed. The defence programme is the main, almost the sole, object of interest. It is not yet clear how soon the Government will be prepared to announce the complete range of its new defence measures: the whole of next week's time is taken up with the second reading or committee stage of several minor measures. Mr Shinwell and the Prime Minister are expected soon to announce an accelerated rearmament programme in general terms, but they may well resist attempts to provoke a debate on military plans, including manpower and equipment, until the Defence White Paper has been published at the end of February. It will be very

difficult, however, to prevent the House from demanding full and speedy information, particularly as there is very little impending legislation with which to distract its attention. In particular, the rumour of a possible call up of the Class Z reservists has filled members' postbags with anxious inquiries, an anxiety which they will be swift to pass on to the Government.

The other ground of political speculation is the possibility of a coalition, and on this the Government will be as anxious to find out the views of its supporters as members will be to discover the opinion of the Cabinet. Undoubtedly the increased defence programme will tend to divide the Labour Party. It is interesting that the idea of a coalition has gained considerable acceptance on the "intellectual" wing of the party: it is the men responsible for operating the party machines, on both sides of the House, who would probably put up the hardest fight against it.

Until it knows whether a coalition is being seriously considered, the Conservative Opposition will be hard put to it to decide on its tactics. There will presumably be a debate on the groundnut scheme, involving sharp criticisms of Mr Strachey which could be carried on to an effective general attack on the quality of the Service Ministers if the Prime Minister showed no sign of forming a national Government. The alternative of a general election is unlikely to be pressed, not only because of the dangerous international situation but also because the course of events has exploded the vote-getting stunts of both parties. The needs of defence have made nonsense of Mr Morrison's claim in November, at the time of the debate on the Supplies and Services Act, that only Labour can be trusted to plan and control the economy—just as it has falsified the Tory promise to build 300,000 houses a year. If there are to be new political alignments, they must be based on far grimmer realities.

* * *

No Cease Fire

The Peking Government has rejected the proposal, approved by 50 of the United Nations, for a cease fire in Korea and for subsequent negotiations on the matters at issue in the Far East. If they had accepted, the fighting in Korea would have stopped and that would have been a great immediate gain for humanity. Whether humanity would have gained in the end is another matter, for there is no doubt that a Chinese acceptance would have faced the free nations with a very awkward diplomatic position indeed, in which it would have been very difficult to prevent the emergence of a real split between the United States and its allies.

The difficulty in which the European nations find themselves in this Far Eastern imbroglio is that they are pulled in opposite directions by two almost equally strong principles of their policy. On the one hand, they are reluctant in the highest degree to get involved in a war with China, both because they recognise no necessary quarrel (as yet at least) and because their eyes are fixed on the greater peril in Europe. On the other hand, they recognise the American alliance as their rock of salvation. No wonder they veer from side to side, and if Mao had said yes, they might well have been torn apart. Many voices in America—by no means confined to the "Asialationists"—have been raised to condemn the policy of negotiating with the Chinese Communists and seating them at Uno, even if thereby an armistice could be secured. To have gone further on these lines would obviously have had dangers quite as great as any that will arise from fighting on in Korea.

However, Mao has spared the European nations the agony of the choices that negotiations would have forced upon

them. Any regrets that may naturally be felt at the failure of a proposal to stop slaughter can be answered in three ways. First, Mao would almost certainly have served his Russian masters' ultimate purpose better by accepting. Secondly, British critics should stop to reflect how much their tune would be changed if the Chinese should attack Hongkong; would there then be so much anxiety not to provoke them? And thirdly, there is really very little reason for hoping that negotiations, even if they were begun, would have any success, as the extremism of the Chinese "counter proposals" shows; the cease-fire would only be temporary.

Attention can now be turned back to the process of re-consolidating the alliance of the free nations. It would be foolish of the Europeans to try to dissuade the Americans from moving in the United Nations that China be declared an aggressor. It would be equally foolish of the Americans to ask the Europeans to back up such a declaration by any action that would further strain their resources without any assurance that it would be effective.

* * *

Next Steps in Kashmir

The Commonwealth Conference has produced no solution of the Kashmir problem. This time, however, unlike all the previous occasions, it is reasonably clear where the responsibility lies for the continuance of the deadlock. Mr Attlee and Mr Menzies, who led the attempts to mediate, concentrated on the steps that might be taken to demilitarise and neutralise Kashmir before the taking of the plebiscite, which both sides have accepted in principle. Three proposals were put forward—that a neutral Commonwealth force should oversee the plebiscite, that a joint Indo-Pakistani force should be formed, and that the United Nations should raise a force to do the job. Pakistan accepted all three; India rejected all three. Public opinion outside the two countries concerned has hitherto hesitated to express any judgment on the merits of the Kashmir dispute itself and will probably continue to do so, since it is a complex matter; but on the tactical manoeuvring for position, it is now clear that Mr Nehru has put himself in the wrong. To insist that the consent of the former ruler legitimises India's position in Kashmir and makes Pakistan an aggressor seems to be wholly inconsistent with India's action in Hyderabad. To insist that the "aggressor" must totally withdraw before anything further can be done is wholly inconsistent with India's attitude towards the Korean war. Those who have spoken with him have no doubts of Mr Nehru's sincerity; but in the eyes of the world he is giving an excellent imitation of a man with a bad case.

Mr Liaquat Ali Khan, the Prime Minister of Pakistan, has thus achieved something by his belated visit to London. Unfortunately, it may not help him very much on his return to Karachi, where an excited public opinion may not be satisfied with anything short of an immediate and favourable solution of the whole problem—and, what is more, without any concessions on the other matters at issue with India, where Pakistan's case, both on their merits and in the methods by which they have been handled, is far less strong. There are important provincial elections pending, and the increasingly vocal critics of the government party, the Muslim League, may well be able to strike a serious blow at Mr Liaquat Ali Khan's position. This would be unfortunate for the cause of moderation and good sense in Pakistan's internal affairs, in its relations with India and in its links with the Commonwealth.

Even yet, it is not generally recognised just how tragic this dispute is. It may yet lead to open war, which would be bad enough. It is diverting the attention of both governments from more important things, which in the long run may be worse. And it is threatening to undermine the whole strategy of the free nations in the Middle East. There can be no question of dropping it. Now that the Commonwealth

Conference has failed, it must go back to the Security Council, which has so far not even discussed Sir Owen Dixon's report.

* * *

Middle East Defence

Had the Conference settled the Kashmir dispute, one at least of its tasks would have been greatly simplified—the planning of Middle East defence. Under present peacetime arrangements, this, though of vital interest to all the Dominions in the old world, is shouldered by the United Kingdom alone. In the event of war, the others can be expected, as they have done twice before, to contribute their quota of land, air and even sea forces. Australia and New Zealand, now that they are no longer threatened by a naval adversary in the Pacific, are in a stronger position to proffer all this than they were in 1940. But how can Pakistan (and indeed India also, if it were to consider its interests directly affected by an aggression in the Middle East) spare troops while each is glowering at the other over frontiers within their own sub-continent. Although the one is spending over 60 per cent of its budget on defence, and the other upwards of 40 per cent, considerations of military security forbid that they should participate even in talks of what is to happen if their Persian flank is threatened. While the Kashmir situation stands as it does at present, there can be no hope of the useful contribution that Pakistan's army would otherwise make to the defence of a vital area.

Many people in Britain would like to see peacetime contributions from the Dominions on the Suez Canal, or—better still—nearer to the mouth of the Persian gulf, which is, after all, only some 250 miles from a Commonwealth frontier—that of Pakistan. But the chances of this are remote. The Pakistanis are not the only people who cannot come. Australians and South Africans are unready to shoulder the burdens of taxation and compulsory military service which preventive reinforcement of the Middle East would entail. The free world—vulnerable here—must go on hoping that the cautious Stalin will walk warily in an area which is, after all, also the heel of the Soviet Achilles.

* * *

Liberals and the Speaker

The council of the Liberal Party last weekend considered resolutions left over from the party's autumn assembly. It solemnly approved, and passed to the executive with a demand for a final draft by March, a proposal to create an artificial constituency of St. Stephens for the Speaker. The idea has cropped up before and has little merit. What is regrettably significant is that the Liberal Party should lend its support to a scheme so far removed from the realities of political life in the House of Commons.

The present system has the undoubted disadvantage that the Speaker's constituents are, during his period of office, deprived of the services of an active member. The idea of giving him an artificial constituency was examined by a Select Committee before the war. The reasons for rejecting it—along with proposals to make the Speaker's a two-membered constituency or to prevent further contests there so long as he held office—have not become less valid. MPs are not the delegates of their constituents but members of the High Court of Parliament, elected by the method of constituency representation because that is a convenient way of satisfying the requirements of political democracy. The Speaker's power rests on the very fact that he is chosen from among the ordinary members of Parliament to act as its representative and to preside over its debates. To change this would weaken not only his position but the sense of unity and independence of the Commons as a whole. In practice, the disadvantages are not great: the Speaker is able to get neighbouring members to take up matters on behalf of his constituents; and if any change were made it

should logically be extended to cover the two Chairmen of Committees as well.

The real trouble is that the party organisations in the Speaker's constituency dislike the present system—not so much because the member cannot represent his constituents in the ordinary way as because the convention that the Speaker should not be opposed at elections makes it difficult to keep the party workers together. The revived proposal came from the Liberals of the present Speaker's constituency. A party that magnifies a local grouse into a point of official policy is in danger of losing all claim to be taken seriously. This is unfortunately not the first time in the past few years that the Liberals have confused crankiness with the search for something different and “independent.”

* * *

The People's Choice

In the windy tumult of a political campaign, the “floating voter” bobs along on his own uncharted course, refusing to steer by the lights of any political party until he makes his private decision on election day. When the votes are counted, his decision is revealed in a bright burst of statistics, but his reasons for it remain as unplumbed as ever.

To gather a few facts about the motives of voters, both party members and floaters, the London School of Economics conducted a survey in Greenwich, before and after the General Election of 1950. Some preliminary results of the survey have been published in the current number of *The British Journal of Sociology* and in a Bureau of Current Affairs pamphlet. After tabulating the answers given in 2,058 lengthy interviews, the survey team decided that “behaviour at the polls cannot easily be called informed or educated or even, in any conscious sense, responsible.” At the height of the campaign in Greenwich, with literature and photographs pushed into every letter box, not one voter in ten knew the name of the candidate he was going to vote for. “I'm not interested in him personally,” explained one. The voter's interest is in the glittering personalities of the big party leaders, and the local candidate who is clean-cut and inconspicuous can slide in on a party vote. But this does not mean that the voters always identify even the party leaders with their policies. When the survey team read off at random a series of Conservative and Labour statements of policy, they found that the Conservative statements won general favour. By this token, the Labour candidate in Greenwich should have lost; he was elected by 11,000 votes.

Whatever the decision of the voter, he usually makes it a family affair. “I'm the breadwinner and the missus votes like I say,” explained one husband. The survey confirms that this tendency to vote in clumps is carried forward in a strong class movement to the polls. The voter, whether coal miner or clubman, marks his ballot one way rather than another because he feels that his chosen candidate represents a party prepared to strike a blow for his class. It is this vague pottage of class consciousness, spiced with prejudice and brought to a quick boil by the heat of personal grievance, that is usually served up as a substitute for public opinion during an election. The Greenwich survey makes it easier to agree with a party worker who claimed that most reasons for voting “are not reasons but emotions.”

* * *

The Party Looks for Trouble

There have been signs during the past few weeks that a new Communist offensive is about to be launched in British industry. The strike at St. Pancras, the present attempts of the *Daily Worker* to persuade miners to reject the wage and work agreement made last week, and the call for direct action in the Cominform journal of January 12th look like something more than a coincidence. The chief target seems

again to be the transport industry, which has always been particularly susceptible to Communist interference.

There is plenty of material for trouble-makers. The widespread discontent among railwaymen has been only partially mollified by the recent inquiry into their dispute with the Railway Executive, and the leaders of the unions concerned have had to take a determined stand to prevent the passing of strike resolutions. The dockers are showing impatience at the tardiness with which their wage claims are being handled, and it is possible that serious trouble was avoided only by the outbreak of the influenza epidemic on Merseyside. The National Union of Seamen is also pressing hard for the implementation by shipowners of the Seattle Convention of 1946.

These are all situations of the kind in which Communists revel, and it would be surprising if they did not succeed in stirring up trouble somewhere. Fortunately, none of the transport unions is dominated by Communists, and, although it has always been difficult in so scattered an industry for leaders to reach all members, there are indications that responsible union officials are at last beginning to destroy the influence of local Communist cadres. There is a clearer appreciation by the rank-and-file of Communist tactics and less risk of the unquestioning, sympathetic strike. Nevertheless, it would be dangerous to underrate the power which the Communists still possess; much more work remains to be done by union officials before it can be dismissed as negligible.

Eisenhower in Twelve Parts

Throughout his European tour, General Eisenhower has said that he is not a politician; and he is right to insist that his job is purely military and that soldiering is his profession. Nothing could be more disastrous to his purpose, which is to raise and train an adequate army in Western Europe, than association with the complicated and inconclusive world of politics. But he almost invalidates his thesis by the skill and assiduity with which he has set himself to dispel the political obstacles in his path.

At his press conference in London he sought out with unerring instinct one of the nagging political fears about his appointment in both Britain and Europe. He is an American who will, Congress and the President willing, include in his command a very large American force. Can he avoid remaining more American than European? Will he consider himself as reporting primarily to the Pentagon, or to the twelve capitals of the Atlantic powers and their representatives, or the standing groups of the Atlantic organisation? The experience of General MacArthur in Korea has shown, if nothing else, the enormous difficulty of allocating military responsibility in a campaign conducted by several nations who are not in a state of war. In Korea, the instructions have come from Washington and the directive from the United Nations, and no one has been satisfied: neither the Americans who feel that they have been blamed for decisions which were not theirs but the consequences of United Nations' action; nor the other countries who feel that Washington control has been misguided or inadequate.

General Eisenhower gave his own and the only satisfactory answer. His relation to all governments will be equal and similar. They must try, he says, and believe him henceforth no more than one twelfth American. The feat of imagination for which he asks will be greatly eased by the unifying force of his personality—already well known to Europeans—as well as by the centralisation of initiative through his official appointment. In a sense he will simplify the political difficulties, not complicate them; for he will be able to bring into the open and command a solution to problems which individual governments have been anxious to face but have hung back from raising themselves. For the rest, the onus is on the twelve governments to show that multiple responsibility need not necessarily be divided.

The Two Germanies

Dr Adenauer of the west has quite properly and skilfully snubbed Herr Grotewohl of the east by replying indirectly—by radio and white paper—to overtures made by the latter in November. The proposal was that six men from each government should meet, arrange an all-German Council (on a fifty-fifty basis), and so prepare the way for elections throughout the country. Its tone was smooth and the trap was cunningly baited. It was suggested that Germans had a common interest in saving peace by uniting against “imperialist” rearmament; to continue the division of 46 million Western from 17 million Eastern Germans could only put off a peace settlement. As the Foreign Minister, Herr Dertinger, put it: “There will be no third world war if Germany refuses to fight.” To make fear of war the impulse behind a movement for unity under Communist leadership was quite a bright idea, and it had Dr Adenauer thinking hard for six weeks.

By replying direct he would be tacitly recognising a regime which is under Soviet orders and whose authority rests on the rigged elections of last October. By accepting he would be running all the risks of collaborating with men who have made open disagreement with Soviet views about America a capital offence; the Social Democrats of the west were violently against both actions, because they understand better than anybody how the trap is set. But to say simply “No” was to leave the initiative in advocating peace and unity with the Soviet camp. He has therefore wisely pointed out that western terms for unity and elections have already been stated—and restated them. In the east the rule of law and personal liberty must first be re-established; the Soviet-controlled People's Police must be disbanded; and there must be real political liberty. Just to rub it in, the reply points out that it is the Communists who have cut off the East Germans from their fellow countrymen, and that a group of men who have signed away the territories beyond the Oder-Neisse line cannot pose as champions of German unity.

This reply should stiffen German opinion and check the drift to neutralism. But it will not do so for long unless the western powers now seize the initiative in their exchanges with Moscow, make quite clear what their programme for German unity is, and remove the fear that is dominating politics west of the Elbe by an increase of troops on the spot.

* * *

Dulles for Japan

The visit of Mr Dulles to Japan as Ambassador-Extraordinary is an event of great importance, for it shows that the American Government, thoroughly alarmed at the deterioration of its affairs in the Far East, is now resolved to cut the Gordian Knot of a Japanese peace treaty. It also signifies that the delicate negotiations involved are to be removed from the overriding authority of the Supreme Commander of the Allied Powers and entrusted to a major political personage straight from Washington. Although it is officially stated that he is going to Tokyo for “discussions” and not “negotiations,” he is too much of a politician to be able to afford such an expedition unless he expects to accomplish something by it. His own views on what ought to be done are sufficiently well known. He believes that a strong and independent Japan in close alliance with the United States must be the future pivot of American policy in the Pacific, now that China, on which such high American hopes were set in 1945, has proved such an unrewarding investment.

In approaching the question of the defence of Japan, the American Government is hampered by no such division in internal politics as confronts it in its European policy. The neo-isolationism of Senator Taft and his faction does not apply to insular territories; on this view of the proper

American strategy, a frontier on the Straits of Tsushima is defensible, whereas one on the Elbe is not. The defence of Japan would be mainly a matter of sea and air power (in contrast to that of West Germany, which lies under direct threat from Soviet land forces) and this would be supplied by America. Japan's share would be the provision of land forces strong enough to ward off seaborne or airborne invasions from the mainland of Asia, which might combine with an insurgent fifth column inside Japan.

The idea of a joint American-Japanese defence of Japan against possible Communist aggression or armed infiltration is now fundamental to the American idea of a peace treaty with Japan, and as neither Russia nor China can be expected to agree to Japanese rearmament for this purpose, a joint treaty concluded by all the ex-allies of the Pacific war is today virtually out of the question. The actual negotiation of unilateral treaties, however, is likely to bring to the surface various conflicts of interest and opinion which have remained dormant as long as the question of a peace treaty was postponed. Within Japan itself there is much opposition to a separate peace and an American alliance. This springs partly from unwillingness to be committed definitely to one side of the world schism, partly from yearnings for an unarmed neutrality, and partly from the fears of democrats that a restoration of the army would mean a return to the old political system. Internationally, American policy implies a further economic strengthening of Japan to render it independent of trade with China. (The hope of this is being used by Peking as a bait to draw Japan into the Communist orbit.) It will result in a promotion of Japanese commercial expansion which may add another awkward issue to those already troubling Anglo-American relations.

* * *

The Plan and the Miasma

Mr Aneurin Bevan is no longer the undisputed champion of the Labour Left, and it is doubtful whether his personality will ever allow him to recover that position. His fundamental beliefs are, none the less, of considerable interest and some practical importance. He is still among the most popular men inside his party, while being the least popular outside it, because he sums up in his own person the things that divide Socialists from anti-Socialists—or, at all events, the Labour Party from the Opposition.

The first of last autumn's series of Fabian lectures, now presented in pamphlet form,* indicates that dividing line with unusual clarity; not merely the obvious dividing line between the Tory believer in hierarchy and the Socialist leveller, but that between the organic and the mechanical view of society which divides liberals, with or without the capital letter, from anti-liberals. The supreme democratic value is, for Mr Bevan, the attainment by the mass of the people of control over their social environment. Control over the social environment can only be exercised where all the “levers” of economic power are in the hands of Parliament; public ownership, pushed to a stage where no “large elements of the economic machine” remain in the hands of private persons, is essential to the maintenance of democracy and to “the showing up (*sic*) of civilised values in modern society.”

Here is the mechanical view of society in all its purity. Apply the motive power, the will of 51 per cent of the electorate, at the centre; let the representatives of the 51 per cent pull the appropriate “levers”; and the power will be transmitted through the appropriate gears so as to produce, in meticulous correspondence to the people's desires, a predictable economic environment, stability of employment, the “proper dispersal of industry”—in short, The Plan. That

* “Democratic Values.” By the Rt. Hon. Aneurin Bevan, M.P., Fabian Tract No. 282. Fabian Publications and Gollancz, Ltd., 14 pp. 6d.

Insistence on the predictable and stable in an unpredictable and unstable world is self-defeating and already, as successive Economic Surveys make clear, demonstrably self-defeated, troubles Mr Bevan not at all ; it is not efficiency or the economic balance sheet that matters, it is the “value” of knowing that bureaucrats and Boards, however remotely responsible to the consumer, are responsible for whatever decisions, good or bad, are being taken. Such, when stripped of the rhetoric of class war, is the drearily negative creed to which many sections of the Labour movement grimly cling.

* * *

A Shorn Press Council

The newspaper industry has taken eighteen months to produce a draft plan for the Press Council recommended to it by the Royal Commission on the Press. That is natural enough. The commission itself sat for two years and, while its fact-finding was excellent, it did little more on the major issues of policy than hand them back to newspaper owners and journalists for solution. What seems a pity is that the further eighteen months’ meditation should have been so patently inconclusive.

The draft plan published last week makes no additions to the commission’s suggestions. It leaves out several of them. The proposed council will be purely a professional association, without the 20 per cent of independently-nominated lay members suggested by the commission. That was to be expected: two journalist members of the commission dissented from this part of the proposal in the first place, and it is not apparent why the building up of better standards of journalistic conduct should demand outside members when other professional bodies have managed without them. Also entirely reasonable is the insistence that the council should deal only with such complaints about the press as come to it from the individuals directly affected. It seems a pity, however, to have rejected the idea that the council should to some extent supersede existing organisations by representing the press as a whole in dealings with the Government and with newspaper organisations abroad. When the scope of its functions inside the British press is so doubtful even the most tenuous external functions would be useful in helping to promote some sort of cohesion. The moral authority of the council is bound also to suffer from the rather aggressively “representative” character suggested for its members.

The National Union of Journalists is objecting to the amount of representation the proprietors propose for themselves, but that is a very minor question. What matters is to decide whether there really are any concrete ways in which a council can raise the standards of the press. It is hard to resist the impression that the newspaper organisations have in eighteen months done no more than dilute the commission’s proposals because they remain very doubtful whether a council can do anything that existing bodies cannot. Would it not be better to say so—and then try to improve the work of the existing bodies ?

* * *

Raw Materials Roundabout

The Washington scheme for raw materials, announced last week-end, is a curious blend of democratic idealism and resigned hard-headedness. (The scheme is discussed in detail on page 149.) At first sight it appears that a new organisation even looser than the old—a paragon of free association—is to potter in where the old bodies have failed to tread. Neither OEEC or Nato is to have any prescribed place in the pattern. The affair is to be open to the whole free world—allies and neutrals, Latins and Asiatics alike.

On closer inspection it will be seen that what has in fact happened is some practical and ruthless adjustment in existing spheres of influence. The slightly undignified scramble between OEEC and Nato for the honour of handling raw materials has been finished, once and for all. OEEC, with many well earned compliments, has been bowed out of the picture—and rightly so. The problem is, first, one of defence and, second, one of the economic health of the whole free world ; in neither case is it appropriate to an organisation whose concern is the economic well being of Europe. Nato also has now been set in its proper perspective, in relation to a problem which concerns the world economy as well as military strategy.

On the other hand, the new structure is clearly not designed to be self-supporting. It must, and is intended to, rest on the dissimilar pillars of the Organisation of American States (OAS), the British Commonwealth, and Nato. The OAS and the Commonwealth must provide the political associations through which the recommendations of the commodity groups are to be distilled into suitable action. Nato must do the same for the Atlantic powers, but within the tighter specifications which defence needs will dictate. There will remain the lonely European neutrals, bereft of their OEEC shell, on whom the pressure to cease being neutrals may become harder to bear. On the whole, this seems to be as good a political framework for the job as anyone has yet suggested. It remains to be seen if it can work.

* * *

Courage in Egypt

When some hundreds of Cairo students and schoolboys, shouting slogans called “decisions of the people,” massed in front of Egypt’s Foreign Ministry last Saturday, they met with an unusual reception. The Foreign Minister, Salah ed Din, told them from the Ministry’s balcony that dictation of policy was no job of theirs.

Whatever the topic on which they wished to make their weight felt (this time, it was Anglo-Egyptian relations), this display of ministerial courage constitutes a landmark. For thirty years—ever since Zaghlul decided to harness the volatile Egyptian crowd to his purposes—successive ministries have too often been obliged to bend policy to suit the whims of street demonstrators. They have done so partly out of an ingrained distaste for saying what their listeners do not like to hear, but chiefly for sheer lack of public backing. No Egyptian political party, except the Wafd, has any form of nation-wide organisation or broad public support. Therefore, Government after Government has been obliged to jettison policy in order to please the mob. Student power has been immense, with two pernicious results: the first, that a prime element in Egyptian politics has been purely destructive in character ; the second, that politics have distracted from their books young men whose examiners have perforce become satisfied with standards that grow progressively lower.

When the Wafd came to power a year ago, there were grounds for hope that it would use its public backing in order to arrest this student habit. Not until now has any one of its leaders done so. Salah ed Din was no doubt moved to make the stand he did by the sight of the crowd. About half of this was Wafdist, but about half—for the first time in Egypt—recognisably Communist. He had the gumption to force it to shout “Down with Communism” as well as “Down with Imperialism,” and to reprove it for shouting “Down with Britain and America.” Some of his victims are bound to gun for him therefor. But his fellow Ministers would do well to stand by him, for he set a precedent in the handling of demonstrators which, if it is followed, can but do Egypt good.

Sabotage from the Saar

One way of encouraging Germans to resist any contribution to Europe’s defence is to do things that exasperate their acute sense of difference and subordination. It has been difficult hitherto to believe that French statesmen and officials were doing this with the deliberate object of frustrating plans for a German defence contribution ; but the revelation of the latest plans for the Saar makes one stop to think. It is seriously proposed to form a contingent of 10,000 Saarlanders for a European army that does not yet exist. No German officers would be admitted, but German-speaking French officers would. The condition laid down by the Saar Premier, Herr Hoffmann, is that his land is formally recognised as a sovereign state. It is said that these are his ideas—big ideas ; but it appears that the British and the Americans, as well as the French, have been consulted.

One can look at this curious proposal in two ways. Either France and Germany are going to find a new basis of European partnership in which the Saar ceases to be a bone of contention and small sovereign states become increasingly anomalous ; or they will remain rivals that will have to get along as best they can by more old-fashioned methods. If the former is the object of French policy, then it would be wise to recognise that this proposal will exasperate the mood in which Germans tackle the final stages of the Schuman plan and the first stage of the European army plan. If French policy is resigned to the latter, then the sooner it is recognised how strong will be the attractive power of a reviving Germany on the German-speaking Saar the better for French security and Europe’s peace of mind.

Sir Ivone Kirkpatrick pointed out in Hamburg last week how selfish, unco-operative and strident the Germans are proving. That is true enough and needed saying. But Allied blunders have contributed to this mood, and the task now is to make it worthwhile for more responsible Germans to take a stand against bad manners. Herr Hoffmann’s proposals for the Saar, coming from a member of the Strasbourg Assembly, are ill-timed and inappropriate. It would not be surprising if he gets telegrams of congratulation from the French Communist Party, for sabotage of the “European spirit.”

* * *

Golden Gate or Prison Wall ?

There has been a little flurry of excitement in the educational world about the number of pupils who are said to leave grammar schools before they are sixteen. The Minister of Education and several headmasters have expressed their concern. During 1948-9, some 26,000 pupils left grammar school before the age of 16, compared with 22,000 in 1946-7. The belief that many left for lack of money is supported by an inquiry, sponsored last year by the Association of University Teachers, into the number of worthwhile candidates who could not find a university place. The number of good candidates who failed to gain entry to the universities was smaller than had been expected, but many schools reported a serious wastage of those who would have made excellent university candidates if they had not been compelled to leave school at 15 or 16 “for lack of financial help.”

But the evidence is not all on the side of the pessimists. According to the Ministry of Education, the proportion of students leaving grammar school before the age of 16 was only 23 per cent in 1948-9, compared with 27.6 per cent in 1937-8. In addition, the sixth form population is going up by leaps and bounds: in 1946-7 there were 12,600 pupils in England who remained until they were 18 ; in 1948-9 the number had risen to 16,600. The gains at this age counter-balance the losses under 16.

Economic pressure is no doubt the main reason for the losses at sixteen. Family liabilities look more formidable to many parents than they did directly after the war. On

balance, however, the premium on a grammar school education is higher than it has ever been. The abolition of fees has built up the demand for places, but not all of those who clamour for entry make their choice with a full sense of responsibility, nor are many of their parents aware how rigorous a grammar school course can be for the border-line child. What looked at the age of eleven like the golden gate to security and success may at the age of fifteen seem a prison wall—particularly if the neighbour’s children are earning £2-£3 a week.

* * *

Traffic Police in Disguise

This seems to be the season for unwelcome developments in the police service. The Commissioner of the Metropolitan Police began the New Year by introducing an experimental system of police squads in a few London areas, and now the chief constables of Oxfordshire, Berkshire and Buckinghamshire have agreed to use policemen in plain clothes in cars without police markings to trap offending motorists. It is claimed that the knowledge that such cars are about will make motorists more cautious and that such drastic measures are necessary to reduce the high rate of road accidents in the three counties.

Both claims may be challenged. If experience in the prevention of crime is any guide, it has been long established that the presence of a uniformed constable on the beat is a far more successful way of preventing criminals from operating than the threat of an efficient detective force which may catch the criminal after the crime has been committed. It can be argued that, similarly, the careless motorist, who is in many ways more dangerous than most criminals, is more likely to be brought to his senses by the sight of a clearly identifiable police car than by the fear of being trapped by disguised traffic policemen. It is also doubtful whether other methods of traffic control have been fully exploited in the three counties concerned. Two police motor-cyclists, for example, can cover more ground than two policemen in one patrol car, and it is difficult to understand why they have not been used more extensively.

It is true that detectives have always operated out of uniform in their attempts to catch criminals, but there is a real distinction between catching a man who has already committed a crime and setting a trap for someone who only might commit a crime. The whole principle of having disguised policemen watching the general public is abhorrent, and it should be abandoned before it spreads beyond the three counties.

Matrimony Made Easy

Miss Norrington continues to send free to any address, on receipt of thirteen postage stamps, and a directed envelope, plain directions to enable Ladies or Gentlemen to win the affections of as many of the opposite sex as their hearts may desire. The proposal is simple, and so captivating and enthralling that all may be married, irrespective of age, appearance, or position ; young and old, high and low are subject to its influence ; and last, though not least, it can be arranged with such ease and delicacy that detection is impossible. Address: Miss Lavinia Norrington, 7, King’s Terrace, Bagnigge Well’s Road, London.

N.B.—Beware of ignorant pretenders.

The Economist

Letters to the Editor

Transport in Trouble

Sir,—The issue seems to be quite simple, that where the railways responsible had sufficient capital resources, they have been able to do a good job. Southampton is an outstanding example and it is now the best equipped and most up-to-date port for its size in the country. Other railway owned ports have not been so fortunate, and have suffered accordingly.

The British Transport Commission, who now own the docks, have far greater resources than the railways ever had. Unfortunately, development is held up by the shortage of labour and materials and other prior claims for capital expenditure.

Nevertheless, my original statement must still stand, that the ports in this country will be in a much better position to develop their resources now they are no longer hampered by the exigencies of railway finance.—Yours faithfully,

GEORGE CADBURY

Birmingham 29

The Sardines Return

Sir,—I should like to correct some inaccuracies in the letter which appeared in your issue of January 13th:

1. There are "sardines" in the sea off the Portuguese coast and elsewhere, such being the name applied to pilchards before they attain their full maturity and quite independently of their relation to the canning industry.

2. This variety of pilchards, which is fished in the Mediterranean and off the Atlantic coasts of France, Portugal, Spain and Morocco, is known as *clupea pilchardus* and, according to the now generally accepted classification, belongs to a class of clupeidae going by the name of *sardinops*. This class includes in addition: *sardinops melanostica* (Japan), *sardinops neopilchardus* (Australia and New Zealand), *sardinops coerulea* (California), *sardinops sagax* (Peru and Chile) and *sardinops ocellata* (South Africa)—to all of which the name of "sardine" could also be held to apply, though already somewhat loosely. One may mention further the related species of *clupea stratus* and *clupea harengus*, which in Norway are known respectively as brisling and sild.

3. The Merchandise Marks Act of 1887 restricted the use of the trade name "sardine" to the species known in Britain as "pilchard"—this trade description being also legally protected in Belgium, Germany, Italy and, of course, France, Spain and Portugal. But in the United States the "Pure Food Law" of 1906 allowed all clupeidae to be sold under the denomination of "sardines."

4. The Portuguese town of Setubal has long ceased to be the main centre of the sardine fishing and canning industry; the latter did, however, originate in Setubal when, in 1880, the first factory was set up there by French emi-

grants from Brittany, then in throes of a fishing crisis similar to the one recently experienced by the Portuguese. The main centre of the industry, normally totalling 50 per cent of the national output, has now been for some years the modern town of Matosinhos, near Oporto.

5. Lastly, being a first-class product, the olive oil variety of tinned sardine is limited to a relatively small percentage of the total output, by far the largest part being taken up by the peanut oil preparation.—Yours faithfully,

DANIEL SEPULCHRE

Brussels

Mid-Century

Sir,—Without denying for a moment the importance, stressed in *The Economist* of January 6th, either of capital accumulation or of the productive effort required of us, it would seem somewhat exaggerated to sublimate our need of both into a faith for the West; to inform us that, "What is necessary for the second half of the twentieth century is to show the world that the West is still capable of practising this faith" (in the importance of production and capital accumulation). Surely we need faith in something more profound than production if we are to make our way through the next 50 years without complete disintegration.

Your article mentions freedom and justice; but its concluding stress seems heavily set on what are, at the best, material factors and, as such, subordinate to freedom. One is left with the impression of inverted values—that you see human contentment primarily as a function of material well-being; and that, as a consequence, the productive process is all-important. It is but a small step from this outlook to that which submits the individual entirely to the state in the (supposed) interests of increased production. Between the materialism it represents and that of the Marxist, the difference is one of degree not of kind. With it as the predominant "faith" of the West, our effort against Communism will be reduced to a futile endeavour to fight one form of materialism with a paler version of its essentially evil self. In the ensuing struggle, if it can be called such, it is only too clear which side will win.—Yours faithfully,

PAUL CRANE, S.J.

Out-of-Date Pensions

Sir,—The letter of your correspondent, Mr G. D. Rokeling, is of particular interest at the present time because it deals with a problem which will become worse for all concerned—ex-Government, ex-local government, and ex-commercial employees—as the cost of living rises.

In the past, recruitment of the best type of men and women to central and local government services was stimulated by the promise of good pensions and

consequent security at retirement. This is no longer true today. Pensions to local government servants are in many cases little better today than they were in 1939, despite the 1944 and 1947 Local Government Pensions Increase Acts.

It is true that these Acts allow increases to be made in pension rates. But because such increases are only made after a test of the needs of the individual, and after taking into account the total income of the individual and his wife, such increases are very often negative.

It is surely unfair to assess a contributory pension on the basis of means. It can fairly be asked why should the income from the savings of a lifetime, or the holding of a property, mean that a pension increase is withheld, while the less thrifty individual who has secured for himself no other form of retirement income secures an increase?

What is wanted is a definite increase in pension rates in line with the increases given to salaries and wages to be effective throughout commercial and Government spheres.—Yours faithfully,

KENNETH LEWIS

Alnwick

Students' Referendum

Sir,—In commenting on the recent referendum of students concerning affiliation to the International Union of Students you say that "British students will now recognise how they have been duped in the past." This statement does not correspond very accurately with the facts. There is no other subject that has been so thoroughly discussed among students in this country.

The referendum result is so obviously indecisive that the matter cannot be regarded as closed. Those who wish to continue affiliation to IUS see in membership a vital link between East and West. It is a link that, if broken, can only serve to help consolidate the world into two hostile blocs. Many students regard it as preferable to "slang" one another from the same platform than to fight the matter out on the field of battle. IUS offers great opportunities for co-operation, whereas disaffiliation holds no prospect of any advantage.

In these circumstances your comments do little to clarify the issues at stake. Your implicit assumption that the world is divided with little hope of co-operation existing, combined with the results of an unconstitutional and unrepresentative referendum, does not automatically lead to the conclusion that the British student has abandoned international co-operation or, indeed, is prepared to do so.—Yours faithfully,

R. H. R. ARMSTRONG

Hillingdon, Middlesex

[There is no evidence that such a bridge as our correspondent conceives would be used for anything but one-way traffic. The essential point surely is that a non-political organisation has been turned into a political pressure group in which no useful work can be done by British students.—EDITOR.]

CATERPILLAR OR BUTTERFLY?

Utility or beauty? Well, as far as it concerns refrigeration we are happy to provide both or either. For 70 years now, we have been producing refrigeration units for every conceivable purpose for trade and industry... for big projects such as ice rinks, marine storage, or meeting the more modest requirements of shops and businesses by way of store cabinets and showcases. We also make it our special concern to ensure that each of our customers, big, medium and small, receives a first-class service in the maintenance of his equipment. Our experience, in other words, is as broad as it is long, and therefore, whether yours is a caterpillar or a butterfly of a problem, we will be only too glad to help you. Why not write to us today?

The MANCHESTER GUARDIAN Annual Review

of Industry, Commerce and Finance

will be published on January 23rd, 1951

In the years before the war the MANCHESTER GUARDIAN published many special numbers and established a high reputation for their informative contents. Not least important was the Annual Trade Review, a supplement issued in January each year. It is now proposed to revive this Review in a more elaborate form and as a separate publication.

Printed on fine quality paper, fully illustrated and with a four-colour cover and inset, this issue will not only review industry, commerce and finance over the past twelve months but will survey the coming year in those

fields. Business men and women will find it an authentic source of information and a most useful book of reference.

The following
are among the contributors:

The Rt. Hon. Harold Wilson, M.P.
President of the Board of Trade

Sir Charles Renold
Chairman, Renold & Coventry Chain Co. Ltd

The Rt. Hon. Oliver Lyttelton, M.P.

G. N. Vansittart
Chairman, Vauxhall Motors

R. M. Shona
Director, British Iron & Steel Federation

A STATEMENT of PRINCIPLE by the makers of

National

ACCOUNTING & ADDING MACHINES
It is a basic feature of the Company's policy
that those who represent it should be excep-
tionally knowledgeable and fully competent
to give advice in all matters relating to the
mechanization of accounting procedures. It
is considered imperative that the Company's
standard of representation should match the
calibre of its products which are without
equal in their own fields.

Apart from the Company's interest in securing
the widest acceptance of its products wherever
their use brings advantage, it is a firmly held
principle that the Company's fund of experience
should be available to whomever would benefit
from it. Enquiries and consultations are always
treated as confidential.

CANADA CALLING UP BUSINESS MEN

CANADA is calling Britain's
business men—up across
the Atlantic by Skyliner!
Over in Canada, there are
valuable dollar orders just
waiting for you. But before
you can capture them, you'll
have to fly there in person
and sell-sell-sell in the way
Canadians expect.

NEXT TO NO TIME—MONTREAL

Yes, operate on the spot as
American business men do.
Board your Skyliner at London
or Prestwick—and in next to no
time at all, Trans-Canada Air
Lines, the most frequent direct
service, will have landed you in
Montreal. Only a day from now
—you can be grabbing those
tempting dollar orders. And in
the U.S. market, too. T.C.A.
study business men's require-
ments—they now operate a
direct service from Montreal to

New York with, if you wish, stop-
over in Montreal at no extra cost.
Just sit back in the deep,
reclining chairs and enjoy the
piping-hot meals aboard your
T.C.A. Skyliner. It will fly you to
any important Canadian or
U.S. city—and you will collar
those dollar orders!

Fly T.C.A. during the new "LOW FARE" seasons Here's your new travel savings calendar

Employment or Wealth?

Monetary Policy for a Competitive Society. By Lloyd W. Mints. McGraw Hill.
236 pages. 25s. 6d.

This book tackles what has emerged
since 1945 as the practical economic
problem *par excellence*; that of
harmonising the policies required to
maintain a high level of employment and
damp down fluctuations to a tolerable
amplitude, with those required to ensure
that economic resources shall be
rationally allocated between different
uses both internally and internationally.
Experience has shown both that policies
aimed directly at rationality, the classical
policies of the pre-Keynesian era, do
not automatically produce full employ-
ment and stability, and that policies
aimed at full employment are only too
capable of producing a cumulatively
irrational distribution of resources,
carrying with it a growing danger of
breakdown for the full employment
policy itself. Generally speaking, writers
on employment policy have pushed the
allocations-of-resources problem into the
background—Keynes most decidedly did
so in the "General Theory"—while
those concerned with the allocation of
resources have rarely taken into account
the "employment effect," except as a
frictional influence. Space forbids illu-
stration of this admittedly sweeping
assertion; certainly "Monetary Policy
for a Competitive Society" shows a rare
willingness to confront both problems
simultaneously and in relation to one
another, and despite the disagreements
which it must arouse deserves respect
accordingly.

Dr Mints's main thesis is that mon-
etary instability, due to a defective
banking system and the lack of a
"definite and announced monetary
policy" on the part of authority,
is the sufficient cause of economic
instability in general, and that a
right and above all consistent monetary
policy, beginning with banking reform
is accordingly the most important
means of ensuring the proper working
of a free economy. Here a good
many economists will part company
with him immediately, holding that
enough inherent instability would
remain, even with satisfactorily
"neutral" money, to call for further
deliberate stabilising devices in other
than the monetary field. All will agree,
however, that the monetary factor is
responsible for the worst and most
explosive kind of instability; and having
so agreed, must admire the breadth, in-
genuity and realism of his analysis of
the merits and demerits of the alterna-
tive possible plans for monetary stabili-
sation. These are considered from the
point of view of their effect on general
equilibrium, the relative price move-
ments of different classes of goods and
the ensuing readjustment of resources
internally and internationally; from that
of deflationary or inflationary effect;
from that of the distribution of wealth

between wage earners and property
owners, debtors and creditors; from that
of the sensitiveness or insensitiveness of
the indicators pointing to the need for
action; from that of sheer practical
administrative possibility. Out of all
the various possibilities, Dr Mints pre-
fers, after balancing all these considera-
tions, stabilisation of a combined whole-
sale price index of domestic and
internationally traded goods, with
flexible exchange rates; any necessary
creation of new money or "impound-
ing" of old being accomplished by
way of national Budgets—which apart
from such creation or impounding
should be strictly balanced. This im-
plies that banking legislation should be
altered to prevent variations of purchas-
ing power based on a fractional reserve,
and that open market operations in the
intervals between Budgets should con-
sist of direct dealings with the public.

This summary does Dr Mints much
less than justice. His book deserves to
be widely read and taken seriously. He
has chosen to address himself to his
fellow economists, holding that "to rush
to the public with urgent appeals for
the adoption of policies" is premature
and self-defeating so long as agreement
among experts has not been attained.
He does not, however, address them in
such esoterically technical terms, nor
deal in such refinements of advanced
theory, as to make his argument inacces-
sible to the lay reader; to whom, if
willing to take a little trouble and able,
let us say, to feel at home on the City
Page, it is warmly recommended.

A Critic Recants

Keynes's "General Theory": A Retro-
spective View. By A. C. Pigou.
Macmillan. 68 pages. 6s.

Keynes's "fundamental conception"
of the variables determining the level of
income and employment in the modern
economy was "an extremely fruitful
germinal idea." In this, from almost the
severest of the master's prewar critics,
Keynesians should see victory enough.
It may well be, indeed, that Professor
Pigou's later thoughts on Keynes will be
taken by future historians of economic
theory as marking the high-water point
in the influence of Keynesian doctrine.
The two admirably clear lectures in
which they were expressed (at Cam-
bridge in November, 1949) have now
been printed.

In the controversies that followed the
publication of *The General Theory* Mr
Pigou, together with other critics,
was very far from being defeated on
every point. But on the central point
of the theory he now says bluntly that
in the famous *Economica* review of 1936
"I failed to grasp its significance." The
ground for this reversal of judgment had

been well prepared in Mr Pigou's
writings during the intervening thirteen
years. It certainly does not mean that
by now he has swallowed Keynes whole.
The reappraisal is critical. On many
points of definition and method
Marshall's successor still stands far from
the theorist of the thirties. He insists
that Keynes's analysis is of the short-
period equilibrium positions that various
given conditions would establish; it
describes, that is to say, the tendencies
that in a constantly changing world are
rarely fulfilled. At the best—even if the
changes are infrequent—the analysis
provides a series of economic stills, not
a moving picture of what actually
happens to the economy in between the
positions of short-period equilibrium.

This formal reservation has practical
implications of some importance. It
leads Mr Pigou to refuse to think of
investment as a function of consumption.
When the comparison is between two
positions of short-period equilibrium,
this is no doubt correct. But the
Keynesian analysis surely stands or falls
according to its fruitfulness, in spite of
logical imperfections, as a method of
thought about the real world of
"dynamic" economics, not about the
abstractions of short-period equilibrium.
And Mr Pigou recognises, with everyone
else, that investment is a function of
changes in consumption. His point of
view has the interesting result that, while
he agrees that high savings are associated
with low employment, he denies that
they imply low investment; on the con-
trary, they make employment smaller
only because they require a lower price-
level and a lower rate of interest in order
that investment may be bigger. This is
one of several points at which Mr Pigou's
analytical scheme, with its concentration
on the implications of differences in the
variables rather than the consequences
of changes in them, seems awkward as
well as restricted.

Yet the predominant impression given
by Mr Pigou is of how little he now
disagrees with Keynes. There are many
differences of practical as well as
theoretical emphasis. He points out,
fairly enough, that Keynes—preoccupied
with the problems of the thirties—con-
centrated too much of his attention on
the weakness of the inducement to invest
among the various determinants of the
level of employment. Again, Mr Pigou
maintains, in effect, that the conse-
quences for employment of a cut in
wages are indeterminate, in the sense
that they depend on the state of expecta-
tions about which little more than
guessing can be done. It is here that
the ghosts of old controversies rage most
furiously behind the decent screen of
Mr Pigou's detachment. But the sur-
prising thing about this reappraisal is
the extent to which Mr Pigou passes
over the gaps in Keynesian thinking that
both postwar experience and recent
theory have suggested. And for that
reason his partial conversion may in one
sense represent the extremity of Keynes's
academic influence.

The Journalist's Craft

The Kemsley Manual of Journalism.
Casell and Co., Ltd. 424 pages. 25s.

Both the idea and execution of this generous and glossy volume are admirable. Indeed, it is resplendent with craftsman's pride, team spirit and sense of public responsibility to an extent that is here and there a little irksome. Journalists are not priests; if they were, daily newspapers would be unreadable. And the main lesson of this manual is the immense amount of talent, ingenuity, organisation and thought that go into the production of something that will entertain as well as inform.

It begins with a full description, process by process, of the day's work, starting with the sorting of letters by an assistant editor and ending with the last rush in the publisher's room. Each process is fully illustrated and explained in such a way that the layman will find himself absorbing the essential jargon in the same way that he absorbs American slang from a film. Then each process is gone over again in a separate chapter by a practitioner. There is some extraordinarily good sense about leader-writing; a vivid chapter—the best of all—on make-up and typography, in which the rivals of Kemsley Newspapers get a fair showing; several exciting sections on the hustle and bustle of foreign news transmission and reporting; and some amusing specimens of the cartoonist's art. Even the literary editor gets a look in, pays a much needed tribute to the difficulty of book reviewing and confesses that "it is a hazardous thing to ask a poet, particularly a modern poet," to review a book.

The high seriousness of the treatment is scattered rather than concentrated, and it is not clear just how Lord Kemsley's admirable efforts to work out a training for aspiring journalists produce increasingly intelligent yet lively newspapers. It might have been better to give more attention to one or two of his provincial organs and less to the *Daily Graphic*. Now that this manual has been produced it is clear that newspaper production can be made an entertaining subject for the layman to which both radio and film producers might give their attention. It is particularly recommended to the attention of the dullest and worst presented newspaper in Europe—the Cominform journal.

Implications of Citizenship

Citizenship and Social Class. By T. H. Marshall. Cambridge University Press. 10s. 6d.

This small book, somewhat difficult to read, is nevertheless of considerable importance. It begins with the study from which it takes its general title, this study being a somewhat extended version of two lectures given on the Alfred Marshall Foundation in 1949; while the other three essays—one a "preliminary analysis" of social class, another on the nature of the class conflict, and a third on the "Recent History of Professionalism in relation to Social Structure and Social Policy" date from the decade

before the war. Their background, therefore, is to some extent coloured by the growth and dominance of Fascist and Nazi conceptions, though in the preliminary analysis (1934) the author is expressly dealing with social class in England. He is considering in these three shorter essays a phase when the new "salarial" is emerging, and finds its development frustrated by the wrangles of capital and labour. In the later work, printed first, he is writing against the background of the welfare state, and is discussing the paradox of its steady extension in a society in which the stratification of social class has persisted. The method of this more recent work is historical. The writer studies the history of "citizenship" in its civil, political, and social aspects severally, with the achievement of civil rights in the eighteenth century (the climax being the Reform Bill of 1832), of political rights in the nineteenth, and of social rights, beginning with the institution of compulsory education, and spreading out with the growth of the socialist state.

It might be possible to attack the problem of class statistically. That great book, the "Social Structure of England and Wales," can be regarded as, in one sense, a statistical approach to it. And any such approach is, of course, necessarily both elaborate and also inconclusive, since many different categories, which can be statistically appraised, obviously have some importance in determining class, while no one of them corresponds with any precision to a social class division such as is here being discussed; class which is in a sense "a force that unites into groups people who differ from one another, by overriding the differences between them."

Throughout the book, this elusive force is pursued, with considerable analytical skill, and with elaborate documentation from the work of other sociologists who have discussed the concept. It is always difficult to see the wood for the trees of contemporary history. It would be, however, a matter of great interest to work out how far the situation which lies at the heart of the treatment of citizenship and social class has made out of date that which underlies the earlier essays. There has never been in this country's history a decade of comparable change.

Political History

Revolution in Eastern Europe. By Doreen Warriner. The Turnstile Press. 188 pages. 12s. 6d.

This book has been written in the belief that politics have been allowed to obscure the important social and economic changes which have been taking place in eastern Europe since the war. But politics have a way of creeping in, even when economic matters are the chief topic of interest. As a contribution to history the political chapters in this book are easily the least valuable part, not because they are a summary but because they are written exclusively from one political angle. To take one small example—it is rather surprising to find Yugoslavia's help to the Greek rebels fighting against the legal govern-

ment of Greece, described without qualification as Yugoslavia's "aid to Greece."

No reasonable person would deny that far-reaching measures were essential to improve the appallingly low living standards of so many of the people of eastern Europe. Miss Warriner is extremely well qualified, both by her expert technical knowledge and by her personal experience of the countries concerned, to describe the goals which the Communist planners have set themselves and the progress they have so far made. On the whole the difficulties and failures are not omitted, but she is convinced that the planners are proceeding on the right lines. Only the Yugoslavs are condemned for making a complete mess of their economic planning; one suspects that a few good words would have been found for them, too, if they had not chosen to defy the Soviet Union.

The Soviet Union's role in eastern Europe is, indeed, described in an unconvincing way. Its influence on politics and economic planning is minimised, and, where admitted, is regarded as benevolent. But few in Hungary or Rumania, except hardened Communists, would agree that Soviet control of their most important industries is only used "to secure essential supplies" and "does not constitute exploitation." All the evidence suggests that the Soviet Union's chief interest in the economies of eastern Europe lies in what it can get out of them and not in the people's welfare—whatever the Cominform Journal may say to the contrary.

Anthropological Enlightenment

Mirror for Man. By Clyde Kluckhohn. Harrop and Company. 228 pages. 12s. 6d.

The Beginnings of Diplomacy. By Ragnar Numelin, Geoffrey Cumberlege. Oxford University Press. 372 pages. 45s.

A greater contrast in method, manner and theme than these two books present would be hard to find in contemporary anthropology. Professor Kluckhohn has written a text-book for "the intelligent layman." It is unmistakably written by an American for Americans. Hence the latest American fashion in anthropology is expounded at length. According to it, the essentials of social life in all societies can be traced back to the conditions of infant care; and not only the commonplace facts but such complicated matters as national character are "explained" in psycho-analytical jargon. Inevitably, also, the book includes two stock features of the latest American text books, a disquisition on present-day American "culture," and a declaration of faith in science, reason, democracy and anthropological enlightenment.

It is remarkable that Professor Kluckhohn almost completely avoids discussing the economic and political institutions of primitive peoples, but does not refrain from categorical opinions on the subject of international relations with Russia. But then the most important work on primitive economic

Entrusted to our care on the last day of 1950 were deposits and other balances exceeding £1,393 millions, and nearly two-thirds of this great sum consisted of current accounts, upon which customers draw their cheques. To meet their needs all over the country we held cash in our tills and balances at the Bank of England amounting to £116 millions, representing the usual ratio of approximately 8% of deposits.

Our cash holding can be replenished rapidly from sums lent at call or at a few days' notice to the money market, in total £88 millions, while our holdings of Treasury Bills, Treasury Deposit Receipts and other British Government securities amounted in all to £779 millions. In addition, advances to our customers reached a total of £344 millions, mainly to help in the running of Britain's factories, farms and other businesses.

and political organisation has been done by European scholars and Professor Kluckhohn seems to be unacquainted with it. Yet he is obviously a versatile and sound scholar. Moreover there is charity as well as shrewd understanding and freedom from bias in his judgments. His discussion of what anthropologists mean by such terms as culture is sensible; his account of modern archaeology is illuminating; his chapter on race is a skilful synopsis of established facts and of enlightened opinion; on language he is poor; and, in spite of reservations, he implies exaggerated claims for the use of anthropology in public affairs.

Dr Numelin takes us back to the nineteenth century. His book is a comparative study in the heavy, academic style of his revered teacher, E. Westermarck. As he is the Finnish Minister in Brussels, his theme bears directly on his practical interests. He pursues it assiduously in all its ramifications. His main argument is that diplomacy—"the maintenance of official relations between tribes and peoples"—is an institution as ancient and widespread as human society, not an invention of classical antiquity as some historians assert. He therefore sets out to show that diplomacy and international law are found in the intertribal relations of primitive peoples, if only in rudimentary form, and may, in this sense, be said to have their beginnings in the earliest state of human society. Every conceivable authority is quoted and profuse, but uncritical and indiscriminate, citations of ethnological data are given. The tone is set by the preliminary discussion of the nature of government in primitive society, which concludes with conventional and outmoded distinctions between various forms of juridical relations. Inter-tribal contacts in war and peace are then discussed in the same way. Dr Numelin brings to light interesting information about the role of envoys and emissaries, which he connects with the rules concerning the treatment of strangers and guests and their protection by religious conventions and etiquette. Many of the customs pertaining to diplomatic intercourse in modern times are seen to have parallels in primitive society. Peacemaking ceremonies are described, and there is a full account of the part played by trade in maintaining peaceful relations between tribes. Dr Numelin's

numerous misprints and occasional grammatical slips must be forgiven since the author writes in a language foreign to him. Dr Numelin opens up an important subject in comparative politics, a subject apparently deemed by Professor Kluckhohn to be less germane to anthropology than the excretory habits of infants. Unfortunately Dr Numelin's method and concepts are out of date and his conclusions too general.

How to Invest

Principles of Finance and Investment.

By Lewis G. Whyte, F.F.A. Cambridge University Press. Vol. I. 192 pages; Vol. II. 176 pages. 12s. 6d. each.

The perfect textbook is a rare work of art. The best practitioners often set down their knowledge indifferently; the overburdened student spurns grace and demands systematised knowledge. Mr Whyte's book may not be perfect of its kind, but it is the most comprehensive discussion of the theory and practice of investment for many years. It is intended in particular to serve the needs of actuarial students and that fact alone gives it a particular leaning towards institutional investment. More is to be found here of the factors that determine the course of gilt-edged values than of the influences that determine company profits and equity prices. In recent years the predominant fact for all investors has been the control exercised by the authorities in determining the public value of their own credit. The understanding of these processes of control is far from complete, even by those who follow them closely; someday a modern Bagehot will have to write a "Great George Street cum Threadneedle Street" to explain and rationalise them. In setting down his summary, Mr Whyte can claim to be one of the first to discuss these difficult matters within stiff covers.

These two volumes could be usefully studied by others apart from budding actuaries. The author has succeeded in the one essential purpose of any textbook—to set minds working. He ranges over the fields of economic history and theory, introduces the student reader to the concept of the national income and the practice of the investment markets and then discusses banking and the rate of interest. All this is by way of pre-

liminary to a detailed analysis of the main categories of investment as seen from the particular point of view of life assurance offices—a section of the book that is excellent. The whole task of setting down the historical and theoretical background and then linking this with investment practice represents a large assignment that is not easy to fulfil in well under four hundred pages. Each of the questions on which Mr Whyte touches could easily take up as much space to itself. Thus his "Principles" does not provide—and was not intended to provide—a complete answer to all investment problems. It gives a wide-sweeping survey of the factors that play upon investment values, and provokes thought about them. A certain looseness of form is inevitable with a structural scheme of this kind, and to this must be added an occasional looseness of writing. But it remains a useful book for all, whether future actuaries or not, who want to improve their knowledge and sharpen their thinking about investment matters.

Thanks for Your Shilling

Bernard Shaw's Rhyming Picture Guide to Ayot St. Lawrence. Leagrave Press, Luton. 31 pages. 1s.

This is George Bernard Shaw's last work—the amiable hobby of an old man who wanted to write about the village he lived in and to show off his photograph album. Ayot St. Lawrence is as distinguished and remote as any of the villages within thirty miles of London, and Shaw's shots of it show off its gentle features with true amateur care. Of the rhymes, the less said the better. Shaw calls them doggerel, and doggerel indeed they are. To describe the parish pump Shaw thought it proper to become the parish poet, and he turned out lines of a quality so dreadful that they would be embarrassing if spoken in rustic pageantry on the vicarage lawn. This is in fact his last literary jest, for there is plenty of evidence that he loved his adopted village and joined in its community. Warm feeling and buffoonery survived in his make-up to the end:

Now there is nothing more for me to tell.
Thanks for your shilling friend, and
fare thee well.

ECONOMICS—Postal Tuition

• Founded in 1887, U.C.C. provides tuition for the B.Sc. Econ. Degree of the University of London, open to all without residence or attendance at lectures. The College is an Educational Trust, not conducted primarily as a profit-making concern, and has a staff of highly qualified Tutors. Fees are moderate, and may be paid by instalments if desired.

• SELF-EDUCATION COURSES are available in Economics, Economic History, Statistics, Foreign Languages, etc.

AMERICAN SURVEY

State of the Debate

Washington, D.C.

IN 1949 Mr Truman began his annual message to Congress with the statement that "the State of the Union is good"; last year he was able to say that "the State of the Union continues to be good." This time, however, he had to warn the Eighty-second Congress that it faced "as grave a task as any Congress in the history of our Republic." The gulf between these two statements is the gulf between the comfortable assumption of the years since 1945 that the Soviet Union was prepared to take every step short of war and the realisation today that it appears to be willing to risk even open war. The economic evidence on which the optimism of the President's last two messages was based is still there. But it rated only a passing reference—"I am glad to say that our country is in a healthy condition"—in a speech which concentrated on the external dangers.

The evidence of the health, the rude health even, of the American economy was produced four days later in the Economic Report, but it failed to cheer anyone, least of all the President, who sent it to Congress with stern warnings of how much of the national output must go into the defence effort. In some ways the Economic Report was more frightening than reassuring in its implications. It revealed that, although current expenditure for defence only represents about 7 per cent of total national output, wholesale prices rose more than 15 per cent in the last six months of the year. The *New York Times*, in commenting on the report, said that the performance of the American economy during this period had been "on the scandalous side." By the end of 1951 expenditure for defence will be 18 per cent of output and there are any number of guesses as to what will have happened to prices and wages by then if the disagreements between Dr Alan Valentine, the Director of Economic Stabilisation, and Mr diSalle, the Price Administrator, are not resolved.

The whole Economic Report, when it dealt with the future, was so devoid of hard facts and clear estimates that it created almost no interest. Self-satisfaction about the dead past—even if it was not, as the *New York Times* thought, misplaced self-satisfaction—was little consolation in a message that spoke bleakly of "a defence effort of great size for a number of years." And the Budget when it came a few days later was so tentative, in spite of its unprecedented size, that it provoked neither enthusiasm nor apoplexy. It was a sign that Representative Martin, the Republican leader in the House, was himself tired—and bored by the inevitability of 90 per cent of the proposed expenditure—that he could find no stronger words for it than "the same old tired programme."

Such interest as there might have been in the economic and fiscal messages, or in those parts of the State of the

Union message which referred to such matters, or recapitulated the dangers to the free world and the intentions of the masters of the slave world, was drowned by the President's intervention in the debate on foreign policy and his appeal for unity. A few days before, Senator Taft had begun his 10,000-word speech in the Senate with the complaint that "a theory has developed that there shall be no criticism of the foreign policy of the Administration, that any such criticism is an attack on the unity of the nation," preferring not to remember that the "criticism" of the last year had consisted almost entirely of outrageous personal attacks on the Secretary of State and his staff. Mr Truman was able to remind the Senator gently that when he asked for unity he did not mean unanimity, and that there was such a thing as responsible and constructive criticism.

★

By comparison with what had gone before, Senator Taft's marathon speech was responsible and constructive, even though what it constructed was a crazy quilt of unrelated policies. And it had the advantage of bringing on to the floor a few days later many of those Senators, from both parties, whose opinions on foreign affairs are worth attention. Senators Connally, Lodge, Knowland and McFarland made prepared speeches and Senators Fulbright, Saltonstall, Morse and, of course, Taft joined in the debate. By the time the smoke had cleared Mr Taft appeared to have explained that what he had meant was exactly what Mr Lodge had said, and it was even generally agreed, among the Republicans, that, in spite of appearances, Mr Hoover obviously meant the same thing, too.

It was a curious afternoon, in which the Republican Senator Lodge showed again those qualities which he used to display regularly when Senator Vandenberg was in Washington. He took care to make a speech which would carry as many of his party as possible, but wasted little time on the irreconcilables. When Senator Wherry, Republican of Nebraska, asked whether he felt that, under the North Atlantic Treaty, the President could commit foot soldiers to be part of an international army, Mr Lodge snapped that "of course he can do it. . . . He can order them to go anywhere. . . . The North Atlantic Treaty does not stop him." But he worked patiently on Senator Taft, whose weakness is his habit of setting up straw men in order to knock them down. Mr Taft had talked as if there were an intention to send a million and a half men to Europe and he had disapproved of the idea, but he finally admitted that he would not object to committing "some limited number of divisions."

Senator Lodge pointed out that the Administration was at present asking Congress for eighteen divisions in all. "We have seven divisions in Korea," he said, "and we are starting to build a total of eleven more to be ready by the end of this year. That is not a vast army." In fact, he inferred, remembering those troops which must be kept in the United States for continental defence and to provide cadres, it represented probably a limited number of divisions. "We doubtless have more dollars per capita than any other nation,"

he remarked, "but obviously we have no more manpower per capita. In this respect all nations are alike and all alike should share the burden." He would, he said, commit no additional troops to Europe without an iron-clad agreement that their dispatch meant the automatic commitment of a very much larger number of European troops. This, Senator Capehart discovered, was "exactly what former President Hoover advocated in his speech some three weeks ago," a discovery which surprised Mr Lodge—and many other people—but which he accepted gratefully as proof that "we are close to agreement" and that the Senate need not "divide up into globalists on one side and retreatists on the other."

By the end of the afternoon many felt that the back of the opposition had been broken and that the great debate was petering out. But during the weekend the enemy rallied and Senator Wherry pressed his resolution that

It is the sense of the Senate that no ground forces of the United States should be assigned to duty in the European area for the purposes of the North Atlantic Treaty pending the formulation of a policy with respect thereto by the Congress.

And when the debate was resumed on Monday the quality of the speeches and of the speakers declined sharply. Senator Bridges was no better than usual and Senator Flanders made perhaps the silliest speech he has given in the Senate. Senator Kerr, Democrat of Oklahoma, enlivened a soporific Tuesday by saying that "some men become statesmen, some men become elder statesmen, but some merely become elder. I regard Herbert Hoover as a fine patriotic American but. . . ."

Everything now waits on General Eisenhower's return, not because there is any doubt about how the vote will go, but because his presence is needed to achieve the greatest possible unity. By the time he has got back to Washington and has had his say, the Administration and the Congress will probably be found in general agreement. Those who refuse to agree will be substantially those who have been opposed throughout to the Marshall Plan, the Atlantic Pact and all such adventures. And the debate which began with Mr Hoover's whimper will have ended with Senator Lodge's bang. At least, that is the present hope of Washington.

Fifty Billion for Defence

ALL the free world, as well as the United States, is concerned with the physical reality behind the astronomical figures of the Budget that President Truman presented to Congress last Monday. The reality that matters is not fact but faith. It is faith that by the end of this year the American economy will have carried very far its reconversion to defence work. It is faith that the defence expenditure authorised by Congress during the past six months will be bearing fruit in a greatly expanded flow of aircraft, tanks, guns and all the rest to the armed forces of the United States and its allies.

The proposed increase in expenditure no doubt reflects a considerable allowance for further rises in prices. Much of the money will be needed to pay the enlarged forces and for investments that cannot begin to contribute to current armament output until 1953. But, after all allowance for these elements in the programme, it is safe to say that the Administration will succeed in spending all it plans to do, in the absence of general war, only if the deliveries of finished armaments to be paid for have expanded very sharply by

the end of 1951. The proposed expenditure on military services between July, 1951, and June, 1952, is double that of the current fiscal year, for which the revised estimate is now put at \$21 billion (compared with \$12.3 billion in 1949-50); the budget estimate for 1951-52 is \$41.4 billion.

This is not the whole of the increase in defence expenditure. Foreign relations and foreign aid are to take \$7.5 billion, against \$4.7 billion in the current fiscal year; the President emphasised the changing purpose of American aid to foreign countries. The European Recovery Programme can now become relatively unimportant. The "great preponderance" of foreign aid in 1952 will be designed "directly for the rapid build-up of mutual defence forces"; more than one-half—that is, over \$3.5 billion—will consist of shipments of military equipment from the United States to allied countries.

These two main categories do not exhaust the defence expenditures. The costs of defence production carried outside the service departments are put at \$1,100 million (against \$200 million in the current year); the cost of economic controls is to rise from \$36 million to \$276 million. The Atomic Energy Commission is to have \$1,277 million instead of \$818 million. There are comparatively minor costs, almost entirely fresh, like \$330 million for civil defence and \$164 million for new government buildings dispersed, as an air-raid precaution, outside the District of Columbia. When these things (included amongst "other expenditures" in the accompanying chart) are added, the total defence spending estimated for 1951-52 comes out at \$52 billion, compared with \$26.8 billion this year and only \$17.7 billion (even if Marshall aid is reckoned as a defence expenditure throughout) in 1949-50.

Located in the heart of the City, the London office of this old established bank offers its services to those interested in trade with countries in the Americas and throughout the world.

LONDON . . . 7 Princes Street, E. C. 2

NEW YORK . . . 70 Broadway

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Here is the measure of American optimism about the speed at which industry can turn government decisions into ready weapons. The beginning of the current financial year coincided with the beginning of fighting in Korea. All the effort since then will have increased actual defence expenditure by \$9 billion in twelve months; in the following twelve months the increase is expected to be a further \$25 billion. As a proportion of the national income, the equivalent increases in Britain would be about £400 million in 1950-51 and another £1,100 million in 1951-52.

At \$52 billion defence will take almost three-quarters of the total expenditure of \$71.6 billion. The proportion has risen from 44 per cent in the last financial year to an estimated 57 per cent currently and 73 per cent in 1951-52. There is no possibility of finding the extra money for defence by cutting other expenditure. The whole of that other expenditure is in the present fiscal year \$20.4 billion; it is, in other words, only four-fifths of the increase proposed for defence in 1951-52.

Spending for purposes other than defence is to be cut by \$850 million (4 per cent) from the current level and by \$2,935 million (13 per cent) from that of 1949-50. These are net charges, implying much sharper cuts in some departments partially offset by increases elsewhere. Mr Truman naturally emphasised that "in order that our resources can be diverted to meet the demands of national scarcity, strict economy in non-defence spending is required," but in fact the main change is the automatic reduction in educational and other benefits provided for veterans of the last war. This yields in the new estimates an economy of \$835 million compared with the current year and of \$1,716 million compared with 1949-50. There are, in addition, some savings through changes of policy. Many public works projects have been curtailed. Stiffer terms for government credit will reduce house-building by more than a third, to 850,000 units this year. But, in general, the President's policy for civil expenditure is, in British terms, one of "consolidation," of abstaining from desirable new projects for peaceful times, not of retrenchment.

Something has already been done to limit inflation. The Government now expects to spend in the current fiscal year some \$5 billion more than the original Budget estimate, but the tax increases so far passed by Congress have, together with the inflation-bred buoyancy of the revenue, raised expected receipts by over \$7 billion. The current Budget deficit is therefore now expected to be about \$2.7 billion instead of \$5.1 billion. Existing taxes are expected to yield an additional \$10.6 billion in 1951-52; they will cover, that

is to say, about 40 per cent of the extra spending. Even so, if there were no new taxes the deficit would rise to no less than \$16.5 billion.

The President left no room for doubt that the tax proposals he will send to Congress within the next few weeks will be designed to bridge the whole of this gap, and perhaps a bit more. "At this time, sound public finance and fiscal policy require that we balance the Budget." The American people are to be asked to hand over to their government something like a further 6 per cent of their income. Fortunately, such reserves of taxable capacity do exist in the United States, if Congress agrees to tap them. With a balanced Budget of \$71.6 billion federal taxation will absorb the, by British standards, moderate proportion of a quarter of national income. (State and local taxes take about another 5 per cent.)

In Britain any net increase in government expenditure, even if on paper it is fully matched by extra taxation, must be almost automatically inflationary because the taxes will in one way or another be paid in large part by reducing saving from current incomes. The United States, starting from a much lower level of taxation, is perhaps still free from this dilemma. But a balanced Budget will not prevent inflation, even for the Americans.

With a rapidly expanding defence programme the Government's call on real resources is not measured by the actual spending of \$71.6 billion in the financial year. The President asks for contractual authority to spend in future \$94.4 billion. And, in the President's own words,

bidding for manpower and materials, which pushes prices upward, begins as soon as procurement contracts to be paid from these authorisations are signed, even though expenditures may not take place for a year or more.

Private industry starts investing—in new equipment, in materials, in goods in process—long before the government pays out, and inflationary pressure would be avoided only by a Budget surplus sufficient to offset this investment stage of the armament programme. That, plainly, is not President Truman's intention. He prefers to suppress some of the symptoms of inflation by "positive stabilisation measures"—that is, by price and wage controls and allocation systems. It is too early to try to guess how much may be lost, in the speed and efficiency of rearmament, by that choice—or by how little it may be, politically, the lesser evil.

American Notes

Basis for Mobilisation

The plan for universal military service which the Defence Department has outlined to Congress reflects General Marshall's conviction that the nation must prepare for a long period of tension and that it is better to make haste slowly than to plunge into emergency measures which the country would not tolerate for long in the absence of a full-scale war. It is one of the ironies of the situation that most of the proponents of an army of 6,000,000 men have been civilians, and that it is the generals who are not resigned to war, and have insisted that the aim, instead, must be a workable system of partial mobilisation which can be expanded rapidly if necessary.

The combination of universal service and universal military training which Congress is to be asked to approve, and which goes by the ungainly abbreviation of UMST, is a permanent measure designed to find the manpower needed to maintain 3,500,000 men in the forces, and assure a steady flow of trained men into the reserves. All 18-year-olds would undergo a 4 to 6-month period of basic training, and most of them would then serve up to 23 months with the forces, after which they would be required to join the reserves. The alternative, if the present Selective Service system is continued, is to start calling up married men, which is costly in terms of allowances as well as in disruption of family life, or to recall former servicemen, a step many people consider unfair. At 18, moreover, there would be the least interruption to education, and the least loss of skills to industry.

The scheme also provides for continuing at least a trickle through the educational pipeline by proposing the deferment of 75,000 college students a year for the next three years, in order to maintain the supply of scientists, engineers, and doctors. These men would take their training at 18, but the service requirement would be postponed until after graduation. The colleges would also benefit from an expansion of military scholarships, though the two provisions combined will hardly compensate them for the loss of the 400,000 men who normally enter each year.

In the field of arms production, it is also noticeable that President Truman called, not for the production of 50,000 aircraft a year, as President Roosevelt did on an historic occasion in 1940, but for the capacity to turn out that number. The aim of the Administration is to raise production from its present 250 a month to 2,000 a month by mid-1952; by the end of that year the number of Air Force groups should be nearing the latest goal of 95 to 100, and in the event of an emergency it is believed production could be very quickly doubled by opening stand-by assembly lines and working shifts all around the clock.

For the Navy, however, tomorrow's ships must be ordered today. The House of Representatives has authorised a \$2 billion programme to provide 173 new ships and the modernisation of nearly 300 more. Among the first group, to the Navy's profound satisfaction, is a 60,000-ton super-carrier, only slightly smaller than the *USS United States*, scuttled nearly two years ago by Mr Johnson, then Secretary of Defence, in the name of economy and the Air Force. Then, a carrier capable of launching today's larger aircraft would have cost \$189 million; now it will take \$235 million, a measure of military inflation.

Stabilisation Round the Corner

The economic stabilisers seem at last to be on the point of turning the corner round which lurk general mandatory controls on prices and wages. For weeks it has been recognised that the corner would have to be turned sooner or

later, but Mr Valentine, the head of the Economic Stabilisation Agency, has been trying to put off the evil day until his office is sufficiently well organised to face what is lying in wait for it. Experienced businessmen are apparently becoming more reconciled to joining ESA and its various divisions are at last being built up; but Mr Valentine still has only 450 employees, about one per cent of the number found necessary for the similar work in the last war, and there is certainly some justification for his delaying tactics.

On the other hand, the certainty that price controls are bound to come, and the uncertainty as to how and when and where (an uncertainty that has been increased by conflicting statements from all those concerned), has had much to do with the comparative failure of the voluntary price freeze which ESA introduced a month ago. It hoped to gain enough time by this means to develop a system under which price controls could be imposed selectively instead of all at once. It has been working out price agreements with individual industries, starting with the basic metals, and with the automobile industry, the guinea pig on which a mandatory price freeze has already been tried. But Mr Valentine has already called his Price Administrator, Mr DiSalle, to heel for advocating a general mandatory price freeze for thirty days. From the latest reports it appears that this is nevertheless coming within the week.

It is the rise in food prices, mounting steadily in recent weeks, that has pushed the stabilisers round the corner, but most of these must rise much higher before they can be effectively controlled. Congress, now clamouring to know why the cost of living is still going up, took care when it passed the Defence Production Act to protect the farmers from price control. And when President Truman suggested recently that the Act would have to be amended in this respect, the farm leaders in Congress made it quite clear that they had no intention of indulging his flight of fancy. But labour leaders, called to Washington last week to discuss the wage stabilisation that must by law accompany mandatory price controls, made it equally clear that they would not accept wage restrictions unless the rise in the cost of living was firmly checked. They made other conditions too, of which the most important was that responsibility for wages should be given to an independent agency, which they thought should also be responsible for handling labour disputes, as was the War Labor Board in the last war.

The Constitutional Issue

The old "twilight zone" between Presidential and Congressional authority has been lighted up, fitfully, by Senator Taft's decision to argue that Mr Truman had no authority to send American troops into Korea, and similarly has no constitutional right, without Congressional assent, to reinforce the European democracies. Resolutions to this effect are now before both Houses. The root of the debate is that, though the Constitution empowers Congress, and Congress alone, to declare war, it makes the President Commander-in-Chief of the armed forces. The only reins left in Congressional hands are the purse-strings and the threat of impeachment, and neither of these is likely to be employed in a war-like situation.

On the purely constitutional issue, there is no doubt that the bulk of judicial opinion is against Senator Taft; his own father, the Republican President, has been made to bear witness against him, on the inability of Congress to interfere with the President's movement of troops. What the Congressional critics can argue with more success is that the President was under no obligation to send troops to Korea; the legal—apart from the moral—obligation does not arise until the signing of the special military agreement with the United Nations. Nor, of course, did the ratification of the North Atlantic Pact involve any specific obligation to send

troops or arms in advance of an attack; the methods of developing collective defence were left to the judgment of the signatories.

Not all those who would like Congress to vote on the sending of troops—as it voted on the sending of arms—are trying to scuttle the North Atlantic Pact. Senator Douglas, who is miles apart from Senator Wherry on other issues, believes it would cement national unity to secure a favourable vote from Congress. And there is no doubt that, if General Eisenhower returns convinced of Europe's determination to defend itself, such a vote could be secured.

There is no certainty, however, that President Truman will take this apparently attractive course. He has promised to consult Congress—even to talk to Senator Taft, though, as he pointed out, this would be more easily and regularly accomplished if the Senator had been willing to accept the responsibilities of a seat on the Foreign Relations Committee. But to permit Congress to assert a veto over military policy would be dangerous; it might delay action in a future emergency and, as Senator Lodge has indicated, Congress is no place to debate or discuss military strategy. There is the additional danger that if the Wherry resolution came to a vote—which does not appear likely—the overwhelming approval of Congress might be frustrated, for a time at least, by isolationist filibustering. For Senators retain the right of unlimited debate.

But if Mr Truman is determined, and right, to stand upon his Presidential prerogative, the intense anxiety of the country over the commitment of American troops in substantial numbers, and the desirability of bridging any constitutional gap, also imposes on him an obligation to do more than he has done to convince the public that the course the Administration is pursuing is the right one. It is possible that Senator Connally may bring forward a resolution similar to that proposed by Senator Douglas which would not be binding on the President, but would range the Senate behind him on such a fundamental departure from past American foreign policy.

Steel Steps Out

At last the steel industry is stepping out smartly enough to satisfy even the President's Council of Economic Advisers; in their annual review they admit that plans have already been made to bring capacity up to 120 million ingot tons a year in the next three or four years. This is the capacity the Council thinks necessary, in view of the sustained defence programme at present contemplated, if steel shortages are neither to check economic expansion nor require an indefinite continuation of controls on civilian consumption. The steel industry has surprised even itself by the strides it has made lately: when its New Year's inventory of annual capacity was taken, it added up to 104,229,650 tons, about 1,000,000 tons more than had been expected, an increase of 4,800,000 tons in the year and of 22,600,000 since 1940. After the Korean outbreak, the industry doubled its planned expansion for 1951 and 1952; by the end of that time total annual capacity is expected to reach 115,000,000 tons.

Much of this expansion takes the form of additions to existing facilities, but the industry is stepping out in new directions as well, to the North Atlantic seaboard in particular. Steel-makers are moving there to be nearer the iron ore which may become so short in the next few years that the new steel mills may not be able to work to capacity. For the much threatened exhaustion of the Minnesota iron mines may have materialised before new mines in Labrador, Venezuela and elsewhere are fully developed. When they are, however, the leading steel corporations will be ready and waiting to receive their raw material by cheap ocean transport.

The US Steel Corporation is building a huge integrated

plant, with an annual capacity of 1,800,000 tons, to be finished by the end of 1952. It is on the Delaware River just above Philadelphia, and the National Steel Corporation is also building a new mill lower down on the other side of the same river. The Bethlehem Steel Corporation already has a plant near Baltimore in Maryland. And in addition the defence programme seems to be going to give New England the steel plant on which it has long pinned its hopes of checking its industrial decay.

There is another reason why steel is going to the sea: as a result of the Supreme Court's decision on basing point prices, steel consumers, for the present at least, have to pay the full freight charges from the mill. Steel firms that move into the rich industrial area on the coast thus have an advantage nowadays over competitors who remain in Pittsburgh or centres further west.

The fact that the government is encouraging the steel industry to expand has been taken as an indication that war is not anticipated this year; if it were, the steel that is going into the new industrial plants would be more useful in guns and tanks. The present rearmament programme is not expected to need much more than 10 per cent of steel output, while in 1944 war production was taking 40 per cent. This should not mean any severe hardship for civilians, but they will nevertheless have to do without some steel today, if they are to have steel (and other things) tomorrow.

In Self-defence

The chief reason for speeding the civil defence Act through the short session of Congress was to stimulate the 44 state legislatures which meet this month to pass the laws and appropriate the money needed for their own defence. Many of them will not meet again for two years. A sum of over \$1.6 billion in federal money was authorised—though it has not yet been appropriated—for the states if they would

find about \$1.4 billion of their own. Most of the states will give priority to preparations against an atomic attack ; this is true even in Connecticut where the incoming Republican Governor inherits a \$45 million yearly deficit from his predecessor. But a careful reading of the civil defence Act has somewhat blunted enthusiasm for the federal lead the states have been demanding.

New York State, for example, is entitled to draw up to \$249 million, in recognition of the fact that it contains 22 per cent of the people living in primary target areas throughout the country. But, as Mr Dewey indignantly points out, to obtain it the state must find an equal sum—one only a little less than the annual cost of its government. To make matters worse, a Democratic Congress, to prevent “boon-doggling,” insisted that none of this money—with certain exceptions—was to go to finance double-purpose, self-liquidating shelters. States such as New York, which hoped to finance a new underground railway and underground parking lots through federal grants, in part, at least, must rely, instead, on 50-year loans from the \$250 million revolving fund set up for this purpose in the Reconstruction Finance Corporation. The \$104 million scheme for shelters in the existing and proposed underground systems would be entitled to recover only about 1 per cent of the cost from Washington, according to Mr Dewey, and his indignation is echoed across the river in New Jersey. Mr Dewey does not even believe that single-purpose shelters would be of much value ; gaps in the radar screen may prevent the giving of warning in time to make use of them.

These complaints from the Republican Governor of the wealthiest state in the union—and one who has managed its affairs so efficiently as to produce a slight surplus this year—cannot go entirely unheeded in Washington. They certainly are not rooted in any underestimate of the seriousness of the situation. Not to be outdone by the White House, Mr Dewey has issued his own emergency proclamation: he has asked for the revival of the wartime bipartisan State Council, which in an emergency would have drastic powers to conscript manpower and private property without waiting for the recall of the legislature.

Shorter Notes

With the cancellation of the trade agreement with Mexico on January 1st, tariffs on lead are doubled, to 1½ cents a pound on ore and 2½ cents on metal, and those on oil imports go back to the rate established under the Venezuelan agreement in 1939. This allows an amount equal to 5 per cent of domestic oil production to come in at the half-rate of 10½ cents a barrel ; the rest must pay 21 cents. Venezuela has been allotted 60 per cent of the amount permitted at the low rate and the Netherlands 19 per cent.

Six months ago the New York State Legislature permitted those responsible for trust funds to invest 35 per cent of the money in so-called “non-legal” securities, such as common and preferred stocks. The policies of the various banks and trustees handling these funds varies, and in New York City so far only about half of the permitted amount has been transferred. It is estimated that there are about 20,000 trusts with a value of around \$4 billion in New York City, but for various reasons only about \$160 million of this is actually available for investment under the new legislation.

★

The Munitions Board is to stockpile wool as soon as the Quartermaster's Corps has completed its current purchase of \$100 million worth for a war reserve. Another new item on the stockpile list is guayule seed: the plant is a possible rubber substitute which is once more to be grown for experimental purposes.

★

As part of its good neighbourly attempt to eradicate foot and mouth disease in Mexico, the US government has been purchasing Mexican tinned meat, but has not sold it in the United States because Mexican standards have not been considered sufficiently high for American consumers. Now, however, the Secretary for Agriculture is relaxing this ban and permitting the taxpayers to enjoy the meat they have long been paying for.

★

A week after New York's private bus lines celebrated the New Year by putting their fares up to the 10 cents already charged on the municipal service, the fee for local calls on public telephones all over the state also went up to a dime (about 8½d.).

★

In the nine months since the Census was taken, there has been a net increase of 2,233,000 in the population of the continental United States, which now totals 152,340,000.

★

All restrictions have been removed on the amounts of maize and wheat that can be planted this year, although too late to affect the winter wheat crop, about 70 per cent of the total, which is already in the ground. Reserve stocks have been depleted in recent months more rapidly than expected, largely because of the big demand for livestock feed, and the Department of Agriculture is determined to run no risk of short supplies in the present emergency.

THE WORLD OVERSEAS

The Rousset Case

(From Our Paris Correspondent)

THE libel suit between M. David Rousset, ex-déporté and present campaigner for human freedom, and the Communist review *Les Lettres Françaises* has ended after sixteen virulent sessions. M. Rousset receives 100,000 francs damages from MM. Morgan and Daix, who must insert the court's judgment in ten publications including their own and also pay fines amounting to 30,000 francs for irregular behaviour during the hearings. The defendants will appeal.

While it lacked the boisterous sensationalism of the Kravchenko trial of March, 1940, the Rousset case has made a definite impression on French opinion, weary as that is of all totalitarian horrors. In France, indeed, the problem for democrats is not so much how to persuade people of the existence of Soviet labour camps—a nation which has first hand experience of one totalitarian system naturally expects similar practices in another—but to renew their vital reactions against bestialities which they would sooner forget. Thus at a given moment it is always doubtful whether publicity about the Soviet danger will “take.” The Rousset case, which was accompanied by a large newspaper campaign of Right and Left featuring many articles by witnesses at the trial, seems to have served the democratic cause well. A touch of the agreeably fantastic was added by *El Campesino*, the ex-Spanish Republican general whose innumerable adventures have been inspired by Venus as well as Mars.

Republican Idealism

David Rousset, the jovial *bon enfant* type of *militant* which disappeared from western Communism the day that the Soviet-Nazi pact was signed, is as abhorrent to the Kremlinists as Bertrand Russell or Ernest Bevin. Inmate of Matthausen and author of the famous *Univèrs Concentrationnaire*, Rousset manifestly knew what he was talking about. His personality and record have set a fatal stumbling block before the Communists who experienced no similar difficulties with Kravchenko. As commentaries in *Franc-Tireur* and *Le Populaire* have shown, Rousset has symbolised France's republican idealism, with its disappointed hopes and nostalgic reminiscence of Popular Front and Resistance.

At first sight the Communist handling of the Rousset affair seems mysteriously crude. Why, in the first place, was it necessary to insult Rousset when public abuse clearly risked a court action? Libel cases with their judicial framework and detailed scrutinies are quite unsuited to Communism's propagandist objective, which is to diffuse feeling rather than conquer in debate. Why, moreover, did MM. Morgan and Daix, when brought to court, have to renew their personal attack on Rousset by calling him a counterfeiter (*faussaire*)? It would surely have been so much more effective politely to represent him as a misguided unfortunate. As it was, the world at large has observed once more that the Stalinists are obliged irrationally but systematically to vilify anybody and everybody who levels any criticism whatsoever at the Soviet Union. The reason for this methodical general abuse is probably an internal one. It is, perhaps, the sole means which western Communist parties now have

of preserving their cohesion and their very identity. In France, for instance, only an extreme imposed orthodoxy could, at this juncture in Soviet foreign policy, prevent large desertions by the thinking sections of the French Communist Party. Only a rigorous division of blacks from whites could prevent a disastrous deviation of the inner rings (although not the hard core of *moscouitaires*) to an anti-Soviet (Titoist) or at least relatively independent and critical position. In this respect a man like Rousset must be a serious menace not only to the allegiance of the Communist masses but also—and far graver—to the loyalty of the initiates and semi-initiates. Therefore no challenge must be allowed to pass without riposte. The systematic vilification of the blacks is psychologically a way in which the Party maintains the camaraderie of its members, just as, consciously or unconsciously, the Soviet leaders themselves project all evil designs upon foreign capitalists. In a capitalist country this camaraderie of the besieged band of faithful is clearly of special importance.

Difficulties of Recantation

It is, moreover, naturally reinforced by the social ostracism which Communists inevitably suffer when they become real *militants*. For even if he be grievously assailed by doubt, it is no easy matter for the Communist to return to the circles which he once so contemptuously abandoned. In England the Communist “quitter” may be joyously welcomed back as a prodigal son with a “there! there! you've been through a bad time.” Not so at all in France where in Communism's heyday ordinary folk felt the cold breath of Communist disapproval on their necks and whole regions were virtually ruled by Communists. From 1944 to 1946 to be outspokenly anti-Communist was to be something of a courageous non-conformist ; and in certain places might easily provoke terroristic reprisals. In the intelligentsia, moreover, to become an ex-Communist involves tortures of intellectual humiliation, and where, as in the case of Louis Aragon, a whole reputation is puffed to the high heavens by the wind of organised flattery, recantation would amount virtually to self-extinction. Even Professor Joliot Curie might now feel a little lonely in the silence of his laboratory.

Maîtres Nordmann and Vienney, Kremlinist advocates of Kremlinist clients, were consequently forced to batter blindly at all and sundry. They questioned the competence of the tribunal, the regularity of the proceedings, the presence of journalists, the good faith of the witnesses ; they introduced wholly irrelevant topics such as camps in Madagascar, Greece and Spain ; above all they sought to discredit M. Rousset himself by calling him “prima donna” and “would-be film star.” With a neurotic impertinence peculiar to Communist propaganda before non-Communist audiences Maître Nordmann charged the tribunal with distorting French justice for the purpose of “framing” the Soviet Union. There is no doubt at all that the Rousset-*Lettres Françaises* suit has done severe damage to the French Communist Party.

Is Chinese Communism “different”?

It is not long ago that it was customary for western liberals, sympathetic to the cause of much-needed social reforms in China, to claim that Chinese Communism was somehow “different” from Russian Communism and even to write the word in inverted commas when used in a Chinese context. The Chinese “Communists,” it was commonly said, were merely practical agrarian reformers, whose Marxist-Leninist doctrine was quite superficial. The Anglo-Saxon mind has indeed been so long under the sway of empiricist and liberal thought that it now finds great difficulty in appreciating the force of ideological fanaticism or in believing that policy in great affairs really may be determined by a body of abstract doctrine. Nowhere has this attitude been more natural than in the Far East, for the Chinese over the last three generations have impressed foreign observers as a people exceptionally pragmatic and opportunist in outlook, with a minimum of fixed and definite beliefs.

However, these supposedly typical Chinese characteristics were precisely the qualities of the China which has been overcome by the Communists, and the latter have been victorious, not simply because they have been clever politicians with an attractive programme, but above all because they have been possessed by an intense energy derived from unquestioning dogmatic conviction. This dedicated zeal, which, by its contrast with the apathy and corruption of their predecessors, has won them the respect of so many observers far removed from the Communist faith, is just what also makes them a danger to the peace of the world and renders vain the idea that the new rulers of China are men ready to be seduced from their spiritual allegiance by a little diplomatic flattery or bourgeois blandishment.

The notion that the Chinese Communists are not good Marxist-Leninists arose partly from their apparent practice and partly from expositions of their creed which seemed to minds untrained in this field of theory to be divergent from the orthodoxy of Moscow. Visitors to Yenan in the period of Communist provincial seclusion found its rustic simplicity something quite unlike Russia, and even after the Communists had captured Peking, Shanghai and other large cities, the initial changes brought about in social and economic life were so much smaller than had been expected that they were taken as evidence of a moderation altogether alien to the spirit of Bolshevism. That this behaviour corresponded to a distinct political theory appeared to be confirmed by the proclaimed principle of the “union of the four classes” [proletariat, peasants, petty bourgeoisie and national bourgeoisie] under the leadership of the Communist

party—a conception which sounded less sinister in capitalist ears than the old formula of the “dictatorship of the proletariat.”

This Chinese variant on Communist theory, however, is really a legitimate development of Leninism, and is by no means incompatible with the faith as held in the Soviet Union. The Chinese Communists admit that their revolution is, in the words of Liu Shao-chi, “generally speaking, still a new-democratic revolution against imperialism and feudalism and not a revolution of a socialist nature,” but claim that “this difference does not in the least minimise its world-historical significance” because the Chinese revolution is a part of the world revolution, the base for which it has greatly “strengthened and expanded.” Or, as Chen Po-ta has explained the matter:

The Chinese Communist party was modelled on the bolshevism of Lenin and Stalin, untainted by traditions of social democracy. . . . The Chinese Communist party upheld the principle of the peasants’ war led by the working class. [Mao Tse-tung] campaigned against the vagabondism of the old type of peasants’ war. . . . The most fundamental point was the leadership of the proletariat, that is, the leadership of the Chinese Communist party or of bolshevism.

Flexible Tactics

The “fundamental point” is indeed the supremacy of the Communist party, which determines the character of the regime, even though the larger part of the national economy remains for the time being in private hands. In the original Marxist theory the objective was socialism and the forces for bringing it about were exclusively those of the proletariat. But once Lenin had put into the foreground of the theory the idea of a highly disciplined party of “professional revolutionaries,” which, because of its social objective, could be regarded as representing the proletariat (even though hardly any of the important leaders, either in Russia or in China, have been proletarian by origin), then the way was open for an extreme flexibility of tactics in exploiting all possible forces of discontent for the overthrow of the established order. Lenin exploited the land-hunger of the Russian peasantry as a revolutionary force, though the transformation of millions of tenants into peasant proprietors was formally contrary to the socialist objective, and the whole idea of an alliance with the peasants was then condemned by old-fashioned Marxists. Mao Tse-tung has gone even further than Lenin in the tactical use of class alliances; he has found room for the petty bourgeoisie and national bourgeoisie (i.e., Chinese capitalists without links with the Kuomintang or foreign capital) against the triple-headed enemy consisting of feudalism, bureaucratic capitalism and imperialism (i.e., landlords, business enterprises run by Kuomintang politicians and all foreign capitalist concerns).

Both in the Russian and Chinese examples what is

important from a Marxist-Leninist point of view is that the Communist party gains power by exploiting the short-term desires and grievances of various discontented classes, even though these have nothing in common with its own ultimate aims. When it has established its own absolute power, it can dispense with such alliances and proceed towards its goal at whatever pace appears expedient in the circumstances. In Russia the peasants to whom Lenin gave the land in private ownership were expropriated a decade later; a similar fate is intended in the future for the peasants and middle-classes who have supported, or failed to resist, the Communists in China. Since in Marxist doctrine the bourgeois-democratic revolution must intervene between feudalism and the socialist revolution, it is recognised that the Communist party in a feudal country must first carry out the bourgeois-democratic revolution before advancing to socialism, but when a Communist party performs this function, it cannot, of course, permit other political parties to compete with it, and therefore the form of state called “people’s democracy” or “new democracy” is adopted. If the Communist party is in power and orders the state so that it cannot be removed by peaceful means, then, as long as it is kept ideologically pure, it can make all sorts of temporary concessions to peasants or capitalists without incurring blame. Moreover, unlike internal policy, foreign policy is not affected by any need for going slow owing to the backwardness of a country’s economy or the absence of the technical conditions for socialism; the principle of the solidarity of the “democratic camp” (i.e., the Communist states) against the “imperialist camp” (i.e., Europe and America) operates from the beginning. Thus the policy of the new regime in China was very fairly defined in a broadcast from Peking a year ago as

the political line of internally carrying out the people’s democratic dictatorship under the leadership of the working class and internationally uniting with the Soviet Union and the revolutionary peoples of the world.

Education in Communist Poland

[BY A CORRESPONDENT]

WITH the new academic year the Communist regime in Poland began a determined drive to mould the universities to its will. As “seats of learning” in the liberal arts their end is in sight. They are to become at one and the same time forcing houses for the “new economic cadres” required by the Six-Year Plan and the fountain source of Marxist-Leninist precept.

The Bierut Government, occupied with things of more immediate importance, has only recently caught up with the universities which had been left to some extent to their un-Marxist devices. In August last, Mieczyslaw Hoffman,

Secretary of the Warsaw Communist party, foretold radical changes. He called attention to the alarming situation—in view of the demands of the Six-Year Plan for qualified experts—that only some 30 per cent of the university students were able to pass their examinations and graduate. (This was no doubt due to the forced admittance of large numbers of proletarian students regardless of their intellectual capacity.) He also emphasised the small numbers enrolling in Communist organisations. Of 30,000 students in the University and other colleges of Warsaw only 6.5 per cent were party members; of professors 16.6 per cent and of assistant professors 8.5 per cent were party members. Attributing the cause to the “weakness of the ideological offence,” he demanded that the Communist party “create an atmosphere in which students are forced to study systematically.”

“Schools of Class Struggle”

How this is now being put into effect was described in a recent speech by the Minister for Higher Education, Adam Rapacki, who spent some time in Moscow last summer. The Soviet system of training youth was, he said, to be the pattern for the new Poland, and by following it 146,000 additional college graduates were to be furnished for the Six-Year Plan. (Present Polish university student membership is about 100,000.) “The universities must become the schools of the class struggle,” the Minister declared. The percentage of peasant and worker students would be raised in the present academic year to 70 compared with 55 per cent in 1949-50. The older and less ideologically adaptable professors are to be eliminated to make way for younger teachers imbued with the new socialist ideals. It is this atmosphere, according to Mr Rapacki, which will produce the required 54,000 engineers, 8,000 agricultural experts, 20,000 graduates in economics and 20,000 teachers as laid down in the Six-Year Plan.

An entrance test on “political knowledge” has already been instituted in the universities. The study of Marxism-Leninism and the history of the Bolshevik party has been made compulsory in such faculties as social science, economics and law; so has the study of the Russian language. Chairs in Marxism-Leninism have been established in Warsaw and other universities. A special group of Marxist professors of history led by Professor Natalia Gasiotowski of Lodz University and Professor Arnold of Warsaw University have been given the task of revising the teaching of history in Polish universities and schools in the light of the class struggle.

To enforce the “discipline of study” students are now being organised into “watch groups” supervised by a “starosta” or monitor, responsible for their punctual attendance at lectures, particularly at political talks. He must report regularly to the dean as to the progress or the reverse of students under his care. Each group is further supervised by a professor or “guardian.”

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE
— ESTABLISHED 1835 —
48 Gracechurch Street, London, E.C.3

144

The Communist party has recently set up in Warsaw under the directorship of Adam Schaff, an "Institute for the training of Scientific Cadres." In a recent article in the *Trybuna Ludu*, Dr Schaff announced that the Institute was a counterpart of the Academy of Social Science of the Bolshevik Party. Its function will be to turn out indoctrinated teaching personnel for all Polish universities and technical higher institutions. He admitted that so far these had been woefully lacking.

In Polish grammar schools today, and to some extent in elementary schools, the lives of Lenin and Stalin are a part of regular study together with extracts from the works of Karl Marx with Lenin's interpretations. Historical subjects such as the French revolution and British rule in India are taught as presented by Marx. From the seventh form in high schools, modern history teaching includes lessons on political parties, social legislation, co-operatives, and what is called "fascist aggression since 1939." Marxist theories on the class struggle in the Communist Manifesto together with Lenin's interpretations have also to be studied in the higher classes, also the works of the Soviet scientists, Michurin and Lysenko. Polish-Russian history from the early wars of Stefan Batory with the Moscovites down to the partitions is taught from the point of view of Marxist dialectics.

Again, the ideological education of youth is one of the chief functions of the youth newspaper started last May under the auspices of the state-controlled Polish Youth Association with a membership of 1,200,000 boys and girls who also undergo training in military and various forms of national service in order to "be ready to defend the peace and fight the imperialists."

Under Minister Rapacki Polish youth is travelling swiftly along the Marxist road. Four years ago his predecessor in office, Czeslaw Mycech, was still able to declare: "Poland has decided to end the centuries-old quarrel with the brotherly nation of the Soviet Union and to sign an alliance, but we have also two other great nations as our allies, Great Britain and the United States."

Signor De Gasperi's Hard Task

[FROM OUR ROME CORRESPONDENT]

SIGNOR DE GASPERI and his colleagues have now had to turn their hands publicly to the unwelcome task of devising a policy of military preparedness. Government spokesmen have assured the nation that none of the high aims of civil policy are being renounced; the lira is to be kept firm, the agrarian and other social reforms are to be pursued. But evidently a second grade priority is all that can now be promised for the purposes to which in 1950 the Government was asking the nation to bend all its energies. It was typical of the present attitude that an article at the end of the year in the major daily paper of North Italy summing up the entire reform, as it is now being partially put into effect, as a product of competing demagogues resulting in lamentable impoverishment of the land, passed almost unnoticed. The arguments of rapidly succeeding Cabinet Councils since Christmas have been concerned not with reforms but with prospective restraints—price control, census of raw materials, restrictions upon private luxury production. All this—like the full equipment of seventeen, nine, or perhaps only six divisions, and the turning of Italy's industry on to war production—is in the future tense, but a future insistent enough to monopolise the attention of the present.

To render the Government's task as painful as it could possibly be, the Communist Opposition has breathed its softest, most Lydian airs, suggestive of a perfect peace round the corner if only brutal and boisterous men would pause to cull its flowers. Only three weeks ago the Italian Communist

THE ECONOMIST, January 20, 1951

Press received from the Central Cominform office hefty reproofs on its own softness and "Westerliness" of news presentation. *L'Unita*, eating crow, promised to be adamant. One awaited torrents of pitiless invective. Instead, its tones have become strangely dulcet towards that arch-enemy, the Holy See. Pope Pius XII in his Christmas and New Year messages, speaking tenderly of the ideal of peace, is alleged by the Communist commentators to have done so in tones of reproof to the American warmongers. It is hard to assess the fine shades of the Roman hierarchy's prose. But it is not only the Communists who have scented "Something New" (the title of a leader on Catholic politics in another para-Communist daily). The principal "bourgeois" daily of Rome, the *Messaggero*, in a singular article, hinted that Vatican policy was really taking one of those turns which are so bewildering to worldly politicians, like the conciliation with Napoleon immediately after his outrages against Pius VI. The Vatican's battle against Communism would stop short of any taking of sides in a struggle between states, suggested this important and judicious newspaper. This probable truth, pointed out with such emphasis, has given the cue for a recrudescence in Signor De Gasperi's party of that neutralism in foreign policy which is one of the forms of a persistent latent rebelliousness among some of its secondary leaders. There are no signs that this internal dissension among Italian political Catholics will attain big dimensions, but the task of national leadership is rendered all the harder at a miserably hard time.

Cheques and Balances in Ireland

[FROM OUR DUBLIN CORRESPONDENT]

In the last four weeks Ireland has experienced a bank strike, a partial stoppage on one major railway system and an inter-governmental agreement to purchase the other, the institution of a prices tribunal and the issue of a Government order designed to freeze prices. So set down, these happenings may suggest an economic society on the verge of dissolution: the surprising aspect of the situation is that life can go on as easily as in fact it has.

The bank dispute began on December 23rd when the Irish Bank Officials Association notified the Irish Banks Joint Committee that it proposed to withdraw its labour from that day pending satisfactory consideration of demands for increased salaries. Since then the banks have been closed under a series of permissive Government orders. The Labour Court intervened by using for the first time its powers to subpoena parties to an industrial dispute. The bank officials, who appeared to feel that the Court was going not so much outside its province as above its station in industrial life, attended under protest and the proceedings were marked by some acerbity. The Court has since published its recommendations. In them it points out that an agreement of 1948 provided machinery for the discussion of issues arising between the banks and their officials. It found "the Association guilty of a breach of faith, all the more reprehensible because committed by a body of officials who claimed that they occupy positions of trust and responsibility." It had no difficulty in showing that some of the salaries now claimed would be very far out of line with those given for comparable occupations. On the other hand, it pointed out that there were matters, such as the promotion bottleneck that now arises from a large intake of officials after 1918, that might well form the basis of discussion. It concluded by recommending that the officials should return to work and that the machinery agreed on in 1948 should be used to compose these issues. These proposals were rejected out of hand by the officials. The case, however, provided another example of the usefulness

of the Labour Court in examining such disputes, and thereby presenting the issues at stake so that the public can appreciate their merits. After some unofficial representations by the Government, an unsuccessful meeting of the parties was held on January 16th. In the meantime, the officials have constituted themselves as pickets or, rather, observers, outside their premises.

The spectacle of bank managers standing picket outside their own premises is not likely to excite the sympathy of the public but it has led to a fascinating instruction in the velocity of money and the nature of credit. Since it started on Christmas Eve, the strike found the public with unusually large supplies of currency. There was some anxiety lest firms should be unable to pay wages on the next pay-day but, so far as can be seen, no difficulty has arisen on this ground. Business firms have helped each other out. Hotels and cinemas have proved to be ample sources of ready money; and firms generally have been glad to dispose of large holdings of cash after Christmas. Cheques, cashed with local butchers and bakers, have supplemented currency; and there is some irreverent speculation on the number of them that will stand up when the banks reopen at last. Cheque-forms themselves are now coming to an end as the books are exhausted. The printers, in a gesture of solidarity with their new allies, have refused to produce fresh supplies: but there are few now who do not know all about making out cheques on sheets of notepaper. No one as yet has emulated Mr Haddock and executed a cheque on the flank of a cow; but the number of people who claim to have met the January instalment on income tax by the prompt issue of a cheque seems to be unusually high. So far as the general public is concerned, a certain shortage of small change appears to be the only inconvenience though there is some speculation on whether the banks will charge interest

on overdrafts for the period of the strike. The financing of imports also appears to have been maintained by agreement but this must present increasing difficulty as time goes on. The property market, although not very active at this time of year, has also been affected.

Trouble on the Railways

The railway dispute is in every sense a more serious affair. In December the three principal unions concerned with CIE (*Coras Iompair Eireann*), the major railway in the Republic, received an award from the Labour Court. Two of them accepted it and their members have remained at work. The third, the Irish Transport and General Workers Union, refused to do so and has been on strike since December 17th. The carriage of goods by rail has been suspended as a result although passenger services largely remain in operation. Attempts to divert to the road goods normally carried by rail have been frustrated by the strikers. This dispute is not merely a matter of wages. It is part of the struggle between the Transport Union and the unions affiliated to or associated with British unions which has plagued the Irish public so many times in the last decade. Politically speaking, the National Labour Party, which returned five members at the last General Election, was associated with the Transport Union. Its decision to join the Inter-Party Government in 1948, and its merger last June with the fourteen members of the Labour Party (which represents the other wing of trade unionism) was not well viewed by the leaders of the Transport Union who are thought to look upon *Fianna Fail* (Mr de Valera's party) with considerable personal sympathy. The strike is thus particularly embarrassing. It has now lasted considerably longer than, it is likely, its leaders expected; but its ramifications are liable to cause a general suspension, voluntary or involuntary, of work. In the meantime there is serious

Can figures make you short-sighted?

Burroughs sees farther

THE EYES of a business are in the office. It will be operating half-blind if delays and bottlenecks in this department interrupt the flow of vital facts and figures. The fault generally lies in obsolete figuring methods—and the price a business pays in rising office-costs can upset its whole planned economy.

Call Burroughs today, and clear the cobwebs from your calculating. There'll be a Burroughs business machine to fulfil your requirements exactly, giving your business vital facts and figures when they're wanted, and in the way they're wanted.

For a start, enquire about models 51435 and 51455—the British-made, key-driven, non-listing adding-calculating machines.

You can count on **Burroughs** 

ADDING • CALCULATING • ACCOUNTING • STATISTICAL MACHINES

The new Burroughs factory at Strathleven, Scotland, is now turning out an ever-increasing supply of business machines for home and overseas markets.

BURROUGHS ADDING MACHINE LTD.,
AVON HOUSE,

£9,999,999,999.19.11½

BURROUGHS ELECTRIC DUPLEX
ADDING-CALCULATOR

interference with getting in supplies that may not be available in a few months; and the general public grows less sympathetic to all forms of organised labour.

The other major Irish railway, the Great Northern, has had its own troubles. It operates partly in the Republic and partly in Northern Ireland. In the first, it works at a profit; in the second it has incurred a loss due, it is claimed, to the existence of the state-sponsored Ulster Transport Authority. With commendable independence the directors of the railway gave notice of their intention to close down the railway after December 31st. This brought to a head some discussions between the two Governments in Ireland. The result was the announcement on January 10th that they intended to purchase the system which, it seems, is to be operated by a joint board of representatives from north and south. The ability of the two Governments to come together again—this is the third major agreement between them this year—has given general satisfaction to everyone except the railway shareholders, who have been offered £3,900,000 for the system which, they claim, is worth £10 million. Both Irish Governments have a good record in compensating railway shareholders and it may be that the last word has not yet been said.

Australia's Fears of Japan

[FROM OUR MELBOURNE CORRESPONDENT]

NOT without good reason, Australia has a haunting fear that the Allied victory in the Pacific has not stilled for ever the expansionist ambitions of the Japanese. For this reason, Australians cannot regard with the same equanimity as the Americans the suggestion that the Japanese might have to re-arm themselves "in defence of their democracy." Australia was spared the horrors of occupation by the Japanese, but Australians have no illusions what such an occupation would have entailed, refreshed as they are by the stories of atrocities that were inflicted on Australian servicemen and women which still come forth with monotonous regularity from the Los Negros war trials.

There is little evidence in Australia of a "forgive and forget" attitude towards the Japanese. It is only slowly and with reluctance that trade with Japan is beginning to be accepted. Import licences are still granted only for scarce commodities which cannot be obtained from any other source. The flooding of the Australian market with cheap Japanese textiles before the war is vividly remembered by the trade and the public and there is a general determination that such devastating competition shall not be repeated.

For these reasons, suggestions that Japan should be re-armed are invariably received with undisguised hostility in Australia. As the Melbourne *Argus* pointed out after General MacArthur's latest pronouncement:

Fear of Japanese aggression is in our blood. During the last war we were threatened with annihilation by this people, and we have not yet had time to forget bombs on Darwin, the Sydney raid, or the great Coral Sea salvation, let alone Changi or the Death Railway of Siam.

This attitude must, of necessity, be considered in the development of the relations between Australia and the countries bordering the Pacific. Australia, according to a recent pronouncement by the Minister for External Affairs (Mr Spender) is still working for a Pacific Pact as part of its policy of security in the Pacific. Australia has made it plain to the American Government that such a pact would be meaningless without the active participation of the United States, and, in Mr Spender's words, "the question is still being pursued by Australia with the United States Government."

But here, Australia finds itself in a particular dilemma.

If Australia achieves its objective of a Pacific Pact, and secures full participation by the United States, it is clear that Australia must fall in with the American policy of admitting Japan as an armed and intimate partner of the Pacific bloc. Both Australia and the United States have a common objective in their policy in the Pacific—common action to block the spread of Communism in and from Asia. But a common means of achieving this raises in Australia at least grave disquiet if it means the building up of the naval, military and air strength of Japan.

Possible Inconsistencies

This is awkward, of course, and Mr Spender is fully aware of the difficulty it raises. With some emphasis he explains that "it makes plain sense to Australians that the closer the ties between America and ourselves the greater the security in the Pacific." This, as it stands, is undoubtedly true, but it is equally true that the prospect of a fully armed Japan, ostensibly standing athwart the mainland of Asia ready to protect Australia from possible attack from yet undeclared enemies does not make a ready appeal to Australians. The unbelievably poor response of the manhood of Australia to the call to enlist for service in Korea shows how seriously Australians regard the prospect of a direct threat from the Asian mainland. As the *Argus* pointed out, "there is no potential maritime enemy within striking distance, *except Japan*."

In its relations with other countries of South-east Asia, Australia also faces the charge of inconsistency in refusing point blank to agree to a common frontier with Indonesia in Western New Guinea, while at the same time it is giving material aid for economic development in South-east Asia and is making particular overtures of friendship to these countries in general, and to India in particular.

Both the Government and the Opposition are at one in their opposition to any transfer of sovereignty in Western New Guinea from the Dutch to the Indonesians. The Government and the Opposition would regard any change in sovereignty in Western New Guinea as a "grave threat to Australia's security." The Commonwealth Government is determined to exert every diplomatic means of preventing the territory from falling into the hands of the Indonesians. The former Minister for External Affairs indeed made the novel suggestion in Parliament last year that Australia might consider purchasing the territory if the Dutch were willing to part with it.

Concern over New Guinea

The concern over Western New Guinea has been resolved temporarily by the Dutch refusal at The Hague last month to cede sovereignty to Indonesia. The issues, nevertheless, underline the difficult position in which Australia finds itself in its relations with its near neighbours. In the past, the Australian attitude towards the peoples of South-east Asia has been more sentimental than realistic. There has been on the one hand a disturbing fear lest the great Asiatic hordes should decide to set envious eyes on the unpeopled lands of the Commonwealth. On the other hand, there has been a humanitarian interest in the backward peoples of East Asia accompanied by a vague desire to help.

As the nationalist revolution in these countries develops, Australia's interest becomes much more realistic than sentimental. This is shown by the strong stand taken towards Indonesian claims to Western New Guinea and the dilemma which the Japanese issue undoubtedly raises. The Government clearly finds it difficult to formulate a clear-cut policy on these issues in the welter of political, economic and racial cross-currents. It looks as if Australia's greatest difficulty will lie in maintaining friendly relations with countries whose policies may be running counter to western strategy.

women matter . . .

even when they natter

When we are about to advertise a product that appeals to women, we prefer to hear what women think about it before we burst into print.

We go about it in the practical way. We appoint a panel—of teen-agers if it's a teen-age product; mothers and mothers-to-be if it's a baby product and so on. They start by discussing activities related to the product rather than the product itself, but what comes out of their talk is vital stuff from our point of view—likes and dislikes, spontaneous criticism, suggestions and ideas and comparisons with competitive products.

It is intended merely to provide us with an indication of possible pitfalls and of issues that should be explored more thoroughly. Sometimes it serves only to confirm what we know already, but occasionally it reveals an unexpected need for deeper forms of market research.

Always it gives us and our clients a better understanding of the people who buy the product and that in itself is an encouraging factor towards successful advertising.

FESTIVAL OF BRITAIN

3 MAY — 30 SEPTEMBER 1951

A HUNDRED YEARS AGO Britain surprised the world by staging the first of all Great Exhibitions, housed in a vast palace of glass, the famous 'Crystal Palace'.

The Festival of Britain will mark the centenary of this event; but it is not just another Great Exhibition, nor is it a gathering dedicated to the Arts alone. It is a national Festival the like of which has never before been attempted. Britain's contribution to Civilisation will be the theme underlying the Festival of 1951. The story of that contribution, measured in terms of Science, Invention, Industry and Culture, will be told in Exhibitions in London, Glasgow and Belfast, and Festivals of the Arts in

twenty-three famous towns throughout England, Scotland, Wales and Northern Ireland.

At a time when the peoples of many nations live behind a veil of secrecy and suspicion, Britain will open her doorways wide. Visitors will have an opportunity as never before to get to know the work of her technicians, architects, craftsmen, painters, composers and dramatists; to see how her people live and work and use their leisure, and to enjoy the experience with them.

From the Exhibitions and Arts Festivals in the great cities to the traditional country ceremonies in the villages, for five packed months the whole nation will be on show.

THE BUSINESS WORLD

Co-operation on Commodities

AT first sight, the Washington proposals for dealing with the critical shortages of raw materials seem disappointing. No formal international scheme for the allocation of scarce materials has been proposed. No emergency shipments of vital raw materials from the United States stockpile to Western Europe have been arranged. No interference with existing commodity markets is contemplated and no restrictions on prices. On this showing the problem of securing enough raw materials to maintain full employment and a high level of industrial activity in Britain and Western Europe seems no nearer solution. A new international organisation is to be set up, supplementing the work of the Organisation for European Economic Co-operation, the North Atlantic Treaty Organisation and the Organisation of American States and supplanting the functions of the various international study groups. The decision to create yet another piece of machinery for international negotiation may be questioned when action is more necessary than words. But closer study of the proposals suggests a new approach to commodity problems.

The proposals themselves are simple enough. A number of standing international commodity groups are to be created, each with representatives of "governments of producing and consuming countries throughout the free world which have a substantial interest in the commodities concerned." The three sponsoring countries, Britain, the United States and France will act only as a steering committee, initiating and co-ordinating the work of the individual commodity groups and organising a general secretariat for them. The steering committee will apparently have no executive power. This simple organisation, lacking defined powers, is novel in the field of international commodity bargaining. This, it would seem, is no longer to be decided by the outcome of wrangles between producers and consumers. No longer will Britain and the United States champion opposite causes as they have in every international commodity discussion since the war. Instead, policy is to be the product of freely given co-operation between the major producers and consumers to achieve a common end—the defence of the free world. Let us at least hope so.

No official mention has been made of the commodities to be considered. The original list included sulphur, copper, zinc, lead, aluminium, cotton, wool and rubber. But it is known that this week the United States has sent out invitations to friendly governments to establish commodity groups for sulphur, zinc and cotton, in each of which the United States is the predominant producer and consumer. Nor has the exact composition of these groups been determined. Friendly countries with a substantial interest in a particular commodity will be invited to join; "substantial" is a word difficult to define statistically, but it implies that the groups will be small enough to enable them to work and large enough to cover a sufficient volume of world production, trade and con-

sumption to make their recommendations effective. The task of the groups is to recommend to governments the specific action that should be taken for each commodity "to expand production, increase availabilities, conserve supplies and assure the most effective distribution and utilisation of supplies among the consuming countries."

The communique issued after the Washington proposals had been made known to member countries of OEEC last week merely described the framework of the scheme. Its method of operation can only be a matter of conjecture at this stage. A special meeting of the OEEC has given the proposal unanimous approval. Commonwealth countries have promised their support. The Organisation of American States does not meet until March but no doubt the United States has already tested the reactions of the more important members. It would seem, then, that most if not all the countries concerned in western defence approve the scheme. It is now their job to make it work.

★

Considerable pressure has been exerted from time to time to resurrect the Combined Raw Materials Board. But it is well to recall the conditions under which such a board could be expected to operate successfully. It was successful during the war, first, because it was run by only two countries, Britain and the United States, with the assistance of Canada. Secondly, control of shipping space facilitated the control of raw material supplies since Britain and the United States allocated the available ships. Thirdly, the allies were enforcing a total blockade of their enemies, and the latter were in almost total occupation of Continental Europe. These conditions do not obtain today. If the Combined Raw Materials Board were to be re-established now, it would comprise many more than three countries and to get agreement on any specific action quickly would be most difficult. Nor can there be any question, at the present time, of imposing economic sanctions on any country until it is formally denounced as an aggressor by the United Nations.

Even at its best the CRMB could do little more than lessen the direct impact of certain shortages in consuming countries. It prevented bottlenecks from occurring or mitigated their effects. It was helped, too, by the fact that the allies were engaged on an all-out war effort; supplies for civilian consumption could be given second place or not even considered. Under present conditions such a board would presumably have to allocate supplies not merely between countries but also between defence and civilian requirements in the various participating countries.

The three sponsoring powers have evidently concluded that any formal organisation akin to the combined Raw Materials Board would be politically inopportune,

difficult to administer, and doubtful of achieving results. The new scheme is at once more flexible and much less precise. It will not enforce economic sanctions against any consuming country, nor will it necessarily spend weeks in delicate negotiations to achieve a unanimous recommendation. It would seem—though this is largely conjecture—that the real function of the proposed commodity groups is to see that important producers and consumers know about the supplies of and the requirements for each particular commodity. They will then recommend their governments to take appropriate action to achieve the common end. But that action need not be the same for all the producers or for all the consumers. Each country will decide on the action appropriate to its own political and economic situation, given this agreed position on supplies and requirements. Member countries will no doubt try to help one another as far as possible, but it will be voluntary help, imposed by their own spirit of co-operation rather than by a majority vote.

The study of methods of expanding production is likely to boil down to long-term projects and these will have to be co-ordinated with developments already agreed to under Point IV. Consuming countries may be asked to supply machinery and equipment to facilitate such developments. These matters will require close discussion at a later stage. A more urgent topic is the "increasing of availabilities." This phrase presumably means increasing exports to friendly countries—one evident way is by reducing exports to non-friendly countries. Again no uniform system seems likely to be imposed on exporting countries. Each will do whatever it can to expand supplies to the countries collaborating in common defence. Certain countries may find it possible to introduce a system of export licensing and still retain the operation of free markets. Other countries may prefer other methods.

In conserving supplies, the consuming countries will

have to consider the use of possible substitute materials and here the steering committee is likely to play an important role. Such co-ordination has not been characteristic of the international study groups, or if it existed it certainly did not work. The question of the distribution of supplies between defence and civilian requirements will be left to individual countries. But the defence programmes will be co-ordinated and agreed by other bodies such as NATO and OAS and presumably they will be given priority.

The vital question of stockpiling was not mentioned in the communique. Perhaps stockpile requirements will be included in the defence programmes. Clearly the possibility of a co-ordinated stockpile policy must be discussed in one of the various bodies. At the present time it is not only militarily necessary for a country to acquire stocks; it is also financially profitable. But in some circumstances, it may be better to have a stock of weapons ready for use than a stock of unprocessed raw materials. NATO would seem to be an appropriate organisation to discuss this topic in detail, though it can hardly be ignored by the new commodity groups.

The scheme is imaginative rather than compulsive; the approach is new and informal. There is to be no coercion by the steering committee, but the commodity groups will have scope to bring pressure upon their members. The new organisation could in time develop into a body of swift action. It cannot overcome the present raw material shortage immediately; it can only mitigate the more dire effects of the shortage on certain countries. It has no executive power and its usefulness will lie in providing machinery for multilateral negotiations on commodity problems without the need for convening special conferences. It seems loose and informal; but it could become a bold experiment in international co-operation if participating countries were determined to make it work.

Motors and Defence

LAST year the British motor industry produced 788,000 private and commercial vehicles and exported 540,000 of them. The industry now faces a cut in production that might on the least favourable assumptions amount to 20 per cent. Its only consolation is that this time last year it did not expect such great things of 1950. It was then supposed that enough steel would be found for 450,000 cars; in fact, 525,000 were built. Some of the extra steel sheet came from higher home production, but most of it was bought from the United States. In the last quarter of the year, about one thousand tons a week were being imported and the industry was able to raise its output to an annual rate of 564,000 cars.

Last week's announcement of a cut in car production was not unexpected. Production in the last quarter of 1950 was higher than normal and by contrast the seasonal reduction in output for the first quarter of this year was bound to be marked. Manufacturers no longer hold comfortable stocks of important materials and are thus more vulnerable to any delays in delivery. Allowing for seasonal factors of this kind and for the scarcity of non-ferrous metals, the Society of Motor Manufacturers and Traders thought that output in this quarter would probably be 15 to 20 per cent lower than output for the last

quarter of 1950. This estimate suggested an output of between 113,000 and 120,000 cars; these figures would be 11,000 to 18,000 lower than the number of cars produced in the first quarter of 1950 which is, perhaps, the better period for comparison.

There had been some speculation in the motor industry whether its supplies of sheet steel could be maintained, but it was only two weeks ago that the Ministry of Supply admitted failure to obtain any more sheet from America. Most of the imported steel had been going to the Pressed Steel Company, which is now receiving enough sheet only to work four days a week. Since Austin, Nuffield, Rootes, Jaguar, Rover and Singer all depend to a greater or lesser extent on Pressed Steel for their motor bodies, the flow of production in their plants is also threatened. Those car manufacturers who press their own bodies, or obtain them from suppliers other than Pressed Steel, are not affected yet; these include Ford, Vauxhall and Standard, but they fear that the Ministry of Supply will divert sheet to Pressed Steel in order to spread the limited supplies as evenly as possible over the industry. The total tonnage available is about 20 per cent less than the average rate of supplies in 1950.

Since other difficulties would in any case have reduced output by roughly this proportion, the steel cut is unlikely

to affect the total number of cars produced in the first three months, apart from temporary dislocation to the production schedules of Pressed Steel's customers. This does not mean that the cut has no significance. So long as the industry felt that the limit was set to output by the scarcity of zinc, it could fairly hope to recover some lost production later in the year. The Ministry of Supply promised the motor industry high priority for zinc, and although the die-casters have had a 15 per cent cut in their allocations, some other zinc users suffered a 50 per cent cut. The industry was also busy finding substitutes, particularly among plastics, for other scarce non-ferrous metals used in cars. A 20 per cent reduction in steel supplies may make these stratagems unnecessary. If deliveries of sheet could have been maintained during the first quarter of the year the industry could have built up its stocks in preparation for the competing demands of rearmament for the limited amount of sheet that comes forward during the summer. Lacking this breathing space, the industry will face a hand to mouth existence, and instead of being able to work on plans twelve months ahead, it will have to improvise and scramble for supplies.

Throughout 1950, exports of cars rose steadily; the Ministry of Supply demands that exports must be maintained at all costs, though to do so will mean cutting into the 110,000 cars already allocated to the home market. It is indeed hard to see how supplies of essential raw materials, so seriously reduced already, can feed both the rearmament and the exporting industries. Some confidence is placed in salvation from the opening of the sheet-making sections at Margam in the late summer;

but this will be a gradual process, for these mammoth plants take time to run in and later this year other industries apart from the motor industry will have important claims on part of its output. Sheet steel is by no means the only shortage. For the first quarter of this year, the large producers should be able to rely on long connections with their principal suppliers to tide them over the most obvious difficulties caused by shortages. But even these bonds could hardly survive the return of dire scarcity of particular materials and components; on paper, some breakdown of production and trade connections seems possible enough. There have been signs during the past few weeks of a greater concern on the part of some units in the industry to get defence contracts; by this means they hope to make sure of materials to keep their factories working.

★

The industry's immediate contribution to defence is likely to be limited. The present output of tanks can easily be handled by the established tank builders, and no subcontracting is yet called for. The aircraft industry has reserves of capacity, and even if the motor industry were called in to help it would have to learn a new branch of engineering before it could turn to producing gas turbine aero engines. The only contribution that the motor industry could make—without radical changes in its framework—is the supply of military vehicles, and even so, twelve or eighteen months might be needed to get them fully into production.

Defence orders for military vehicles are now being negotiated, but on lines that do not commend themselves

Where can your goods go?

The world is wide—but economic conditions, currency restrictions and the like exercise a limiting effect... It is part of the service of the Westminster Bank to provide the accurate and up-to-date information on trade conditions which must form the background to any discussions of new markets and new business ventures. This facility is included in the wider service which the Bank offers to all importers and exporters and which is described in a booklet called *The Foreign Business Service of the Westminster Bank*. Your nearest branch will be glad to give you a copy.

to a large and influential section of the industry. At the end of the war, the number and variety of spare parts for no fewer than six hundred types of vehicles in service use had created serious storekeeping problems. A private design experiment by Rolls Royce Ltd. evolved into what has become known as the "B" range of three engines, with powers ranging from 80 to 160 bhp. The War Office decided to standardise all its combat vehicles on this range, largely because the engines had been designed with 90 per cent of their parts in common; its object was sensible—to reduce the number of spares carried and also the large number employed in storekeeping and generally to simplify the problems of supplying a highly mobile army.

The logical outcome of this choice would be that the army no longer required engines designed by any other manufacturer. Rolls Royce is not a mass-producing firm in the sense that the motor industry understands mass-production and although the company designed the engines, it will not make large numbers of them. The first mass-production firm to appreciate the implications of this decision was the Austin Motor Company which recently obtained, in the face of strong competition, a contract for jeep-type army vehicles to be powered by the smallest of the engines; the company has since been given more orders. Last week it was announced that the Rootes group had been given an order for a large number of one-ton lorries and for some of the engines for them. Some of the combat vehicles still in store may have their engines replaced with "B" engines—the RAF is doing this to some of its specialised equipment—but it may still be necessary to place orders for a good number of heavy combat vehicles and their engines. Manufacturers working on design contracts have been told to choose their engines from the "B" range.

*

Some sections of the motor industry criticise this decision to standardise on the three designs. From the point of view of production it may not be an ideal arrangement. Some firms, like Austin, Rootes and Vauxhall, make engines for their own heavy lorries. These could change over quite easily to army contracts for their own types of vehicle and engine. But if the contract calls for a Rolls Royce engine, there will be delay for tooling up and training. Other manufacturers suggest that the engines do not lend themselves to mass-production, but the decision of Austin which, after some experience of the engines, is starting to produce them, does not seem to support this point. Further objection is taken to the higher cost of the "B" range of engines, which are

produced to higher specifications than standard truck engines. Army tests, however, have suggested that their longer life between overhauls and lower fuel consumption may outweigh their higher initial cost.

The Treasury as well as the War Office have approved the scheme to standardise on these engines, so presumably these arguments, including those involving finance, have been taken into account. It was at one time hoped that the engines of all army vehicles would be standardised, but approval was withheld on grounds of expense. Non-combat vehicles operate under less arduous conditions and their engines enjoy a more economic life; for these a more expensive engine would be something of a luxury. There are also large stocks of them held since the last war and to change their engines for the sake of standardisation alone would be an expensive proceeding. The army's scheme for full standardisation is, therefore, to be carried through in two stages, the second stage being at present in abeyance. Meanwhile, the number of new non-combat vehicles which the army will need to order depends on the condition of those in store. This is believed to be generally good, and many such vehicles are being sent back to their makers for overhaul. It seems unlikely, therefore, that very large orders will have to be placed for new non-combat vehicles, at least in the first stages of rearmament. In addition to these military orders, a certain number of special civil defence vehicles may be required.

*

Defence orders are the industry's insurance against the possibility of any fall in civil production, and for some sections of the commercial vehicle industry they may arrive at a useful time. But they cannot save the motor industry as a whole from several months of real difficulty. With one or two exceptions work cannot start on these orders, whether they are for combat vehicles with Rolls engines or non-combat vehicles with the company's own engine, without some disturbance of current production. When most of next year's output is already sold, these are serious decisions to take. There are strong pressures to stay as long as possible on normal car and commercial vehicle production in the hope that the most acute difficulties will prove temporary or that the Ministry will find a means of carrying out its promises to exporters. Whatever the choice may be, the industry and its leading producers will not make it without much misgiving. For the first time since the war, they may be faced with radical and painful decisions quite unlike any they have known in five years of sellers' markets.

Business Notes

Buoyant Markets

The Stock Exchange this week has not merely sustained, but has actually intensified, its paradoxical buoyancy—in defiant disregard of the news from China, the Cabinet changes at home, and the lowering shadow of the first defence budget. Equity values, after their sharp rise in the first week of the year—a rise that carried the ordinary share index of the *Financial Times* from 115.8 to 118.0—had paused for a few days around that level. But in the past week they have advanced almost every day, raising the index beyond 119, its best level for nearly two years. Since the low point reached just after full-scale Chinese intervention in the Korean struggle, this index has gained 5 per cent. Over the same period, Wall Street industrials (as measured by the Dow Jones index) have leapt by nearly 12 per cent, having been particularly strong in the past week—despite the huge programme of defence outlays and the promise of large tax increases that emerged from the Presidential messages to Congress. The dominant influence in both centres has clearly been the prospect of heavy and inflationary spending—but in London the market's response to this prospect has evidently been strongly coloured by hopes that a further thawing of frozen dividends will permit some of the presumed fruits of inflation to filter through to shareholders. This argument overlooks not only the patterns of domestic politics and the dangers of the coming budget but also—and this is a more significant omission—the fact that, even before defence threatened a new inflation, industrial companies were becoming seriously alarmed at the strain upon their capital resources. It would be most unrealistic to suppose that this strain will in future mount less fast than retainable profits after taxation.

It is even harder to find good theoretical grounds for the continued firmness of gilt edged securities, which have been steadily edging their way upwards for some time now, though without any spectacular movements. There is no reason, however, to suppose that this firmness is other than a quite "natural" movement, despite the approach of the date for the steel takeover. The official operators appear to have been relatively quiescent, and have shown no signs of forcing tactics. Meanwhile, the fruits of this buoyancy in the markets continue to be reaped in a harvest of new issues. The latest and most striking success was that of the Kenya issue, which was heavily oversubscribed and has since risen to a premium of $\frac{1}{2}$. The queue of applicants awaiting the chance to profit from this favourable—and perhaps temporary—mood in the markets includes both gilt-edged and important industrial borrowers. Among the latter, following on the heels of the success of the big operation by Tube Investments (whose new preference stock is now quoted at nearly 10d. premium), is J. Lyons and Co., which is about to launch a "rights" issue of 660,000 £1 shares (at £4 10s.); the existing ordinary and "A" stockholders are offered one new share for each three of the old.

*

The Cost of Promises

Last week's negotiations, if indeed they could be called such, between the National Coal Board and the National Union of Mineworkers ended with the "sympathetic consideration" that Mr Attlee had promised the miners a week earlier. The presence of a bloc of miners' MPs at Westminster has ensured for many years that negotiations about coal wages are always liable to finish in Downing Street; these latest negotiations changed the fashion only in beginning there—and in conceding in advance the principle of the claims without benefit of consultation with the miners' employer.

It remains to be seen whether, under the gentlemen's agreement between the Coal Board and the Minister of Fuel and Power by which the latter requires any proposed changes in home coal prices to be submitted to him for approval, the Government will be as eager to accept the financial consequences of this rise in coal costs. In the coming year the Coal Board will have to recoup not only this new rise in wages and the increase granted a few months earlier, amounting together to perhaps £15 million in a full year; it will also have to make up the revenue lost between the hope of higher exports at premium prices and the reality of lower exports partly consisting of American coal sold at lower prices than it cost. This suggests it may have to find some £20 million to meet increased prices and costs—equivalent at the present level of output to about 2s. a ton extra.

It remains, moreover, to be seen what results in coal output will flow from the new concessions to the miners. An extra 3,000,000 tons by the end of April seems a dim hope. The prospect of a general pensions scheme, and increases in pay of 5s. to 7s. a week for the majority of miners paid on day rates, may have some effect in checking loss of manpower from the pits, and enabling recruitment to build up the labour force. For these valuable considerations—the only item that the Board managed to refuse (though it again conceded the principle) was a second week's paid holiday this year—the miners gave verbal undertakings covering a slightly wider range of measures to increase output than they have done before. The union withdrew its opposition to the introduction of Italian miners, but this is a national decision and could be upset by local branches; Lancashire, however, last weekend reversed its previous decision and accepted them. The NUM spoke of an "all-out campaign" to reduce absenteeism and unofficial stoppages of work, of continued support for Saturday shift working (and its possible substitution for the alternative method of working an extra half-hour a day), of reconsidering stints, and of a possible temporary cessation of "cavilling" (a system of drawing lots for profitable workplaces in certain northern pits that wastes time and output in unnecessary transfers). For what they are worth, these words are no doubt welcome in Downing Street. Some of them are of a kind that have been heard before, though they did not manage to prevent the Grime-thorpe stoppage. The Coal Board, which is becoming dreadfully familiar with promises bought at a high price, is not allowing them to temper its general gloom—which now extends meteorologically to predictions of a bitterly cold winter.

*

Gambling on Weather

Coal stocks normally fall at this time of year, but the drop of nearly a million tons in the first week of 1951—from a level already critically low—has heightened the risks that will attend any lengthy spell of bad weather in the next two months. The week in question included New Year holidays in some coalfields, which cost the nation nearly half a million tons of coal, but consumption at the same time was lower than it had been in recent weeks. Stocks on January 6th amounted to 11,505,000 tons, little more than two and a half weeks' consumption for the whole country; the most serious shortage continues to be at power stations in the north-west, where the arrival of some American coal has not prevented stocks from declining towards a mere fortnight's supply.

In the second week of the year deep-mined output was higher than in the corresponding week of 1950, but opencast production, nearly a hundred thousand tons lower, kept total output below that of the second week of 1950. The industry has gained and managed to retain some 3,000

workers since the low point of 686,400 men in mid-November, and it has 600 more men at the coal-face; whether the faint hopes which this scrap of statistical evidence is arousing in the corridors of Hobart House are justified cannot be gauged until the effects of Christmas spending have passed. But it must be said that in certain pits manpower has fallen so low that further slight losses would have much more than proportionate effects upon production. Haulage and surface workers cannot be reduced below a safety minimum, and when this is reached any further departures involve taking men from the face to replace them and perhaps closing certain workplaces. Production therefore rests upon a narrow margin, and the chances of a dramatic expansion of output in the next three and a half months are slim. Immediate action to remedy the coal situation rests therefore upon control of consumption; the full effects of the Ministry of Fuel and Power's reductions in supplies to railways and domestic users have not yet been realised, but they will certainly not suffice during any prolonged break in the present mild weather.

* * *

Bankers on Retrenchment

When this issue of *The Economist* went to press five of the big seven banks had published their end-year balance sheets and four of their chairmen had issued their annual addresses. There is no doubt about the central motif of this year's addresses. In the words of Sir Jasper Ridley, the new chairman of the National Provincial Bank, the provision of hundreds of millions of pounds for additional defence expenditure can surely best be met by postponing "to an easier and more spacious day the spending of harassed pounds on other objects, however desirable they may be." Sir William Goodenough, of Barclays Bank, stressed the same point when he argued that extra taxation should be used only as a measure of last resort since by "disrupting sound habits of work and thrift, direct taxation itself becomes inflationary when it passes beyond a certain level." Sir Thomas Barlow, of the District Bank, in effect applied the same stigma to indirect taxation; he dwelt in particular on the crippling effects of the present level of purchase tax on producers of non-utility textiles. Mr A. H. Bibby, of Martins Bank, laid especial emphasis on the need in 1951 for restraint in personal claims upon production and for an adequate supply of capital to trade and industry.

Despite the deterioration in the international situation, the year 1950, to quote Sir William Goodenough, "has not been entirely unfruitful" in the economic sphere. Perhaps the most satisfactory feature of it, as all the bank chairmen pointed out, has been the revival of confidence in sterling. For the banks themselves it has been a year of expanding resources. The five big banks that have so far issued their balance sheets record an expansion in net deposits of about £116 million in 1950—some £34 million of it in the last six weeks of the year. About three-quarters of the year's increase may be accounted for by an expansion in advances, the bank's most remunerative asset. The bank chairmen, however, were not inclined to misread this as a wholly healthy sign. As Sir Walrond Sinclair, of Williams Deacon's Bank, pointed out, increased demand for advances is largely the result of high raw material prices and of the undercapitalisation of British industry after ten years of heavy taxation and of diminishing buying power of money.

Gradualism in Steel

While the responsibility for licensing private steel firms under arrangements announced this week belongs to the Ministry of Supply, the Iron and Steel Corporation is now in being, and is cautiously approaching the task of taking

over its nationalised share of the industry on February 15th. The Corporation has an office—two floors of a block near Victoria Station—a nucleus of staff, and a very little to say about its primary policy.

The day-to-day general management of the 80 to 90 companies and 200 subsidiaries it is taking over will be left in the hands of their directors and managements, who are being asked to remain—and it is expected that a large proportion of the executive and technical directors will consent to do so. The Corporation will not operate as a "functional board" on Coal Board lines; its immediate concern will be with finance, development plans, prices, labour conditions, and broad management policy. Despite the Ministry of Labour's gaffe last year concerning the Corporation's methods, the declared intention is to operate upon anything but Civil Service lines; it has been recruiting a fairly small staff, but the final size of the central organisation will depend mainly upon whatever division of responsibility is finally agreed between it and the British Iron and Steel Federation. This division is presumably being discussed at present between the two organisations. While there are certain spheres of activity that may eventually be transferred to the Corporation, it is likely that some matters affecting the industry as a whole, nationalised and privately owned, will be left with the Federation.

A brief but comprehensive survey of the industry that the Corporation will be partly acquiring appears this week in the Federation's *Statistical Bulletin*, reviewing the last "Five Years of Progress." Since 1945 the industry has passed its first objective of 16 million tons, which it did not originally hope to reach until 1952-53; the amended target of 18 million tons, which the Plowden Committee decided would be required by 1955, is now "well in sight," though mainly dependent upon material supplies. The survey makes clear once again the Federation's understandable preference of the system of public control exercised through the former Iron and Steel Board. A major share in development policy, obviously, will pass to the Corporation; its reception of and action upon the industry's second development plan, which is presumably well advanced, will provide a fairly early test of its power and its policy.

* * *

Month's Respite on Metals

Though the prohibition of manufacture of certain goods from zinc or copper has been deferred for a month, so that it will not take effect until March 1st, makers of these goods have acquired from the decision no right to further supplies of metals in the meantime. The Minister of Supply's decision this week did not in fact reflect any change in the supply of non-ferrous metals; the postponement was merely a concession by Mr Strauss to representations from the Birmingham Chamber of Commerce and trade associations—and from certain Midland MPs. The Ministry was later at some pains to explain (for foreign as well as home opinion) that postponement did not mean any relaxing of rationing plans; it pointed out that the new date for the prohibitions would be the same as that upon which the United States will impose a similar ban.

The decision was also taken, according to the Ministry, to keep in production firms necessary in defence production. The mass of small firms in the industries using non-ferrous metals—particularly among brassfoundries in the Midlands—which are potentially much more important in terms of skill than of present output or use of materials, may justify this view. But if these firms are necessary for the enhanced defence effort, it seems doubtful whether permission to use up their scanty stocks for a month will grant them a very effective lease of life; it does not seem likely that defence sub-contracts will be reaching them upon any very large

HALT!
Who goes there?

Unless it is stopped, corrosive water eats insidiously into the iron and steel pipes of many industrial water systems. This corrosion is a trouble-maker which brings dislocation of work and high maintenance costs in its train. But Calgon (Albright & Wilson's Sodium Metaphosphate) introduced into the system by what is known as Threshold Treatment will halt corrosion and banish the troubles that arise from it. A few parts of Calgon in a million parts of water effect a cure—a cure which our technical department will be pleased to discuss with you.

scale within the next few months. Their survival will depend rather upon their ability to switch to alternative materials or products; the extra month may certainly assist them to adjust to changing circumstances—which is, after all, the most important part of management.

* * *

Fewer Tins of Food

Though the closing of certain food-canning factories as a result of further tinplate cuts is less important in terms of production now than it would be if fruit and vegetables were being harvested, the new cuts are serious for the industry and will soon become vexatious for the housewife. The season for canning fruit and vegetables runs from about May to October; for herring it varies in different districts from February to September; and even for milk there are seasonal peaks in spring and autumn. But in the present off-season firms are generally running their factories well below capacity, canning various miscellaneous foods partly in order to keep workers employed. A threat to the industry's labour force is thus perhaps the most serious immediate effect of the shortage of cans—though shortages of what were formerly considered less popular foods, such as spaghetti, seem already to have caused a surprising volume of public protest to the Ministry of Food.

Within a total allocation of tinplate, the Ministry sets priorities between different preserved foods to guide the container firms in supplying individual firms; milk and herring tend to be favoured more than vegetables or fruit. The effect of successive cuts, however, is being felt in all sections of the industry; total tinplate supplies to the canners were about 18 per cent lower in 1950 than in 1949, and the latest cuts set supplies for the first quarter of this year 17½ per cent lower than in the first quarter of 1950. Last year the preserved food industry canned roughly 600,000 tons of food and used more than 200,000 tons of tinplate; the prewar pack of about 360,000 tons used to take about 120,000 tons. Changing containers is being more widely discussed in the industry than practised; aluminium, the only alternative metal, is scarce apart from its price. One manufacturer at least has begun packing certain vegetables in glass bottles, and jam is almost entirely packed in glass once again. But each bottle normally needs a metal closure; and glass bottle production, which incidentally requires large amounts of coal, is already running close to the manufacturers' full capacity.

Resentment in the canning and container industries is focused upon the high rate of British tinplate exports which are largely responsible for the cuts in home consumption, since production was still rising in 1950. This rate of exports, in which the Board of Trade, the Treasury, and the Ministry of Food are all concerned, rose by 57,000 tons last year to 252,000 tons, while home tinplate consumption dropped by 45,000 tons. To the industry's assertion that it would be more profitable to export tinned goods worth probably fifteen times the value of flat tinplate sheets, these Ministries reply that existing trade agreements, and the liberalisation of trade policy, deter them from curtailing exports (from the plate manufacturers' point of view, it may be possible to get 10s. to 15s. more for each basic box of tinplate exported than by selling it at home). Among the trade agreements which the Ministries hold inviolable, incidentally, is one with the Argentine, to which last year Britain sent more than double the amount of tinplate than was shipped in 1949. Continued deliveries of tinplate after the Argentine stopped sending meat, therefore, may easily have enabled it to continue canning its surplus beef, and assisted it to hold out in the meat negotiations with this country, but when present contracts are completed, further tinplate for the Argentine will be strictly dependent upon meat shipments.

Brabazon and Comet

The third de Havilland Comet made its first flight last week and so became the first production version of a gas turbine civil aircraft to fly anywhere in the world. On the same day an official statement at last confirmed that the Bristol Brabazon would not be put into commercial operation and that work on the project would cease on completion of the second prototype. With the Brabazon abandoned, it seems unlikely that that other aerial dinosaur, the Saunders Roe Princess flying boat, will go into commercial operation either. The Brabazon is a splendid technical achievement and victim of a change in airline policy. There has been a move away from the standard of travel epitomised by luxury non-stop Atlantic crossings, for which the Brabazon was intended, and towards the fast, but more austere, travel offered by the Comet.

This does not mean that BOAC is now basing its policy on the Comet alone. The corporation has on order from the Bristol Company twenty-five of the turbo-prop "175" airliners which, in final form, will have roughly the same range as the Comet. Like the Comet, the "175" will probably be suitable for Atlantic crossings with one or two stops. De Havilland's recent decision to experiment with alternative engines for the Comet suggests that the aircraft's performance is not at present as economical as the airline operators would wish. Equipped with the company's Ghost engines, the Comet can compete with aircraft now in operation; what is less clear is whether it will compare so favourably with the type of aircraft likely to be in operation in a few years' time. The first few Comet aircraft delivered to BOAC will have Ghost engines, but the remainder of the order will have Rolls Royce Avon engines, if Rolls Royce is able to supply them. The Armstrong-Siddeley Sapphire has been mentioned as an alternative, but this engine is not yet fully developed. The object of the change is to give the Comet more power and to reduce its fuel consumption. These changes are of consequence because engine installations cannot easily be modified, and the pressure system of the present Comet, the key point in turbo-jet aircraft, runs off the engines' compressors in a way which could not be done with the Avon or Sapphire engines. No doubt the de Havilland company will find an answer to these difficulties. The company has wisely resisted pressure to make an earlier change of engine, and its ability to do so, coupled with the comparatively smooth development of the Comet illustrates the advantages of keeping the aircraft as a private venture. It is in contrast with the generous spending of public money and enthusiastic use of design resources that have marked some other less successful projects.

* * *

More Softwood, but When?

Six months ago the softwood trade was in a sorry plight. At the end of June stocks had fallen to the very low level of 170,000 standards, and there was little hope that imports for the year would reach even the reduced target of 1,050,000 standards. The prospects for 1951 were no brighter. The timber trade with European countries was returned to private hands in the autumn, but supplies were scarce and prices were high. The Timber Control, chastened by the Seventh Report of the Select Committee on Civil Estimates, was willing to buy in Canada and the United States even at inflated prices if that could have conjured up supplies from nowhere. Then the chance came.

In October the Federal Reserve Board restricted instalment credit for house building and purchasing in an attempt to stem the internal American inflation. The effect of this action on the timber trade was surprising. Producers found that contracts were cancelled and prices of softwood in the United States fell. The Timber Control saw its opportunity and bought; according to reports, some 800,000

standards have been purchased and a further 450,000 standards contracted for. In all it is estimated that Britain should receive 1,250,000 standards from North America in 1951.

These purchases have at least turned shortage into adequacy, and they have also strengthened the bargaining power of British timber merchants in their negotiations with Sweden and Finland. It is an interesting illustration of what may happen in other commodities—some day, and probably not soon—when American demand contracts. Like the Timber Control twelve months ago, the timber trade has been unwilling to pay the high prices asked by the Scandinavian producers. Private imports this year are, however, expected to reach 500,000 standards. On this basis, Britain should receive about 1,750,000 standards, which would be sufficient to meet requirements (1,500,000 standards) and to leave something over for replenishment of stocks.

On paper, there should be an adequate supply of softwood this year. The real difficulty will come in shipping the timber to this country. The Timber Control has already discovered that the chartering of ships to bring American coal to Britain has created a dearth of American west coast tonnage. Certainly for the first part of the year the shortage of shipping space is likely to become more acute rather than less. But at least it is something that the Timber Control has learned the lesson that dear timber is better than no timber at all.

* * *

Wool Jumps Again

The behaviour of the wool market since the turn of the year defies description. Indeed the further sharp rise in prices in recent weeks has become difficult even to draw, as can be seen from the accompanying chart. It is not strictly accurate to compare wool prices from week to week because the qualities and grades offered differ. But there is no doubt that since the second half of the selling season opened a fortnight ago wool prices have risen broadly by 20 per cent compared with the December level. According to market reports the main pressure of buying has come from Britain and the United States. Bradford was very doubtful of the

staying power of prices after the sharp rise last September, and fearing a fall, it bought only relatively small quantities of wool in the first half of the season. It has now to make up for lost opportunities at very much higher prices. American buying has been mainly for defence contracts.

Even before Korea it was clear that wool would be dearer in 1950-51 than in 1949-50 (when record prices were reached) owing to the high level of consumption, the prospective shortage in supplies and the existence of inflationary conditions. There are some signs, but by no means definite ones, that civilian consumption of wool is beginning to

decline. But there is no sign that inflationary conditions are likely to be curbed in the immediate future.

When the present high cost of raw wool comes to be reflected in the prices of wool textiles, some consumers may be alarmed, despite the best efforts of manufacturers to limit the rise by mixing wool with cheaper fibres. Whether their alarm will stop them buying is another matter. Opportunities for other forms of spending will be restricted as defence production cuts into civilian production, and consumer resistance to higher wool prices might be small. A bigger danger facing manufacturers might be the institution of price control, though this would have to make some allowance for the present high cost of raw wool.

* * *

Power in Zinc Packets

One of the few articles in which the ordinary consumer buys much zinc across the counter is the ordinary dry battery for a radio set, torch, or cycle lamp. Many types of dry cell use zinc both electrically and as a conveniently robust casing for the other elements in the battery; but sizes vary from a railway signalling battery, in which there may be three pounds of zinc, to a tiny hearing aid battery taking no more than a few grammes. Approximately seventeen million cells are produced in Britain each week; thus the industry is an important end-user of rolled zinc (as well as of brass for batteries, torches, and lamps), and reduced supplies of zinc will present it with important production problems.

In 1949 the industry used about 11,000 tons of zinc to make about 862 million unit cells, and last year consumption rose to about 11,500 tons to make about the same number (presumably including a larger proportion of the heavier cells). This year it had plans to reach 900 million cells, taking 12,000 tons of zinc. The electrolytic grade used in batteries is to be cut generally by some 30 per cent, according to the Ministry's allocation scheme, and this would impose a considerable check upon the present rate of production and on future expansion. In fact, however, it seems unlikely that the loss of production will be nearly so serious as this. There is some reason to believe that the official allocation may be more lenient; dry batteries are essential not only for much service radio and telephone equipment but for vital civilian communications such as railway signalling and standby power for the GPO telephone system. Some economies in zinc may be possible in production, though in the last ten years one almost revolutionary change in battery construction has already taken place, from the multi-cell battery to the more compact and economical "layer" type. A factor of perhaps greater importance is that the Ever Ready Company, which dominates the dry-cell industry, is itself an important producer of rolled zinc from bought ingots.

* * *

American Coal for Europe

Europe's imports of American coal this winter will amount to about four million tons including 1,200,000 tons bought by this country. This is less than Europe requires—eighteen nations recently attending the Coal Committee of the Economic Commission for Europe at Geneva hoped to import in the first quarter of this year five million tons more coal and a million tons more coke than European exporters could offer. There is no coke for shipment from the United States and since ECA is releasing no dollars for extra coal, the nations concerned are spending their free dollars reluctantly upon expensive American coal which incurs ever-rising freight charges for delivery across the Atlantic.

Apart from Britain, purchases will be roughly as follows: Belgium 500,000 tons, Austria 150,000 tons, France (including French North Africa) 600,000 tons, Greece 60,000 tons,

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
Manchester Branch: 52 Mosley Street, Manchester 2.
Liverpool Branch: 27 Derby House, Liverpool 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

With over 80 Branches at the leading centres of Industry and Commerce in India, Pakistan, Malaya and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

Eire 125,000 tons, Switzerland at least 100,000 tons, Portugal 75,000 tons, Italy 300,000 tons, the Netherlands 700,000 tons, Finland 50,000 tons and Norway 450,000 tons. These cover roughly the first four months' needs though some of the coal may not be delivered until after April. The Committee is meeting again shortly to consider coal supplies and needs in the second quarter of 1951, and will attempt to devise some stricter allocation scheme for "essential" coal demands this year. Here the inevitable squabbles about competitive degrees of need arise: the steel-producing countries, for example, feel that they should have an over-riding call upon supplies of metallurgical fuels, but the Scandinavian countries, which use coke for domestic heating, argue that their needs are equally important.

Future supplies are uncertain. The Germans have been ordered by the International Ruhr Authority to accept an export target for this quarter about a million tons higher than they desired; conceivably they will simply allow their deliveries to run into arrear. Poland has not withdrawn so completely from the coal market in Western Europe as had been expected; but it has been raising its prices almost to American levels, so that the order of coal prices on the Continent now ranges from American, the most expensive of all delivered, through Polish, Belgian, French, and British down to German. German coal exporters are anxious to raise their prices, and if the occupying authorities agree this may exercise a corrective influence upon estimates of coal need. In recent months import requirements have been inflated partly because no nation is willing to forgo its quota of cheap German coal. The National Coal Board, which precipitated matters last summer with its cuts in exports, is now continuing export deliveries to meet some two million tons of arrears on 1950 orders. But at present, except for certain contracts agreed with countries that have already agreed to cancel orders in arrear, it is hesitating to accept export commitments for this year.

Rise in Oil Prices

This week's increases in the maximum prices of petroleum products (ranging from a farthing a gallon for 100 octane spirit, to 3d. for diesel oil for road vehicles and to a halfpenny for motor spirit) follow the oil companies' regular half-yearly review of their freight costs and are not the result of any increase in the price of crude oil. The American Government has, in fact, taken steps to freeze Gulf oil prices at the December levels. The cost of operating tankers, as well as the cost of internal distribution, has been rising steadily and one of the biggest factors has itself been the increase in fuel prices. But more important is the fact that since the start of fighting in Korea, the charter charges for tankers have risen sharply while the number of tankers available for charter has fallen. The oil companies carry about 50 per cent. of their products in their own tankers and charter the remainder, usually on a 5-year basis. Some of the older agreements have been made on terms which are by present comparisons very favourable to the oil companies, but those made now are more than 100 per cent. above the general level of charges in June and will probably continue to rise as the shortage of tankers becomes more acute. The fleets in the Far East have made heavy demands on available tonnage; there are no storage facilities in Korea, and a number of tankers are being virtually taken out of service to act as floating depots. These are fortunate if they complete one round trip in the time in which they would normally have completed ten. More tonnage must wait until the tanker construction programme is completed.

Integration and the St Pancras Strike

The unofficial strikers at St. Pancras returned to work on Wednesday night after the Railway Executive had agreed to postpone the scheme for the integration of road and rail

goods services to Glasgow. The Railway Executive acted after urgent representations from the National Union of Railwaymen that the scheme should be discussed once again by the joint committee so that the points raised by the strikers could be aired and explained. The scheme is now due to come into force on January 29th, but, somewhat ominously, the strike committee has not been disbanded.

That employees would become the most difficult obstacle in the way of the integration schemes which were hailed as the chief purpose of the Transport Act seems never to have been seriously anticipated. It is obvious now, however, that integration will be impossible unless employees are satisfied that they will not suffer either from redundancy or even from inconvenience. It may well be that there was more to the St. Pancras strike than a simple breakdown of labour relations—the unions, after all, had been fully consulted about the scheme—but not all the mutterings of the strikers were inspired by trouble-makers. There seems to be a genuine fear that improved efficiency must mean redundancy, and far too few attempts have been made to explain the changes which might result from integration.

It is a poor prospect for the Transport Commission. Its main hope of turning its deficits into a surplus lies in the improved efficiency which integration should bring about. But if every goods worker, porter or engine-driver is going to strike every time a new idea is introduced, the Commission might as well abandon hope now. Clearly, management and union officials alike must make the utmost effort to drive home to the men the consequences of short-sighted action and to explain in detail what labour changes, if any, will be entailed by integration.

* * *

More Gold from Europe

The sterling area continues to run an unexpectedly large surplus with Western Europe. The latest monthly compensation of the European Payments Union, covering transactions for December, showed a United Kingdom surplus of £20,444,286. A part of this was probably earned through payments for sterling area commodities at the recently prevailing high levels of prices. This surplus was financed as to £4,354,643 by the use of existing sterling resources, i.e. pre-June 30th balances held by the deficit countries. The United Kingdom is now at the stage at which, as a creditor, it receives in gold half the net amounts due to it and makes the other half available in the form of credits to EPU. In respect of December it received £8,158,929 in gold, increasing the amount so far received from EPU in this form to £12,668,214. The United Kingdom is now a creditor in the books of EPU to the amount of £88,382,857. Here is further evidence that the trend of international gold movements is still strongly towards London.

* * *

Australian Bank Merger

Subject to approval by shareholders and the Australian courts, the long-expected merger between the Bank of Australasia and the Union Bank of Australia will take place next autumn. Since the assets of each bank were in excess of £170 million at their last balance sheet dates, the new institution (which is to be called the "Australia and New Zealand Bank") will start with assets of nearly £350 million; it will thus be the second largest bank in Australia and the largest in New Zealand. The two banks, which were both founded over one hundred and fifteen years ago, have long been complementary rather than competitive in their activities. Rumours of a merger were rife just before the war but the natural unwillingness of the Bank of Australasia to give up its Royal Charter (as it will have to do when the merger takes place) prevented any action at that time. After the war, however, the proposal was taken up again and

arrangements were at an advanced stage in 1947 when the Australian Labour Government introduced its abortive legislation to nationalise all trading banks. The proposal for a merger was dropped during the period of the long legal battle over the Bank Nationalisation Act. It was revived again when the Act was quashed by the Privy Council decision in the summer of 1949, but legal and technical complexities in the three countries in which the banks transact business (particularly in matters of taxation and stamp duties) have complicated the working out of a scheme that will bring advantage to all shareholders.

The reason for the merger are strikingly portrayed by the banks' recent balance sheets, which show that the assets of each bank have been expanding at the extraordinary rate of about 25 per cent. per annum in each of the last two years; the size of the accommodation now required by both banks' largest customers, the increased demand for technical services and the heavy building programmes of both banks have clearly made the establishment of a larger bank desirable.

IMF Sells Sterling

The Brazilian Government has recently purchased £10 million of sterling from the International Monetary Fund in Washington. This operation is notable on two counts. First, it reveals how part of the funds required for the clearing of commercial arrears due by Brazil to exporters in Britain is being mobilised. Some of the necessary resources were secured by another £10 million operation that took the form of a forward exchange swap, through which spot sterling was obtained against a sale of dollars and with an undertaking to reverse the operation later by offsetting forward transactions. The balance of the £10 million is being provided by the recently reported purchase of sterling from the IMF. Brazil will pay for this sterling in local currency. This is the third approach that Brazil has made to the IMF. The first two occurred in 1949 and involved the purchase of \$17½ million.

Secondly, the transaction between Brazil and the IMF is significant, for its indication that sterling has become a sufficiently scarce currency for its supplies to be augmented from IMF sources. This is not the first sale of sterling by the fund. Within the first few months of its operations a small amount of sterling was sold to the Netherlands. But, apart from this modest precedent, the latest operation is the first occasion on which a sizeable line of sterling has been made available to a member by the Fund. This is an important straw showing the direction of the prevailing winds in the world's foreign exchange situation. Now that Brazil has strengthened its current holdings of sterling, it will be interesting to note how these resources will be used in payment of commercial arrears and how much in financing new purchases.

* * *

Agreement with Belgium

A new monetary agreement was recently signed between the British and Belgian governments. In the main, it does no more than adjust the previous agreement to the fact of both countries' membership of the European Payments Union. The principal adjustment is the disappearance of the reciprocal overdraft clauses in the old agreement by which each country was prepared to hold the other's currency up to a limit of £12 million, any excess holding being convertible into gold. This provision has made way for arrangements by which, during the period between each pair of EPU settlements, each country is prepared to hold the other's currency up to any amount. Such balances are then put into the subsequent clearing and any gold loss or receipt by the two countries arises, not from any bilateral arrangements, but from the terms of their membership of EPU.

It is interesting to note that Belgium remains outside the

group of sterling "transferable account" countries. An offer was made by Britain to Belgium, as to all other EPU members that were not already "transferable account" countries, to enter into this fold. This was done so as to achieve the complete non-discrimination in their mutual exchange and monetary arrangements enjoined by the EPU agreement on all members. Belgium is one of the countries that have seen fit not to accept the invitation. This may be due to the suspicion that EPU has only a short life before it. Belgium therefore may not want to commit itself to any undertaking to accept sterling without limit, except within the context of strictly bilateral transactions between the Belgian franc and sterling monetary areas.

* * *

Prices at the Double

The trend of wholesale prices in 1950 vividly illustrates the burden of rising costs. Throughout the twelve months the Board of Trade's index has displayed an unbroken rise. In the first quarter it was modest, but it became sharper as the year progressed and particularly sharp after June. By December the index had risen 21 per cent—the largest annual increase since 1940. The rise in the food component of the index was to some extent damped by the incidence of the subsidies, but industrial materials fully reflected the rise in world commodity prices. Basic materials rose by no less than 85 per cent on the year, intermediate products by 22 per cent and manufactured goods by 7 per cent. Food and

tobacco rose by 8 per cent, and building materials by 6 per cent.

The main contribution to the higher cost of industrial materials has come from wool, the price of which rose by 117 per cent during 1950 (raw wool itself rose by 133 per cent). Non-ferrous metals rose by 60 per cent, cotton by 36 per cent and other textiles by 29 per cent. Most of these increases occurred in the latter part of the year and have still to filter through into retail prices; a sharp increase in retail prices is evidently to be expected in 1951. The actual increase in wholesale prices in December was only one per cent, the smallest monthly rise since June. But this slowing down was only a temporary phase; commodity prices have continued to bound upwards this month.

* * *

Commodity Movements

At long last a break has occurred in the steady rise in commodity prices. This week the price of Cuban sugar was more than ½ cent a pound cheaper; it fell to its lowest price since July. The record world crop was bound to affect the market sooner or later, but it took time to do so. Wheat and maize are also cheaper, but this may be partly seasonal,

BARIUM

PATIENTS may associate barium with the unpalatable meals which they are given before an X-ray examination, but it is barium sulphate which is used for this purpose, and not the soft silvery-white barium metal. Barium is found in nature in the form of barytes (barium sulphate) and witherite (barium carbonate); it is never found free since the metal readily reacts with air and moisture. It was first recognised as an element by Scheele, a Swedish chemist, in 1774. Its name is derived from a Greek word meaning heavy, because all barium compounds are much heavier than an equal volume of water. Barytes deposits, often found in lead and zinc veins, are mined in the North of England, Germany, Canada and the United States. Witherite is far less common. The most famous witherite mine in the world is at Hexham in Northumberland, and workable quantities are also found in Durham. Compounds of barium are important in the manufacture of paper, glass, oilcloth, linoleum and in oil well drilling. Barium metal itself is used to remove the last traces of gas from radio valves and television tubes. I.C.I. uses barium sulphate in the manufacture of paint, and barium nitrate in certain kinds of industrial explosives.

"South African Sherry for me every time

So I've converted you, too, then?

You certainly have! Do you remember you told me to look specially for the fine South African sherries. Since then I've found some which are just exactly to my taste. And don't you find them easy on the pocket, too? That means something these days!

Yes, how is it they can send us such remarkably good wines at such a reasonable price?

Well, there are two reasons: that amazing climate of theirs at the Cape, and then the Preferential Duty.

No wonder South African Sherry is becoming so popular, then.

It deserves to be. Do you know they've been making wine in South Africa for nearly 300 years. With all that experience behind them and the splendid organization they have now built up, they're able to produce the very highest quality. Their really fine wines are matured for many years before they're shipped to this country.

I suppose we can now say, then, that South Africa is one of the leading wine producing countries?

Well, wouldn't you say it was, from the taste of this sherry? *Let me fill your glass!"*

SOUTH AFRICAN WINE FARMERS ASSOCIATION (LONDON) LIMITED

Traffic duty policemen can do very little to combat the crime wave.

as much as it did in September, and quicksilver three times as much. The United States "grey" market for copper and zinc is rapidly developing into a black market. In these dealings copper is selling at about 42 cents a pound and zinc at 30 cents. Prices of vegetable oils and tallow are still rising, but rubber and tin have weakened.

* * *

National Income Comparisons

The study of national incomes has opened up new fields of economic investigation. It also involves some pretty exercises of statistical ingenuity. The Statistical Office of the United Nations has recently prepared and published* estimates of national incomes (as totals and per head of popula-

tion) for seventy countries in 1949. These seventy countries are thought to include about 90 per cent of the world's population and more than that proportion of the world's income.

Two striking features of the figures (which are given in * Statistical Papers Series E No. 1.—United Nations.

national currencies and also in dollars) are the overwhelming predominance of the United States on the one hand and the large number of countries with extremely low levels of national income per head of population on the other hand. In 1949 only nine countries had total national incomes exceeding \$10,000 million—Britain was the third largest after the United States and Russia—and only twelve had a national income per head of population above \$500.

The report does not shirk the difficulties of measuring and method that are involved in drawing up comparable estimates of the national incomes of different countries. Only a quarter of the countries examined had up-to-date estimates based on good statistical evidence and less than a quarter had estimates within tolerable margins of errors for one or more years since the war. The range in national incomes is considerable, from \$62 million for Liberia to \$217,000 million for the United States. The median for the seventy countries is \$1,425 million but the countries below this level accounted for only 10 per cent of the population covered by the report. Analysis of income per head of population, however, shows more disturbing results. Twenty-five countries in 1949, representing 54 per cent of the total population, had an annual income of less than \$100 per head. Some 85 per cent of the world's population (55 countries) had an annual income of under \$400. In contrast average income per head in Britain was \$773 and in the United States \$1,453.

Shorter Notes

Largely as a result of heavy orders for transatlantic coal tonnage, the Chamber of Shipping index of tramp shipping freights rose by 18 points in December to 115.7 (1948=100). This was nearly 60 per cent above the level in December, 1949, and brings the average for the year 1950 to 84.0 against the 1949 average of 82.3. The index covers fixtures in sterling only; many other bookings of ships to carry coal to European ports were made in dollars. Since the beginning of the year bookings have generally continued to be heavy, though in the last week some bookings of vessels for forward loading dates have been made at rates slightly below the recent peaks.

*

The Royal Commission on the Taxation of Profits and Income announce that they propose to consider in the first place (a) the general structure of the present system of taxation of profits and income, and its effects on the national economy, and any suggestions for alternative methods of raising revenue by taxes on profits and income; at a later stage they will consider (b) particular matters arising in connection with Income Tax, Sur-tax and Profits Tax. The Commission intend to begin taking oral evidence in June on matters falling under (a). They therefore hope that the written evidence on these matters will reach them as soon as possible and not later than May 15th. Written evidence on matters under (b) should be sent in by December 1st next.

*

The London Cocoa Terminal Market reopened this week after a lapse of nearly twelve years. The terms of contract are virtually the same as before the war. The basis grade is G. F. Accra but other descriptions can be offered at various differentials and conditions. The unit of trading is 5 tons; before the war it was 10 tons. On the first day of trading prices were very high, much higher than the New York level, but they have since fallen, and appear now to be keeping in step with the American market. The volume of trading so far has not been very large.

Company Notes

F. W. Woolworth.—The 5s. ordinary stock units of F. W. Woolworth showed scarcely a flutter of response to the dividend, so accurately had the market anticipated the dividend announcement. The final dividend is 2½ per cent; the rate is unchanged and the payment is made, as in the previous year, on an ordinary capital of £15 million, after it was doubled by the 100 per cent bonus issue. The year's total distribution on the new capital is equivalent to 4½ per cent, compared with a 1949 payment equivalent on the same basis to 35 per cent. The difference represents the payment of the interim dividend for 1950 at the same percentage rate of 15 per cent, but on the doubled capital.

Is a note of caution to be inferred from the mere maintenance of the final dividend? There is nothing in the preliminary statement of profits to suggest that the company did not enjoy a satisfactory year. The rise in profit before tax from £10,822,307 to £11,768,410—almost 9 per cent—is impressive; the Woolworth organisation must have made the most of its opportunities to sell a

greater volume and a greater variety of goods last year. If purses felt the pinch in 1950, they seem to have been freely opened at least in the Woolworth stores. But 1950 cannot have been a year of unmixed advantage. Costs have increased and have affected certain profit margins; and as the year proceeded the claims of defence competing with those of civilian consumption were becoming evident. These may assume real importance during the current year by limiting the range of goods that the stores can offer—thus narrowing the scope for successful merchandising that in recent years has been markedly expanded.

When the chairman issued his statement on dividend policy last June, he emphasised that the increased interim payment (on the doubled capital) did not necessarily betoken an increase in the total distribution for 1950. The total distribution has been increased, but only to the extent of the change in the interim payment. But the warning that any increase in the final dividend must necessarily depend on the board's view when the 1950 accounts were produced does now assume a certain significance. Stockholders have no reason for complaint at this display of caution—if caution it is. It will clearly assist the undertaking in coping with the more difficult problems of 1951 to have the additional support of nearly £1,500,000 of profits ploughed back.

Carreras Ltd.—Despite the high level of the tobacco duties, the demand for tobacco continues to be relatively inelastic. Last year, there were no complaints on the score of demand, but manufacturers had to contend with mounting costs of leaf, processing and distribution. Against this background the rise in group trading profits of Carreras Ltd. for the year ended October 31, 1950, from £2,749,891 to a record figure of £3,524,581 is an impressive achievement.

Heavy taxation charges, which absorb nearly half of total profits, have prevented an increase in earnings on the same substantial scale, though they are up by some £376,000 to £1,392,754. This rise is equiva-

lent to an increase in group earnings from 41.3 per cent to 54.8 per cent, which comfortably covers the maintained ordinary dividend of 35 per cent. Reserves have been strengthened by the appropriation of £100,000, against £96,785, to general reserves; the company has not this year made a specific allocation to a reserve for the replacement of fixed assets, as was the case in the previous year when £119,279 was so transferred.

Acquisition of new plant and machinery may be reflected in the rise in the book value of group fixed assets after depreciation from £1,748,340 to £1,932,601. Total capital and revenue reserves of £7,449,681, against £6,603,052, compare impressively with the

	Years to October 31, 1949	1950
Consolidated earnings:—		
Trading profits	2,749,891	3,524,581
Total profit	2,918,603	3,670,653
Taxation	1,350,224	1,728,087

Cash and bank balances	667,860	180,358
Stocks	9,282,597	11,035,865
Reserves	6,603,052	7,449,681
Ordinary capital	3,720,300	3,720,300
£1 "A" Ordinary stock at £5 17s. 6d. yields £5 19s. 2d. per cent.		

issued equity capital of £3,720,300. Stocks are up from £9,282,597 to £11,035,865, which represents more than half of total assets of £21,206,763; it is not surprising, therefore, that cash has fallen from £667,860 to £180,358. Although net working capital has risen from £8,302,235 to £9,024,445, the burden of carrying stocks continues to impose a considerable strain on liquid resources.

Buyers of leaf tobacco have now to bear the full effects of devaluation on prices, but supplies are adequate to cover demand. Tobacco might be taxed even further in the coming budget, but even so the question would remain whether a higher rate of duty would reduce the demand.

Colvilles Ltd.—The value of the preference and ordinary capital of Colvilles Ltd. for the purpose of assessing compensation payable on nationalisation has now been agreed between the company and the Ministry of Supply, as have compensation terms for the privately held preference shares of the Lanarkshire Steel Company, Ltd. (of which all ordinary shares are held by Colvilles). The agreed bases for compensation, which will be presented to a special meeting of shareholders on February 2nd, are as follows:

Colvilles Ltd.: £2,000,000 5½ per cent cumulative preference stock, 26s. 6d. per £1 unit; £3,919,000 ordinary stock, 38s. per £1 unit.

Lanarkshire Steel Company, Ltd.: £275,000 6 per cent cumulative preference shares, 25s. per £1 share.

These take-over prices compare with "middle" market quotations on Wednesday, the day before the announcement of 36s. 6d. for Colvilles' ordinary and 24s. 9d. for the preference; and for Lanarkshire Steel preference on January 1st of 22s. 6d.

Teachers (Distillers) Ltd.—Group profits of Teachers (Distillers) Ltd. for the year ended September 30, 1950—the first complete year of trading as a public company—are £714,428, which compares with £313,965 for the nine months to September 30, 1949. The sum of £372,000 is provided for taxation, and group net profits amount to £311,485. Of this sum £232,951 is retained by the subsidiary company, William Teacher and Sons. The total ordinary dividend of 12½ per cent, against 7½ per cent for the nine months ended September 30, 1949, absorbs £41,250.

Statistical Summary

EXCHEQUER RETURNS

For the week ended January 13, 1951, total ordinary revenue was £174,260,000, against ordinary expenditure of £57,051,000, and issues to sinking funds £590,000. Thus, including sinking fund allocations of £13,653,000 the surplus accrued since April 1st is £220,660,000 compared with £181,405,000 for the corresponding period a year ago.

BARCLAYS BANK LIMITED

INCREASED NET PROFIT

INFLATION RISK A DANGER TO EFFICIENCY

STRICT ECONOMY IMPERATIVE

DIVERSION OF RESOURCES FOR DEFENCE PROGRAMME

NEED FOR NEW OUTLOOK ON PRODUCTION PROBLEMS

SIR WILLIAM GOODENOUGH ON THE POSITION AND OUTLOOK

The fifty-sixth ordinary general meeting (being the annual general meeting for the year 1951) of the stockholders of Barclays Bank Limited will be held at the Head Office of the Bank, 54, Lombard Street, London, E.C., on February 8th.

that the great changes in conditions since the war had removed the advantages of direct representation in that country.

CURRENT AND DEPOSIT ACCOUNTS

On December 31st, our current, deposit and other accounts totalled £1,287,849,866, compared with £1,266,243,422 at the close of 1949. It is encouraging to be able to add that the number of current accounts in our books has been increasing from month to month. During part of the year bank deposits as a whole, including our own, were lower than they had been twelve months before, but in August there was the beginning of an increase which raised the total in October and again in November to a new high record. The increase in bank deposits has been in part a reflection of an inward movement of foreign money. It is surely quite contrary to anything that could have been in our thoughts a year ago that events should bring such a remarkable technical alteration in world financial affairs as to induce an inflow of funds to London from abroad. But this has happened. Influences which pressed so hard against the pound as to make devaluation inevitable, have exerted themselves in the opposite direction. Causes beyond our control have had a good deal to do with this extraordinary somersault, but it is the best possible indication that our currency has come to be more highly esteemed than for a long time past. The influx of foreign money has made it necessary for the authorities to provide the sterling to give in exchange, and this has had its effect on the liquid assets held by the banking system.

LIQUID ASSETS

During the earlier part of the year, and again in the closing months, the tendency continued for the Treasury Deposit Receipt to be substituted for the Treasury Deposit Receipt as a means of short-term borrowing by the Government. At the end of the year we ourselves had £315,585,740 in bills discounted, consisting very largely of Treasury Bills, and £97,500,000 in Treasury Deposit Receipts, compared with £260,803,323 and £171,500,000 respectively on December 31, 1949. The increase in our holding of bills, which was higher by £54,782,417 than it had been a year before and bore a ratio of 24.5 per cent. to our deposits, is of very great importance, for it gives us added flexibility at a time when it could hardly be more welcome. I may add that our specially liquid assets taken as a whole, namely, cash in hand and with the Bank of England; balances with other British banks and cheques in course of collection; money at call and short notice; bills discounted and Treasury deposit receipts amounted to £863,149,912 or 49.1 per cent. of current, deposit and other accounts. Investments, apart from those classified as fixed assets, are £468,647,322 and advances to customers and other accounts stand at £453,031,646.

CHANGE IN INTERNATIONAL OUTLOOK

Now may I make some reference of a more general kind to what has been happening in the past twelve months. Our minds have been much preoccupied by the sombre change in international affairs, but in the economic sphere the year has not been entirely unfruitful. Initially, the outlook was in the highest degree uncertain but, just as our hopes of 1949 were disappointed, so our fears of 1950 were not realised. Even before fighting began in Korea we had benefited from the renewed flow of American prosperity. Moreover, the devaluation of sterling,

which had in a sense been forced upon us, and was carried out at an unexpectedly low rate, had given impetus to our export trade and had brought about a more realistic pattern of exchange rates, particularly in Europe.

These conditions have given Western Europe as a whole a valuable opportunity to gather strength. In our own case the change for the better in our balance of trade, the growing confidence in sterling and the suspension of Marshall Aid suggest improvement. There is no need for me to emphasise how vital it is for this country that confidence in its currency should be fully restored. We are the bankers to the whole of the sterling area, and something like half the world's international payments are made in sterling. Our livelihood rests on the maintenance of that position. Confidence implies willingness to hold sterling without any mental reservations and confidence depends primarily upon the view that is taken of our economic strength and stability. But it depends also upon the adequacy of the reserves that we have available to take whatever normal strain may be put upon us as a great financial centre, and in this respect there has been a change for the better. Just before the devaluation of sterling the gold and dollar holding had fallen to £1,340 million. By June last year it had risen to \$2,422 million and three months later it was \$2,756 million.

SITUATION BETTER THAN HOPED FOR

The situation is much more satisfactory than we had any reason to hope, but when we analyse the causes of the increase and take account of our responsibilities in world trade and finance, it is clear that the improvement should be viewed with some caution. Some of it came from purely negative action—the limitation of our own dollar imports and expenditure and that of the rest of the sterling area; some was the natural reflex from devaluation itself; and some the result of the positive effort to sell British goods in the dollar market. But there was the continued flow of Marshall Aid to help us and a heavy American demand for the primary products of the sterling area. This last influence, based on the upward surge of activity in the United States, has been reinforced by pressure there to build up stocks of strategic raw materials. But it has not involved purchases from the United Kingdom.

Therefore, although this demand has helped materially to increase our reserves of gold and dollars, it has brought about at the same time a substantial addition to our liabilities in the shape of the sterling balances which are kept in London by other members of the sterling area. It has also caused a rapid worsening of our terms of trade, which means that the prices we have had to pay for our imports have risen much faster than the prices we have obtained for our exports. In November last it would have cost us £18 million more in exports to import the same amount of goods as we did in the previous January, and it will be surprising if there has been no further deterioration since then.

COMPETITIVE EFFICIENCY

Recent experience has brought home nothing more strongly than the degree to which economic conditions in the United Kingdom and elsewhere are responsive to changes in the level of activity in the United States. This is bound to remain the case and, while healthy prosperity can be left to take care of itself, it would be alarming to contemplate the prospect of a depression in the American economy when we remember the severe effect upon us of a mere hesitation in 1949. Events in the past eight months seem to have put this prospect out of sight, but it must not be out of mind.

We ought now to keep our thoughts and actions bent more than ever upon competitive efficiency throughout our whole economy—industry, commerce and agriculture.

This would serve a double purpose: it would give us strength and resilience to meet a situation such as we feared might be developing a year ago, and it would help us to deal with the new and quite different problems which have since arisen. There is a great deal to the credit of all who are engaged in British industry and it is most heartening to see what has been achieved. The improvement in industrial production has been at a much faster rate than was thought likely and, as post-war investment has begun to show results on an increasing scale, standards of efficiency have risen. But we have not encountered the full force of competition and it may be that we shall not do so for some time to come. The fact that the urge to reach the best standards of efficiency is weakened in this way must not lead to loss of ground that will have to be made up later on.

INFLATION RISK TO EFFICIENCY

A great danger to efficiency, and indeed to the whole stability of our economy, lies in the risk that inflation, which is already with us before the armaments programme has begun to make itself felt, may become really serious. The further demand upon our resources for the purposes of defence must increase that risk. Much will depend upon the method chosen to deal with the budgetary problem. For the moment the extra defence expenditure, although substantial, is not a very large item in relation to the budget total, but a much more material addition is in sight. Therefore, it is of very great importance to tackle the financial problem soundly and boldly from the start. The only proper cause, difficult though it be, is to obtain the additional sums which are spent on defence by reducing other expenditure: first and foremost public expenditure. Extra taxation may be inevitable but to add materially to the present burden of direct taxation might easily defeat its own object and it should be used as a measure of last resort. This is because by disrupting sound habits of work and thrift, direct taxation itself becomes inflationary when it passes beyond a certain level, which, in conditions as they are, must be perilously near at this moment. Therefore, however distasteful, the order of the day should be to meet our needs in the first place by cutting and paring in other directions. There is no commonsense alternative. It is not so much now a question of looking for the greater ease that everybody so much desires as of trying to hold as much as possible of what has been gained and not impairing it by needlessly allowing inflation to get the upper hand. With the future so uncertain it is no more than common prudence to conserve our strength by holding inflation in check and by sparing no effort to retain some sort of reserve of taxable capacity. Strict economy in Government expenditure, unpopular as it is, was never more imperative than it is now. While, owing to the special dependence of this country upon international trade, we must always be sensitive to what happens abroad and, to that extent, subject to influences over which we have no control, inflation is not an elemental force. By this I mean that, at any rate in peace-time, it is largely within the decision of the Government of the day and this ought to be clearly understood.

PUBLIC AUTHORITIES EXPENDITURE

When so much turns on efficiency and economy one cannot help wondering how far we are really getting proper value from the vast outpourings of money represented by the expenditure of public authority both

central and local, because here is a most serious responsibility for leakages which may greatly add to the burdens of the people of this country. War conditions and the subsequent course of affairs have resulted in a new bureaucracy of immense proportions becoming a parasitical growth in our social system. Unhappily, it is implicit in a planned and controlled economy that this should be so. All systems develop problems of their own, however carefully they may be devised, and it seems to me that we have to solve a whole series of problems here in order to ensure that we get money's worth for money spent which is, after all, no more than the nation's due. Anybody who goes about with his eyes open is bound to become aware from time to time of specific and glaring instances of delay, neglect and waste emanating from official sources.

Some waste of effort is inseparable from any undertaking, particularly if it is large and complex, but the public authority as such is a proper object of criticism because it cannot feel the pressure of competition which would produce a sense of urgency in its work, and because the elements of time and price and the need for saving cannot have the meaning to it that is an essential part of the world in which any business man lives. What I have said is not meant in personal disparagement of public servants and officials who are, of course, no worse and no better than other people. I am thinking only of the circumstances of their work which, as happens with all of us, must undoubtedly have a profound influence on their standards and outlook.

DEFENCE PROGRAMME

The additional defence programme is bound to involve a diversion of resources to military purposes: it is scarcely to be hoped that the whole burden can be met out of the natural increase in production. This is because the increase is unevenly spread over the productive system and because the rhythm of production is sure to be affected both by the redirection of effort and by the scarcity of raw materials and manpower. But the possibility of help from that source is considerable, especially if the national temper comes to the right pitch and there is a sense of unity in peril inculcated from the level of Government downwards. Such a frame of mind as this is favourable not only to greater individual output but to the acceptance of the new methods and new ways of thought implied in a rapid increase in efficiency. It could help to speed up a practical outcome from the visits to the United States of the industrial teams organised by the Anglo-American Council on Productivity, whose reports have given much food for thought in the vital matter of productive efficiency.

DEEP-ROOTED MISUNDERSTANDINGS

At least as important as American techniques is the eagerly progressive attitude of mind which is characteristic at all levels in the productive organisation of that country, in contrast to habits of thought still common in our own. That this attitude should have made a deep impression upon the visiting teams is a very important fact, for it has potentialities for good which are well-nigh incalculable. It has become possible now for this particular lesson to be interpreted here in terms that can be understood and appreciated by ordinary people. But there are difficulties. Besides natural inertia there are deep-rooted misunderstandings, some of them almost traditional. There is, for instance, the supposed cleavage of interest between what are described as the "two sides" of industry. Most unfortunately, voices are still raised to keep open these unhappy differences and even to sharpen and extend them, not only by deliberate misrepresentation, but also by the honest ex-

pression of views based on imperfect understanding of facts which with proper care could be verified. As one whose interests are engaged with town and countryside alike, I think at once, as an example, of the controversy on the subject of the subsidies paid by the state in connection with food and agriculture. This particular issue has been confused and distorted in a way that tends to impair the sympathy and understanding between town and country which it becomes more than ever desirable to strengthen.

I have in mind the mischievous caricature representing the farmer as luxuriating in a sheltered prosperity which involves intolerable expense to the rest of the community and fosters inefficiency in the industry. It gives the impression that, besides the payments made direct to the industry—amounting to £24 million in the present financial year—the whole of the so-called consumer subsidies on home produced food, a total of £246 million, is being poured by the taxpayer into the farmer's lap. One does not need to look with more than ordinary care at the published information to see that the direct payments are devoted to raising the standard of husbandry, with a national end in view, while all but a small part of the consumer subsidies is what it purports to be, namely, subsidies to the consumer. It is perfectly clear that the main purpose and

effect of all these payments is not to provide gratuitous ease and comfort for the farmer but to help the consumer and to serve the long-term interests of the community as a whole. What is involved is a reorientation of the industry which would be impossible without help from outside. But whatever may be said or done to put matters right in the public mind some mud is bound to stick.

THE IMMEDIATE TASK

Misunderstandings, either between different groups of people or between people at different levels in the same group or environment, can be much more easily created than removed. Before really substantial practical results on the human side are likely to follow along the lines indicated by the industrial teams which visited the United States, these difficulties will have to be overcome. They will not disappear of their own accord: to remove them a strong positive effort is needed.

The task is to demonstrate beyond argument the advantages both to the individual and to the community of a more progressive frame of mind towards production. This principal might be more readily accepted if it were shown to be compatible with a proper sense of economic security for the individual and were associated with full opportunity for everyone to satisfy his proper ambitions.

DISTRICT BANK LIMITED

RECORD DEPOSIT FIGURE

TAXATION AND THE PRODUCTION EFFORT

URGENT NEED FOR STABLE EXCHANGE

COTTON TRADE PROBLEMS

SIR THOMAS D. BARLOW'S SURVEY

The chairman, Sir Thomas D. Barlow, G.B.E., has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the 121st annual general meeting, to be held on February 9th at the head office, Spring Gardens, Manchester:—

As you will see from the report, Sir R. Noton Barclay has decided not to offer himself for re-election. He has been a member of the Board for thirty-seven years and since 1932 has held with distinction first the office of deputy chairman and then that of chairman. As he occupied the latter position throughout the whole of the last war, the responsibilities he had to shoulder were particularly heavy. In 1947 he decided to relinquish the duties of chairman but retained his seat on the board, and it is with reluctance that we now accept his decision to retire. I am sure you will wish me to convey to him our very best wishes for the future, as well as our grateful thanks for the inestimable services which he has always given to the bank.

During the year we have had the pleasure of welcoming the Duke of Devonshire, the Earl of Verulam and Mr Leslie Shaw to our board. The Duke of Devonshire has deep roots in the county of Derbyshire, one of the shires from which the bank itself drew its first strength. The Earl of Verulam, who is closely associated with industry in and around London, is also a member of our London committee. Mr. Leslie Shaw, who was one of our auditors, has had a wide experience of business problems and is a director of a number of companies in Lancashire and other parts of the country.

THE YEAR'S ACCOUNTS

The statement of accounts shows that deposits, now standing at £239 million,

exceed last year's record figure by £8,300,000. This increase, reflecting as it does the general trend of banking figures, is all too closely linked with the new phase of inflation.

Turning to the assets side of the balance sheet, you will see that the more liquid items, cash, money at call and short notice and bills of exchange, are higher in total and in proportion to our deposit liabilities than they were last year. Underlying this change is the increase in Treasury Bills, which partly offsets the decline in the next item, Treasury deposit receipts. For yet another year the latter form of borrowing by the Government has been running at a lower level. It may be that this trend will be reversed as rearmament gets under way. In the meantime the substitution of Treasury Bills slightly reduces our earnings although we gain something in flexibility.

During the year we have added £731,000 to our investments which are mainly repayable at fixed dates and appear in the balance sheet at less than their market value.

There is an increase of over £10 million in our advances. A sharp upward movement occurred in the early part of the year when there was evidence that stocks were accumulating. Following the outbreak of the war in Korea, these dwindled and our advances showed some reduction. The closing months of the year, however, have brought a change. Prospective shortages of commodities and components, rising prices and a general expansion of business have made additional demands on working capital, the full effect of which seems likely to be carried forward well into the present year. Meanwhile we are pleased to observe that our lendings are chiefly associated with trades which are actively engaged on work of national importance. The gravity of the

international situation has once again focused attention on the importance of our farming industry, and loans to those engaged in this vital task are responsible for an appropriate portion of the increase.

The much larger figures for liabilities of customers for acceptances, confirmed credits and other obligations are particularly pleasing, since they are principally due to the growing activities of customers engaged in overseas trade.

Last year our properties were professionally valued and it is satisfactory to know that they stand at a very conservative figure in our books. No further provision for depreciation has therefore been considered necessary. The increase in the bank property item is explained by purchases which have been made during the year.

PROFIT AND DIVIDENDS

As regards earnings, larger resources and increased advances have helped to swell income, but against this have to be reckoned high taxation and rising working costs. After making the usual provisions, the net profit is £513,168 and, with the amount brought forward, we have a disposable balance of £826,424. Of this we propose to transfer £200,000 to our general reserve and to allocate £50,000 to reserve for contingencies. After allowing for dividend payments at the same rate as formerly there remains a sum of £290,784 to be carried to the next account.

OTHER ACTIVITIES

The further relaxation in Exchange Control, permitting as it does a wider use of sterling for trade and travel, has enabled our foreign department to offer more facilities to customers. The growing volume of foreign bills for collection and of commercial credits handled by the department is complementary to the continued increase of both exports and imports. The returning confidence in sterling is also reflected in the higher balances held in overseas correspondents' accounts and in the greater number and value of forward sales to us of foreign currencies.

Our trustee department continues to grow, and recently it has been necessary to transfer the trustee branch in Lancaster to larger and more suitable premises adjacent to our main banking office in that city.

In connection with trustee work, it is perhaps opportune to mention that the necessity of making a will has once again been emphasised by the fact that a special committee has been appointed by the Lord Chancellor to consider the statutory benefits received by a widow or widower in cases of intestacy. Benefits in certain circumstances are inadequate to meet present-day needs and a will avoids these difficulties by ensuring that a testator can himself decide what bequests best suit the requirements of his widow and dependants. Furthermore, the absence of a will may often increase the cost of administering an estate.

The extension of the bank's activities is constantly under review. At present our development scheme is considerably hampered by the difficulty of obtaining suitable premises and also by the restrictions on structural alterations, but we shall continue our policy of territorial expansion when opportunity offers. In the meantime the two new branches in Oxford Street, London, and in Tunbridge Wells, to which I referred last year, are now open.

MANAGEMENT AND STAFF

The memorial in the banking hall at head office to the eighty-six members of the staff who gave their lives in the Second World War was unveiled on March 22nd. A representative gathering, including more than one

hundred and fifty relatives of the fallen, attended the service of dedication conducted by the Bishop of Manchester. Since the ceremony a photograph of the memorial and a booklet containing the Roll of Honour have been sent to the next of kin.

The men who returned from the forces quickly settled down to banking duties and, as a result of special training and their wider experience, a number have been appointed to positions of greater responsibility. For those of the staff holding executive positions we continue to arrange area conferences. These interchanges of views with our higher officials help to solve practical and technical problems which are invariably encountered in the day-to-day workings of the bank. The courses arranged to familiarise our branch managers and accountants with the work at head office and the specialist services of the foreign and trustee departments are proving of great benefit.

The progress of the bank could not be maintained without the loyal co-operation of the management and staff, and I should like to take this opportunity of thanking the chief executives and all who serve under them for the excellent work they have done throughout the year.

A YEAR OF CONTRASTS

During the early part of last year there was considerable disappointment because devaluation was not having as beneficial an effect as had been anticipated. Despite the exchange advantage, export markets were becoming increasingly difficult and indications of a falling demand for consumer goods brought with them a loss of confidence and an expectation of lower prices. Under pressure of these events, which foreshadowed the return of a buyers' market, it did seem possible that a certain amount of progress would be made in regard to disinflation and the tightening up of our economy.

These hopes, however, were not realised, since the deterioration in trading conditions was arrested largely through the astonishing capacity of the American economy to resist the impact of a business recession. To what extent this resilience was due to the continued provision of Marshall Aid, and how much this policy helped to avert a general decline in world trade, it is difficult to say. The outbreak of the Korean war was of such transcendent significance that such speculations cease to have any immediate value. Indeed the consequences of the war are already revealed in a manner which is all too familiar. Rearmament has transformed the scene and once again we are back to a sellers' market. It might be thought that this would be a favourable opportunity for the business world to plan well ahead, but the grave economic and political uncertainties which obscure the outlook make such a course quite impossible.

A universal fear of inflation has encouraged internal consumption in many countries with substantial anticipatory buying by the general public both here and abroad. In addition a number of commodities are in short supply and their cost has risen alarmingly. The position of many producers is indeed unenviable. Every fresh purchase is on a higher level and the long and complex chain of operations which production now involves throws commitments forward to a degree which cannot be regarded without misgivings. The prospect of a recession in demand and a fall in prices sooner or later is not a pleasant one.

SHORTAGES OF MATERIALS

That the future course of world prices is so unpredictable greatly adds to our difficulties. Raw materials, already subject to an extraordinary demand because of the very

high level of industrial activity throughout the world as well as non-commercial buying for strategic stockpiling, are becoming either unobtainable or only procurable at exorbitant prices. In order to afford some amelioration steps are now being taken to ensure a wider distribution of essential materials. Nevertheless, it seems likely that military demands will continue to absorb any surpluses and thus keep up an artificial level of prices.

For our country in particular this problem looms large, since imported food and raw materials are so vital to our economy. It is, of course, circumstances such as these which make it so difficult for us to avoid further inflation, especially when we are confronted with a rising tide of expenditure on rearmament. Admittedly, external assistance may be afforded to us in the form of dollars, raw materials and components, but the main burden of our defence must of necessity be our responsibility.

EFFECTS OF HIGH TAXATION

In the absence of economies in other directions, additional revenue will obviously be required. The renewed inflationary trend will automatically augment the flow of revenue but, to the extent that extra spending on defence exceeds this additional income, by so much will the load on the taxpayer be increased. Further taxation to meet this deficit cannot, however, be accepted as the solution of future problems without having regard to our limited reserves of taxable capacity. Bearing in mind that so much of the nation's income is already taxed away, a heavier burden can hardly be borne by current income and may have to be met largely out of savings. Thus, by its extra spending on defence, the Government would be actively creating fresh inflation.

Beyond this, high taxation impedes productive effort at every turn. It drains off irrevocably a large proportion of liquid resources, thus leading, through an inability to replace much less expand capital assets, to an eventual restriction of production. In this direction lies economic retrogression unless additional capital can be obtained to rectify the position. Unfortunately, however, with heavy taxation the accumulation of private savings becomes almost impossible. Moreover, it would seem that the penal rate of death duties and the deflection of their proceeds to defray current Government expenditure steadily reduce the capital resources of the country. In view of the consequences of heavy taxation and its misapplication, it appears likely that any additional demand will still further run down real capital assets and retard production at the very time when it ought to be greatly accelerated.

MORE PRODUCTION AND ECONOMIES

Such a strain should obviously be avoided, but other steps will also be necessary if economic stresses are to be prevented. In the first place there must be a big increase in human effort, since hard work can go a long way to increase output from the limited productive resources at our disposal. Also vital to increased production is the full use of expensive plant and machinery, the tapping of marginal sources of labour, the elimination of concealed unemployment and the driving force of more efficient management.

Whilst such measures as these will greatly help to maintain economic stability and check inflation, we must also give serious attention to Government spending. This is already far too high. Now, in addition, we shall have to face the new inflationary pressures which will result from an ever-growing rearmament programme. How, then, can we continue our present budgetary extravagances when the diversion of manpower and materials to defence will so greatly add to

the Government's outgoings, and when the simultaneous drive for exports will so sharply curtail production for the home market? What can this mean but an increased capacity for both public and private spending when there are fewer goods available in the shops? Plainly these are conditions which call for most vigorous retrenchment in all forms of unproductive public expenditure. In particular, the authorities should avoid all unnecessary outlay on capital projects and thus restrain the ever-increasing Government activities with their ugly offspring of directions, regulations, rules, orders and other interferences from whose coils, Laocoon-like, we struggle to be free.

A STABLE EXCHANGE

The urgent need for implementing all possible measures to uphold our economy is not lessened by the noticeable improvement in our balance-of-payments position, since we should be unwise to assume that certain contributory factors will continue to work in our favour. For one thing, although our income from invisible exports may continue its gratifying increase, its upward movement can hardly be expected to offset the future strains our full defence programme will impose on our visible trade. For another, it is the stockpiling in America, necessitating as it has imports of high-priced sterling products—incidentally greatly increasing our obligations to the Sterling Area—which has contributed so much to our increased gold and dollar reserves. More especially, the favourable position has been achieved by a reduction of our imports from America, although part of this saving has only been possible because of the help afforded us by Marshall Aid.

In our present strength, therefore, may lie our future weakness. Stockpiling by the United States cannot go on indefinitely and we might be wise to allow for some diminution. Moreover, whilst there may be a demand for our exports, rearmament will begin to interfere with their supply. Depleted stocks and a lack of raw materials are likely to restrain the available productive capacity of our export industries. Our deferred purchase of dollar imports also means that we have yet to replenish stores in readiness to meet future requirements, and at higher prices than would have been paid earlier.

Having regard to future purchases whether for defence, export or domestic consumption, there is an obvious advantage in revaluing the pound. But against this there is the disadvantage that revaluation would make our exports more expensive, although the need to increase our sales abroad would still remain. Temporarily, as a result of the high level of world trade, we might find a keen demand for our products and thus enjoy the dual benefits of revaluation but, since we have no reason to believe our economy is any less rigid than when we depreciated sterling, any present upward adjustment of the pound would be followed by a readjustment as soon as trade took a downward turn. Could there be anything more damaging to our relationship with the Sterling Area and to our present and future need for dollar capital investment than a constantly fluctuating rate of exchange? Could there, moreover, be anything more harmful to international trade than an unstable pound?

Much more practicable than the revaluation of sterling is that we should aim at freeing it from as many existing encumbrances as possible. We should do this, not only because it is a desirable objective, but also because the more sterling can be pressed into use the better will be the prospects for our overseas trade. Greater freedom for sterling would, in addition, be a challenge to the rigidity of our economy. In particular some relaxation of Exchange Control would force upon us the long-term need for exports at competitive prices.

THE COTTON INDUSTRY

Faced with the complications caused by rearmament, a certain degree of emancipation of the pound would test the efficiency of all our export industries. In this connection, however, the cotton trade would have its special problems. Because of the shortage of American cotton, the demands upon Lancashire's skill in using other growths have become infinitely greater. Whatever can be achieved in this way, the lack of adequate supplies from the United States must inevitably constitute a serious handicap to producers. The rearmament drive will also increase the trade's difficulties in attracting labour, since other vital industries will exert every effort to add to their own manpower. These factors, together with larger Government contracts for the Services, will make it particularly hard for the cotton trade either to step up the volume of exports or to restrain prices.

Admittedly, many of Lancashire's difficulties are unavoidable. Their number, however, is unquestionably increased by such elements of our economic and financial policy as are represented by the utility scheme and purchase tax. A much greater flexibility in utility specifications and more latitude in regard to ceiling prices would provide further

scope for increasing output, for the home market as well as for exports. Purchase tax, designed to curb inflation, now has precisely the opposite effect. As the prices of raw materials and the costs of production increase, so does the amount of purchase tax. Particularly serious to cotton manufacturers is the fact that, as prices become prohibitive through the spiralling effects of purchase tax, there is a falling off in demand for quality goods in the home market. As a consequence, producers for overseas markets are not able to experiment with new fabrics and designs since, if the goods fail to catch the fancy of the foreign purchaser, they cannot easily be absorbed at home. A reduction of purchase tax on non-utilities would therefore lessen the risks for manufacturers producing specialities for export. It would, by the same token, encourage them to develop new lines as they ought constantly to be doing if they are to keep in the van of the world's textile industries.

In the course of my remarks I have made references to the aid which has been afforded to this country by America under the Marshall Plan. I should, however, like to add a special word of appreciation and thanks for this act of generosity which has contributed so much to our economic recovery.

THE CARDIFF MALTING COMPANY, LIMITED

INCREASED SALES AND PROFITS

BONUS ISSUE APPROVED

MR L. NIDDITCH'S STATEMENT

The sixty-fourth annual general meeting of The Cardiff Malting Co., Limited, was held on January 16th at the New Inn Hotel, Pontypridd, Col. Sir Gerald T. Bruce, K.C.B., C.M.G., D.S.O. (vice-chairman), presiding in the absence abroad of Mr L. Nidditch, F.F.S. (Eng.), F.V.I. (chairman and financial director).

The following is an extract from the statement of the chairman circulated with the annual report and accounts for the year ended September 30, 1950:—

Ladies and Gentlemen, I have pleasure in presenting the accounts for the year ended September 30, 1950, and I feel confident that shareholders will agree they are satisfactory, considering the difficult trading conditions which confronted us.

It is with great regret that I have to advise you of the fact that after twenty years of close connection with your company, Colonel Sir Gerald T. Bruce, K.C.B., C.M.G., D.S.O., your vice-chairman, no longer feels able, owing to advancing years, to offer himself for re-election to the board of directors. I feel bound to express my sincere gratitude to Sir Gerald for his friendly co-operation and advice in connection with occurrences of past years, and I feel sure that shareholders will join with me and the rest of the board of directors in appreciation of his wise counsel and sober solid judgment at all times. We wish Sir Gerald all happiness and contentment in his retirement.

PROFIT AND LOSS ACCOUNT

The barrelage sales of the brewing industry as a whole decreased by several millions, and as the gravity of beer was still restricted to that of 1945-46 production, less malt was demanded by brewers, although the specific gravity was raised somewhat last April. However, I am pleased to report we

finished up the year with a slight increase in sales, both in volume and money values.

As you are all obviously aware, rising costs in all directions somewhat affected our gross profits, which is part of Government policy as to restriction of profits.

APPROPRIATION ACCOUNT

The balance of trading account amounted to £36,134, as against £34,924 for the previous year, although the latter was a record for the company and the 1946-47 period was a peak year for the brewing industry. The sum set aside for depreciation is £1,254 and directors' and management remuneration absorbs £2,763, taxation requires £18,500, the balance to appropriation account is £14,570.

Your directors recommend a final dividend of 10 per cent., less tax, making a total of 17½ per cent., less tax, for the year, which is equal to that of the preceding two years, although the capital is now 10 per cent. higher than last year, because of the bonus issue. In addition, your directors recommend a cash bonus of 2½ per cent., less tax. A transfer of £500 to the staff pension fund will, I hope, be approved, thus helping to maintain good relations between employees and management. We again propose to place £5,000 to general reserve.

BONUS ISSUE

Your board also recommends a bonus issue of 12½ per cent. from the capital reserve account, by way of an issue of ordinary stock on the basis of one 5s. stock unit for every eight units held as at the date of the annual general meeting. The liquid cash and reserves are healthily related to the paid-up capital, and the new shares should not be a burden, but should be considered as a legitimate step towards bring-

ing the working paid-up capital into line, hence making the balance sheet more realistic. Stockholders who subscribed in 1947 at 17s. 9d. per unit when the company was made public, are in a position where their holdings now cost them 14s. 4d. for each 5s. unit, after taking into consideration the proposed bonus issue. Dividends have been maintained as then contemplated; we have "ploughed back" considerably more than the share bonus issues and the trading position has been really fruitful.

FIXED ASSETS

There is no change in the fixed assets, excepting the automatic sprinkler installation, completed last month after being on order for two years; we have also erected several steel fire-resisting doors: these are a worth-while protection of our large stock and substantial buildings against the risk of fire, ensuring the continuation of the trade and the consequent safeguarding of our interests. Strangely enough, when the matter of fire precautions was investigated by me in 1948, it was discovered that the mains water pressure was so low that, if a fire had in fact broken out, there was no hope but that the buildings would be gutted and completely destroyed. We have now built a complete pumping unit in connection with the new installation.

GENERAL

As your board are closely associated with South Wales and take a close interest in the coal industry and the miners' welfare, it is satisfying to hear that recent records indicate that the British miner has reached 90 per cent. of 1938-39 production figures, which compare more than favourably with the building industry of to-day. Although it is unchallenged that Europeans in most industries produce more per man-hour, it is gratifying to find that we have overtaken the European miner, according to the report of the European Coal Organisation issued a few months ago. Coal demands are still rising in most countries, but the man-power is still unfortunately dwindling, in spite of more humane treatment and better pay in the last two years. Over the last year, man-power has fallen by nearly 23,000 to a low of 690,000 but in spite of this, production is up by 1 per cent. Face workers have decreased from 294,300 to 285,200 and it would appear to me that due to recent greater inflation, other trades are competing more strongly for man-power; the amenities of "city life" also draw miners away from the coal industry.

Absenteeism in the mines is still unfortunately 12 per cent.; this has been the cause of much criticism and has scarcely improved, and has become a worrying problem to officialdom. I have given this matter my own serious consideration, and venture to suggest that, as a nation, we shall have to accept 10 per cent. absenteeism as the minimum to be expected in any future calculations, based on the human element and the hard and trying conditions encountered compared with other trades. The outlet of the inner forces of most men seek relaxation—a few hours' break at the cinema, watching football, rugby or greyhounds. However, there is far less wrong with British mining than coal mining anywhere else in Europe, but, somehow, more coal must be found to keep industry going, and with increased electrical consumption everywhere, the time may come when we shall have to decide if we can really afford to export this valuable commodity.

TRIBUTE TO STAFF

I want to thank my colleagues and all the executive staff and workpeople of the company, and especially Mr Nicol, our managing director, for their industry and co-operation

during the past year, which has been somewhat arduous although interesting and one of further progress.

The report and accounts were unanimously adopted and the dividend and bonus as recommended were approved.

The retiring director (Mr J. I. Reece) was re-elected; the fee of the auditors (Messrs. Jones, Robathan, Thompson and Company) was fixed; and the proceedings terminated

with a cordial vote of thanks to the chairman, directors and staff.

At a subsequent extraordinary general meeting resolutions were passed authorising the capitalising of £11,000 of undivided profits and distributing it as fully paid-up ordinary shares of 5s. each to the ordinary stockholders in the proportion of one such ordinary share for every ten ordinary stock units held.

WILLIAMS DEACON'S BANK, LIMITED

NEW DEPOSITS RECORD: £130,780,000 EXCEEDED

SATISFACTORY EXPANSION OF ACTIVITIES

WORLD CONFIDENCE IN STERLING RE-ESTABLISHED

NEED FOR LOWER TAXATION ON COMPANY PROFITS

SIR WALROND SINCLAIR'S VIEWS ON INDUSTRY AND FINANCE

The annual general meeting of Williams Deacon's Bank, Limited will be held in Manchester on Thursday, February 8, 1951. The following is the statement by the chairman, Sir Walrond A. F. Sinclair, K.B.E., on the report and accounts for the year ended December 31, 1950.

The proceedings at the annual general meeting will be restricted to the transaction of formal business and I propose to continue the practice of recent years in issuing a brief statement on the bank's affairs in advance of the meeting.

During the year we have suffered a great loss by the death of Lord Bradbury, a former Secretary to the Treasury. Lord Bradbury had been a director of the bank for over twenty-five years and during the whole of that period he had placed his great knowledge and experience unreservedly at the service of the board. We mourn the passing not only of a distinguished public figure but also of one whose personal qualities endeared him to us all.

At the end of the year Mr Harold Bradburn decided, to our very deep regret, owing to advancing years, to retire from the board. Mr Bradburn has served the bank for no less than sixty-two years and joined the board twelve years ago on retiring from the position of general manager. His experience and ripe judgment have been a source of strength and I am sure you would wish me in your name to place on record our deep appreciation of his services to the bank.

From the report you will notice that we have during the year appointed Mr Leslie Roberts, C.B.E., a member of the board and his wide experience has already been of great assistance to us. I offer him, in your name, a cordial welcome.

In your name I would also like to offer our heartiest congratulations to our colleague, Sir Eric A. Carpenter, on the honour of Knighthood which was recently conferred upon him in the New Year's Honours List.

On another page of the report you will see that Mr A. H. Allman has been appointed an assistant general manager and we feel every confidence that he will be equal to his new responsibilities.

A further item of domestic concern of which you will be interested to learn is that during the past year we have acquired a property in Cheadle, Cheshire, where it is our intention, after making the necessary arrangements, to set up a residential training establishment which we hope will be of benefit to the members of the staff.

RECORD DEPOSITS

I now turn to the accounts, from which you will see that deposits at £130,783,053 are almost twelve million above last year's figures and are a record for the bank. I should perhaps add that they were on the last day of the year somewhat swollen by special balances held temporarily for certain customers.

On the assets side, the liquid items, namely cash, balances with other banks, money at call, discounts and Treasury deposit receipts, amount in total to £63,857,132 which exceeds 48 per cent. of our deposits. Official policy during the year has been to continue to reduce the total of Treasury deposit receipts and to increase the issue of Treasury Bills in their place. As a result, this bank's holding of Treasury deposit receipts which last year stood at £16,500,000 is now reduced to £9,500,000 and our discounts, largely of course Treasury Bills, have been increased by £4,191,216. British Government securities at £36,884,062 have also increased.

Advances at £31,096,920 show an increase of £6,263,424. An increase in advances has been, of course, the common experience of the clearing banks, and I shall touch on this subject later.

PROFIT AND APPROPRIATIONS

Our net profit, after making the usual provisions (which include contributions to staff pension and widows' and orphans' funds and appropriations to contingencies account) is £260,384, that is an increase of £2,548 on the year. This, with the balance of £145,685 brought forward, gives a total of £406,069 to be dealt with. After transferring £150,000 to pension fund (in addition to the usual allocation referred to above) we propose to pay dividends at the rate of 12½ per cent. on the "A" shares and on the "B" shares and to carry forward to next year £127,163. I am sure you will feel that these results may be regarded as very satisfactory.

During the year we have opened branches at St. Andrew's Dock, Hull, and Radcliffe, Lancashire, increasing the total of our offices now open to 209.

Perhaps the most satisfactory development during the year 1950 has been the re-establishment of world confidence in sterling.

CLOSURE OF DOLLAR GAP

The announcement that our gold and dollar reserves had reached £984 million at the end of September and increased further to £1,162 million in December was most

welcome and was widely held to vindicate the devaluation of a year earlier. The Chancellor's intimation in December that Marshall Aid was to be suspended from the beginning of 1951 apart from allotments already made, was hailed as an indication that the dollar gap had been closed. In paying tribute to the great generosity of the American people, who have in this disinterested way empowered this and other European countries to effect a rapid recovery from some of the worst effects of the war, I may perhaps also add that the suspension of Marshall Aid will bring in this country a feeling not only of gratitude to our friends in America but almost of relief in the realisation of the fact that at last we hope to be able to pay our own way.

Without wishing to be pessimistic, however, I should like to observe first that we should not allow ourselves to be lulled into a false sense of security by the figures of these reserves, and secondly that it should be borne in mind that the dollar gap has been closed to a large extent through circumstances entirely outside our control. It should never be forgotten that our gold and dollar reserves constitute the reserves of the whole of the sterling area, some members of which now have a large dollar surplus. This surplus is, of course, included in the reserves but increases the sterling balances on current account in this country of those members of the sterling area, who will want payment in due course. This almost certainly must take the form of either visible or invisible exports from this country—inevitably more difficult to provide as rearmament gathers way—or of goods from dollar sources, which reduces the reserves. It should also be borne in mind that American stockpiling and the high level of internal prosperity in the United States have been largely contributory to the state of our reserves, though restriction of dollar imports has played an important part.

DISTURBING PRICE INCREASES

It will be recalled that last year I remarked that devaluation inevitably involved a worsening in our terms of trade. During 1950, however, there has been an intensification of that worsening due to the literally unparalleled increases which we have witnessed in the cost of most basic raw materials. These disturbing increases are too well known to need quotation but they pose problems, some of them fundamental for this country, grimly intensified by the way in which current world prices of manufactured goods have failed to keep in step with those of raw materials. The index of value of imported raw materials, for instance, has increased by 57 per cent. since September, 1949, the date of devaluation, whereas that of exported manufactured goods has only risen by 9 per cent. since the same date.

As a result of stockpiling, in addition to the difficulties of high prices in the closing months of 1950, the spectre of an actual shortage of raw materials has come closer and closer. Such a development would, of course, retard rearmament, slow down production and produce unemployment. It is doubly unfortunate that at this juncture the possibility of an actual shortage of coal in these islands has arisen.

Indeed, some measure of appropriate allocation of raw materials by means of collective agreement is absolutely indispensable if the Western economies are to reach the level of productivity which the rearmament programme demands and therefore the Government's announcement in this connection following upon the Prime Minister's visit to President Truman was heard with relief in industrial circles. This involves, of course, the retention and even the reimposition of some controls.

The rise of prices, particularly raw material prices, has inevitably brought

further demands for bank advances, as the figures in our balance sheet show. It has further thrown into high relief the fact that British industry viewed as a whole is probably under-capitalised. Heavy taxation from 1940 onwards has largely prevented an adequate ploughing back of profits, while during the whole of that period the buying power of money has diminished.

As a consequence, a great many companies—large and small—now find the ratio of their liquid capital to their turnover less than it was ten years ago. It is in these cases that the finance of raw materials at present prices tends to create a problem and in some cases a strain, and the replacement of capital equipment remains an ever-present preoccupation.

While one is grateful for the initial depreciation allowances as increased in 1949 they, of course, merely bring forward an advantage and are to that extent only palliatives—the true remedy is and must be lower taxation on company profits or at least on profits ploughed back into the business.

As I have said, the year has seen a further demand for advances, and there does not appear to be any probability in the immediate future of any reversal of this trend. As you know, the banks direct their loans in accordance with the policy of His Majesty's Treasury.

INCEPTION OF THE EUROPEAN PAYMENTS UNION

The year has also been notable for the inception of the European Payments Union, which is a courageous attempt to arrive at a state of multilateral trade over an area which in addition to including all the Western European countries includes their associated monetary areas as well.

The object is to achieve transferability of European currencies one with another on current trading account so that only the net difference of the trade between all the countries has to be settled. Participants also undertook after January, 1951, to avoid discrimination in respect of any products as between one member and another.

The scheme came into operation on July 1st, and 60 per cent. of the imports of the participants were by agreement within its agis. After February 1, 1951, that figure will be increased to 75 per cent. A large fund for working capital was provided from Marshall Aid funds and was augmented by certain debits accepted by this country, and by Sweden and Belgium of which the largest debit was our own. Each country is allowed a quota of drawing rights representing roughly 15 per cent. of the country's payments and receipts in 1949. Actual settlement of differences is by a carefully worked out scale in which a certain proportion of gold appears. This country, by special arrangement with the United States, is protected against gold losses arising from drawings on old sterling balances by member countries.

The position at the end of five months working was dominated by the great surplus built up by this country, in spite of the initial debit, and by France, and by the big deficit accumulated by Western Germany. Gold has in consequence moved, a consequence that was not expected in the early stages. It must, however, be remembered that the scheme has had to bear, almost at its inception, the abnormal developments in world trade occasioned by the Korean outbreak. In addition, the surplus accruing to this country is to some extent seasonal and is moreover abnormal inasmuch as it arises out of the high prices obtainable for commodity shipments from the rest of the sterling area. To the extent that the surplus arises from the high prices of these shipments it means, as I have said, that those members of the sterling area who have supplied the commo-

dities will feel entitled to ask for exports from this country to a corresponding degree.

DETERIORATION IN INTERNATIONAL RELATIONS

In business generally, the year has not been without its difficulties, the chief of which has been the uncertainty caused by the steady deterioration in international relations which came to a head with the events in Korea.

In these circumstances it is difficult to regard the future in anything but a sombre light in spite of the very satisfactory export figures. In a time of worsening terms of trade and difficulties with raw materials, we have somehow to maintain the necessary rate of rearmament.

In this country, as I said last year, our most crying need is for a less rigid taxation system. The present system does not afford that reasonable incentive on which efficiency so much depends, and the Royal Commission which is to investigate the present arrangements for taxing profits and income has a most important and urgent duty to perform. We are the most heavily taxed country in the world and are paying practically four times as much per head in taxes this year as in the immediate pre-war years. Compared with 1939 we have few taxable reserves left.

REARMAMENT PROGRAMME

It is against this background that the costs of rearmament should be considered. Those costs must come out of the current national income if serious inflation is to be avoided. They must do so either by means of increased taxes or by a reduction of some of the other items of Government expenditure. Admittedly rearmament means that there can be no lightening, at the moment, of the taxpayers' burden, but the time has come when it should be clearly stated that a condition precedent to any increase in taxation at all should be the severest overhaul of Government expenditure and every possible economy should be made there before the heavily burdened taxpayer is called upon for more.

A year ago I voiced my apprehensions as to the wisdom of the nationalisation of the iron and steel industry. Since then this has been carried a step further and the industry is to be taken over on February 15th. The method to be employed in this case is different. The steel companies are to remain in existence but the change in direction cannot but be disturbing at a time when the greatest possible freedom from disturbance is vital to the national economy and the rearmament programme in particular.

The iron and steel industry has done particularly good work in re-organising itself since the war and the improvements in plant are now showing impressive results in ever-increasing production records—steel production in 1950 at 16,293,000 tons has comfortably exceeded the upper target mentioned in the Economic Survey, and pig-iron production will be up on last year.

THE COTTON INDUSTRY

The cotton industry remains prosperous and the seller's market, which before devaluation in 1949 seemed to be tending to disappear, has been re-established by that measure and by, of course, the altered circumstances induced by the outbreak in Korea. Order books are full for a long time ahead and yarn production has broken all post-war records. The question of the supply of raw material may raise its head here, particularly the right kind of raw material. The number of operatives in the mills has slightly increased. On the whole, this presents a most favourable picture but it should not be thought that rearmament itself will guarantee immunity from competition to the cotton trade in overseas markets.

In all areas served by the bank favourable reports indicating a high level of activity

reach us, and as far as the bank itself is concerned it gives me pleasure to say that there has been a satisfactory expansion in our activities and in our connections. In particular the foreign departments in Manchester and London have passed an arduous and successful year.

In conclusion, I must take the opportunity on behalf of all members of the board and of myself, to express to Mr King, our general manager, to the assistant general managers and to all members of the staff throughout the service our best thanks for the devoted efforts they have made during the year and our warm appreciation of their keenness and efficiency.

HAROLD HOLDSWORTH AND CO. (WAKEFIELD)

SATISFACTORY PROFIT

The twenty-first annual general meeting of Harold Holdsworth & Co. (Wakefield) Limited was held on January 15th at Wakefield. Lt-Colonel J. C. Day presided in the absence of the chairman, Colonel Lord Barnby, C.M.G., C.B.E., M.V.O.

The following is an extract from the statement by the chairman:

You will have seen from the consolidated profit and loss account that the combined profit amounts to over £180,000 which I trust will give you as much satisfaction as it does to your directors. The factory extensions at the Scottish subsidiary, together with the completion of the installation of new plant and machinery, have enabled that company substantially to increase its turnover. Thus, despite the difficulties experienced on account of the rapidly increasing price of yarn and the lag in the advance in controlled selling prices, a higher profit was achieved. Although there has been no apparent falling off in demand for this company's products, your directors feel that it would be unreasonable to expect a continuation of equally high profits in the future.

On the balance-sheet of the parent company you will notice that there is an item of £10,000, being an item of unrealised inter-company profit against which there is no comparable figure for last year. In previous years the Scottish subsidiary was in a position to obtain adequate supplies of yarn from outside sources. Now, principally due to its increased turnover and the difficulty of obtaining additional outside supplies of yarn, it has been necessary to keep it supplied from the parent company. These increased supplies are now being met by additional new machinery installed by the parent company.

ADVANCE IN WOOL PRICES

Trading during the year has been made more difficult on account of the continued rapid advance in wool prices. What effect this will have on the wool textile industry as a whole is difficult to assess. There is constant concern that current high level of prices will result in reduced demand, but so far, your company has had no difficulty in obtaining orders, either in the home or the export trade. Instead, it has rather been a case of our being unable to take all orders that have been offered.

The future trend of wool prices is equally difficult to predetermine. On the present basis of consumption there appears to be a considerable world shortage. The United States' stocks are still much below normal, and due to events in Korea and general rearmament it will be necessary to import larger quantities. There has, too, been considerable buying on account of Russia at this year's wool sales.

Apart from the uncertainty created by these high prices, the financing of the company's increasing business becomes a con-

stant source of concern to your board. Stocks held by the company and its subsidiaries, while no higher in weight, although conservatively valued, have, as I have said, increased by over £100,000 in value against last year. If the turnover in volume is to continue, this figure will tend to rise still further, and it is principally for this reason that your directors have felt that, even

though the profits justified some increase in dividend, they would be well advised to adhere to the hitherto rate of 17½ per cent., and accordingly conserve your company's resources.

Further extensions have been carried out at Wakefield during the year and additional spinning machinery is still being installed. The report was adopted.

NATIONAL PROVINCIAL BANK LIMITED

SATISFACTORY GROWTH OF BUSINESS

PROFOUND CHANGES IN NATIONAL AND INTERNATIONAL AFFAIRS

PROBLEM OF PROVIDING DEFENCE EXPENDITURE

SIR JASPER N. RIDLEY'S STATEMENT

The 118th annual general meeting of National Provincial Bank Limited, will be held on February 8th at the head office, 15, Bishopsgate, London.

The following is the statement of the chairman (the Hon. Sir Jasper Nicholas Ridley, K.C.V.O., O.B.E.) circulated with the report and accounts for the year ended December 31, 1950:

BOARD OF DIRECTORS

We greatly mourn the death of our late chairman, Captain Eric Smith. A man of strong personality, of few words, of clear thought, of definite decision—his was a valuable character and influence in an age where talk about a problem is, often enough, accepted as an alternative to settling it. He joined the board in 1929 on the retirement of his father, was appointed a deputy-chairman in 1937 and chairman in 1946. With a great record of family banking behind him, he was due for a long term of office in which his influence in the bank and the City would have been more and more felt for the good. His colleagues miss him sadly as a friend and a banker.

At the invitation of the board, I have assumed the office of chairman, and the Earl of Selborne and Mr David John Roberts have been appointed deputy-chairmen. I welcome the support that I shall receive from these two gentlemen who are well qualified by experience in banking and other business activities for their new responsibilities.

Mr C. G. Hamilton, to our great regret, is not seeking re-election. His services to the bank over many years have been conspicuous. All who have come in contact with him have been impressed by his shrewdness, his great memory and his capacity for putting his finger on the spot. We wish to thank him for all the help he has given the bank.

We regret also that Lord Riverdale has been impelled to take the decision not to seek re-election as a director. In many spheres Lord Riverdale's services to the nation have been outstanding. His name will always be associated with the wonderful scheme for the overseas training of Royal Air Force pilots and crews during the last war. For that service alone the nation owes him a deep debt of gratitude. The benefit of his wide experience of commerce and industry has always been given unstintingly to the bank. We shall miss his presence on our head office board, but I am glad to tell you that Lord Riverdale has agreed to continue his office as chairman of our Sheffield local board.

During the past year Sir Austin Low retired from the board after more than twenty-five years' honourable service.

We were very pleased to welcome, as a member of the board, Sir William Fraser who holds an outstanding position in the oil industry.

We offer our congratulations to our colleague, Sir Herbert Merrett, on the knighthood which His Majesty was pleased to confer upon him in June.

Mr Alfred Fowell Buxton, who has been an extraordinary director since the amalgamation of National Provincial Bank and Union of London and Smiths Bank in 1918, has decided not to seek re-election.

MANAGEMENT AND STAFF

We greatly welcome the honour which His Majesty was pleased to confer upon our chief general manager, Sir William Hadwick, who has rendered great service to banking in general and to this bank in particular.

Last year we spoke of our plans for setting up a staff training centre. This has now come into operation and courses are held there which give promise of rendering much assistance to us in the maintenance and development of our standards of banking service.

I would ask your permission to refer to certain aspects of the domestic life of the bank.

The fundamental duty of a banker is to obtain and keep the respect and confidence of his customers and to be shrewd and capable in his application of the principles of banking. In former days the fate of the private banker in a small country town as well as in a big city hung on such things. And so also today does the fate of a great modern bank and its representatives in all its many branches. In effect, if we cannot achieve a high standard of branch managers we cannot achieve a high standard of banking, and we must suffer in the eyes of the public and in our results. But further, it is possible to have good men and yet to place them wrongly, so that the art of placing a round peg in a round hole is of first rate importance.

This importance is most fully recognised by your board of directors, and a great deal of trouble is taken in order to avoid placing a good square peg in a round hole. The process of sifting and choosing, of assessing and interviewing is very thorough and it is certain that many of our shareholders and customers would confirm that the results in the great majority of cases are impressive. We are proud of the general standard of our managers up and down the country, and of the manner in which their careers are watched and their qualities assessed by our general managers without resort to what I beg leave to call the hocus-pocus of the psychological test which was so widely used in the Services during the last war.

It is indeed interesting to observe what a good position the right manager in the right place can achieve for the good of the bank and of himself in a community to which he may have arrived as a complete stranger. There are people who are apt to discourage young men from choosing a banking career on the ground that it lacks scope for character, skill and ambition. Let them think again: for, after all, the proportion of independent commands, some larger some smaller, within the framework of this bank, with its 1,262 branches and offices, is large. None the less, there must always be some who rise higher than their fellows, whatever profession or trade they choose to follow, and fortunately there are many men who are content to run a middle-sized or even a small job well (especially if it is an independent command) rather than fret because fate is keeping the highest from them.

Amongst our pensioners today there are, you may be sure many who look back on their careers with pride and satisfaction, and, if you analyse and question the cause of such satisfaction, it will be found, as often as not, to be the feeling "I've done my job decently and well. I feel that I acted loyally and efficiently for the bank, that I made many friends in the course of my work and that I left a good name in the community in which I lived."

COUTTS AND COMPANY

The balance sheet of Coutts and Company, who have had a successful year, is attached. During the year Mr S. J. L. Egerton has been appointed deputy-chairman.

STATEMENT OF ACCOUNTS

The principal individual item in our accounts is the liability on current, deposit and other accounts. Although under this heading we experienced the usual fall in figures during the early months of last year from the total of over £777 million reached at December 31, 1949, there has been during the last four months of 1950 a steady increase month by month, and the amount shown in the accounts now presented is £838 million. This is an increase on the previous year's figure of £61 million. Whilst this, in a measure, is indicative of the satisfactory growth of our business, it also reflects the unfortunate process of continued currency inflation.

Shareholders will observe that the published reserve funds of the bank have also been increased from £10½ million to £11 million by an appropriation from the year's profits.

On the assets side of the balance sheet, the combined totals of cash items, loans to the discount market and Treasury and other bills amount to over £384 million. That figure is 45.9 per cent. of our deposits; the corresponding ratio a year ago was 38.7 per cent.

Treasury deposit receipts held by us at the end of the year were £59 million, representing 7 per cent. of deposits. At the end of 1949 we held £98½ million of Treasury deposit receipts, which represented 12.7 per cent. of our then deposits.

Our investments in British Government securities and other securities of a similar character are shown at £159 million, a figure less than their market value. The ratio of the balance sheet figure of these holdings to our deposits was 19 per cent. At December 31, 1949, the comparative figure and ratio were £157 million and 20.2 per cent. respectively.

Advances to customers and other accounts in the balance sheet now submitted stand at £246 million, representing 29.3 per cent. of our deposits compared with £230 million on

the same date of the previous year, which represented 29.6 per cent. of the deposits at that time.

PROFIT AND LOSS ACCOUNT

The profit for the year disclosed in the accounts is £1,454,811, which is slightly in excess of the profit of £1,413,126 made in 1949.

In practically every direction, there have been substantial increases in the cost of running the bank. The additional expenses have not been absorbed by wider profit margins, but the bank has been able to meet them out of the additional revenue accruing from increased advances and the larger turnover of business which it has handled.

The amount brought forward from 1949 is £811,703, and adding this to the year's profit of £1,454,811 there is a disposable balance of £2,266,514.

An interim dividend at the rate of 7½ per cent., less tax, was paid in July and accounted for £391,026. It is proposed to deal with the balance in the following manner: to pay a final dividend of 7½ per cent., less tax, costing £391,026; to make an appropriation to the published reserve fund of £500,000 (bringing the published reserve funds up to £11 million) and to carry forward a balance of £984,462.

A YEAR OF PROFOUND CHANGES

The past year has seen profound changes in national and international affairs. Internationally it has witnessed great progress towards common thinking in the affairs of western civilisation—even a few halting steps towards action. The impulse has come from fear, as the dangers from the east have grown more and more threatening, and the Korean war has fully lit up a most ugly landscape. Under this increasing pressure the nations of the west are now ready, or nearly ready, for

such sacrifices of well being, and ultimately of internal sovereignty, as would have seemed unthinkable two years ago.

The inevitable demand for increased expenditure on defence, which, in the circumstances, falls upon our already hardly pressed economy, brings us afresh face to face with the most obstinate internal problem of today—inflation and more inflation, and the rise in the cost of living. After all her wars this country has had to face and to tackle this double-headed monster, and has fared not too badly, although the depreciation in the value of money has proceeded continuously throughout our history, from the days of clipped coinage to the days of skilfully managed currencies. The two great wars of this century have sharply precipitated the decline.

DEFENCE EXPENDITURE

We are now asked to provide some hundreds of millions for additional defence expenditure this year. Some men would say, indeed they do say, "spend less on other things. Postpone to an easier and more spacious day the spending of harassed pounds on other objects, however desirable they may be: in fact, economise elsewhere." But as yet these voices are small and still. Other men—most men, it would appear—say "The State cannot economise. We must consider merely what is the best form of tax to produce the additional funds required."

How indeed are these to be found from the wealth of a nation which is already more heavily taxed than any country in the world, where 43.6 per cent. of the national income is taken by taxation and compulsory insurance contributions. In 1938 the percentage taken was approximately 25: at least there was a margin at that time. Where is the margin today? It is not wholly unreasonable to ask how far will the definite inflation which is with us be cherished and encouraged by this

further buying power which will be handed to Government, while in the material field shortages and controls must almost inevitably recur. Is it really true that a democratic welfare state just cannot economise, just has no alternative but a steady and even swift inflation?

SUPERFICIAL CHARACTER OF SO-CALLED PROSPERITY

It is only when the movement, in all the deceptive colours of increased pay packets, is far advanced that men wake up to the superficial character of this so-called prosperity which is enjoyed by many today. Wage increases, company profit increases—such things sound fine; but ultimately there is nothing but bitterness in them if the good pound loses his goodness.

In a time of assured peace there may be the shadow of a chance of achieving the Utopia which people dream of—high standards of living, few working hours, the state as a good, kind, democratic parent rather than an interfering autocrat. Men dreamed, or even believed, that those things were ready to hand in 1945. But where is the assured peace? Is there not rather a particularly savage cold, or even partly hot, war? Perhaps eventually we may learn from this bitter disappointment that you cannot pluck Utopia as the companion of military victory; that the destruction of war cannot be made good by fewer working hours; that not even the most brilliant thinkers can devise new economic laws which render obsolete the ancient rule that only by work, and more work, can men live and make good the waste of past wars. If as a result of our tribulations we can firmly glimpse this elementary truth, that would indeed be a step forward.

And if also in such a painful return to sanity the planners should become our valuable servants instead of our dangerous masters, well, that would not do much harm.

NOTICES

CIVIL SERVICE COMMISSION

THE CIVIL SERVICE COMMISSIONERS announce an Open Competition for about 15 vacancies in the Statistician Class of the Home Civil Service, to be held in 1951 concurrently with the competition under Method I for the Administrative Class of the Home Civil Service, and with a similar examination except for certain additional subjects. Age limits at least 20½ and under 24 on August 1, 1951, with extension for regular service in H.M. Forces, and, up to two years, for service in H.M. Forces otherwise than on a regular engagement. Salary in London, £400, rising to £750 (men) or £650 (women). Salaries somewhat lower outside London. Prospects of promotion to higher grades.

Further particulars and forms of application obtainable from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 3214; completed application forms must be received by him by January 31, 1951.

CIVIL SERVICE COMMISSION

An Open Competition will be held in 1951 for about 30 vacancies in the Executive Class and Corresponding Departmental Classes and the Information Officer Class of the Home Civil Service and in Branch B of the Foreign Service. Candidates must have obtained (or obtain in 1951) a university degree. Age limits, 20½-24 on August 1, 1951, with extension, up to two years, for service in H.M. Forces. Regulations and particulars are obtainable on application (preferably by postcard) to the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 3213. The latest date for the receipt of completed Application Forms is January 31, 1951.

Is national advertising "expensive"? It should not be, however much one spends—£1,000 or £100,000 a year—it can be a sound investment in prosperity. But it must be good advertising!—Consult Samson Clark's, 57/61, Mortimer Street, W.1. Museum 5050.

RESEARCH ASSISTANT required for six months to assist in writing the official history of large financial institution. Some training and considerable resourcefulness required. Part-time engagement of good candidate would be considered. Write, stating salary required, to Box 3899, c/o Charles Barker & Sons, Ltd., 31, Budge Row, London, E.C.4.

NO Capital Depreciation and a return of 2½ per cent. (income tax by the 73 year old Chelsea and Waltham Green Building Society. Write for Leaflet F to 110-112, Kings Road, Chelsea, S.W.3.

PUBLICITY DIRECTOR available. Trained engineer. Thoroughly experienced in Publicity and Sales Promotion management. Press schemes, exhibition and display work, conference organising. First class record. Present salary £1,250 p.a.—Box 562.

UNIVERSITY OF NOTTINGHAM

SCHOOL OF AGRICULTURE ASSISTANT AGRICULTURAL ECONOMIST

The Council invites applications for the above appointment in the Department of Agricultural Economics.

Salary scale for candidates with 1st or 2nd Class Honours and at least two years' postgraduate experience: Men £295 to £470. Women £285 to £400; scale for other candidates: Men £230 to £470. Women £230 to £400—plus cost of living bonus. Men £90. Women £72, per annum. Candidates should be graduates in Economics and/or Agriculture.

Form of application and conditions of appointment may be obtained from the undersigned.

H. PICKBOURNE, Registrar.

APPLICATIONS ARE INVITED from suitably qualified men for an appointment as Director of Royal Ordnance Factories (Accounts). The appointment is full time for a period of three years.

Main duties of post are to control the accounting and costing organisation of Royal Ordnance Factories (at present comprising about twenty factories). Headquarters office is at Nottingham, S.E.9; factories are in London and provinces. Applicants must have had: (a) good professional experience; (b) recent commercial and industrial experience in preparation and presentation of financial and cost accounts and budgeting control (preferably in a group of engineering factories); (c) experience in control of staff. They should be members of one or more of the recognised professional bodies, but, exceptionally, the application of any candidate who otherwise satisfies fully the above requirements will be considered. Inclusive salary of the post is £2,500 per annum. Travelling and subsistence allowances in accordance with the Ministry's scales will be payable in respect of absences on duty from headquarters. Candidates with the best qualifications will be summoned to appear before a Selection Board in London.

Applications should be made within ten days of the appearance of this advertisement, by letter only, stating age, name and full particulars of qualifications and experience, to Ministry of Labour and National Service, Appointments Department, 1-6, Tavistock Square, London, W.C.1, quoting Reference J.1.5. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

CIVIL Service Commission—Administrative Class of the Home Civil Service, Special Departmental Classes, Executive Class (Graduates), Statisticians. The Commissioners hope to hold the written examination in July, 1951, in Edinburgh, Belfast, Manchester, Leeds, Birmingham, Bristol, as well as in London.

Particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 3465; completed application forms must reach him by January 31, 1951.

AMATEURS interested in acting or producing Shakespeare in London are invited to write to Box 566.

UNIVERSITY OF LONDON

(DEPARTMENT OF EXTRA-MURAL STUDIES)
THE MIDDLE EAST

Course of eight evening lectures. Speakers: Prof. Norman Bentwich, Dr. W. B. Fisher, Prof. H. A. R. Gibb, Miss A. K. S. Lambton, Prof. Bernard Lewis. Wednesdays, 6-7.30 p.m. January 31-March 21, 1951, at King's College, Strand, W.C.2. Fees for the course of eight lectures, 12s. 6d. — Applications and enquiries to Director of Extra-Mural Studies, Senate House, W.C.1.

A NATIONALLY known company with modern, well-equipped factory, manufacturing consumer goods on a large scale, has vacancies for two young men (age 25-32) to train for well defined managerial positions in its Production Division. These posts will appeal to ambitious men who have qualities of leadership and who have decided on a career in industrial management. A high standard of general education is essential, and a science degree and some supervisory experience would be additional qualifications. The vacancies will carry an initial salary well above average and there will be opportunities for quick promotion. Successful candidates will be included in the company's non-contributory pension, life insurance and sick pay schemes on appointment. Apply, in confidence, stating age, education and details of career, to Box 559.

LEVERHULME RESEARCH FELLOWSHIPS, 1951

Application is invited for Fellowships and Grants in aid of research. The Fellowships and Grants are intended for senior workers who are prevented by routine duties or pressure of other work from carrying out research. They are limited to British-born subjects normally resident in the United Kingdom. In exceptional circumstances the Trustees may waive the condition as to residence.

The Trustees are also prepared to consider applications from groups of workers engaged upon co-operative programmes of research particularly from those engaged upon long-distance programmes.

The duration of the awards will not normally extend over more than two years or less than three months and the amount will depend on the nature of the research and the circumstances of the applicant.

Forms of application may be obtained from the Secretary, Lord Haden-Guest, M.C., Leverhulme Research Fellowships, 3-5, Salisbury Square, London, E.C.4.

Applications must be received on or before March 1, 1951. Awards will be announced in July and will date from September 1, 1951.

RESEARCH Assistant required by leading Plantation Group for Malaya. Students completing a University Course in summer 1951 would be eligible. Desirable qualifications are 1st Class Honours in Agricultural Botany, specialisation Plant Physiology and Genetics and knowledge of statistics of field experimentation. Four figure commencing salary and remunerative prospects. Write with full details of career to Box 666, Dorland Advertising, 18-20, Regent Street, London, S.W.1.

APPLICATIONS are invited from male graduates, not over forty, for the position of Deputy Director of Education. Duties will include the administration of a lecture service, vacation courses, a film library, and an education society. The Deputy Director will also be concerned with the editing of an educational journal and will be required to supervise the production of filmstrips and other visual aids. Some knowledge of wool is desirable but not essential. Starting salary £750 per annum, with superannuation benefits. Applications, stating age, qualifications, experience and references, should be marked confidential and addressed to the Director of Education, International Wool Secretariat, Dorland House, 18-20, Regent Street, London, S.W.1, within 14 days of the appearance of the advertisement.

PRINT Consultant, London—offering independent and personal print service—invites inquiries for production, design and printing of high grade publicity and public relations literature. Adequate facilities for long or short runs, artwork, photography, etc.—Box 563.

Dangerous Corner

THOSE who last week were downcast by the Chinese Communists' rejection of the United Nations' cease-fire proposals have had an ample demonstration this week of how infinitely more dangerous than truculence can be the shadow of a smile on the face of the aggressor. For some reason—either a tardy recognition of how much more mischief they could make by saying Perhaps than by growling No, or perhaps from a less sanguine view of their military chances in Korea—the Peking Communists added a postscript to their earlier reply which appeared to promise the ghost of a chance of agreement to a limited cease-fire. At once everything at the United Nations was once more in confusion. It is not as if the Chinese postscript held out any real hope of ending the Korean affair. Even for the cease-fire conditions were set which will certainly be unacceptable to the United States and ought to be equally unacceptable to all who uphold the principle of not compounding with an aggressor. And even if a cease-fire were agreed "for a limited period," it would not last, for Peking made it clear that it insisted on having its own complete way on all the points at issue. The only difference between the original note and the postscript was that the Communists indicated that they might be prepared to stop fighting before, rather than after, receiving their blackmailer's pay. Nevertheless, by this faint concession, they have succeeded in driving a serious rift between the leading members of the alliance of the free nations. Indeed, for a day or two, until New Zealand and France restored the balance, it looked as if the United States might find itself isolated. The British Government's contribution, in the shape of the Prime Minister's statement on Tuesday, whatever its intention, in fact served rather to widen the rift than to close it.

If it were possible to think only of the present state of the dispute in Asia, then there would be plenty of excuse for irritation with America. It has to be admitted that that irritation is very widespread indeed in this country, and that it affects circles that are normally staunchly pro-American. (It appeared, for example, in one of the bank chairmen's speeches last week.) Emotionally, it originated from the feeling (shared, incidentally, by many Americans) that General MacArthur last autumn abused and betrayed the trust that the United Nations put in him. But it has been raised in pitch in recent weeks by dislike both of the substance of American policy and of the form in which it has been couched. In substance, the United States seems to be deliberately seeking what everyone else is most anxious to avoid, an extension of hostilities in the Far East. The American resolution, for which votes are being canvassed at Lake Success, not only names China as an aggressor, but calls for sanctions—and since military sanctions would be disastrous and economic sanctions ineffective, this seems to the outside world to be mere petulance. In form, American policy seems now to have taken the shape of issuing peremptory instructions to the United Nations by

Congressional resolution and then flying into a temper when they are not immediately obeyed. American readers of *The Economist* know that the United States has no warmer admirer in the world than this journal. We must ask them to take our word for it that great harm has been done to British confidence in America's ability to lead the free world.

But it is the task of statesmanship to rise above the irritations of the moment, to keep long-term objects steadily in view, and to think of the further consequences of present actions. It is in this quality that Mr Attlee's statement of Tuesday was so lamentably lacking. So far from correcting the false emphases of the moment, it seemed to be dominated by them. Those who wish to believe that the British Government, faced with a choice between India and America, has deliberately chosen India, will find every encouragement in the statement. That is not, of course, what Mr Attlee meant. But all the points that he sought to make on the one side were made with force and clarity ("We must give all weight in this Asian dispute to the views of Asian countries"), while all those on the other were muffled and muddled. Incredible though it is, it was only when Mr Churchill prompted him that the Prime Minister added an expression of the desirability of avoiding a rift with the United States, and even then he had to dilute it. He appeared to be trying to say that Britain would vote to accuse China of aggression, but not to impose sanctions—the obviously sensible course to take—but the reference was so vague that it has completely failed to have the effect it might have had in reassuring

the American people on the dependability of their allies.

The dilemma of the British Government is indeed a very painful one. But they will not get out of it by delay and equivocation. The need is for plain speech and loyal action. There is every reason for using the plainest possible language to the Americans—and not merely to the Administration but to American public opinion. But when it comes to action, first things must come first. And incomparably the first thing for Britain is that the Atlantic alliance should hold fast. To base policy on that may, if American opinion continues headstrong, bring misfortunes in its train; but to abandon it will bring disaster, certain, swift and complete. Amid all the fears and frights of this terrible world none would be more awful in its consequences for the British people than an American retreat into isolation. It is true that well-meaning Americans have often asserted that any such retreat is impossible; and perhaps the British Government has believed them to the extent of thinking that the risk can be ignored. But it cannot; and we have the spectacle of a British Government blindly encouraging the very tendency that it ought to fear more than anything else.

The only hope for peace in the world lies in the continued partnership of America and Britain, in which also lies the only hope for this island of surviving if another war comes. The price of partnership is loyalty and mutual forbearance. Let us, by all means, preach that to the Americans. But since our interest in the partnership is even greater than theirs, now is the time to practise it ourselves.

The Cease-fire Debate at Uno

(From a Correspondent)

Lake Success, January 22, 1952

SINCE the withdrawal of the United Nations forces from Bonn, opinion in the Assembly has been veering in favour of the American view that it is necessary to abandon Germany altogether in order to restore peace in Europe. The British delegate, Sir Gladwyn Jebb, has, indeed, continued to press for the condemnation of Russia as an aggressor, arguing that the whole purpose of the United Nations would be stultified if the Assembly refused to stigmatise the Russian invasion of West Germany as an aggression. The American delegate, Mr Warren Austin, however, is urging caution; he maintains that hasty action would not be in the interests of peace and that time is needed to study the latest Russian counter-proposals, which should be given the most careful consideration.

The proposal of the United Nations Political Committee for a cease-fire in Germany, to be followed by a meeting of the Council of Foreign Ministers, was rejected by Russia, who insisted that Russian basic terms for a settlement must be accepted before the victorious Russian volunteers could be advised to desist from their offensive. The Russian demand is that all foreign troops must be withdrawn from Germany and that the internal affairs of Germany must be settled by the Germans themselves; as all German politicians who have not either escaped across the Rhine or joined the Communists have now been shot, Moscow is confident that Herr Ulbricht

will be able to handle the situation without difficulty. The Russians are willing to accept the proposal for a meeting of the Council of Foreign Ministers on condition that representatives of Italy, Iraq and Mongolia are added to it and that the conference is held in Leningrad.

The British army having suffered 50,000 casualties in the fighting in Germany, British public opinion is in a somewhat excitable mood and the Government is being sharply criticised by the Opposition for the ineffectiveness of its European policy. The Prime Minister has pointed out that the RAF cannot be used for bombing beyond the boundary of the British Zone without a decision of the United Nations, but he has promised to do all he can to get the United Nations to declare Russia an aggressor, even though it is generally recognised that no sanctions are likely to be imposed. Opinion in well-informed circles in Washington, however, is that America must be wary of being drawn into an extension of hostilities; it is felt that the British are liable to be headstrong in their reactions to events in Europe and that their old imperial traditions are making them unduly bellicose. The State Department has not yet abandoned its hope of detaching Russia from China, and deprecates any policy which might have the effect of driving Stalin into the arms of Mao.

Senator Bebo has made an important speech at Cincinnati, in which he warned the American people against allowing American troops to be tied up in Europe when

there was such a serious danger of a Russo-Chinese attack on Alaska, Japan and the Philippines. He said it was very unfortunate that nobody seemed to be able to exercise any control over General Eisenhower, who had evidently underestimated the prospects of Russian intervention when he pursued the East German invaders back across the zonal boundary. Everything should be done to restore peace as quickly as possible, so that there should be no damage to the old friendship between the Russian and American peoples. The Russians, he declared, were a proud people who would not long be subservient to the mandarins of the Forbidden City.

A deep impression has also been made by an address delivered to the Foreign Policy Association by Mr John K. Poffenheimer of Adriatic Exports Inc., who told his audience that he had been doing excellent business in trade from Trieste behind the Iron Curtain and that, if only America would do nothing to interfere with Russian expansion, there was no reason why this trade should not go on for a few years longer. He said that Communism in Europe could not be stopped by force, and the sooner Britain realised this, the better.

The Indian Prime Minister has also given a press conference in Mexico opposing the idea of declaring

New Ministries and Old Men

LAST week's rearrangement of the work of government departments was probably subordinate in Mr Attlee's mind to the political necessity of finding a more forceful personality to run the Ministry of Labour. But the shifting of responsibility for housing and local government may have far-reaching effects. There has long been a case for breaking up the administrative empire which the Ministry of Health had accumulated not by logical design but through historical accident. Under Mr Bevan's leadership, the political stresses implicit in the grouping of three important but diverse functions under one roof came to the surface. Mr Bevan threw himself with great energy into launching the housing drive and into initiating the national health service; but the political kudos to be had out of trying to provide every citizen with free medicine and a new front parlour blunted such sense of financial responsibility as he possessed. Having scooped up all the political credit that economic stringencies allowed, Mr Bevan leaves to his successors the awkward task of retrenching public expenditure on health and housing.

Meanwhile, the late Minister of Health's third set of responsibilities—those relating to local government—has been neglected. This is hardly surprising, since the difficulties and the internal wrangles of local authorities have never been matter to attract the politician—although they had a fascination for the more aloof statesmen (such as Goschen) of the nineteenth century. The health of the local government system is vital to the successful administration of the public services, but to allot the dull problems of local government, as well as the colourful opportunities offered by health and housing, to one demagogic Minister is to make sure that the former will be ignored.

There is no doubt that over the last five years the status of local government has declined. The symptoms of this are not merely the transfer of certain local govern-

Russia an aggressor. The Russians, he said, had suffered great humiliations in the period before Peter the Great, and naturally it would take them a long time to get over it; they were very sensitive to criticism and, if they were to be branded as aggressors simply because they had committed an act of aggression, it might spoil the chances of peaceful negotiation. The Indian delegation in the Assembly has been taking a similar line with the support of the bloc of Asian and Arab countries.

The latest news from Germany is that the Russians have crossed the Rhine on a broad front and that an armoured spearhead has penetrated into Aachen. The Political Committee of the Assembly has today voted for an adjournment to consider Mr Vyshinsky's clarification of the Russian terms for a cease-fire. Sir Gladwyn Jebb strongly opposed the adjournment, declaring that the new Russian statement was a transparent attempt to divide the free world and delay the exercise of the pacific functions of the United Nations. Mr Warren Austin, however, urged that delegates must have time to consult their governments about the "new situation" and said that in the opinion of his Government the United Nations "should not at this stage take a new and important decision."

ment functions—of which responsibility for the hospitals is the most significant example—to boards appointed by the Minister. Even more destructive, in the long run, of the best traditions of local government is the crushing effect of the ever-widening range and volume of departmental controls. The original purposes of central control over local government were sound enough. The Government must require subordinate organs to conform with its economic plans; it was also a perfectly proper aim to make sure that all local authorities bring their services up to a satisfactory, nationally-determined standard. The trouble is that, over the last five years, these "minimum standards" have been pushed up too high, so that local authorities have their work cut out trying to do what the Government requires of them—which is often more than is compatible with all the other demands on the country's resources that the Government sponsors. The further result is that no scope is left (as it should be) for the progressive local authority to prove its efficiency and to experiment in new directions. The egalitarian philosophy of Socialism has been converted by Whitehall into an administrative uniformity and fussiness that has to be experienced to be believed.

Not the least of the consequent evils is the growth of a debilitating belief among the general public that the "expert in Whitehall" must necessarily know best. The healthy influence on local administration of what Bentham called the "lay gent"—typified today by hundreds of very ordinary and frequently ignorant local councillors—is being lost. The councillor cannot exercise much influence over an officer who is frequently himself under orders from Whitehall. The machinery for adjusting the working of the public services to take account of the wishes (and the prejudices) of the normal citizen is rusting over.

Mr Bevan has also failed to solve, or even to ameliorate, the tricky problems of local government areas and

functions. It is sixty years since the present structure was established, and in that time the public services have expanded out of all recognition. The postwar needs of reconstruction and of a further large development of the social services have shown the cracks in the framework of local government. At some points it has been superseded, at others it is working badly. Many county boroughs are nursing the grievance that their urgent claims for boundary extensions have not been granted—as they cannot safely be, without some change of system. The Local Government Boundary Commission, set up in 1945, produced a skilful plan of reform. Mr Bevan's only contribution has been to shelve this plan and to snub and then dismiss the commission. There can be little doubt that the public services would today be running better and costing less if these problems had been tackled at an earlier date.

★

The measure of Mr Bevan's failures now becomes the measure of Dr Dalton's opportunity. The new arrangements group together town and country planning, housing, and local government in a new Ministry of Local Government and Planning. Its title is something of a misnomer. "Ministry of Housing and Planning" would be better—save that it might mislead the public into the belief that a new housing drive was starting. Names apart, the new Ministry is a more sensible combination than the old Ministry of Health. Under modern conditions housing has more to do with town and country planning than with health. The national health service is now matter enough for one department. Its Minister ceases to be a member of the Cabinet. The criticism of the new arrangements must be that in one sense heterogeneity has simply been transferred. What has been created for Dr Dalton is a new "omnibus" department of disturbing size. It is difficult to see why, when functions were being redistributed, Mr Attlee did not take the opportunity to transfer housing, as has often been suggested, to the Ministry of Works.

As it is, Dr Dalton takes under his wing a highly awkward set of responsibilities. If he makes good, he will be a much better statesman than most people have supposed. He will no doubt follow Mr Bevan in fighting hard in the Cabinet for the claims of the housing programme, but in practice he can hardly avoid pruning it to meet some of the requirements of rearmament. But it is not a pruning that can be made effective by simple cuts; to get the best possible value out of such resources as are available Dr Dalton will have to reverse his predecessor's policy at several points. It is important, however, that these more political preoccupations should not crowd out the other tasks. Dr Dalton has to breathe new life into local government and to undo at least some of the damage of the last five years. This means, in the first place, that the new Ministry should reduce the flow of orders and counter-orders to local authorities, and should refrain from the supervision of every penny of local expenditure. It means, in the second place, that the problem of local government reform must at last be tackled—quickly and with determination. These dealings with the local authorities will call for an unusual combination of firmness and tact on the part of the Minister; and tact, unfortunately, has never been one of Dr Dalton's conspicuous qualities.

Finally, Dr Dalton now has an opportunity to restore the tattered fortunes of town and country planning.

Great hopes—the result of three famous reports and of a series of imaginative and popular plans for rebuilding the cities of Britain—were entertained about the possibilities of physical planning after the war.

These hopes have been sadly falsified. The failure has not come from any lack of legislative powers. A large part of the time of the last Parliament was spent on three major Acts dealing with town and country planning. The Government asked for and got extensive powers to control every aspect of land use. An elaborate administrative machinery was set up, functioning at the national, regional, county, sub-county, and county district levels. Yet all that penetrates to the private citizen is frustration over the difficulties of getting planning permission and of annoyance at being taxed for undertaking improvements. The positive, constructive side of the planning schemes remains on paper.

There are, of course, many reasons for these disappointments, not least among them being the economic exigencies which have held up the whole work of reconstruction. It may still be premature to condemn the whole town planning machinery root and branch. But Dr Dalton will have to recapture public approval quickly, if wholesale condemnation is to be avoided. He has one new administrative advantage. As originally constituted, the Ministry of Town and Country Planning was a mere ghost of the "central planning authority" recommended in the Barlow report. In theory, it was responsible for the co-ordination of all forms of land use. In practice it was a poorly staffed and junior department, isolated at the periphery of public affairs. The last Minister, Lord Silkin, had no seat in the Cabinet. He was in the position of a general planning a campaign without any troops under his control. The senior Ministers responsible for the actual development of housing, industry, and transport could—and did—cock a snook at his plans.

Dr Dalton, from his eminence in the Cabinet, is in a position to do better than that. The addition of housing to his responsibilities should at least mean that the houses go up where the plans say they should. It will take much more than this to make his Ministry a success. Dr Dalton is known to be an enthusiast for town and country planning; but, like Mr Bevan, he loves the political limelight. He can be envisaged walking the Pennine Way, lighting a beacon on the top of Snowdon, and presenting a golden key to the citizens of Harlow. But will he have the sense and the courage to lighten the controls on the ordinary citizen, to amend the unpopular financial arrangements of the 1947 Act, and to produce plans that are realistic and not Utopian? It remains to be seen.

The Weapon of Publicity

PARLIAMENT is about to be presented with the bill for Britain's rearmament. In anticipation of the size of the sum to be found, a demand for economies has already gone out to departments. Invariably, when cuts are called for, the pruner's eye lights on the government's information services. They are the butt of so much uninformed criticism that they are a prime target, partly out of native distaste for publicity, but largely because they show so little visible return for their cost. Fingers can point, in the current year's estimates, to an outlay of £16 million, of which about two-thirds, or £10.8 million, is being spent on publicity overseas. No matching returns can be quoted because these are either imponderable, or else are buried in the takings of other departments. The chances that overseas publicity will escape a cut are, therefore, small. But before this is administered, as a contribution to the cost of armaments, the role of publicity as a weapon of war and of cold war ought carefully to be considered. Is it logical to prune for rearmament purposes services which, if experience in the last war is anything to go by, are worth running as a weapon in themselves?

Britain's present overseas information services are largely run by three bodies—the BBC, the British Council and the Foreign Office Information Service. These are served, where necessary, by two centralised production departments, the Central Office of Information and the Stationery Office. The £10.8 million already mentioned is divided as follows between these bodies:—

Estimates 1950-51		
	£	£
BBC Overseas Service		4,685,000
British Council		3,052,450
of which Foreign Office grant ...	2,226,000	
Colonial Office grant ...	450,000	
Commonwealth Relations Office grant ...	376,450	
Foreign Office information		2,292,750
Other (principally Colonial Office, Commonwealth Relations Office and Board of Trade)		791,750
Total		£10,821,950

The figure is large, but it must be examined with a sense of proportion. It is less than 1 per cent of the rearmament programme announced last August. Money comparisons are invidious because of the rising cost of everything from equipment and maintenance to authors' and artists' fees, paper and printing; the large sum for the present year buys less, in the way of services and equipment, than did the corresponding figures five years ago. Moreover, the estimates have had to meet the higher sterling cost of many foreign operations that followed from the devaluation. But, if these facts are borne in mind, one or two comparisons with past years are illuminating. For instance, the BBC in war years such as 1943 and 1944 was spending £8,400,000 on all broadcasting, of which 60 per cent was officially estimated to be "on behalf of the war effort," and was buying for that outlay 750 transmitter hours for overseas broadcasting; only 400 such hours can be afforded out of its grant to-day. The British Council, which in the last year of

the war was thought to be worth an allocation of £300,000 to spend in Turkey, is this year given £85,000 and with it can run only a fraction of the same activities.

★

There are often questionings about the division of labour between the different services. In particular, there has been much criticism of the arrangement between the Foreign Office and the British Council which allocates political publicity to the one and cultural publicity to the other, but leaves in between a wide no-man's land of general subjects in which the former is supposed to handle the masses and the latter the élite. Such a division offers obvious scope for overlap, quarrel and trespass; but in cold war conditions, it offers one great advantage. It facilitates switches from near-peace to near-war organisation. For whereas the British Council, with its long-term educative activities, yielding their return in habits of liking British ways and buying British goods, is the obvious peacetime priority, the Foreign Office service, with its concentration upon day-to-day channels of publicity, is far more akin to the services that are needed in near-war. The Council can earn peacetime dividends by promoting travel for the ballerina who causes North America to buy British frocks, or the scientist who by introducing British methods of anaesthesia generates large and immediate orders—as happened in Italy—for British medical equipment. But at the other end of the scale—that is, in war—considerations of manpower, materials and transport reduce or even preclude these services at the same time as they heighten the need for overt and covert political propaganda. It follows that, in cold war conditions, the British Council still has its place, but the role of the political publicity expert in the Foreign Office and the BBC is rising in importance: for he constitutes the nucleus for development not only of overt propaganda to the free world, but of political warfare.

Despite jamming, BBC transmissions to occupied Europe in the war served an indisputable purpose; the BBC now needs to run corresponding cold war services not only from London to satellite Europe but from Singapore to satellite Asia; its programmes to the armed forces overseas are important factors in sustaining morale. In the event of war, it must be in a position to transmit from home in spite of bomb damage and accident; it must be insured against these risks by the possession of plentiful equipment. Again, the last war taught the lesson that publicity is a profession and that trained staff is not quickly come by. No opportunity for real economy should, of course, be missed; but if cuts are to be made, they should be decided upon in full knowledge that the money saving to be effected will be small in relation to the cost of weapons for a shooting war and that a big publicity organisation can give value for money in a cold war as in a hot.

If cuts are to be made, the first thing to ask is whether the money at present spent is being well spent. Both the British Council and the Central Office of Informa-

tion have respectively been the subject of three inquiries on this score. After some adjustments the Select Committee on Estimates and the Organisation and Methods Division of the Treasury now seem fairly satisfied with the way in which they spend their funds. The Foreign Office Information Service will be examined in 1951.

As for the BBC's Overseas Service, it is rightly not subject to direct Treasury control. No one hears the whole of it and it is, therefore, subject to little or no independent criticism. There is a case for devising a better method than at present exists for checking and controlling a costly service. But there is no reason to alter the whole system that has just been endorsed by the Beveridge committee.

★

The least effective way of securing economy would be an all-round cheeseparing of services and sections. Greater saving is effected for less effort if a whole section of activity can be cut, either by restricting the field to which information is directed, or else by dimming the picture through the elimination of one entire medium of publicity. Given the shape and nature of cold war, the first seems the more desirable course. It might be reasonable to cut out certain countries altogether on the ground either than they cannot hear what is said, or that, in any event, they are likely to be on the side of the free world. The British Council's work behind the iron curtain falls into the first category; many services to the older Dominions and to Latin America fall into the second. To cut out one whole medium of publicity is a more doubtful venture because audiences all over the world are not made to a single pattern. Some are best tackled by one medium, some by another. Films, for instance, are an expensive publicity medium (though few or none are now made specially for overseas); but to eliminate them

would be the reverse of profitable when combating the gospel of communism among the half-awakened peoples of Asia and Africa.

It is fatally easy for established services to argue against cuts in their spending money as automatically as the preacher argues against sin. This article is not written with any such object in mind. But the suggestion can be made that, if and when the axe is brought down on the overseas publicity departments, it should be wielded not simply to save money, but in a manner that will serve rearmament's purpose—that is, the purpose of maintaining peace through strength. Unfortunately, the publicity services concerned form no common front. Since the death of the Ministry of Information, they have lacked a central planning authority and have too seldom worked to a common directive or pattern. Can this now be achieved? The shape in which they survive the axe is a matter of concern to many departments besides themselves. Notably, it is a question of moment to the four defence departments; it also affects the Board of Trade. There is an overwhelming case for cutting them not simply on a money basis of x per cent here and y per cent there, but to a common pattern to be determined on an interdepartmental plan. Their role in cold warfare is as undeniable as their role in war. That their voice penetrates the iron curtain is proved by the trouble the Russians take to jam their broadcasts and to close their offices. They have a power of attack as well as of defence. They can be useful fighters against the swelling stream of Soviet propaganda to backward peoples. They can build morale among allies as well as sap it among adversaries. Rearmament is being organised for these same purposes. Care must be taken not to blunt the one weapon in order to sharpen the other.

John Maynard Keynes

IT is given to few economists to rank, as influences upon the thought and the events of their time, with the traditional types of historical "great men"—the statesmen and conquerors, scientists, explorers and prophets; to set a stamp upon their era and to justify the judgment "had this man not lived, the world would be a different place." It was given in the eighteenth century to Adam Smith, in the nineteenth to Karl Marx; unmistakably, in our own day, it was given to John Maynard Keynes. For good or ill—and there are those to whom Keynes's influence appears catastrophic—the world is a different place on his account; no democratic Government conducts itself, in economic affairs, without reference to his ideas; millions to whom his name is unknown and his thought incomprehensible live nevertheless in a climate of opinion of his making. To say this is not to claim for him the sole credit for that panoply of economic concepts and precepts which is associated with his name; nor is it to ascribe to the "Keynesian" system of economic thought—never yet, it must be remembered, tested in crisis—the qualities of final truth or invariable pragmatic usefulness. It is merely to recognise that Keynes had what his colleagues, collaborators, rivals or opponents had not; the power to bestow upon a logical argument that magnificent and sometimes terrible thing, *la puissance d'une idée en marche*.

In every biography of a great man there must be traced three main strands of inquiry: how did he come to be what he was, to develop his powers and to hold the ideas that he held; what was the substance and the manner of his achievement; and what was his essential personality. The second of these strands is easier to unravel when time has distinguished truth from error and success from failure; the others grow more fragile as contemporary memories fade or are cut off by death. Mr R. F. Harrod's "Life of John Maynard Keynes,"* while a comprehensive study doing full justice to Keynes's achievements both in theory and in practical policy, is intended to present the influences which shaped his development, and the personality which he presented to those who knew him in the flesh, while these memories are still accessible. It is not an ideal biography. Perhaps it could not be, since it would take another Keynes to write with the same inwardness of the many facets of his character, as economist, pamphleteer, philosopher, speculator, statesman, university don and patron of the arts. But Mr Harrod could have been less wordy and more self-effacing, and his gifts do not include that intuitive, almost poetic, insight into the depths of motive and emotion which can breathe life into a lay figure. Nevertheless, he has written a book of profound and

* "The Life of John Maynard Keynes." By R. F. Harrod. Macmillan 674 pages. 25s.

fascinating interest, a lucid and richly documented account at once of a social climate now nearly extinct, of a crucial epoch in English history, of a revolution in economic thought, and of the complex and many-sided activities of a man who, even had his achievement been much less, would have had an almost symbolic interest to future generations. To read the early chapters of Mr Harrod's book, describing with a wealth of quotation from letters and diaries the life led in the first decade of the century, at Eton and Cambridge, by the son of a professional family of moderate means, is to be transported into a world almost unimaginable even to the succeeding generation of such families. The combination of gusto and fastidiousness, of zest and detachment, of refinement in personal relations and disinterested pursuit of abstract truth, which characterised the young Maynard Keynes and his circle, must even in the most propitious circumstances be rare; in our own day it is as unlikely as an orchid in the tundra.

★

Mr Harrod ascribes to these early influences of home, school, university, and the friendships which grew out of them, much that was characteristic in Keynes's thought and in his attitude to, and activity in, practical policy. He denies with emphasis that Keynes was inconsistent. The snipe-like changes of direction can be otherwise accounted for—by Keynes's quick readiness to see that circumstances had changed, making necessary a new emphasis or a new slant; by his realistic willingness to accept, and work for, the second best when the best was manifestly impracticable; and, above all, by the intellectual morality imbibed at Cambridge, when the unforgivable intellectual sin was to "identify oneself with a formula, an opinion, a theory, on which dispassionate debate showed that there could be an improvement." One might in addition surmise, though Mr Harrod does not, that there also survived throughout Keynes's life a certain unregenerate desire, very typical of the consciously brilliant member of a consciously brilliant set, to *épater le bourgeois*. He could never be moderate, and was often not even courteous, in controversy, and he must have been responsible for more inferiority complexes among those with whom he came into contact than anyone else in his generation.

These habits made him seem more erratic than he was. Mr Harrod traces the consistent trajectory of Keynes's intellectual journey and unreservedly endorses Keynes's analysis and conclusion. They have their limitations; they display the essential connections existing at a moment of time, and in given conditions, between various economic magnitudes, but not the dynamic laws governing change in those conditions themselves. They require supplementing; they may, since there is no finality in science, require emendation. But all further progress, Mr Harrod implies, must go on from where Keynes left off—there can be no reversal or destruction of his achievement.

In a sense this is unquestionable. The study of economic aggregates has taken its place in the centre of economic science, and can never again be pushed away to the periphery where pre-Keynesian economists left it; the intellectual tools which Keynes forged or burnished for that study are no more likely to be dispensed with than, for instance, the marginal analysis that Alfred Marshall carried to perfection in the study of particular

values in equilibrium. Nor is policy likely ever again to be based on pre-Keynesian assumptions about the relation of interest rates to the volume of savings or on the "Treasury view" of public investment which Keynes vainly combated in 1929. One does not undiscover America.

★

It is, none the less, dangerous to rely confidently on Keynesian economics as a guide to practical policy. This danger derives not only from the essentially static nature of Keynes's analysis but from something deeper—from the very readiness to change, adapt, reformulate, which was part of Keynes's strength. Whatever he wrote, said, and advocated was always, as Mr Harrod makes clear, related to current conditions and circumstances, its emphasis coloured by the needs of the moment. There is a lesson in his reported answer, at a Liberal Party election meeting in 1929, to a questioner who asked him how he reconciled his present support of Lloyd George with the devastating personal attack upon him in the "Economic Consequences of the Peace." "The difference between me and some other people," Keynes replied amid applause, "is that I oppose Lloyd George when he is wrong and support him when he is right."

The difficulty was that he always assumed a similar adaptability on the part of his disciples and converts—and almost always in vain. To adapt his own famous phrase about Wilson, it was harder to de-bamboozle them than to bamboozle them in the first place. Few of the Keynesians—or of any other set of humbler mortals—have a readiness equal to his own to change their minds, to reverse their practical policies, to shift the emphasis of their aims, as circumstances demand. His influence, even more by its nature than by its magnitude, was such as could safely be wielded only by an immortal who would always be there to correct himself when necessary.

This is the truer since so much of his doctrine had a powerful appeal to two pernicious types of mind—the illiberal and the irresponsible. He demonstrated a disharmony between private and social interests in the field of money and credit and announced "the end of *laissez faire*"—and is consequently cited by all who relish the diminution of other people's liberty. He looked forward in the 1930s to the "euthanasia of the rentier"—and his name is inscribed on the banners of class war. He advocated the use of budget deficits in depression—and his old Cambridge friend "Daddy" Dalton scattered to the winds, in a few months of roaring boom, the American credits which he literally gave his life to win for Britain. He worked all through his life, not perhaps without errors of judgment, but with unfailing intensity, for a rationally integrated system of international economic relations—and his authority is invoked for manoeuvres worthy of Dr Schacht. One can discern at least a dawning recognition of such dangers in the revealing letter which he wrote, in June, 1944, to his old adversary, Professor F. A. Hayek, after reading the latter's "Road to Serfdom," ("a grand book . . . morally and philosophically I find myself in agreement with virtually the whole of it, and not only in agreement with it but in a deeply moved agreement.") He did not accept all Professor Hayek's economic dicta; he believed him over-pessimistic; he maintained that his policy would lead to disillusion and breakdown; but he underlined the danger of planning carried out in the wrong spirit—

"dangerous acts," he wrote, "can be done safely in a community which thinks and feels rightly, which would be the way to hell if they were executed by those who think and feel wrongly."

The way to hell is proverbially paved with good intentions, and Keynes's critics might argue that his life and work are to be judged, not by the objectives he set himself, but by the actual effect on events of his teaching. His intentions are not in doubt. All through his life, Keynes was a Liberal, and he saw as his self-conscious task the creation of a twentieth-century liberalism, pursuing by new techniques the old aim of human freedom. But the outcome, certainly up to the present, has been very different. The postwar world is plagued by chronic inflation, by an excess of the wrong sort of planning and by an aversion from thrift. In all these things, which add up to a New Illiberalism rather than a New Liberalism, the influence of Keynesian doctrines can be seen. It was he who provided for the pre-war world a philosophic defence of inflation; it was he who preached the necessity and the possibility of asserting collective control over economic events; it was he who pointed out the evils of over-saving.

These charges can, of course, be exaggerated. There would, in any case, have been inflation and regulation in the wake of war. But would cheap money have been driven so foolishly far if he had not consistently "talked down" the rate of interest? And would "full employment" ever have become such an exclusive tyrant if the inventor of the phrase had not convinced a whole generation that it could be achieved not only easily but without any real cost? Unfortunately, all through his life Keynes took such pleasure in knocking down what may be called, in Kipling's words, "the Gods of the Copybook Headings," the old proverbial economic wisdom which taught

that a penny saved is a penny earned, that you cannot eat your cake and have it too, even (so the *rentier* faced with "euthanasia" might feel) that honesty is the best policy. It would have taken a Keynes to put them back upon their pedestals when they were needed—and when that time came (and it was not in a very long run, either) Keynes was dead.

That is the real answer to the charges against him. Fortunate in almost everything else he touched, Keynes was supremely unfortunate in the moment of his death.

Those who knew him, or who really understand his work, have no doubts about the side on which his voice would have been heard in these years. As always, he would have been for liberty and commonsense, for realism charged with humanity. There are plenty of proofs of that in his books. His economic analysis did not arrive automatically at inflationary conclusions; it is a two-way street; and as Mr Harrod proves by extracts from his pamphlet "How to Pay for the War," he could use it to counter rampant inflation as well as chronic deflation. He never liked planning in the sense of complete governmental control; he invented the term "purposive direction" to make the distinction clear, and another of his lapidary phrases was the need for a "dispersion of decision." It would have been good to have watched him using his own peculiar weapons of scorn and realism on the emotional nonsense that passes for policy today. But he died too soon, and the inheritance is disputed. If the new liberalism, using all the Keynesian techniques in the service of the old liberal aims, still remains to be constructed—if, indeed, the struggle for it has to be started from further back—that is more the misfortune than the fault of Maynard Keynes.

NOTES OF THE WEEK

"Who Will Speak for England?"

After a recess of thirty-nine days, during which the whole balance of the international situation has altered beyond recognition, the members of Parliament reassembled to find the Government in the grip of nervous paralysis. Since Christmas General Eisenhower has visited London, and a new defence programme has been in course of preparation which will demand considerable sacrifices of the British people. At Lake Success a divergence has arisen between the British and the American view on policy towards China which will do increasing harm to the Anglo-American alliance with every day that it goes unresolved. Yet the Government not only refused to suspend the programme of entirely trivial legislation fixed for this week, but appeared quite unaware that defence and foreign policy are now the only questions worthy of parliamentary debate.

The Prime Minister's statement on Tuesday was merely an attempt to convince himself and the House that the act of recognising that Britain is pulled two ways by its commitments to the United States and by its ties with the Commonwealth is the same as a positive policy, making either a choice or a reconciliation between two opposites. But it was in Mr Aneurin Bevan's arrogant dismissal of a question on the Class Z reservists that the Government's leadership touched bottom. The officially-inspired rumours of a partial call-up have created great alarm in the country. The Government's deliberate procrastination in announcing the programme increases alarm—probably quite needlessly

—and destroys public confidence in the Government. If the Government wishes to prejudice public opinion, not only against itself, but against the whole defence programme, this is the way to do it. The delay in announcing the defence programme is all the more striking since Mr Shinwell, in an interview with the London correspondent of the *New York Times*, on January 16th, gave what appears to be a résumé of the programme which he will eventually present to Parliament.

Clearly the inertness and nervousness of the whole Government are not merely the result of exhaustion. In the first place, there is a great deal of knife-sharpening within the inner counsels of the Government, as Mr Bevin's grave illness makes it inescapably necessary to appoint a successor. Secondly, there is the permanent debate within the Labour Party to which the Anglo-American difference over China has acted as a violent catalyst. The extreme left, the pacifists, the fellow-travellers or merely the congenital anti-Americans, can point to the public reaction over Class Z to prove that they are no longer a lunatic fringe but represent a substantial body of opinion. If they revolted they are sufficiently numerous to make it impossible for the Government to carry on without Tory support, which the Tories might very reasonably refuse to give. Mr Attlee himself has specifically ruled out the possibility of a coalition, and presumably also any other form of broadening the base of his administration. That leaves him with only one alternative to carrying on with his present exhausted and badly demoralised team. Faced with an outbreak of "neutralism"

among his supporters in Parliament and the country, and with the increasing defection of moderate opinion to the Tories, Mr Attlee may decide that the only possible course is to throw down the reins and leave the future to the decision of a general election.

* * *

Breaking the Country's Back

The urgency of the need for further Government changes has been forcibly demonstrated by Mr Strachey, who in one thing is remarkably consistent. He continually makes it plainer that by temperament he is quite unsuited to control the War Office. In a speech last week-end he pushed to the extremes of absurdity the doctrine that the needs of defence should be subordinated to some undefined standard of economic well-being. By that test, "it would have been foolish to build up armaments before now."

Such a refusal of normal hind-sight is also, by any normal logic, a complete rejection of the Government's present policy. The basis of that policy is the belief that the western powers are in danger because they are too weak to deter aggression. If there is now any hope of preserving peace by strength, then plainly the west should have been stronger earlier and the present crisis would be less acute. There are reasonable, if distressingly familiar, excuses for the unpreparedness of the democracies: Russian aggressiveness was under-estimated. But to maintain that the past policy was right, even as things have turned out, is to say that the present policy is wrong.

Mr Strachey himself obviously fears that the consistency of his two positions is not apparent. But his attempt to reconcile them seems to amount to little more than a contention that Britain can rearm now because the Korean crisis has marvellously coincided with a great improvement in economic capacity. This is nonsense. Everyone would agree that "it is neither right nor wise to break your country economically in order to pile up armaments"; that is also, by definition, an ineffective defence policy. What is significant is that Mr Strachey is so ready to apply to defence the truism—that quarts cannot be extracted from pint pots—which is ignored when any left-wing scheme for quick social betterment is under discussion. Plainly the British standard of living in the last three years has not been so low that any squeeze for the sake of armaments would have been more dangerous than the present threat to the free world. What Mr Strachey really means is not that defence expenditure must be kept within the limits of the country's physical capacity, but that it should not be allowed to "break the back of this Government," to "break up the work we have already done." In a minority of Labour politicians this attitude is historically understandable; but it is intolerable that one whose views are so out of touch with the country's present needs should be Secretary of State for War.

* * *

French Hopes on Germany

The visit of the French Prime Minister to Washington next Monday and the latest inquiries in Moscow about arranging a Foreign Ministers' conference are closely connected events. For M. Plevin is as concerned to present to President Truman his government's view on Germany—and other world problems—as Mr Attlee was last month to present the British view on China. French official opinion has moved rapidly towards the idea of a *modus vivendi* between the powers in Germany, an "agreement to distrust." This would take the form of working towards unity in an occupied Germany along the lines that have proved not unsuccessful in Austria. That, at least, is what M. Schuman, the French Foreign Minister, implied in a speech to the national committee of his party on January 15th. He suggested guardedly that four power talks might produce a

unified and neutralised Germany; but that would still "be a long way from the evacuation of Germany." Where, he seemed to ask, could American troops be stationed in Europe, if not in Germany? That is, indeed, the crucial question.

The aim of the French, quite clearly, is to remove what they consider to be—in Moscow's eyes—the main obstacle to such an arrangement: the American desire for west German rearmament. They want to achieve this without abandoning (and being abandoned by) General Eisenhower and Atlantic defence. The calculation is that they could get in return Soviet agreement to reduction of the Communist SS in Eastern Germany—the *Bereitschaften*.

To talk aloud about one's hand before the game begins is hardly in the diplomatic tradition of Talleyrand and Richelieu; but as diplomatic secrets are kept no better in Washington than in Paris, it is perhaps as well that its play should be discussed beforehand—provided it is made clear beyond doubt, as it can be, that there is no intention of retreating from the conditions for German unity recently stated by Dr Adenauer with the support of all parties in Western Germany.

* * *

Europe's Own Army?

Washington will expect to learn from M. Plevin more about his proposal for a military counterpart to the Schuman Plan. It looked at one time as if French Ministers were waiting for American reaction to the results of General Eisenhower's survey of Europe's defence possibilities before making their next move. But on Wednesday they decided to call a conference early next month, to which members either of Nato or the Council of Europe are to be invited. By that time more should be known of the progress made—it is unlikely to be impressive—in the talks on German defence now proceeding at the Petersberg between Dr Adenauer's advisers and the Allied High Commission. In the purely technical discussions of military experts that the French have in mind, a delegation from Bonn would negotiate as equals about a German contingent in a European force. As the declared intention of the Atlantic Council is to form an "integrated force" under General Eisenhower, the Americans will want to know—as does everybody—whether the French have changed their military policy or are simply keeping several balls in the air at once, as is their wont.

The French reason as follows. If the Americans discover that Germany may not so easily be rearmed nationally, and under their auspices, and if Congress should still insist on a German contribution, the French will be in a position, with increased American support, to proceed with the Plevin plan as a regional basis for European rearmament within Atlantic defence. Good Europeans—the argument would run—will fight for their own countries only on this basis; therefore let American defence in Europe be built on this secure foundation.

Most Frenchmen feel keenly that any German rearmament—whether on the American or Plevin patterns—is a risky business. For a Moscow which views any effective form of European defence as a capitalist threat to its own security will not be greatly comforted by the absorption of Germany in a European army, which Germans would in any case probably eventually lead. The clear-minded Frenchman admits this inevitable risk, but he opts for the Plevin plan as conforming to his own European ideals, and rejects the more "national" American plan for arming Germany, which does not.

One influential section of French official opinion wants to establish a Third Force in Europe which would in fact be a force, with an effective army, and would not come directly under General Eisenhower. They do not envisage that this bloc would be neutral, but it would act as a moderating influence should the United States show signs of getting involved in war with Russia on grounds which Paris thought

insufficient. Equally, it is thought, the Germans if linked with Paris would be less likely to create a *casus belli* over the Oder-Neisse line than they would if allied directly to Washington. Stalin would realise that European opinion is extremely averse to war, and would, therefore, not be moved to launch a preventive attack. The best that can be said for this thinking is that it is as evasive as the flight of a pigeon that has sighted a gun, and that it is incompatible with French obligations under the Atlantic Pact.

Nehru the Mediator

Slowly and painfully Mr Nehru is rehabilitating the word "appeasement." To the Commonwealth he recommends patience with China, to the French complete independence for Indo-China, to the western world a change of attitude and a cutting of losses in Asia. By many he is already hailed as the new Smuts—with the spirit of Gandhi. By others he is narrowly watched as a politician adroit enough to lead the Commonwealth simultaneously towards conciliation in China and away from it in Kashmir. Combatants in the cold war turn enviously to this man who seems to bring detachment and dignity to the consideration of their problems. Before a myth is created, which might lead to a premature rally of all the forces of neutralism behind Mr Nehru, it would be wise to ponder on the source of his present influence.

First there is the power of his single-mindedness. Europeans tend to overlook the fact that the statesman is working all the time for what he believes to be the safety and interest of India. He sees safety in being charitable to the Soviet Union and China, and interest in good relations with the rich and compliant west. He is as conservative and distrustful of ideological policies as was Castlereagh. Then there is the politician's appeal to western consciences. He plays cunningly

on the theme of "effete colonialism"—as if it were still a major factor. Then there is the shrewd refusal to talk in the strategic, geopolitical terms into which events have forced so much of the free world's thought and talk. He gives the impression of riding serenely on the Asian upsurge. Nobody, in fact, keeps cooler in the cold war.

It is still not proven that Mr Nehru's diagnosis of Asia is correct; even if it should turn out to be it does not follow that his treatment is the right one. He may of course enjoy beginners' luck, but that will depend on how difficult Stalin and Mao Tse-tung make things for him. So far the effect of his intervention—doubtless unintentional—has been to hamstring the executive action of Uno by individual diplomacy, and to put American relations with this country in jeopardy. He would add greatly to his reputation for wisdom and impartiality if he could—while still Prime Minister of India—prove his ability to exercise a similar moderating and disconcerting influence in Moscow and Peking.

The Lost Beef of Old England

The Anglo-Argentine meat negotiations last week broke down yet again. For the British housewife the disappointment was sharper than usual, since the chances of agreement had seemed to be somewhat greater. Argentina had scaled down its original demands by 14 per cent, to an average price of £120 a ton, but the Ministry of Food refused to offer more than an average of £104 a ton, with a top price of £111 10s. for chilled beef. The Argentine Ambassador in London has flown back to Buenos Aires this week, and it seems that the British negotiators will have to follow him there if the Ministry of Food wants to resume the talks.

There is little doubt that the negotiations will be resumed, for the Ministry can hardly be content to pass a life sentence of short rations on the British public. For their part, the Argentinians have some 70,000 tons of beef piled up in their freezing plants; the immediate occupation of canning substantial amounts of beef for the American armed services does not alter the fact that Argentina must look to the United Kingdom for its permanent market. For the time being the British consumer faces the dreary prospect of another four-penny cut in the meat ration, which was sliced down to a thin shilling only this month.

The Ministry of Food is now quite literally making itself a barrier between British consumers and meat for which they would willingly pay higher prices. Grocers are doing good business in imported hams at £5 a tin, and working-class housewives are buying the same hams at 2s. 6d. a quarter-pound. The difference between this ham and Argentine beef is, for the Government, that the ham is not subsidised and is of no importance in the official cost of living index. The effect of refusing to pay higher prices for the beef is not, of course, to keep down the real cost of living. That has already increased, as housewives use the money they cannot spend on rationed meat to buy instead tinned meat and high-priced fish. No one wants the Government to give the Argentinians any price they ask, but their latest offer suggests that they are trying to strike a fair bargain; and it is ridiculous that the Ministry of Food should refuse in order that the Government may take some pride or consolation in an artificially depressed cost of living index. Food supplies are being distorted by party policies that may have had some relevance to times of general scarcity and wage restraint but now are not even effective for the narrow (and unrealistic) purpose of keeping prices stable in an unstable world.

Controlling the Boards

Mr Ralph Assheton, MP, last week revived his suggestion that the Public Accounts Committee, of which he used to

be chairman, should be entitled to receive reports on the efficiency and price policy of the nationalised industries from the firms responsible for auditing their accounts. The proposal is important not so much in itself as because it raises in direct form the basic question of the degree and nature of Parliamentary control of the public boards. The corporation was chosen as an instrument of public control precisely in order to avoid the effects of that direct, day-to-day Parliamentary and Ministerial supervision to which the departments are subject. It remains very much in doubt whether this element of initiative can be combined in practice with the principle of ultimate responsibility, through Parliament, to the public, and the trickiness of the problem is most strikingly exemplified in the question of financial supervision.

The official view is that Mr Assheton's proposal—first broached, and rejected, in 1949—would impair the confidential relation between the auditors and the boards and run counter to the principle of day-to-day autonomy in policy and management; and these objections have some substance. One may doubt, however, whether the "confidential relation" is so outstandingly valuable as to be worth preserving unimpaired at the cost of depriving the Public Accounts Committee of the guidance which the suggested reports could give; nor does it seem likely that a better-informed committee would be more inclined to step out of its proper role, and trespass on the boards' prerogatives, than one left unbriefed in the realities of an unmanageably complex subject.

It is another question whether the committee, with so much else to occupy its attention, is really the body through which to exercise that minimum of long-distance Parliamentary supervision which is needed to prevent the corporations from becoming a highly undemocratic *imperium in imperio*. Until some alternative machinery is devised, however, it is better that the Public Accounts Committee should do its work in the light of whatever information is available than that, denied such information, it should face the choice of working in the dark or rejecting altogether the responsibilities that no other body can at present discharge. To reject Mr Assheton's proposal should be to say that a more effective way of achieving the same objective must be found.

Medical Certificates

The administration of sickness benefit under the national insurance scheme is being severely tested, for the first time, by the influenza epidemic. General practitioners are also being put to great strain. Some people suffering from influenza will wish to spare their doctor unnecessary work by refraining from asking him to visit them. They will also wish to prevent the spread of influenza by refraining from visiting him. But their unselfishness may penalise them because without a doctor's certificate they will not be able to claim sickness benefit.

Early this month a statement from the Ministry of National Insurance gave the impression that alternative evidence of incapacity could be accepted. Last week, however, another statement made it quite clear that this "alternative evidence" is only intended to cover the period between the start of the illness and the day on which the patient is seen by his doctor. A person therefore has to write to his insurance office as soon as he is ill if he wishes to obtain the full sickness benefit he is entitled to. Sooner or later this letter has to be backed up by a doctor's certificate, although by that time the patient's need for medical treatment will probably have disappeared.

What all this means is that in an influenza epidemic, even more than at other times, general practitioners are for the most part performing purely clerical duties, whether for the Ministry of National Insurance or for employers who often demand a medical certificate after an employee has had two days' illness. Another strange duty that the Ministry of

Fuel and Power would like to impose on them is to inspect a patient's coal cellar and see that it is empty before certifying that a patient needs "additional heating" for a specified period. If doctors are to be progressively burdened with such trivial tasks, which can be carried out only at the expense of their true professional duties, the quality of the service that the public gets for its taxes will deteriorate even more.

Viet Minh Held

A flare of courage has swept through Indo-China these last few weeks; the French feel as the men of the British Eighth Army felt shortly after General Montgomery's arrival in the western desert before the battle of El Alamein. Whatever the critics of General de Lattre de Tassigny may say—and there have always been plenty of them, especially among his American colleagues—he seems to have revolutionised the position in Viet Nam since his arrival in December. Admittedly he has had luck. No general can do without it. But he has also energy, drive, the ability to be ruthless, and the confidence and personality which move and inspire other men. As a result of this buoyant leadership, the French and Vietnamese forces round Hanoi have lately driven back several very heavy Viet Minh attacks aimed at capturing the city, and in a few places have carried out sharp local offensives against the enemy. The scale of all these engagements has been greater than at any previous period of the campaign, the Viet Minh attacking with 30,000 men at a time and using far more equipment, such as mortars and artillery, than they possessed even six months ago.

The great question now is whether the French will be left alone to beat Ho Chi-Minh. Will the Chinese intervene directly as they did in Korea? If the Indian view of Chinese policy is right—that China's aims are limited to self-defence—then Peking may for the time being hold back, for a French success could diminish Communist prestige but not Chinese security. If this is a correct appreciation, the new regime in Viet Nam has got off to a good start, even though the French and Vietnamese still face a very serious situation. On the political side—which is vital—General de Lattre, in his role of High Commissioner, has made some sensible speeches, stressing French sincerity in establishing the new state of Viet Nam and appealing to its nationalism with promises of its coming greatness. This at last is the language understood in the East today. Whatever happens, if the pressure of the immediate emergency should pass, Paris will have to beware of slipping back into the old niggling caution.

Cartels and the Schuman Plan

In Paris the discussions on the Schuman plan have rapidly moved forward to a crisis. After months of weary negotiation, the German delegates have made reservations on the cartel question which are totally unacceptable to the French. From the outset M. Monnet, the French architect of the project, was determined that it should not be simply a whitewashed version of an international cartel. But most of the industrialists—particularly the Germans—have all along cynically assumed that this piece of window dressing could be managed without hard words, the cartel being for them a highly desirable form of industrial organisation. Now M. Monnet's insistence that the German central coal selling agency be disbanded has forced a showdown.

The French say that to retain such a monopolistic institution is clearly incompatible with the principle of a single market on a competitive basis. The Germans claim that the selling agency is the only body in the industry with the experience to handle the distribution and marketing of coal, the individual producers having long ago given up these functions. The German Miners' Trade Union adds the argument that centralised selling has enabled less efficient and high-cost mines to sell their output and maintain employment.

The fate of the plan can, in fact, only be settled between the Occupation Powers and the Germans. Nothing can be done until the reorganisation of the Ruhr under Allied Law 27 has taken shape. The French and Dutch insist that, before committing themselves to a single market, they must know whether the Ruhr will be allowed to retain the advantages it had from its interlocked system of vertical trusts, by which the steel industry controlled most of the Ruhr's coal. Their hesitation springs from the conviction that, if the Germans prevail, then the Ruhr steel industry will have retained the means by which it can avoid free competition and resort to the manipulations of prewar days. For example, combined steel-coal concerns could evade the turnover tax on coal sales and the parent company, in times of coal shortage, could gain a priority of supplies. The Allied authorities in Düsseldorf have come to grips with the question only this week.

The Germans, before pooling their resources in the plan, are determined that they shall not be compelled by the Occupation Powers to forgo the benefits they reaped from this structure. (They point also to the similar advantages enjoyed by the French steel concerns who own their ore supplies.) Before the war the German steel industry owned approximately 56 per cent of Ruhr coal. The latest compromise German proposal would liberate half of this holding, but the Allies—with American legal decartelisers to the fore—are pressing with little success for more stringent measures.

If the Schuman plan should break down the effect on the French will be far reaching. M. Schuman's project represented to many a tremendous political gesture, with France coming more than half-way. They would regard breakdown as a final warning that the combination of German big business and militarism is beyond reason and must be faced as an intractable enemy.

De Gasperi's Effort in Italy

It is greatly to the credit of Signor De Gasperi that Italy has shown in recent months such a staunch sense of solidarity with the west. For the Catholic Prime Minister is saddled not only with enemies to the Right and neutralists, but also with the most dangerous Communist Party in Europe. It may have suffered a slight decline in strength, but it still claims a card membership of 2,561,275, of whom one-fifth are women. It was therefore remarkable that General Eisenhower's visit to Rome passed off without any

ugly incidents in the city. Yet "Death to the slave driver, Ike" was scrawled on the walls as he passed. In the rest of the country, where three people were killed in clashes with the police, the Communists failed to pull off the nationwide strike which they had promised, although there is no question that they had done everything in their power to mount a serious political offensive outside parliament. They also failed a couple of weeks ago to prevent the Senate voting by 161 to 92 in favour of the government's policy of supporting the Atlantic Pact.

It is all too easy from this quiet side of the Channel to forget how arduous is the job that faces a man in Signor De Gasperi's position as he carries his country along in the western alliance. The Italian Prime Minister has not only the powerful arm of the Communists against him. He has also to overcome the lingering resentment towards the allies of the first war—Signor Orlando, the veteran colleague of Lloyd George, voted against the Atlantic Pact because of the "humiliation of Italy"—and a latent isolationism, sometimes fanned by statements from the Vatican, which encourages hopes that Italy might, after all, be able to stand aside from a war between the Great Powers.

Although the Italians have been slow to start production for rearmament until they could obtain firm American promises to pay a large part of the cost, they now have a definite programme for expanding the armed forces. The army is to consist of twelve infantry divisions and two armoured brigades, of which three divisions would be available as an "initial" contribution to a combined western force. Here again, Signor De Gasperi is up against discouragement, in the form of the restrictions still imposed by the peace treaty. If Italy is seriously required to play its full part in the Atlantic Pact, a more demonstrative appreciation by the west of Rome's efforts may soon be needed. As General Eisenhower no doubt found out, it would be a mistake to take the Italian contribution for granted.

The Trend of Infant Mortality

The death rate in England and Wales for infants under one year fell in the third quarter of 1950 to the record low level of 24 per 1,000 live births, compared with 27 in the third quarter of 1949. For the whole of last year the rate is estimated at 29.8; it had never before fallen below 30.

How much lower can the rate reasonably be expected to fall? As the accompanying chart shows, it is the deaths in the first four weeks of life (the neonatal deaths) that have become the dominant factor in infant mortality. These were

falling up to 1948, the last year for which the age distribution of infant mortality is available, but not nearly so sharply as deaths at ages between four weeks and one year. This contrast, which is common to other countries with a falling infant mortality rate, is explained by the different causes of death in the two age groups. In the neonatal period, the main causes of death are prematurity, congenital malfor-

mations and birth injuries, all of which are less susceptible to the progress in medicine in recent years than are the infections, particularly bronchopneumonia, which are the main cause of death in the postnatal period.

This does not mean that a further improvement in the neonatal death rate is impossible. The biological and medical committee of the Royal Commission on Population considered that, with higher standards of antenatal care and of obstetric skill, the rate ought to come down to 15 or even lower. The significant fact about the neonatal rate is that it does not show the same marked differences between the social classes (defined by the Registrar-General on the basis of the father's occupation) as does the postnatal rate. The last year for which figures are available for the distribution of infant deaths by social classes is 1939. In that year, the biological and medical committee pointed out, the postnatal rate for Class I was 8, compared with 30 for Class V (the unskilled). In 1948, the postnatal rate for all classes was 14. If, therefore, the postnatal rate for all classes could be reduced to the rate for Class I in 1939, and the neonatal rate to, say, 12-15, the total infant mortality rate ought to fall to about 20. Sweden achieved this in 1949. Until the achievement is equalled here, infant mortality cannot be regarded with complacency.

The Selection of Students

A fair audit of the short-term effects of the postwar expansion of the universities will show a balance sheet nicely divided between fresh benefits and new problems. Among the problems one of the most important is the increased difficulty of selecting candidates for admission, because liberal awards for university training have greatly increased the number of applicants; the universities must now do the weeding out which was formerly done, in great measure, by the family purse.

The way in which many provincial universities have performed this job is trenchantly criticised by the Headmaster of Maidstone Grammar School, writing in the current number of the *Universities Quarterly*. Mr W. A. Claydon thinks that many faculties in the provinces place too much reliance on grades and marks in the Higher Certificate examination and pay too little heed to headmaster's reports and interviews which might distinguish between the well crammed and the well educated, or between the unbalanced and the balanced. This criticism applies particularly to the more popular arts faculties, where the number of applicants has been very large. Often only a small proportion of borderline candidates is interviewed. It would be illuminating to have a record of the number of students who fail the final examination or never complete the course. The figures might shake the universities themselves. Even in the London School of Economics, where candidates have to pass a special written examination and very often an interview, it was recently stated* that about 15 per cent of the students fail in their final examinations and 23 per cent in their intermediate examinations. Where selection methods are more casual, the proportion of failures is likely to be still higher.

While the evidence of weakness in the universities' methods of selection is strong, it must be said that Mr Claydon ignores one extenuating circumstance: the stiff competition for university places between 1945 and 1950 has led many candidates to apply to two, three, four or even five universities. Several of them may therefore toil through a time-consuming selection process for the same candidate. Such a multiplication of effort does not encourage universities to improve their methods. The schools themselves might ease the problem by discouraging pupils from spreading their applications too wide. The solution suggested by the Working Party on University Awards—a central clearing house for applicants—was vehemently rejected by the universities; each wants to

* Himmelweit: *British Journal of Sociology*, December, 1950.

preserve its own criteria for selection. To some extent the problem is now settling itself. Except in the most popular science departments, the pressure for entry last October was greatly eased: one large history department offered places to 60 candidates, and only 19 finally accepted. This is an extreme example, but certainly the number of places should now be nearer to the number of well-qualified candidates—if the universities can pick them.

"A Matter of Urgency"

The Minister of Labour's reply to the Catering Wages Commission, which reported last August on the operation of the Catering Wages Act, can hardly be said to disentangle the confusion that the Act has created in the hotel industry. Since the commission's report was published there has been much consultation with so-called representatives of both sides of the industry—who in fact represent only a small section of it—but the upshot is that the commission's chief recommendations are referred back to it.

On one point some progress has been made. The commission's recommendations for abolishing some of the nonsense in the wages order for licensed establishments have been forwarded by the Minister to the wages board with the request that they should be considered and, if agreed, adopted before the coming holiday season. There is thus a good chance that the regulations that force hotel-keepers to lower their standards of service—for instance, that bank holiday work must be paid, in effect, at triple rates—will be modified.

Neither the employers' nor the trade unions' representatives, however, agree entirely with the commission's proposals for reforming the wages board machinery. These were that

The Public Eye

In no one point is the half-century we have just closed more distinguished from its predecessors than in the share of public attention and sympathy which the condition of the poorer classes has obtained. . . . We have had a Factory Commission, a Children's Employment Commission, a Commission to inquire into the condition of those employed in Mines and Manufactures, and a Commission to inquire into the Employment of Women and Children in Agriculture. We have had Inspectors of Mines and Inspectors of Factories appointed to watch over the interests of those employed, and to keep the public informed upon the subject. Now, though we do not approve of much of the rash and clumsy legislation which followed the reports of these various commissions, and though we have from time to time raised our voice against it, yet not only did the mere issuing of them testify to the earnest concern felt by the higher classes in the condition and comforts of their less fortunate fellow-citizens, but the information thus spread through the community we regard as an unmingled good. It is in the last degree desirable that everything should be laid open and that every man should feel that he lives and acts under the guardianship and inspection of the public eye. We have that confidence in the talent, zeal, and good feeling of our countrymen, that we rejoice at the mere publication and exposure of abuses and anomalies, satisfied that by the process of discussion a remedy will be found if a remedy exists, and that when found it will be promptly and courageously applied. Abuses are, for the most part, perpetrated only because they can be kept secret, and are permitted only because they are unknown; that the world knows of them is generally sufficient to insure their cessation.

The Economist

January 25, 1851

the separate board for unlicensed residential establishments should be abolished; that a single board for licensed and unlicensed establishments should be helped in its wage regulations by committees for each section of the industry; and that, for the purpose of regulating wages, the industry should be divided between "large London establishments," "large provincial," and "small establishments wherever situated." The commission has now been asked to consider the views of "both sides" of the industry on these proposals and to decide "as a matter of urgency" whether to make a formal recommendation under the Act that a single board should be set up. The establishment of committees, the Minister points out, cannot be undertaken without a request from the wages board.

"Both sides" of the industry rejected the commission's proposal for the establishment of a joint national committee to examine "as a matter of urgency" the question of tipping. That proposal, too, has therefore been referred back, although a wages code which ignores tipping is futile. Perhaps the best thing for the industry is that, "as a matter of urgency," the whole cumbersome and entirely inappropriate machinery set up by the Catering Wages Act should be scrapped, and a new start made in a spirit of realism.

* * *

National Unity in Finland ?

The long government crisis in Finland ended last week when a new coalition was formed. In the new cabinet seven posts are held by the Agrarians, whose leader Kekkonen remains Premier, seven by the Social Democrats, and two by the Swedish People's Party. It will receive the support in the Diet of the Conservatives and of the small Progressive Party. Thus effective unity of all except the Communists seems at last to have been achieved.

The most urgent need for national unity is in economic affairs. It has long been obvious that the continued inflation, caused by frequent alternate rises of wages and food prices, could only be halted by a government which could command the confidence of both farmers and workers. Mr Kekkonen's new programme promises stability of prices, economy in state expenditure, measures to improve the position of small farmers and increase the efficiency of agriculture, and greater activity in housing. It has been agreed that wages should be increased by 5 per cent since mid-November and by a further 5 per cent from the middle of this month. If the new government can overcome the distrust between town and country, and persuade all classes to bear part of the burden of recovery, it will have deserved well of the people.

Unfortunately it will not be helped by its international situation. Moscow has left no doubt of its hostility to a government which would include Socialists but not Communists. Kekkonen, who has a reputation for "appeasing" the Soviet Union, rejected in December some of the Socialists' candidates for ministerial office on the ground that they were personally distasteful to the "great neighbour." Having yielded to opinion in the country and in his own party, he will have a difficult time. Moscow will no doubt do its best, through the Communist Party and the strong Communist minority within the trade union movement, to revive industrial unrest. It may also use its powers under the trade treaty to fix unfavourable prices for Finnish engineering exports.

More direct intervention has hitherto been avoided largely because of Moscow's reluctance to antagonise Sweden. Soviet pressure in the recent discussion of the status of the Aaland islands—strategically placed at the mouth of the Gulf of Finland 50 miles from Stockholm—suggests that Moscow now cares less for Sweden's goodwill and may be more ready to cause trouble in Finland. The Finns, as so often before, have decided that courage is less dangerous than surrender.

Letters to the Editor

Planning in Germany

Sir,—The review in *The Economist* of January 6th of Mr Balogh's valuable survey of economic trends in Western Germany seems to me to depart from the careful objectivity you usually maintain. You admit the disastrous consequences of the economic policies pursued by the Bonn Government and by the Bi-Zonal authorities before that Government took over. After all, you could scarcely deny them; they are flagrant. But then, instead of providing us with an alternative set of reasons for these disastrous consequences, you content yourself with denying Mr Balogh's conclusions under a cloud of verbiage about the German people's "unsuitability" for "experiments in controlled inflation." It looks to me like word-making to conceal a poverty of argument: in the last 25 years the Germans have shown themselves as "suitable" for economic experiment as any other people, and, indeed, far more ingenious than most in devising and applying such experiment.

The nasty fact, which is ably brought out in Mr Balogh's paper and as ably concealed by your reviewer, is that the economic policies of the Bi-Zonal authorities in Frankfurt (at any rate after the middle of 1948), and later of the Bonn Government, have been inspired by a quite ruthless determination to restore

the economic *status quo*. To "explain" such policies by dogmatic *obiter dicta* on the German character is not worthy of *The Economist*.

Your reviewer seems not to have understood the argument about controls. Mr. Balogh's thesis, unless I have misunderstood him, was that an economy as dislocated and dismantled as Germany's was after 1945 could be restored to health only by a clearly conceived programme which should advance, by *controlled* steps, towards a high level of employment. No one wants to restore Nazi controls: what is wanted are democratic controls. In the case of food collection, for example—where the British and American record has been scandalously inefficient and misguided—controls were applied from the beginning. Instead of combining coercion with inducement—surely the essence of all good economic policies—British and American military government merely applied the threat of coercion. Farmers were told to deliver their crops; when they failed, nothing but verbal violence was used against them—although their failure went side-by-side with real starvation in the towns.

Lastly, it was not, as your reviewer asserts, "the Russian thesis" that Germany could pay reparations from current production. It was also, and just as

much, the Western thesis (see sub-para. (b) of Section (2) of the Yalta Protocol). The later dispute with the Russians was never that Germany could not or should not pay reparations from current production: it was entirely a question of precedence. The Russians maintained that the payment of reparations was a primary obligation on Germany; the western powers (but the French only when it was convenient) held that reparations from current production should be paid by Germany only after the deficit in the four-zonal balance of payments had been made good.—Yours faithfully,

BASIL DAVIDSON

Traffic Police in Disgrace

Sir,—The note in *The Economist* of January 20th will disappoint many of those who are anxious to reduce the disastrous toll of traffic deaths, by placing on the roads a number of plain-clothes officers in plain clothes the chief constable of Oxfordshire has followed a procedure which is neither novel nor contrary to the spirit of the English law. Your suggestion that in the past these police have used plain-clothes officers, whether called detectives or not, only "after the crime has been committed" is, I believe, contrary to the facts. We all know that when there is a public pro-

HOTELS

personally and independently
recommended by
Ashley Courtenay

*A man he seems of cheerful yesterday and
confident tomorrow.*

This one of my correspondents described me last week. During the last year in my visitation of hotels, I have experienced the bitter and the sweet, and it is the latter that I can pass on to you for your To-morrow's holiday, with confidence. Write to me at 68, St. James's Street, London, S.W.1, enclosing a stamped addressed envelope please.

REMBRIDGE, I.O.W. for your holiday. **ROYAL SPITHEAD HOTEL** offers comfort and good food. Direct access to beach. Sports. Family parties welcomed. Fully licensed. Brochure on application. S. C. Selwyn, resident Managing Director.

BROADWAY, Wores. **THE LYON ARMS.** Always in season, though there are many who feel its mellowness is enhanced on a winter's night—the curtain drawn, log fires, cooking in the best English tradition, plus a pleasantly warmed bedroom complete in its comfort. Tel.: 8.

HAWKHURST, Kent. **COLLINGWOOD HOUSE HOTEL.** In this historic and lovely Georgian home, the art of gracious living is still practised. Warmth, unusual comfort and a high standard of catering will be your lot. For Brochure write, N. Allan-Smith. Tel.: 3399.

HYTHE, Kent. **HOTEL IMPERIAL.** A first-class hotel, where every room is centrally heated. Enclosed, air-conditioned sun-deck. Games room, Billiards (full size), Ballroom. Fully licensed. Special week-end terms including Golf on own course. Furnished suites and doublets available. Tel.: 67411.

JERSEY, I.L. **ST. BRELAD'S BAY HOTEL** (1st Register). 14 hrs. flight from London. Flowers, sunshine and sea equable climate. Completely sheltered, facing the sea and the south. Now looking for Spring. Details with pleasure from H. H. Colley. Tel.: St. Aubin, 1.

MINCHEAD, Somerset. **NORTHFIELD.** Situated in 10 acres of ground, aims at high standards of catering and comfort AT ANY TIME OF THE YEAR. Convalescence? A Honeymoon? Or just in holiday mood? Exmoor, the sea, and Northfield make a happy combination. Tel.: 864.

NR. NEWQUAY, Cornwall. **GLENDORGAL.** Nigel Tanze offers you the perfect holiday by the sea. Private steps to Atlantic surf-bathing and golden sands. 10-acres of private coastline grounds. Own farm produce: cream, milk. Children's paradise: comfort and rest for adults. Tel.: Newquay 2949.

SALCOMBE, S. Devon. **TIDES BEACH HOTEL.** What a lovely address for a seaside holiday! Here, on the edge of a sandy beach, with boats, fishing, safe bathing and fine walks, are added the finishing touches of comfortable accommodation, good fare and ample garage space. Tel.: 285.

ST. MAWES, Cornwall. **HOTEL TRESANTON.** Lovely Country House in sheltered Bay. Beautifully furnished, every modern convenience. First-class cuisine: Club bar. Re-opens March 1951; terms from 30/- per day. Trains met. Truro. Resident Manager, A. Miles Humbert. Tel.: 322.

SIDMOUTH, Devon. **BELMONT HOTEL.** A.A. Appointed. A first-class luxury hotel noted for its excellent food, and occupying the finest position extending to the sea front. Through-coaches daily from Waterloo. Private Suites. Gas fire. Private bathroom. Lift. Fully licensed. Tel.: Sidmouth 1261.

RAVENSCAR,
Scarborough.

RAVEN HALL HOTEL

A completely self-contained, fully licensed holiday hotel. Heated sea-water Bathing Pool, 9-hole Golf Course, Putting, Mini Tennis, Bowls, Billiards, Dancing (Orchestra)—all free to residents. Riding available. Fully inclusive terms 35/- to 47/6d. per day. Tel. Cloughton 228.

SCARBOROUGH,
ROYAL HOTEL

Planning a sunny, bracing holiday this year? Write Tom Loughton, Resident Director of this superbly situated hotel, providing excellent food, delightful surroundings, light music, dancing and comprehensive holiday amenities. Early application is essential. Terms 25/- to 39/- per day. Tel.: 1048.

VALUE YOUR HEALTH

TORQUAY'S

GRAND HOTEL

For rest and recuperation. Bathed in sunshine. Write E. Paul, General Manager. Tel.: 2234.

Long before the Festival

LONG BEFORE the Festival of Britain, long before the new Concert Hall and the Dome of Discovery arose on the South Bank, London boasted an amenity unique among cities—the famous Connaught Rooms. Here, grouped together beneath a single roof, are twenty separate banqueting rooms, capable of accommodating anything from an intimate party of a dozen to a gathering of over a thousand guests. The excellence of its cuisine is proverbial: its service is quietly discreet. Many of our visitors from beyond the seas, returning to the capitals of their native lands, will carry with them the story of London's unique institution—the Connaught Rooms.

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But... have you ever stopped to ask yourself...

"Who are Britain's Craftsmen?"

Introducing Robert Jones. With half a century's service behind him, he is a vatman in a paper mill. A swing of his wrists and a mass of fibres and water becomes a sheet of high quality hand-made paper. A starting point of a trade that enables Britain to export increasing quantities of books and printed matter.*

But... does craftsmanship mean only handicraftsmanship? Bigger, speedier and more complex machines

are the showmen of the vast paper and printing trades... but behind them, away from the limelight, the craftsmen work on as before. And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so, and they follow this rule in making chemicals for a long list of British industries. Monsanto chemicals for the paper trade are playing an increasingly important part in the production of better paper for Britain and the world.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

cession, such as at the opening of Parliament, police officers in plain clothes mix with the crowd because it would otherwise be easy for the potential criminal to know when he was under observation. To talk of these plain-clothes officers as being "in disguise" is to introduce prejudice in place of argument.

You say that the purpose of the plan is "to trap offending motorists." This seems to suggest that motorists will be encouraged to drive dangerously and will then be snared, for this is the ordinary implication of the word "trap." It is clear, however, that the primary purpose of the plan is not to trap motorists, but to stop reckless and dangerous driving. The other day I was driving along an unrestricted main road at a respectable pace when a following car, going at racing speed, cut in between me and an approaching lorry. I escaped death by not more than three feet. If that reckless driver had suspected that I was a police officer in plain clothes would he have been so ready to take a chance?

Your suggestion that there should be more police motor-cyclists is a valuable one, but, even if their number were more than doubled, which is obviously impracticable at the present time, they could not patrol more than a small part of the public highways.—Yours faithfully,

ARTHUR GOODHART

University College, Oxford

Taxing Capital Gains

Sir,—To an American tax lawyer who has had some superficial experience with the British income tax system, the note that appeared in your issue of December 16, 1950, contained much of interest but arrived at one conclusion which was, to say the least, misleading.

As you are doubtless aware, capital gains in this country have been taxed since the beginning of the Federal income tax, but beginning with the early twenties they have received special treatment differing from that accorded to such periodically recurrent forms of income as salaries, interest and dividends. The theory of this special treatment is that, when a capital gain is realised, it usually represents an accession to the taxpayer's wealth which has been taking place over a long period of time. It is considered unfair, therefore, to lump this gain on top of all of the taxpayer's other income so as to cause it to be taxed in his highest bracket in the year of receipt. At present, in the United States, this special treatment takes the form of an option to include one-half of the gain on the sale of a capital asset held for more than six months with the taxpayer's other income to be taxed at the appropriate rate, or to tax the entire capital gain separately at a flat rate of 25 per cent.

While, as your note well points out, it is often difficult if not impossible to distinguish between a true capital gain and a mere increase in cash, without any increase in actual purchasing power owing to the declining value of the currency, there would seem to be considerable practical and political justification for a capital gains tax on the American plan, provided that the rate does not go

too high. It is, in a sense, a sop to Cerberus.

Your note, however, poses a dilemma which in fact does not exist. You say

The difficulty about it is that either the taxpayer is refused permission to set his capital losses off against his capital gains (which is illogical and unjust), or else persons who, in the ordinary sense of the word, are very rich can wholly escape taxation in years of falling prices.

No one "can wholly escape taxation in years of falling prices" if the expedient, now in force in this country, is adopted of having capital losses deductible only against capital gains. No matter how great a man's capital losses may be in any year, he is still taxable on his other income as if such losses did not exist. To be strictly accurate, he can deduct such losses up to \$1,000 from other income, but this does not make a significant difference to the large taxpayer.

Injustice can be prevented, as it is here, by providing that the excess of losses over gains in any one year can be carried forward and used to offset gains of any of the next five years, any amount not used in the first succeeding year being carried forward to the second and so on. In this way what is taxed is in effect the net gain over a six-year period. In general this practice has given rise to substantial justice and has been widely approved in this country.—Yours faithfully,

JOHN DANE

Brookline, Massachusetts

New Records in Life Assurance

Sir,—In your issue of January 6th, you imply that there is comparability between new Life Assurance sums assured for 1950 and National Savings for the same period.

The comparison is misleading. The figure which is best compared, as a measure of purchasing power applied through the medium of Life Office investments to the financing of capital projects rather than to the purchase of consumer goods, is the net increase during the year of the Office's funds. That is, the excess of their total premium and interest income (including that derived from the year's new business) over claims, annuities, surrender values and management expenses disbursed. This figure is strictly comparable with net National Savings including accrued interest on deposits.—Yours faithfully,

K. MUIR MCKELVEY

Glasgow, C.I.

Bank Salary Dispute

Sir,—The factual account of the bank salary dispute in your issue of January 6th has been read with interest and approval by many people who work in banks, and doubtless by others. You are quite right in suggesting that though it is disappointment with the Midland Bank bonus and the consequent dissolution of that bank's staff association which is attracting public attention at the moment, the trouble is widespread and deep seated. What annoys bank employees is that they are coming to believe that successive waves of inflation which

have made them poorer have made the institutions they serve richer than ever before.

An article in the November number of *The Bank Officer* (the organ of the National Union of Bank Employees), purported to prove that the "gross profit" of the eleven clearing banks was £50 million in 1938 and £92 million in 1949, an increase of 84 per cent, and there is no obvious flaw in the train of argument. The writer then went on to try to draw further inferences but admitted that he was badly handicapped by lack of reliable information. (Was this his fault, or was it the fault of the banks?) He finally arrived at the conclusion that he and his fellows are now getting a much smaller share of a much larger cake than was the case before the war.

Is there any good reason why banks in Britain should not publish their profit and loss figures in detail as do American banks? I submit there is none. If candour does no harm in the United States, does secrecy do good here? I believe it does harm, alike to the relationship of the banks to their staffs on the one hand and to the public on the other. The annual report of one of the great New York banks contains much detailed information and shows the amount of interest received, dividends received, other earnings, salaries and wages paid, reserved for bad debts, etc. When banks in this country publish similar information, either voluntarily or because of legal compulsion, they will be subjected to less ill-informed criticism, but they will also, I suspect, probably have to pay the union's national minimum salary scale.

Let no one be in doubt about it, bank employees are intensely loyal to their salt, but they are becoming increasingly critical of the size of the salt ration.—Yours faithfully, BANK MANAGER

Chilled Beef from Argentina

Sir,—You ask in *The Economist* of January 13th if we would not all jump at the chance of paying extra for prime chilled beef.

Yes, but suppose we could do so only by cutting our expenditure on tobacco or beer—if, in other words, we removed ourselves from the subsidy-paying class into the subsidy-receiving class—just think of the catastrophic consequences to the Treasury! Carrying this system of "fair shares" to its logical conclusion, is it indeed right that any of us should be allowed to smoke or drink at all if there are still some unfortunate people who can afford to do neither, or at best only sparingly? This monstrous injustice should not be allowed to continue. Already I feel a twinge of moral pain on lighting up a cigarette and gulping down a pint, and I am sure I could not face a choice juicy steak of prime chilled beef (cooked to a turn, with fried onions and new potatoes) without anguish wringing my brow and tears of remorse running down my cheeks.—Yours faithfully,

ALAN SMITH

Dundee

194

What Does "Sterling" Mean?

Sir,—A note in your issue of December 2, 1950, discussed the recent Privy Council decision that a holder of a Commonwealth of Australia loan (formerly a Queensland loan), which was expressed to be repayable in "pounds sterling," must be satisfied to receive only Australian currency. Your note pointed out that "a London lender in 1895" apparently failed to get unequivocally inscribed in the contract his right to be repaid, in London, in sterling.

May I hasten to defend the Commonwealth from the possible implication that it was unfairly attempting to repay English holders of this loan in currency less valuable than—to coin a phrase—"English sterling." It seems that the Commonwealth paid English holders of this loan both their interest and later their capital, in "English sterling." This should, I hope, dispose of any suggestion that the Commonwealth had tried to act unfairly to "a London lender." The Commonwealth's action may, however, have been unintentionally generous,

because it was ignorant of its now ascertained legal rights.

I must report that charity does not necessarily begin at home. What is good enough for an English holder may be too good for an Australian; the Commonwealth decided that, however it treated English holders, it did not have to treat Australians on the same footing. Australian holders were repaid only in—to coin another phrase—"Australian sterling." In other words, though English and Australian lenders lent currency of the same value, Australians were repaid 25 per cent less.

What considerations of equity were applied by the Australian governmental authorities (let me say it was in 1944) in evolving these methods of repayment, one for English and another for Australian lenders, are still secret. It is, though, poor consolation to Australian holders to realise that, according to the Privy Council, the English holders were overpaid—for I assume that this is what the decision means.

Perhaps the "London lender" was not so clever after all—only lucky. Australians were not even lucky.—Yours faithfully,
JOHN BONYTHON
Adelaide, Australia

THE ECONOMIST, January 27, 1951

Organised Farmers

Sir,—The closing sentence of your note on "Organised Farmers," in the issue of January 13th, betrays an unfortunate state of mind. I quote: "Senator McCarthy himself gave the Wisconsin Farmers' Union a clean bill."

One can hardly quote the Senator as an infallible authority in these matters, and it seems doubtful that he is quoted for the true value of his statements. The only possible conclusion is that, as the most arrant of those who smear reputations behind congressional immunity, if the Senator refuses to attack the organisation, it is safe to predict that it will not be denounced. The safety of the prediction is, however, known to lie not in the truth or soundness of the Senator's judgments, but in the fact that no one likes to contradict himself.

Whatever the Wisconsin Farmers' Union may or may not be (I know nothing about it), it would seem preferable to make up one's mind on criteria other than the fact that they are safe from calumny.—Yours faithfully,

HERBERT CAHN
Christ Church, Oxford

Books and Publications

La France Combattante

Envers et contre tout. By Jacques Soustelle. Vol. I. "De Londres à Alger (1940-1942)." 470 pages. 420 francs. Vol. II. "d'Alger à Paris (1942-1944)." 452 pages. 585 francs. Robert Laffont, Paris.

These volumes are a survey of the French contribution to the defeat of the Axis. M. Soustelle, an ethnologist working in Mexico, joined General de Gaulle in London in June, 1940. He remained in the General's *Comité National* as director of information until 1942. After the formation of the Algiers Committee he continued the co-ordination of the resistance until the Normandy landings. A large part of M. Soustelle's admirable record deals with the elaboration of the Resistance; with espionage, sabotage and the French armed forces of the interior. The story which has been veiled from the foreign reader by Communist propaganda now emerges clearly as a great national effort. From the first reconnaissances by agents landed in Brittany in the autumn of 1940 to the large

destructions and armed resistance synchronised with the landings of June, 1944, the lines of development are carefully drawn.

But the supreme interest of the book lies in its central thesis, which transcends the strategic conduct of the war by the Allies as a military whole. General de Gaulle knew from the moment of the military collapse of 1940 that he would be nobody and his country nothing unless it could be demonstrated that France had never ceased to fight against Hitler. This was at once a juridical and diplomatic position and a national magnet to French arms. Thus the General maintained throughout that the Pétain armistice was illegal and the *Etat Français*, a collaborationist fraud; that the Victor of Verdun had usurped the

prerogatives of the French Republic; and, Vichy and all its works being illegal, de Gaulle was to summon all Frenchmen to the colours of the sole valid representative of France, himself, their *de facto* and *de jure* president and commander-and-chief until victory.

General de Gaulle's conviction that France would have no place in the victory unless unified under himself as *La France Combattante* led him to titanic efforts to preserve this cohesion. In 1942, says M. Soustelle, Mr Churchill was no longer able to support the General against Mr Roosevelt (who still maintained relations with Marshal Pétain) on account of the greater necessities of British imperial strategy. However this may be, the course of events justified the Gaullist position against the American President. M. Soustelle gives an excellent description of the long fiasco of Algiers in which the Americans supported first Admiral Darlan then, after his assassination, General Giraud. In the event this intellectual and spiritual obstinacy did create a military organisation, which would have been destroyed by a less uncompromising attitude. The legend and reality of the appeal of June 18, 1940, was, above all, quite essential to the resistance within France.

In some ways the resistance of the interior was most important of all for France's political future as the Gaullists had planned it. The General's ideological starting-point was a vacuum left by the defection, as he saw it, of the prewar French *élites*. The events of 1940 proved to him that France, in war or in peace, could no longer be governed by the representatives of "the parties." The Republic must therefore be renewed

by the spontaneous introduction of a new constitution that would ensure the observance of its laws. (In 1950 de Gaulle's position is still the same: M. Soustelle is moreover still his director of information.) Granted this premiss, any theoretical admission that the Pétain armistice might have been expedient; any "agreement to differ" with the Marshal's emissaries abroad or in the French Empire would, for the Gaullists, have prejudiced not only the fighting present but the political future of France. Hence the General's intransigence with the Allies who, having an entirely different list of priorities, not unnaturally found him often impossible. M. Soustelle's account of British liaison with Carlton Gardens is often rich in unconscious humour.

De Gaulle beat the Germans; he beat the Americans and he beat the Pétainists. He gave the lie to Mr Churchill's occasional doubts of his authenticity. ("After all, are you France?" asked the Prime Minister in a bleak interview at a black moment. "If I am not, why do you deal with me?" came the reply.) Nevertheless he was beaten in the end by the old Third Republican political parties which, if unworthy survivors, were yet not in the least dead. The Communists, with their flair for the exploitation of the worst and the corruption of the best, stole much of the Gaullist glory in the post-war apathy. But, beyond them, the *renovation* so much spoken of at Carlton Gardens did not prevail against the natural diversity, disharmony and regionalism of the French people. In a sense de Gaulle fell between two stools. Having staked all on a united France, "pure et dure" he fanned the revolt against the past *élites* to a degree sufficient to discredit individuals but not to displace the system to which they were appropriate.

The Severed Nation

Korea Today. By George M. McCune, with the collaboration of Arthur L. Grey Jr. *Institute of Pacific Relations, Allen and Unwin.* 372 pages. \$25.

The title of this book might well be changed to "Korea Yesterday," for it was completed in the spring of last year and thus deals with the situation before the outbreak of the Korean war—which has

already made all previous history of the Far East seem rather remote. Nevertheless, any settlement which may in future be made in Korea must take account of the basic factors which Mr McCune has surveyed in detail in this work. The facts here set forth should at least arouse a sympathy for the peculiar ill-fortune of the Korean people and a sense of the responsibility shared by all Korea's "liberators" for the fate which has befallen the country. In the Judgment of Solomon the child was awarded to the claimant who was not willing to have it cut in half, but it was by agreement between Russia and America that Korea was bisected, though it is only fair to add that on the American side the zones of military occupation were not originally intended to be separate political units. Today, after five years of partition and factional strife, Korea is a battleground between foreign armies which have swept to and fro over almost the whole length of the peninsula in their devastating warfare, and it is no wonder that many Koreans do not care what the result is, if only they can get a cessation of hostilities.

Mr McCune shows how the Russians initially had the advantage in the struggle for political supremacy because they backed the Korean Communists and their camp-followers resolutely from the beginning, whereas the Americans, wishing merely to prepare Korea for political democracy, did not at first recognise any particular Korean authority or party as entitled to speak for Korea. The author emphasises the discontinuity and inconsistency of American policies in Korea and the lack of planning before the commitment of occupation was undertaken. If the American and British Governments have now made up their minds to continue support for South Korea, even after the failure to incorporate the North, much more thought will have to be given to its problems than was forthcoming between 1945 and 1950.

Threats to Democracy

The Only Way. By Alexander Loveday. *Hodge.* 221 pages. 12s. 6d.

It was never more necessary than today to think through afresh, without political *parti pris*, the assumptions of democracy, and to restate them, not in the abstract, not in the peculiar idiom of political philosophers—but in relation to familiar

current events and in a vocabulary and style accessible to ordinary educated persons. It has rarely, moreover, been harder; those who have the spiritual and mental energy for such thinking *through* rarely have at once the gift of expression in lay terms and the faculty of detachment from political bias. Mr Loveday, an academic with long experience of practical administration, an economist widely read in political theory, an Englishman intimately acquainted with the life of other countries, is rarely qualified for the job; and "The Only Way" is an outstanding presentation of that fundamental liberal creed which is common to a very wide range of party opinion but, for lack of clear conception, is too often overlaid with contradictions.

"Democracy," so Mr Loveday sums up, "is not primarily a system of government, but a system of ideals and ethical principles" constituting rules of conduct whose purpose "is to give the individual scope to develop a harmonious personality as full and complete as his natural endowments permit." This aim calls for a harmonious society—social harmony depending in turn not on paper constitutions but on the respect paid by the average citizen to "the principles that constitute our democratic ethics." War, inflation, depression, variously disintegrate that respect; while the agencies transmitting it from generation to generation, family, church, neighbourhood, have been weakened, leaving the schools to carry a burden to which they are not equal. The freedom essential to harmonious development is under-valued by individuals obsessed with the fear of war or unemployment sacrificed to the illusion of national or economic security; the task of democratic thought today is on the one hand to re-establish a rational and consistent hierarchy of aims, to distinguish between ends and means, to weed out what is contradictory and self-stultifying in its aspirations, and on the other to devise practical institutions of self-defence and self-betterment within whose framework the weakened confidence, responsibility and human solidarity of the individual may, however slowly, reconstitute themselves.

To both parts of this task, though particularly to the former and more fundamental, Mr Loveday brings a valuable contribution. One can disagree with him. One can retain, for instance, a conviction that that Federal Union of all free

CRIME and the POLICE

with a foreword by

R. M. HOWE, C.V.O. (Chief of the C.I.D.)

"It is an accurate and admirably objective account of police work and problems and will, I hope, be widely read."—Sir Harold Scott, K.B.E., Chief Commissioner of Police.

10s. 6d.

Secker & Warburg

nations which he prescribes, even were it politically acceptable, would suffer such spasms of internal economic adjustment as to be actually weaker, not stronger, than the mere alliance or confederation which he rejects. One can question the relative importance, to the development of harmonious personalities, of this particular enlargement of free choice and that particular assurance of an economic minimum. It is not, however, so much by inexpugnable conclusions and demonstrations as by the establishment of the agreed point of departure and of the method and spirit of enquiry that "The Only Way" claims attention and respect. This is a book to be widely read and discussed.

Relativity

Out of My Later Years. By Albert Einstein. *Thames and Hudson.* 282 pages. 15s.

This collection of essays, addresses, extracts from articles and interviews, and unpublished fragments, epitomises Einstein's outlook on the world during the last sixteen years. His publishers claim that the chapters on his theory of relativity are simple enough to be understood by every intelligent person, and this, alas, may be so! The present reviewer will concentrate on more general matter.

The arrangement is not chronological but according to subject, which demands a continual adjustment from the reader between pre- and post-atom bomb perspective; but in spite of these disconcerting breaks in continuity, there emerges from the whole book a three-fold impression: of an abiding enthusiasm for the cause of supranational organisation as the only means of saving the world from self destruction; of a belief in socialism as the framework in which the solution of present problems could be achieved; and of the wisdom and humanity of the writer.

Einstein believes that world government will come, either through the military power of the victor in a third world war, or through international agreement and the force of persuasion. It is his single minded endeavour in every public utterance, upon whatever topic, to drive home a plea for the latter course. He considers that the essence of the crisis of our time is the

dependence of the individual upon society, not as an organic tie or protective force, but as a threat to his natural rights and his economic existence. At the same time, man's egotistical characteristics are unavoidably being accentuated at the expense of his social urges. All human beings are suffering from this deterioration: "Unknowingly prisoners of their own egotism, they feel insecure, lonely, and deprived of the naive, simple and unsophisticated enjoyment of life." The remedy is the establishment of a socialist economy, accompanied by education towards social goals instead of the worship of acquisitive success.

But Einstein postulates that a planned economy is not necessarily socialism, since it may be accompanied by the complete enslavement of the individual by the power of bureaucracy, and unless it is international it might "more easily lead to war than capitalism, because it represents a still greater concentration of power." He also warns the Soviet Union against blaming capitalism for all existing social and political evils, adding that government is in itself an evil if it does not resist the tendency to deteriorate into tyranny.

This would be an excellent bedside book, since it is so full of steadying reflections. But the most comforting glimpse into the mind of a great thinker is contained in the last sentence of his "Self Portrait": "I live in that solitude which is painful in youth, but delicious in the years of maturity."

Afghanistan

Afghanistan. By Sir Kerr Fraser-Tytler. *Oxford University Press.* 330 pages. 21s.

Not much has been written about Afghanistan since the late Sir Percy Sykes produced his great two-volume history. Sir Kerr Fraser-Tytler has now written an informative and well-documented book which, as he says, is a "study of political developments in Central Asia" with particular reference to Afghanistan. It is a work that is much needed at the present time, for it is a careful appraisal of all the factors that have been at work in that little-known territory which

contains within it the dividing line which separates Southern from Central Asia. The mountains of the Hindu Kush projecting from the main ranges of the

Pamirs have served throughout the ages as a breakwater diverting westward the flood of the migrations from further Asia and protecting the approaches to India.

But this natural mountain barrier can be traversed by armies and has been since the time of Alexander the Great. It can also be outflanked on the west. Along this route the invaders from Timur to Sultan Mahmud of Ghazni and Nadir Shah have invaded India. The Hindu Kush then provides no barrier for India like the Himalayas but rather a deterrent which slows down a forward march.

Sir Kerr Fraser-Tytler has served in the Indian army and in the External Affairs department of the Government of India and is therefore well qualified to write on the various phases through which British policy has passed in seeking the best way to defend the Indian sub-continent. In the first two Afghan wars we attempted to make the Hindu Kush the virtual frontier of India. But no power has ever been strong enough to hold such an advanced post. The British then attempted to create with some success a buffer state under their protection. But Afghanistan is still a country largely in a tribal state and periods of instability following the assassination of an Amir often led to an upset of the buffer state policy.

At last in the Mahomedzai family rulers have been found who were able to weld the polyglot of races and tribes into something like a state. The future will largely depend on whether this stability can be maintained. The author does not deal with the economic and social developments that are going on in Afghanistan, but he has a lot to say about the problem of the Pathan tribes and on the fluctuations of British policy on the North-west Frontier.

This is one of the danger points of the future. For the rulers of Afghanistan have never recognised the Durand line as preventing them from influencing the tribes across the border. The present Pathanistan movement which is being inspired from Kabul is only a new stage in uniting the Pushtu-speaking tribes and aims at consolidating the Pathans behind the present rulers of Afghanistan. The book has much to say on this important subject which is causing so much trouble to Pakistan and may be the source of Russian intrigue whenever the Kremlin thinks the time opportune.

AMERICAN SURVEY

Congress Makes its Bow

Washington, D.C.

THE opening of the Eighty-second Congress has been comparable in sound and effect to the opening of Fibber McGee's clothes closet; and in a way the circumstances were similarly predictable. Every loyal listener to the wireless in the United States knows that when McGee undertakes to fetch something for his wife, Molly, he is going to the well-beloved cupboard, and that, as soon as he pulls the door open, there will fall out of it with an immense and prolonged clatter the accumulated copper plant-pots, roller-skates, picture frames, old boots and bicycle-pumps of a long family life.

It is just over 150 years since Congress first took up its quarters in Washington. The cupboard on Capitol Hill is packed to bursting with ideas and attitudes put out of sight, but not altogether discarded. And a lot of them have tumbled forth during the last two weeks into and beyond the current "Great Debate" on foreign policy.

The chambers in which the new Senate and House are assembled have been newly decorated on lines which irritable critics have variously compared to those of a funeral parlour and a cinema. Within these freshly brocaded walls, gold and blue respectively, there was quickly revealed to be a remarkable unanimity on the need for swift and comprehensive rearmament. When President Truman's \$71.6 billion Budget arrived, the prevailing reaction of both Houses was that the sooner the projected immense sums were authorised, appropriated and spent for military procurement and services, the better and safer it would be for everyone. But after that the rope of unity began to unravel.

★

The new Congress, meeting at a moment of national apprehension, nervous tension and fault-finding, has been pervaded by the consciousness of defeat in Korea, by uncertainty concerning what the Far East is going to produce next, by the brooding sense of dissatisfaction with the performance of America's allies both in the United Nations and in Western Europe, and by the knowledge that the election results had deprived the Administration's supporters of their secure majority.

It took the Southern Democrats and the conservative Republicans only a day or two to show off the fire-power they were going to be able to bring against the Administration designs which arouse their displeasure. In the House the "reactionary coalition," as the revived *cliché* has it, swiftly scrapped one of the most useful reforms the dominant Democrats of the Eighty-first Congress had devised to ease the passage of liberal Bills. This was the provision that the Rules Committee, which decides what legislation shall reach the floor of the House, may be prevented from holding up a Bill if it does not like for longer than 21 days.

In the Senate one of the three new Republican Senators posted to the Appropriations Committee was Senator McCarthy of Wisconsin, the scourge of the State Department. Once upon a time, the Senate Appropriations Com-

mittee concerned itself only with the amount of money it would be proper to appropriate under given Bills. More lately, particularly in the case of legislation involving foreign aid, it has felt entitled to require the State Department and other officials to repeat evidence and re-answer questions on policy and performance already thrashed out in the Foreign Relations Committee. Senator McCarthy has now improved his strategic position by being appointed to a sub-committee of the Appropriations Committee which deals specifically with funds for the State Department, and it may be a reasonable assumption that unquiet times are in store for a number of Mr Acheson's assistants.

The chairmanships of committees remain in Democratic hands, since the Democrats at the elections managed to preserve a majority. But, by virtue of the seniority rule, the chairmen and members of a disproportionate number are conservative Democrats whom the Solid South has faithfully returned for many years. (Senator George of Georgia has been *in situ* since 1922.) Their hand, in several cases, has been strengthened by the advent of new Republicans entitled to committee seats because of the increased Republican representation in the Senate. On the Senate Foreign Relations Committee Senator Tom Connally will preside, in future, over seven Democrats and six Republicans, instead of eight Democrats and five Republicans. The new Republican on this powerful body has turned out, after much intricate jockeying and horse-trading, to be Senator Tobey of New Hampshire, who, though not a jet-propelled liberal, is generally considered to be a worthy choice.

Up to the outbreak of the Korean war there had been thirty issues in the Eighty-first Congress on which a vote for the bi-partisan foreign policy was asked; and among the Senators who were discarded by the electorate or retired last November there were five—Senators Lucas, Downey, Myers, Thomas of Utah and Thomas of Oklahoma—who had voted for the bi-partisan policy on every one of these issues. And there were others who were almost as reliable—Senator Tydings and Senator Pepper—whose departure the Administration has mourned.

Senator Dirksen, who has taken Mr Lucas's Illinois seat, and Senator Nixon, who has come into possession of the California seat Mr Downey held, will chalk up no such records. On the other hand, liberals expect a good deal of Senator Mike Monroney, of Oklahoma, one of the few successful Democrats, and the predictions are that Senator Duff, recently Republican Governor of Pennsylvania, is destined to become a mighty and not an illiberal power in the Senate. Neither in the House nor the Senate have the Republican leaders been displaced. The Democratic leadership is carrying on business as usual in the House, but in the Senate, where the mantle of Senator Lucas has fallen upon the less experienced shoulders of Senator McFarland of Arizona, the opening days of the Eighty-second Congress have produced moments when Democrats have wept for the touch of a vanished hand.

But these changes, the new faces and the new decorations, the new committee members and the voices ringing with new

authority, amount, in the main, to a variation of the ornaments on the cake. Underneath the icing, below the marzipan, the consistency of Congress is about the same. If there is reason to expect stronger coalitions of Southern Democrats and Republicans, there is little mystery about what sort of legislation will be allowed to pass and what will bring the coalition into action. Mr Truman will not secure from the present Congress the civil rights, social and labour reforms he would like, but he could not persuade its predecessor to pass them either, and for similar reasons.

The Great Debate has not, up to the present, revealed any decisive renunciations of ideas and attitudes on foreign policy developed during the post-war years. Apprehensions stirred by events on two sides of the world have been reflected in both the composition and the oratory of the Congress, yet the signs of a sensational *volte face* have not so far appeared. Nor is there yet any reason to believe that if General Eisenhower returns with a recommendation for action, the Eighty-second Congress will be less willing—after passing a “compromise resolution”—to support the President on sending American troops to Europe than, in similar circumstances, the Eighty-first Congress would have been.

Story of an Inflation

Washington, D.C.

THE Annual Economic Review by the Council of Economic Advisers, which is a report to the President, accompanies the Economic Report from the President to Congress at the beginning of every year. The Review for 1950 was written with a kind of gloomy pride—pride at what the American economy could do and gloom at what the American people could do with it. “We must stop eating so much cake,” the Council of three economists decided, “when the aggressors are arming so many divisions.” And they told the story of how much cake had been eaten in the second half of the year—or, at least, of how much cake had been bought to be stowed away in the deep freeze for consumption in some bleak future. The Department of Agriculture estimates that there are at present one billion pounds of meat, enough for two weeks’ average consumption, stored in deep freeze units in private houses.

A few days after the report had been published, Macy’s department store took a full page in most of the New York newspapers to announce that, since Christmas, the people of New York had been buying 25 per cent more goods in all department stores than they had done during the same period of last year. “Evidently,” Macy’s told the public, “some of you are buying what you don’t need . . . are buying out of fear of the future . . . WHY ARE YOU BUYING SO MUCH, NEW YORK?” The answer, if New York were able to give a composite one, would be that it was buying out of fear of the future, but less from fear of future shortages than from fear of future prices. There has been unending talk of controls and no action, although the evidence that they are needed has been accumulating since the start of the Korean war. It has now been laid out for all to see by the Economic Advisers.

The economic history of 1950, they pointed out, can be divided into three distinct parts. The first was the period of recovery from the mild recession of 1949; during this period the level of expenditure for personal consumption rose slowly from an annual rate of \$180.6 billion in the last quarter of 1949, through \$182.4 billion in the first quarter of 1950, to

\$185.2 billion in the second quarter. It was at the end of the second quarter that the Council’s second period began—the expansion of the defence programme after the Korean outbreak. In the third quarter personal consumption jumped to \$198.4 billion. It declined a little in the fourth to \$197.0 billion because, after the Inchon landings, indiscriminate buying stopped for some twelve weeks; then the reality of large-scale Chinese intervention at the end of November marked the beginning of the third period—that of intensive rearmament. And Macy’s desperate advertisement suggests that personal expenditure will be over the \$200 billion level in the first quarter of 1951.

★

After the Korean war began, the Review says, “there was prompt and universal recognition by the American people that a great defence effort must be made.” Unfortunately, they recognised it not by tightening their belts, but by letting them out another \$15 billion a year. Or, as the Council observes rather obliquely, “the first result took the form of one of those mass movements which occasionally upset economic analysis based solely upon statistical data or assuming a regular pattern of economic behaviour.” The rush of consumers to buy “fantastic quantities” of those goods which had been short during the last war—regardless of whether there was any justification for believing that they would be short in the next one—continued through July and August. The immediate effect, both in rising prices and the reduction in retailers’ and wholesalers’ stocks, was considerable.

But more important was the effect on merchants’ policies. Between July and October, the Review points out, manufacturing and retail inventories increased by \$5 billion from an admittedly conservative level and, during the same period, the loans of all commercial banks increased by the same amount. “The force which directly sustained the rapid advance in economic activity during the third quarter,” the Review says, “was civilian demand, buttressed by rising civilian income, but without any extraordinary increment from government sources. Producers were making goods for civilians, and not for defence, when they pushed up the industrial production index 6.6 per cent between July and August, and continued to carry it forward, although less rapidly, during the next two months.”

The situation in the last month of the year—during the third phase—was different. Industrial production and employment stayed at the level of the two previous months, but wholesale prices doubled their rate of increase and the expansion of business loans by commercial banks, which had been steady at about \$160 million a week since the end of June, suddenly quickened its pace to \$230 million. But wholesale price increases in December, the Council thinks, were largely the result of two factors: “first, an effort by sellers to increase prices before they could be frozen by price controls and, second, the evaluation by businessmen of the pressure on prices which would flow from an accelerated defence programme, and a continuing upward trend of money incomes.” Retail buying during the Christmas season was little more than normal and it was not until after Christmas that the mad rush of which Macy’s complained last week started again.

Even by the end of the year, however, Treasury payments for defence orders had not begun to add to the inflationary effect. During the last five months of the year there was a net surplus and, over the calendar year, the budget was almost in balance. Yet “at the end of 1950,” the Council concludes, “the national economy was subject to forces of inflation far

more powerful than those which arose following the original outbreak in Korea. . . . There will soon be added the direct effect of the rapidly expanding military programme. . . . Clearly it will be necessary to resort to more direct action than has thus far been taken to prevent inflation from continuing its destructive spiral.” It is, indeed, doubtful whether there are many who still need to be persuaded of this necessity. Macy’s, in their advertisement, announce that they “feel strongly there should be controls on prices, on farm-products, on wages, on profits.”

But until the Economic Stabilisation Agency can collect a staff to administer the controls, of the approach of which there have been all too many warnings, the inflation will go

on. And it will be kept from getting completely out of hand only by the incredible productivity of a country which, having raised its gross national product under the stress of war from \$91.3 billion in 1939 to \$215.2 billion in 1945, and, in the first five years of peace, to \$255.6 billion, could, in the year when a new defence effort was needed, raise it still again to \$278.8 billion. The price of this productivity is, however, an ever-increasing consumption, and a consequent rise in the prices of those raw materials which are urgently needed at this moment in other countries, as well as in the United States. There is even a gloomy side to the ability of the American economy to expand and expand and expand.

American Notes

Cease-fire in Washington

Hostilities between the President and Congress over the dispatch of troops to Europe seemed to be petering out this week, thanks to a willingness on both sides to forget the constitutional niceties and act together, as they must if they are to act at all. For defiance of the Wherry resolution, the President substituted a tactful and realistic welcome of the Senate’s wish to be associated with the creation of the European army, Senator Taft, instead of persisting that no troops should be sent, retreated far enough to agree to American reinforcements being dispatched, though he continued to argue that Congress should place a limit on their number.

The result has been that the Wherry Resolution, which would have forbidden the President to act until the Senate came to a decision, has been successfully side-tracked. It will be considered by the Foreign Relations and Armed Services Committees, without any commitments having been made by Senator Connally as to when, or in what form, it would reappear on the floor. If all goes well, it will emerge, after General Eisenhower’s report next week, transformed

into an expression of support for the President’s policy which in no way compromises the Presidential powers.

But while the domestic ranks were being closed, a deeper gulf appeared. Both the House and the Senate rushed to pass virtually unanimous resolutions urging the United Nations to condemn China as an aggressor. Such gratuitous advice—made no more acceptable by the explanation that it was meant to “inject a little backbone into the United Nations”—is not binding on anyone. But the votes are an accurate reflection of the disillusionment and frustration caused in the United States by the reluctance of its friends and allies to abandon the slightest hope of a settlement. In the American view, Uno will be morally bankrupt if it punishes a small aggressor but appeases a big one. Senator Morse felt compelled, after Mr Attlee’s speech, to conclude that the question was whether Britain was on the side of the United States or of Red China.

The Senate went on to call upon the United Nations not to accept Communist China as a member. It would be a hardy Administration which defied such sentiments. But on the Chinese issue, Congress and the State Department appear to be, for the first time, not only in step but hand in glove. The House and Senate resolutions appear to have been introduced with the knowledge of the White House and have been cordially welcomed by Mr Acheson. The recent speech of Mr Ernest Gross, Deputy Representative at Uno, in which he insisted that the Formosan issue must be handled in accordance with American national interests and that the Nationalists must be consulted, suggested to some observers that, driven by the Chinese Communists, the State Department was backing into the arms of its critics at home. It is denied that any change of policy is contemplated. But bipartisanship arrived at by this route might, as the *Washington Post* points out, jeopardise the Atlantic alliance as well as the United Nations.

★

Stabilisers on Thin Ice

The public conclusion of Mr Wilson, the head of the Office of Defence Mobilisation, that “price and wage ceilings must be imposed with speed and forthrightness” because “voluntary controls will not work” was followed almost at once last week by the resignation of Mr Valentine and his replacement at the Economic Stabilisation Agency by Mr Eric Johnston. This is a victory for those, like Mr DiSalle, the Price Administrator, whose sharp political ears told them that the public would tolerate no more delay in controlling the cost of living, and a defeat for the go-slow school who felt that the controllers lacked the staff, as yet, to work out and enforce a general price order. Mr Valentine, an academic figure, was determined to test the economic ice exhaustively before putting any weight on it.

Mr Johnston, the czar of the motion picture industry and experienced not only in business, but in the ways of Washington under mobilisation, will have more powers than Mr Valentine possessed; he will also, probably, be more willing to delegate them than Mr Valentine was. In addition to overseeing price and wage policy, Mr Johnston will exercise authority over rent control, home financing, subsidies and other economic aspects of mobilisation.

The testimony of Mr DiSalle this week before the Joint Congressional Economic Committee suggests that before the week is out a general freeze may be ordered of all wages and prices not specifically exempted under the control act. The conspicuous exemption is food prices as long as they are below parity, and the chairman of the House Banking and Currency Committee revealed that the President will attempt very soon to secure from Congress effective controls over these as well. It is thought in Washington that a thirty-day standstill order on wages will give time to work out a war stabilisation policy. For this, the moment is opportune. Mr

John L. Lewis and the soft coal operators, led by representatives of the steel industry, which has its own "captive mines," have just concluded, with great speed and secrecy, an agreement raising wages by 20 cents an hour. This snaps into place the last main link in the present round of wage increases, the fifth since the war.

It is recognised by everyone that any roll-back and freezing of prices will freeze many injustices into the structure as well, and that intensive re-working of the order will be necessary. The gamble which the President and Mr Wilson seem about to take is that the rudimentary stabilisation organisation will be able to enforce its orders and remedy these inequities quickly enough to avoid a general disillusionment with controls which might lead to widespread evasion.

* * *

Easing Conversion Pains

When partial mobilisation came in the door, the Munitions Board's carefully laid plans for full mobilisation flew out the window. Under these plans firms were supposed to have "shadow" orders for armaments, so that they would know what to do when war came. To have given the green light to these orders would have meant reactivating "shadow" factories; this would have dislocated the labour force, caused housing shortages and so on. It would in fact have meant a disruption of civilian life that is undesirable if a prolonged period of cold war is to be endured. For this reason, the services have, as far as possible, been placing contracts with automobile and other consumer goods' manufacturers who are forced to cut back civilian output because of shortages of raw materials.

How far this policy will in fact ease the pains of industrial conversion is far from certain. Automobile firms are already laying off men and reducing output by 20 per cent, and the cut-backs are sure to get worse. But it will be the end of the year before these firms are tooled up for their new defence contracts, even though these are at last being placed with greater speed. Many car companies would prefer to build new facilities for aircraft and tank production, so that they can keep their labour employed, even if at a reduced rate, on civilian assembly lines, until the time has come to start defence output. For it is everywhere agreed that before long skilled men will be jewels of incalculable price. Some automobile firms have already ordered tools for their 1952 models, although 1951 cars are only being shown this week, in the hope of getting delivery before defence swallows up all the machine tools. Some firms, such as Willys-Overland Motors, which makes jeeps for army or civilian use almost indiscriminately, have no conversion problem. Others are prepared to do both kinds of work side by side, notably the General Motors Corporation, which is to make Thunderjet aircraft in its car assembly plant at Kansas City.

The Department of Defence has another reason for spreading its contracts among a variety of firms. It is anxious to disperse both facilities and "know-how" for making essential weapons, so as to lessen the damage that could be done by air attack. Aircraft firms, which had expected to be allowed to reactivate their stand-by facilities before automobile makers were given a share of the aircraft cake, resented this new policy at first, for licence fees do not push profits nearly so high as contracts do. Now, however, that President Truman has hitched the aircraft wagon to the star of a five-fold increase in output this year, and to the nebula of a fifteen-fold increase in capacity (to 50,000 planes a year) before long, there is obviously more than enough aircraft cake for everyone. The automobile industry has no doubt that it can cope with 35,000 tanks a year as well.

* * *

Housing the Defence Worker

The federal belt which is squeezing workers and materials out of the building industry has been tightened by

two more notches. The Federal Reserve Board has extended to multi-family dwellings the less liberal credit terms applied to one-family and two-family units in October; and the National Production Authority has forbidden the commencement of any new commercial construction costing more than \$5,000 until February 15th, when a licensing system will be introduced. This follows the ban on recreational building. Private builders, who believe that the restrictions on credit will cut the production of new houses from 1,350,000 in 1950 to 700,000 or less in 1951, expect that the next step into austerity will be the placing of price limits on new houses—something never before attempted.

Some of the materials and labour released will go into industrial expansion, but the Administration believes part should also be diverted into building permanent homes for defence workers. During the war, some eight or nine million people followed war industries into new communities, which often had neither the houses nor the facilities to absorb them decently. Military re-enlistments even now are unfavourably affected by sub-standard living conditions. No repetition of the war's mass migration is expected, but the housing authorities wish to be prepared this time.

Much can probably be done by relaxing credit restrictions in defence areas. But in addition, a Bill has been introduced to increase by \$3 billion the authority to guarantee private mortgages, chiefly for flats for workers in war industries, and to empower the government itself to spend some \$125 million on housing and community facilities in defence centres. This would apply particularly to installations in isolated areas, such as the new atomic plant on the Savannah River in South Carolina. Here an influx of 30,000 people is expected, and money will be needed for schools, roads and sewers, as well as to acquire building sites to prevent exploitation. Private builders are torn between their desire to bolster their shrinking incomes by a share of this new federal money, and their traditional fear that the public part of the programme may prove to be a socialistic camel's head in the tent of private enterprise.

Shorter Notes

The Federal Reserve Board has increased the margin requirements for share purchases and short sales from 50 per cent to 75 per cent. This return to the margin required before March, 1949, is regarded as a preventive measure, for the volume of credit in the market on January 1st was only about \$1.4 billion compared with \$3.6 billion four years earlier. However, this type of credit has been creeping slowly upward in recent weeks, with the heavy turnover, which for many days has been greater than 3,000,000 shares. The Board's chief concern, however, remains the excessive expansion of bank credit, and there is talk of reviving its "special reserve" plan, which Congress turned down in 1947.

*

The five-cent coke will soon be as extinct as the five-cent telephone call and the five-cent fare. Some retailers are absorbing wholesalers' increases on Coca-Cola and other soft drinks, in deference to public attachment to the old price, but six cents a bottle is already being charged in New York and many other cities, and even Georgia, home of Coca-Cola, will not be able to hold the line much longer.

*

During the first ten days of January all the estimated 4,000,000 aliens in the United States were required to register, under the provisions of the new Internal Security Act. This registration must be repeated every January. Most uncharacteristically, Senator McCarran in writing his Bill, seems to have overlooked the fact that since 1940 aliens have been required to register within five days any change in their home addresses—a more stringent provision. This requirement has, however, often been neglected.

OF THE 40 ADVERTISERS* whose messages appear in the January 29 issue of LIFE International, 14 are British—including the Festival of Britain's introductory advertisement of four pages in four colours. Never before has such a distinguished group of international advertisers presented their messages, in a single issue of LIFE International, to the highest concentration of the world's most-likely-to-buy prospects made available by any export magazine.

LIFE International has a paid circulation of over 300,000 in more than 100 countries (around 50,000 in the U.K.). Surveys show that an average copy is read by 10 people—making a total world-wide readership of 3 million. And most of these readers are among the world's best customers for British exporters: three out of every four are in the upper and upper-middle income brackets with 92% of them in business, government or one of the professions.

To reach these much better than average prospects around the world is no burden on any appropriation. Space rates range from \$275 for an eighth page to \$2795 for a full page in 4 colours. For full details on why more and more British export advertisers are turning to LIFE International, write to...

THE WORLD OVERSEAS

Russia's Agro-Towns

(By a Correspondent)

THE Soviet countryside is in a turmoil. The process of supplementary collectivisation, which both the State and Party organisations started preparing a year ago, is now in full swing. The amalgamation of smaller collective farms into larger units has already been going on for over 8 months and this first stage of supplementary collectivisation should be ended in April in the whole of the Soviet Union. The only exceptions are the newly acquired territories—the Baltic States, Bukovina and the so-called Western Ukraine and Byelorussia—where the primary collectivisation has not yet been completely carried out.

The quick tempo of amalgamation is to be explained by the tense international situation. The additional collectivisation should immediately free millions of labourers and make this manpower available for industry where it is badly needed for the present armaments race. Besides the reduction in the number of collective farms should also enable the authorities to cut down the number of food supply centres, while the contraction of the agricultural population should increase these food supplies for the towns. The advantages of a concentrated system of supply compelled even the Nazi occupation authorities to maintain the collective system, though its break-up, especially in the Ukraine, would have been very useful for propaganda purposes. The Soviet authorities hope gradually to reduce the collective farmer to the level of the agricultural labourer working in State farms. The big collective farm, which with time should contain some 3,000 farmers, will thus be transformed into an agro-town. The long-term end is to eradicate all differences between agricultural workers and the workers in the towns.

From Soviet sources it appears that already in the first phase the number of collective farms has been reduced by at least 60 per cent. In certain regions the process has already been completed. Thus Byelorussia formerly had just under 10,000 collective farms. Now, after amalgamation, this figure has been cut down to just over 3,250. In the Ukraine the total has been reduced from over 26,000 to below 14,500. The cuts have been even more drastic in central Russia, where there had been many small collective farms with 300 to 400 hectares of land. Since villages were usually changed into *kolkhozy*, the typical small Russian village has led to small collective farms. But now the Soviet authorities consider that modern agricultural machinery, tractors and especially combines, cannot be fully exploited in such small units. Besides, in larger *kolkhozy* more varied crops can be grown and can be more easily combined with large-scale cattle rearing. It is considered that a collective farm should have at least 1,200 hectares of land.

Generally the larger unit should allow for a more rational division of labour and resources and thus assist the Government in its struggle against the drought (carried out mainly by afforestation and also by building ponds and canals) as well as in its plans for housing and electrification of the countryside. The amalgamation should also bring about a saving of machinery and particularly of fuel consumption. The latter is now of the utmost importance, since the Baku sources have been partly exhausted and the new sources on the Volga cannot yet be exploited to the full.

The Soviet Union should soon have 100 or 110,000 col-

lective farms instead of 250,000. A large proportion of agricultural labour will thus become redundant. In addition the country bureaucracy, which is still more numerous than in the towns and which in collective farms accounts for approximately 30 per cent of the total manpower, will be cut drastically. Thus altogether some 3 to 4 million workers will soon be made available and, it is announced, will be immediately directed into industrial production.

The Party expects that the new collectivisation drive will help to reinforce both its own and the Government's influence in the countryside. In the elections of new chairmen of the *kolkhozy*, due care is taken by the authorities that a Party-member is chosen. The extension of the farm should also strengthen the Party cell inside it, thus avoiding the instances, particularly common after the war, when no Party member or even candidate could be found in a collective farm. Besides the character of the chairman will also change. Hitherto he has often been a local man defending the farm against the State, especially over questions of food supplies. Now he will be an agronomist, usually an outsider prepared by the regional Party schools. He will defend the interests of State and Party against the farmers.

Families to be Transplanted

It appears from Soviet sources that the present campaign causes greatest dissatisfaction in the bigger and better organised collective farms, which dislike the amalgamation with smaller and poorer farms, because they fear that it will lower their profits and their standard of life. But it is the second phase of supplementary collectivisation which will meet with greater opposition. The party announces that farmers from the smaller *kolkhozy* will be actually moved, together with their families, to the new houses in the bigger collective farms. Visions of future agro-towns are painted: "Two thousand beautiful houses along asphalted streets and avenues with lawns. Two thousand two-, three- and four-storey houses with electricity, radio, water supplies and bathrooms. A central square with a statue of Stalin. Next to each house a fruit garden." The transplantation of the farmer from the place where he and his family have lived for generations aims at blunting his property instinct. The farmer's house is normally in the neighbourhood of his former land, now incorporated into the collective farm. Once moved away from there, it is hoped, his feeling of ownership will diminish and with it the dreams of recovery.

Soviet propaganda tries to pass over in silence the issue of the farmer's own plot of land. Up to now each collective farmer has had his own plot of a quarter hectare next to his house. He also had a cow and some poultry. These plots were the source of the farmer's private income and, particularly during the war, the farmers used to try to increase their size. The authorities did not react violently as there was not enough machinery and labour to exploit the whole collective property. After the war a strong campaign was carried out for the recovery of these lands, on which the peasants worked much more assiduously than on the collective land. In future, it seems, the farmer will have to content himself with a "fruit garden." The very announcement that peasants will be moved and deprived of their private plots must cause a great

deal of anxiety and unrest in the countryside. The actual migration of the peasants has therefore been postponed to a later date. In the meantime preparatory work is to be done. In each new big collective farm a brickfield producing at least 500,000 bricks per year and a tile factory with an output of 100,000 per annum are to be built.

It seems that in spite of unrest in the countryside the Soviet authorities will be able to overcome the resistance. It was much more difficult to do it in 1929-33, when it was necessary to amalgamate 20 million small farms, inhabited by 70 million people and covering 370 million hectares of land. The resistance was extraordinary and the preparation for collectivisation insufficient. There were only 40,000 tractors in 1929. Famine reigned in the Ukraine. Food supplies for the towns were very small and grain had to be requisitioned by force. Now the output figure for tractors in the last Five Year Plan was 720,000. With a steady supply of machinery and with favourable weather conditions for the last two years, the Soviet authorities claim that the harvest brings in 127 million tons of grain. The grain supplies for stocks and for the towns (the so-called commercial grain), it is claimed, accounts for 40 per cent of the total. The resistance in the Ukraine was broken by 1933. The other main centres of resistance have since been broken. Besides, the migration of the farmers is to be extended over ten years, though some Soviet papers argue that the process may be speeded up.

Japan Welcomes Mr Dulles

[FROM OUR TOKYO CORRESPONDENT]

JAPAN's political leaders whipped themselves into a democratic ecstasy of pacifism in preparation for the arrival this week of Mr John Foster Dulles as ambassador to plan a peace treaty and reach agreement on Japanese rearmament. The crisp Tokyo air is clouded with honourable doubletalk about Peace, beautiful Peace, and Prime Minister Yoshida was credited with a plan to release a flock of white doves carrying United Nations' flags in their beaks at Haneda airfield when Mr Dulles arrived. The situation is one dear to the heart of Japanese international bargainers. They know exactly what the Americans want—which is largely what they themselves want. In the classical Japanese tradition, they are accordingly denying that that is what they want in order to get more of it on more advantageous terms.

Prime Minister Yoshida piously leads the apparent Japanese opposition to the rearmament of Japan. He insists that Japan must have "national independence" and "burning patriotism," but shudders away from the idea of another Japanese army, and blandly quotes General MacArthur's own sonorous words, in the new democratic constitution, renouncing armed forces for Japan "forever." Adopting a more prosaic attitude, Finance Minister Ikeda claimed last week that "it would be utterly impossible for Japan to finance rearmament" and stated that he had "no thought whatever of compiling a budget that makes any provision for rearmament."

The Japanese Socialists alone appear honestly and sincerely to oppose rearmament, but their arguments comprise little else than vague hopes. For instance, Secretary-General Inejiro Asanuma of the Social Democratic party rests sternly on his party's resolve to continue its "peace movement based on humanity to achieve the ardent wish of mankind to exterminate war." The Japanese people generally want war as little as most people anywhere want war. But they will accept an army with a shrug. And, anyway, the people's view still matters little in Japan, despite the singular American delusion that the nation has been satisfactorily democratised inside five years.

Japan's leaders are, of course, privately delighted at the discrediting of the occupation-dictated constitution before

even the end of the occupation. Despite their profound and grateful obeisances, they hated it as a compulsory conqueror's monument to their defeat and humiliation, and they would in any event have moved to amend or modify it by due "democratic" processes once the opportunity presented itself. Now the opportunity is prematurely here.

The real demands and wishes of Japan are contained in a privately circulated series of recommendations prepared and submitted this week to Prime Minister Yoshida by four influential managerial associations—the Japan Management Association, the Federation of Employers' Association, the Federation of Economic Organisations, and the Osaka Management Association. They include the following: Peace with "majority nations"; rearmament, "in the interests of domestic peace and order and national defence"; territorial and immigration considerations, "in view of the extreme difficulty of maintaining the livelihood of the Japanese people within the present territory"; the unfreezing of frozen Japanese assets overseas; and permission to organise "industrial defence corps" in key industrial plants deemed "susceptible to possible rioting."

In addition, Japan's Economic Stabilisation Board is working independently on proposals for Government and private loans from the United States for the development of Japanese industries—especially power plants, shipping and machine-tool plants—and for financial and material aid for the equipment of a Japanese army.

Apart from the comforting knowledge that the Americans want to persuade them to do what they fundamentally want to do anyway, the Japanese have another strong bargaining argument in their huge manpower resources—the one cardinal weakness in all United Nations planning. It is expected that the Japanese Government will insist on the development of an armed force which will be intrinsically and sturdily Japanese, with no suggestion or hint of "a mercenary United Nations force."

Meantime, while the pacifist Yoshida prepares to yield to the blandishments of the warlike Dulles, the training of the nucleus of the new Japanese army is already actively under way—75,000 recruits of the National Police Reserve, mostly ex-servicemen and officers, who rushed to enlist within two weeks and who wear a smart army uniform and—in harmony with Japan's present mood of expedient pacifism—an insignia amusingly compact of a new white dove of peace and the old rising sun of war.

The French Budget for 1951

[FROM OUR PARIS CORRESPONDENT]

THE crux of the French budget for 1951 lay in the acceptance of 740,000 million francs of military expenditure. M. Pieven's insistence upon pressing the vital part of the corresponding appropriations through the National Assembly on the last day of the old year has paid the Government handsomely. With the new taxes safely on the statute book and with the "provisional twelfths" to go on with (the monthly advances voted by the Assembly pending the passing of the several chapters of the budget), M.M. Petsche and Fauré may regard their task as virtually complete. The one remaining uncertainty concerns the 25,000 million francs of economies which the Government must specify by February in order to balance the rearmament budget. (The original total of 165,000 million francs of new taxes was provisionally lowered to 140,000 million in the course of the debate, the Government reserving the right to increase the new voted taxes to the extent that the proposed economies are not implemented).

In expenditure the massive increase has been on the armed forces, a rise of 180,000 million francs (excluding the

140,000 million of American aid). The civil budget, which stands not much higher than last year, nevertheless contains many supplementary expenses, including a rise in the salaries of civil servants and in war veterans and old age pensions and an estimated deficit of 90,000 million francs in the state railways. These extraordinary charges are masked by considerable administrative economies.

The 1951 budget compares with its predecessors as follows:

FRENCH BUDGETS OF 1949-51 ('000 Million Francs of 1950)			
	1949	1950	1951
Civil expenditure	950	950	1,040
Military expenditure	432	420*	740†
Civil equipment and reconstruction	132	141	155
TOTAL	1,514	1,511	1,935
Reconstruction: War damage	350	329	318
(buildings, railways, merchant fleet)			
Productive investments (Plan Monnet)	317	398	362
GRAND TOTAL	2,181	2,238	2,615

* 19 per cent. † 29 per cent.

In order to give priority to rearmament, the credits for modernisation and equipment (Plan Monnet) have been substantially reduced from 398,000 million to 362,000 million francs. Of the latter amount, moreover, 80,000 million may be spent only if corresponding receipts accrue from loans floated by the public utilities. The exact extent of the reverse to French industrial development occasioned by the special rearmament budget is hard to determine. *Electricité de France*, which has vast hydro-electric and thermo-electric projects in hand, probably loses the most. The Communists are making as much as they can out of the curtailment of the Monnet Plan: i.e. guns instead of dams like those in the Soviet Union. Yet, from an electoral viewpoint it is clear that out of the 355,000 million francs special rearmament fund only the 50,000 million francs to be secured by a National Defence Loan might have been attributed to investments. The American aid is strictly military and the new taxes would not have been proposed, let alone voted.

M. Petsche's original *projet de loi*, which the Assembly by its voting of the military budget has substantially maintained, is as follows:

THE FRENCH BUDGET FOR 1951 ('000 Million Francs)			
EXPENDITURE		RECEIPTS	
PART I—(General Budget):		PART I—(General resources):	
Ordinary civil expenditure	1,040	All previous taxes as at December 31, 1950	1,455
Reconstruction and equipment of State property	145	Increased fiscal control	20
	1,185	Counterpart of Marshall Aid funds	115
(Military Budget)		Treasury loans	180
Metropolitan France	500		
Gendarmerie	20		
Indochina	194		
Overseas territories	26		
	740	PART II—(Special armament fund):	2,170
PART II—(Budget for Reconstruction and investment):		New taxes	165
Renewal of war-damage	263	United States Military Aid	140
Housing	34	National Defence loan	50
Merchant navy and railways	55		
Monnet Plan	248		
	600		355
GRAND TOTAL	2,525	GRAND TOTAL	2,525
SUPPLEMENT			
(Credits conditional upon the Raising of Resources)			
Reconstruction and equipment of State property	10	State-guaranteed loans (post office & other public utilities)	90
Investments (Monnet Plan)	80		
	90		90
	2,615		2,615

The main gap in receipts, in comparison with last year, is caused by the reduction of Marshall Aid counterpart funds by 135,000 million francs (on the original estimate for 1950). Reinforcing the huge increase in the military budget this void has necessitated fiscal measures that just about scrape the bottom of the barrel. The principal added burdens in 1951 are a jump in the tax on companies' profits from 24 per cent to 34 per cent and a rise in the production tax from 13.50 per cent to 14.50 per cent (also from 4.75 per cent to 5.50 per cent on certain services and other exchanges).

The production tax, which is levied only once in the chain of exchange—when the finished product passes from the producer to the distributor—is a great fiscal stand-by in France because it is the easiest of the indirect taxes to collect. In this respect it differs from the tax on transactions, which is much harder to track down in an economy in which self-employed artisans occupy so prominent a place. (The transactions tax, with its two-tenths added since 1948 is, however, also a pillar of the 1951 budget.) This year the Ministry of Finance considered reintroducing the luxury taxes—on furs, scent, night-clubs, cafés, etc.—which were levied during the war. But the scheme was turned down; partly because "luxury" is a word capable of no adequate definition in France (necessities are luxuries and luxuries necessities); partly because such taxes if levied are apt not only to be uncollectable but also to stimulate fraud on the transaction tax: for the small tradesman, faced with a tax both complicated to compute and, when computed, liable to dispel his clientele, is inclined to pay no taxes on the philosophy that he may as well be hung for a sheep as a lamb.

The tax on companies' profits has, as usual, been harshly received by the business community, which argues, first, that it hamstringing an economy which must expand its existing resources if only for the sake of future revenue; secondly, that it hopelessly prejudices the state's chances of borrowing. The same section of the community is strongly in favour of a "fiscal amnesty" for all those who have hidden resources for the same reason that this capital might serve the state. (M. Fauré, Minister of the Budget, is at present studying the conditions of such an amnesty.)

The least onerous taxes appear to be those on petrol and tobacco. Although petrol is over five shillings a gallon, the motoring class does not stint itself and could probably pay more. If, as is probable, the 25,000 million francs of proposed economies are not achieved and consequently the new voted taxes must be increased, the only margin seems to reside in these consumers' taxes.

Booming Pakistan

[FROM OUR KARACHI CORRESPONDENT]

By now it is fairly obvious that a good fairy must have attended the birth of Pakistan, and that the boon she conferred on the infant princess was that she would always be lucky in her financial and commercial ventures. Alas, as so often happens in the pages of Hans Andersen, among those present was also a wicked fairy who bestowed the curse of corresponding political ill-fortune. Politically nothing has gone quite right for the country: the Kashmir dispute should never have been allowed to begin and, once begun, should have been rapidly smothered at birth; Afghanistan's malevolence was totally unexpected and seems unappeasable; and the Bengal troubles mostly owed their origin to the Hindu irredentists of West Bengal, who have never forgiven Pakistan for coming into existence at all.

But economically Pakistan has had much better fortune. Again and again during these three years it has seemed that the Commerce Ministry or the Finance Ministry has taken the pitcher once too often to the well, but always it seems to come back unbroken, thanks to the intervention of

providence in one form or another; there has been an unexpected windfall of revenue, or a sudden sharpening of world demand, or a bumper crop, or even—when the situation demanded it—an exceptionally small crop. It would, of course, be churlish to deny that there has been good judgment as well, but luck has certainly played a big part.

The biggest gamble was the decision not to devalue the Pakistan rupee, and events have proved that this was largely justified. The chief virtue of the decision was that it put the lid on inflation. Prices of rice and wheat dropped along with prices of jute and, temporarily, cotton, and all agreed that this was thoroughly healthy. Yet hardly a soul expected that the Pakistan rupee could maintain its ascendancy over the Indian rupee for more than a year. Jute and cotton exports were the main factor in the problem, with wool and hides and skins next in importance. But from the time when the Korean affair started a world-wide rush to stockpile raw materials, the Pakistan Government has been able to sit back and watch the prices of its export commodities rising steadily and, in some cases, spectacularly. Wool never caused the slightest anxiety and, even with the rupee standing at 2s. 2d., it has been fetching record prices, so much so that the Government has been able to impose an export duty of 25 per cent *ad valorem*. The hides and skins market was dead for a time, but this, too, has recovered and is in a healthy condition.

Jute was the main anxiety. The short-term quasi-barter deal with India helped Pakistan through the first jute year (July, 1949, to June, 1950), but the Government of India, when approached in September, 1950, for another short-term agreement, would have none of it; the Pakistan jute grower was to be left to get along as best he could, and India would not help to bolster up the Pakistan rupee. It has since, however, turned out that the Indian jute mills are in a far worse state, and the Government of India has, it is understood, had to reopen negotiations. The Pakistan Government may not be interested in these, for the foreign jute demand is exceptionally keen, and baling and shipping facilities in East Bengal have been greatly improved. Thanks to the opening of the new port of Chalna, December shipments of jute reached an all-time record, and, with half the jute year gone, over half the current crop has been shipped.

Cotton behaved almost as sensationally as wool. With a smaller American export quota, world prices firmed up to a point where the Pakistan rupee ratio was no obstacle whatever. In fact, the rapid rise in prices after the Korean outbreak forced the Government to intervene, in order to steady the market, by increasing the export duty from Rs. 60 to Rs. 300 a bale. After a brief hesitation, keen buying was resumed. Unfortunately the foreign buyers were shabbily treated by the Pakistan Government and may not easily forget this, for the duty was at buyer's risk in nearly all contracts, and the Government made no exemption

in favour of outstanding contracts. This meant that the buyer of 1,000 bales had to amend his letter of credit by adding no less than £25,000 to it.

Out of this transaction the Government receives a windfall of about Rs. 24 crores (over £25 million at the present rate of exchange) which for a Government whose total annual revenue is only Rs. 115 crores is no small amount. The Finance Minister, Mr Ghulam Mohammed, will in any case have little difficulty in balancing his budget on the revenue side, and it is possible that the whole windfall will be earmarked for the Government's first year expenditure under the six-year development plan, which forms part of the Colombo Plan. It would nearly cover the amount scheduled for this purpose. Pakistan is also fortunate in finding itself comfortably self-sufficient in rice and with a surplus in wheat, at a time when India is faced with the necessity of importing over 3,000,000 tons of food grains.

Nevertheless, these same world conditions, which have given Pakistan such striking immediate advantages, carry with them long-term disadvantages which cannot be ignored. In the first place they militate against the industrialisation of the country and the fulfilment of the six-year development plan, for Pakistan is short of many basic materials, and its industries have to depend largely on supplies from abroad. The Government has now joined in the general rush to stockpile such commodities as iron and steel and non-ferrous metals, but it is somewhat far back in the queue for the dwindling supplies. This may result in a serious set-back. Secondly, the easy money conditions for trade are tending to perpetuate a fundamental weakness. Few Muslim businessmen have any idea of building steadily and solidly for the future by investing in industrial enterprise, and they generally prefer a rapid turnover and quick profits. It is recognised on all sides that this has been the main reason for the shyness of indigenous capital, and the Government has been fighting against this tendency; at present, however, it seems to be fighting a losing battle against the demoralising influence of easy trading conditions.

Political Currents in South Africa

[FROM OUR JOHANNESBURG CORRESPONDENT]

HAVING increased its own majority at Pretoria East and reduced the Nationalists' majority at Smithfield, the United Party surveys the political scene with a slightly more hopeful eye. There have even been rumours that Dr Malan may rush into a General Election in 1951. But the Nationalists are hardly likely to follow the fatal course of the Scots at Dunbar, and come off their hill on to the plain. Early in

HOLIDAYS ABROAD

COST YOU LESS THIS YEAR!

Once again a wonderful selection of Holidays is available to you through Dean & Dawson, and this year prices are lower so that value is better than ever! Make your choice from the synopsis for 1951—"Holidays Abroad." In it you will find hundreds of attractive suggestions for inclusive holidays. Any branch will supply you with a copy of "Holidays Abroad" and give that personal attention to your plans for which Dean & Dawson have been known for so many years.

★ If unable to call write for a free copy of "Holidays Abroad" to Dean & Dawson Ltd., Dept. 49, H.A., 81 Piccadilly, London, W.1.

DEAN & DAWSON LTD

BRANCHES IN PRINCIPAL TOWNS

the new session of Parliament, which began last week, the Nationalists hope to knock the tenacious Cape Coloured voters, who support the Unity Party and spoil the beauties of Table Mountain and are objectionable in other ways, off the common roll where they have been since 1853. But the Nationalists will not reap their political advantage until after the Delimitation Commission has redistributed seats, and its report, based on the 1951 census figures, can scarcely be ready before mid-1952. The other possibility is a general election fought in the event of war. But this would hardly put the Government out—times, the enemy and the Nationalists have all changed since 1939—while Mr Strauss, the United Party leader, is reported to be stoutly opposed to entering into a coalition even if the Nationalists offered it.

Dr Malan is 76. If he dies or retires, he will be succeeded by Mr Havenga—who, however, is 69. Mr Havenga will now never be more than a caretaker Prime Minister. Who, assuming the Nationalists remain in power, would succeed him? Dr Malan's choice is Dr Donges, 52, wily, and robust. The bland pipe-smoking Dr Donges might manoeuvre a squirming United Party into having a try to out-thunder him as the defender of "white South Africa," opposed to the United Nations interference yet firmly anti-Communist, pro-West and if necessary pro-war. This is the current Nationalist line, and it presents the United Party with considerable difficulties. *Die Burger*, with a smile of austere satisfaction, enjoins the United Party for its own good not to give the appearance of being a "fifth column" supporting Uno over South-West Africa. Mr Oswald Pirow, prophet-fuhrer of the *Nuwe Orde* and indefatigable hander-out of all-round knocks, professes bewilderment that the Nationalists should continue to send Ministers to Lake Success to be shot down by an international organisation, "three-quarters" of whose members would have to leave if South Africa's "justified" colour-bar were ever applied to Uno itself. *Die Burger*, and the new Minister of Mines, Mr J. H. Viljoen, jointly chant that the happy alliance between Dr Malan and Mr Havenga could be the forerunner of "unification on a much broader basis."

But lurking in the wings, with all the unobtrusiveness of the trained elephants about to enter the circus ring, are Mr J. G. Strydom and the *Ossewa Brandwag* under its remarkably patient leader, Dr Hans van Rensburg. Already hailed by his enthusiastic supporters as next Prime Minister and first President thereafter (with Dr Donges thus relegated to the role of MacDuff), Mr Strydom effectively controls the Nationalist caucus and rules the Transvaal Nationalist organisation, of which he is undisputed boss, with an iron hand. No aspiring Nationalist has much chance of parliamentary nomination without the approval of this large-lunged, broad-chested man with the disturbingly hypnotic gaze—like some other political seers, Mr Strydom watches visions in the air without ever losing his grip of the political machine.

Demands for a "Real" Republic

Dr van Rensburg stands aghast at Mr Strydom's side. Aghast, because he sees piffling *apartheid* replacing sturdy republicanism as the chief Nationalist slogan. While Mr Pirow merely jeers at the penchant of Nationalist Ministers for rushing overseas to attend conferences, the *Ossewa Brandwag* more sternly cries out against the newfangled notion of a republic "within the British Commonwealth" which to those suspicious minds would be almost worse than no republic at all. Dr van Rensburg once threatened to bring his commandos into Johannesburg, and learned much of profit and interest at the Brown House in Munich. Mr Strydom still staunchly holds to the view that Adolf Hitler could and would have been the saviour of Europe against Bolshevism, if Britain, America and Smuts, their handyman, had not wickedly conspired to destroy the Brown bulwark

against the Red flood; and his leather lungs have also frequently demanded a real republic.

Awkwardly placed over UN "interference," the United Party must not be regarded as in other matters just the Tweedle-dee to the Nationalist Tweedle-dum. Hazlitt poured scorn on Tories and Whigs as two stage-coaches bound for the same destination but splashing each other with mud on the way. To apply the metaphor to the United Party and the Nationalists would be tempting, but unfair. It is true the United Party programme includes "social and residential separation of the races," "prohibition or avoidance of racial inter-marriage," and other apparent pale reflections of the Nationalists' gaudy vote-pulling *apartheid*. Yet the United Party will fight with every weapon at its command against the proposal virtually to disfranchise the Coloured voters, and not just because of the effect this will have on its own political chances. Dr Malan cannot get the Coloureds off the common roll without a frontal attack on the Constitution, and it is over this that the United Party is sticking in its toes. It also genuinely objects to the Nationalists using *apartheid* to make enemies for South Africa and isolate it from the rest of the world, by insisting on "special" hygiene for Indians travelling on State aeroplanes, and barring the entry of delegates to international conferences unless they are of "pure European descent" (which may make it impossible to hold the joint congress of the South African and British Medical Associations that was to assemble in Johannesburg in 1951).

The Native Problem

Others too have misgivings about Nationalist policies. The chief misgivings are, of course, the 8,000,000 natives, represented by their highly intelligent leaders in the Native Representative Council, now threatened anew with abolition. Burly but soft-spoken Professor Z. K. Matthews, who was born 49 years ago of Bamangwato parents who emigrated from Bechuanaland to the Cape, and has studied at London and Yale and served on a British Royal Commission on Native education in 1936, has declared that the natives do not want equality but will not tolerate a "master-servant" relationship between white and black.

Some Nationalists would like to get on good terms with the NRC. *Die Burger* regrets the latest ban, which prevents natives from other African territories from studying at South African native colleges, as unwise. The Dutch Reformed Church is divided. At the funeral of a policeman killed by natives in the Witzieshoek riot, the Rev. W. F. Venter recalled that the dead man was a great-grandson of the Voortrekker David Malan who was murdered by Dingaan, and darkly declared: "We shall continue to have a history of conflict between European and non-Europeans which eventually will lead to the flow of blood we see in the distant future." But Dr Ben Marais wrote from the United States, where he represented the DRC at the congress of the World Council of Churches, that "the friendly feeling towards South Africa and our Church which I encountered here in 1935-6 has changed to an ice-cold atmosphere of criticism and condemnation."

All these voices carry weight. But it is certainly premature to think in terms of a swing-over from the Nationalists to the United Party—though some forecasters have pointed out that the 200 to 300 vote shifts at Pretoria East and Smithfield would, on a national scale, do the trick. More probable is a "moderate" Nationalist policy as favoured by Malan, Havenga and Donges—continued membership of Uno, no isolationism or neutrality, cold-storage republicanism, and *apartheid* reached only by gradual degrees. Mr Strydom would then be to a Malan or his successor what Malan was to Hertzog, a dangerous but not fatal thorn in the flesh. And when even General Smuts agreed to fusion with Hertzog, Mr Strauss might not in the end be able to resist it with the "moderate" Nationalists.

Rearmament and Civil Aviation

WE face the new year hardened by the pressure of world events. The rearmament programme takes shape and is being tackled with a will. No country was quicker to recognise the need than Great Britain, although the fact was for long obscured by our necessary concentration upon industrial and economic reconstruction in the general sense, universally recognised to be of prime strategic importance.

It is probable that in addition to the reinforcement of American air forces on the Continent and in England we shall see American fighters being flown by the Royal Air Force in the near future, bridging the gap until British production can build up. For all such support we are thankful—it is indeed necessary to the interests of both America and ourselves.

Steps which de Havilland took within a year of the end of the last war, to produce Vampire fighters for export in response to an envisaged demand, yield four valuable benefits to-day. They have resulted in the establishment of a fighter manufacturing organisation, strong and well dispersed by subcontracting, able to be swiftly expanded for rearmament; the sale of Vampires in large quantities overseas (when only small numbers were needed for our own forces) has resulted in development of the design in regard to performance and functional versatility, leading expeditiously to the Venom and beyond; the fighter strength of thirteen Dominion and friendly powers has been built up; and millions of pounds' worth of export trade has been effected to aid British economy.

Because this effort has been paralleled in the civil field, by world-wide sales of the Dove light transport, leading now to the Heron, and by the realisation of the Comet jet airliner and the Ambassador inter-city liner, the rearmament requirements can be satisfied without jeopardising export business so long as war is averted.

Of these considerations the ones which are vital in the situation with which the new year opens concern the progress which has been made in fighter production and in design towards the operational needs of the period ahead.

DE HAVILLAND

A FREELY MARKETABLE INVESTMENT IN A TRUST
SPREAD OVER THE SHARES OF THE LEADING
30 BRITISH INSURANCE COMPANIES

INSURANCE-UNITS

AT THE PRESENT TIME, these Trust Units are particularly suitable for those who seek a stable income combined with good prospects of capital appreciation.

Dividend Prospects

The insurance companies, whose shares constitute Insurance-Units, have a common policy of maintaining a wide margin between what they earn and what they pay out in dividends. Many of these margins are substantial enough to give the investor high hopes that his patience during the past few years will soon be rewarded.

Advantages of £ Revaluation

These companies receive a large part of their premium income in \$. They also have very big \$ investments. Revaluation of the £ means therefore greater £ income from \$ sources and a considerable increase in the £ value of their \$ investments.

Easy Purchase of Units

Though "Insurance-Units" gives a spread over the shares of the 30 leading British insurance companies, the investor can purchase Units for as small a sum as £10 approximately. Ask any Stockbroker or Bank for full details.

Offer Price 24th Jan. 23/10 x.d. Yield calculated in accordance with Board of Trade requirements £3/4/9 %.

Aspects of enterprise

No. 7.

Tyre retreading had a bad name in 1933 when the Tyresoles process was taken up by Simon. Warnings were ignored and risks taken in a totally unfamiliar field in the knowledge that the new process was technically outstanding. There are now over a hundred Tyresoles works in Britain and abroad, and force of example has helped to create the present high reputation of the retreading industry. The original Tyresoles patents have expired, but concessionaires in over thirty countries gladly pay for the use of the plant, services, know-how and new patents provided by Tyresoles Ltd. and Tyresoles (Overseas) Ltd.

Fuel in the Fifties—I

How Many Miners?

THIS winter's fuel crisis is a matter for vigilance. Its risks are thoroughly appreciated in the country, but they will not be averted by discussion or by such emergency measures as the Minister of Fuel and Power has ordered. The National Coal Board can contribute little beyond an anxious concern to get more output in time. Given kinder weather than planners deserve, the country may scrape through the next eight weeks with inconvenience but without industrial dislocation. But it knows how Micawberish are the margins upon which British coal supplies are balanced. Four million extra tons of coal—a week's output—would meet the primary needs of consumers; without them, stocks are tumbling and customers are starved of fuel. The shade of Micawber haunts the corridors of Ministry and Board; something may turn up to save the situation, including the mercy of mild weather.

What matters most about this crisis, the second in four years, is its bearing upon fuel prospects for the next few years—the near future of practical reality as distinct from the middle distance of the mid-sixties upon which the Coal Board's recent plan for coal was focused. Is the failure of 1950-51 a culpable but non-recurring breakdown of policy or practice, or is it, as some people close to the facts of the industry fear, only the opening of a chronic coal shortage in the fifties?

The industry's 15-year plan is of limited assistance in considering this question. The practical men who devised it were concerned with coal fifteen years from now, not with coal during the next fifteen years—a fact that left them a certain latitude and partly disarmed their critics. Their private expectations about 1950 to 1965 seem to be vague and heavily qualified. On certain assumptions, the plan postulated a rise in the industry's annual output to 240 million tons by 1965; this would represent an average cumulative rise in output of about 1.2 per cent a year from 1949 until then. This rate of increase was exceeded in 1948 and 1949, but not in 1950. Such a rise in output would not be spread evenly throughout the fifteen years. In the early part of this period, only modest benefit would be reaped from large-scale development schemes and output per manshift could not be expected to rise as fast as in recent years. The plan assumed, with reason, that the industry could not afford to lose much labour until perhaps the mid-fifties. To accept any immediate reduction of the industry's manpower from the 1949 figure of 700,000 men to the planned 1965 figure of 618,000 men would reduce output. Recent new investment might provide a small annual rise in output per manshift until say 1955, sufficient with a somewhat diminishing labour force to carry output to a level slightly higher than in 1949. "Slightly higher" is vague enough; but clearly the first third of the period, up to 1955, is likely to see much less than a third of the extra 38 million tons a year expected to

accrue by 1965. In the second quinquennium, large plans would begin to mature and output per manshift should rise more sharply, while in the last this rise should be accentuated. Not until these later years would it be safe to let the industry's manpower run down really fast (which means, ideally at least, continuing to recruit young miners but taking less trouble to persuade older ones to stay). Thus the prospect for 1955 is an increase in deep-mined production of much less than thirteen million tons a year. But thirteen million tons a year is the planned level of opencast production for the last two years. And by 1955, on present lines of policy, output from opencast workings will have dwindled to little or nothing; early in 1950 it was calculated that 45 million tons of coal were economically worth winning by this method, and last year twelve million tons was removed.

★

Given the assumptions of the Coal Board's long-term plan, it seems that by 1955 the biggest conceivable increase in deep-mined coal production would only cover the expected decline in opencast production. The real gains, from continuous mining and other technical developments, will come only in later years. The prospect of perhaps as much coal in 1955 as is sufficient today is profoundly disturbing, even though the years immediately after 1955 might bring quickening increases in output if the plan works. Unfortunately, doubt has even been cast on this pace of progress because of developments since the plan was completed. The assumption that labour for the plan would be available in the right numbers and at the right places now looks very shaky. Last year the industry lost twenty thousand men; and the men are not staying where the plan assumes that they will—in the South Wales anthracite area, where the plan demands 18 per cent more men by 1965, there was a fall of 6 per cent last year. The change in the total number of miners since the plan was devised would set the Coal Board's man-power division the task of engineering not a gradual decline throughout the fifties, but an actual increase for some years, if the man-power curve postulated in the plan were to be regained. Recruitment of young men is being hampered by a large block of older men working at the coalface, so that youth can only slowly rise in skill and earnings. In practice, despite the present expedient of importing trained Italian miners into surface and haulage jobs to release British miners for the coalface, the Board is making little attempt to recruit men from outside the mining areas. Of the body of "foreigners" recruited in 1947—both from abroad and from "white" non-mining areas—only a number of Poles and European voluntary workers remain, working fairly effectively in most pits. The majority of the men who were attracted by the general recruiting drive for coal—and whose lack of skill and need for training

brought a decline in output per manshift—have since left. In mining areas, despite its attractive "Ladder Plan" for promotion, the Coal Board is recruiting only about 7,000 young men a year to stem wastage.

If the manpower assumptions upon which the plan was partly based prove incorrect, the plan becomes untenable. A considerably more pessimistic, but upon the face of it more realistic, hypothesis is now being considered. In practice, recruiting officers have found that at present the mining communities are the only useful source of recruits. The new hypothesis examines the implications of that practical view. The industry's present labour force is far from ideally balanced; at the end of 1948 there were roughly 220,000 young men under 30, 330,000 miners between 30 and 50, and 160,000 older miners over 50. Since 1870, it is argued, the mining villages have fed the industry's manpower from miners' sons. The growth of miners' families increased the proportion of miners to the total working population from 6 to 8 per cent between 1870 and 1913. From 1920 until the mid-thirties some 400,000 more miners left the mines than the number of recruits that entered them. Between 1935 and 1950 the industry took in and retained those who are now the younger miners of between 15 and 30—roughly 200,000 without the foreigners; there may have been between 425,000 and 500,000 miners' sons alive in those years, of whom the industry succeeded in attracting only about 40 per cent.

*

In the course of the next fifteen years all miners over 50 will leave the industry. The industry plans to lose 80,000 miners by 1965, but there will also be "natural wastage" of mining manpower at all ages; as a result the Board may have to make up a loss of 300,000 men during the fifteen-year period. Upon the practical recruiting assumption that only mining communities produce miners who stay in the industry, it must look to the miners' sons of today to make up the loss. And the frightening fact is that one cannot find enough of them. Estimates are sketchy, but it seems doubtful whether there are more than 220,000 to 250,000 miners' sons; and all the boys who will enter the industry by 1965 have now been born. If the industry manages to attract only the same proportion of miners' sons as it has in the last fifteen years, and if outside recruitment still fails to produce useful miners to stay, the coal plan's manpower assumption would fall apart. The industry on this worst hypothesis might get 100,000 men to replace

300,000; and instead of a fall in manpower to 618,000 by 1965, or an average loss of 5,300 a year, it might have to face a fall to 418,000, or 18,600 a year. Incidentally, this last average is slightly lower than the annual decline of 1949 and 1950.

*

If such a catastrophic fall in manpower were to occur, what would it mean in terms of coal? On the output per manshift for 1965 assumed in the coal plan, it would mean missing the target of 240 million tons by 80 million tons. Extraordinary measures would no doubt be employed to draft outside manpower to the mines should such a crippling wastage continue into the late 'fifties, with effects upon output which cannot be guessed. But in the short term, perhaps up to 1955, the trend that has already set in may not yet seem sufficiently alarming automatically to set in train emergency measures. If by better recruitment the National Coal Board were able to reduce the rate of continuous wastage to only 14,000 men per year, the loss of seventy thousand men would mean in five years a loss of twenty million tons of coal to be made up by increased output. That would need a rise in productivity, over the five years, of perhaps ten per cent; this is not likely, but perhaps, remembering the new techniques, not impossible. But such a prospect would mean that at best output was held near the 205 million tons a year mark; and unless opencast production could be prolonged Britain in 1955 might dispose of 12 million tons of coal less than it has had in 1950.

This whole pessimistic hypothesis is worth airing if only to throw the assumptions of the Board's long-term plan into perspective; it is fair to say that its implications are not being ignored in the industry. Figures apart, the implications of the sociological argument alone are alarming. When a way of life goes out of fashion with such good reason as mining it is hard to arrest the trend. Whether the "flight from the mines" could be checked by the pressure of propaganda seems doubtful. A second incentive, featherbedding the miners, is the argument of Mr Horner. But the levels of extra wages, pensions, better conditions, or additional houses necessary steadily to bring in new miners, or persuade all born in the industry to stay and have larger families are impossible to foresee. And the financial consequences of such a policy for a country whose industrial production is founded on coal—and not dear if not always very cheap coal—would be far too serious to accept without close examination of the country's fuel needs and resources. (To be concluded)

Are Gilt-edged Vulnerable?

PRICES of gilt-edged securities have faltered in the past few days, but it is not this flickering in the face of an apprehended rise in the international temperature that calls for explanation in the market's behaviour; it is the sustained strength of gilt-edged ever since the spectre of massive outlays on defence first raised again its ugly head. This is not the only obscurity in the gilt-edged picture. There are, indeed, three principal questions. First, how far has the market's strength been due to irrational factors and is it, therefore, vulnerable at its present level? Secondly, if it is vulnerable, will the issue of steel stock on February 15th precipitate a change of trend? Thirdly, what is the prospect for gilt-edged securities as the national economy takes up the full strain of its defence burden?

Movements in the market have not, in fact, been spectacular at any time since its rally from the violent slump of the summer and autumn of 1949. Barely a couple of points separate the present prices of long-dated and irredeemable stocks from those of end-1949, and scarcely more than that margin marked the extent of the market's immediate fall after both the first and the second of the aggressions in Korea. Dated stocks, it is true, now yield up to half a crown per cent more than they did during the "home for Christmas" buoyancy of late November; but they still yield nearly half a crown less than they did before the Korean hostilities started. The moderation of these movements is scarcely less surprising than their general direction. An untutored observer might be excused for supposing that the international events of last summer held at least as great a threat for the future of gilt-edged as did the devaluation crisis of 1949; but any forecast based on this supposition would have been proved hopelessly wrong—so far.

The immediate explanation of this paradox must be sought in the changing whims of investors and in monetary policy rather than in the underlying "real" factors. The balance between the fundamental influences that underlie the pattern of interest rates—the total flow of the nation's "real" savings on the one hand, and the total "real" demands on those savings on the other—has certainly deteriorated since last midsummer. The main cause of deterioration has been the large increase in investment outlay that is represented by Britain's rapidly rising current surplus on its balance of external payments; the direct impact of rising defence expenditure has presumably so far been relatively small. Production devoted to building up an export surplus calls for increased "real" saving in much the same way as does an increase in capital works or defence expenditure at home—although it is true that part of the associated money incomes, notably the portion flowing through invisible exports into profits, may yield a high proportion of new savings (or increased tax yields). This kind of self-financing depends to a large extent on the maintenance of dividend moderation, and in any case it would meet only part—perhaps a small part—of the new demands. The only other way in which the pressure of "real" demand has been relieved has been by drafts upon inventories of food and materials—a non-recurring

relief and one that actually presages added strain for the future, and threatens the level of production.

The disequilibrium in the savings-investment account would assuredly have put pressure on interest rates but for one other development—the readiness of the authorities to pursue an expansionary monetary policy. The growth of a surplus on the balance of payments puts roughly corresponding strain on central Government finances; this strain arises in various ways, but most obviously for the financing of gold and dollar purchases. During the second half of 1950 the Treasury appears to have met most of the resultant net demands upon it (after allowing for the reduction in Government-owned inventories) by additional borrowings from the

banks of newly created deposits. In effect, the additional supplies of current sterling required by foreigners to pay for the goods represented by Britain's export surplus (and to provide, also, their additional holdings of bank deposits and of sterling securities that represent last autumn's capital inflow) have been furnished without reducing significantly the original volume of sterling funds available for domestic financing. Thus has the securities market escaped the pressure that might otherwise have been imposed upon it; but the balance between saving and investment has been achieved only by an inflationary depletion of stocks and by the generation of additional savings and tax revenues through the effects of rising prices upon incomes.

Against this background, the paradox of the market becomes somewhat easier to understand. Since the rising pressure of the "real" forces has not so far been allowed to exert itself in the securities market, investors have found no compelling reason for reversing, or even discontinuing, the policies they were pursuing before Korea. During that period there was a tendency to move from cash into securities, and from short-dated into medium- or longer-dated stocks. There is no reason to suppose that the authorities, in their market operations as distinct from their monetary policy, have encouraged

this tendency in any aggressive way. During the second half of the year, they were almost certainly net sellers of securities—either by public issue (the £250 million issue of 3 per cent Funding Loan last November, of which only a small part was immediately subscribed by the public) or by market deals. In this respect the technique has differed markedly from the blatant efforts of the Dalton phase. But the very fact that the November issue, as well as the British Electricity Authority loan earlier in the year, was pitched on a basis that inevitably compelled the “departments” to subscribe the lion’s share makes it quite plain that the authorities were glad to capitalise the opportunities created by the willingness of investors to become somewhat less liquid. By biding their time, and creating new credit, they were able to peddle their BEA holdings on a rising market—and they hope to do the same with Funding Loan.

The answer to the first question, therefore, seems to be that, although there has been much of the irrational in the recent behaviour of the market, it may be less vulnerable, on a short view, than the underlying factors would suggest—provided, of course, that the authorities are ready to create credit and do not press their sales.

★

The second question is whether, even so, the present level of gilt-edged prices may be unable to withstand the shock of the steel issue. In this context, the nature of the issue itself is probably not very material. The fact that there has lately been a demand for the 3 per cent medium-dated stocks has led to some suggestions that steel stock might carry this rate, with redemption dates in the middle to late sixties. But both precedent and orthodoxy argue for a long life for a compensation stock, and most competent observers remain convinced that a 3½ per cent stock will be chosen; such a stock, unless allotted at a premium, could on the present basis have a life extending to the next century, say 1995-2000, or even a little longer than that. The choice between these two alternatives is unlikely, however, to decide the degree of pressure that the operation will involve. The remaining private holders of steel shares who find gilt-edged securities an unacceptable alternative are likely to be just as ready sellers in either case.

The precise amount of the issue is not yet known, but it may be expected to approach £300 million. The amount to be allotted to private holders, however, will be much less than this. During the past four months or so there has been a steady flow of steel securities to institutional buyers seeking a cheap route into gilt-edged.

Profits and Replacement

THE last quarter of 1950 (as the accompanying table shows) saw another material increase in published “profits.” With each month that passes, it becomes more and more desirable that accountants and economists should find an agreed definition of what profits are. The accountants are immersed in the intricacies of the 1948 Companies Act and of postwar Finance Acts; the economists find it difficult to translate their concepts of profits and capital into the language of the market place. “Profits” as they appear in company reports—with the assurance of an auditor’s certificate that they

Thus the impact of the operation has been well cushioned already. Even so, prospective sellers of the new stock may be sufficiently numerous to offer a significant threat to a market left to its own devices. But the authorities will have both the wish and the moral duty to provide a shock-absorber. They will also certainly have ample resources for the purpose; and, in the light of recent monetary policy, it seems most unlikely that they will be deterred from using them by the thought that, by so doing, they will be diminishing the rate of contraction of bank credit that seasonal factors are already producing. The answer to the second question, therefore, seems to be that, short of a coincidental shock from international politics, there is no reason to expect the operation to touch off any abrupt change in the market’s direction.

These relatively reassuring conclusions for gilt-edged investors are, however, strictly related to the short run. In a fundamental sense, the market undoubtedly is vulnerable already. There is a dangerous assumption implicit in both the expansionist policy pursued by the authorities and in the complacency of investors in face of international danger and defence burdens. Both assume—though perhaps unconsciously—that the monetary policy for defence financing in a cold war can be the same as that adopted in total war. In the last war, the gilt-edged market was prevented from falling (and did, in fact, slowly rise) by injections of newly-created credit on a scale sufficient to meet whatever demands for finance would otherwise have put pressure on the market. But the only reason why this credit could be created without causing disaster to the war effort was that the spending of surplus money and surplus incomes was prevented by a network of physical controls and by other sanctions that work only in actual war.

Those who assume that the pressures of defence can be financed similarly are taking for granted not only the speedy erection of a similar complex of controls but that such controls could work in peace with no more friction and evasion than in war. All postwar experience—and especially the experience of the Dalton phase—shows this to be an entirely unwarrantable assumption. Eventually the controls will have to be buttressed by sterner disinflation and general retrenchment and by restraint in monetary policy. The first tentative steps in this direction may, indeed, be witnessed even sooner than the market appears to expect. An effort, expected to be announced next week, to make “small” savings securities more attractive would in principle concede this whole argument—however carefully it might be presented as a limited concession to the “small” man.

present “a true and fair view” of the results—are rising fast. Some 646 companies whose reports appeared last quarter reported an increase in disclosed profits of 18 per cent, from £184.9 million to £218.8 million. But a growing number of practising accountants are now beginning to question the economic meaning of such figures. To some extent they have a “real” content, corresponding to increased output and to the more efficient use of plant and equipment last year. To some extent also, they have an illusory content, corresponding to the rise in prices with its consequent increase in so-

called inventory profits. And, further, there is an illusory element of another kind, which corresponds to the inadequacy of the provisions for replacing used-up capital—the old argument of provision based on replacement cost versus provision based on original cost.

This is well-worn ground. There are fewer accountants nowadays who would reject—as many were rejecting only two years ago—arguments for the need to make provision for replacement on the basis of current costs. Last year’s inflation of costs and prices has made converts to this principle in unexpected places. When it is said that the “profits” of 2,708 companies whose reports appeared last year increased by £100 million, many who would formerly have accepted the statement without demur now stop to ask what it really means. They observe that after deducting various costs and provisions (including depreciation) the residual “profit” was about £1,010 million, of which income

can pray in aid these assumptions in support of their certificate that the profit and loss account shows a “true and fair view” have been heard to doubt whether, in real terms, a genuine profit has been made—on the ground that insufficient provision has been made at current prices to replace stocks and used-up capital.

The dressing up of capital to look like revenue has become a thoroughly vicious habit of our time. No one can say by how much the reported total income of these companies (£1,293.3 million) was inflated by “inventory gains” that ought to be put straight back into the business to maintain the level of its physical working capital but are taxed instead to the extent of more than half. No one can say by how much last year’s depreciation provisions (£181.3 million) fell below what will be needed to replace industry’s plant and equipment when the time comes. The 646 last quarter companies set aside £28 million for depreciation, compared with fixed assets with a book value (after deducting depreciation) of £586 million. This was less than 5 per cent—wholly insufficient to meet even the increase in

the money cost of replacement last year. But this is all that the income tax inspector allows; the difference—if provision is made for it at all—must come out of taxed profits. On this showing it is seriously to be doubted whether any appreciable part of last year’s ordinary dividends—they amounted to £133.9 million, compared with £129.1 million in the previous year—were truly earned in any economic sense.

In money terms, the figures look impressive enough. They appear to provide a great reservoir of taxable capacity, for profits (as computed by traditional methods) show an immediate response to inflation, and thus provide an open invitation to Chancellors to claw back the deceptively coloured fruits of their own laxity of financial control over the economy as a whole. The appearance, however, is dangerously misleading, more particularly since companies cannot speak for themselves but only through their chairmen, whose views are habitually dis-

missed by politicians as being mere expressions of self-interest. It is here that considered professional support of the case for protecting the substance of industry could be of immense benefit to the economic health of the country. Unless there is a change of attitude on the basic problem of capital replacement, the damage of a few more years of debilitating inflation may be too great to overtake. Already it is, in effect, hypothecating the savings of future years to maintain capital assets that are being depleted here and now; and it is not clear whether, if present trends con-

tinue, this unequal struggle will succeed. It is becoming more and more certain that there will be little enough

to spare for the expansion (as distinct from the maintenance) of the country’s productive assets.

Business Notes

Bankers' Diagnosis

This year's series of annual addresses by the chairmen of the big banks has been completed this week by the appearance of those of Lord Aldenham, the new chairman of the Westminster Bank, Lord Linlithgow of the Midland Bank, and Lord Balfour of Burleigh, of Lloyds. They make it plain that on nearly all the leading issues, the whole group speaks with a single voice. All are concerned at the rising pressure of inflation, and all are convinced that the task of keeping it within bounds as defence outlays mount must be tackled by firm measures of budgetary disinflation. The crucial point, that this is indeed the only way of securing the necessary diversion of productive resources to defence effort without creating a grave risk of at least partial breakdown of the nation's productive machine, was made most forcibly by Lord Balfour:—

No doubt an attempt will be made to direct resources towards essential uses through the allocation of key raw materials and by reimposing a host of other controls; but the whole lesson of the past five years is that in a country not actually at war, and unless financial policy is pulling in the same direction, physical controls work very badly, if at all.

Lord Linlithgow approaches the problem more timidly, but there is no sign now of the preference for "direct action," instead of orthodox financial restraints, that seemed implicit in his argument twelve months ago. He regrets the prospective reversal of the recent trend of decontrol; remarks that "even before the new defence programmes were drawn up the forces of inflation had not been decisively arrested, despite the unprecedented calls made upon the taxable capacity of the country"; and questions whether, given the inflationary process of the past five years, the objective of full employment has been "correctly interpreted." Both he and Lord Balfour are concerned at the lack of mobility of labour.

None of the bankers believes it to be practicable to secure the requisite disinflation by means of tax increases. Though some addition to taxation may be inevitable, the bankers are convinced that this by itself would defeat its object. Beyond doubt, the main contribution to the process of curtailing the excessive demands upon the community's resources must be sought in cuts in the Government spending for civil purposes—and in the "social" part of the capital investment programme. No Government, however, and least of all the present Government, will be able to pursue retrenchment with the necessary vigour unless it first promotes a popular understanding of the simple underlying facts of public finance. As Lord Aldenham forcibly argued, the public must be made to understand that it is itself paying for the "free" social services—and that wasteful use of the facilities they afford puts immediate strain upon individual private purses. It is not confined within that mythical concept, the "public purse," which Lord Aldenham would prefer to call the "public sieve," through which taxpayers' money is filtered to some essential uses, some desirable ones, and some sheer waste.

The Banks in 1950

Each of the clearing banks has now published its full accounts, but, at the time this issue of *The Economist* went to press, the combined statement of position as at the end of 1950 was not available. From the individual balance sheets (which are not all drawn up on a basis strictly comparable with the regular monthly figures), it would seem that gross deposits rose by between £160 and £170 million in 1950; this rise, which was spread fairly evenly among the bigger banks, is in unhappy contrast to the experience in 1949, when

gross deposits had remained fairly stable. The chief explanation of this differing experience lies in the fact that the rise in advances (which amounted to about £125 million in 1950 compared with about £145 million in 1949) was supplemented

by an increase in Government borrowing, from the banks last year; in 1949 it had been offset by a reduction in such borrowing. In the first three and a half months of the year, it is true, heavy repayments of floating debt out of tax proceeds enabled net bank deposits to run down by £300 million despite an increase of £108 million in bank advances. In the following six months net deposits increased by £340 million although advances declined. Since mid-October there has been some sign that advances have begun to mount again. It remains to be seen whether repayment of floating debt in the next three months of heavy tax gathering (when inflation will be making the revenue buoyant) will be sufficient to start this cycle of events at the beginning again.

The Midland Bank has extended the experiment that it inaugurated last year in presenting some interesting statistics and charts with its balance sheet. These show the percentage increases during 1950 in turnover on current accounts and in various types of overseas services, the distribution of the bank's advances between different sectors of the economy, and the wide dispersion of the bank's capital among 73,000 shareholders. Public understanding of the banking system would be greatly facilitated if the other big banks were to follow the Midland's example next year.

* * *

Success Story

The success of the export drive in 1950 was a great achievement for British industry. The country's deficit on visible trade (which was discussed on page 94 of *The Economist* dated January 13th) was reduced to £128 million compared with £147 million in 1949; the deficit would have been much smaller but for the sharp rise in the cost of

imports. The devaluation of sterling undoubtedly made British costs more competitive in world markets, but manufacturers made the most of their opportunity. Total exports last year were worth £2,170 million, a rise of 21 per cent on 1949. Only part of this was due to higher prices; the volume of exports is estimated to have increased by 15 per cent. Exports of food, drink and tobacco were 38 per cent higher, by value, than in 1949; exports of raw materials were 29 per cent higher, while exports of manufactures increased by 21 per cent. Most of the increase in the first two categories was due to higher prices, whereas for manufactures the volume increased more than export prices.

The vehicle group was again Britain's largest exporter; motor vehicles in particular made a notable contribution, which is discussed at greater length in these notes. Vehicle exports increased by nearly 30 per cent on the year to a new record of £407 million—almost a fifth of Britain's total exports. Shipments to the United States were more than double those of 1949 but still smaller than of 1948. Exports to Canada, on the other hand, were not quite double their 1949 level but were three and a half times their value in 1948. Machinery remained the second largest group with £317 million, a rise of 14 per cent on 1949. Exports of agricultural machinery and generating sets showed particularly large increases; Russia was the largest market for generators, taking over 35 per cent of the total. Iron and

BRITISH EXPORTS (£ million)

Other items	44.8	47.2	48.2
TOTAL EXPORTS	1,582.9	1,766.1	2,170.1

steel exports rose by 24 per cent to £156 million; shipments to Australia, the largest market, were almost double those of 1949 while exports to Canada increased nearly fourfold. Canada became the third largest market, following very closely on South Africa.

The increase in the export of textiles was the smallest among manufactured goods. The value of cotton exports at £158 million was actually smaller than in 1949, though shipments to the United States and Canada increased. Exports to British West Africa declined from £19 million to £15 million while those to India fell much more sharply, from £11 million to £1 million. In contrast exports of wool textiles increased by 35 per cent to £140½ million. Canada has remained the largest market; it and the United States together accounted for over a fifth of the total value. Exports of other textiles increased by a little over 20 per cent compared with 1949.

* * *

Record Car Exports

Last year the British motor industry exported 343,618 cars and 54,684 car chassis. Their combined value came to nearly £117 million, which was 60 per cent higher than in 1949. The surprising thing about these figures, which are the highest the industry has ever known, is that sales in the second half of the year were greater than in the first half. Such a result is uncommon, for car sales normally show a peak in the spring followed by an appreciable decline in the latter part of the year.

The most important developments have been in the dollar markets. The motor industry has always sold primarily to soft-currency countries and Australia is still its largest customer. In addition to the 76,246 cars shipped there during the year, no fewer than 45,916 chassis valued at £7,269,881 were also sent out to which Australian-built bodies were attached in local assembly plants. But by the end of the year, shipments of complete cars to Canada were running at a higher rate than shipments to Australia; exports to Canada for the whole of last year were more than double those of 1949. At the same time, the United States has moved up into fourth place in the market for British cars. Two factors have helped sales in North America—the rising price of American cars and the high price of petrol which has encouraged the demand for cars with economical fuel consumption. The cuts made in the 1951 production schedules of the

(cars and chassis)						

American motor industry are too recent to have brought any benefit for British manufacturers; the latter have their own production problems that may have to be weighed against a further stimulus to their sales in dollar markets.

Adequate sales and service facilities have now been established in Canada, and the industry is confident of being able to hold the ground it has gained there. The United States market is less predictable. Of the six leading British manufacturers, Vauxhall makes no attempt to sell there at all and Ford has only a limited interest in the market—both for obvious reasons. The revived popularity of small British cars dates from the New York motor show organised by the industry after a number of less successful sales campaigns on conventional lines. The subsequent increase in orders was very rapid; at least half the shipments were made in the last four months of the year, and it is too early to say whether the volume of orders will be maintained.

* * *

Prospect for 1951

The motor industry's immediate export problem is to distribute a limited number of cars to the best advantage. Scarcity of shipping on the Australian, New Zealand, East and West African and Swedish routes is likely to cut exports to those countries in the next few months. This may be of incidental help to the industry because supplies intended for those markets can be diverted with more profit to North America. The biggest fear of British manufacturers is that they will face growing price competition from European, and particularly German, manufacturers who have expanded their exports. The Ford company has recently raised its prices and a rise all round the industry seems inevitable. But the factors responsible for the price increases—rising material costs and reduced output—will equally affect European manufacturers and to place so much emphasis on prices may well underrate the strength of inflationary pressure in some of the best export markets. The average value of the cars exported from this country has risen, in spite of devaluation, from £286 in 1948 to more than £313 in 1950, while the numbers exported have risen from 193,995 to 343,618. The persistent rise in exports during the industry's off-season

last year is only another indication of this trend. It would be folly for British car manufacturers to price themselves out of the market; it would be regrettable, on broad national grounds, on the other hand, if the industry were tempted to sell its exports too cheaply.

The real problem may not be prices so much as deliveries. As the rolling mills change over to defence orders, so they will gradually put into effect the Ministry of Supply's directive to cut deliveries of sheet steel to the motor industry by 20 per cent. Because this transition takes time and affects different mills in different ways, it will not be easy to spread the cuts evenly between individual firms. Pressed Steel, for example, had to reduce deliveries of car bodies to its customers shortly after sheet imports from the United States came to an end, while other body builders are still working normally. The motor industry has in the past few weeks maintained its present high rate of output by eating into its stocks and each firm is now peculiarly vulnerable to interruptions in its supplies. Both the Nuffield and Austin factories had to work short time after Pressed Steel cut its deliveries, and neither firm has yet suffered the anticipated 20 per cent reduction in deliveries of sheet to its own body building works. Whether the cuts, when they come, will mean a four-day week all round the industry depends on the amount of overtime now being worked, and the possibility of putting the men on to other work. The Standard Company, for example, expect to balance reduced car output by increased tractor output, but the Nuffield organisation still has 1,500 men on a short week out of its total payroll of 6,000.

Austin Motors was back to normal working this week after changing production schedules and making more chassis. This is one of the methods by which the industry hopes to maintain its exports, apart from taking cars from the home market's allocation of 110,000 for the year (in 1950 home deliveries are estimated to have been between 113,000 and 114,000). The export of chassis depends on the existence of assembly-plants abroad capable of making car bodies—several British makers have assembly plants in Australia, New Zealand and South Africa—and on those plants being able to get the necessary sheet steel. In Australia, where large numbers of chassis are already imported, sheet is not yet a problem, but this does not mean that it may not become one, and the opportunities for a change of this kind are not unlimited. An alternative might be to export commercial vehicle chassis, to which wooden bodies could be built locally. From the half a ton of sheet or more per chassis so saved, car bodies could be built.

* * *

Is there a Film Crisis?

Sharply varying proposals for reviving the British film industry have been put forward in the last fortnight by the industry's largest trade union and by the other five. The Cinematograph Films Council met this week, and Mr J. H. Lawrie, of the National Film Finance Corporation, has issued a statement about the Corporation's future policy. These verbal developments have focused more publicity upon the industry's "crisis" than is perhaps altogether justified; disinterested scrutiny suggests that in fact the industry may now be economically slightly healthier—or less sick—than in the previous eighteen months. Slightly fewer films were produced last year—62 first features compared with 66 in 1949 and 63 in 1948—but this output was achieved with a smaller studio labour force (3,422 in December against 5,317 in December, 1949, and 7,618 in March, 1948). There is evidence that some progress was achieved in cutting film production costs: and those interested observers who make a practice of estimating the "total" balance-sheet of the industry put last year's loss on film production at nearer £2,000,000 than the £7,000,000 guessed for 1949 and the £5,000,000 for 1948.

Such economies, as the trade unions justifiably point out, mean lower output and more unemployment for their members. At present, certainly, only four of the industry's fifteen studios are fully occupied and eight are wholly idle. Only a dozen films are "on the floor," and though Mr O'Brien of the National Association of Theatrical and Kinema Employees is confident that forty-eight first features will be produced during the year, production plans in the industry are notoriously unreliable. Of the points made by the NATKE and the group of other unions it is significant that the first union, generally considered the more conservative, now wants strong Government action: a £20 million subsidy administered through the Film Finance Corporation. Sir Laurence Olivier, speaking at the meeting of the other unions last Sunday, put his finger upon an undoubted central factor in the industry's difficulties—that exhibition and distribution take too big a share of film proceeds. Adjustments in this field, within the industries' own financial boundaries, would need more radical treatment than slight changes in Entertainment Tax on the lines of the present "Eady plan." The group of smaller unions, however, rejected the £20 million subsidy plan, as well as more Government control of film production. But they, too, wanted an all-party meeting "to consider Government steps to assist the industry."

* * *

Groups and Independents

Mr Lawrie's plan, however, is for the present merely a new method of spending part of the million pounds the NFFC has in hand together with the £200,000 it expects in repayments during the first half of this year. The NFFC is to set up two companies, one in association with the Rank Organisation and one with the Associated British group. Groups of independent producers will be associated with each on a contract basis; the projects which they submit to the new companies will, if approved, be financed jointly, NFFC paying 30 per cent and the commercial firms 70 per cent. The advantage for the distributing circuits is that these films will provide work for the studios they own and that they will be assigned distribution rights; for the producers, freedom from financial preoccupations; and for the NFFC, hopes of more economical continuous production. A third, smaller company will also be set up under Mr John Grierson and Mr John Baxter to use the services of younger producers such as those associated with documentary films; this more experimental group might perhaps be allotted £100,000 or so for up to half a dozen pictures. On all three groups Mr Lawrie estimates that only £700,000 of the £1,200,000 available might be spent; the remainder will be advanced by the Corporation as hitherto to other independent producers, including those associated with the British Lion group.

Present resources of the NFFC will not take it much farther than the next six months, at present rates of repayment; and inevitably if the group system is a success the question of further public money will arise. The scheme accepts the present structure of the industry and does nothing to affect division of the proceeds; the Corporation correctly considers both points outside its scope. It is not the "fundamental attack" on the industry's problems which Mr Wilson once promised, but probably would not repeat now; it seems a workable arrangement which might well have come earlier. Obviously it would be an elaborate system of spending the NFFC's last funds (to finance perhaps not more than nine features from the two larger groups), and presumably the Corporation hopes for further funds. These might be justifiable upon a modest scale; but wider schemes of Government assistance, in present circumstances particularly, are quite unjustifiable. Last year's experience suggests that there may be a level of production at which the industry, by internal reorganisation of various kinds, can eventually earn a living; and there is, in the last analysis, no good reason why it should not be left to find that level.

Martins bank has made a friendly personal approach a particular feature of its service to

customers. The bank's system of decentralisation of control into clearly defined districts ensures the full advantage of local knowledge and with the care and consideration of your branch manager, the "personal touch" is ensured.

SPEKE HALL (Property of the National Trust)

This beautiful Tudor House is Liverpool's most cherished heritage of antiquity. Its half-timbered fabric, mulioned windows, bridge and moat delight the eye and prepare the visitors for the treasures within, the Great Hall and the Great Parlour, the courtyard with its magnificent yew trees, the priest's refuge and, not least, the magnificent kitchens.

BANANAS: The

Latin name of the common banana is *musa sapientum* and the name comes from the legend that in ancient Asia, Wise Men

used to rest under its shady leaves and eat the fruit. The banana was originally an Asiatic fruit but in 1615 a Portuguese missionary brought it to Santo Domingo in the West Indies. The cultivation of bananas soon spread throughout the Caribbean and from the nineteenth century onwards Jamaica became the world's largest supplier of the fruit although in the late 1930's the trade was seriously affected by diseases which attacked the plantations. Full and up-to-date information from our branches in the island on market conditions and industrial trends is readily obtainable on request. Please write to our Intelligence Department at the address given below.

NEW STEEL FROM OLD

Every extra ton of scrap returned means another ton of new steel.

There is still a lot of scrap not coming back into production quickly enough.

The British Iron and Steel Federation appeals now, in the national interest, to all industrialists to speed the return of iron and steel scrap through scrap merchants who can assist in dismantling and collection however difficult. Steel is serving you well—now is *your* chance to help steel to help you.

Improved scrap supplies have helped to raise steel output by 3,500,000 tons in the last 3 years.

BRITISH IRON AND STEEL FEDERATION

STEEL HOUSE, TOTHILL STREET, LONDON, S.W.1. S.I.A.

An Account of STEWARDSHIP

AT THE END of 1950 our Deposits amounted to over £1,148 millions. Four of the chief ways in which we have employed these vast sums entrusted to our care are as follows:—

Advanced to Trade, Industry, Agriculture and other borrowers: £289 millions

Invested in British Government Securities, including Treasury Bills and Treasury Deposit Receipts: £545 millions

Loaned at Call or short notice to the Money Market (which in turn invests mainly in Treasury Bills and short-dated Government Bonds): £116 millions

Held as Cash in our tills and with the Bank of England and other Central Banks: £97 millions

LLOYDS BANK
LIMITED

Spotlight on Australia

In the business world today attention has been focussed on the remarkable industrial development in Australia. The Union Bank of Australia has therefore published two Booklets: "Industrial Australia" containing authoritative information on industrial resources, markets, labour and finance, "Company Formation in Australia" providing a general guide to Company Law with notes on current taxation and the establishment of a business in the Commonwealth. Anyone contemplating business in Australia will find in these Booklets the preliminary information they require. Copies of these Booklets will be sent on request.

BEA's Vain Chase

The bringing into service of nearly a million kilowatts of new generating capacity in 1950 has left the British Electricity Authority almost as far from catching up with peak demand for electricity as it was twelve months ago. It issued figures last week showing that of 1,023,000 kW of new plant installed last year some 923,000 kW was brought into service; but since the rise in peak demand was estimated at the lowest at 700,000 kW during the same period this additional equipment did little to reduce the gap between total capacity and peak demand—which amounts to some 800,000 kW in terms of installed capacity and in practice, taking into account plant "outage," to some 1,500,000 kW at the highest peak load periods of the year. Unlike the National Coal Board, which according to Lord Hyndley has the problem of a man running up a downward escalator, the BEA is involved in an apparently interminable chase, hoping but never quite managing to narrow the lead held by its quarry.

General discussion of fuel problems, engendered by the present threats of a crisis, has recently reinforced the criticisms, upon broad economic grounds, of the BEA's single-minded policy of continued expansion of generating capacity. To all suggestions that peak demand might be restricted—including those put forward by the Clow Committee two and a half years ago—the BEA continues to cite overpowering "technical difficulties"; and since it commands perhaps the majority of the electrical supply experts in the country, and many of the remainder are equally imbued with the industry's traditional expansionism, these objections, though open to doubt, have been difficult to controvert. One independent and expert estimate, however, has recently been made concerning the "load limiting" system suggested by the Clow Committee in 1948. This system would involve the installation in consumer's premises of a limit switch which when in operation would restrict total consumption to an agreed "firm" minimum (above which the switch would first cause the lights to flicker and after a short period, unless the excess were switched off, cut off the load). This would operate only at times of peak load, being set into operation by a "ripple" or similar signal sent over the distribution network. Ripple control at peak periods would thus ensure that the surplus load above consumers' firm minimum requirements would then be switched off—thus lopping off the summit which BEA has always sought vainly to scale.

Price of the Peak

Though at present some 110 central control installations exist in the country, considerable further extension of the system has always been rejected as likely to consume too much capital and time. This independent estimate, however, suggests that the whole of the BEA's network could be "ripple signalled" at a cost of approximately £2,000,000. If the ten per cent of domestic power consumers whose electricity bills amount to £10 a year and over, plus most commercial consumers (in all about two million users) could be induced to allow a limiting switch to be installed to reduce their demand at times of peak loads—and only then—to an agreed essential minimum, it is estimated that the cost of the two million relays and cutouts might not exceed £6 per installation, or £14 million in all. If each consumer were thus induced to reduce demand by one kilowatt during peak hours, two million kilowatts would be saved, and the peak load problem, with its present attendant power cuts, would disappear. Generating capacity to provide that two million kW, at present prices, would cost some £120 million.

Previous objections by the BEA to the tremendous costs involved in dual wiring of each consumer's premises, to allow central switching off of "non-essential" demand, would not appear to apply to this proposal, which would set an agreed "essential" total consumption for each consumer and allow the consumer to decide how he allocated that total at any

one time. An economic incentive to consumers to accept such limitations—which would also have the economic virtue of bringing electricity prices nearer its costs at the time of consumption—would be to charge for the guaranteed "essential" minimum supply at a higher rate, and for that which was liable to interruption at a lower rate. In the long run, of course, any system which successfully limited peak demand would tend to lower general production costs by improving the load factor and by limiting uneconomic investment in generating plant. It is difficult for the non-specialist to weigh the technical possibilities of such a system, or the possible drawbacks: but it deserves a more considered and more convincing answer than the BEA's old standby of "technical difficulties."

Boom in Tanker Freights

The trend of the freight market for dry-cargo tramp ships has been followed closely by tramp tankers; in fact, the characteristic inelasticity of the tanker market has resulted in a far steeper curve, although the peak rates of the winter of 1947-48 have scarcely yet been reached. Until July last year freights had been fairly steady for several months at about the same level as the Ministry of Transport and US Maritime Commission schedule rates, which had been abandoned at the end of 1946 (although rates had previously been much lower than this until they were boosted by the increased operating expenses resulting from devaluation in September, 1949). The Ministry of Transport rate for a single voyage with a cargo of "dirty" oil from the Persian Gulf to UK-Continent ports was 57s. 6d. a ton. By September last year 126s. 6d. was a typical quotation, and at the end of the year 165s. had been reached. Tonnage is still scarce, but British charterers, at any rate, have not been disposed to offer more than 172s. 6d., which is the MOT rate plus 200 per cent: the highest rates at the 1947-48 peak were about 250 per cent above the MOT rate. From the Caribbean, the MOT schedule rate was 32s. 6d., but freights paid in September had advanced to 70s. and by December to some 94s. A recent fixture from the Caribbean to Denmark was made at MOT rate plus 230 per cent, while a forward tanker for May loading has been taken at MOT plus 180 per cent.

The rise in dollar freights has been even more marked. The USMC schedule rate for voyages from the US Gulf to US East Coast ports was \$2.85, but as little as \$1.70 had been accepted in the summer of last year. The Korean campaign, however, had the effect of withdrawing a good deal of American tanker tonnage from the market, and by the end of the year as much as \$6.80 was being offered. Now, at the period of peak winter demand in North America, USMC plus 190 per cent is the basis for early tonnage (equivalent to MOT plus 317 per cent) and USMC plus 185 per cent has been paid for three consecutive voyages for a Liberty type tanker early next month. These attractive dollar freights, which are now readily available for non-American tonnage, have naturally diverted tonnage from other markets, so that freight rates everywhere have been affected. Although tankers now form a large percentage of new building, most of the new ships have been booked on long-term time charter from the date of ordering. The opening of the trans-Arabian pipeline, however, is expected eventually to release more than sixty vessels by reducing the haulage distance via the Suez Canal, though there is little sign of relief from this source yet. It has probably been offset to some degree by the need to use tankers as storage vessels for the Korean campaign, owing to the lack of shore installations. Further substantial withdrawals of tankers for military purposes are in fact expected.

Meanwhile there has been a considerable increase in the fixture of tankers for consecutive voyages at high rates. More than MOT plus 190 per cent has been paid for three consecutive voyages from the Persian Gulf, about April, and

charterers have indicated that they will pay MOT plus 200 per cent for the first voyage in April, with a reduction of 10 per cent for each subsequent voyage. Another alternative offered is MOT plus 150 per cent for trips over one year starting in the summer, but offers of a fixed rate of MOT plus 40 per cent until the end of 1953 have failed so far to attract owners.

Discount Houses' Year

The balance sheets of the three largest discount houses, and their chairmen's addresses that accompany them, confirm the impression set down in *The Economist* two weeks ago that Lombard Street has had a profitable year and one in which resources have expanded to a new record level. The "big three's" bill portfolios have increased by £33.8 million to £433 million, their investment holdings by £37.9 million to £211.1 million, and their total of loans and deposits by £71.1 million to £634.7 million; if other discount houses experienced a proportionate rise in their assets in the calendar year 1950, Lombard Street's total portfolios of bills and bonds may now exceed £1,050 million. It should be noted, however, that the accompanying table may somewhat overstate the propor-

"BIG THREE " DISCOUNT HOUSES—1948-50 (£ million)				
At December 31st	Union	National	Alexanders	Total
Bills :—				
1948	164.8	107.2	52.0	324.0
1949	212.1	109.1	78.0	399.2
1950	216.8	132.7	83.5	435.0
Investments :—				
1948	78.6	52.0	55.2	185.8
1949	52.8	60.4	59.0	172.2
1950	87.2	63.9	60.0	211.1
Loans and Deposits :—				
1948	240.9	156.6	105.1	502.6
1949	271.2	166.7	125.7	563.6
1950	300.0	194.0	140.7	634.7
Net Profits :—				
	£ 000's	£ 000's	£ 000's	£ 000's
1948	305.3	251.1	175.5	731.9
1949	310.8	236.5	150.4	747.7
1950	327.0	301.5	165.1	793.6

tionate holding of bonds; Lord Kennet, of the Union Discount Company, revealed in his address that his company's short bond holdings had been considerably reduced in the year, although the holding on its balance sheet date was some £24 million higher than a year previously.

Both Lord Kennet and Commander Coke, the chairman of the National Discount Company, revealed in their addresses that there had been a welcome increase in turnover of commercial bills during the year; Commander Coke, indeed, reported an increase of 42 per cent in his company's purchases of these acceptances. All three chairmen referred to the conversion of National War Bonds, 1949-51, which has given the discount market one less "short" to deal in, but Sir Eric Gore Browne of Alexander's Discount Company (who, like Commander Coke, was making his inaugural speech as chairman) pointed out that the total of Government securities outstanding with a life of less than five years still exceeds £2,000 million.

Dollars for South Africa

The South African Government has carried its negotiations for four separate dollar loans to a successful conclusion. It was announced this week that the World Bank is to lend it \$20 million for the expansion of railway and harbour facilities and \$30 million for electric power facilities; these loans will be for 15 years at 3½ per cent and for 20 years at 4 per cent, respectively. At the same time the Union Government has arranged through Dillon, Read and Co. to place \$10 million of 4 to 5 year promissory notes with eight large American commercial banks and to replace its existing (but

soon expiring) 3 year revolving credit of \$20 million with those banks by another credit of the same amount. It is understood that up to \$10 million of the proceeds of this private loan will also be used for transportation projects. South Africa's development programme is at present passing through its salad years and it has long been obvious that it is precisely in this sort of economy that the American investor should take over the role that the British investor would have played in bygone days. The World Bank has estimated that only about 20 per cent of the equipment that South Africa will buy with the proceeds of its new loan will come from the dollar area. Most of the rest will come from the United Kingdom and, since the equipment concerned (rolling stock, turbo-generators and so on) is presumably on South Africa's "universal licence" list, this means that Britain will be paid in dollars. Six months ago, when dollars were even more valuable than the resources that make turbo-generators, this would perhaps have been a cause for greater satisfaction than it is now—but then it is about six months since the loan began to be negotiated.

The World Bank has also announced this week that it is to increase by \$15 million its existing \$75 million loan to the Brazilian Traction, Light and Power Company; this loan is for 25 years at 4½ per cent. It is expected that about three-quarters of the proceeds will be spent in Canada.

Six Months of EPU

Details have now arrived from Paris of the full results of the December compensations conducted by the European Payments Union, and thus supplement the British figures summarised in *The Economist* last week. The complete figures reveal the counterpart of the United Kingdom's substantial surplus—a surplus that, after allowing for the use of existing resources by the deficit countries, amounted to £16,318,000 for December alone, of which one half (£8,159,000) was settled in gold. Western Germany continued to run a deficit in December and had to use 32.5 million units (each unit being equal to a US dollar) out of the special credit of \$120 million that was put at its disposal when it had exhausted its EPU quota. Another deficit country was the Netherlands, which had to meet a deficiency of 12.1 million units, of which 2.4 million units was paid in gold. Norway had a deficit of 1.4 million units in December and has now exhausted its initial credit of 50 million units granted at the start of EPU. Italy, contrary to expectations, is also among the deficit countries and in December increased its deficit with EPU from 17.1 million to 30.9 million units.

With the completion of the December compensations, EPU has now run for six months. The position of the member countries at the end of this period is shown in the following table:

EPU COMPENSATIONS, JULY—DECEMBER, 1950 (millions of units of account)				
Country	Amount of Initial Debit (+) or Credit (−) Balance Used	Use of Quota		
		Credit Granted (+) or Received (−)	Gold Received (+) or Paid (−)	
Austria	− 37.4	...	...	
Belgium-Luxemburg	+ 21.8	...	...	
Denmark	...	− 38.4	...	
France	...	+ 153.2	+ 51.2	
Germany	...	− 192.0*	− 128.0*	
Greece	− 70.8	...	...	
Ireland	− 3.3	...	...	
Italy	− 30.0	− 30.9	...	
Netherlands	− 51.1†	− 75.5	− 2.4	
Norway	...	+ 25.4	+ 11.4	
Portugal	...	...	− 12.6‡	
Switzerland	...	...	...	
Sweden	...	+ 5.3	...	
Turkey	...	+ 247.5	+ 35.5	
United Kingdom	+ 150.0	...	...	

* 36.7m. units of account covered outside the quota under special credit to Germany.
† Including 50m. units of account as a grant and 1.1m. units of account as a loan.
‡ Switzerland chose to settle in dollars rather than receive credit from the Union.

The United Kingdom—or, rather, the Sterling Area—has been the dominant creditor. If the figures continue their recent trend, a point will soon be reached at which the other members of EPU will deem themselves justified in taking action against the hardness and scarcity of sterling. EPU, however, is far from being deadlocked by this chronic creditor status of the United Kingdom. The gold payments into the Union to date still exceed by nearly \$50 million the payments made to the three creditor countries, France, Britain and Portugal.

Shipbuilding Output Improves

It is possible to trace, from the latest shipbuilding returns issued by Lloyd's Register of Shipping, signs of an improvement in the output from British shipyards in recent months. During the last quarter of 1950 the tonnage completed, launched and started was greater than in the previous quarter; the industry's performance last year is summarised below:—

	Commenced		Launched		Completed	
	No.	Tons	No.	Tons	No.	Tons
1950 :—		Gross		Gross		Gross
1st quarter	66	268,392	65	204,440	86	360,969
2nd "	66	372,435	95	484,873	85	345,614
3rd "	68	387,650	63	307,472	71	288,858
4th "	64	389,502	55	317,750	77	393,481
Total, 1950	264	1,417,977	278	1,314,535	319	1,388,922
Total, 1949	282	1,212,139	321	1,260,078	340	1,353,350

Tonnage launched and completed in 1950 was higher than in the previous year, although the number of ships was smaller. The tonnage on which work was started, however,

was more than 200,000 tons greater, and the number of ships increased by two. During the last quarter, moreover, the number and tonnage of ships fitting out afloat was reduced from 99 of 599,220 tons gross to 76 of 516,358 tons gross; while the respective figures for ships on the stocks or for which materials were being worked increased from 224 ships of 1,447,014 tons to 254 ships of 1,528,330 tons gross. If the improvement in this category can be continued through the launching and fitting out stages in succeeding quarters, the hope inspired by the latest figures will be justified. The greatest danger may lie in shortages of materials and components.

The total of ships under construction in Great Britain and Northern Ireland at the end of December was 330 vessels, of 2,044,688 tons gross, an increase of seven vessels and a decrease of only 1,546 tons compared with the previous quarter. This figure amounted to 42.43 per cent of the world total of 4,818,753 tons which was 20,392 tons less than at the end of September. Although 556,057 tons were completed abroad, and 693,627 tons launched, only 524,468 tons gross were started during the quarter. Work under construction increased by 79,376 tons in the United States and by 24,766 tons in Germany, but fell by 115,400 tons in Japan and 33,620 tons in Sweden. The leading shipbuilding countries abroad are now France (457,413 tons gross), USA (340,195), Italy (313,978), Holland (306,794) and Sweden (304,990).

Oil tankers under construction continue to increase and now amount to 178 ships of 1,927,814 tons gross, or 40 per cent of all construction. In British yards, the proportion is even higher, at 56.1 per cent, and they are building 97 vessels totalling 1,146,364 tons gross—more than half the world total. At the end of the year plans had been approved or material ordered for 148 vessels of 954,486 tons gross, on which work has not yet started. Of this tonnage, no less than 70 per cent consists of tankers.

THE STANDARD BANK OF SOUTH AFRICA LIMITED

The Demand for Silver

The recent rise in the price of silver appears to be a belated response to changes in the supply and demand equation of which full and interesting details are provided in the latest review of the silver market published by the New York firm of Messrs Handy & Harman. They estimate the production of silver in 1950 in the Western Hemisphere at 134.7 million ounces, an increase of about 6 per cent; production outside the Western Hemisphere is provisionally estimated at 22½ million ounces, compared with 23 million ounces in 1949. As against this total estimated production of 157 million ounces, industrial consumption of silver in the United States alone amounted to 120 million ounces last year, the highest rate reached since the war. Estimates of industrial consumption in other countries include 12.2 million ounces for Britain, 5.2 million ounces for Canada and 9.6 million ounces for Western Germany. It is, therefore, clear that current consumption has been running well ahead of output. The gap has been largely filled by supplies of demonetised coins. Supplies of this metal imported into the United States amounted to 37.3 million ounces in 1950, including 21.6 million from Cuba, 9.8 million from Spain, 2,400,000 from Yugoslavia and a similar amount from China and Hongkong. Messrs Handy & Harman remark that "events of the past year have brought about a basic change in the factors affecting silver. From 1946 to 1950 the situation generally was one of over-supply. Since the middle of 1950, with the non-Communist world, and especially the United States, apparently committed to a long-term defence economy, there has been a growing demand for the use of silver, not only in present lines, but also as a substitute for those metals already under government allocation. The indications are that this demand will continue to expand."

A slightly different slant on the situation was provided by Messrs Mocatta and Goldsmid in their recent annual circular. They raised the interesting question whether silver might not go the same way as gold and become a metal whose main usefulness to the world sprang from the fact that the United States was willing to buy it at an arbitrary price and sterilise it. If this happened, Messrs Mocatta and Goldsmid pointed out, "no country would be able to use it freely and, regarding it as a means of earning dollars, would not even wish to do so. Its use in art and industry might become even more restricted and its standing in the East as a measure of value might disappear altogether." The demonetisation of the metal is certainly proceeding apace, but the industrial demand for silver is likely in the near future to outpace any resultant additional supply of silver in the world's markets.

New Advance in Fibres

Natural fibres are feeling the full blast of rearmament demand. Cotton prices are still creeping upwards and this week were approaching 46 cents a lb. Wool continues its fantastic rise and crossbreds (56's) are now only twopence less than "a pound a pound"; merino wool is well above

Commodity and Unit	PRICES OF NATURAL FIBRES						
	1949		1950		1951		
	Dec.	June	Dec.	Jan. 3	Jan. 10	Jan. 17	Jan. 24
Cotton, US middling (cents per lb.)	31.43	34.64	44.13	44.62	44.88	45.01	45.70
Wool, 56's (d. per lb.)	71	81	167	202	220	238	258
Sisal (£ per ton)	114	130	200	200	210	210	210
Jute (£ per ton)	115	120	120	122	129	131*	141*
Flax, Courtauld (£ per ton)	333	335	408	408	415	440	448

that level. British and American buyers have been competing against each other in Australia during the past fortnight, but it is very unlikely that British manufacturers can maintain this scale of buying. Finance will be one limiting factor. Jute has jumped £10 in the past week to £141½ a ton; port facilities have been extended in Pakistan but now there is

little or no shipping space available. Flax has also risen but more modestly while sisal has remained unchanged, more because of the timing of the contracts than because of any lessening of demand.

Atomic Power Developments

If reports that the Ministry of Supply's plutonium plant in Cumberland has completed its trial runs are correct, far larger quantities of nuclear fuels will now become available for the atomic energy research programme. So long as this work depended on using uranium 235 as a fuel, its field was bound to be limited. This, the only fissionable form of uranium occurring naturally, is present in uranium metal only as one part in every 140, the balance consisting of non-fissile uranium 238. The Cumberland plant is designed to use neutrons released from the fission of U235 to turn a proportion of the non-fissile atoms of uranium into plutonium, which is fissionable and has been the starting point of much of the nuclear research work done in the United States. Small quantities of plutonium have been imported from Canada during the past year for work in this country. Plutonium was the explosive used in the first test explosions as well as in one of the bombs dropped on Japan, and it is assumed that a country must have its own supplies of plutonium before it can start producing atom bombs; there are no natural deposits.

The Ministry of Supply has always described the Cumberland plant as a research project, and it is doubtful whether its output will be large enough to support more than a greatly expanded research programme. But plants of this type, which can convert stable materials like U238 and possibly the much more plentiful thorium into useful fuels, are the obvious answer to the problem of finding nuclear fuels for a full atomic power programme, and both here and in the United States physicists are anxious to get practical experience in running them. It is held that an atomic power plant, that is, one generating electricity with heat provided by an atomic pile, is now a practical proposition and there is nothing to prevent work from starting on one immediately should it be required. But before this is done, more experimental work into the materials of such a plant is considered necessary to see if costs could be reduced. Sir John Cockcroft has estimated that the capital cost of a plant generating 50 megawatts would be about £7,500,000 compared with £2,500,000 for a coal-fired station of the same capacity. But against this, Sir John also estimated that over 30 years the fuel costs of the nuclear generator would be between £1,000,000 and £4,000,000 compared with £16 million for coal. In the type of plants for which design studies have been commissioned, such as atomic power plants for submarines and, in America, for aircraft, these cost comparisons are much less important.

Dearer Road Haulage

The announcement by the Road Haulage Executive that rates for freight and parcels will be increased by 10 per cent from January 29th is hardly surprising. Indeed, private hauliers have followed suit with an increase of 7½ per cent. The new wage agreements and the higher costs of tyres and fuel have increased operating costs to a point at which some rise in rates was inescapable if a working profit was to be maintained. No single rate book exists for British Road Services as a whole, and presumably rates will continue to be charged, subject to the new increase, according to local custom and to the agreements between group managers and traders. This poses the question whether a general increase in rates will prove more desirable than leaving group managers to work out their own rate adjustments within the ambit of a 10 per cent increase.

It may be, of course, that the financial state of British Road Services is still unsatisfactory and that its revenue

Abridged Particulars for Information Only

Application has been made to The Council of The Stock Exchange, London, for permission to deal in, and quotation for, all the issued Preference and Ordinary Shares in the capital of the Company.

S. D. STRETTON & SONS (HOLDINGS)

LIMITED

(Incorporated under the Companies Act, 1948.)

Manufacturers of knitted underwear, outerwear and half-hose for the Admiralty, the Ministry of Supply, and the Crown Agents for the Colonies.

Authorised	SHARE CAPITAL	Issued and Fully Paid
£150,000	in 150,000 6 per cent. Cumulative Redeemable Preference Shares of £1 each	£132,766
£150,000	in 3,000,000 Ordinary Shares of 1s. each	£135,000
£300,000		£267,766

(Neither the Company nor its Subsidiary has any Mortgages, Debentures or Loan Capital outstanding.)

The Advertisement shows (*inter alia*) that:—

- The Operating Company, S. D. Stretton & Sons, Limited, whose business was originally formed in 1796, is well known in the Trade, by its registered Trade Marks "Moon", "Capstan" and "Welfex". The Accountants' Report in the above-mentioned Advertisement sets out the Operating Company's profits for the eleven years ended 31st March, 1950. In these eleven years the Operating Company's sales have increased, in marked degree and the sales for the last year were some £247,000 in excess of those for the year to 31st March, 1940. The demand for the Operating Company's production and particularly for its men's and boys' knitted underwear, swimwear, fishermen's jerseys, and half-hose is at present in excess of the output.
- The profit attributable to the Company's holding in the Operating Company, for the year ended 31st March, 1950, as shown in Column (4) of the Accountants' Report in the above-mentioned Advertisement, was £76,846. The Directors estimate that, having regard to the preliminary figures available to them for the six months ended 30th September, 1950, and in the absence of any substantial change in present trading conditions, the profit of the Operating Company attributable to the Company for the year ending 31st March, 1951, will be not less than the previous year, namely £76,846. After deducting from this figure, a total of £23,455, as stated in the above-mentioned Advertisement, there would remain a balance of £53,391, which is sufficient to cover over 5½ times, the gross annual dividend on the £132,766 issued 6 per cent. Cumulative Redeemable Preference Shares and Profits Tax at the rate of 20 per cent, thereon, together requiring £9,559. After deducting from the remaining balance of £43,832 an amount of £2,700 in respect of Profits Tax at the rate of 20 per cent, on the anticipated dividend of 10 per cent, on the £135,000 Ordinary Share Capital, there would remain available for payment of the Ordinary Dividend and for reserves, subject only to Income Tax, an amount of £41,132. An Ordinary Dividend of 10 per cent would absorb gross £13,500.
- The first accounts of the Company will be made up to the 31st March, 1951, and will cover a period of approximately 2½ months. The Directors propose, in the absence of any substantial change in present trading conditions, to recommend the payment of a dividend on the issued Ordinary Shares, at a rate of not less than 10 per cent. per annum (less Tax) for such period.
- The total net Tangible Assets of the Operating Company are shown in the Accountants' Report in the above-mentioned Advertisement to amount to £273,193, and the proportion thereof attributable to the Company is £270,959. The Valuations set out in the Advertisement, show that the present-day values of the fixed assets, are considerably greater than the book values. If the valuation figures, which it is not proposed to adopt in the books of the Operating Company, were taken into account, the proportion of the present-day value of the net Tangible Assets of the Operating Company attributable to the Company, after deducting estimated preliminary expenses, would be approximately £590,000.

A copy of the above-mentioned advertisement, giving particulars required to be advertised in connection with an application made to the Council of The Stock Exchange, London, for permission to deal in and for quotation for, all the issued Preference and Ordinary Shares in the capital of the Company, may be obtained on application to:

needed to be increased by more than was strictly justified by the rise in operating costs. Lord Hurcomb, in reviewing the work of the Road Haulage Executive during the past year, said last week that a fairly large sum would again have to be written off because of unusable stores and vehicles that had been acquired in the course of taking over private undertakings. He also stressed the poor maintenance and garaging facilities of British Road Services; although these facilities are now being improved, they must have resulted in heavy hidden costs in the form of excessive wear and tear of vehicles.

With so much work still to be done towards consolidating their present undertakings and sorting out their new possessions, the Road Haulage Executive's decision to revoke so many original permits remains a mystery. There is still no indication of how many holders of the 5,000 original permits concerned will elect to be acquired by the Transport Commission, but it will not take a very large number to swamp the already overburdened staffs at group and divisional headquarters. Efficiency, which had begun to show signs of improvement at the end of 1950, will inevitably decline.

* * *

Israel's Sterling

The sterling balances that the Government of Israel inherited from Palestine are now coming within sight of liquidation. At the end of World War II these balances amounted to about £110 million. They have now been reduced to about £14 million, and, by an agreement announced this week, between the British Government and that of Israel, this blocked sterling is to be released over the next two years in amounts of £7,000,000 and £6,700,000 respectively. It has also been agreed that in case of need the second year's release may be anticipated by the Government of Israel, to the extent of not more than £2,000,000. As in 1950, charitable remittances made privately to Israel from residents in Britain may extend in 1951 to £2,250,000.

This agreement has been well received in Tel-Aviv, where it has been hailed as the removal "of the last stumbling block in the way of regular financial and commercial relations" between the two countries. The rapidity with which Israel has run through its available sterling and has built up indebtedness to the United States, Switzerland, France, Belgium and Sweden is a significant reminder of the extremely artificial basis on which the economy of that country is still operating. A situation is emerging where serious thought will have to be given to the value of the Israeli £ and its bearing on the balance of payments of the country. The Director-General of the Ministry of Trade and Industry, Mr Hollander, has recently stated that there was absolutely no reason even to consider a devaluation of the Israeli £. He agreed that the exchange rate probably acted as a deterrent to the flow of investment capital to Israel. It would have been more to the point to have his views on the effect of the exchange rate, not on the flow of capital (on which Israel is becoming far too dependent) but on that more fundamental factor in the situation, the balance of current payments.

Shorter Notes

The Governor of the Bank of England, Mr Cameron Cobbold, left this week on a visit to the Commonwealth Bank of Australia. Mr Cobbold, who will return via New Zealand and the United States, is expected to be away from London for about two months. While in Sydney, Mr Cobbold will hold discussions with a number of other central bank governors who will be in Australia for the Jubilee celebrations.

The proposal of the Sun Insurance to pay a second interim dividend for 1950 of 2s. 2d. per share requires a change in the articles, which at present limit the amount of interim dividends to the previous year's final dividend. In 1949 the interim and final dividends were 1s. 8d. per share, making 3s. 4d. for the year; for 1950 a final interim of 1s. 8d. has been paid. The directors' statement argues that "the shareholders should in all justice receive by way of dividend a larger proportion of the income arising from accumulated funds," and they think that the annual dividend rate should be raised moderately. A decision about a final dividend for 1950 (if any) must depend on the results of the year. This statement has greatly stimulated the insurance share market as a whole.

*

The Chairman of Seager Evans has informed shareholders of dealings in the shares of the company carried out by Mr Ernest Thornton-Smith, a director, on December 5th, when a special board meeting was held to approve a bonus issue. These dealings were investigated by the Stock Exchange authorities and entailed the purchase of 4,000 shares on that date. Mr Thornton-Smith, in a letter to the chairman of the company, has stated that "the purchase of this small number of shares was purely coincidental with the result of a later meeting during the same day" and that "the whole affair was due entirely to inadvertence." Mr Thornton-Smith intends to place his resignation in the chairman's hands, to take effect on March 31st.

*

The report of the Issuing Houses Association for the year to November 30, 1950, records that a communication has been sent to the Governor of the Bank of England asking him to inform the Chancellor of the Exchequer of the injurious effect of the 2 per cent stamp duty and the ill-effects caused by the profits tax and by restrictions on the capitalisation of reserves. The Association holds—quite rightly—that the use of the word "bonus" in connection with such capitalisation is misleading; they have searched without success for another word, but suggest that "bonus" should not be used when referring to the capitalisation of reserves.

*

The chairman of the Hawker Siddeley Group has stated this week that an application has been made to the Treasury to capitalise a proportion of the group's £13 million reserves. The nominal issued equity capital is £1,500,000. The board have been anxious to do this for some years but have not, apparently, found negotiations easy. Mr Sopwith spoke of "too stringent" conditions governing an operation of this kind. He also appealed for more rapid expansion of aircraft production, with particular reference to some of the group's new prototypes. This has a special importance for Hawker Siddeley, since some of its largest outstanding orders are for the Meteor, one of the two standard jet fighters in service in this country and in Western Europe. The Meteor is now due for replacement and competition for a successor may involve in addition to the Hawker Siddeley group, Vickers and de Havilland.

*

Lord Inman, who resigned from the chairmanship of the Hotels Executive on January 15th, revealed on Tuesday some of the principles that have guided the work of the Executive since its constitution three years ago. It was accepted, for example, that restaurant cars could not be run at a profit—a loss of eightpence was incurred on each 5s. meal—and that to pay its way the Executive had to balance these losses against the profits from hotels and refreshment rooms. The Executive had therefore sold, and would continue to sell, hotels which did not fulfil one of three conditions: that it earned a profit, that it provided an essential service for travellers where other accommodation was not available, or that it earned dollars.

Company Notes

Raleigh Industries.—Output and sales of the Raleigh Industries group in the fifty-three weeks ended August 26, 1950, broke all previous records and showed an increase of some twenty per cent over the previous year. The production of bicycles and tricycles now exceeds one million machines per annum and output of accessories has increased proportionately. Total output has increased by over one hundred per cent since 1939, and the praiseworthy expansionist policy of the company may be judged by the doubling of the business of its subsidiary companies in the United States. The demand for the company's products, particularly in foreign markets, has been so great that it has proved impossible to meet all requirements. This expansion may have been assisted by devaluation, but it also took place in a year of rapidly increasing costs; in this sense, the rise in group trading profits from £1,472,764 to £1,681,984 is a considerable performance.

Nor have the equity shareholders been forgotten, for the ordinary dividend has been raised from 20 per cent to 25 per cent, a rate which is comfortably covered more than twice by earnings. The chairman justifies the increase—if any justification is needed—by comparing the voluntary limitation of dividends with the rise in wages, which are now approximately one hundred per cent above prewar rates. The problem of replacement, which is now a commonplace of industrial policy, has been tackled by the provision of £269,560, against £250,000, to

	Years ended	Aug. 26, 1949	Aug. 26, 1950
Consolidated earnings:—			
Total profit	£	1,472,764	1,681,984
Taxation	£	625,819	764,041

Ordinary capital	£	1,250,000	1,250,000
£1 ordinary stock at 80s. 3d. yields 15s. 8d. per cent.			

a special reserve to meet additional replacement costs; this reserve now totals £953,792. Stockholders may feel that there is good ground for expecting at least the maintenance of the increased ordinary dividend in the coming year. But the chairman emphasises that rising costs may force up prices and so "jeopardise the large and competitive export markets." Current orders on the books stand at a record figure, but it will only be possible to fill them if adequate supplies of raw materials are forthcoming. Subject to this necessary proviso, the chairman comments, the outlook for the next twelve months should be "bright indeed."

Steel Company of Wales.—Interest in the Steel Company of Wales report for the year to September 30, 1950, lies less in the profit and loss account and more in the balance sheet. But it is proper to record an increase in trading profit from £2,112,728 to £2,411,201, and of the latter amount only £50,000 arose from the appreciation of stock values compared with £250,000 in 1948-49. Thus the trading figures reflect a real achievement of increased output—concurrently with the major development projects now nearing completion—and of profitable export business. Net profits have suffered because interest on the Finance Corporation for Industry loan has required £504,678 compared with only £37,767 in the previous year. But it is satisfactory that this sum has been charged to revenue and still leaves, after other charges, a balance carried forward on profit and loss account of £1,451,512 against £994,055 a year earlier.

The report shows that expenditure sanctioned on the development schemes at

Margam and Trostre totalled £63 million last September, of which £41.4 million had been incurred. This is the first official intimation of what was to be expected—that the original estimate of £60 million has been exceeded; labour and materials have risen and certain changes in the original plan have also affected the outcome, and the total cost of the new developments will be "appreciably higher." The company itself had arrangements well in hand for raising the additional cash, but the formation of the Iron and Steel Corporation has ruled out any possibility of securing finance through normal channels. Provision of the balance of funds required now falls, presumably, to the Corporation; and a further substantial sum will also be needed for other developments.

Engineering progress continues to be satisfactory. Since September one of the new blast furnaces and the slabbing mill have been brought into production, and most of the remaining plant in the development scheme—including the wide strip mill—should start operating before September. But the success of the whole scheme will depend, as the chairman emphasises, on the solution of the urgent problem of raw material supplies, and in particular of coal.

Associated Commercial Vehicles.—Comparison of the trading results of A.C.V. in the past two financial years is difficult, since in the year ended September 30, 1949, profits of the Park Royal subsidiaries for approximately six months only were incorporated in the consolidated accounts. Group trading profits for the year ended September 30, 1950, are shown as £1,794,840, which compares

	Years ended	Sept. 30, 1949	Sept. 30, 1950
Consolidated earnings:—			
Total profit	£	2,000,976	1,794,840
Taxation	£	2,019,734	1,816,429
Depreciation	£	1,332,922	922,456
Group earnings for ord. stk.	£	394,140	1518,024
Paid	£	260,937	250,937
To group reserves and c/f	£	133,203	428,948
Cons. balance sheet analysis:—			
Fixed assets, less depreciation	£	1,811,774	1,755,928
Net current assets	£	6,440,433	7,317,250
"Quick" assets	£	926,187	2,529,293
Stocks	£	5,705,532	4,497,016
Reserves	£	4,314,841	5,177,501
Ordinary capital	£	2,087,500	2,087,500
£1 ordinary stock at 80s. 3d. yields 15s. 8d. per cent.			

with £2,000,976 in 1949. The market has accepted this result as evidence of a less satisfactory year's trading, and has marked down the £1 Ordinary Stock units.

In addition to this apparent fall in profits, there is a further difficulty in interpreting the movement of group earnings. The calculation is complicated by the inclusion in the accounts of £171,861 of exceptional income, while in 1949 there was an exceptional loss of £74,673; in the latest year, £273,534 is transferred to general reserves, whereas in the previous year £97,500 was appropriated to a future tax reserve on pre-acquisition profits. Views may differ on the treatment of these items, but one interpretation, as shown in the accompanying table, would be that earnings have risen from 19 per cent to 25 per cent, free of tax.

On this basis, the maintenance of the Ordinary dividend at 12½ per cent, tax free, a rate which has been paid since 1946, is covered nearly twice. The company calculates the provision for taxation as 49.71 per cent of "so-called profit" against 67.48 per cent in 1949; the tax position of the company is, of course, the more complicated because the important AEC subsidiary only started trading (for the purpose of present tax computations) in October, 1948. The balance sheet conveys an impression of strength that would certainly make a greater impact if it were not for a certain doubt about the trading prospects in the coming year.

Statistical Summary

EXCHEQUER RETURNS

For the week ended January 20, 1951, total ordinary revenue was £142,730,000, against ordinary expenditure of £66,639,000 and issues to sinking funds £120,000. Thus, including sinking fund allocations of £13,773,000 the surplus accrued since April 1st is £296,630,000 compared with £272,585,000 for the corresponding period a year ago.

MIDLAND BANK LIMITED

YEAR DOMINATED BY INTERNATIONAL AFFAIRS

MARKED PROGRESS TOWARDS EQUILIBRIUM

UNCERTAINTIES IN THE OUTLOOK

LORD LINLITHGOW ON GROWTH OF DEPOSITS

The one hundred and fifteenth annual general meeting of the Midland Bank Limited will be held at the head office, Poultry, London, E.C.2, on February 16th.

The following is the statement by the chairman, the Most Hon. the Marquess of Linlithgow, K.G., K.T., on the report of directors and balance-sheet for the year to December 31, 1950, which has been circulated to shareholders:—

During the year just ended attention has been concentrated very largely on international affairs. Developments on the political plane have, unhappily, commanded instant concern; but on the financial and economic level they have been scarcely less striking. Indeed, if one were to be satisfied with a superficial view, the change, in one vital respect at least, since the time of widespread currency devaluation could be taken as far more gratifying than anyone had a right to expect. Even with proper qualifications it may be recorded that marked progress has been made towards that international equilibrium for which Britain, in company with other countries damaged and impoverished by war, has been struggling through more than five strenuous, exacting years.

DOLLAR GAP CLOSED

The past twelve months or so have seen a rapid narrowing of the "dollar gap"; for the sterling area, indeed, the gap has actually been closed, and estimates indicate that even by the middle of 1950 a surplus of dollar earnings on current account had been achieved. More generally, the monetary reserves, in gold and dollars, of postwar "deficit countries," taken in the aggregate, have been growing faster than the most hopeful prophet could have foreseen 18 months ago, so that an appreciable part of the world's monetary gold stocks, unduly concentrated in the United States, has by now been redistributed to serve the purposes of properly dispersed resources.

The production of goods has been growing markedly with the progress of postwar reconstruction and technical improvement, and important steps have been taken along the road of liberalisation of trade and payments in Western Europe. Negotiations are proceeding, moreover, under the terms of the general agreement on tariffs and trade, for further lowering of the barriers to international commerce. All this adds up to a solid achievement, even when full allowance is made for the impetus given by the acceleration and enlargement of defence measures in response to increased political tension.

UNITED STATES' CONTRIBUTION TO RECOVERY

It would be an endless task, merely provoking unprofitable controversy, to try to allocate the credit for this achievement. One thing that can be said indisputably, however, is of high significance in any consideration of the prospects for consolidating and extending the gains already won. It is that the speed and extent of the progress recorded thus far must be ascribed very largely to the immense contribution made, directly or indirectly, by the United States of America.

It has indeed been a political miracle of modern times that the United States, re-

versing her long-standing policy, has accepted with astonishing promptitude, and expressed in munificent and decisive action, the responsibilities of leadership in world affairs. Let us look for a moment at the variety and scale of the material contribution made by the United States to economic recovery, particularly in the war-ravaged countries of Western Europe.

FAR-SIGHTED ENTERPRISE

In the line of succession from lease-lend, which came to an end immediately the fighting ceased, the United States Government was by far the largest contributor to postwar relief, especially through Unrra. Then, when something more than relief was seen to be necessary if any progress were to be made towards the re-establishment of a sound basis of economic life in Europe, the European Recovery Programme was conceived, and brought into operation towards the middle of 1948.

Under the guidance of Mr Paul Hoffman this far-reaching enterprise, it is safe to say, was carried through with a degree of vision, adaptability and wisely directed generosity which alone renders it unique, quite apart from the magnitudes involved. Altogether, outright grants under these two and other similar headings had amounted, by last September, to nearly \$18,000 million net in cash or in kind, all provided within the Budget of the United States Government and all therefore subject to the scrutiny and assent of Congress. Added to this vast sum must be the further provisions by way of loans or credits, including the 1946 loan to the United Kingdom Government and the operations of the Export-Import Bank, amounting to a net total of over \$9,000 million.

Then, again, the United States has contributed \$3,400 million to the resources of the International Bank and the International Monetary Fund. A complete enumeration of all such allocations, including, for example, the expenditure authorised by Congress for "Point Four" technical assistance for underdeveloped areas, makes an astonishingly varied and imposing list. It is important, moreover, not to forget the secondary results of provision on this scale. Our friends in Canada, for example, who themselves have played a notable part in measures of postwar recovery, would be the first to recognise the substantial support given to the economy of the Dominion by the "off-shore" purchases arranged under the European Recovery Programme, which went far to fortify Canada's resources of United States dollars.

DEVELOPING EUROPEAN TRADE

I have mentioned the far-sighted vision with which the programme was carried into action, and one of the ways in which this quality has been expressed is in the action taken to quicken the reviving powers of self-support among European countries on the basis of adequate dollar-earning exports. The substantial reduction already achieved, even before the war, in the scale of United States import duties has been carried still further—though one must add with regret that measures to remove administrative obstacles to the entry of foreign goods still lag woefully behind the good intentions of enlightened Americans from the President downward.

It has indeed been a political miracle of modern times that

developed territories may grow in magnitude; the plans embodied in the Gray report on post-Marshall measures may perhaps extend the period of American-supported recovery and provide the momentum for sustained expansion without resort to further "emergency" arrangements; and American investment abroad, through Governmental agencies or under private auspices, may grow in volume if confidence gathers strength on both the political and economic planes.

STAGE OF SELF-SUPPORT

While, therefore, direct assistance from the United States may be foreseen as continuing in one way or another for some time ahead, it seems that the world—given peace—is coming within sight of the day when sustained economic welfare can and should be achieved on the basis of self-support within a freely moving system of international trade and finance. Even so, and beyond the stage of "emergency" aid, the international economy will continue to be powerfully influenced by conditions within the United States. We had a short and happily mild demonstration of this dependence in the secondary consequences of the American business recession early in 1949.

It may thus become a question of cardinal importance to the rest of the world whether business activity in the United States is likely to be steadier than in times past, or whether it will prove to be still subject to violent fluctuations, the effects of which will be speedily and disturbingly transmitted to other countries. No one expects stability—in free-enterprise America, I believe, the objective of economic policy has been described as progress through "high-frequency oscillation"—but equally everyone recognises the catastrophic reactions throughout the world of such upheavals as occurred within the economy of the United States in prewar times.

INHERENT U.S. STEADINESS

For myself, I do not think we need nurture anxiety on this account, for, despite some evidence of continued surface effervescence, there is good ground for believing that the economy of the United States has greater inherent steadiness than in times past. One has to reckon, for example, with what are sometimes called "built-in supports" for consumers' buying power in the form of pensions and similar social security arrangements as well as measures of unemployment insurance and relief which come into operation automatically in a period of lagging demand for the products of industry; and further with a system of support of prices of farm products which again, with all its faults, does tend to maintain the demand for industrial goods.

On another aspect of the matter, the financial system has been strengthened by a variety of measures, including powers of control over some forms of bank lending and business in stock exchange securities, having the effect of fortifying the structure and enlarging the possibility of restraining undesirable developments. Then, again, a marked contrast with conditions in the 'thirties is to be found in the smaller volume of outstanding mortgage and other debt in relation to the flow of incomes, and in the far larger liquid resources in the hands of agriculture, industry and trade.

BALANCE ON RIGHT SIDE

I do not pretend that this is a complete array of the factors to be considered in forming a judgment; nor am I blind to the weaknesses that have to be brought into the account, such as the heavy dependence of some industries on the maintenance of liberal facilities for consumer-credit. Yet I feel sure that the balance is on the right side, especially when we acknowledge the convincing signs of

a less volatile, better informed and more long-sighted attitude towards capital investment and business fluctuations among those responsible for the conduct of industry and trade.

If the psychological trend is indeed in this direction, then a powerful factor which formerly helped to exaggerate the upward and downward phases into extreme boom and depression will have been weakened, to the great advantage of the United States itself and of the entire world. For it requires little knowledge or intelligence to understand that, for as far ahead as can be foreseen, the maintenance of a high level of employment and a steady advance of prosperity within the United States must be a condition of continued progress towards economic recovery and expansion throughout the world.

EQUAL PARTNERSHIP

The disproportionate influence exercised by the United States on world affairs, in part by reason of the "natural" course of economic evolution and in part as a consequence of the damage and disruption wrought by war, is to some extent inevitable; but it is also excessive when judged by the long-term interest of the world as a whole. It can, I believe, be accepted as sound dogma that very heavy, concentrated dependence—whether direct, as in terms of imperialism, or indirect as in present circumstances—upon a single political and economic power is basically unhealthy, however strong and consistently far-sighted and benevolent that power may be.

It follows that insistent stress should be laid on that objective of mutually accepted policy which consists in a closer approach to equal partnership; and nowhere is such a movement more to be desired than in relations between the United States and the British Commonwealth. That this article of policy is generally approved is one of the hopeful signs in international affairs, and I am sure everyone will have noted with gratification the words used by Mr Douglas in his letter of resignation from the office of Ambassador of the United States, which he had occupied with unusual distinction: "A continuing close relationship between our own country and the people of the British Isles and of the British Commonwealth of Nations, even though that relationship has now become somewhat merged with international organisations in which we all play a part and which we all support, is one of the solid corner stones of the civilised world."

IMPLICATIONS FOR BRITISH POLICY

For reasons of both short- and long-term relevance, therefore, and in the widest of world interests, our own policy should be framed with a view to constantly strengthening the economic foundations of the British Commonwealth. And this purpose should continue to rank high notwithstanding urgent preoccupations, as with matters of social policy or national security—indeed, it must always be an essential element in such preoccupations, since economic staying-power and capacity for expansion may well be the first requirement of success in dealing with what seem to be the most pressing problems, whether domestic or in external relations. I therefore ask myself, looking at the situation as a banker, what should be the guiding lines, in the years immediately ahead, of action in the economic and financial sphere, and there are three matters on which it seems to me timely to make some comment.

My first point arises from the necessity, everywhere deplored but recognised as inescapable, of diverting to concerted defence measures some of the economic resources actually or potentially at our command. In this matter we should resist any temptation to lean too heavily on the United States, for there are limits to the resources, in manpower and materials, even of that great

nation; yet help may be made available therefrom in support of the common effort. Then again, notwithstanding supply difficulties and the demands of the Forces for manpower, some reliance may be placed on the growing productivity of British industry, which gives cause for congratulation to all who have contributed to it in any one of a number of ways.

For the rest—and the rest need not turn out to be so onerous as to give rise to serious hardship—it is essential that the diversion of resources should be at the expense of current consumption. It would be a culpable example of short-sighted expediency to divert resources from the improvement of economic capital at home or the development of productive capacity in overseas parts of the Commonwealth, more particularly in Africa and south and south-east Asia. I repeat that the quality we need, above most things, in the present state of the world is staying power.

HIGH DOLLAR EARNINGS ESSENTIAL

Secondly, no effort should be abated in maintaining at the highest attainable level the dollar earnings of the sterling area, and of Britain in particular as the central unit of that association. The defence programme may require larger imports of raw materials and may impair export capacity in some branches of industry. The fact that the balance of current payments of the United Kingdom showed a substantial surplus last year, and the further, more directly relevant, fact that the sterling area as a whole has been earning a dollar surplus, give no ground whatsoever for any slackening of endeavour. The suspension of Marshall aid must in itself tend to slow down the growth of gold and dollar reserves; yet only by the maintenance of that growth can the pound sterling reach a position in which steps can be taken towards wider convertibility.

Then again, we in Great Britain must prepare ourselves for meeting the interest and sinking fund on the American and Canadian Government loans, the service of which is due to begin at the end of this year. The first annual payments will entail drawing on our gold and dollar resources to the extent of well over \$150 million. It is true that the "escape clause" in the loan agreements might perhaps be invoked; but there is everything to be said for avoiding recourse to that expedient and for according the highest priority to payments falling due under the debt contracts.

SUSTAINED EXPORT EFFORT

To fulfil these liabilities, while at the same time adding to monetary reserves, meeting more of the import requirements of partners in the sterling area and supplying capital for development of resources overseas, will call for the greatest and most sustained export effort that can be put forth. The work of the Dollar Exports Board and of the Anglo-American Council on Productivity has yielded gratifying results, which will need to be applied and multiplied in the period immediately ahead.

Assuming continued success along these lines, so that equilibrium on the balance of payments is firmly established and the monetary reserves of the sterling area are powerfully reinforced, the question will arise whether the time has not come for moving gradually towards fuller convertibility and freer use of the pound sterling. Britain's participation in the European Payments Union, on terms which provided a link between members of the Union and of the sterling area, was an important step in this direction; so also were the offer of transferable account facilities to O.E.E.C. countries not previously enjoying them and the institution of more liberal exchange control arrangements with Scandinavian countries.

It may be worth considering whether further progress could be made by offering inducements, with suitable safeguards, to wider membership of the sterling area. We can perhaps usefully remind ourselves and our friends abroad that the sterling area, which historically was a natural growth arising from complementary trading and financial relations, has a much firmer economic foundation than has a deliberately devised association like the E.P.U., comprising a group of countries that have little in the way of economic solidarity beyond that which is provided by geographical proximity and common devastation by war. A number of countries which formerly were "natural" members of the sterling bloc, by reason of long-standing trade and financial connections, are not now members of the sterling area, and it seems not unduly visionary to hope that arrangements might be concerted under which they might see fit to bring themselves once again into this firmly grounded monetary association.

Whatever the particular methods, however, by which the pound sterling might be brought nearer to its old position of ready availability for all trading purposes, there can be no doubt that progress along this line would constitute a far more desirable application of regained strength than a deliberate revaluation of the pound in terms of the dollar, which might easily have the result of dissipating some of the gains already achieved.

WEAKNESS IN THE DOMESTIC SITUATION

Turning, very briefly, to the domestic scene, we find here, too, as on the external side of affairs, a record of substantial if qualified achievement. The notable increase in the volume of industrial output, apparent a year ago, has continued, thanks largely to the extensive improvement of capital equipment; and there is evidence that the opportunity presented by devaluation of the pound to expand export trade, often in spite of the attractions of the home market, has been vigorously seized. All this, and more, is remarkable in face of the inescapable difficulties of the postwar period, to which have been added the distractions resulting from political divisions and the needless diversion of effort caused by such projects as the nationalisation of the steel industry. If, moreover, any complacency should be felt on the basis of past, very solid, accomplishment, it can be speedily dispelled by reflecting upon the fuel shortage and the all-too-frequent power cuts which disturb the smooth running of industry and cause endless inconvenience. It is further to be regretted that defence measures would seem to have entailed arresting, and perhaps even reversing, the trend of decontrol which had made substantial advances in the past two years or so.

In considering the prospects for continuance of the rising trend of productivity—upon which so much depends in terms of both national security and individual welfare—one cannot ignore the accumulating evidence of stringency or lack of balance in the financing of industry, associated with the progressive shortage of equity capital. The Governor of the Bank of England called attention to this problem some months ago, and as time passes its urgency becomes more evident. It is to be hoped that the expert inquiries instituted by the Government into the effects of the present system of taxation of incomes and profits will be pressed forward rapidly, and the resultant recommendations treated as questions for prompt decision.

INFLATIONARY PRESSURE

The complex problem of industrial financing, however, is but one manifestation of a single cardinal factor in the economic situation, namely the continuance, and perhaps intensification, of inflationary pressure. Herein lies the prime cause of anxiety in any view of the immediate future. It seems to

be officially recognised that the pressure may be increased by the needs of rearmament, not only in this country but throughout the world; what seems to be less readily admitted is that even before the new defence programmes were drawn up the forces of inflation had not been decisively arrested, despite the unprecedented calls made upon the taxable capacity of the country.

On this matter one's judgment is to some extent dependent on personal definitions, particularly of the term "full employment"; but if one accepts as the objective the absence of prolonged and enforced idleness among competent and willing workers, then it can be argued that the maintenance of a "high and stable level of employment" is practicable without prejudice to the preser-

defence charges on the national revenue, which may make more difficult the further pursuit of such a policy, that the reasons for the growth of bank deposits should be brought to light. The November issue of the Midland Bank Review contained an article which was designed to explain the working out of various factors governing the rise or fall in bank deposits, and I propose to follow the pattern of that article in attempting to interpret the movements of the past year. For this purpose the latest figures I can use are drawn from the November returns of the London clearing banks, but there is no reason to suppose that the substitution of December figures will seriously modify the conclusions reached. The essential data may, then, be set out as follows:—

	FLUCTUATIONS IN BANK LIABILITIES AND ASSETS (£ Million: Approximately at Mid-Month)				
	Net Deposits	Investments	Other	Total	Advances
Nov., 1948, to Aug., 1949	-117	+ 31	-227	-196	+ 86
Nov., 1949, to Aug., 1950	- 86	- 18	-203	-221	+125
Aug. to Nov., 1949.....	+126	+ 6	+ 69	+ 75	+ 46
Aug. to Nov., 1950.....	+252	+ 15	+224	+239	+ 15
Year to Nov., 1949.....	+ 9	+ 37	-158	-121	+132
Year to Nov., 1950.....	+166	- 3	+ 21	+ 18	+140

CLEARING BANKS' DEPOSITS

valuation of sound monetary conditions. As events have turned out the pound, considered in its domestic setting, has depreciated continuously in postwar years; measured in perhaps the most realistic and comprehensive way, on the basis of actual consumers' expenditure, it lost about one-fifth of its purchasing power in the home market in the five years to October, 1950.

FULL EMPLOYMENT

This being so, one is forced to ask whether the objective of full employment has been correctly interpreted in terms of policy—whether, that is to say, we have in fact had too strong a demand for labour, at the cost of inflation and of that quality of mobility which was laid down as necessary in the famous White Paper on Employment Policy, and whether policy in associated directions, as in the expansion of desirable social services, has been carried forward so rapidly as to put an excessive strain on the country's command over goods and services.

Whatever be the final answer to these questions, it is certain that, so long as monetary or other factors operate to impede the maximum exploitation of our productive capabilities, both human and material, progress along the lines, already indicated, of full and fruitful international collaboration is bound to be held back. In such circumstances Britain—which can mean nothing other than the people of this country acting both individually and collectively—would scarcely be able to avoid the verdict of having acted as a brake on the wheels of internationally concerted measures of political security and economic expansion. To remove all ground for such a verdict must be the task to which our country is committed for the years immediately ahead.

MONETARY CONDITIONS

Arising out of my remarks on inflationary pressure, it will not have escaped notice that the latter part of the past year has seen a marked expansion of liquid money in the form of bank deposits—a movement which is reflected in our own balance-sheet, where deposits are shown to be £40 million, or 3 per cent. higher than at the end of 1949. The expansion is the more noteworthy since it follows a period of more than two years over which the trend was almost level, thus according with the official policy of stabilisation through budgetary disinflation. Are we to infer, then, notwithstanding statements in the Budget speech last April, that that policy has failed or been abandoned? It is obviously important, especially in view of heavier

It will be seen that over the year to November, 1949, the net deposits (that is, deposits as recorded less cheques on and balances with other banks) of the clearing banks were practically unchanged in amount, whereas over the year to November, 1950, they increased by roughly £170 million, or nearly 3 per cent. The disparity, however, was concentrated in the last quarter of the year. It is clear from the table that, largely under the impact of seasonal movements, there was a shrinkage in the first nine months of each year. In both periods an increase in non-Governmental borrowings from the banks was far more than offset by a reduction in the requirements of public authorities including the Government itself; but in the later period the net contraction was less pronounced.

For the concluding three months, however, a marked divergence is to be noted, the expansion of deposits being twice as large in 1950 as a year earlier. Inspection of month-by-month figures for 1950 shows that the expansive movement was at its full strength in the period mid-August to mid-October. The divergence is not to be traced to the borrowing demands of the "private sector" of the national economy, for the increase in advances was smaller than a year before. The responsible factor is to be found in the banks' holdings of "public sector" assets, in particular Treasury bills and Treasury deposit receipts; taken together, the "public sector" assets expanded more than three times as much in the quarter to November, 1950, as in the corresponding period of 1949.

REASONS FOR EXPANSION

The clue to the source of the expansion has now to be followed into the Exchequer returns, and at the first stage the evidence conflicts with the results; for on the basis of revenue and outgoings the past year's record is slightly more disinflationary than that of 1948-49, while the same comparison is true of the concluding three months of the year. To reach any accurate interpretation of the figures, knowledge would be required of the magnitude of the decline which it is thought may have taken place in Government-financed stocks of primary commodities; but at least one may conclude that it is not in any rapidly mounting scale of current Government expenditure, or in any shortfall of revenue, that the origin of the expansion in bank deposits is to be found—the pressure of rearmament outlay, it appears, has yet to be felt.

We are driven, then, to search for other possible causes of the addition to the amount of bank finance provided for Government needs. Looking first at domestic conditions, it is possible—though the facts are by no means clear—that some decline may have occurred in private, non-banking holdings of Government debt; but when allowance is made for other internal factors, such as the accumulating surplus on the national insurance funds, it would not be warrantable to find here the cause of expansion on such a scale as has been noted.

STERLING AREA'S BALANCE

It follows that the expansion must have been due overwhelmingly to the changed external position, including the establishment—for the time being at least—of a surplus on the sterling area's balance of payments with dollar countries and the tendency among foreign buyers to meet their foreseeable requirements of sterling by purchases in advance of actual need. Under the impact of these forces the Exchange Equalisation Account had to take into its possession large amounts of gold and dollars, and in paying for these it had to hand out equivalent quantities of sterling, a substantial part of which went on to deposit with the banks. The fact that it was found necessary, in July and again in October, to make large additions in sterling to the resources of the Exchange Account indicates the pressure of the requirements thus arising.

As the outcome of the whole process, bank liabilities and assets were both enlarged as opposite facets of the same movement: on the one side deposits grew, and on the other the banks came to hold, or finance the holding of, additional Treasury bills put out by the Exchange Account to pay for the gold and dollars it was acquiring. Against the expanded volume of deposits the banks had to hold a larger quantity of cash, in order to maintain the regular ratio of 8 per cent. and, in accordance with the now well-established system, the authorities accepted the responsibility of providing the additional cash in the form of bankers' balances with the Bank of England.

IMPACT OF TAXATION

Thus analysed, the growth of bank deposits gives far less cause for anxiety than if it had been traceable simply to deficit financing through a sharply unbalanced Budget. Indeed, it would be possible to argue that some part of the momentum towards expansion will work itself into reverse as sterling bought in anticipation of needs is used to pay trade debts as they fall due. Nevertheless, it would be wrong to regard the increase with complete equanimity, particularly in the light of foreseeable factors making in themselves for further expansion. One of these is the prospective rise in Government expenditure, particularly on account of defence, which, having regard to the existing level of taxation, will not be easy to provide for out of revenue while leaving still a substantial Budget surplus to cover "below-the-line" outlays.

It is relevant here to remark that, in order to exert full disinflationary effects, taxation needs to have its impact on incomes and private spending; taxes which have the result merely of transferring capital are largely ineffective for this purpose. The relation between revenue and outgoings, it is true, is only one of the major factors governing the total Governmental requirements of bank finance, and no one can judge at all confidently the weight to be exerted by other factors, particularly the course of the external balance of payments.

INDICATIONS OF FURTHER PRESSURE

In the non-Governmental field, however, there seem to be indications of continued expansive pressure through the upward trend

in bank advances, which lifted our own balance-sheet item by £13 million to £344 million in the course of 1950. The rise in the level of prices, possible further increases in production in some industries, the return of important parts of the trade in primary commodities into private hands and the widespread financial stringency in business all point in this direction. On the other hand, many undertakings are finding it impracticable to maintain their required stocks of materials and may have to operate on a lower level of activity, while some have already taken the view that their turnovers must be restricted, even at the cost of a reduction of output, to accord with the capital resources at their disposal. It can be taken for granted, moreover, that the banks will continue to scrutinise applications for credit with full regard for the national interests as expressed in the terms of official communications of Government policy.

Taking all things in view, as far as the prospects can be judged, it would not be surprising if a trend towards monetary expansion were to continue, unless measures to combat inflationary pressure are adopted which go nearer to the source of the trouble than those so far employed—unless, in particular, the heavier rearmament outlay can be brought within the compass of the present volume of Government spending.

AFFAIRS OF THE BANK

In accordance with monetary developments just mentioned, and with the upward trend of business activity, our gross earnings for 1950 were higher than for the preceding year. This increase, however, was more than offset by the continued growth of salaries and wages, pension provisions and other staff costs, as well as other running charges and the higher load of profits tax, so that the net profit, as already announced, was again slightly lower on the year.

Out of the net profit we have allocated a larger amount than a year ago to the general reserve for future contingencies, believing that the many uncertainties clouding the future impose upon us the necessity of strengthening to the fullest possible extent—in the interests of depositors, shareholders and staff alike—the inner reserves of the bank. If the directors' recommendation for a final dividend is approved, the balance to be carried forward into the next year's account will be a trifle larger than that brought in. As evidence of healthy growth in the volume of our business I would refer you to the diagrams printed at the end of the annual report. The experiment begun a year ago along these lines was so cordially welcomed that I feel sure the present expanded and improved series will be of wide interest.

OVERSEAS BUSINESS

On the overseas side of the business, perhaps the major part of the postwar re-expansion arises from the still growing use of documentary credits, covering British imports and exports and trade between countries other than the United Kingdom. The volume and diversity of transactions under the last heading are a tribute both to the strengthening of the position of London as the pre-eminent financial centre of the world and to the leading part played in it by our own overseas branch. Associated with, and in addition to, this essential service to international trade is the work involved in the task, imposed by national necessity, of operating the elaborate system of exchange control, under which we have to apply a never-ending stream of new or revised regulations and instructions. We estimate that the equivalent of the full time of several hundreds of our staff, whether at the overseas branch and the four special foreign branches of the bank, is occupied in this work; quite apart from the skilled labour of

dealing with exchange control forms, for trade, travel and other purposes, at a rate approaching a million a year, much time of highly trained and specially equipped officials is taken up in interpreting the regulations to customers and helping them to frame their applications to the authorities.

DEALINGS IN CANADIAN DOLLARS

A warm welcome was given to the limited facilities accorded some months ago for dealing in Canadian dollars, for which we were particularly well prepared by the installation of new equipment following destruction by enemy action; and it is hoped that, in the light of experience now being gained, some further steps in the direction of larger freedom for approved business may be found possible as time goes on. In common with other banks, we experienced in the later summer months an accumulation in our hands of foreign-owned balances as a result of rumours, usually having their source outside this country, of pending revaluation of the pound, which led traders abroad to anticipate their sterling requirements; a large part of these balances has now been worked off in course of trade, but the residue is indicative, along with other signs, of the higher esteem in which sterling is now held throughout the world.

This sustained growth of our overseas business, however, is by no means wholly due to circumstantial factors; it could not have been secured without a high standard of service and the maintenance of a lively attention to the infinitely varied needs of customers at home and of banking and other clients abroad. For both purposes constant contact has to be maintained on a personal level, and we believe it to be in the interests of the trade of this country and its earnings on "invisible" account that these intimate relations should be cultivated and periodically refreshed. During the past year representatives of this bank have visited the United States and Canada, the Scandinavian countries and Finland, the Netherlands, Belgium, France, Spain, Italy, Switzerland, Germany, Yugoslavia, Greece and a number of Middle East countries; and visits are about to be made to various parts of South America.

"SELF-BALANCING" ITEMS

Attention has already been directed to the rise, over the past year, in the bank's deposits and advances, and one or two other items of the balance-sheet call for mention. A striking increase has occurred in the "self-balancing" items relating to acceptances and confirmed credits, and this, together with the enlargement of forward exchange contracts, has to be attributed mainly to the expanding volume of international trade, at rapidly rising prices, financed through these particular facilities available in the London market.

With regard to the assets held against deposits, the switching over of official requirements, noted a year ago, from Treasury deposit receipts to Treasury bills was carried further, though there have been signs latterly that the movement may have come to an end. In recent months we have added to our holding of investments by purchases of short-dated Government securities, thus keeping the ratio of investments to deposits at about the same figure as a year or two years ago. Investments and advances together still cover less than one-half of our deposits, as against the conventional two-thirds before the war, so that a very high standard of liquidity is maintained.

PROGRESS OF AFFILIATED COMPANIES

Personal observation, as well as accounting and other records, enable me to report favour-

ably on the progress of our affiliated companies. Our oldest affiliation is with the Belfast Banking Company, which, under the chairmanship of Lord Alanbrooke, amply maintains its record of trusted service in the financial affairs of public authorities, business undertakings and private citizens in Northern Ireland. Thanks very largely to the guiding wisdom of Sir Harold Yarrow, the combined Clydesdale and North of Scotland Bank has begun the writing of a new chapter in the long and honourable history of the two separate institutions—a chapter marked by the issuing of a new note, the design of which happily embodies the elements of this historic union. The arrangements for fusion of the two businesses have gone forward smoothly and, I am confident, to the advantage of all concerned, particularly customers of the two amalgamating banks.

The business of the Executor and Trustee Company is still growing, and during the past year two more branches have been opened. In our own bank, new offices have been established in various places where public need holds out the prospect of remunerative service, and the total of branches and sub-branches, at 2,118, is now very close to that

recorded just before the outbreak of war, which enforced a large number of closures.

STAFF PENSIONS

During the past year two important steps have been taken, with the approval of the Board, in the interests of the staff and the bank. First, in the light of an actuarial inquiry, the bank's contribution to the Mutual Provident and Widows Fund has been heavily increased in order to enable present benefits to widows and orphans to be maintained without raising the rate of contribution from members of the staff.

Secondly, a Pension Trust Fund has been established, requiring very large appropriations out of the current earnings of the bank to provide for the great expansion of pension liabilities which results from unevenness in recruitment caused by two world wars. The new scheme, like that in force hitherto, involves no contribution from existing members of the permanent staff. In conclusion, I am glad to pay tribute once again to the high standards of efficient service steadily maintained by our staff in every department of the bank's work.

LLOYDS BANK LIMITED

SPECTACULAR IMPROVEMENT IN STERLING POSITION

DOLLAR EXPORT EARNINGS RISE TO NEW RECORD LEVELS

NATION ALREADY OVERTAXED

LORD BALFOUR OF BURLEIGH ON NEED FOR DRASTIC PUBLIC ECONOMY

The annual meeting of Lloyds Bank Limited will be held on February 16th at the head office of the bank, 71, Lombard Street, London, E.C.3.

The following is the statement by the chairman, The Rt. Hon. Lord Balfour of Burleigh, D.C.L., D.L., which has been circulated with the report and accounts for the year to December 30, 1950:—

My Lords, ladies and gentlemen,

During the past year we have suffered the loss by death of Lord Wardington, and I must begin my annual statement to shareholders by placing on record our deep sense of the value of the services rendered by him for forty-seven years to Lloyds Bank. Lord Wardington, affectionately known to his friends for most of his life as Montie Pease, joined the board as a partner in Hodgkin, Barnett, Pease, Spence and Company, on the amalgamation with the bank of the business of that firm in 1903. He was chairman of the bank from 1922 to 1945, and during that period served no less than four separate terms of office as chairman of the Committee of London Clearing Bankers and president of the British Bankers Association.

Lord Wardington left behind him a great record in the fields both of banking and of sport. Special tribute to his memory was paid on his passing both by his colleagues on the board and by the staff of the bank.

I must also refer with deep regret to the death of Mr L. D. Williams, which occurred on February 4, 1950, after my last year's annual statement had been issued to shareholders. Mr Williams was a member of our South Wales Committee. His untimely death deprived the bank of a most valuable director.

RETIREMENT OF DIRECTORS

Shareholders will recollect in the report of the directors for the year 1948 a phrase to the effect that their directors had accepted the general principles of the new Companies

Act as to retirement. It had become evident to your board that there was a danger that with the passing of the years the average age of the board might become too high. In October, 1947 (the new statutory provision as to directors' retirement did not come into force until June 30, 1948), your directors resolved that the retiring age for directors should be considered to be seventy, and that re-election after that age should be exceptional rather than usual. Many men of over seventy retain such mental and physical powers as to enable them, with their accumulated wisdom and experience, most admirably to fulfil their full duty as directors. Examples are numerous among those of our former colleagues who have retired during the last few years, both before and since the coming into force of the new Act. Shareholders will, I know, wish me to record their appreciation of the public spirit of men who voluntarily refrain from offering themselves for re-election in such circumstances. While in the short run we lose the benefit of their wisdom and experience, we all recognise the importance of securing a regular accession of younger men to the board, and we believe that this policy will in the long run prove to be in the best interests of the bank.

On this occasion seven directors who have attained the age of seventy or over retire in accordance with our agreed policy and do not offer themselves for re-election. They are Sir Peter Bennett, Kt., O.B.E., M.P., Sir Harold Bowden, Bt., G.B.E., Lieut.-Colonel R. K. Morcom, C.B.E., Sir William Verdon Smith, Kt., C.B.E., The Rt. Hon. Lord Teviot, D.S.O., M.C., Sir Henry E. S. Upcher, Kt., and Sir Evan Williams, Bt., LL.D., D.L. The bank is indeed fortunate to have the benefit of counsel of so eminent a group of men, every single one of whom has been honoured by the King in recognition of services rendered in many spheres of public life, more particularly in industry, in

agriculture and in public administration. Special reference must be made to Colonel Morcom, who completed forty years' service on the board in 1950 and since the death of Lord Wardington has been our senior director. The sincere regret we feel at our friends' relinquishment of office as directors is mitigated only by our conviction of the soundness of the policy which dictates it, and by the fact that in almost every case geographical circumstances most fortunately permit us still to benefit by their collaboration. Sir Peter Bennett and Colonel Morcom will continue to serve on our Birmingham committee, Lord Teviot on our Salisbury committee and Sir Evan Williams on our South Wales committee and Sir William Verdon Smith will continue to give us the benefit of his advice in Bristol.

The re-election is proposed of Lord Brand, Mr W. H. Fraser, Mr C. E. Lloyd, Sir Sydney Parkes and Mr R. A. Wilson, who have attained the age of seventy years, and special resolutions will be moved to this effect.

NEW APPOINTMENTS TO THE BOARD

Of the five new directors appointed to the board whose re-election the shareholders will be asked to confirm, Sir Edmund Bacon is Lord Lieutenant of Norfolk and a prominent agriculturalist. Sir Frederick Burrows, after being president of the National Union of Railwaymen, served with distinction as Governor of Bengal at a critical period, and is chairman of the Agricultural Land Commission; I would direct the special attention of the shareholders to this appointment, for Sir Frederick Burrows brings to our counsels a wealth of experience of a kind not previously available to us. Lord De L'Isle and Dudley comes to us with an exceptionally fine record of war service; Sir George Nelson is head of a great industrial enterprise; Mr E. Whitley-Jones, after a lifetime of service in banking, has been joint chief general manager since 1946. I am confident that these appointments will give as great a measure of satisfaction to shareholders as they will prove themselves to be of advantage to the board.

I record with pleasure the conferment of a knighthood on Sir George Leigh-Jones.

Mr J. C. Taylor has been appointed a member of the Liverpool Committee and Mr H. B. Robin Rowell, C.B.E., A.F.C., D.L., a member of the Newcastle-upon-Tyne Committee.

In consequence of Mr Whitley-Jones's election to the Board Mr A. H. Ensor becomes sole chief general manager. Mr R. G. Smerdon, M.C., and Mr E. J. Hill have been appointed deputy chief general managers and Mr A. J. Faux and Mr G. Y. Hinwood have succeeded them as joint general managers.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

I will refer now to our profit and loss account and the balance sheet.

Our profit at £1,761,603 is £52,327 higher than last year.

It might have been anticipated that, with the large increase experienced towards the end of 1949 and during the current year in our loans and advances, there would have been a substantial increase in our profit. It has been necessary, however, to give all the assistance possible to our staff to meet the increased cost of living with which they have been faced, and other running expenses continue to mount, with the result that additional earnings have been largely absorbed.

Referring to the balance sheet, although our current, deposit and other accounts at £1,149 million show an increase of £17 million over those at the end of 1949, the increase was experienced in the closing months of the year—following the pattern of several preceding years.

On the assets side of our balance sheet, British Government Treasury Bills at £219 million show an increase of £32 million, which is largely attributable to the fall of £56 million in our holding of Treasury deposit receipts.

The other item upon which comment is necessary is loans and advances at £289 million; showing an increase of £18 million; even so our lending is still only 25 per cent. of our deposits.

I indicated last year that, in view of the large increase in the price of raw materials, the heavy incidence of taxation and the rise generally in the cost of overheads, it would be inevitable that a further expansion in bank advances would occur. It is impossible in such circumstances for the commerce and industry of the country to be carried on with its prewar working capital; and we cannot refuse support for legitimate trading requirements where they do not conflict with national policy.

EXECUTOR AND TRUSTEE DEPARTMENT

This section of our business continues to expand in a most satisfactory manner. Our policy of decentralisation has proved successful and we now have twenty-four branches open. Arrangements are in train to establish further branches.

INDIA, PAKISTAN AND BURMA

It is with pleasure that I again record further satisfactory progress of our business in India and Pakistan. During the year we opened a branch at Dacca in Eastern Pakistan and arrangements are well advanced to establish new branches in Karachi and Madras. I anticipate that these will be in operation during the course of the year.

The exchange difficulties still remain to restrict business between India and Pakistan. I sincerely hope that this problem will be resolved before long.

Owing to changed conditions which followed the events of 1947, we have closed our branch at Simla. Simla has now lost its importance as the summer seat of the central Government of India.

Conditions in Burma remain unsettled but we maintain our business in Rangoon.

A high standard has been maintained by the officials and staff of our Eastern branches, and I would like to offer them my warm thanks for all they have accomplished under very difficult conditions.

THE NEW TRAINING CENTRE

A further step in our staff training programme was taken during 1950 when on October 2nd the training centre at Hindhead was opened.

The training centre, which is entirely distinct from the staff college, is framed to deal with the preliminary training of new entrants, both young men and young women, in order that they may take their place in our branches and departments with some basic knowledge of the work required of them, and to foster in them a sense of loyalty to our bank and pride in its service.

The opening courses at the training centre have given most promising and encouraging results, and I feel certain that our training plans are being developed on sound lines and will prove most profitable from every point of view in the future.

OVERSEAS DEPARTMENT (FORMERLY COLONIAL AND FOREIGN DEPARTMENT)

During November the overseas business of the bank was transferred from 80, Gracechurch Street into new premises which we had acquired in Eastcheap. Owing to the rapid growth of that business our old offices were inadequate to accommodate the staff,

and working conditions became very trying; I am pleased that it has been possible to remedy that unsatisfactory position.

STAFF

Our thanks are due and should be recorded here to our staff for another year's excellent work. There is ample evidence of the lively spirit in which the daily tasks are carried out, and there is a keenness to be of service throughout our staff, non-clerical as well as clerical, which must conduce to the interests of the public and of our shareholders alike.

I feel sure the existence of our staff college and of our new training centre is valued by the staff, who know that there never has been a time when better or quicker opportunity was open to hard work and talent wherever they are to be found. The times we live in are difficult but the difficulties are being faced, I believe, with a determination and courage which deserve high praise.

THE BURDEN OF REARMAMENT

Since my last statement there has been a very serious worsening of the international situation. Twelve months ago we were still living in the uneasy peace generally called the Cold War. Today, British troops are fighting with other United Nations forces in Korea. At many other points, fresh disturbances may well flare up at any time. The peaceful nations of the world are forced to shoulder a vast additional burden of armaments if they are to become strong enough to keep the threat of war at bay.

This marked deterioration in the political scene did not, paradoxically, prevent a notable improvement in the world economic and financial picture. Obviously, that cannot last; world-wide rearmament cannot take place without throwing up many and serious economic problems. It represents at least a partial return to war economics, and the typical features of a war—or even a postwar—economy tend, as we all have cause to know only too well, to be inflation and regimentation. To some extent we have already had a foretaste of these problems. The prices of many important primary commodities have been bid up to fantastic levels in a world-wide scramble to build up strategic stocks. This process has sharply inflated the level of incomes in primary producing countries, such as Australia, and the level of costs in manufacturing countries, such as Britain. In the U.S.A. itself, President Truman's proclamation of a state of emergency may foreshadow the imposition of very far-reaching controls.

DOLLAR GAP CLOSED

For the most part, however, the problems of rearmament, both at home and in the world at large, still lie before us. In the meantime, Korea has accelerated a development which, if it had come about for any other reason, would have been a cause of great satisfaction. I refer, of course, to the alleviation of the world dollar shortage. Those who take a defeatist view of the possibilities of achieving dollar balance should note that the world dollar gap was shrinking very rapidly even before Korea. In the preceding nine months American exports continued to decline while American imports showed an appreciable expansion. This is, of course, the result that one would expect on general principles to follow the sharp appreciation of the U.S. dollar against most other leading currencies.

Admittedly, devaluation is not the whole story. It is fortunate that by September, 1949, American industry had completed the lightening of stocks responsible for the minor recession of the summer, and was ready to take the currency adjustments in its stride

and to forge ahead once again to unprecedented heights of prosperity, with industrial production well over twice the prewar level. Had American business confidence been in a less robust condition, the prospect of intensified competition in home and overseas markets from greatly cheapened sterling and other products might well have initiated a deflationary spiral of declining prices and activity, in which event the result of the devaluations would have been very different. Nevertheless, the subsequent course of trade lends strong support to the view that much of the previous lack of balance between the dollar area and the rest of the non-Russian world was attributable to the clearly excessive level of costs in Europe and elsewhere at the artificial exchange parities then prevailing.

In combination with a high level of internal activity in the United States, therefore, devaluation has proved an important corrective influence. We have actually seen the beginnings of a redistribution of world monetary reserves: since September, 1949, the United States has been losing gold to other countries, whose gold and dollar reserves, for this and other reasons, have risen by some \$4,000 million.

The improvement in the position of sterling has been most spectacular of all. Throughout 1950, indeed, the sterling area was able to earn a modest surplus in trade with the dollar area, the United Kingdom deficit having shrunk to a fraction of its former level and having been more than offset by the surplus achieved by other sterling countries. The most important single factor contributing to this result has been the sharp curtailment in purchases of dollar imports. But in addition our dollar export earnings rapidly recovered after September, 1949, and, notwithstanding the devaluation, have recently been reaching new records. Invisible earnings show even greater improvement, and the former drain of gold payments to non-dollar countries under bilateral agreements has been eliminated.

EUROPEAN PAYMENTS

Nor is that drain at all likely to recur, for a great step forward has been made with the formation of the European Payments Union, which includes the former European "hard currency" countries, Belgium and Switzerland. The Payments Union at last gets rid of the restrictive framework of bilateral agreements, provides for a generous exchange of mutual credits between the member countries and places settlements within Europe upon a fully multilateral footing. As was to be expected, the new organisation has had its teething troubles. Germany in particular virtually exhausted her quota within the first four months, and had to be provided with additional credit. The sterling area, by contrast, registered a surplus in European trade so huge as to raise the question whether we can afford to extend so much credit to this particular group of countries, having regard to our obligations to the rest of the world. The Colombo Plan, designed to promote the rapid development of South-east Asia—a very constructive undertaking—will in particular call for large amounts of sterling finance in the next few years. In judging the results of E.P.U., however, it must be remembered that part of our export surplus to Europe has earned conditional Marshall Aid, and that we are now receiving gold from E.P.U. in respect of half of any surplus. Moreover, our credit with E.P.U. can at any time be translated into imports if we care to purchase them.

The elimination of the sterling area's current dollar deficit meant that during 1950 we were able to place the whole of our Marshall Aid receipts to reserve. The recovery in the reserves gave rise in turn to rumours that the dollar-sterling exchange rate might be raised. Americans suddenly became

anxious to cover their sterling commitments for many months ahead, the forward quotation for sterling in New York rose for a time to a substantial premium and dollar funds flowed into the country on a large scale. After allowing for this movement, the sterling area's current dollar surplus for the past fifteen months was no more than \$774 million. On the other hand, our reserves more than doubled during this period, rising by as much as \$1,875 million to \$3,300 million, easily their highest postwar level.

MARSHALL AID SUSPENDED

The recovery in our reserves has had an important repercussion: it has led to the cessation of Marshall Aid to the United Kingdom much sooner than could have been anticipated even a short while before on either side of the Atlantic. With the disappearance of our deficit in current trade, a continuance of dollar aid in that particular form would, of course, have been completely inappropriate. Indeed, both parties will rejoice at this testimony to the success of the Marshall Plan, one of the most unanimous acts in history. Fortunately, American generosity is not exhausted. Marshall Aid itself is not terminated but only suspended, and meanwhile the North Atlantic Powers are working out an equitable means of sharing the common defence burden that will doubtless result in a flow of military aid by the United States to her European partners.

So much for the facts. What of their implications? From all that has been said, it is clear that there has been an immense improvement in the position of sterling in the world during the past year. Whether that improvement is sufficiently lasting and far-reaching to permit a fundamental change in the technical position of sterling, such as an upward move in the dollar-sterling rate or an early return to convertibility, is a question that has been exercising many minds. Whatever the merits of any technical arguments for an alteration in the dollar rate, it should be emphasised that what may seem convenient at any moment from the purely British point of view is in any case not conclusive. Like all the other signatories of the Bretton Woods Agreements, we are pledged to observe a certain code of conduct in our external monetary affairs, the object being to substitute a certain measure of international co-operation for the monetary anarchy which played such havoc with international trade before the war and was clearly detrimental to the basic interests of this country. If at times any such discipline may seem a little irksome, let us remember the disruptive effects of the competitive devaluation of the United States dollar in 1934 and be thankful that all the Bretton Woods signatories have renounced such expedients in future.

REVALUE THE POUND?

Our own Bretton Woods obligations seem to me one among other good reasons for rejecting the popular nostrum that we should "set the pound free," i.e., abandon any fixed parity and allow the day-to-day value of sterling to be decided by market forces. As anything more than a transitional stage towards a new parity, a return to the prewar regime of a "floating pound" would be contrary to the Bretton Woods Agreements and threaten to demolish the new system before this has had an opportunity to prove its worth. Before setting sterling adrift to weather the buffeting of supply and demand one would in any event have to be very sure that the underlying position was indeed strong and the reserves in hand sufficient to meet every contingency.

Any eventual upward change should thus be to a definite new parity, partially reversing

the devaluation of 1949. Suggestions have been put forward that such a move would already be expedient as a means of countering inflationary pressure. At first sight this argument seems plausible, but on closer investigation one doubts whether a moderate appreciation of the exchange rate would, in fact, produce any very significant results in this direction. Certainly, if the object is to combat inflation, one can think of many more effective ways of doing so.

It is interesting to speculate, moreover, on the case the British delegate to the I.M.F. would put forward for the proposed action. In 1949 it was easy to demonstrate that sterling was suffering from a "fundamental disequilibrium" at the prevailing exchange rate. It would be difficult indeed to show that the converse of this situation exists at the present time. Surely the obvious answer to any proposal to raise the dollar rate would be to point to the severe import restrictions that are still in force. We should be placed in the paradoxical situation of arguing at one and the same time that sterling is so strong that it should rise against the dollar but so weak that it needs to be defended by a formidable array of discriminatory import restrictions, quotas and exchange controls.

NEEDLESS RESTRICTIONS

The first reflection of any genuine improvement in the strength of the pound, in other words, should take the form of dismantling the special import restrictions which according to the generally accepted international code, only a country in balance of payments difficulties may legitimately employ. When sterling is self-supporting at \$2.80 without the aid of these special props it will be time enough to discuss an improvement in the rate. Those in this country and in North America who supported the case for devaluation in 1949 did so in the belief that it was above all the artificiality of exchange rates which had split the non-Russian world into two separate "hard" and "soft" currency trading areas. It was taken for granted that the adoption of more realistic parities, bringing the level of costs in those two areas much more into alignment, would make it possible once again for them to trade together without the necessity for discriminatory restrictions to keep that trade in approximate balance. Before the event, indeed, nobody supposed that sterling need fall as low as \$2.80 in order to restore equilibrium in our dollar accounts. To suggest that after the sterling price of dollar goods had been raised by 44 per cent. and the dollar cost of sterling goods reduced by 30 per cent. we should nevertheless still need the whole panoply of exchange restrictions to keep the situation under control would have seemed fantastic.

And indeed the absurdity of any such contention is surely demonstrated by what has in fact happened. In this country, as well as in the overseas sterling countries, purchases from the dollar area have declined by appreciably more than the "planned" 25 per cent. This clearly suggests that the steep rise in the sterling cost of dollar goods to importers has been as effective as the planned restrictions in bringing about the desired curtailment, and that we could have lifted many of the import embargoes without in fact releasing any flood of pent-up demand. Surely, too, that is the least we might have done as a gesture of good faith to our Canadian and American friends, an assurance that British policy in these matters really does aim, as our Government has so often affirmed, at a return to non-discriminatory trading just as soon as our circumstances permit.

The scope for actual increases in dollar expenditure, unfortunately, is still narrowly restricted by the exiguous level of our exchange reserves. Admittedly, these are now back to something like their prewar level,

but in the meantime rising prices have almost trebled the monetary value of world trade. There is, of course, no valid method of placing an actual figure on the minimum reserves which are needed, but in my view our present holdings should probably be at least doubled before there can be any thought of a return to full convertibility even in respect of current payments.

LONDON AS FINANCIAL CENTRE

Complete freedom of transfer for capital as well as current transactions frankly does not seem to me to be even in sight so long as we remain the most over-taxed country in the world. This I say with the greatest regret, for nobody could be more conscious that the position of Britain as a great trading nation, and of London as the financial capital of the world, must inevitably be lost unless sterling can in fact regain its prewar status as a strong and free currency. The value to our whole economy of the overseas income earned by the City of London through its banking, insurance and other financial services to the outside world (including in prewar days the earnings of flourishing commodity futures markets) is only too easily overlooked. It is a remarkable fact also that the income from our sadly depleted overseas investments is even now sufficient to pay for nearly one-fifth of our food or one-quarter of our raw materials. How dangerously easy it would be for London to slip behind as a financial centre is sharply brought home to us by the recent exodus of several important Rhodesian companies as the direct result of penal taxation—a most disturbing phenomenon.

CONVERTIBILITY PROSPECTS

Nobody will suppose, therefore, that I under-estimate the importance of an early return to full convertibility of sterling on current account or, in consequence, the importance of our acquiring sufficient gold reserves to make that possible. Whether the best way to acquire those reserves under present conditions is to build them up out of the proceeds of a current surplus in trade with the dollar area is an altogether different question. Basically, such a policy means exchanging goods for gold, a process that must aggravate the inflationary pressures which already threaten us. It would be ironical if we were to undermine the intrinsic worth of sterling by the very measures designed to buttress its position.

Nevertheless, the restoration of sterling convertibility remains a most desirable objective for the United States as well as for ourselves. And provided the dollar gap remains closed, with or without military aid, there is in principle always the possibility of achieving it by means of a currency stabilisation loan. When the Economic Recovery Act was introduced, President Truman explicitly stated that Marshall Aid was not intended to preclude such operations, for which the necessary legislation would be introduced at the proper time. It is satisfactory that Mr Gordon Gray, in his sympathetic and enlightened report to the President, has reopened this question. A stabilisation credit on a scale that would facilitate the restoration of sterling convertibility clearly merits the consideration of all concerned.

Unfortunately, the military situation may have rendered the whole subject of convertibility for the time being an academic one. In spite of the rise in primary commodity prices and the steady decline in U.S. exports, it would clearly be unwise to count on a continuance of the sterling area's surplus in current trade with the dollar area. Moreover, preoccupation with such matters as the convertibility of currencies and the safeguarding of exchange reserves belongs essentially to a

peacetime environment. If strategic considerations are to be paramount, then, as we learnt in 1940, one has to think in terms of a pooling of resources: it would be absurd, for example, for this country to devote its resources to the production of peacetime luxuries for shipment to North America simply in order to earn dollars.

EFFECTS OF DEVALUATION

The past year has seen a welcome liberalisation of our trade with Western Europe and some minor relaxations of the exchange control as affecting European countries. On the other hand, devaluation, as we have seen, has not brought that dismantling of import restrictions and exchange controls vis-à-vis the dollar area which it was hoped would result. It did, however, reverse the declining trend of our dollar export earnings and imparted fresh life to the export drive. Exports per working day in the second half of 1950 averaged more than 175 per cent. of the pre-war volume—a level that seemed an almost unattainable target a few years ago. The proportion of our exports going to North America has increased and, in spite of the cut in the exchange rate, our dollar export earnings have risen to new record levels.

Welcome as it is, this expansion in exports naturally imposes a severe burden on our economy. In our exchanges with the outside world, we are now receiving only the terms of trade to which the productivity of our labour and the level of our money costs of production entitle us. The need to give more of our exports to pay for a given volume of imports has absorbed a large share of the additional output resulting from the remarkable increase in productivity that has been in progress for the past eighteen months or so. And the Chancellor of the Exchequer has estimated that this adverse shift in the terms of trade would necessitate yet a further stepping up of exports by some £400 million this year to maintain our balance of payments position.

Internally, the effects of devaluation have as yet been less inflationary than was feared. The interim index of retail prices actually showed no rise on balance during the first eight months of 1950, though whether this tells anything like the full story is open to question. There can, in fact, be no doubt that the high and rising cost of living is causing severe hardship to many sections of our people and giving rise to considerable discontent.

Fortunately, the upward pressure on prices has not—thanks to the responsible attitude of trade union leaders and employers alike—provoked wage increases on the scale that might have been feared. I have indicated on previous occasions that the attempt to suppress inflation by “wage-freezing” policies, instead of combating the inflation at source by an effective disinflationary policy, inflicts grievous harm on our economy by destroying the mobility of labour and in many other ways. Nor can such policies ever hope to be completely successful, and this means that the decline in the purchasing power of money (and therefore in the value of savings), which has now been in progress without interruption for over eleven years, must be expected to continue until Government expenditure is curtailed and our finances generally put on a sound footing once more. Given the continued state of suppressed inflation, however, the wage front has held better than one dared to expect—welcome evidence of a growing sense of social responsibility all round.

REARMAMENT PROBLEMS

Can this restraint be maintained, or will the dams break under the impact of rearmament? This additional burden is one that our policies of the last five years have done little to fit us to bear, and that applies both

to the finding of the necessary resources of labour and materials and to the finding of the necessary money.

Any suggestion that the additional output needed for rearmament may come simply from a continued rise in productivity per head is highly optimistic. To a large extent the recent rise in productivity has reflected the elimination of bottlenecks and the smoother flow of production. It is therefore likely to be halted by the dislocation inseparable from a large-scale change-over to defence production. There is even some question whether we shall be able to keep our labour force fully employed in the face of incipient shortages, not only of imported materials, but of the one important raw material we should be able to produce at home, namely, coal. Even the supply of steel, in spite of the industry's wonderful production record, is once again a bottleneck.

On the other hand, it would be absurd to suggest that there is no slack in our economy. The fact that virtually every employable person is on somebody's payroll does not mean that production is running at the absolute maximum when most industries are working a five-day week. The labour force itself may be capable of expansion through the attraction of women back to the factories, distasteful though the social implications of that would be, or by the employment of redundant European workers. In such ways—but above all by an increase in individual effort, including if necessary the working of longer hours and multiple shifts—it is undoubtedly possible to expand production, given the necessary supplies of raw materials, fuel and power. It is another question whether such additional production can possibly be sufficient to take care of defence demands and so remove the need for drastic curtailment in other directions. It is even more doubtful how the extra output is to be secured in the industries where it is most needed.

LACK OF MOBILITY

Rearmament requires a major shift in the pattern of production within an economy which now lacks the flexibility needed for such adjustments. How are the defence industries, in the absence of an effective policy of disinflation, to secure the additional manpower they need? Direction of labour in peacetime would be, to say the least, an extremely serious step to take. To allow the defence industries to bid up wages in order to attract labour would aggravate the wages spiral. No doubt an attempt will be made to direct resources towards essential uses through the allocation of key raw materials and by reimposing a host of other controls; but the whole lesson of the past five years is that in a country not actually at war, and unless financial policy is pulling in the same direction, physical controls work very badly, if at all.

Adequate mobility of labour between industries can be restored only by reducing the over-all pressure of demand. Failing that, the rigidities of our present situation will make it very difficult to shift resources into the defence industries. It follows that to some extent at least production for defence will have to be at the expense of exports or capital formation: for the very industries most essential to rearmament are also highly important producers of exports and capital equipment.

CAPITAL PROGRAMME MUST BE CUT

This must be borne in mind in appraising the financial burdens in store for us, for it means that it is still impossible to assess with any precision what the financial implications of rearmament actually are. The Chancellor's “rash guess” that defence expenditure in the coming year might rise by £300 million has obviously been already overtaken by

events, but a round estimate of what the Treasury expects to spend does not in any case really indicate the actual financial problem which is involved. On the one hand, much preliminary work on defence may have to be financed by private industry. On the other hand, we do not know how far the necessary resources will be provided by increased production and how far by a mere diversion of output to armaments production from exports or capital investment.

The undesirable consequences of cutting down exports or investments have to be weighed against equally unpleasant alternatives. Exports to the dollar area should, no doubt, be maintained to the best of our ability. In recent months, however, we have been running a surplus of the order of £400 million per annum in our over-all balance of payments, and it is questionable whether overseas investment can or need be maintained at this rate. Again, little more than half of our total capital formation is devoted to the modernisation and equipment of productive industry. Some £500/£600 million of the remainder represents expenditure on “social capital”; and, desirable though these things are, some of that expenditure might be postponed without grievous hardship at the present time of national emergency. Certainly, such expenditure should be cut to the irreducible minimum before there should be any thought of raising taxation. It is to the capital programme that one would look for a large share of the economies by which rearmament ought primarily to be financed: the lavish standards which have grown up since the war over the whole field of public expenditure stand in striking contrast with the difficulties in making ends meet in their personal expenditure suffered by so many of the taxpayers who foot the bill.

RETRENCHMENT ESSENTIAL

Even before Korea, the case for reducing Government and other public expenditure to permit an alleviation of the tax burden was so overwhelming that it is appalling now to have to contemplate an actual increase in taxation. One cannot doubt that a real policy of retrenchment would yield very substantial economies, though one or two cherished idols would have to be shattered in the process. I have in mind such things as the notion that the majority of families derive any net benefit from the food subsidies, or that new houses must be occupied exclusively by tenants receiving enormous subsidies when many others, worse housed, would be only too happy to pay an economic rent for them. Unfortunately, there seems little hope that this radical overhaul of spending policies, designed to eliminate waste and to limit public subsidies to those really in need of such assistance, will be carried out even now. If not, we must prepare ourselves for yet a further addition to the crippling load of taxation which our people are carrying.

What is absolutely certain is that any additional fiscal burden will fall on a nation which is already grossly over-taxed. Still higher taxation will not only diminish still further the incentives to effort and initiative; it will have lost a great deal of its former effectiveness in curbing inflationary pressures. More taxation, especially more direct taxation, will mean less saving, while any increase in indirect taxation will raise prices and provoke demands for higher wages. In other words, any remaining margin of taxable capacity is terribly small. To finance defence we must look, in the main, not to increases in revenue, but to drastic reductions in other public expenditure.

To secure adequate resources for rearmament, to safeguard the purchasing power of our savings, and to restore to our internal economy that resilience which alone will permit the maintenance of our social services

unimpaired—these are the main objectives of a policy of vigorous retrenchment. Drastic economy is always difficult, disagreeable and unpopular, but to follow any other course now would be to sacrifice the substance for the shadow and to condemn our people to slow strangulation, social services and all.

UNION DISCOUNT COMPANY OF LONDON, LIMITED

RECORD FIGURES

LORD KENNET'S STATEMENT

The annual general meeting of The Union Discount Company of London, Limited, will be held on February 15th at the offices of the company, 39, Cornhill, London, E.C.

The following is the statement of the chairman, the Rt. Hon. Lord Kennet of the Dene, P.C., G.B.E., D.S.O., circulated with the report and accounts for the year to December 31, 1950:—

The past year, despite the varied political scene, has not been a particularly eventful one for the discount market. The movement from Treasury Deposit Receipts into Treasury Bills has continued and there has been an expansion in our commercial bill activity: this latter growth is largely due to the considerably higher prices of all commodities. Despite this increased demand for bill credits, the discount rate for bank and fine commercial paper has remained unchanged throughout the year.

During the year there have been no major movements in the discount market, but it has been an active year with our turnover in bills and bonds considerably increased.

The balance sheet total of £308,790,028 is a new high record, being £29,027,320 larger than the figure for 1949. The main item on the assets side of the balance sheet reflecting this increase is our holding of short-dated British Government and other securities, which is £87,235,330, this figure being £24,459,073 greater than the 1949 figure. As I have stated before, over long periods some inference may be drawn from changes in this figure, but on a year to year basis increases or decreases may merely reflect the technical position of the market on our accounting date. As an example of this, I would mention that our holding has already been considerably reduced this year. Conditions generally in the short-dated bond market have not been unfavourable and this company has been able to trade at a reasonable profit.

TWO CONVERSIONS

The main events in the short bond market have been the two offers to convert National War Bonds 2½ per cent. 1949/51 into Funding 2½ per cent. 1956/61 and Funding 3 per cent. 1966/68, and the fact that no notice has been given to redeem National War Bonds 1951/53 at the earliest possible date. These two conversions of 1949/51s have, of course, removed this stock altogether from the scope of the discount market, which accordingly at the present time has one less “short” to deal in.

The net profits are £326,985, which is £16,157 greater than last year and the balance carried forward to the credit of profit and loss account is now £872,888.

Once again we have to express to our many friends our appreciation of their continued good will and to our management and staff our thanks for their able and loyal co-operation in the furthering of our affairs in an active year.

ALEXANDERS DISCOUNT COMPANY, LIMITED

SATISFACTORY ACCOUNTS

The eighty-third annual general meeting of Alexanders Discount Company, Limited, will be held on February 14th in London.

The following is the circulated statement by the chairman, Sir Eric Gore Browne, D.S.O., O.B.E., T.D.:—

In the accounts, I think that I should draw your attention to the following items. In the balance sheet an increase in deposits from £125,689,101 to £140,677,567, an increase in bills discounted from £77,987,312 to £83,467,405, an increase in British Government securities from £49,611,930 to £59,264,313, and an increase in our balance sheet total from £129,767,401 to £144,798,867. I have recently had occasion to examine some of the accounts of this company for the years long ago, and it is interesting to recall that at the end of 1911, thirty-nine years ago, a year before Lord Colgrain joined the board, the corresponding figures were:—Deposits £9,311,740, bills discounted £9,878,739, British Imperial Indian and Colonial Government securities £1,024,777.

RECORD FIGURES

The figures which we now present are the largest in our long history of over 140 years. They demonstrate, I think, not only the importance of the part which this company is called upon to play in the London money market; they also serve to emphasise the vital necessity, to which my predecessor has frequently referred, of continuing to build up our inner reserves, a task made harder by the heavy burden of taxation. Only thus can we face the future with increasing confidence, whether or not changes occur in current interest rates. It is of course true to say that the policy of the Government plays a dominant part in the movement of these rates, which, in our national economy, no longer depend in the main on the movement of goods and gold. But we must never forget that, even in a controlled economy, as recent events have shown, public confidence is still an important factor.

A bill of exchange has been defined as “An order drawn on a person or firm, at a distance, requesting payment of money to some person or firm assigned by the drawer in consideration of value received.” We look forward to the day when this company, as a discount house, will handle once more, in increasing volume, true commercial bills covering the movement of goods both at home and abroad.

PROFIT AND ALLOCATIONS

If you will now turn to the profit and loss account, there we show balance of profit for the year of £224,212, compared with £204,669 for 1949, while our expenses were £59,112 compared with £54,269. We propose to pay the same dividends as last year and to carry forward £452,000 compared with £409,000 in the preceding year. I hope that you will agree that these accounts may be regarded as satisfactory.

During the past year the main events of interest to the discount market were the offer in June to holders of the 2½ per cent. National War Bonds 1949/51 to convert into 2½ per cent. Funding Loan 1956/61, together with a cash payment of 33s. 9d. per £100. Later, in November, notice was given for the repayment of the remainder of the 2½ per cent. National War Bonds 1949/51 on February 1, 1951, with conversion rights into 3 per cent. Funding Loan 1966/68 at par. Neither of these new issues was suitable for us, but, in spite of the redemption during the year of £714 million of short-dated bonds, the total of British Government securities outstanding with a life of less than five years still amounts to over £2,000 million.

NATIONAL DISCOUNT COMPANY, LIMITED

EXPANSION OF BUSINESS

The annual general meeting of the National Discount Company, Limited, will be held on February 14th in London.

The following is an extract from the circulated statement of the chairman, Commander the Hon. Lovel W. Coke, R.N.

The accounts will, I hope, be considered satisfactory. One of the main functions of the discount market is to provide the means for the negotiability of the commercial bill drawn on London. We are pleased to report an increase over last year of 42 per cent. in our purchases of these acceptances.

Our business in short-dated bonds has been very considerable, and although there have been no outstanding movements in prices, there have been opportunities for profitable operations from this source.

You will see that there has been a considerable expansion in our business, and the total now amounts to £199 million, being an increase of 16 per cent., or some £27 million over the previous year's figures. Our deposits, which now stand at £194 million, are proof that the company has shared fully in the expansion which has taken place in the discount market's activities during the past year.

After making provision for rebate, amortisation of premiums on securities (including special amortisation) and taxation, and after making transfers to contingency reserves and deducting directors' fees, there remains a profit of £301,522.

It will be proposed at the forthcoming meeting to pay dividends of 5 per cent., less tax, on the “A” and “B” stock, making 10 per cent. for the year on both classes, and to carry forward to the next account the sum of £250,912 against £212,890 brought in.

APEX (TRINIDAD) OILFIELDS LIMITED

STRONG FINANCIAL POSITION

The thirty-first annual ordinary general meeting of Apex (Trinidad) Oilfields Limited was held on January 24th in London, Mr Malcolm MacLachlan (chairman and joint managing director) presiding.

The chairman said that oil revenue, after provision for development and contingencies, and after depreciation of fixed assets, amounted to £1,704,000. After providing £10,000 for London and New York expenditure, etc., and £1,025,000 for taxation in Trinidad and the United Kingdom, the net profit was £669,000.

The directors recommended a final dividend of 1s. 3d. free of income tax per 5s. 0d. unit of stock, making a total dividend for the year of 1s. 9d. free of income tax.

The production for the year amounted to 2,833,000 barrels of crude oil and 3,549,000 gallons of casinghead gasolene.

During the year 82,371 feet had been drilled in continuance of the programme to obtain production and to extend the tested areas of the property. Eleven wells had been completed in the main field and 7 in the South Quarry area. Interesting developments continued in the Synclinal zone. Well No. 481 was now giving good production from the main sand. Three further wells had since been completed. Well 496 gave no production. Well 504 was giving excellent production from the largest sand body so far encountered, and was the outstanding development of the year. Well 511 was not a commercial producer.

The company's financial position was one of great strength.

The report was adopted.

WESTMINSTER BANK LIMITED

STRONG POSITION OF STERLING

LORD ALDENHAM ON CAUSES OF IMPROVEMENT

The statement by the Rt. Hon. Lord Aldenham, chairman of Westminster Bank Limited, has been circulated to shareholders, with the report and accounts for the year ended December 31, 1950, which will be presented at the annual general meeting at the head office on Wednesday, February 14th. The following is a summary of the statement, which is dated January 11, 1951.

Lord Aldenham, in recounting the year's changes in the directorate, paid a specially warm tribute to the Hon. Rupert E. Beckett, who during 1950 resigned from the chairmanship of the bank, which he had held with such distinction for twenty years. Mr Beckett still remains as a director.

The balance sheet shows that current, deposit and other accounts, at £815 million, were £7 million higher than at the end of 1949. This increase was in some degree associated with the strong position of sterling and the consequent influx of money from abroad.

INCREASED ADVANCES

Advances to customers and other accounts increased on the year by £18 million to £208 million. This upward trend was well spread and was a natural accompaniment of increased trade and industrial production.

The course of bank deposits and advances in 1950, taken in conjunction with increased production, suggests that there was no great addition to inflationary pressure; but the outlook for 1951 is by no means so favourable in this respect.

The accounts show a profit for the year of £1,471,031, an increase of £10,474 compared with 1949. Higher earnings from advances were partially offset by a reduction of income from investments. All expenses continued to rise, especially staff costs, which are, of course, by far the largest item. The profit has enabled the declaration of the same dividends as for last year and again the placing of £600,000 to reserves for contingencies.

In the wider field of national affairs the economic progress of 1950 must now be viewed in the light of the outbreak of war in Korea, which has been taken by all the freedom-loving nations as an indication that the cold war in Europe may at any time become a real war. But our defence measures are a long way in arrears; making up for lost time must impose a heavy burden on this country and greatly add to our economic difficulties.

STERLING AREA'S RESERVES

The other outstanding development of 1950 was the striking increase in the gold and dollar reserve of the sterling area, a change of fortune which led to the mutual agreement between the Governments of the United States and the United Kingdom that Marshall Aid to Britain should be suspended from January 1, 1951. It is difficult to exaggerate the success of the Marshall Plan, an act of international co-operation surely without parallel in time of peace.

The appearance of a surplus of dollars in the balance of payments of the sterling area and the consequent suspension of Marshall Aid to Britain do not mean that, quite apart from the strain of defence preparations, the economic recovery of this country is anywhere near complete. An examination of the causes of the improve-

ment makes this clear. The devaluation of the pound in September, 1949, coincided, roughly speaking, with an upward turn in the level of business activity in the United States. A second strong influence was the heavy cut in dollar imports which the United Kingdom and the countries of the overseas sterling area were forced to make at the time of devaluation.

THE KOREAN WAR

At the end of June, 1950, a third factor was added—the outbreak of war in Korea. A new stimulus was given to the demand for raw materials, and the third quarter of the year ended with the reserve standing at rather more than double the figure at the time of devaluation, the sterling area having had a surplus of \$400 million in the first nine months of 1950 apart from Marshall Aid received. This fact encouraged the idea abroad that the pound might be revalued. The result was a sharp rise in the demand for sterling exchange for forward covering of purchases of sterling area goods—an exact reversal of the conditions which prevailed immediately before devaluation.

At the end of 1950 the gold and dollar reserve of the sterling area had risen to \$3,300 million, compared with \$1,688 million at the end of 1949. In the last quarter of the year there was an increase of \$544 million, consisting of a surplus of \$398 million and Marshall Aid amounting to \$146 million. The Treasury announcement confirmed that the forward purchasing of sterling mentioned above accounted for a large part of the surplus in the last quarter—probably over one-third.

HOW U.K. FARED

Figures to show how the United Kingdom (as distinct from the sterling area) fared in 1950 in the effort to balance her dollar trade are available for the first six months only. The overall balance of payments of the United Kingdom showed a surplus of £52 million for the first half of 1950, compared with a deficit of £38 million for the whole of 1949; and it seems probable that in the second half of 1950 the growth of exports and the increase in invisible earnings produced even better results than in the first half in respect of both our dollar balance and our overall balance.

While therefore genuine progress was made in 1950, much of the gain both in the sterling area as a whole, and in our own position was attributable to exceptional factors the removal of which would leave us once again short of dollars. We need a much more substantial dollar reserve before any revaluation of the pound should be considered.

The real test of our ability to earn our living in a competitive world has been postponed, not averted, by the present emergency, which has once again created "sellers' markets."

INTERNAL CONDITIONS

Internal conditions in this country during 1950 were more favourable than had been expected. The rise in the cost of imports due to devaluation was slower in reaching retail prices than forecasts had suggested. A large part of our increase in exports was provided by higher production, and we were thereby saved the feared reduction in the volume of consumer goods available at home. Personal incomes were kept fairly stable in

accordance with the policy courageously initiated by Sir Stafford Cripps.

There must be a wider understanding that it is American charity that has enabled us for some years to live, as a nation, beyond our means. The national standard of living in future must be set by reference to the production index rather than to the cost-of-living index. It will, in fact, be so set whether we wish it or not.

Industrial production did increase notably during 1950—at a much greater rate than was anticipated in the Government's Economic Survey but, by progress on both sides of industry, much more still can be achieved in this direction. Shortages of raw materials will check production in some industries in 1951; but recent reports from our branches all over the country refer to the under-manning of many industries. This under-manning and the needs of the Services should absorb any labour displaced by lack of raw materials. But the difficulty of persuading men displaced from one industry to take work in another is formidable, as is exemplified by the grave lack of manpower in the coal-mining industry.

During the year demand in several lines of business was curtailed, and there was a widespread impression of there being "less money about," but in fact the explanation of this impression lies in the changed directions of demand. Statistics of retail trade show that as a result, no doubt, of higher prices and the greater selection of goods on offer in the shops, money was drawn away from entertainments and semi-luxuries and spent on essential goods, such as groceries, clothing and house furnishings. The total amount spent by the public on their living expenses was probably greater than ever before.

The appointment of a strong Royal Commission under Lord Justice Cohen to inquire into the present system of direct taxation is a sign of a tardy recognition of the bearing of this matter on economic efficiency, although the exclusion of the level of taxation from the terms of reference makes the Commission's task more difficult.

"THE STATE WILL PAY"

It would seem that the only real contribution that the private individual can make towards the lowering of the level of taxation is to kill the idea, which is by no means confined to the lower income groups, that "the State will pay." We used to be told that the State purse was not inexhaustible; that is an under-statement; the State purse does not exist.

We need to get public opinion mobilised against waste. As an instance of waste, Lord Aldenham quotes figures of estimates and expenditure on the National Health Service, and says there may be waste in administering the Service; there is certainly waste in the use made of it by the public. No Government can provide the nation with an economical Health Service except with the co-operation of the individual.

There is no doubt that we in this country face yet again the possibility of a great war, and that yet again we are not in such a position of strength as we should be to meet that threat. Surely, then, every act and word of responsible statesmen of all parties should now be judged by the contribution they make towards restoring the national unity of wartime or helping to increase the national productivity. If the Dunkirk spirit can be roused in the nation throughout 1951, we can show all the freedom-loving nations that we are once again making ready to shoulder more than our fair share in the defence of liberty and we may well be able to reach such a position of strength in twelve months' time that we can look back and say, "One more danger squarely met."

BURNLEY BUILDING SOCIETY

A CENTURY OF PROGRESS

The annual meeting of the Society was held at Burnley on January 24th.

Sir John H. Grey, J.P., the chairman, in the course of his speech, said:—Few institutions on attaining the distinguished age of 100 years can review the past with greater reason for satisfaction, or look forward to the future with more cause for confidence, than the Burnley Building Society. It is consequently with all the more pride and pleasure that I present for your consideration today the one hundredth annual report and statement of accounts of your Society, which was established on November 8, 1850.

There is a very considerable difference between the total assets of £29,578,845 shown on our latest accounts and those at the end of the first financial year, which were £1,998. And yet, with all this difference in size, there is, I feel, very little change in the aims and ideals of the Society, and in many ways the path we are pursuing today is merely a continuation of that trodden by those few pioneers to whose zeal and enthusiasm, and determination to see that the Society progressed on the right lines, we owe so much.

We repeat again our distribution of 2½ per cent. to old series shareholders, 2½ per cent. to new series shareholders (Class A) and 2½ per cent. to new series shareholders (Class B). Results during the year have been rather better than was expected. In fact, our share department shows a record increase of £3,480,653 to £20,387,742.

Deposit balances now stand at £7,490,146. Much of our balance represents genuine savings which have been built up over a period of years. There is now as great a need for individual saving as ever, and I cannot stress too strongly the urgency of this, both from the national and the personal point of view.

MORTGAGES

On the mortgage side we have made 9,610 advances to a total of £6,793,404. Repayments have not been quite so heavy as last year, and the net increase in our mortgage assets is £2,687,497. Altogether we have now 41,424 mortgage accounts, and the average amount owing is £619. During the year we have continued our policy of lending almost entirely to borrowers wishing to buy homes for their own occupation.

The Government's present policy of virtually refusing to allow the private builder to build houses for owner-occupiers is difficult to understand, especially when we bear in mind that in the inter-war period private enterprise was responsible for providing a total of some 2,886,000 houses out of a total of 3,998,000. The need of the moment is for homes, and in not setting free the private builder to use his initiative and enterprise the Government has failed to seize its opportunity.

Our profit and loss account shows gross income of £1,081,454. The amount of £438,241 paid to shareholders represents 88 per cent. of the net earnings. Total assets now stand at £29,578,845, an increase of £3,128,056. Mortgages at £25,631,221 represent some 86 per cent. of the total assets, while investments, bank balance and cash at £3,788,669 represent a further 13 per cent. Our total reserves now reach a figure of £1,335,701.

We press on to our second century in the hope that we, and other building societies, may be allowed to make an even more useful contribution to the nation's needs, and with the determination to leave nothing undone to ensure that our members in another hundred years' time look back on our efforts with the same approval as we now bestow on the pioneers.

The report was adopted.

ASSOCIATED MOTOR CYCLES LIMITED

POPULARITY OF COMPANY'S PRODUCTS

The twenty-second annual general meeting of Associated Motor Cycles Limited was held on January 22nd in London, Mr S. R. Hogg, the chairman, presiding.

In the course of his speech, the chairman said: The total profit of the group, after taxation, is £178,334, compared with a figure of £135,354 for the preceding year. After bringing in the balance of undistributed profit brought forward—£207,110—there is a total available profit of £385,444. It is proposed that a final dividend of 15 per cent., less tax, be paid, making 20 per cent., less tax, for the year, as compared with 17½ per cent.

It may cause some surprise to note that the company is able to work on what appears to be a reduced value of stock and work in progress, and I hasten to give an assurance, if such assurance be necessary, that your Board are fully conscious of the difficulties of obtaining raw materials and have taken every step to deal with the position and to maintain adequate stocks within the possibilities of the present situation.

It will interest the shareholders to know that the total net assets of the group, apart from goodwill, now amount to a book value of £973,572, being nearly 3½ times the company's issued share capital, even though the parent company alone has had to make provision for the payment of approximately 4½ times as much in taxation as it has distributed to the shareholders in net dividends.

The book value of the fixed assets, apart from goodwill of the group of companies, after providing for depreciation, is £188,159. Your company has always adopted a conservative policy as regards depreciation and amortisation and this figure is, therefore, already well written down. The heavy burden of taxation makes it extremely difficult, if not almost impossible, for undertakings to set aside out of revenue the necessary sums for yearly replacement and development.

NEW ACQUISITION

I now have to report that as a result of negotiations which were commenced early in the year 1950 your company has acquired, on terms which your directors consider satisfactory, more than 95 per cent. of the issued share capital of the James Cycle Company Limited of Birmingham.

During the year under review, costs of raw material and services continued to rise against us, but our improved efficiency with corresponding increased output has enabled us to absorb the increases in cost and show improved results without any increase in our own selling prices. In fact, the prices of our motor cycles remain at the same basic level as in September, 1947, an achievement of which I think we may be proud in view of the very substantial increase which has occurred in all manufacturing costs in the past three years.

The popularity of our Matchless, A.J.S. and Francis-Barnett motor cycles continues to increase in home and export markets and the demand remains substantially in excess of our manufacturing capacity. We have continued, in the national interest, to send a very high proportion of our motor cycles to the export markets.

You will expect me to say something about future prospects. All I will venture to say is that in spite of all difficulties I hope to be able to present to you another satisfactory report at this time next year.

The report was adopted.

BRITISH STEEL CONSTRUCTIONS (BIRMINGHAM)

YEAR OF SUBSTANTIAL PROGRESS

The fourteenth annual general meeting of British Steel Constructions (Birmingham), Limited, was held on January 18th at Birmingham, Mr Arthur H. Johnson, O.B.E., the chairman, presiding.

The following is an extract from his circulated statement:—

The past year has been one of substantial progress. Among the highlights, the settlement of the claim against the Ministry of Works must take precedence. Although the full amount of the claim was not met, I feel that the settlement for £77,500 may be regarded as very satisfactory.

During the year an arrangement was concluded with the Finance Corporation for Industry, Limited, whereby the corporation accepted 160,000 shares of 5s. each in settlement of the sum of £75,000 which was due to be paid on December 6, 1950, in respect of loans to Smiths Building Systems (Birmingham), Limited.

As a result of the above settlements, the liquid position of the company was considerably improved, and with the cash which was available, supplemented by the proceeds of the recent issue for cash of 240,000 shares of 5s. each, we have been able to complete the arrangements for the discharge of the further loan and premium of £92,250 from the Finance Corporation for Industry, Limited, which was secured by a debenture on Granwood Flooring Company, Limited. The completion of all these arrangements will enable your board to proceed with the further steps required to provide permanent capital to replace the temporary capital so readily placed at their disposal by the company's bankers, and with this object in view you will be asked in due course to approve a proposal for the increase of the share capital of the company.

THREE VITAL REQUIREMENTS PROVIDED

We have assisted very considerably in the provision of three vital requirements of the nation, namely: (1) Houses for the people; (2) Schools for the children; (3) Exports for dollars. Since August, 1949, we have handed over for occupation no less than 600 houses, an achievement of which the company has reason to be proud.

It is hoped that in the not too distant future we may be able to convince the appropriate Government departments and other builders that the "Smith" system is the method by which it is possible to produce the extra houses which are so urgently required in the minimum of time and at less cost than traditionally constructed houses.

In the aggregate, the turnover of the company was slightly under one and a-quarter million pounds, which showed an increase of approximately 10 per cent. over the preceding year, and the trading profits have increased by approximately 20 per cent., and this net profit represents approximately 10 per cent. on the average capital employed in the business.

CURRENT YEAR'S GOOD OUTLOOK

We have reason to believe that the results of the current year will show some improvement over the past year. We already have firm contracts for more than 600 houses, and several local authorities have intimated to us that they will require us to build further houses for them during 1951. In addition, the volume of orders on hand for steelwork, flooring and heating equipment is larger than at any time previous.

The report and accounts were adopted.

THE HONGKONG AND SHANGHAI BANKING CORPORATION
(Incorporated in the Colony of Hong Kong)
The Liability of Members is limited to the extent and in the manner prescribed by Ordinance No. 1 of 1929 of the Colony.

UNIVERSITY OF CAMBRIDGE
UNIVERSITY LECTURESHIPS AND UNIVERSITY ASSISTANT LECTURESHIPS IN ECONOMICS

The Appointments Committee of the Faculty of Economics and Politics give notice that they hope to appoint several University Lecturers and University Assistant Lecturers in Economics to take office from October 1, 1951. The appointments will be subject to the Statutes and Ordinances of the University. Further particulars can be obtained from the Secretary of the Faculty, the Marshall Library, Downing Street, Cambridge, to whom applications should be sent to reach her not later than February 24th. Eight copies of the application should be sent, and, if so desired, at least one copy of any published work or unpublished writings. Testimonials are not required, but a candidate should give the names of two persons to whom reference can be made.

THE Civil Service Commissioners invite applications for pensionable appointments as Professional Accountants in the Home Civil Service.

Candidates must be at least 25 and under 35 years of age on August 1, 1950, with extension for regular service in H.M. Forces. Candidates must have had wide professional experience and be members of one of the following bodies—

- Institute of Chartered Accountants in England and Wales.
- Society of Incorporated Accountants and Auditors.
- Society of Accountants in Edinburgh.
- Institute of Accountants and Actuaries in Glasgow.
- Society of Accountants in Aberdeen.
- Institute of Chartered Accountants in Ireland.
- Association of Certified and Corporate Accountants.

The London salary scale for men is £600 x £25—£750. Men aged 30 or over start at £600. Lower starting salary for younger entrants, from £475 at age 25. Provision for special increases on completion of probation. The rates for women and for posts in the Provinces will be somewhat lower.

Particulars and application forms from Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1, quoting No. 3426; completed application forms must reach him by February 15, 1951.

CHIEF Accountant required for large group of old-established companies in N.E. London. University education preferred. Must be Chartered Accountant with practical experience as company accountant in financial cost and consolidated accounts. Wide general commercial experience necessary. Position offers opportunities of advancement, and only first-class applicants should apply. Commencing salary not less than £1,500 per annum.—Apply Box 561.

CHIEF MEDICAL STATISTICIAN in the General Register Office. The Civil Service Commissioners will shortly be filling this post owing to the retirement of Dr. Percy Stocks. Those wishing to be considered must be registered medical practitioners with knowledge of medical statistics and experience appropriate to the post. Salary £1,850—£2,125.

Full particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 3471. Completed application forms must reach him by February 23, 1951.

NO Capital Depreciation and a return of 2½ per cent. (income tax paid by the Society) are the terms offered for Share Investments by the 73 year old Chelsea and Waltham Green Building Society. Write for Leaflet F to 110-112, Kings Road, Chelsea, S.W.3.

TRANSLATOR, French, German, Spanish. Economics Graduate. Journalistic experience. Seeks position with commercial organisation, bank or publication.—Box 565.

LEADING oil company requires in London, Hons. degree graduate (economics) age 26-30 with some business experience to join specialised staff of central department serving general management. Appointment offers considerable scope for initiative. Salary according to experience and qualifications.—Full particulars in writing to Box No. 569.

HOUBLON-NORMAN FUND

The Trustees of the Houblon-Norman Fund invite applications for Fellowships or Grants in aid of research into the working of financial and business institutions in Great Britain and elsewhere and the economic conditions affecting them.

Apart from exceptional cases, awards will be confined to British-born subjects normally resident in the United Kingdom and will take effect from October 1, 1951. Fellowships will be awarded for one year, renewable for a second year; and the amount of all awards will depend upon the circumstances of the candidate and the likely expenses of his work.

Applications should be made not later than the 31st March and forms of application may be obtained from the Secretary of the Fund (W. M. Allen), c/o the Bank of England, London, E.C.2.

W. M. ALLEN, Secretary.

January 5, 1951.

UNIVERSITY OF BELFAST

Applications are invited for Two Lectureships in Economics in The Queen's University of Belfast.

(I) Salary £800 by £50 to £1,150. (II) salary £550 by £50 to £850, and on certain conditions being satisfied, to £1,150. Both posts have contributory pension under the F.S.S.U. Initial placing on the scales will depend on experience and qualifications. Applications should be received by April 2, 1951. Particulars from G. R. Cowie, M.A., LL.B., Secretary.

THE Civil Service Commissioners invite applications for appointments as *Senior Scientific Officer* and *Scientific Officer* to be filled by competitive interview during 1951. Interviews will begin in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1951, may eventually be announced. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree with first or second class honours in a scientific subject (including engineering) or in Mathematics, or an equivalent qualification, or possess high professional attainments. Candidates for *Senior Scientific Officer* posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for *Scientific Officer* posts taking their degrees in 1951 may be admitted to compete before the result of their degree examination is known.

Age Limits: For *Senior Scientific Officers*, at least 26 and under 31 on August 1, 1951; for *Scientific Officers*, at least 21 and under 28 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1951. Salary Scales for men in London, *Senior Scientific Officers*, £700 x £25—£900; *Scientific Officers* £400 x £25—£550. Rates for women are somewhat lower.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. 3399.

URWICK, ORR AND PARTNERS LTD., Consulting Specialists in Organisation and Management, are appointing an additional Consultant to their Marketing and Selling Division. Applicants must satisfy the following requirements:

1. University degree or equivalent professional qualification.
 2. Considerable experience as a senior executive in Sales or Merchandise Management; or in Marketing.
 3. Breadth of outlook and interest in contemporary affairs.
- The appointment offers considerable scope in a particularly interesting type of work. Applications should be addressed in writing to the Company's Offices, 7, Park Lane, London, W.1, quoting Reference: MS/1057.

THE Organising Committee of CO-OWNERSHIP IN INDUSTRY have planned a CONFERENCE, to be held February 9th to 11th, in the Bishop Partridge Hall, Church House, Westminster. They invite those who support the principle of Co-Ownership to write for tickets to the Organising Secretary of Co-Ownership, 11, Suffolk Street, Pall Mall, London, S.W.1. Price of ticket for Conference, including buffet supper, on Friday evening, 15s.

RESEARCH ASSISTANT required for six months to assist in writing the official history of large financial institutions. Sound training and considerable resourcefulness required. Part-time engagement of good candidate would be considered.—Write, stating salary required, to Box 3399, c/o Charles Barker & Sons, Ltd., 31 Budge Row, London, E.C.4.

EXPERIENCED Chartered Patent Agent offers services as a consultant and adviser to financier(s) interested in seeking out developing and exploiting meritorious inventions for which capital is required.—Box 567.

INFORMATION bulletins, Journals of Societies or Institutions. Editing, design, layout, and finalization of text for printer. Moderate fees. Inquiries from Embassies, literary, social and industrial bodies.—Box 561.

Korean Stalemate

THERE are now two main dangers to be avoided in the handling of the Korean problem. One is that the British Government should be swept by strong currents of pro-Chinese feeling in the Labour Party into a role which would worsen its relations with the United States without improving its precarious contacts with Peking. The other is that the Americans, encouraged by the United Nations Assembly's resolution declaring China an aggressor, should turn their backs on the moderating counsels which began to be heard in Washington after Mr Attlee's visit. Either development alone is undesirable; the combination of the two might be disastrous.

What has to be emphasised both in Washington and London is that the military situation—which seemed, not so long ago, to be yielding to the Chinese the very triumphs that their propaganda promised in its wildest moments—has now changed. The troops of the United Nations are no longer in retreat but are waging a limited offensive; they are within striking distance of Seoul and their armour has advanced to within 20 miles of the 38th parallel. Whether they will advance further, whether the Chinese will counter-attack effectively, or whether there is to be a stalemate on the battlefield is quite uncertain. But the fact of which policy must take account is that the Chinese "volunteers" are clearly feeling the strain. Indeed, Peking now faces the prospect of a war of attrition in which the odds may not be in its favour. Its losses have been heavy—lately overwhelming; an epidemic of typhus is taking its toll, and the difficulties of supplying a large army half-way down the peninsula are severely straining the capacity of a power that controls neither sea nor air. What is more, the weeks ahead, with improving weather and the thawing of bridgeless rivers, will increase both the difficulties of the Chinese supply columns and the striking power of the Uno air force.

To expect American—and British—policy to be unaffected by this turn of fortune would be quite unreasonable. Too often, in the controversy about China that has been raging in this country, has it been overlooked that there is and must be a connection between the tone of the talking at Uno and the course of the fighting in Korea. It is forgotten that the period of greatest intransigence by the Chinese at Lake Success was also the period of retreat by Uno's forces; and it remains a mystery to anyone who had read the threats and boasts of the Chinese in their press and radio why they should have been expected at this period to negotiate on any terms likely to be considered in Washington. Now, if the military situation continues to develop in Uno's favour (or even if it merely remains what it is now) the time may be coming when Peking will find it worth while to think—if not to talk—in realistic terms. It is vitally important that this time should be used with skill and patience.

The signs at the moment are not favourable. The United Nations' charge of aggression has drawn from Mr Chou En-lai, the Chinese Foreign Minister, a reply describing the resolution as "illegal,"

"slanderous," and due to the "coercion and domination" of the Organisation by the United States; and he has declared that the People's Government will have nothing to do with the Good Offices Committee set up by the Assembly. Also regrettable is the fact that Sir Benegal Rau of India has laid down his role of mediator and that Mr Lester Pearson of Canada is considering a similar decision. There is for the moment, therefore, a breakdown of Uno's diplomatic activity while its military role goes on. That may do no harm. So long as the military situation is clearly moving in favour of the United Nations, its Good Offices Committee and, above all, its Collective Measures Committee—which would have the job of recommending economic sanctions—need show no undue haste.

★

It is and should remain the British argument that economic sanctions will do more harm than good. Because the main strategic materials from all sources—oil, for example—are already under embargo, very little of vital importance is going into China from the western world. A greatly increased effort at control would produce only small additional results, which could have little effect on the slender war potential of Peking. It is understandable that Americans should resent the use of Hongkong as a channel into China for valuable goods and materials; but it is also reasonable that the British should wish to provoke no Communist action against Hongkong, which is almost the last channel left for information about what is going on in China. What is more, the strict application of sanctions means sooner or later that an American warship stops on the high seas ships bearing Indian jute to China; or that British officials try to stop remittances home from the millions of overseas Chinese in Malaya. Can it be seriously argued in Washington that the divisions and difficulties that such action would cause among America's friends would not far outweigh its effect on the People's Government in Peking?

By all means let the private study of economic sanctions go on. It is desirable that the United Nations should understand clearly what sacrifices are called for, in this and other possible cases, when it tries to enforce its will. But let Mr Acheson, and particularly those who are urging him on to stronger measures, think carefully whether the application of sanctions is the right and useful next move. Indeed, it should be asked whether, for the time being, it is wise to make any fresh move. There are times in every military and diplomatic situation when it is wiser to do nothing—just to wait. Clearly, in the present state of deadlock at Uno, the speechmaking methods of the Assembly serve no purpose at all. If Mr Chou En-lai has anything fresh to say, the lines from Peking to Lake Success remain open, however much it may be said that the door has been slammed in the Chinese Foreign Minister's face. Peking can have an armistice whenever it is ready to withdraw its troops behind the 38th parallel and to start negotiations, without demanding that its ultimate peace terms shall be accepted as conditions for a cease-fire.

If the best course for the Americans at the moment is to do nothing and for Uno to say as little as possible while General Ridgway's offensive has its effect, what is the right course for the British? The question will be asked anxiously, even passionately, in the House of

Commons next week. Some members will be tempted to urge such drastic and foolish ideas as the withdrawal of British troops from Korea or separate approaches to Peking. They will command little support because their advocates seem more interested in rebuking the United States than in settling the Korean question fairly and firmly. What will command more attention is the suggestion that Britain should now mediate between the Americans and the Chinese. It is being argued that the British have made clear beyond doubt their good will towards the People's Republic by recognising its government, by dissociating themselves from American actions in Formosa, by their caution and restraint at Lake Success. It is further argued that Britain, as America's principal partner, as a mediator with Asia by virtue of its Commonwealth ties, will be listened to with respect in Washington. All these things are true within limits; but they are not true all the time and in every situation. Washington is at the moment little more disposed to listen to conciliatory views on China than for some time past. Peking, so far as is known, has shown of late no special sign of interest or favour. The gap between Chinese and American terms for negotiation—whether about Korea or about a general settlement of Far Eastern questions—is as wide as ever; and the excitement and indignation in both countries have only lately shown signs of subsiding.

★

For the British to mediate now in such a situation would be certainly rash and probably futile. It would undermine Uno's military effort without improving the prospects of peace. One can imagine no more invidious position than that of a British Government deliberately affronting much of American, and not a little of British, opinion by such action when co-operation with the United States is the first aim of its policy, when it has troops fighting for the United Nations in Korea—and fighting successfully—and when it has seen many of the estimates that it has made of China's intentions falsified by events. If the Chinese showed clear signs of wishing to stop the war, and if the British Government were then to use diplomatic channels to get Washington and Peking into contact, that would be a quite different matter. Indeed, there would be much to be gained by keeping any such preliminaries away from the public proceedings of the Uno Assembly, where American behaviour is not seen at its best. But at the moment such possibilities do not exist. Just as the next stage on the battlefield is uncertain, so is the next stage in the diplomatic exchanges.

It would, in fact, be not unsatisfactory if the next few weeks produced both in Korea and Lake Success a position of stalemate on the 38th parallel. Now that the impetus of the Chinese military offensive has died away there must be time for the violent American political reaction to it to die away too. Fresh proposals for terms and negotiations at this stage will only revive it, especially if they come from this country. The sensible thing now is for the British Government to argue in Washington with the greatest firmness against economic sanctions and to press for a breathing space. Peace may come in Korea only through a stalemate, and it will assist both sides to a realisation of this fact if the House of Commons next week concentrates on making the Government's task easier and not more difficult.

The Heave and the Pull

THE defence programme that Parliament debates next week has already commanded a wide measure of respect and assent. Whatever the criticisms in detail—and these can be made only in the course of the debate, as Ministers disclose the programme in more detail—most people are ready to regard its general form as "about right." Any other reaction would, indeed, be an utterly damning indictment of the Government. However completely Ministers are excused their lack of foresight before war began in Korea, they have now had nearly eight months in which to assess the country's needs, to educate their party, and to summon up their courage. It is the measure of their weakness that even so the present programme can be accepted as big enough only because it is commonly assumed to be not the final but the penultimate bite at the cherry: as was argued in these columns last week, if the programme is carried out in full the expenditure for purposes other than production is likely to be bigger in the second and third years than is implied in the official estimate. If things develop as now looks likely, expenditure on defence will in little more than two years' time have risen to an annual rate of about £2,000 million, or one-sixth of the national income. There are no standards by which to assess its adequacy; but it can reasonably be regarded, on a broad, pragmatic judgment, as about the right scale of effort to which to commit Britain at this stage in international affairs.

The realists in the Government deserve praise for their courage in undertaking so much. They have dropped the politically attractive illusion that security can be had on the cheap, by forgoing prospective improvements in the standard of living rather than by sacrifices of current consumption. They have accepted the unpopular principle—particularly repugnant to much Labour thinking—that efficiency in defence requires discrimination in the call-up of reservists, not equal service from all. They no longer make British efforts dependent on American aid. These were major hurdles, and the taking of them—even after so much hesitation—is this Government's greatest achievement. What it does not do (however quiet the Russians may be) is to leave the country with a straight run home.

The defence programme will be carried out successfully only after the Government has taken one more, and a bigger, psychological hurdle. That is to realise that by its nature the programme will work only if it works comfortably, with a margin of resources in hand. This is the paradox of defence in the cold war: the effort has to be great, but it must be made without the sharp strains and dislocations that are tolerable in war. This is true in the sense that peace-time objectives remain important; but, more important, it is essential to the defence programme itself. British rearmament has two psychological aims. One is to deter Russian aggression; to the creation of joint Western forces adequate for this purpose Britain has to make the largest single contribution after that of the United States. The second aim is to reassure the weaker allies. It is to give them the confidence to stand up to threats, to resist Communist disruption from within; it is to make the two main members of the free world look strong enough for the smaller powers to feel it worthwhile to add their own contributions to mutual defence rather than to retreat into defeatism.

The actual accumulation of strength will necessarily be slow at first. If its psychological purposes are to be served during the next two years the effort will have to be made with apparent reserves. Neither Russia nor Britain's allies will be impressed by the doubling of expenditure on arms production this year if the small access of strength gained thereby is paid for by a fuel crisis and by reducing the British people to vegetarianism while the rest of the world eats meat. Rearmament will fail in its psychological purposes if it is the work of a country struggling with fresh weaknesses in its balance of payments, with factories closing down or stuttering at half-pressure for lack of raw materials. If the economy is over-driven in this fashion it is likely, of course, that defence production will in practice fall behind the programme. But even if that is by heroic measures avoided, the impression on the world of a Britain exhausted and distracted in its efforts will defeat the immediate aims of rearmament; the sacrifices will be much less likely to prevent war than good management could make them. What is required of Britain is the quickest possible strengthening of the armed forces, but the movement that will impress both enemies and friends is a collected canter not a panting gallop.

★

The implications for Government policy are very simple—and very unlikely to be accepted. They are just that it should plan rather than wait for things to turn up; that it should reckon, and prepare to meet, the costs of defence before the bills come in. The real costs are the cuts in civilian consumption that are inevitable to make room for defence production. What has to be debated is the method by which those cuts shall be made. The Government can order the armaments; wait for civilian supplies to fall off while the real volume of demand is maintained, or—if money incomes rise faster than prices—increased; and then, when the shortages have materialised, the cuts in consumption can be enforced partly by rising prices but mainly by the Government jumping in with physical controls, with rationing schemes and allocations and prohibitions and price ceilings. This is the way that, politically, the Government will be tempted to go, and on past performance certainly will go. There will, indeed, be some Budget measures to check purchasing-power, but they will be half-hearted; they will always lag behind the reduction in civilian supplies. This is the new form of the error of over-optimism that led to the economic crises of 1947 and 1949. Its consequences may not be catastrophic but they will certainly be appalling. They are an economy of half-suppressed inflation, of coal crises and widespread raw material shortages, of lagging exports and rigid restrictions on new enterprise. If the rearmament programme is fulfilled in spite of these handicaps, it will be at the cost of unnecessarily large sacrifices; the rigidity of men and resources, which inflation creates, will be overcome only by far more burdensome Government interferences with individual liberty—including the direction of labour—than anyone can want to contemplate as a long-term policy.

The objection is not, of course, to controls as such. There are two aspects of the rearmament pro-

gramme: one is the immediate, once-for-all heave necessary to get British defences into better shape; the other is the high level of preparedness—claiming perhaps one-eighth or so of the national resources—that may have to be maintained for as long ahead as can be foreseen. For the initial heave some controls are certainly necessary. The objection is to relying on them also to keep the effort going. For that purpose they can hardly be more efficient than were the controls of the postwar period. And a Britain with the economic weaknesses of 1946-49 is certainly not going to impress the world by its rearmament. If the policy of seeking peace through strength may have to be maintained for a decade or more (and so we must hope, since the alternative is war) then its economic counterpart must also be planned for the long run.

What is necessary to make the defence programme effective, at the smallest real cost, is a further act of political courage from the Government. It is to reckon realistically, without assuming that everything for the best will turn up, what the necessary sacrifices of con-

sumption are going to be; to state those sacrifices bluntly; and then firmly to set financial policy to secure the full cut in consumption quickly and smoothly, without inflationary strains, as supplies are reduced. No one would pretend that this is an easy policy: in this matter the Opposition stands in almost as much need as the Government to demonstrate its good sense. At the moment opinion in the country is swinging in favour of the Conservatives in part (though only in part) because of hardships—and particularly rising prices—that are not merely inevitable but will increase. The Opposition will demonstrate its worth as an alternative government only if it can resist the temptation to play on these causes of popularity. But, above all, it is Labour's responsibility, as long as it chooses to remain in office, to show that it is willing boldly to ask for sacrifices when they will do most good, not to impose them by arbitrary cuts after the over-loaded economy has got into further jams. This is now the test of political leadership, and next week's debate should show which party is the more capable of it.

Neutrality

IF the criticism and indignation now being directed against American foreign policy from this and neighbouring countries were being vented against the Soviet Union by voices in Eastern Europe the arrests, the purges and the trials would already have begun. In that half of Europe public criticism of Moscow's foreign policy is a "crime against peace," punishable by death; whereas in the Atlantic alliance the right to free discussion and open disagreement is firmly upheld between partners who are far from equal. The comparison is not one to be pressed; but no more is it one to be forgotten whenever deep divisions open up between the United States and its allies. For to keep it in mind is one way of maintaining a clear distinction between vital and superficial differences.

It is clearly time to apply such a test to the movement of opinion known as "neutrality." It can be neither ignored nor despised, for it has the support of some people of integrity and intelligence. And it achieves a prominence out of proportion to its political strength just because its point of view is argued with passion and brilliance. Among its opponents it causes an exasperation which recalls the bitterness of 1938 over Munich. Among the enemies of the free world it causes unceasing glee. Indeed, it must sometimes be thought in Moscow that America, too, has its Titos to deal with, forgetting that it takes a Stalin to provoke Titoism. What, then, is this neutrality? Is it the product of that "pessimism bordering on defeatism" which General Eisenhower found in "many strata of society" in Europe? Is it a passing phase or a permanent trend?

The neutralists seem to represent a wide range of attitudes and aims. They include genuine pacifists who are a law (or an anarchy) unto themselves; persons whose fear or weariness of war leads them to welcome any escapist rationalisation of their feelings that is offered; politicians and intellectuals of both Left and Right—but mostly Left—who see in rearmament and protracted cold war the end of their hopes for social advance and prosperity; lonely, sensitive minds that detest the raucous and tough manner in which relations between the free world and the Communist govern-

ments are conducted; and, finally, those bodies of opinion that genuinely believe partnership with capitalist and materialist America to be against the interests of their country and of Europe. It remains to add the fellow-travellers, who are not neutral at all but who see in this movement of opinion rich opportunities for mischief.

Leaving aside the special situation in Germany, what arguments are at work among these neutralists? Theirs is an attitude in some ways comparable to isolationism in America, though its origins are different. The neutralist is often a recent convert to what he calls political realism. In his time he has been starry-eyed: he has, for example, advocated collective security without thinking out what that implies against a strong and resolute aggressor. Within the last six months he has seen the test made—and he dislikes the result. He now sees with dismay that collective security means a sacrifice of independence in foreign policy; a dogged persistence in taking the very risks from which he thought the system and the slogan would protect him; the use of methods of discussion and negotiation that lend themselves to demagoguery and exhibitionism. From such risks and excitements he begs leave to withdraw, and advocates the methods of conciliation and appeasement on which he once poured such scorn. In this sense he is an isolationist; he turns against national commitments because he had not correctly estimated their risks.

This isolationism of the neutralist may take a more particular form. He may object not so much to alliances or commitments in general as to the association with the United States in particular. He will protest that the interests—indeed, the fate—of his nation are at the mercy of a foreign policy that is blown hither and thither by the gusts of popular opinion. He finds the manner of the American rearmament effort provocative, and argues that the Russians may just as well be frightened into war as into peace.

Then there is the kind of neutralist who wants to have his cake and eat it: who makes alliances and re-insures against them. He will protest that diplomacy can prevail where the display of strength will fail. He talks

longingly of the subtle technique by which the light of agreement dawns during the redrafting of a paragraph; by which a Europe growing in strength might interpose itself between the two world giants; by which procrastination is used to appease and heal differences. He will advocate simultaneously the integration of Germans into a European army, discussion of the demilitarisation of Germany with the Russians, and general disarmament. He distrusts the forthright simplifications of what he believes to be American thinking and heartily supports the Attlee manner.

Clearly, in this neutrality there is something that is not merely disloyal, evasive and defeatist. In the nations of the Continent some of it is due to the fact that the last war is remembered for its defeats, whereas in Britain and America it is remembered as a victory. Let it be admitted that the rationalisation of such emotions coincides only too often with the main lines of the Soviet-directed "peace campaign." Let it be admitted, too, that neutrality is quite often the merest Usaphobia, an attitude compounded of jealousy, resentment, cussedness and genuine disagreement with the workings of American democracy. But when these have been allowed for, let it also be granted that there are significant and honourable ideas to be studied in neutrality. The morale of European peoples still rests mainly on national pride and the spirit of independence. It is stronger even than the love of individual freedom. To guard that spirit against the predominance of the greater powers in the Atlantic Pact is an important function of opinion in the free world. Again, let it be realised how much easier it is for an American than for a European to accept as a premise of policy the indefinite division of the Continent into two hostile camps. For many French and Germans the premise is unacceptable. Sooner or later Europeans will try to overcome those divisions by traditional political methods; sooner or later they will want to see both American and Russian armies withdrawn from Europe, the presence of the one—as they see it—being the cause of the presence of the other. Finally, let it be admitted that it is one of the functions of the intellectual not only to treat all points of view, including the Russian, on their merits, but also to put aside the language of strategy and cold war.

Here, however, is the rub. The neutralist intellectual is often not content with such a role. He, too, talks strategy; he, too, makes his estimates of forces and intentions, and his forecasts of economic and political consequences. Being unconcerned with politics as the art of the possible, he is liable to talk nonsense about them. He wants to see everything in black and white, and to move towards those ends which his reasoning proves desirable and possible. In this role he can in a time of danger exercise a dangerous influence, because he may be subject to, and unconsciously acts as a channel for, the propaganda of the enemies of the free nations. It is necessary, therefore, to find some test by which to distinguish between disloyalty and independence, between deliberately subversive comment and naïveté. Without it there is danger of weakening the tradition of toleration, and of strengthening too much the pressure for conformity in the public opinion of the free world.

The tests which the liberal mind can apply are, first, is the argument of the neutralist honest and untempered? Secondly, does he apply his standards of

criticism impartially to the free world and the Communist world? Where there is passion and distortion of facts and thought, there speaks the mischief-maker, who is abusing the privileges of the intellectual in a free society at a time of danger. Where there is no criticism of Russia or China, but only the persistent indictment of America, there, too, the mischief-maker is at work, applying moral standards according to the exigencies of party politics or doctrine. Where the former Pétainist or supporter of Hitler and Mussolini is found in the ranks of neutrality—there, too, is ground for deep suspicion of motives. But where these tests can be passed, there is something to be treated with respect.

There is yet a third test, less easily applied but of equal importance. Has the neutralist a constructive and practicable political idea? If the French neutralist advocates the European army which, he says, can command pride and respect on the Continent, is he facing or evading the main issues of western defence? If the Italian speaks longingly of the Third Force in Europe, is he asking for something politically practicable or is it just escapism? These are difficult tests, it is true, but it is part of the task of American and British foreign policy to apply them with care and sympathy. For, if it is the security of Europe that is the main issue in the years ahead, it is likely that Europeans will have useful ideas to contribute. The time is now passing when the political initiative has in every case to come from outside Europe, as in the case of the Marshall Plan, the Atlantic Pact and even the United Nations. Soon the stage will have been reached where, in order to get out of Europeans and Americans the effort needed to make themselves strong, it will be no longer necessary to concentrate all attention on common dangers and common fears. If peace can be preserved and the free world's alliances maintained, a time of release from present tensions is bound to come. It is the error of the genuine neutralist to anticipate this moment, to be the swallow that arrives before the spring. And it is the offence of the mere mischief-maker to delay it by trying to weaken an alliance built up by patient and painful effort.

Land of Promise

WE are as sanguine of our Future Progress as we are satisfied with our recent steps. We laugh at those faithless prophets—the querulous Jeremiahs of the day—who affirm our retrogression, and predict our decadence. Where is the warrant of their prophecy? Where are the symptoms of the growing malady which is to carry England to her grave? Are they to be found in her spreading Empire—in her expanding and multiplying population—in her accumulating wealth—in her commerce bounding with new elasticity—in her industry, buoyant with recovered freedom? Has her science ceased to be inventive? Have her engineers forgot their cunning? Have her people begun to be indifferent to their civil rights, or to abnegate their mental freedom? Are her poor falling back in their physical condition—becoming more turbulent, more ignorant, more destitute? Or is it not true . . . that in all points our national position in 1850 is almost as much in advance of that which we occupied in 1800, as it is behind that which we hope to occupy when the opening of a new century shall shine upon our quiet graves, and gladden the hearts of our children and our children's children, with the promise of yet richer harvests and the hope of a more unchequered civilisation?

Colonial Responsibility

LAST week, in an address of welcome to the Secretary of State for Commonwealth Relations, the Prime Minister of Southern Rhodesia uttered what were doubtless intended to be words of warning. Southern Rhodesians hoped that Mr Gordon-Walker would realise that

it is impossible to expect people who only sixty years ago were unaware of the use of the wheel, and knew no modern language, to advance suddenly to the sphere of legislation in this part of Africa.

Sir Godfrey Huggins was careful to say "in this part of Africa." But his warning is significant because this week the people of the Gold Coast have been going to the polls under a new constitution which will take them to a point of political advancement far ahead of anything else in colonial Africa. To some people this new constitution is a bold experiment; to others it is a gamble which can lead only to disaster and anarchy. What is more important is that the Convention People's Party, which is expected to become the dominant party in the new legislative Assembly, thinks that the new constitution does not go far enough.

There is nothing new in the general principles governing constitutional reform in the Gold Coast. The transfer from crown colony government to responsible government follows a set pattern all over the colonial empire. First comes the appointment of unofficial members to the Legislative Council and the gradual increase in their numbers and influence. Then they are elected instead of nominated, and eventually a main step forward is taken when the elected, unofficial, members are in the majority in the council. They now have power; but, to prevent this power from degenerating into obstruction, attempts are made at the same time to foster a sense of responsibility by giving some of the unofficial members of the legislative council seats in the executive council. To begin with, they are nominated by the Governor; this was the position reached in the Gold Coast under the Burns Constitution of 1946. Another stage is reached when these unofficial members of the executive council are elected by the legislative council from its own membership—a position reached in Trinidad last year, and in Jamaica in 1945. Then comes another big advance when these elected unofficial members of the executive council are in a majority over the official members. By this time the executive council has become the centre of government, the instrument of policy, in place of the Chief Secretary's Office under crown colony government.

When this stage has been reached—as it has in Trinidad, and in the Gold Coast under the new constitution—the local political leaders have attained considerable power. Indeed, only two things then remain to prevent either the obstruction of good measures or the enactment of bad ones. One of these is the powers still reserved to the Governor, the other is the elected members' own sense of responsibility.

The powers reserved to the Governor are those of veto—that is, the power of refusing assent to a measure—and of certification—that is, of declaring that a Bill which he considers essential for good government should have effect even though it has not been passed by the Legislative Council. On paper, these powers are con-

siderable. In practice, they are much smaller. The constitution usually provides for some check on the Governor's use of his reserve powers—such as that they can be used only with the consent of the executive council or, failing that, with the prior authority of the Secretary of State (except in cases of urgency). It may be that the existence of these reserve powers acts as a brake on the worst forms of irresponsibility. But they are rarely used nowadays, and there is some force in the view that their disadvantage as an irritant outweighs their value as a deterrent. The Coussey Committee, the all-African body whose recommendations form the basis of the new Gold Coast constitution, nevertheless advised the retention of reserve powers. The British Caribbean Standing Closer Association Committee (the "standing closer committee"), which drew up the framework of a federal constitution for the West Indies, also thought there was a need for reserved powers to enable the imperial government to discharge its responsibilities for defence, international relations and financial stability; but it made the interesting suggestion that they should be exercised by His Majesty by order-in-council. This would not in reality diminish the authority of the Governor, since he now has to get the consent of the Secretary of State before he can use his powers, and it might remove a potential source of friction between him and the local political leaders. The reserve powers are, at best, not a very strong guarantee of good government. The major reliance must be on a growth of a sense of responsibility among those to whom power is being transferred.

*

Yet another, more serious, obstacle to the growth of responsibility lies in the executive council itself. It is asking too much for the unofficial members of the council, when they have not a clear majority, to accept responsibility for government. This has been made very clear in Jamaica under its present constitution. The island's executive council consists of equal numbers of elected and of nominated and *ex-officio* members, with the Governor exercising a casting vote. There is, it should be pointed out, no question of the Governor using his casting vote to force through a measure which is obviously opposed by the elected members. It would be contrary to commonsense for him to do so. Similarly, he would not use his vote to defeat a measure on which the elected members had set their heart. Yet so long as they can, in theory, be outvoted in the executive council, they can disclaim all responsibility for the actions and measures of the council when they want to. It can often happen that, when a measure agreed on in the Jamaican executive council turns out to be unpopular the minister concerned can stand up in the House of

Assembly and court popularity by declaring that he had no responsibility for it.

Those who say that to give the unofficial elected members of an executive council a majority is going too far should reflect on the experience of Jamaica in the last five years. It will probably be said, when the present constitution is revised and there is an elected majority on the executive council, that the island's politicians have not shown themselves worthy of a further advance towards responsible government. But they can hardly acquire a sense of responsibility without it.

An elected majority on the executive council is not, however, enough. The "standing closer committee" pointed out another failing in the normal method of selecting the unofficial members of the executive council. Where, as in many colonies which have reached this stage of constitutional advance, these members are severally elected to the executive council by the legislative council, there can be no sense of cohesion, of collective responsibility, among them. Their primary loyalty, the committee pointed out, is to the body which elects them, not to their colleagues. It, therefore, recommended that, in the proposed federal government for the West Indies, the House of Assembly should elect one of its members to the Council of State (the executive council) who should thereupon be designated Prime Minister. The other unofficial members of the council should be selected by him, and authority would, therefore, be concentrated in his hands. A similar practice has been in force in Barbados in the last few years. There, the leader of the House of Assembly is invited to submit the names of four members of the House of Assembly for appointment to the executive committee. It will be interesting to see the results of the compromise reached in the Gold Coast, where the executive council is to be appointed by, and responsible to, the Governor, but will also require the approval of the Legislative Assembly appointed by the Governor.

*

It may be objected that all this concern with the details of colonial constitutions is really beside the point. The important decision to be taken is whether, judged

by the results to date and the foreseeable prospects for the future, the process of transfer of power and responsibility to the colonial peoples is going too fast. The liberal British theory in the past has been that the process can hardly be too rapid, that whenever a group of inhabitants can be found ready to shoulder responsibility, it should be thrust upon them. But though this is still the principle of the Colonial Office's policy, many sections of opinion in Great Britain which have supported it in the past have come to have serious doubts about it today.

This is too big a question to be debated in a paragraph or two. But the questioners might reasonably be asked whether they have considered the practical consequences of calling a halt. Perhaps, if a different decision had been taken a generation or more ago, a different course might present fewer difficulties today. But His Majesty's Government has been proclaiming so long and so often that self-government within the Commonwealth is the goal of all colonial peoples that their politicians can be forgiven for taking it at its word. And constitutional reform, once it has been started on its course, acquires a momentum that makes it very difficult to stop, especially in its later stages. It is worth noting, for instance, that the Soulbury Constitution for Ceylon lasted only three months, after which the colony achieved full dominion status.

Judged by their general level of education and economic development, the colonies that are now hovering on the brink of responsible government are not ready for it. Yet are those who argue that the pace should have been slowed down prepared to accept the force and the bloodshed which refusal to grant reform would almost certainly entail? The demand for political advancement is catching—already Central African leaders are aspiring to a "Gold Coast constitution." The only way to direct colonial nationalism along sound lines is to give the colonial politicians—of whatever race or colour—a chance to act responsibly, and this can best be done not through the ballot box, which confers power without responsibility, but through the executive council. Yet, however soundly a constitution is drawn up, it cannot force the colonial politicians to act responsibly. In the next few years, it will depend on them whether government is responsible in fact as well as in name.

Defence Comparisons

COMPARISONS are proverbially invidious, and comparisons of efforts and sacrifices between allies are possibly the most invidious of all. It is doubtful whether anybody in Great Britain would have wanted to institute a comparison between what is being, has been and is about to be done in the common cause in Britain and in America. But in American public opinion, the widespread belief that Britain is "dragging its feet" and that a disproportionate part of the burdens of resisting Soviet imperialism is being placed on American shoulders appears to be reaching a point of some public importance. If these things are to be debated, it is as well that the debate should be based upon facts and not upon fancies. This article is an attempt to provide some of the facts as nearly as possible in comparable form. No attempt will be made to draw conclusions.

Two preliminary points should be made. First, if the comparison is to be factual, it can only be based on

the record of the past and present. Estimates of what is to be done in the future must be excluded, partly because they are only estimates, which may turn out to be very defective, and partly because the practice of the two governments in regard to future expenditure is very different. The American executive asks Congress for very large authorisations which are intended to be ceiling figures and may never in fact be attained. The British Government, with its more intimate relation to the legislature, puts forward estimates which are more the minimum figures and can always be supplemented later. This article, therefore, is confined to the period from the culmination of the war to date. Secondly, the comparison made here is between the expenditures of money and manpower made by each country in its own defence. Both countries have, throughout the period, been giving aid to other nations, America by the Marshall Plan, Britain by the release of sterling balances and other

means. These programmes have doubtless served defence ends; but they have been mainly civil in character; and it would be beyond the ingenuity of statisticians to separate the defence element.

The data are presented in the accompanying tables and diagrams. One table and one diagram show money expenditure; the other table and diagram give a comparison of the size and disposition of the armed forces of the two countries.

*

The financial figures have, so far as possible, been reduced to a comparable basis. Thus the American figures have been readjusted to the British financial year, which runs from April to March. The amounts include, in addition to the costs of the armed forces, certain programmes closely related to military services and, in particular, the stockpiling of strategic materials. Thus, on the British side, the expenditures of the Ministry of Defence and of that part of the Ministry of Supply directly devoted to defence (with the Ministry of Aircraft Production during the war years) are added to those of the armed services. The British figure of £824 million for the current year is the total of the estimates, including supplementaries. The American figure of \$16,400 million is based partly on the actual expenditure of \$10,522 million in nine months to December 31st and partly on the President's recent estimate for the twelve months ending June 30, 1951. In the eight years covered by the table, from April 1, 1943, to March 31, 1951, the United Kingdom will have devoted 23.0 per cent of its national income to defence; the corresponding figure for the United States is 19.5 per cent.

The manpower table contains three pairs of columns.

Year Commencing April 1st	DEFENCE EXPENDITURE					
	Total Figures		Index, 1943-44=100		As Percentage of National Income	
	UK	USA	UK	USA	UK	USA
1943	£ mn. 4,183	\$ mn. 85,781	100	100	51.0	49.5
1944	4,184	89,984			50.3	49.0
1945	3,812	64,763			45.8	35.6
1946	1,590	19,618			18.8	10.6
1947	881	13,334			15	6.5
1948	758	11,604	18	13	7.6	5.2
1949	736	12,739	18	14	7.1	5.7
1950*	824	16,400	20	19	7.7	6.9
Total of above.	16,968	314,223	...	...	23.0	19.5

* Estimated.

The first of these gives the absolute totals of men and women in the armed forces (excluding part-time service such as immobilised National Guard or Territorials). These figures, of course, ignore the relative size of the two communities. Accordingly, the second pair of columns gives the total of men in uniform as a percentage of the field of recruitment from which they are drawn—that is, of the total of men of military age. The third pair of columns gives the proportion of each country's armed forces serving overseas. This comparison is more difficult to make since the definition of "overseas" is not the same in the two countries. In the United States, the distinction is between those within and those outside the continental United States. Consequently, soldiers or sailors afloat at the time of the census are "overseas" whereas in Britain they are classified according to their base. Although men serving in the British Home Fleet may be away from the coast for a considerable period of the year, they are not regarded as on foreign service. It is only necessary to recall the part played by the Home Fleet in the Battle of the Atlantic to realise how misleading these statistics can be. In the table, the British figures have been adjusted as far as possible to bring them into line with the American ones but the adjustments are almost certainly on the conservative side. It is also only fair to add that the home base in Britain is considerably nearer to at least one probable seat of trouble than is any base in the United States.

It is not intended in this article to draw more than one moral. When allowance is made for the imperfections of the statistics, the salient fact that emerges is the very close parallelism between the two sets of figures. There is no basis of fact sufficient to support either an eastbound or a westbound traffic of complaint across the Atlantic.

Date	DEFENCE MANPOWER					
	Total Numbers including Women (thousands)		Men in Armed Forces as Percentage of all Men Aged 18-44		Percentage of Total Forces Serving Overseas	
	UK	USA	UK	USA	UK*	USA
Mid-1943	4,761	9,043	41.8	30.9	n.a.	29
" 1944	4,967	11,450	43.9	38.5	38	49

NOTES OF THE WEEK

The Government Wins

The Government's majority of ten in Wednesday's division on steel was larger than had been expected in an influenza-ridden House, but at no time did the Opposition in fact entertain any great hopes of winning this division; indeed, the more realistic Tory leaders are reconciled to the possibility that the Government may go on winning set-piece divisions for some time. From the Opposition's point of view, the debate achieved its two secondary purposes. It enabled the Conservatives to reaffirm their intention to undo steel nationalisation if they regain power, and it gave Mr Churchill a further opportunity to deploy the arguments which he hopes will carry final conviction at the next general election.

The debate itself produced little that was new except Mr. Strauss's vague references to the interim machinery by which it is hoped to smooth the changeover in steel and to ensure priority for the needs of the rearmament programme. The Opposition's main case was once again that nationalisation should be postponed in the interests of national unity and efficient rearmament, and naturally it fell on determinedly deaf Ministerial ears. The Labour party has not grown more willing to change its set course on steel nationalisation in order to secure Conservative support at this stage. Mr Churchill spent some time examining the motives for this act of "partisan aggression," this "crazy step," this "unpatriotic deed," and concluded that it was a major act of appeasement of Labour's left wing. This, however true it may have been when the Steel Act was first devised in 1948, is now an over-simplification. Even the more moderate Ministers undoubtedly feel that, having committed themselves on this highly controversial measure, to draw back would be to throw doubt both on their own leadership and on the principle of nationalisation which, for want of a better, remains the mainspring of Labour theory. They are driven on as much by the fear of admitting to themselves that they might be wrong as by any fear of their critics.

In the division the Liberal Party rallied after its many hesitations of recent months and voted unanimously against the Government. Any other course would have been one more deadly blow at its own position in the country. On the other hand, the Liberals have made it clear that they do not propose to join the Tories in any further attempt in this Parliament to reverse the steel decision. This emphasises what the Tories have now recognised, that only a general election can secure the return of steel to private ownership. Meanwhile, they have made it clear that they will harry at every turn what Mr Oliver Lyttelton described as this "planless, coalless, meatless, hopeless government."

* * *

The Government's Insecurity

In attacking the Government on steel, the Opposition chose a subject on which there are no longer any important dissensions within the Labour Party. But on all the other subjects due for debate, there is still a considerable turmoil of opinion within the party. It is true that the special meeting of the Parliamentary Labour Party on Wednesday produced no violent explosion—it seldom comes up to expectations in this respect—but this was partly because the ground of debate was shifted from the economic implications of defence, on which there is considerable feeling, to defence itself, which occasions less interest. There was, however, a spirited attack on Mr Maurice Webb, the Minister of Food, for the harm that his handling of the meat ration has done to the Government's reputation.

It is clear that in next week's debate on foreign policy and defence there will be no mass abstention or opposition by the left wing of the Labour Party, not because it has been converted to the Government's view but merely on the ground that open dissension would mean a Tory government. Ramsay MacDonald more completely dominates the policy of the Labour Party from beyond the grave than he ever did when alive.

The difference between the present political situation and that of a few months ago is not that the Government's narrow parliamentary majority is any less secure. It is that the majority quite clearly no longer corresponds to the degree of public support for Labour. The latest Gallup Poll figures published on Monday in the *News Chronicle* show the Tories with a lead of 51 per cent of the popular vote, against Labour's 38 per cent. No doubt this margin would narrow during an election campaign, as it did last time. But at the previous peak of the Government's unpopularity, in November, 1949, the Conservatives' lead was 3 per cent smaller than it is now. Ministers must fear not merely that the majority of the country is against them but that they have little chance of regaining a lead over the Tories. If the government were defeated in a snap division, as happened last year, it might well now seek a dissolution.

* * *

Nearer a Four-Power Conference

The latest of the long series of Notes from Moscow on the subject of a four-power conference still leaves the western foreign offices guessing what the inscrutable and verbose Russians really mean. Ninety per cent of the Note is, as usual, pure propaganda; Mr Molotov certainly knows that there is no possibility of the western powers presenting him with a rearmament Germany as a *fait accompli*. Indeed, western policy (which has veered in face of the German opposition to rearmament) is now, very sensibly, to hold only non-committal practical discussions with the German authorities, until such time as the Allied forces are stronger on the ground, and the necessary political conditions have been established for a genuinely willing German contribution to their own defence. General Eisenhower made the present American views on this question very plain in his report to Congress.

The kernel of Mr Molotov's Note is the passage in which he expresses conditional willingness to discuss questions other than German demilitarisation. By this he might mean merely that he would include those provisions of the Prague resolution dealing with a peace treaty and the withdrawal of troops from Germany. These are in any case the main aims of Moscow's policy for both Germany and Japan. On the other hand, Soviet insistence upon keeping the conference within the framework of the Foreign Ministers' Council, as set up at Potsdam, leaves room for the western powers to raise such pertinent matters as the Russian rearming of the ex-enemy satellites in excess of treaty limits.

It may be assumed that Moscow does in fact wish to hold first a conference which would deal exclusively with Germany and then convene a second meeting of the Council of Foreign Ministers, enlarged to include Mr Chou En-lai, for the purpose of reaching a similar settlement on Japan. Mr Molotov would, however, probably be glad to delay the first conference in the hope that Herr Grotewohl, in the meantime, would have succeeded in finding Western German representatives who are willing to meet him and pass a resolution on the same lines as the Prague declaration. It would greatly strengthen the Russian case if a pressure group of east and west Germans could be used at the conference.

Both Dr Adenauer and Dr Schumacher are, however, well aware of the manoeuvre and have exposed it to the German public.

Under these circumstances the western Foreign Ministers would be well advised to advocate at once an early meeting of the powers, and to clarify their own minds on the terms which they should demand for a German settlement. In doing so, it is essential that they should be in full accord with the Federal Chancellor and the Social-Democrat leaders; nothing must be left undone to make it clear that Western Germany is not going to be sacrificed in the attempt to squeeze a smile out of Mr Molotov.

* * *

M. Pleven and His Plans

By all accounts M. Pleven's visit to Washington has been a great success, more successful, in fact, than Mr Attlee's. Apart from more aid for Vietnam, the French Prime Minister was mainly in search of the United States' confidence in France as its chief and permanent military partner on the European continent. In his speech to the National Press Club M. Pleven said:

We shall never allow the unity of the western world to be broken by any act or threat whatever, whether from the interior or the exterior.

This statement evidently gave the lie to American suspicions of French neutrality in a world war and has made its due effect.

Reports of the last days suggest that the Schuman Plan has, largely owing to American representations, been salvaged on the brink of the dust-bin in negotiations between the High Commission and the German Federal Government at Bonn. The Pleven Plan for a European Army—originally the intended sequel to the signing of the coal-steel pact—is, however, still shrouded in diplomatic fog. Invitations have finally been sent by France to the European governments to attend a technical conference on the formation of some kind of supranational army, which may constitute a component of the whole Atlantic Force under the command of General Eisenhower. In this project the French have, it seems, transferred their emphasis from the limitation of the size of units (although not the total volume) of German armed force to the question of effective Atlantic control of the personnel and policy of the German command. Thus, while the dispute over combat teams and divisions may subside, France will stick to its contention that some European politician must be authorised by "Europe" as High Commissioner to sanction or blackball the appointment of individual German officers to positions under General Eisenhower. Neither French public opinion nor the French government is likely, for instance, to swallow the re-appearance on the European stage of General Guderian or any other leading light of Hitler's war, however great their military skill. In this manner the formation of General Eisenhower's armies need be retarded neither by the presence of a "European Defence Minister" at General Eisenhower's elbow nor by an abstract limitation of the size of German units.

Provided that M. Moch makes no further public utterances on German rearmament and that the phrase itself is banished from the headlines of the world press, there is a chance that 1951 will see a harmonious development of Atlantic Defence. The bare formula "European Army," instead of being an escape-concept devised by dispirited continental nations more fearful of ex-Nazi Germany than of Stalinist Russia, may become a real live army in Europe. M. Pleven's talks with President Truman will surely also have done something to lighten the obscurity which has surrounded the future relationship between SHAPE, Nato and the general foreign policies of the governments which participate in these agencies.

Second—and Third—Rounds

The Government is not getting far with ideas of a new wages policy. Mr Gaitskell and Mr Bevan had "exploratory" talks with the TUC's economic committee on Tuesday. The views of the union leaders seem to fall into two groups. There are those who think it futile to try to revive any policy of wage restraint; and there are those who would again champion restraint provided the Government first gave positive proof of its capacity at least to prevent further increases in prices and profits. Since, in fact, prices are bound to go on rising for a time, neither point of view encourages the Government to make proposals of its own.

It seems certain that within a matter of weeks almost every large group of workers will have gained an advance in wages since restraint finally broke down last autumn. The immediate question is whether the new line can be held for a time—with or without any formal policy. Most unions are probably quite prepared to pause before making fresh claims, provided that everyone pauses. But if one or two unions decide otherwise, it is inevitable, with the present pressure of demand, that the rest will soon follow their example, the employers will be unable to resist, and the spiral will take another full turn. It is hard to see that the Government can stand aside and do nothing if this process begins before the Budget. What has to be doubted is whether it can in fact do anything effective by another direct attempt to hold down wages. And even a disinflationary financial policy takes time to exert its influence on wage negotiations; it might be the third rather than the second round of wage advances that the Budget succeeded in inhibiting. That it should succeed is all the more important.

* * *

The Dock Strikes

It is most encouraging that the trade union leaders of the dockers have succeeded in preventing the dock strikes at Liverpool and Manchester from spreading to other ports. Early this week Mr Deakin and his colleagues in the dockers' section of the Transport and General Workers' Union opposed and defeated the attempt of the so-called Port Action Committee to enlist support in London for the strikes; they showed that no more than about two hundred of the 27,000 dockers in the London area were prepared to follow the Communist line. Their success has also had repercussions in Liverpool, where, at the time *The Economist* went to press, the strikers seemed to be losing enthusiasm.

The alleged cause of the strike, which was called by unofficial agitators without warning, was dissatisfaction with the wage agreement ratified by a substantial majority of the dockers' leaders last week; this increased the minimum wage from 19s. to 21s. a day. There is little doubt that the real point was to make one more attempt to break up the official unions. There are also some grounds for believing that, like the "go slow" movement among engineering workers in the same area, the strikes were part of a general campaign by the Communists to dislocate industry in the north-west region.

The chief cause of the Communist failure in London was the energetic effort which the official union leaders have made during the past twelve months to show up Communist motives for what they are. Mr Deakin has been relentless in his attack, and every part of his organisation is now alive to the methods by which the Communists have sought to gain control of branches and districts in the past. From the point of view of the country as a whole, this is undoubtedly the best way of making the Communists harmless. It obviates any need for drastic political or legal action—which might so easily be misunderstood and misrepresented—and it strikes at the foundations of Communist influence.

Shocking Pink

It may or may not be significant that the colour chosen for "The British Road to Socialism"* is one easily recognisable by anyone conversant with fashion literature as "Shocking Pink." It is more certainly significant that the Executive Committee of the Communist Party should choose for its programme a markedly nationalistic title, and that the contents of that programme should have an unprecedentedly nationalist, even patriotic, slant. The familiar pie-in-the-sky and down-with-the-wicked-exploiters themes are of course not omitted, but they are well in the background; the main plank of the Communist platform is nothing less than a declaration of British independence.

Independence, needless to say, of the "American millionaires" whom President Truman presumably represents; independence of the "war camp" of the Atlantic and Brussels pacts; this is the independence now threatened or forfeited by the treachery of the Labour Government. That any threat to an "independent"—i.e. disarmed and isolated—Britain could possibly come from the "peace-loving" nations in general or the Soviet Union in particular is a calumnious myth. Socialism must come in each country in a form, and by means, arising out of that country's needs and traditions; British Communism is British, it is implied, not Soviet-dictated or Cominform-inspired. And so on, for more than half the pamphlet; the remainder being concerned with constitutional and economic projects deserving no more attention than usual.

There are two main bodies of opinion whom this change of front may be designed to impress. One is the Communist Party membership itself. Not all Communists, presumably, are completely devoid of concern for the specific interests of their native land; is there a danger that, unless reassured, some might find in a leadership wholly and overtly subservient to the Kremlin a justification for that horrid thing Titoism? Is King Street vaccinating its devotees with a non-lethal dose of nationalism, to forestall an Italian-style split? The other, of course, is the Labour Party's lunatic fringe, sufficiently disgruntled by rearmament and its attendant discomforts—so Mr Pollitt may think—to be attracted into the fold of true Socialism by a gentle smoothing away of obstacles. In either case it is significant that the means of popularity should be sought in the repudiation of what used to be a central tenet of Communism everywhere—its overriding internationalism, its contempt for frontiers, its assertion of the unqualified unity of the workers' International. Mr Pollitt must have put on his bowler hat to draft this new version of a popular front programme.

* * *

Paris versus London Headquarters

As the time approaches when General Eisenhower's headquarters near Paris take shape attention is focused on a problem which has been worrying European and American officials for some time. What is to be the future of the tenuous relationship between the older Organisation for European Economic Co-operation and the newer North Atlantic Treaty Organisation? Are they to remain separated geographically by the Channel and functionally by two different aid programmes? How can the two staffs be best used?

On the American, the aid-giving, side a marriage has almost been arranged. It is too soon to say that it will shortly take place for a number of questions remain unanswered: in particular, whether economic and military aid, after the present ERP credits expire in June, will actually become one or will merely be tightly co-ordinated; how the Economic Co-operation Administration can be most efficiently merged with American Nato missions, and whether

*"The British Road to Socialism." Published by the Communist Party, 16, King Street, W.C.2. 22 pp. 3d.

Paris or London will be the centre. But Mr Katz, the US special representative in Europe, and Mr Spofford, the American deputy on the Atlantic Council, have just returned to Europe after talks with the new co-ordinator of foreign aid programmes in Washington, Mr Thomas D. Cabot. And they undoubtedly have in their pockets some plans for streamlining the shape of American organisations in Europe.

While the European offices of ECA are thus in suspended animation, the struggle in the field between OEEC and Nato becomes increasingly bitter. The device adopted last October of trying to resolve it in favour of both parties by turning OEEC officials into the Nato economic and financial working group, set up in Paris, has not yet succeeded. The conflict is seen at its most acute on the issue of location. On the one hand, Britain and some leading American officials in Nato want to stay in London. They fear the quicksands of the continental atmosphere and prefer the calmer London air where Anglo-American co-operation thrives so well. On the other hand, the continentals and some Americans argue that it is nonsense to divorce the political and production authorities from the military headquarters, when they must in time of peace be in daily contact. These national arguments have an emotional counterpart in the fears of the smaller countries that London is the breeding ground of great power (particularly Anglo-American) oligarchy. The air is already slightly tainted with resentment over the three-power military Standing Group in Washington and there is a determination that the deputies shall not try a similar coup. The situation threatens to sterilise the economic work of both organisations and should not be allowed to continue.

* * *

Rumours from Prague

The published results of the Czech economic plan for 1950, incomplete and inadequate though they are, provide an important clue to the meaning of last week's rumours of dissensions and purges within the civil service and the Communist Party. Although a rise in production is claimed in almost every branch of industry, it is admitted that heavy engineering production fell 0.6 per cent behind the plan target, which must represent quite a large falling behind in the super-plan target; and although the mining industry exceeded the plan target by 3.7 per cent, it only achieved 99.5 per cent of its super-plan target.

These deficiencies may not appear excessive—the targets were perhaps in any case impossibly high—but they occur in key sectors of Czech industry. Coal is the foundation of all economic development; and the inability of the Czechs to build enough heavy engineering products is placing them in a very difficult position. They have been increasingly unwilling to give the Russians priority in the delivery of machinery because they have been desperately anxious to maintain their deliveries in the West, whence must come essential raw materials as well as consumer goods needed to stimulate the productivity of Czech workers.

The reports of extensive purges in various Czech ministries may be exaggerated. Certainly Mr Kliment, the Minister of Heavy Industry, still seems to be riding out the storm. But whatever purges there have been are undoubtedly due to the Soviet Union's dissatisfaction with the contribution Czech industry is making to its voracious needs. It has also been expressed in the holding up of promised grain supplies to the Czechs. The Czech Government has tried to put the blame for the subsequent food shortage on the hoarding and speculative activities of "criminal hostile elements"; and it has raised the price of bread and flour, ostensibly because of the improved quality of the flour, but really in an attempt to ration by the purse.

It should also be remembered that, apart from their economic performance, the Czech Communists have been

proving unsatisfactory in other ways. They have failed to press ahead with the collectivisation of agriculture; and the Cominform journal's attack two months ago on the "political and theoretical mistakes" of the Czech Communist paper *Rude Pravo* was really an oblique attack on the ideological shortcomings of Gottwald, Zapotocky and other leading Communist politicians.

* * *

Communist Patriots in Italy

It is as yet too early to estimate the exact significance of the latest defections from the Italian Communist Party, which are discussed in an article from our Rome correspondent on page 326. To jump to the conclusion that the revolt led by Signore Magnani and Cucchi, and the subsequent purge to which such revolts always give rise, are a serious blow to the efficiency of the party would certainly be wrong. Similar defections—although not of such leading party members—and similar purges have happened before. They do not touch the inner core of fanatical Stalinists; indeed, it might be argued that they can only benefit from the sloughing-off of all whose loyalties might be divided if ever a real bid for power were made.

The issue over which Magnani and Cucchi split with their comrades was not one of party dogma; it was a simple principle of patriotism. They could not stomach the Communist campaign to undermine the willingness of the reservist to defend his country. They recognised from whence the danger threatens; and they felt compelled to reaffirm their belief that, where Italy's territorial integrity is concerned, the Soviet Union is "just like any other country." Their stand is not likely to affect the Communist diehards, who have already been actively planning their battle stations on the hoped-for day when Italy is invaded by the Red Army. But it is clear that it has been received elsewhere with sympathy, and sometimes with more than sympathy. It is not without significance that the pro-Magnani posters plastered all over the strongly Communist town of Corregio in Emilia were not torn down; that a local general strike, called for last Monday to show the strength of the Communists, was called off; and that the powerful Communist-dominated Partisans' Association is reported to have split over the question of the defence of Italy.

That the party leaders themselves are seriously concerned is shown by the absurdity and virulence of their attacks on the two rebels. Magnani and Cucchi are of sufficient eminence and reputation within the party to serve as a rallying point for any other "national" Communists; and the cause of their quarrel with the party can only increase the discredit into which Communism in Italy has gradually been falling.

* * *

The Use and Abuse of Land

It is an unfortunate coincidence that the Ministry of Local Government and Planning's handbook, "The Control of Mineral Working" (HMSO. 2s.), should appear at the same time as the Minister of Fuel and Power's announcement that open-cast coal-mining is (contrary to an earlier promise) to be carried on indefinitely and on a wider scale. It is the responsibility of Dr Dalton's Ministry to ensure that all land is well used, and nobody contends that open-cast coal-mining falls within this definition. It is a wasteful way of using land, as well as a costly means of getting coal. The provision that the land shall be restored to a suitable condition after use (to the limited extent that this is practicable) makes the operations less wasteful but more costly.

The Ministry's handbook, which is intended as advice to the local planning authorities and the interests affected, significantly excludes coal from its terms of reference. All

other minerals may be worked only by permission of the local planning authority and subject to any conditions imposed by it. The handbook, on the whole, adopts a sensible approach and stresses that economic factors should be carefully studied and onerous conditions avoided. All the same, it is strange justice that private mineral undertakings should be closely regulated while another Ministry is free to tear up as much land as it pleases in pursuit of its production target. In the former case, the interests of agriculture and amenity are carefully protected; in the latter case, the extensive damage done them is merely "regretted" by the Minister.

The need to get more coal is not an adequate defence of Government policy. Open-cast mining is a temporary expedient for avoiding the difficulties involved in recruiting sufficient labour for the mines. As such it may now have to be continued for a few more years. But it provides no permanent solution to the coal problem—especially since suitable sites are being rapidly exhausted without making more than a fractional contribution to coal stocks. A Government which enjoins on others the prudent conservation of land resources should surely not be so careless itself.

* * *

Proposals for Local Government

Sir Malcolm Trustram Eve, in a lecture this week at London University, gave an able defence of the proposals which, as chairman of the ill-fated Local Government Boundary Commission, he put before the Government in 1948. Sir Malcolm is no inhuman advocate of the big unit in local government. He urged that the all-important "human" services—education, health, the care of the aged and of children—should be administered as locally as possible; and he contended that any town having, broadly, 60,000 or more inhabitants could provide these services efficiently. This conception of a new type of borough, responsible for most, but not all, local government functions, was the most fruitful idea in the commission's report. The new type of authority might prove as appropriate to the conditions of this century as the county borough was to those of the last. The complementary aspect of the proposal is that certain other services (notably police, the fire service and the making of town and country planning schemes) should be administered over the broader area of the geographical county.

Sir Malcolm also applied his ideas to Greater London, an area not included in his commission's terms of reference. He recognised the LCC to be an anachronism; but he rejected the idea of a Greater London Authority because it would be grossly oversized—even if its functions were to be restricted (as they well might be) to physical planning and the protective services. Instead he would split up the area of the Metropolitan Police District into six county councils, each with from one to two million inhabitants. This would produce smaller and neater administrative counties both inside and outside the London wen (for Kent, Essex and Surrey would be shorn of their suburban areas). The proposal is worth considering. However, Sir Malcolm might more logically have arrived at the notion of returning his "human" services to the minor authorities in Greater London—most of which already meet his minimum requirement of 60,000 inhabitants. Why, then, should they not become most-purpose authorities, possibly within the framework of a single large county council whose powers could be strictly limited?

In general, the Boundary Commission's scheme of reform is by no means perfect; but it does represent the only constructive official proposals available for dealing with a pressing problem. The Government, which last year promised the quick production of superior proposals of its own, has a difficult task to do—and one that it has shirked for quite long enough.

Canada's Rearmament

The plans for Canadian rearmament and defence, announced on Monday by Mr Brooke Claxton, the Minister of National Defence, represent a very considerable advance on any programme that Canada has previously contemplated in peacetime. The strength of the active forces is to be raised to 115,000 men, which is about 70 per cent higher than the present figure, and ten times the size of the force Canada maintained in the 1930s. A brigade group is to be made available for service in Europe and the Royal Canadian Navy is to have 100 ships in commission. The RCAF will, within the next three years, produce eleven squadrons for the integrated force, will train 1,100 Nato airmen a year, and raise its first line strength by 3,000 aircraft.

The nature of the Canadian defence programme has been shaped by two unalterable factors: the impossibility of inducing the French-Canadian section of the population to accept conscription in peacetime, and the necessity to integrate armament production with that of the United States. It is no secret that General Eisenhower and the other Nato powers had hoped that Canada would send a full division to Europe, but the Canadians clearly feel that this is not possible without conscription. Their military effort has to be confined to a small force in peacetime, and the best offer that they can make is to have ready a speedy mobilisation programme in the event of war. The new programme envisages the mobilisation and equipment of four divisions in the first year of a war.

It is the necessity to standardise on American equipment which led to the decision to put the Canadian brigade group, when it comes to Europe, under American rather than British command, a decision that has been accepted with reluctance by the soldiers, who know and prefer British methods and organisation. At the end of the war Canada had arms and equipment of British make, or made in Canada on British lines, for rather more than two divisions. One division's worth was given to the Dutch last autumn; the decision to dispose of the other division's worth to the other Nato powers marks the final decision to standardise on American types. In aircraft, on the other hand, the Canadians in producing the *Canuck* fighter and certain other aircraft have effected a successful synthesis of their own between British and American types. It is therefore probable that the RCAF squadrons in the integrated force will be able to fit into either the British or American sphere of operations.

Peking's Decoy Ducks

An interesting internal development in China since the outbreak of the Korean war is an officially sponsored drive of the six non-Communist parties in the People's Government coalition for recruiting new members. Plans for this expansion are reported to have been worked out at conferences held in November and December, and each party has been allotted its particular field of political activity. Thus the China Democratic Association for National Reconstruction is to recruit industrialists and merchants, while "democratic overseas Chinese" are to be reserved for the China Democratic League. The licensed sphere for the non-Communist parties is strictly confined to the "national bourgeoisie" and petty bourgeoisie, whose support for the regime is to be thus organised; workers and peasants are strictly reserved for the Communist party, and even the so-called China Peasants' and Workers' Democratic Party is only to recruit "Government employees, specialists and technicians"—presumably those who in a society based on Marxist principles are anxious to cover themselves with a proletarian label. It is laid down that all non-Communists enrolled in the coalition parties must accept the common programme of the People's Political Consultative Conference,

participate in land reform, support the Government's foreign policy and observe the rules of the particular party which they join.

It may seem at first sight odd that a dominant Communist party should be thus encouraging expanded membership of middle-class parties which are in coalition with it. The Communist tactics, however, are quite logical in relation to the policy of postponing the expropriation of the "national bourgeoisie" (capitalists unconnected with either the Kuomintang or foreign interests) and the petty bourgeoisie until these classes have performed their function of expanding Chinese industry. The Communists need to retain and consolidate the support they had during the civil war from these classes, who were inspired by disgust at Kuomintang corruption and fiscal incompetence and also by nationalist motives—but they do not want them in large numbers inside the Communist party.

The function of the non-Communist parties in the People's Government coalition is to act as decoys for the middle classes, whom the Communists regard as class enemies and intend ultimately to destroy. The non-Communist parties have no real power in the state, and can be curbed or suppressed whenever necessary; for the Communists hold the key posts in the administration and keep a firm control of the army. The attitude of the non-Communist parties to their masters has nothing in common with what a free democracy regards as normal in an independent political party. Thus the Democratic League, in a manifesto at the time of its reorganisation a year ago, declared that in representing certain classes of the population its purpose was to "follow the lead of the Communist party," adding that "the path of Mao Tse-tung can never be wrong."

National Insurance Review

The Government Actuary's interim report on the working of the National Insurance Act up to March 31, 1950 (HMSO, 1s.), is non-committal and factual. What it gives is an estimate of the numbers in the different classes of contributors and in the different classes of beneficiaries. It also shows the effect of full employment on the National Insurance Fund. What it does not do is to give any hint that the original estimated rate of unemployment (8½ per cent) should be revised to the current actual rate of under 2 per cent, with a view to increasing national insurance benefits without a comparable increase in contributions.

On March 31, 1950, the reserve fund was unchanged, compared with the figure on July 5, 1948, and the National Insurance Fund, into which contributions are paid and out of which benefits are met, had risen from £109.6 million to £333.7 million. More than four-fifths of this increase is accounted for by the light unemployment figure. The cost of sickness benefit was slightly under the estimate—£66 million in a year compared with £77 million. Because so little has had to be paid out in unemployment benefits, the proportion of national insurance payments accounted for by retirement pensions is even higher than had been expected. It was estimated that they would account for half the total expenditure; in fact they accounted for nearly two-thirds. But this is not all. Owing to the increase in the number of people entitled to retirement pensions during the next thirty years, the cost of these pensions is likely to be doubled; and since the income from contributions will remain about the same (even if allowance is made for the additional 4d. per head per week payable from October), almost the whole of the extra cost of retirement pensions will fall on the Exchequer.

Clearly, therefore, if it is decided that the assumed rate of unemployment can be revised, the benefit should be used to relieve the Exchequer of part of this burden and neither to increase benefits nor to reduce contributions. Any help

that is to be given to national insurance beneficiaries to meet the rise in the cost of living should be given through the national assistance scheme—that is, after a test of needs. This is not the time for the state to become more generous to those of its old-age pensioners who have other resources.

Five Years of Housing

The record of the fifth year of Labour's administration of housing is now available,* and it is possible to look back over the whole period. Since Mr Bevan, as Minister of Health, consistently refused to commit himself to any definite target, no one knows how far he overshot or fell short of his own intentions. The greatest change during the period has been the shift in interest. In the early days the monthly output of houses was the dominant preoccupation and there were constant adjustments to get the programme into balance; there has since been a growing realisation of the problem of costs and an appreciation that the maladjustments have become more financial than physical. For two years the manpower engaged in house-building and the output of houses have remained stationary: 231,000 men have been producing 197,000 or 198,000 houses a year. Over the five years, 821,000 permanent houses and 157,000 temporary houses have been built and 283,000 homes have been provided in houses which have been adapted or converted. Some 1,250,000 families have thus been rehoused since the beginning of 1946.

Housing has now for two years been free from the disorganising shifts in capital investment policy, and it is disappointing that this period of stability has shown no improvement in productivity. The Government and the industry seem to have settled down into a remarkably firm rut. Much has been said about the value of incentive schemes and about the gradual decrease in the time taken to complete houses. These improvements are not visible in the returns. Dr Dalton can hardly be complacent about the resources in men, money and materials devoted to housing. Can they really not be put to better use, either producing more houses or doing something else? At the present rate of building, very little impression can be made on the central problem of housing—slum clearance. Until the Government is prepared to spread the resources devoted to housing more widely—by spending less on each individual house and by allowing private enterprise to attempt faster and more economical methods of building—new slums will come into being nearly as fast as old slums are cleared. At present private enterprise is building only about one-eighth of the

* Quarterly Housing Returns. Cmd. 8138, 8139.

houses. While the weight of Labour opinion will no doubt remain firmly on the side of local authority housing, it surely is not hard to recognise that a little more freedom would probably help to quicken the pace of building.

War's Waifs and Strays

The two most pitiful groups of refugees in the world today are the Arabs and the Koreans. The problem is not primarily to find them jobs and a new niche in the world, but to provide them with the basic necessities of life: food, clothes, shelter and medical supplies. There are about 800,000 Arab refugees and the present estimate of over 2 million refugees in South Korea will swell continuously as long as the fighting goes on. It is disgraceful that a sense of responsibility for these unfortunate people seems still to be so unevenly developed among the members of Uno; for the negotiating committee specially set up to chivy members into paying their agreed share of the cost of relief programmes has had only a qualified success.

It is true that Korea has not done too badly. Of the \$250 million aimed at, \$222 million has been pledged in currency or goods by 38 different countries. But of this sum all but \$29½ million has been pledged by two countries—the United States with \$162½ million and Britain with \$28 million. Only fourteen countries have contributed a total of \$34 million towards the Assembly's \$50 million Arab relief programme. Here again all but \$1 million has been provided by the United States and Britain; and since both the American contribution of \$25 million and the British one of \$8 million are conditional on "adequate contributions" being made by "a sufficient number of other governments," the future of the Arab relief programme seems to be in grave danger.

Unless the United Nations agency in Palestine receives new funds quickly it will clearly have to abandon its constructive rehabilitation projects and concentrate on the prevention of starvation and disease. And even if the Americans and the British waive—as they probably will—the conditions attached to their contributions, the sharp rise in world prices will make it extremely difficult for the agency to meet all demands even in the restricted field of relief. It is time to say frankly to some of the Latin American representatives—so ready with their advice and votes when the political fate of Palestine was at stake—that they are shirking their obligations as members and their responsibilities as civilised governments.

Intelligence

Specialists and research workers, statisticians and overseas correspondents: all these contribute to the columns of *The Economist* each week. Through *The Economist Intelligence Unit*, the same sources can be put at the disposal of business firms and other organisations. Perhaps you could obtain the facts and appreciations that you need by applying to:

world famous in a week... Within seven days of its sensational debut, the Mark VII Jaguar Saloon was heralded as the car of the year throughout the world. Certainly its striking appearance made it (in the words of the *Autocar*) "The Prima Ballerina of the Show" whilst the incorporation of the famous record-breaking XK120 engine ensures speeds in excess of 100 m.p.h. with noiseless, effortless ease. With generous comfort for five or six passengers, wide ranging visibility, enormous luggage accommodation and superior independent front suspension, this Jaguar is the most distinguished car of our time.

THE FINEST CAR OF ITS CLASS IN THE WORLD

The influence of TI in light engineering is world wide. The 49 British TI factories manufacture a range of products which include precision steel tubes—bicycles and their components—aluminium sheet, strip, extrusions and tubes—electrical appliances and accessories—high pressure cylinders—cold rolled metal sections—tubular furniture—glass packings and paint. As direct exports, TI sent overseas last year goods valued at over £14,000,000. Also great quantities of TI products went abroad as parts of finished articles made by many British industries. At home and abroad industry in general, and millions of people, rely on TI's engineering skill, sound craftsmanship and long experience.

Letters to the Editor

The Weapon of Publicity

Sir,—Your article in *The Economist* of January 27th is timely and valuable, but I think you deal too summarily with the BBC's overseas services. The Beveridge committee by its terms of reference excluded "those aspects of the overseas services for which the BBC are not responsible." Clearly the reference here is to the cold war propaganda broadcasting. Moreover the committee's discussion of the overseas services is brief and very general. Some of the fundamental aspects are not dealt with.

Concerning the cold war propaganda broadcasting, most persons who have had adequate and responsible experience of political warfare propaganda will agree that this activity of all others should be entirely a government activity. Such propaganda should be initiated and controlled throughout by an appropriate government agency, since, to be an effective instrument of political warfare and national policy, it must be the work of those who not only know all the relevant facts but are able to direct propaganda with a view to forthcoming developments of which they alone can have the knowledge. The United States government makes no mistake about this since the Voice of America is purely a governmental activity. But this is not all. The immense power of propaganda initiated and controlled throughout by a government is shown not only by the present Russian propaganda broadcasting, but by our own experience in two wars. I would urge on the government the absolute necessity of now making propaganda part of our rearmament, to be controlled and provided for side by side with the provisions for the fighting services.

On the rest of British overseas broadcasting the crucial question to be asked is how many people listen to these elaborate and costly programmes which are broadcast round the clock to all the world, day in and day out? The answer is, nobody knows; but such small information as is available leads to the presumption that listening is on a small scale. Paragraph 245 of the Beveridge report seems to be a tacit admission of this and the forthcoming establishment of an audience research organisation for overseas broadcasting is welcomed. But has the cost of such an organisation been considered? In some of the countries for which the information is most necessary the audience research will not be allowed. And even in friendly countries there will surely be considerable political objection to such an activity, for it will certainly be regarded as a very formidable propaganda activity. Surely the best way to achieve all the aims which our overseas services desire is to have an exchange of transcription programmes with such countries as will accept them. This means that the programmes will be broadcast in the national services of the countries concerned and we can know at once how many people are listening from the records of those same countries. Here the British Council and the BBC can

work very closely together, each saving the other large sums of money and really achieving the objects which they have in mind.

Finally, you put your finger right on the point when you asked if a central planning authority working to a common directive or pattern can be achieved. —Yours faithfully,
J. COATMAN
St. Andrews University

Planning in Germany

Sir,—In championing Mr Balogh, in response to my review of the latter's book on Western German economic policy, Mr Davidson has hardly done his cause a service.

It is no argument against the statement that the German circumstances—defined in my review—were unsuitable for an experiment in controlled inflation to say that the Germans in the last 25 years have shown themselves as suitable as other people for economic experiments, and have been ingenious in devising some themselves. This is indeed "word-making" to conceal a poverty of argument. The only point in harking back to the ineffective method of food-collection practised before 1948 should be to show that it was not possible to offer inducements to the farmers until the currency reform gave value to money, and freedom from controls brought goods to the shops. In other words, Mr Davidson, who thinks he is arguing in favour of "democratic" as opposed to "Nazi" controls, is really recalling evidence in favour of the policy which was pursued with such manifest success after June, 1948. He is, incidentally, wrong in stating that my review "admits the disastrous consequences of the economic policies" in Germany to date. It admits faults; but if the amazing recovery of Western Germany (in contrast to the Soviet Zone) is "disastrous," the word has really lost its meaning.

Mr Davidson's final disservice to Mr Balogh, though not to Russia, is to draw attention once more to the fact that the author supported reparations from current production. The fact that the other Powers once agreed that reparations might be taken when Germany had balanced its payments, does not alter the truth of my statement that it was a Russian thesis—nor does it become better economics.—Yours faithfully,
YOUR REVIEWER

Dangerous Corner

Sir,—In a leading article on January 27th you say "first things must come first. And incomparably, the first thing for Britain is that the Atlantic alliance should hold fast." I am sure that there are many besides myself who regard this as one of the most shocking statements ever published by *The Economist*. "My country, right or wrong" may have something to be said for it, but to adopt as the motto of the Foreign Office "somebody else's country, right or wrong" is to base our foreign policy on the most blatant form of expediency. The first

things for Britain must always be principle and justice, and justice is not something to be reserved for one's friends and denied to one's enemies. If we feel that we are bound by the Cairo Agreement to bring about the return to the present Chinese Government of Formosa, if we feel that the Chinese Communist Government should have a seat on the Security Council, even if we feel, on maturer consideration, that the crossing of the 38th parallel by the United Nations forces was in itself an act of aggression against North Korea, then we must say so publicly, even if by so doing we run the risk of offending our American friends.

To judge by the general tone of your article you have so little confidence in the good sense of the people of the United States, and in their readiness as believers in democracy to conform to the will of the majority, even though it is against their own views, that you feel the greatest risk we can run is to lose the support of the United States by voicing our own opinions. The partnership between America and ourselves which you regard as the only hope for the survival of this island if another war comes, and which I regard as the only hope for world peace and the defeat of Communism, requires, as you say, loyalty and mutual forbearance; but unless the partnership is based on honesty it will achieve nothing, and if it is obtained by the sacrifice on our part not only of the right to speak our minds but also of the right to stick to our principles, it can only result in the destruction of democracy and justice as we understand it.—Yours faithfully,
H. D. WALSTON
London, S.W.1

[Mr Walston should read our article again. So far from wishing to abridge "the right to speak our minds" or "the right to stick to our principles," the article affirmed them. We have never been afraid of frank speech to Americans; they always respect it, as the last two weeks have shown. Policy must, of course, be based on moral principles (is it not a moral principle to act in loyalty to those who have been, and will be, your best friends?) but it is the purest hypocrisy to pretend that the policy of a great power can be based solely on moralising generalities—particularly when, as Mr Walston's examples show, they can be given such queer applications. The true argument against the actions of the United States Government is not one of morality (for if that is the major consideration, the Chinese have behaved much worse) but of prudence; and the most imprudent thing we could do would be to permit the Atlantic alliance to be broken.—EDITOR.]

Ambassadors to Spain

Sir,—You seem to have gone badly astray in your note in *The Economist* of January 13th. You contrast the attitude of the Left to Spain with the lack of volunteers for Korea as symptomatic of loss of direction by the Left. That is a false comparison, as any disciple of the *New Statesman* could soon tell you.

To the Left, Spain was a struggle between socialist democracy and fascism—or so it was thought at first. Korea

is a struggle between a "people's democracy" and the near-fascist Syngman Rhee regime, which provoked the North Koreans even if it did not attack them first.

So, if you make an analogy with Spain, the International Brigade would be fighting for North Korea and not Syngman Rhee. British laws of treason and a slightly different view of Communism are among the reasons why the Left in Britain has not responded in the same way. Our native Communists have had a correspondent with the North Koreans and some have sent medical supplies. The non-Communist Left has been content to assume the discarded mantle of Colonel Blimp in the late thirties: "Gad, Sir, Garvin is right. There's only one way to stop these bullying aggressors—find out what they want us to do and do it."—Yours faithfully,
NEVILLE BEALE

Russlin

Keynes Behind the Curtain

Sir,—In *The Economist* of January 13th, after justly exposing the "extraordinary irrelevance, the effect as of ineffectively flailing fists," etc., as characteristics of a review of Keynes's "General

Theory" in a Soviet journal, you pose the important question: "what manner of mind is expected to be convinced, swayed, or strengthened in its convictions by this piece of epileptic incontinence?" Your answer is somewhat astonishing: Presumably it is the Russian mind, and the educated Russian mind at that. One only needs to look into the discussions of economic questions in "Russian Wealth" and other "thick" journals intended for the average educated reader in pre-revolutionary Russia to become convinced that it is not the Russian manner of dealing with questions of economics which presents itself in the Soviet review. *Le style, c'est l'homme*, true. But this style, "Dshugashvilese," as Koestler named it, is not the style of educated Russians of today. It is Communist style, inaugurated by Stalin and adopted by Communist writers and speakers in all the countries where there are Communists.

The real intention of articles of this kind in the Soviet press is precisely to show "the kind of view that is expected of a theoretical economist in Moscow." It is not necessary that he should be convinced, neither is he expected to be. The only thing needed

and expected is that he should behave as if he were convinced.

As to the genuine reaction of the Russian reader, I can recall my own experience. In 1939-41, as a student of history at the University of Moscow, I passionately and industriously searched in articles like that under consideration. I was searching for grains of truth about the outside world. This "inveighing" article on Keynesian Theory, had I read it in 1940, would have shown me that there are people abroad trying to find a way out of the capitalist system without revolution and "dictatorship of the proletariat," and that some of them seem to have found a theoretical possibility of eliminating at least the most unpleasant phenomena, such as economic crises and unemployment.

It is true that the kindly souls who demand "open-hearted, cards-on-the-table, man-to-man approach to the Soviet should study the style." But must the West deal with the Soviet? Instead of dealing with the Stalinists should it not try to deal with Russians? The latter have not been approached so far.—Yours faithfully,

S. V. UTECHIN

New College, Oxford

Books and Publications

The Rise of the Expert

The British General Election of 1950. By H. G. Nicholas. Macmillan. 353 pages. 21s.

Mr Nicholas has written a straightforward, fair, thorough and readable account of last year's general election. Nuffield College, which sponsored the study, must feel that the value of the experiment first made in 1945 has been entirely confirmed. This book has the same essential merit as its predecessor, Mr R. B. McCallum's "The British General Election of 1945": that is to say, it combines detachment with the ability to enter understandingly and even sympathetically into the spirit of an election campaign as it exists for all the three main parties.

The nature of the 1950 election is summed up in the fact that Mr Nicholas's most important and interesting chapter deals with party organisation.

The parties might differ in their attitude to a planned economy. They were at one in their addition to planned electioneering.

The Conservatives had full-time party officials in charge of all but 15 of the 542 constituencies in England and Wales. The inferiority of Labour organisation was in this respect more apparent than real. Though there were many fewer full-time Labour agents (279 in Great Britain) they were concentrated where the party headquarters wanted them; of the 115 constituencies that Transport House regarded as marginal, all but fourteen had full-time agents. The Liberals' organisational weakness was not in numbers—350 of their 475 candidates had the services of paid agents—so much

as in experience and training. In general, there had never before been such a concentration of power in the hands of the party central offices staffed by, and working through, a class of full-time, professional political workers—among whom there often exists, as Mr Nicholas points out, the camaraderie of experts on opposite sides of the fence.

It is a matter of argument how far the rise of the "back-room" professional is a direct and simple reflection of the development of modern techniques of persuasion, and how far it has been accelerated by the pigmy stature of contemporary political leaders. This issue Mr Nicholas does not discuss directly. It is significant, however, that the things he analyses carefully are the manifestos, the party broadcasts, the election addresses, the methods of canvassing and the social, vocational and educational classification of the candidates. Mr Churchill's is the only personality to receive any definition at all, and that thanks chiefly to the detailed account of his friendly exchanges with the *Manchester Guardian*. Even the Prime Minister and his five best-known colleagues are barely mentioned except for their specific actions or statements: four Cabinet ministers do not appear in the index at all and the remaining seven have twelve references between them.

Mr Nicholas gives a lively account of the campaign: perhaps the chief criticism must be that too much of the detail is confined to his elaborate account

of the newspapers' (not, in fact, the Press's) treatment of the election. It would be difficult by this time to draw any novel conclusions. The paradox of the 1950 election was that the campaign was serious-minded, honest, "demure," and yet it failed to perform satisfactorily any of the major functions of an election. It failed to return a Government with an adequate majority: it provided a mandate for nothing but the sort of moderation that can too easily mean getting the worst of all possible worlds: and—because of the conspiracy of near-silence on foreign affairs and defence, together with the ignorance or cowardice about economic issues that was widespread among the candidates—it contributed disappointingly little to the political education of the electorate. Mr Nicholas is not to be blamed if his book has some of the same characteristics.

There is an admirable statistical appendix by Mr D. E. Butler. Its main conclusions must, however, be treated cautiously. Mr Butler points out the existence of what he calls a "bias" in the electoral system: for any given total of votes over the whole country Labour will get fewer Parliamentary seats than would the Conservatives with the same number of votes, because so many Labour votes are "wasted" in piling up huge majorities in places like the Durham coalfield. This is not in dispute, but there are three dangers of misinterpretation: (1) This is no new development and its existence in no way "explains" the failure in 1950 of arithmetical rules which were supposed to fit the facts without any such allowance. (2) The statistician is looking for a tidy relationship between votes and Parliamentary seats, and what appears to him as a

"bias" is not necessarily an unfairness or a defect in the electoral system; the political theorist may well argue that votes in solid "one party" areas should be subject to some discount in representation. (Such refinement of argument is, of course, irrelevant for both the big parties, since to them the advantages of the non-transferable vote in single-member constituencies far outweigh the unfavourable weighting of votes that it makes possible.) (3) It cannot be assumed that the bias of the relation between votes and seats is necessarily also a bias as between opinions and seats. Mr Butler points out that the poll in safe Conservative constituencies was lighter than in safe Labour constituencies, and it may well be that the Conservative elector is more inclined than the Labour elector to leave things to his neighbours when he feels sure that the job will be done for him. The "wasted" Labour votes in Durham may have a parallel in inhibited Conservative votes in Sussex.

An Awful Example

The Cambridge History of Poland: From the Origins to Sobieski. Edited by W. F. Reddaway and others. Cambridge University Press. 607 pages. 42s.

The Cambridge University Press planned this two-volume history of Poland as long ago as 1936. The volume covering the period since 1696 appeared in 1941. The war has delayed the publication of this, the mediaeval volume, until 1950. Some of the contributors are dead, others have been cut off from the Polish archives by the misfortunes of war or by the political transformation of Poland since 1945. It is therefore not surprising that the volume already has the air of being out of touch with recent research, especially in relation to the earliest history of Poland.

Nevertheless the book is of great interest and value, especially because there is no other full and scholarly history of Poland in English or French. The truly epic political history of Poland, from its first emergence in the path of the German *Drang nach Osten* during the reign of Otto the Great down to the raising of the curtain on the first act of the Polish tragedy at the end of the seventeenth century, is here told with commendable clarity and fullness. The economic, social, religious and cultural

history is dealt with more superficially and patchily and is not clearly integrated with the political story. Nevertheless anyone who reads the book with understanding will perceive the fascinating and instructive idiosyncrasy of the Polish state.

Poland is history's awful example, for in Poland alone of the European states monarchy never won the battle against the land-owners. Even Hungary, the closest parallel, had its period of successful autocracy under the Angevin and Hunyadi dynasties. But the burden of Polish history is the recurrent efforts and failures of its kings, Piasts, Jagellons and Vasas alike, to establish an hereditary royal supremacy. The clue to their failure is to be found in the success which the land-owners had in eliminating the towns from economic and political power, for by so doing they destroyed the only ally which could have ensured the success of the monarchy. The monopoly of production and commerce which the Polish gentry secured for itself helped to make Poland one of the largest and richest states in Europe in the sixteenth century, but the land-owners neither would nor could give the Republic that order and security which alone could have saved it from partition.

Despite the fact that this volume has twenty-three contributors the essential unity of Polish history emerges from their narratives. But the volume is not free from the pit-falls which so often embarrass collective work. The worst fault is that each contributor has been allowed to spell the names of persons and places as he fancies to the confusion of the reader who does not know, for example, that Kassa and Koszyce are the same place or that Wladislaw and Ladislas are the same person.

Big Business

Social Aspects of Enterprise in the Large Corporation. By George Hurff. Pennsylvania University Press (London: Geoffrey Cumberlege). 133 pages. 16s.

The problems of economic size and of the locus, nature and motives of enterprise in the large organisation are generally discussed in this country in terms of the nationalised industries, which exhibit them most acutely. Mr Hurff's book demonstrates that to the greater part of them the issue of public or private ownership is irrelevant. Sheer

magnitude, with the separation of functions and dispersal of ownership which it involves, raises them in its own right.

"Social Aspects of Enterprise" disclaims both comprehensiveness and profundity; but it is neither superficial nor am-:eurish. The author skilfully economises space, energy and his readers' time by constant reference to the literature of the subject, from Alfred Marshall to the latest legal judgment, and builds up a significant and stimulating picture of the implications—economic and juridical as well as social—of great size. From the point of view of pure economics its most striking feature is the separation, with the rise of the salaried executive class, of the traditionally profit-rewarded functions of dynamic innovation and adaptation from the legal right to receive profit. Profit, it appears, may serve as a yardstick long after it has ceased to offer a direct personal incentive—though Mr Hurff is careful to point out that indirectly it may have as big an incentive value as ever. The "division of the corporate usufruct" between executives, labour force and shareholders has ceased, he holds, to be capable of determination on purely economic grounds—an argument of unmistakable political importance. The legal elements of the picture can hardly be fully appreciated, in this country, except by those equipped to draw the necessary international comparisons in company law; they are, however, well worth study regardless of the reader's nationality, particularly as they concern the position, powers and accountability of directors.

But perhaps the most valuable section of all is that dealing with large-scale enterprise as a form of human co-operation. Here, Mr Hurff argues, is the "limiting" or "strategic" factor in progress today; "failure to cope with it" (i.e., human collaboration in the purposive change which is the stuff of enterprise) "imperils the very basis of our social and economic order." One wishes that he had dealt at greater length with the questions of communication, incentive, group loyalties, leadership and ethical conflicts on which he touches in this chapter; but here as elsewhere he has been skilful in indicating essentials, placing them in relation to one another, and setting up guide posts for reference and further study.

Wisdom and Learning

International Law. *The Collected Papers of Sir Cecil J. B. Hurst.* Stevens and Sons, 302 pages. 30s.

Sir Cecil Hurst joined the legal department of the Foreign Office in 1902, serving for 27 years and becoming its head in 1918. The Second Hague Conference of 1907, the London Naval Conference of 1908, the manifold problems of the first world war, the drafting of the Covenant, the creation of the World Court, the Treaty of Locarno were items in his legal practice. He also appeared as counsel for Great Britain in international cases, including cases before the World Court. In 1929 he left the Foreign Office for the bench of that court, being its president from 1933-36. In 1943-45 he was president of the War Crimes Commission.

Sir Cecil's main contribution to international law is, of course, to be found in diplomatic archives and in the records of the court. But he also did much for its scientific study, as chief founder and for some years editor of the *British Year Book*, as a member of the Hague Academy, as president of the Grotius Society in the difficult days of 1940-46 and as chief founder of the new *International Law Quarterly* in 1947. The papers now collected comprise two presidential addresses, seven *Year Book* articles between 1921-29, a course of twelve lectures to the Hague Academy in 1926 and two recent Grotius Society papers. The Hague lectures and one address are here for the first time published in English.

The Hague lectures give an illuminating account of diplomatic immunities. Three of the papers concern the nature and development of international law, three touch on aspects of the claims of individuals against foreign governments, three relate to rights over the sea or the sea-bed and one considers the effect of war on treaties. The range of the papers is thus somewhat limited and there is nothing on the greater issues of peace and war or on international organisation. Within their chosen range, however, the papers are full of interest and show an admirable combination of legal learning and practical wisdom. The two most recent papers are not the least important. One provides a stimulating introduction to the study of the new claims which are being made to oil and other resources of the ocean-bed; the other advocates the scientific re-statement of international law by jurists rather than further attempts at codification by governments and has exercised a wide influence on modern thinking concerning codification. The publication of his collected papers is a happy tribute to a loyal and distinguished servant of international law on his eightieth birthday.

Problems of Partition

The Austrian Economy Since 1945. By K. W. Rothschild. *Royal Institute of International Affairs.* 82 pages. 7s. 6d.

The economics of partition have rarely been studied. In Europe, they can

best be examined in Austria, which has experienced them twice in twenty-five years—the first time in the collapse of the Habsburg Empire, and the second time when it was prized loose from the Greater German Reich in 1945. This second disintegration, which Mr Rothschild describes with a wealth of instructive statistics, coincided with the economic separation of the satellite states from the west, to which Austria belongs. Mr Rothschild sets forth the several stages through which this severely tried country has fairly successfully passed from war conditions. Its currency reforms are of particular interest; for the Austrians were experts in money muddles. The reform plans were well conceived, but were never fully carried through, because the country was not willing to pay the price for success. This was almost inevitable, since it is ruled by a coalition of two antagonistic, almost equally strong parties, the Socialists who represent the wage earners and the industrial urban population, and the Christian Social People's Party, representing the farmers, the small shopkeepers and the handicraftsmen (a good deal of Austria's industrial output continues to come from the latter's workshops). This particular feature is not sufficiently stressed in Mr Rothschild's otherwise very comprehensive picture of Austria's social structure. He is on the whole a believer in the country's future. Yet he barely touches on Russia's claims on "German property in Austria," which have so far barred the way to peace and prosperity. Were they satisfactorily settled, Austria could easily become the playground of the western world, for her mood is far more "playful" than that of her much sterner Swiss rival.

An Intimate Biography

The Life of Joaquim Nabuco. By Carolina Nabuco. *Stanford University Press.* London: Geoffrey Cumberlege. *Oxford University Press.* 373 pages. \$5.00. 40s.

This intimate biography of an outstanding statesman is, naturally, of primary importance to his own countrymen, and in Brazil it has appeared in three editions since it was first published in 1928. Ronald Hilton's translation brings to the English speaking world an opportunity of understanding the complicated relationship of one of the largest—and in some respects the most important—of the Latin-American countries with the United States and Great Britain.

Joaquim Nabuco was a man of extraordinary versatility. He was an intellectual dilettante, an historian of note, a recognised writer, and an accomplished linguist, who wrote in French as well as Portuguese, and lectured to American university students in English. He was an affectionate family man who brought up his children with wisdom and tolerance; a polished diplomat of acknowledged finesse, charm and achievement; and an impassioned crusader for the cause of slave emancipation, and for the ideals and practice of Pan-Americanism.

All this is made apparent by his daughter, who writes his biography with a loving enthusiasm that sometimes verges on the fulsome; and here her translator has served her badly, because superlatives which would appear natural in the original Portuguese, and to readers of a more spontaneous and ardent temperament, become cloying in a more temperate idiom.

His public career falls into three equal phases. The rise of the Brazilian Liberal Party gave him the opportunity to enter parliament in 1879, at the age of 30, and for ten years he waged, and won, an unrelenting fight for the freedom of slaves in Brazil. On the declaration of the Republic he abandoned politics, because of his monarchist principles, in spite of invitations to join the new government, and for the next ten years devoted himself to writing, until political evolution and the modification of his own views made it possible for him to put his talents once more at the service of his country. The last ten years of his life were crowned by a distinguished diplomatic career, first as Minister in London, and later as Ambassador in Washington, where he did much to forward the plans for Pan-American Union.

It is perhaps given to few men to be able to say, as Nabuco did: "Within the sphere of activity which I had prescribed for it, my life is concluded. . . . To me, my life, when viewed in this happy light, seems to be a beautiful dream which Divine Providence, as a special favour, permitted to come true."

Layman's History

History Today. Edited by Peter Quennell and Alan Hodge. 72 *Coleman Street, E.C.2.* Monthly, 2s. 6d.

It is a pleasure to notice the birth of a new and serious monthly periodical, instead of the more usual and melancholy business of writing the obituaries of old favourites. *History Today*, whose second number—for February—has just been published, springs fully armed in a place where the ranks have grown particularly thin—the treatment of history as a serious subject, but presented in such a way that it can be enjoyed and explored by the intelligent layman as much as by the professional. The magazine's aim is to have articles written by professionals with a gift for exposition, and to draw the reader on by illustrations. Certainly the first two numbers have produced a dazzling array of experts—Mr G. M. Young on Mid-Victorianism, Miss C. V. Wedgewood on Stratford, Mr Alan Bullock on The Historian's Purpose, and Mr G. D. H. Cole on The Social Structure of England.

It is to be hoped that *History Today* will fall on fruitful ground, coming out as it does at a time when British historical studies—especially on the political side—have never been more ably conducted, and when external danger has given the normally indifferent Englishman a revived interest in his own heritage.

Have you lost your memory for figures?

Call Burroughs for help

A BUSINESS can suffer from bad memory, too. If its office departments fail in the job of providing figures to order—the organization is losing its grip.

Nearly always these 'blackouts' in the office result from a persistence in figuring methods that belong to the past. These lead to an increasing back-log of delays that can only be reduced by hard cash.

Keep your budget balanced by calling Burroughs. The problem of high-speed calculating can be solved now by a modern Burroughs business machine that exactly meets your requirements.

You'll realize that as soon as you're getting the vital facts and figures when you need them—and in the way you need them.

Ask, first, about models 51435 and 51455—the British-made, key-driven, non-listing adding-calculating machines.

ACCUMULATES GROUP TOTALS AND GRAND TOTAL

Where a grand total of individual results is required, the Duplex Adding-Calculator gives maximum speed, simplicity, and accuracy. Special features are: positive registration of full key values, a column lock that prevents operating errors, direct subtraction without use of complements.

ADDS, SUBTRACTS, MULTIPLIES, DIVIDES, ACCUMULATES. THIRTEEN COLUMNS OF KEYS.

CAPACITY:
£9,999,999,999.19.11½

To be published for the
COLUMBIA UNIVERSITY PRESS
on March 1st

The second edition, completely revised of
**THE COLUMBIA
ENCYCLOPEDIA**
£8. 0s. 0d. net or \$25.00

THE COLUMBIA ENCYCLOPEDIA provides a single comprehensive volume in which to find the facts on any subject quickly and without confusion. It contains 70,000 clearly written, accurate and up-to-date articles for the non-specialist on any subject. These articles are arranged alphabetically with cross references to related subjects and are followed by bibliographies for further reading. The many entries on Americana provide the most complete guide to the United States to be found in any general Encyclopedia, and are of outstanding interest to all those who have business or other connections with the American continent. They include separate articles on every place in the United States with a population of 1,000 or over, and on every U.S. President, every Supreme Court Justice since 1908, and all outstanding Senators and Representatives. In addition, the Encyclopedia contains seven tables which include a table of the elements and a table of weights and measures.

HOTELS

personally and independently
recommended by
Ashley Courtenay

"My foot is on my native beach," and though my name is not *MacGregor*, I can supply you with authentic information on Britain's best hotels. My "Shop Window" below may be of help to you in holiday planning, but for other districts, please write to me, enclosing a stamped-addressed envelope to 68, St. James's Street, London, S.W.1.

BEMBRIDGE, I.O.W. for your holiday. **ROYAL SPITHEAD HOTEL** offers comfort and good food. Direct access to beach. Sports. Family parties welcomed. Fully licensed. Brochure on application. S. C. Selwyn, resident Managing Director.

BROADWAY, Wores. **THE LYCON ARMS.** Always in season, though there are many who feel its mellowness is enhanced when the curtains are drawn, for it is then they appreciate the log fires, cooking in the best English tradition, and a pleasantly warmed bedroom complete in its comfort. Tel.: 5.

BAWKHURST, Kent. **COLLINGWOOD HOUSE HOTEL.** In this historical and lovely Georgian home, the art of gracious living is well practised. Warmth, unusual comfort and a high standard of catering will be your lot. For Brochure write, N. Allan-Smith, Tel.: 3350.

HYTHE, Kent. **HOTEL IMPERIAL.** Holiday this year on the Kentish Coast, at this magnificent hotel facing the sea, 500 acres garden, private Golf Course. A large number of rooms with private bath; some private suites. Fine Ballroom and Cocktail Lounge. A.A., R.A.C. Tel.: 67441.

JERSEY, C.I. **ST. ERELADES BAY HOTEL.** (1st Register). 34 hrs. flight from London. Flowers, sunshine and an equable climate. Completely sheltered, facing the sea and the south. Now looking for Spring. Details with pleasure from R. H. Colley. Tel.: St. Aubin 1.

MINEHEAD, Somerset. **NORTHFIELD.** Situated in 3 acres of grounds, thus at high standards of catering and comfort AT ANY TIME OF THE YEAR. Convalescence? A honeymoon? Or just in holiday mood? Exmoor, the sea, and Northfield make a happy combination. Tel.: 594.

NEWQUAY, Cornwall. **HEADLAND HOTEL.** where there is always something to do. Rhinoceros, Bridge, Bowling, Tennis, Snitting, magnificent sands, 18-hole Golf Course adjoining. Good food, well-stocked cellar, attractive Cocktail Bar and Sun Lounge. Every room with a sea view. (Private bathrooms available). White, W. Pollock. Tel.: 2211.

NINFIELD, Sussex. **MOOR HALL HOTEL.** (Coastal Road 4 miles), has the Country House atmosphere you may be seeking. Rhinoceros, Snitting, Bridge, Tennis, Hard Tennis Court; Golf; Cocktail Bar, and always something to do. Tel.: Ninfield 250.

SALCOMBE, S. Devon. **TIDES REACH HOTEL.** What a lovely address for a seaside holiday! Here, on the edge of a sandy beach, with boats, fishing, safe bathing and fine walks, are added the finishing touches of comfortable accommodation, good fare and ample garage space. Tel.: 285.

SIDMOUTH, Devon. **BELMONT HOTEL.** A.A. Apartments. A first-class luxury hotel, noted for its excellent food, and occupying the finest position extending to the sea front. Through-coaches daily from Waterloo. Private Suites, taxi hire. Private bathrooms. Laid. Fully licensed. Tel.: Sidmouth 1261.

RAVENSCAR,

RAVEN HALL HOTEL

A completely self-contained, fully licensed holiday hotel. Heated sea-water Bathing Pool, 9-hole Golf Course, Putting, Hard Tennis, Bowls, Billiards, Darts (Club etc.)—all free to residents. Riding available. Fully inclusive terms 15/- to 47/6d. per day. Tel.: Cloughdon 253.

SCARBOROUGH,

ROYAL HOTEL

Planning a sunny, bracing holiday this year? Write Tom Langdon, Resident Director of this superbly situated hotel, providing excellent food, delightful surroundings, light music, dancing and comprehensive holiday amenities. Early application is essential. Terms 25/- to 39/- per day. Tel.: 1040.

EASTER IS EARLY

this year, but not too early to enjoy the Spring sunshine and flowers at

TORQUAY'S

GRAND HOTEL

Now looking for Easter. For tariff write R. Paul, General Manager. Tel.: 2234.

Speck in the ocean...

Though a mere speck in mid-Pacific, Fanning Island has a place of importance in the affairs of the world. For it is here that the trans-ocean telegraph cable of Cable & Wireless Ltd. makes a brief appearance on land before continuing its journey along the sea bed. Day and night a small staff vigilantly watch the instruments as the messages pour through—messages of state, messages of commerce and simple messages of love and friendship to the ordinary people of many nations.

The Cable and Wireless Company owns and operates 155,000 miles of submarine cable supplemented by an efficient network of wireless channels. There is the world's biggest communication system, with stations in seventy-five countries, providing an instant, secure and highly efficient medium for the passage of Government, Press and social messages.

AMERICAN SURVEY

Atlas of the Free World

Washington, D.C.

THE great debate on foreign policy had lost its greatness a couple of weeks before General Eisenhower came back from Europe. He had expected to have to take off his coat and join in a fight; instead he could put on his best uniform and join a parade. For some time before he made his appearance in the Library of Congress, the mysterious processes by which the American public makes up its mind and transmits its decisions to its elected representatives had been operating. And its decision was that Mr Herbert Hoover was a great statesman who had made an important and timely speech, that every sentiment expressed in it was admirable, but that it would be disastrous to follow his suggestions.

This is not as contradictory as it seems. Probably most Englishmen would be delighted if circumstances made it possible to disregard anything that happened on the Continent. Equally most Americans would like to be able to disregard anything that happens across the Atlantic. The difference between them is that people in Britain had to abandon rather earlier the pleasant illusion that such a course was possible, so that the Little Englander is almost extinct while the Little American, for whom Mr Hoover is the chief surviving spokesman, can still be found in significant numbers. And there are many more who can be found ready to raise a nostalgic cheer whenever the suggestion is made that the responsibility of power can somehow be lifted from their shoulders.

Mr Hoover unwittingly seems to have played the part of the tap at the bottom of the sump of a motor-car. When he was turned on the dirty oil drained all over the road. All the irritations which had been accumulating in the minds of his speech-writer, his friends and a large section of the public appeared—and they were not a pretty sight. But the engine had been emptied and left ready to receive the clean oil of General Eisenhower. "We cannot either individually or nationally," he said, "afford to look over our shoulders with a suspicious thought that our friend is not doing as much as we are." Nobody else in America today could have dared to tell the assembled Congress to change so radically its established view of foreigners; but nobody else, equally, would have taken the precaution earlier in the speech to put Congressmen in the right mood to accept what he had to say by assuring them that "I know you have no end to serve except the good of the United States."

"By doing no more than voice his own faith and determination," the Alsop Brothers wrote, "Eisenhower measurably altered the Washington atmosphere even before his departure for Europe," and by doing so made his task on his return so much easier. And M. Plevin helped by arriving in Washington and giving an impression of French morale very different from anything the United States had been led to expect. As far as anyone can discover, the General made no important revelations of fact to the various Congressional committees with which he talked in private. It would be hard to think of any important new facts which he could have revealed. But he gave the impression that at last there was someone in high places who knew what he was doing,

knew what he wanted to do and had a superb confidence that all would come out right. No more was necessary.

Since the beginning of the Korean war Washington has suffered from too little leadership at home and too much in Tokyo. Part, at least, of General MacArthur's support has come from the belief that, although in theory he should keep his mouth shut, anything he had to say would probably be more relevant than anything being said at home. Mr Truman is, as the 1948 election proved, well-liked. But popularity is not enough when there is a critical situation in the world; and confidence in him has been declining. Mr Acheson can prove brilliantly that other men's policies are stupid and illogical; he is less successful in persuading anyone that his own are right. General Marshall is trusted completely—and his team in the Defence and Service Departments, with the exception of Mr Matthews, the Secretary of the Navy, make their opposite numbers in London look a sorry bunch—but he cultivates his own Department and makes no forays into general policy. The rest of the Cabinet hardly counts in the present mood.

The American people may be sturdy believers in democracy and perennially suspicious of politicians and bureaucrats. They may like electing Hardings and Coolidges and Hoovers in times of peace. But they want strong leadership, and they want it from an individual who can speak for himself when things look dangerous. Mr Truman has been a fox terrier at bay, rather than a President guiding his nation through a crisis. When answering questions about such things as controls, he has reminded people of the wartime joke about "I didn't say there was any sense in it; I said it was our policy," instead of showing that he knows where he is going and how fast he wants to go. Last week General Eisenhower took over a part of his job for him and was at once recognised as the only man to do it. It is not only the combined armies of the free world which he must lead from now on; its political unity also rests on his shoulders.

All this, of course, is very depressing for Senator Taft, who showed his realisation that he must walk warily by refusing to comment on the General's speech until he could see a little more clearly which way the wind was blowing. At this moment, after his victory in November, the Senator has a firm grip on the Republican National Committee. If the convention were to be held tomorrow he would undoubtedly be nominated for President on the first ballot. Those of his party who dislike his ideas and mistrust his ability to carry the country would be swamped by a double argument—that a Republican victory was certain and that, since a liberal candidate had failed in 1948, a conservative should be chosen this time. Seventeen months from now, when the convention is held, Mr Taft will still be strong and the same arguments will still be convincing—unless they have been invalidated by General Eisenhower.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

It is expected that the General will be prepared to resign some time in the spring of 1952 and, once he has resigned, he will be a possible, though by no means a certain, candidate for the Presidency. It would be an exaggeration to suggest that he would be popular with the high priests of the Republican Party. He is not one of them. But his supporters might be able to organise a revolt of the kind which won the nomination for Mr Willkie in 1940. And, worse still, the regulars might have to admit defeat and accept him out of fear that, if they did not take him, the Democrats would. Few people doubt that General Eisenhower could win as a Republican against anybody the Democrats could find and as a Democrat against any Republican—especially Senator Taft.

How much General Eisenhower wants to be President—even whether he wants to be President at all—nobody knows. He showed quite clearly in 1948 that he disapproved of soldiers in politics. But he also must know, and a year from now will know even better, the dangers of having a man like Mr Taft in the White House. It may be easy by then to persuade him that it is necessary to keep the Senator out, even at the cost of going in himself.

Productivity and Inflation

[FROM AN AMERICAN CORRESPONDENT]

BEFORE the last world war Dr E. G. Nourse, the well-known and conservative economist, in his book "Price-Making in a Democracy," took the automobile industry as the outstanding example of the advantages of passing technological progress in industry on to every section of the community by means of reductions in prices. The chairman of the General Motors Corporation was another who then held that this course was economically preferable to that of raising wages as productivity increased. Yet today the automobile companies are in the vanguard of the firms that think in terms of pushing up wages, and it was the General Motors Corporation which, in 1948, first dabbled in unorthodoxy. In 1950 that company dived head first into the new era of "wage-boosting," long advocated by trade union economists, and was followed by many other leading firms. That was the year when wages were raised by greater amounts than ever before, when higher welfare payments were granted, especially for retirement benefits, and when the trade unions in return accepted long-term agreements providing for five years of industrial peace.

Until last year growing familiarity with the implications of gains in productivity was producing more settled wage policies and more widespread understanding of the inflationary aspects of labour controversies. Now this trend has been checked and the responsibility for stopping inflation has been placed on direct and indirect controls. But the authorities in charge of credit and fiscal policies do not yet show full awareness of the duty that now rests upon them, and as a result the danger of future inflation is acute. In 1950 the incomes of American wage and salary earners rose by \$21.3 billion and in the last quarter of the year they were running at an annual rate of \$155.9 billion. This sharp climb was the combined outcome of gains in productivity, increases in the cost of living, labour's loud demands for higher wages and an unseemly haste on the part of large corporations to give labour what it wanted. There is even a suggestion of "connivance" in the fact that management's record profits in 1950 left it with no tenable grounds on which to refuse wage increases.

At the end of last month the Department of Commerce published its estimates of gross national product (its measure of the country's output of goods and services) in real terms, based upon the 1939 price level. In the usual terms of current dollars, as the accompanying chart shows, much of the remarkable growth in national product has been due to inflation, the result of increases in prices, not in actual production. The Department's new calculation demonstrates that real output gained only 75 per cent from 1929 to 1950. The annual rate of gain per person employed comes out at 1½ per cent; on a man-hour basis it is rather more than

2 per cent, owing to reductions in hours of work. In 1950, however, this rate of gain seems to have been at least 7 per cent, decidedly above the average.

In the automobile industry the gains have been remarkable. When the number of cars and trucks produced is related to the number of General Motors' workers, it appears that productivity rose by 22 per cent in 1949 compared with 1948 and by yet another 25 per cent in 1950. In 1949 average weekly hours worked rose by 4 per cent, but this, like the increases in productivity, was in large part the consequence of a smoother flow of materials, which reduced the stoppages on assembly lines. As a result, the income of the General Motors Corporation rose from \$440 million in 1948 to \$656 million in 1949 and to a rate of \$850 million in 1950. Average weekly earnings of the company's workers rose from \$64 in 1948 to about \$72.50 in 1950; at the present time annual earnings average around \$3,750.

The improvement in productivity in the last two years is now being translated into estimates of the output of the economy for war and civilian purposes. Senator Taft has suggested that the share of the total product to be taken by the federal government be restricted to 25 per cent, and this view appears to be shared by other Senators who do not always agree with Senator Taft; in fact, it is not much below the official budget request of \$71½ billion. In the following table the figures are given in 1950 dollars; the government total includes the expenses of state and local governments, but excludes all transfer payments:—

	\$ billion at 1950 prices.	
	Fiscal Years ended June 30,	
	1950	1952
Gross National Product	263.4	310.0
Government Share (goods and services only, exclusive of transfers):—		
Defence	13.5	54.0
Other	29.7	23.5
	43.2	77.5
Balance available for civilians	220.2	232.5

There would thus appear to be room for an increase, over the two years, of no more than about 5½ per cent in total civilian consumption and capital formation, which, with

rising population, implies a smaller *per capita* rate of increase. This is difficult to reconcile with current wage settlements. Inflation, in fact, is not being directly stimulated at present by budget deficits, but is largely the outcome of the phenomenal growth in labour's total pay. This growth comes in part from higher wage rates, but it also comes from greater employment, especially in the better paying industries. It is clear that increases in productivity will permit wage scales to move upwards; but since such increases will take place in defence as well as in civilian industries, they give every promise of exceeding, at constant prices, the growth in the consumers' share of total output.

In these circumstances heavier taxation is badly needed, as is a savings campaign to make up for the \$500 million by which redemptions of Series E savings bonds (held mostly by the lower-income groups) exceeded sales in the last six months. The "pay-as-we-go" principle of taxation has extraordinarily wide support but, from present indications, the savings campaign is no more likely than are debt management policies and monetary controls to be adequate to stem the inflationary tide in the near future.

It is possible that in the last ten years the country has learned that inflation can prevail and that goods are therefore more desirable than dollars. But it is not yet widely understood that emphasis on the creation of purchasing power must be reversed when it is prices and not employment that continue to rise. Americans are willing to tax themselves, but they still want, and take it for granted that they deserve, wage increases to cover rises not only in productivity but in the cost of living and in taxes.

American Notes

Ten Billion "Package"

This time there is even less reason than usual to think that the taxes finally approved by Congress will be closely related to the Administration's proposals. It was only a first instalment of those proposals that the Secretary of the Treasury, Mr Snyder, laid before the Ways and Means Committee of the House of Representatives on Monday. President Truman sticks to his view that his budget of \$71.6 billion for 1951-52 should be balanced by raising \$16.5 billion in additional taxes. (He does not pretend that this will prevent inflation, but it would require a remarkable President to propose a budget surplus.) Last week Mr Truman proposed that Congress should now quickly write a Bill for a first "package" of \$10 billion of new taxes, and promised suggestions for the further instalment of \$6.5 billion later in the year. His argument for the split was that Government expenditures would rise very rapidly during the next few months, and one instalment of taxes must therefore be rushed through. The point was put rather more bluntly by Mr Snyder, who argued that, since \$10 billion would certainly be needed, it was sensible to get this out of the way and then concentrate Congressional controversy on the second "package."

As a way of trying to shake Congress out of its traditional slowness and independence in preparing tax measures, this is probably as good a strategy as the Administration can hope to devise; but it does not look like being effective. Congressmen seem as anxious as ever to take their time and see, in the hope that all the extra taxes for 1952 can eventually be disposed of in one Bill—which would certainly mean that the President got no new taxes at all until the middle of the year.

Congressmen are stating with customary vigour the two arguments for raising less money than the Administration demands—without, of course, denying the principles of sound

money and balanced budgeting. One argument is that the Administration has underestimated the yield of current taxes; the other is that the expenditure proposed in the President's budget can be cut. It is significant that some Democratic "Fair Dealers" have joined the Republicans in this view. But a very big proportion of non-defence expenditure (which is about \$20 billion) would have to be cut before it made much difference to the budget as a whole. Few Congressmen are prepared to claim that a tax increase of at least \$10 billion can be avoided in the course of the year—and that alone means raising federal taxes as a whole by one-fifth.

*

The President, arguing that the poor are too poor to pay and the rich too few, would concentrate this burden on the middle and lower-middle income groups. The Administration proposes that the lower exemption limit for income tax should be left unchanged, but the rate of tax should be raised by a uniform 4 per cent of taxable income whatever its size. This would yield \$4 billion. The rates of tax both on corporation incomes and on excess profits would be pushed up 8 per cent, to yield another \$3 billion. The capital gains tax would rise from 25 to 37½ per cent. The remainder of the \$10 billion would come from increased excise taxes on cars (the tax rising from 7 to 20 per cent), on many other durable consumer goods (from 10 to 25 per cent), on cigarettes, petrol, beer and spirits; various luxuries (including golf clubs) would bear new taxes. Congress will not follow the President's suggestions for choice but, if in the end it has to find more than \$10 billion of new money, it will be able to drop some of them only by finding instead a substantial new source of revenue; a retail sales tax is the only possibility that has been seriously canvassed as yet.

Sickness on the Railways

The coal miners' long standing reputation for being the sick men of American labour has recently been taken over by the railwaymen. For the second time in six weeks there has been an epidemic of absenteeism amongst members of railway unions on the grounds of sickness. This excuse was used in the hope of escaping the legal penalties which would be incurred by an avowed strike against the government. The Army has been nominally in control of the railways ever since last August, when the special processes of mediation provided for railway disputes were exhausted and a strike was imminent. The argument actually concerns certain of the operating unions only: the conductors, firemen, engineers and so on are claiming the 40-hour week, with no reduction in pay, which the non-operating unions have already won.

An agreement providing for a wage rise was in fact reached after the first outbreak of "sickness" in December, but the 40-hour week was postponed until 1952 at the earliest, when it was hoped the manpower shortage might be eased. The union rank and file refused to ratify this agreement, and the employers therefore accused the railwaymen's leaders of bad faith. As a result, negotiations were completely suspended until last week; when they were resumed, there was no indication that the employers were prepared to make the concessions without which a lasting settlement would appear to be impossible. The railwaymen may not be physically ill, but they can hardly be blamed for being sick of a dispute that has now dragged on for nearly two years, during which other trade unions have had little difficulty in getting what they wanted. The present stoppage was precipitated by the wage freeze which made the men fear, although probably unnecessarily, that their last chance had been lost.

It was in fact only the switchmen who caught the latest sickness, but their absence from work tied up the marshalling yards in the main railway centres to such an extent that military supplies were delayed, passenger services were inter-

rupted, embargoes had to be placed on mails and industrial operations were seriously affected. There is no sympathy felt for the railwaymen's methods, but a good deal for their claims. This is presumably why the Director of Defence Mobilisation, asking the men to go back to work because they were endangering their country, adopted a more moderate and conciliatory approach than had been expected. At the time of writing the switchmen seem to be returning to work, but slowly and without enthusiasm. The moment has come when the government, which has been in charge of the case since last August, should show more energy and initiative in seeking a cure for the railwaymen's complaint.

What Price Credit?

Hostilities between the Treasury and the Federal Reserve Board flared up again last week when President Truman attempted to make it appear that the Board had surrendered unconditionally to the determination of Mr Snyder, the Secretary of the Treasury, not to permit any change in the level of interest rates. A 2½ per cent yield on long-term bonds has been maintained since early in the last war by Federal Reserve purchases at pegged prices; the consequence has been to deprive the central bank authorities of any effective regulation of the supply of credit. Banks wishing to expand their loans have been able to sell their government securities without loss to replenish their reserves. Mr Snyder's announcement that the 2½ per cent rate would not be exceeded in financing mobilisation turned these long-term bonds virtually into demand notes.

Officers of the reserve system quickly and indignantly denied that they had promised any more than the maintenance of orderly conditions in the government bond market, and outside commentators expressed pained surprise that the President had attempted to dictate policy to an independent agency responsible to Congress. From the record of the meeting, some of the President's enthusiasm for freezing bond prices seemed to be based on unhappy memories of a Liberty Bond bought during the first world war, which, when he cashed it, was selling well below par. No one seems to have pointed out that present savings issues are immune to fluctuations.

*

Mr Snyder nailed the 2½ per cent yield to his mast—and, incidentally, scoffed at those who harboured the delusion that fractional changes in the interest rate can be effective in fighting inflation—in announcing that holders of Series E savings bonds, now beginning to mature, would be offered cash, a ten-year extension on the same terms, or a 2½ per cent savings bond. The real test, however, will come in the second half of the year, when the Treasury must refund \$32 billion of outstanding securities, and may call in another \$12 billion. Together, this would involve nearly one-third of the total marketable debt exclusive of bills. Mr Snyder points out a rise of ½ per cent in financing the public debt would cost the government another \$1.5 billion a year.

There is still time, therefore, for the issue to be debated, and a forum is provided by the Senate hearings now opened on the Economic Report. Mr Keyserling, the chairman of the President's Council of Economic Advisers, and one member, Mr Clark, have already submitted a statement arguing that the confidence of investors must not be shaken by falling bond prices, and that inflation can best be cured by rapid economic expansion. In their view, general credit restriction would hamper expansion, and selective controls, on inventory loans, as well as housing and consumer credit, are to be preferred.

The Federal Reserve Board might take its case to Congress; last year a subcommittee under Senator Douglas

concluded—though the Treasury turned a deaf ear—that the Federal Reserve's views should prevail over those of the Treasury when the control of credit was at stake. Senator Douglas, at least, is still of the opinion that any money saved the Treasury by keeping down interest rates artificially is lost many times over through rising prices of goods the government buys. It is not likely, however, that the Federal Reserve will challenge the Treasury on the specific issue of yields and prices; Mr Marriner Eccles, the Treasury's most formidable critic on the Board, recently testified that

I'm not one who would say that any central bank . . . should enforce its will. But it does seem to me that the Government should recognise the dilemma that a fixed pattern of interest rates creates.

Mr Eccles, speaking only for himself, urged that Congress resolve the dilemma by giving the central bank new powers to replace those it has lost, such as the right to impose reserve requirements on all commercial banks, not merely on members of the system, the right to require banks to maintain a secondary, special reserve of government bonds or cash, and perhaps powers to require savings institutions to hold a proportion of their assets in government bonds.

Congress Weighs the Draft

General Eisenhower has taken time off from his other duties to put his shoulder to the wheel of General Marshall's Bill for universal military training and service. This proposal, including, as it does, lowering the draft age from 19 to 18, and lengthening the term of service from 21 to 27 months, is bogged down in Congressional fears of the embattled mothers of America. The service committees are naturally anxious to show that they have exhausted every other source of manpower before they take the unprecedented step of calling up boys of 18 in peacetime. Though the veterans in the draft age groups, 19-26, are certain to remain immune, there are other protected classes. As Mr Vinson, the chairman of the House Armed Services Committee, remarked, the present conscription Act is like a sales tax passed just before an election—all exemptions.

Some Congressional suggestions are clearly unprofitable. Stories of 4-F's, the rejects who, while not strong enough to carry a rifle, manage in civil life as prize fighters or baseball players, have given Congress an exaggerated idea of the number that can be recruited from this group. Mrs Rosenberg, the new Assistant Secretary of Defence in charge of manpower, receiving her baptism of Congressional fire, put the number in the end at not more than 80,000. Veterans with only short service might supply a few more, though most of them were discharged for physical reasons. Raising the age limit would take men who would not make such good soldiers and who had already acquired industrial skills. Occupational deferments can be squeezed. The big concession the Department of Defence has made to Congressional sentiment is to agree to summon some 300,000 childless married men, now deferred by Presidential order. But this is only on condition that the final Bill does not prohibit the conscription of the 18-year-olds. There is a good deal of feeling, as well, that if they are called up, these boys should not be sent overseas until they are 19, but General Marshall has pleaded that this would tie his hands in an emergency.

The Department of Defence perhaps made an error in presenting its case so largely as a question of balancing the manpower accounts. Congress is inclined to believe that from one source and another the forces can reach their 3,462,000 goal without the 18-year olds. This would allow a very small margin, and does not take into account the need for replacements. But, most important, it ignores the need for creating a big back-log of trained men who could spring into action in an emergency in three months, rather than taking a year and a half to train.

While Congress hovers on the brink, the strain on the eighteen- and nineteen-year olds themselves is becoming unbearable. The colleges have been depleted by panic enlistments of young men wishing to assure themselves at least of the service of their choice by volunteering. General Marshall has had to promise that men whose call-up is postponed because they are at college will not necessarily lose their freedom of choice.

Dry Rot in the RFC

The Senate Banking Committee, in the course of its year-long investigation of the Reconstruction Finance Corporation, the government's largest lending agency, has already laid bare a number of cracks in the structure. It has now reported that the whole agency is, in the words of Senator Fulbright, the committee's chairman, "infected with institutional dry rot." The general signs of the disease are said to be lack of resistance to political pressure, personal favoritism in making loans, failure to take expert advice and inefficient management. The particular symptoms that angered even the Democratic members of the committee were the apparent subservience of the directors to the White House, and the readiness of a Republican representative on the board to give special attention to recommendations coming from the Democratic National Committee.

The directors of the RFC of course deny the charges, but the Senate will probably make them an excuse for further refusals to confirm the board. All five members have held interim appointments since last August, when the President completely reorganised the high command of the agency, in an attempt to silence criticism. His new appointees were known for their interest in the small business enterprises which are so dear to Congressional hearts and which are the chief, although not the most publicised, recipients of RFC loans. The agency has also been trying to put its own house in order, by reducing its staff and tightening its operations in other ways, so as to cut expenses.

But this has evidently not satisfied Senator Fulbright, who long ago prescribed a more drastic remedy. He has Bills before Congress which would require greater publicity and stricter terms for loans, and would replace the board of directors with a single governor. This is how the RFC was run in its palmy days, until 1947. Responsibility could thus be pinned on one man, whose position would be important enough to attract a first-class financial administrator to the job. Last spring the most satisfactory cure for the RFC's dry rot might have been to pull down the agency altogether; useful as it was during the depression and the war, such government lending hardly seemed necessary in times of peace and prosperity. But with the Korean outbreak, the RFC once more became an important part of the government structure. Not only is it in charge of the synthetic rubber programme and the Texas tin smelter, the only one in the western hemisphere, but under the Defence Production Act the RFC is also concerned with the granting of loans to encourage industrial expansion for defence purposes.

Doctoring the Hospitals

A long-standing quarrel inside the Veterans' Administration has come to a head with the replacement of the medical director, Dr Paul Magnuson, by Vice-Admiral Boone, once the White House physician. Dr Magnuson declares he did not resign, but was discharged because he believed the veterans' hospitals, which will soon number 170, with over 150,000 beds, should be run by medical men, rather than "bureaucrats." In his five years of service, Dr

Magnuson has helped to make veterans' medical care second to none, chiefly by enlisting the wholehearted co-operation of the medical profession. One point at issue has been his insistence that new hospitals, under the VA's present \$750,000 building programme, should be placed near medical schools, where they are easier to staff and the best civilian advice is available. Mr Gray, the Veterans' Administrator, has, however, been unable to resist Congressional pressures. A number of hospitals have been built in isolated communities and several have been unable to open because of lack of staff.

This tendency to slip back into political control of the veterans' hospitals is all the more deplorable in view of the present general shortage of doctors and nurses and the certainty that it will become more acute. The nation's hospitals, which admitted the record number of 17 million cases in 1950, are already losing their doctors and nurses; by July, more than 14,000 medical men will have been called up under the "doctors' draft," most of them men who received their medical education at government expense and have done little or no military service. Those left behind will have new civil defence duties. The position would be easier if the unification of medical services recommended by the Hoover Commission had not been blocked by the hostility of vested interests, notably the veterans' organisations.

Inside the forces, however, a single medical policy council has been created under the chairmanship of Dr Meiling. As director of medical services for the Department of Defence since 1949, Dr Meiling has been prodding the services to pool their facilities. He is now asking the civilian hospitals, in step with military ones, to lower their requirements for doctors and nurses, to make them go round. President Truman's decision that veterans' hospitals must accept Korean wounded is another sign that the barriers set up by tradition and interest are being broken down.

Your
American
banking
connection

Trade with the dollar areas frequently may be expedited by the services of a bank such as the Chase which has extensive facilities in the United States and which has valuable correspondent banking relationships in every commercially important center within this area.

Champion!

The new 15/- SAVINGS CERTIFICATE

Pays you bigger interest—free of income tax

The new 15/- Savings Certificates are now on sale. They are even better value than the previous issue and unquestionably to-day's finest gilt-edged investment.

See how they earn. They're worth 20/3 in ten years' time—equivalent to £3.0.11 per cent p.a. interest over the entire period.

No income tax to pay. The interest which Savings Certificates earn is

free of income tax and is equivalent to a gross interest of £5.10.9 per cent (taking into account the present standard rate of Income Tax).

You and every member of your family can have 500. These are in addition to permitted holdings of any previous issues you already hold. The new National Savings Certificates are obtainable from Post Offices, Banks or through a Savings Group.

THE BEST INVESTMENT FOR NATIONAL SAVERS

BIGGER INTEREST ON DEFENCE BONDS, TOO!

From February 1st 1951 there is also a new issue of Defence Bonds bearing an interest rate of 3 per cent. Ask your Bank, Stock-broker or Post Office for full details.

THE WORLD OVERSEAS

Trade Union Triumph in Germany

(From Our Special Correspondent)

MANY observers of the German scene have been surprised at the way in which a crisis has developed over the German Trade Union Federation's demands for *Mitbestimmungsrecht*, or right of joint management in the iron, steel and coal industries. The whole subject has appeared unwieldy and as exclusively German as its name. There seemed little reason for British concern about it; for the German trade unions had proved themselves moderate in their wage claims and, it seemed, were only asking that the labour representatives in the decartelised steel firms should continue to sit on the boards after the concerns were released from Allied control. One of the avowed aims of the unions was to use their directorships in order to keep out the old owners—and that is also the intention of the Occupation Powers in breaking up the Ruhr combines. The unions, in fact, seemed to be reasonably justified in threatening a strike if their demands were not met by a law presented to the *Bundestag* by February 1st.

A number of misconceptions, however, lie behind this too complacent attitude. The German trade unions' longing for joint control of industry goes back to the infancy of their movement. It is linked with their desire for unity of the organisation which, in turn, is connected with their present effort to remain independent of any political party. The leaders still have in mind the split in the unions which enabled Hitler to destroy them so easily. Numerous statements by Herr Boeckler, the chairman of the Trade Union Federation, and other leaders leave no doubt that the present demands are only the thin—though not very thin—end of a very large wedge. *Mitbestimmungsrecht* is the name for a syndicalist revolution that has little to do with trade unionism as known to the TUC or with nationalisation as known to the British Labour Party. It means, in general terms, the establishment of a corporate state within a state, in which power would be exercised without democratic responsibility by joint organisations of trade union representatives and employers. If the one party chose to oppose the other, the result would be chaos; it would be equally unfortunate if, on the other hand, they compounded on measures to raise and share profits at the expense of the consumer, and of the stability of the currency. That the latter development might take place is indicated by the way in which the union leaders support cartels and vertical trusts in the Ruhr. In either event, it would mean the end of an independent trade union movement, and of overall regulation of the economy by a democratic government. It would also weaken the works councils in favour of the union headquarters. That it would mean the end of the independent business man goes without saying.

Pyramid of Committees

The main provisions of the Trade Union Federation's demands were made public last year. They fall into two sections. First, they provide for the establishment of a pyramid of boards, chambers of commerce, or in the latest phrasology, "Senates," to deal with industry as a whole, with similar organisations for agriculture; secondly, they demand a fifty per cent representation of trade unionists in

the *Aufsichtsrat* (board of directors) and *Vorstand* (board of managers) of every individual company over a certain size.

During last year, conferences between the "social partners" and the Government took place, with the object of arriving at an agreement which could form the basis of a *Mitbestimmungsrecht* law, to which the Government is in principle committed. They broke down, chiefly because the employers, though willing to have representatives of the works council in the *Vorstand*, objected to giving seats on the boards of directors to nominees of trade union headquarters.

The TU Federation then seized upon the loophole left by the fact that the British, when segregating the steel manufacturing firms out of the Ruhr combines, installed labour directors in the boards under a Trustee who nominally acts for the High Commission. This arrangement was extremely annoying to the owners, and hints were dropped that it would be abolished when the industry was finally regrouped and returned to the Germans. The trade unions thereupon presented their strike ultimatum. The arrangement, they claimed, must not only be retained in the iron and steel industry, but extended to the coal companies. After that, it is clear, will come the chemical industry—and then the rest. If the Government and *Bundestag* do not conform, the strike weapon will be used again. The chief factor that might well stop the union leaders from proceeding further on the road to syndicalism would be reluctance on the part of the workers to down tools on this issue; they realise this possibility, and may overcome it by associating wage claims with demands for further *Mitbestimmung*.

Why Government Gave Way

The trade unions have gained an astonishing victory in the negotiations which have just taken place. In view of the extreme hostility of the employers it can only be explained by the Government's fear of a strike and the fact that the settlement is specifically confined to those heavy industrial firms which fall under Allied Law 27. For this latter reason the Government hopes that it cannot come into effect until the industry reverts to German hands. At present, British military regulations prohibit even a meeting of a board of directors of the decartelised mining companies, or a change in the board.

The settlement provides for the following organisation in the iron, steel and coal companies:

(1) two out of the eleven members of the board of directors (*Aufsichtsrat*) to be nominees of the main trade union concerned, and two more to be trade unionist employees of the firm, who will be nominated by the works council, and may be rejected by the TU headquarters;

(2) a fifth director to be nominated by the trade union but to be a neutral individual having no connection with the industry;

(3) the employers to have similar rights of nomination;

(4) the "eleventh man," as he is popularly termed, will be an expert and an arbitrator, who will be nominated by the rest of the directors. The general meetings are to elect the nominees.

In the board of managers (*Vorstand*) a labour manager will sit with the technical and commercial managers—all of them on a year's probation unless they are already tried men. Finally, two new bodies, called "Senates," will be set up over the steel and coal industries to resolve disputes and give recommendations. They will consist of nominees of the employers and unions chosen by the Government.

This agreement has been passed in principle by the Upper House and will go to the *Bundestag* on February 14th. There it will have the support of the Christian-Democrats, out of loyalty to Dr Adenauer, and of the Social-Democrats (who, however, do not entirely favour the syndicalist revolution, as opposed to nationalisation). But Dr Adenauer's coalition partners, the Free Democrats and the *Deutsche Partei* have expressed their indignation at the way in which parliament has been asked to rubber-stamp a demand made under threat of a disastrous strike. They represent the embattled ranks of employers and shareholders, now fighting under the banner of democracy.

Dr Adenauer is already in a weak position owing to his support for German rearmament. With the Social-Democrats' *approchement* on internal matters is not likely to go far enough to make a "grand coalition" possible, though there is some reason to hope that the antagonists may agree to a bipartisan foreign policy. It is, therefore, possible that *Mitbestimmungsrecht* may disrupt Germany's first post-war democratic government, with incalculable effects on international politics.

Communist Defections in Italy

[FROM OUR ROME CORRESPONDENT]

JUST what tint of liberty has been chosen by the two North-Central Italian Communist hierarchs and deputies, Valdo Magnani and Aldo Cucchi, both aged thirty-nine, both academically distinguished and both voted into Parliament triumphantly in 1948 as heroes of the partisan war, has still to be seen. But to learn that two Emilian Communist Deputies have "resigned" from the party is in itself a piece of news which is, on a small scale, almost as disconcerting as Mussolini's "resignation" of his premiership announced so baldly one evening eight years ago. One does not at this stage quietly shift one's seat from the Communist terminus along to an adjoining sector in the parliamentary amphitheatre. The only sector adjoining that of the Communists is that of the Nenni Socialists. The Nennian party at its recent national congress (also held in the lush political atmosphere of Emilia) radiated such a Muscovite atmosphere that the few remaining advocates of constitutional method within its bosom, though led by one of the sons of the

illustrious Matteotti, felt it more prudent not to open their mouths; while Lelio Bassi, a Nennian revolutionary much in accord with Lenin but a little out of tune with Stalin, was also given the cold shoulder. It can hardly accept refugees from the great big sister party.

Next further along is the PSU (United Socialist Party), striving to serve as hyphen between Nenni and Saragat, but by the time one reaches the PSU, which is at the moment also holding its congress, in Turin, one rubs shoulders with Ignazio Silone, a co-author of *The God that Failed*. It would be as well then perhaps to take the jump to the unblushing Atlanticism of Saragat's PSL (Democratic Socialist Party). There is, however, quite a different route of exit from Muscovite Communism—that which leads in the first place into Left Wing Catholicism.

The Patriotic Heresy

This may prove to be the way chosen by Magnani, whose defection had been preceded by signs of insubordination a fortnight ago at the provincial Communist Party congress at Reggio Emilia. (This was one of the many provincial congresses now being held for the promised but unpromising national Communist congress of a few weeks hence: and the national congress preparations were the motive of the sudden January trip to Russia of the two acting chiefs of the party, Longo, the party Blimp, and the dark and subtle Secchia, to consult with the convalescent Togliatti.) Magnani at the local congress fell into the heresy of "equidistance," saying that the Communists would fight whoever from any side committed aggression against Italy. Somewhat notably it fell to Umberto Terracini to administer the party reproof. Terracini, by length of party service (he was indisputably one of the founders of the Italian party, an honour somewhat dubiously now ascribed to Togliatti), length of prison term, and brilliance of intellect (he presided admirably over liberated Italy's first parliament), should be very high indeed in the party hierarchy. In fact, however, he is tainted by suspicions of heresy, and himself incurred clamorous reproof a year or two ago for a show of "equidistantism" not unlike Magnani's. Terracini has long been wooed to come out and become a national leader, but orthodoxy has prevailed with this truly notable man. Cucchi's defection is much more surprising than that of Magnani. He is one of the silent, tough and highly decorated men whose function had been felt to be not to reason why. It is not entirely a surprise that something "Titoist" has happened in the central stronghold of rural Communism: there were premonitory rumblings even in 1949 when the city of Bologna had to shoulder a general strike on questions of international policy. The personality of the defectors is, however, unexpectedly conspicuous.

Explicitly Titoist splinters exist in Turin and Milan; but they are small and obscure enough to allow of the suspicion that they have been created, or utilised, by, the

BURY

Engineers think of felt as the versatile material which can be die-cut, chiselled, machined. They want it for gaskets, filters, buffing rollers, shock absorbers and innumerable other important functions

Fashion designers want felt for handbags, belts, furnishings, slippers, hats in neat shapes and charming colours. They know felt wears well, is dependable and keeps its shape and colour

WHITE LEAD LADY

PAINTED some two thousand years ago, this mummy portrait of an Egyptian Lady may be seen today at the National gallery... its condition almost as perfect as when the artist finished it. Among the pigments used in it was a familiar one... White Lead. It is a forceful tribute to the lasting qualities of White Lead that even twenty centuries of wear should leave it almost unaffected.

By permission of the Trustees of the National Gallery, London

White Lead as a pigment gives—(1) Elasticity; the paint follows the natural movement of the surface it covers without cracking or flaking. (2) Great resistance to moisture. (3) Protection from the destructive acids of the atmosphere. (4) Long life; both on the job and in the tin.

Jacqmar have a very large stock of fine worsteds and woollens and substantial quantities are still being woven from yarn bought before the most recent rises in wool prices.

Jacqmar ask their customers not to buy beyond their immediate and reasonable requirements so that the finest and newest selection of worsteds and woollens at fair prices will continue to be available

at **Jacqmar** 16 Grosvenor Street W.1.

It took 157 years

This stainless steel cyclone was built for the manufacture of high octane petrol by the seventh generation of Newton Chambers engineers. It is one more proof of their ability to master an intricate and unusual problem in constructional steel work. All credit to these skilled men and to the experience inherited over 157 years from those who led the way to such achievement and helped to build the firm's good name.

Opportunity

EVERY YOUNG MAN employed by John Laing and Son Limited knows what opportunity means. He knows that directors and executives have worked their way up and that the same road is open to him.

His ambitions will be encouraged. Then he will be given a chance to prove any latent ability and, once proved, to develop it both by study and by practical experience.

This policy of selection, training and promotion, initiated 30 years ago, is fundamental; for the firm's capacity to-day consists, first and foremost, of the knowledge, the skill and the will of men—men who have worked, and are working in a climate of opportunity. This fact is one more guarantee of a good job for those who entrust their construction to John Laing and Son Limited.

For speed and efficiency in building and civil engineering

JOHN LAING AND SON LIMITED Established in 1843

What colour is more production?

That's what we said: if you find a factory producing more, more quickly and efficiently, what colour do you expect to see on the walls, the machinery, the controls?

This question matters a lot, and of course there's no single answer to it. But we do know an answer to eye-strain, greatest single factor causing fatigue and keeping production down. That answer is: careful colour planning. Dingy dark greys and browns, which cloak dirt instead of making it easy to shift, are not good enough—even positively harmful sometimes. Yet at no extra cost, when painting, factories can be made lighter, more cheerful, easier places to keep clean and to work in.

This improved atmosphere is always followed by improved production.

In 'Factory Painting for Increased Productivity' you'll find principles that can be applied with profit to any factory, simply and interestingly set out with practical illustrations in colour. We will send you your copy, free of any obligation, if you will write for it to

Cominformists themselves as relatively harmless refuge for malcontents who might otherwise put beef into the PSU or join the Christian Trade Unions. The first impression of the Emilian defection is that it is much more serious.

France's Trade Policy

[FROM OUR PARIS CORRESPONDENT]

MANY policy officials in Paris are becoming increasingly anxious about France's present trade policy and the effect which it is likely to have upon the health of the French economy in the coming period of rearmament. The huge military budget which the country has just accepted is on this view a burden which, if tolerable for a year or two, can scarcely be borne *ad infinitum* without an expansion in the French national income. The steps taken so far to meet this burden will impinge mainly on the already low standard of living of the working class. Expenditure on housing has been delayed and further indirect taxes have been proposed. Money wages are being kept reasonably stable, but rearmament and the consequent inflation must lead to a fall in their purchasing power. Some economic experts in the Ministry of Finance and National Economy, at the Quai d'Orsay and in banking circles, are therefore arguing that one of the best means of increasing prosperity and thus enabling France to support a rearmament programme is to adopt a far freer import policy. American experts in ECA fully agree with this opinion.

When M. Queuille became Prime Minister in the autumn of 1949 and M. Petsche Minister of Finance, the French Government embarked upon a new economic policy. This included a tighter credit regime, the reduction of government expenditure and an increase in tax revenues. At the same time internal controls were gradually removed. This policy, which aimed essentially at curbing inflation and strengthening the franc, succeeded, thanks in part to American assistance in the form of raw materials and funds for the investment programme. It led to a great expansion in production. A further step towards French prosperity then remained to be taken. If France was to bring its industry up to modern standards it had to adopt a much freer trade policy. In the absence of effective internal competition only the impact of foreign competition would create flexibility and high productivity in French industry and thus bring about increased production and consumption. This step has unfortunately not been taken.

Farmers Against Imports

The traditional opposition to free trade has not weakened in postwar France. The peasants and even many urban Frenchmen cling to the belief that the strength of the Republic must be based on a prosperous class of agricultural smallholders and that this prosperity depends upon a high degree of protection. Rural protectionism has been strengthened in recent years by industrialists and their work-people, both of whom suffered heavily during the inter-war depression which hit France with particular severity. There is no possibility that any major political party will take up arms against these ranks in this, an election year.

From time to time the Ministry of Finance and Economic Affairs permits "shock imports" of consumption goods in order to hold down domestic prices. There is invariably a lively market for these goods among the French working class. Such genuine measures of liberalisation both satisfy a demand and stimulate the French producer to increase his productivity—or would do so if they were not promptly rescinded under pressure from industrialists and farmers.

Apart from the harm it does the French nation this attitude toward trade is also a grave obstacle to France's fulfilment

of its obligations under the European Recovery Programme. A glance at the French record in foreign trade over the last two years reveals the fact that its imports have actually declined since it undertook to liberalise its import trade.

AVERAGE MONTHLY VALUES OF FRENCH TRADE
(millions of dollars)

	Imports		Exports	
	Total	OEEC Countries	Total	OEEC Countries
1949:—				
1st quarter	291.2	62.0	231.4	82.1
2nd "	302.2	65.1	245.8	83.9
3rd "	261.0	70.5	216.1	82.9
4th "	238.2	72.6	210.3	76.4
1950:—				
1st quarter	264.3	77.2	224.8	89.0
2nd "	257.6	68.3	232.6	97.8
3rd "	217.7	56.5	228.8	103.0
October	268.8	74.9	332.8	138.5
November				

This table indicates: (a) a slight downward trend in the general total of imports, quarter by quarter, as between 1949 and 1950 with the sole exception of the period October-November; (b) a more or less stationary position in the general total of exports until the sharp rise of October-November, 1950; (c) the establishment of a favourable trade balance for the first time in the third quarter of 1950, but at a lower level of trade than during the corresponding quarter of 1949; (d) most serious of all, a striking increase in the export surplus with OEEC countries in the second half of 1950. Clearly, a liberalisation policy which limits itself to lifting quota restrictions and does not deal with tariffs is unreal.

Doubts Among Neighbours

Nor do the harmful consequences of French trade restrictions end here. They are, in fact, a very direct threat to France's own proposals for a common sharing of the rearmament burden of the Atlantic powers. Rearmament in France will inevitably create strong inflationary pressures, and these will be aggravated as long as France insists on maintaining a substantial export surplus. Rearmament will also call for a larger governmental revenue. Sizeable contributions to this revenue have been promised from the United States on condition that the funds are used for the purchase of imported goods. Further aid might well be forthcoming from France's neighbours if they are certain that the French Government would use these acquisitions of foreign currency not to build up the reserves of the Bank of France but to expand the flow of imported goods. In short, the picture seems to show that everyone is determined to help the French Government ease the burden of rearming—except the French themselves.

Socialist Planning in Sweden

[FROM OUR STOCKHOLM CORRESPONDENT]

THE chief asset of Swedish planning in the postwar years has not been a power to make correct forecasts of economic developments. On the contrary, that power has been conspicuously lacking; and the story of Swedish planning has been characterised by a number of disappointments, some of them very grievous. But, apart from events in 1946 and 1947, the authorities have shown some capacity for adjusting the machinery of planning to new and unforeseen conditions. This flexibility has been facilitated by the fact that the "free" sector of Swedish economic life has all along remained quite large.

The Swedish welfare state does, no doubt, suffer from serious deficiencies such as, for instance, a housing shortage.

330

But the Government can point with satisfaction to the rise in industrial production to a level more than 45 per cent above the record figures of 1939. According to official statistics, real wages of male industrial workers were in 1949 26 per cent above the 1939 level, and women's wages had risen still faster. Agriculture is also prosperous and building activity is very considerable. In 1945-1948 the production of housing was larger than at any other period of corresponding length.

On the other side of the balance sheet there must be listed a loss of almost two-thirds of the gold and foreign exchange reserve as well as considerable restrictions on imports and on dealings in foreign exchange.

The economic and social policy that has been pursued in recent years was to some extent mapped out in the "Post-war Programme of the Labour Movement," published in 1944. It contained a great number of recommendations for socialist policy but had less to say about the means that must be used to implement them. The authors were, however, much more interested in planning than in nationalisation measures, the latter being largely relegated to a dim and distant future.

It was taken for granted in 1944 that an extensive building programme was indispensable for securing that full employment which was considered a chief aim of Sweden's postwar economic policy. In 1944 housing production was again at a very high level, but the stagnation during the first part of the war had left a legacy in the shape of a housing shortage. This was also due to the rent restriction introduced in 1942, and it has tended to grow worse, in spite of the ambitious building programme. There is therefore some element of truth in the saying that the Swedish building planners have indefatigably been pouring water into a sieve. It was realised that both the maintenance of rent restriction and the financing of new buildings, which, by the way, were partly subsidised by the community, would become more difficult if there was a rise in the rate of interest. The programme of 1944 accordingly recommended a policy of low interest rates, and this elimination of rises in interest rates from the armoury of monetary policy was stubbornly maintained in subsequent years.

Balance of Payments Difficulties

In 1946 the government took steps for carrying into effect some of the recommendations of the 1944 programme in the field of social policy. The official view that the new expenditure, although considerable, could be fitted into the current budget without any very serious difficulties seemed—at least at first—to be borne out by events. The immediate danger arose from a source which had been entirely overlooked—the balance of payments. The gold and foreign exchange reserve of the Riksbank at the end of the war

seemed more than ample and it rose still further in 1945 in spite of the large credits granted by Sweden to different countries about the end of the war. The increase continued during the first half of 1946 and in the middle of the year the authorities thought the position so unshakeable that they did not hesitate to carry through an appreciation of the krona, the dollar rate being reduced from 4:20 to 3:60. By that measure the Government hoped to prevent the rise of prices in the United States from affecting costs of living and wages in Sweden. The same aim of checking an inflationary rise in wages by price reductions was also pursued in other ways, particularly by the repeal of the turn-over tax.

This policy proved largely abortive. Ultimately there was a rise both in prices and in wages. Meanwhile the great outflow of gold and foreign exchange, which had started when purchases abroad and particularly in the United States could be made in greater volume than before, attained alarming proportions. In face of these unexpected developments the authorities were for a long time unable to agree on any efficient measures to counteract them.

A rise in interest rates was out of the question from the beginning. When rates showed a tendency to stiffen under the influence of the outflow of foreign exchange, the Riksbank had to buy bonds in very large quantities, in this way preventing that contraction in the market which would have facilitated any attempts to put an end to the drain of the Riksbank reserves. Ultimately the governor of the Riksbank, Mr Rooth, resigned as a protest against the official policy.

Pressure on Property Owners

The Minister of Finance, Mr Wigforss, seemed for some time less interested in the monetary crisis than in the new taxation bill which was introduced at the spring session of the Riksdag in 1947 and adopted by the Socialist majority without any very extensive alterations. This new legislation brought alleviations in income tax to the lower income groups. Company taxation on the other hand was considerably increased. As the companies had in 1938 been accorded very great advantages in the way of depreciation allowances, there was some likelihood that the new law would, if anything, bring an increase of investment that would be most inopportune.

An important feature of the new law was the heavy increase in property taxes. The inheritance tax was supplemented by an estate tax more or less on the British pattern. Total death duties were after that, in spite of differences in detail, comparable to the British and they were also applicable to gifts. The current property tax was raised to ruinous heights which virtually forced capital consumption on considerable groups of property owners. Like the rise in the tax on company income the increased property tax was, therefore, likely to aggravate the monetary difficulties.

(To be continued)

Aspects of enterprise

No. 8.

The Simon engineering works at Cheadle Heath have been extensively re-equipped since the war, and layout and production methods have been drastically re-organised. This has been expensive in hard thinking and hard cash, but not to have done it would have been more expensive still. Compared with 1938 the labour force has increased by 75 per cent and total output by 125 per cent. In this solid achievement the management, shop stewards and men have all played a part.

THE BUSINESS WORLD

Rubber for the West

NEWS has come from Washington this week about the first steps towards a common western policy on key commodities. In London a conference of the major rubber producing and consuming countries has been in session; it is said to be in no way to be connected with the Washington discussions, though its terms of reference are very similar. Its purpose is "to review supply and demand of natural and synthetic rubber particularly in 1951 and 1952 and to consider if action is necessary or desirable to secure an equitable distribution of prospective available supplies." This phraseology is in wide terms, but it could clearly include—and in all probability has emphasised—the possibility of directing exports of natural rubber to certain countries rather than to others. Unlike previous conferences, this week's meetings have not been held under the aegis of the International Rubber Study Group. British colonial and dependent territories, Indonesia, Ceylon, Thailand and Vietnam represent the producers, and the United States, Britain, Canada, France, Italy and the Netherlands represent the consuming countries. Only governments have been represented at the conference which would seem to indicate that matters of governmental as distinct from trade policy were under consideration.

The conference has been called at a moment of particular difficulty. To bring production, prices and deliveries into a degree of order best suited to serve the needs of the Western countries for civilian and defence purposes will plainly be difficult. The average monthly price for spot rubber in London rose continuously until November, then declined temporarily in December and then resumed its rise last month. But world production also increased sharply, quarter by quarter, last year; total output, at 1,860,000 tons, was the highest ever recorded and nearly 400,000 tons larger than in 1949. Most of this increase was due to much larger output from smallholdings; apparently smallholder production no longer falls when the price of rubber rises. In Malaya, smallholders produced 329,000 tons compared with 271,000 tons in 1949, and the increase in their output was most marked in the second half of the year when the high rubber prices offered the prospect of high profits. On the other hand, estate pro-

duction fell from 401,000 tons to 377,000 tons, though output from the large holdings was also higher in the second than in the first half of the year. Wet weather in the early months of 1950 reduced tappings and certain areas were replanted with high yielding stock. But far greater difficulty was caused by interruption to normal output by banditry and by the attraction of tappers from the estates in response to higher wages and calmer life on the smallholdings. Total production in Malaya, despite these troubles, increased from 672,000 tons to 705,000 tons. In 1951, an output of 700,000 tons might be maintained if smallholders' production continued at the recent high level; but estate output is expected to fall slightly since large areas are due for replanting.

But the welcome improvement in the supply of natural rubber must be largely credited to the rapid expansion of Indonesian production from 431,000 tons in 1949 to 692,000 tons. Here, again, the larger contribution came from the smallholders. Their output (calculated by reference to exports) was extremely low in the first quarter of last year, when output was hoarded rather than marketed. But after the currency reform eleven months ago, exports increased steadily and the total for the year, 520,000 tons, was almost double that of 1949. Estate production increased very modestly from 167,000 tons to 172,000 tons. This year, given the continuation of present political stability, Indonesian output might well reach 700,000-750,000 tons. Production in Ceylon and in most of the other smaller producing countries has also expanded during the past twelve months and may increase further this year. World production in 1951 might therefore approach 1,900,000 tons; it should without difficulty maintain last year's level of 1,850,000 tons.

Consumption of natural rubber has not increased to the same extent as production. World total consumption in 1950 is estimated at 1,650,000 tons, some 212,000 tons more than in 1949, but still 210,000 tons less than current output. American consumption at 713,000 tons was the largest in any year except 1941, and a single month's consumption reached 69,178 tons last October. But the subsequent fall to 44,000 tons in December shows

(a) Net imports

† Provisional.

the measure of effectiveness of governmental restriction on civilian consumption; consumption of natural rubber in the United States is limited to 40,000 tons a month in the first quarter of 1951, and if this restriction is maintained, total consumption of natural rubber in America this year will not reach 500,000 tons. Consumption of synthetic began to increase from March last year, when the price of natural rubber rose well above that for general purpose synthetic (GR-S). Stand-by plants for producing synthetic rubber have been recommissioned and production this year is expected to reach at least 600,000 tons despite the shortage of the raw materials. Although natural rubber has been forbidden for certain civilian products, synthetic rubber can be used to an unlimited extent. Since the end of December the United States Government has become the sole importer of natural rubber, but purchases this year are unlikely to be smaller than last year. In 1950 only 100,000 tons were put into the stockpile. In 1951, if imports are maintained at last year's level and if consumption is no higher than 500,000 tons, some 300,000 tons should be available for the stockpile. This would give the Munitions Board about a year's supply of natural rubber (850,000 tons) and this quantity could be eked out over a longer period if synthetic production can be stepped up—say to 750,000 tons a year.

In this country, consumption of natural rubber increased last year from 184,000 tons to 220,000 tons; 1951 is not expected to show a rise much above this level. European consumption has also increased though not so markedly; only a modest rise is to be

expected in 1951. Russian purchases (despite some of last year's headlines) were on a smaller scale in 1950 than in either 1949 or 1948. In fact, Russia took only 82,000 tons compared with 105,000 tons in 1949; an increase of 18,000 tons this year, therefore, would not be an occasion for any extreme raising of Western eyebrows. Any estimate of world consumption in 1951 at this stage must be largely a guess, but probable trends suggest that it might reach 1,500,000 tons for normal purposes and 1,800,000 tons if American needs for stockpiling are included.

Stockpiling will remain the key to the market. Last year world production exceeded consumption by 200,000 tons; of this balance, 100,000 tons went to the American stockpile, 50,000 tons to China, 20,000 tons believed to be stockpiled by Japan, 20,000 tons put into

stock by other countries, including Australia, Italy and Germany, and 10,000 tons destroyed by fire in Singapore. This year the margin of world production over consumption is likely to be of the order of 350,000-400,000 tons, of which 300,000 tons will find their way into the American stockpile. Britain and France also intend to build up strategic reserves which could account for a further 200,000 tons; such a quantity would represent barely eight months' supply for the two countries taken together. If these three countries were to be forced to compete with China and the Soviet Union in the open market, the price of rubber could rise to fantastic heights. A primary problem thus confronting the London rubber conference is to discover means of providing enough natural rubber for the Western Powers without unduly forcing up the price.

Last year Malaya exported 38,500 tons of rubber to China and 44,000 tons to Hongkong—much of which must have been for transshipment to China. These shipments occurred largely in the second half of the year. Indonesia, up to November, sent nothing to China and only 2,000 tons to Hongkong. If Malaya's shipments could be stopped, and if, in addition, supplies to Japan and other countries could be kept at little more than the 1949 level, some 100,000 tons could be released for Britain and France. Such a redirection of exports could be contrived by a system of export licensing or of international allocation; either method is politically feasible so long as some supplies are allowed to go to countries not actually arraigned as aggressors. But each method would be administratively difficult to enforce. In Malaya, Chinese dealers control all the smallholders' and part of the estate output, in all perhaps half of Malaya's total production. Well over 10 per cent of Indonesia's production is smuggled out to Malaya by Chinese merchants, while the long, rambling land frontiers of Siam and Vietnam—both adjoining China—would provide grand opportunities for illicit trading. It is not that the Chinese dealers are necessarily sympathetic towards Communist China. But to enforce a system of allocation or export licensing for rubber, it is useless for the appropriate governments merely to pass well-meaning resolutions in London; the measures must be policed, and to do that effectively they would need the full backing of Malayan rubber traders. On this view a complete denial of rubber to, say, China would seem out of the question; the more realistic aim is to find a method which would keep the leakage to a minimum.

International allocation could be a powerful means of reducing the world price of rubber. No country wants to be held to ransom by primary producers at a time when it is accumulating a strategic reserve for common defence (though such a reserve in peacetime would be a potential threat to producers). But if an agreed method of redirecting supplies of natural rubber to the Western Powers—whatever it might be—had the effect of holding the price of rubber at an artificially low level, the incentive to smuggle supplies to China and elsewhere would be all the greater. Britain learned during the last war that to deny supplies to enemy or potential enemy countries was a costly business. It would still be a costly business in conditions of "near war." If the leakage is to be reduced to a minimum, the price of rubber may have to be maintained at a high level. It will not be easy for the London conference to find the right answers to these difficult questions.

Next Stage in Nylon

NYLON is the classic case of a new material developed from laboratory experiment into an important industry in little more than a decade. To a prewar observer, the forecast that this country would have a total capacity for producing ten million pounds of nylon yarn a year would have seemed fantastic. When a spinning plant of this size was first planned, there were doubts whether markets could be found for so much nylon yarn; before the plant came into full production last summer, it was clear that demand had been under-estimated. Present users would be glad to get 50 per cent more yarn; promising applications are not being pursued because there is no hope of more nylon yarn for at least four years, when new plant now on order should be in production. Until then, domestic capacity is fixed at ten million pounds of yarn a year and a million pounds of nylon polymer for the plastics industry.

The successful development of nylon production in this country is the outcome of a partnership between Imperial Chemical Industries and Courtaulds. The former had acquired the Commonwealth rights (outside Canada) to develop nylon, from du Pont; the latter brought its great experience of spinning and weaving rayon; and the two combined in equal shares to form British Nylon Spinners. A venture of this kind into new techniques applied on a large scale is a challenge to scientific skill and financial risk-taking. It was soon discovered that the production of nylon polymer is one of the most difficult chemical operations to handle on a large scale. The process starts with benzene, oxygen, nitrogen and hydrogen, and after eight stages of formidable complexity there emerges a nylon salt; when this has been polymerised (in the layman's terms, when it has been made plastic) the first stage is complete and the nylon can be drawn into yarn or used as a plastic material. The larger the scale of production, the more difficult does it become to control this process. ICI's first commercial polymer plant had a capacity of a million pounds a year; this was opened in Huddersfield in 1941, but not before the engineers had learnt to their cost that in a full-scale plant the process behaved differently from what they had come to expect from their experience with the pilot plant. This experience was repeated on a grander scale in bringing a plant of ten times the size into production at Billingham.

During the war the Huddersfield plant supplied nylon polymer to two small spinning factories of British Nylon Spinners. In 1944 plans were prepared for a spinning factory at Pontypool to cost £6 million, capable of producing ten million pounds of yarn a year. ICI undertook to build a plant at Billingham to turn out this amount of nylon polymer. The Pontypool plant is probably the largest multi-floored factory in Europe, with processing sections nearly a quarter of a mile long; but production within the plant is built up by the endless multiplication of a small-scale process. The polymer from Billingham is melted in small autoclaves, extruded through spinnerets, and allowed to cool into a filament. This thread is then cold-drawn to four times its length, a physical process that rearranges the molecules in the material so that the filament becomes a yarn. None of this was simple to organise on a large scale, but it was

less formidable than the difficulties that the engineers had to solve at Billingham, where it took more than a year to bring the plant into smooth operation. Not until last summer, indeed, were both plants running to their full capacities.

*

So much for the establishment of a large-scale nylon industry in this country. The second phase of expansion started some months ago. It shows once again how quickly events can overtake plans, for it was conceived before the latest increases in natural fibres, when nylon was a comparatively costly yarn. Perhaps by the time the new plants are working this basic assumption about comparative costs will be more accurate than it seems today. The expansion programme also allowed for competition from other synthetic fibres, notably "terylene," which may be in production when the nylon plants are ready. On these bases, it seemed reasonable to suppose that British Nylon Spinners could safely count on finding a market for another twenty million pounds of yarn a year. A two-fold increase sounds a lot, but some who are close to the industry are confident that consumption will eventually reach seventy million pounds when all applications are fully developed.

ICI's expansion of nylon polymer production is governed first, by the company's obligation to British Nylon Spinners and, secondly, by the requirements of the plastics industry. Plant for twenty-two million pounds of polymer a year is planned, which allows for trebling the present consumption of nylon yarn and plastic—say thirty million pounds of yarn and three million pounds of polymer. The uses of nylon as a plastic are barely developed. American experience suggests that nylon will remain a special purpose plastic and its use in filaments, extrusions and sheets is growing. Nylon is not easy to prepare in the form of moulding powders, but the greatest scope for development may lie in this direction—for example, if nylon could be moulded in cheap self-lubricating bearings.

The market for nylon yarn is difficult to predict. It may never become a "cheap" material like rayon and the entire development of its markets has been conducted on the basis that nylon is a material of special properties. Yet it may be that demand has been under-estimated because undue stress has been put on developing specialised outlets for these special properties. There are many uses in which nylon is the obvious choice for technical reasons; examples can be found in certain types of filter cloths, glider ropes, and in hosiery where the rare combination of strength and elasticity in a thin yarn has revolutionised the knitting of fine stockings. But there are wide markets in fields where nylon competes with established fibres. To take one example, laundries are using an increasing amount of nylon for nets, press cloths and guide tapes, all of which used to be cotton. The nylon article costs more, but it lasts longer. In other uses scarcely out of the experimental stage, such as nylon coal sacks or carpets, there has been less resistance to the higher initial cost than might have been expected.

The development of knitted nylon fabrics owes much to the British warp knitters, who were quicker than the American knitting industry to develop the possibilities of continuous filament nylon and now have the satisfaction of exporting knitted nylon goods to the United States. Woven nylon may prove in the end to be a more limited market. It has the advantage of being non-inflammable, but its main attractions lie in permanently pleated fabrics and fine fabrics of considerable strength that are easy to wash. A more important expansion of nylon consumption may rest upon the woollen industry. In spite of nylon's comparatively high cost, some wool weavers and knitters have been using continuous filament nylon to reinforce weak yarns for processing at high tensions. About a tenth of the output of yarn at Pontypool is being converted into nylon staple and experience from using up to 20 per cent of nylon with wool suggests that British Nylon Spinners will be justified in producing a much larger proportion of staple.

Most of this experimental work was done under the shadow of rising wool prices. The present level of wool prices has completely altered the emphasis. It is no longer the aim merely to enhance the technical qualities of wool with a judicious admixture of nylon, but rather to determine how much nylon can be added without destroying the character of the cloth. Rising prices of natural fibres, combined with shortage of spruce pulp (and sulphuric acid) for rayon, has changed nylon from a yarn sold on performance to one which sells on price. Nylon staple costs 11s. 3d. a pound now compared with 19s. for fine crossbred wool. But the civilian consumer should not suppose that high wool prices will be counteracted by developing nylon mixture cloths. A recent exhibition in Manchester showed some of the military uses of nylon; these were varied enough to suggest that rearmament may involve heavy cuts in civilian supplies. At least 55 per cent of the yarn produced is going to the hosiery industry and another 15 per cent goes by special arrangement of the Board of Trade to hosiery manufacturers in Australia and New Zealand. The balance is spread over the rest of the textile industry, and because nylon stockings and fabrics have a high export value there may be official pressure this year to maintain the supplies of yarn to exporters at the expense of the home market. The entire output of some warp knitters is being sold in the United States.

*

For the future, much will depend on whether nylon and the new synthetics are to be developed in parallel or in competition. Both du Pont and ICI are putting other synthetic materials into production. At the same time both are expanding their output of nylon, and du Pont may grant nylon production rights to a new formed subsidiary of Monsanto and American Viscose. This company, the Chemstrand Corporation, will also produce a synthetic of its own, and other American chemical firms are known to be developing synthetic products. In some respects the materials have complementary properties—where nylon is elastic and alkali resistant, ICI's new "terylene" is inelastic and acid resistant. But in other respects they are undoubtedly competitive. "Orlon," developed by du Pont, has greater resistance to light than nylon and can be expected to encroach on outdoor uses for nylon. "Terylene" is bound to trespass on nylon's important industrial fabric

market and both new synthetics are spoken of as clothing fibres—"orlon," in particular, as a wool substitute. Yet nylon may still prove to be the best adapted to textile requirements in that it calls for no major change in machines or techniques. It dyes by ordinary methods, whereas special methods will probably be needed for dyeing "orlon" and "terylene." This point may be of small importance when these latter yarns are dyed alone, but it could make all the difference to the yarn chosen for a wool mixture.

Presumably ICI, Monsanto and du Pont hold the view that the prospective world market is large enough for several synthetic fibres of this type. But these markets may not lie wholly within their control. In Germany, I G Farben is producing "perlon," a material of the nylon family which I G claims to have developed before du Pont produced nylon. Although the two sets of patents do not conflict, the consumer might find it hard to establish any difference between the two products. Moreover, the development of perlon, like the development of nylon, is considered by chemists as the starting point for a whole group of related textile yarns. The possible consequences of development on these lines by I G or by firms holding licences from it should not be underrated.

*

The interest which nylon has stimulated must not be allowed to exaggerate the size of its contribution to the textile industry. This has been technically important but physically small. A comparison between the output of nylon and of wool, cotton and rayon shows that since the middle of last year, the nylon spinning plant has been running at full capacity of about 800,000 pounds of yarn a month. The latest monthly figures show rayon yarn output at 34 million pounds, cotton yarns at 20 million pounds and wool yarns at 47 million pounds. In four years' time the combined output of nylon and "terylene" yarn might just exceed 40 million pounds a year; this is less than five weeks' output for the rayon industry.

But to forecast the future demand for nylon on present evidence would be to limit it to a comparatively narrow field. The nylon industry cannot develop fully until the textile industry and its customers have become sufficiently familiar with nylon's properties to recognise when circumstances justify its use. There are signs that the wool industry was the more aware of this, and had discovered in wool-nylon mixtures a higher standard of quality than was expected from ordinary mixture yarns, as well as characteristics not found in pure wool. In much the same way, the industrial market for nylon yarns is building piecemeal as engineers learn to understand its behaviour under various conditions. It is important that nylon, or indeed any of the related synthetics, should not be treated as mere substitutes for established yarns. Their strength lies in points of difference rather than in similarities; if the markets for natural fibres were at some future time to be less strong than they are today, the high capital costs of synthetic plants might make them vulnerable to price fluctuations in any of the natural fibres, from jute to silk. But given a probable reduction in rayon production, and the present high prices of other yarns, substitution is more likely to sustain the demand for nylon rather than extension of its uses.

Business Notes

Corporation and Federation

In this week's steel debate Mr Strauss had more success in mustering partisan votes to confirm the disruption of a vital industry than in explaining how his creature, the Iron and Steel Corporation, proposed to go about it. He was unable to announce agreement between the Corporation and the British Iron and Steel Federation even upon interim arrangements between the two bodies for the first few months of nationalisation. Frequent and lengthy discussions culminated upon the day of the debate in a meeting between Mr Steven Hardie, chairman of the Corporation, and certain leaders of the Federation; but the Minister on the same afternoon was still able to speak only of "discussions now proceeding."

The interim arrangements envisaged by the Corporation, which would insert its representatives into parts of the existing machinery of the Federation without otherwise modifying it, may be the minimum necessary to enable it to carry out its statutory duties; but in three months' time the Minister and Mr Hardie propose to take another, much larger bite. From being represented upon the Federation's various conferences dealing with different sections of the industry, the Corporation would then, according to the plans Mr Strauss outlined, in effect take over those conferences in which publicly owned companies had a predominant interest. These conferences—which of course include privately-owned companies—would then report directly to the Corporation. They would also appoint an advisory council to the Corporation with an executive committee—the body of experts that the Corporation is understandably anxious to recruit. Whether they would retain any formal link with the Federation or not, they would thus effectively come under the general control of the Corporation, and some parallel division of the Federation's staff and services would presumably be proposed.

This involves more than the powers of a normal holding company, as do certain of the spheres of control that the Corporation proposes to reserve in its relations with constituent nationalised firms. It hardly accords, either, with the Minister's description of Corporation policy as "the minimum of centralisation and the maximum of devolution." Apart from its merits as a structure of organisation, however, it is clear that the Federation cannot accept any such change within so hasty a period. Mr Hardie, no doubt, must now be impatient to bring nationalised steel into being, rather than to devise an ideal structure. The Federation's equally strong and more justified determination, presumably, is to concede the minimum of change in the structure of the industry until the electorate has once again been heard on the issue. In the long run—if it should be a Socialist long run—Mr Hardie would no doubt have his way. But in the short run, although he may have the power to make such fundamental changes and may be anxious to make them, they would be very difficult to justify, given the present balance of political power.

*

Witchback in Steels

The momentum imparted to activity in stock markets, Billings to the scissors movement between gilt-edged securities through industrials, by the approach of steel vesting day has gathered strength in this past week. Although steel shares have been moving steadily from private investors towards the public institutions for many weeks, it is now clear that the effect of the whole operation had been much less fully discounted than was generally supposed a fortnight ago. As soon as

dealings in these shares became free of stamp and fee (because the stock to be delivered will in effect be steel stock), the stream of private selling increased and the appetite of the institutional investors was whetted by the resultant persistence of the discount on take-over prices. These cross movements set powerful influences in motion. The gilt-edged market could not compete with the attractive "back-door" route through steel stock, and hence has languished for lack of buyers as well as from some selling for the purpose of buying steel shares; and the industrial market has had a powerful flow of reinvestment funds directed towards it. By Monday of this week this demand had raised the ordinary share index of the *Financial Times* to 121.8—no less than six points above its level at the turn of the year—and on that day the number of Stock Exchange markings leapt to its highest level for four years. Gilt-edged, meanwhile, continued to sag.

On Tuesday, however, this complicated market situation became further involved. The broad streams flowing from the steel switching then met in head-on collision with opposite movements set in motion by the possibility of a Government defeat in Wednesday's debate. Institutional investors then became worried about the possibility of being saddled with steel shares that they do not want—during the general market scramble many such shares had been bought almost indiscriminately, without regard to the merits of the companies as continuing private entities—while brokers were debating the knotty technical problems that a postponement of vesting day would have presented for the machinery of the Stock Exchange settlement. These new influences provoked both a sharp rise in the discounts on steel shares and, on Wednesday, a sudden interruption of the slide in gilt-edged. It was scarcely surprising, therefore, that on Thursday morning those who would have had to wrestle with unprecedented technical problems of Stock Exchange practice were confessing to a feeling of relief—though fully sharing, of course, the City's disgust at the act of nationalisation itself. As expected, the discounts on steel shares returned to their former levels, while gilt-edged were inclined to falter.

The principal questions, in this context, in the coming week will be the terms of the steel issue itself, the extent of private and institutional selling of the stock after the vesting and the extent of resistance that the authorities will offer to it. The "departments" have been unexpectedly—and satisfactorily—inactive in recent weeks, but they are expected to ensure that the market remains on an even keel at least during the first day's dealings in the new stock. Thereafter their tactics will presumably be dictated principally by the degree of pressure encountered. That will depend partly upon the general view of gilt-edged prospects as a whole. It is still a matter for debate how far the recent slide has been due to the steel operation as such, rather than to more fundamental influences; and there is likewise a parallel debate about industrials. When the steel reinvestment stimulus has exhausted itself, will the inflationary prospect and the hopes of further dividend increases suffice to support the present upward trend?

*

*

Coal Cheer and Costs

Cheered by some improved statistics and mericful weather, the Parliamentary Secretary to the Ministry of Fuel and Power this week became so cautiously confident that he forsook English for jargon. Given good weather and good behaviour by consumers, Mr Robens is reported to have

said, "then undoubtedly we shall ease through this position without any serious deleterious effect on the situation." By this form of words, Mr Robens was no doubt suggesting that the chances of avoiding a major fuel crisis were a little better. After all, the weeks pass and the spring approaches. Mr Robens had indeed to report a further fall in distributed stocks of coal in the week to January 27th, but at least at a slower rate. Both home consumption and exports declined in that week, and output for the following week remained higher than in the corresponding week of 1950. Colder weather at the beginning of last week, however, caused the power stations to burn 50,000 tons more coal, and may partly have offset the effects of new economies upon general coal consumption. The weather has contributed far more to the hope of averting disaster than the varied fuel economies described last week by Mr Noel-Baker; in the first four weeks of the year the average temperature was 40.8 degrees, nearly two degrees lower than last year but five degrees higher than in the January preceding the bitter fuel crisis of 1947. The effect of the 15 per cent cut in coal deliveries to industries has not yet appeared in consumption figures, nor has the saving from cuts in railway services; but Mr Noel-Baker was at last able to hazard a guess at the value of banning lighted shopwindows and advertising—50,000 tons of coal in three months.

The financial effects of the higher coal prices he announced will not be fully felt immediately. Output has been insufficient to meet a growing industrial demand, itself partly stimulated because coal was becoming relatively cheaper than other materials that industry uses. Some rise was justified and inevitable, apart from the recent wage concessions. But this does not alter the widespread effect that higher coal prices will have in increasing costs and prices throughout industry. Electric power, an equally widely-distributed item of cost, must rise accordingly; the price went up last year even though fuel costs declined slightly. A flat rise of 4s. 2d. a ton in coal prices will put up the British Electricity Authority's fuel bill by £6,000,000, and generating works costs by perhaps one-tenth. The steel industry today uses roughly 35 cwt. of coal to make a ton of steel, which implies a rise of at least seven shillings a ton in prime costs. On last year's figures of consumption, the coal price increase would cost other industrial consumers perhaps £7,000,000 a year in direct fuel costs alone, apart from concomitant rises in the cost of transport and other materials.

* * *

Balancing the Board's Books

The increase in price approved by the Minister was more prompt, and also larger, than the National Coal Board might have expected from its earlier experience. The first round of wage increases granted from last October will cost the Board £4,000,000 in a full year, and the second round £8,000,000 a year, plus £2,000,000 as a non-recurring contribution to begin a pension fund; and material purchases, according to Mr Noel-Baker, will cost £13 million more this year than in 1949. Against these current and impending rises in expenditure—£27 million—the higher prices should contribute more than £40 million in a full year.

Two other items to be charged against this increased revenue are more difficult to estimate. The NCB exported roughly two million tons less coal last year than it hoped to do, which involved the sacrifice of £2,000,000 from its £1-a-ton export premium; it is likely to export even less this year. Its imports of coal are to include 1.2 million tons of American coal upon which it is likely to lose not less than £3 a ton (Mr Gaitskell's figure of \$3,345,440 "spent" up to January 22nd bears, of course, no direct relation to Mr Noel-Baker's earlier statement that 1,073,000 tons had been ordered from USA, India and Nigeria). This expenditure will fall almost entirely into the Board's 1951 accounts, not those for 1950; and Mr Noel-Baker's fairly ample provision of revenue gives

a broad hint that neither he nor the Coal Board is hoping for much assistance from exports to assist the profit from home coal operations in 1951.

The Board's financial statement for the first nine months of 1950 shows, in fact, that such assistance from high-priced exports was proving insufficient to offset increases in costs. In the first quarter of the year the Board showed a surplus of £5,600,011, which represented, other items apart, a profit of 3s. 9d. a ton on 52.6 million tons of saleable deep-mined coal. The second quarter's surplus was £2,451,971, resulting from a profit of 2s. 8d. a ton on 50.1 million tons. In the third quarter, 46.9 million tons of coal were sold at a profit of 1s. 6d. a ton but the Board finally incurred a total deficit of £450,524. For these three quarters the additional earnings from exported coal, at £1 a ton higher than home prices, would have amounted to £5.3 million, £4.7 million, and £3.9 million respectively; thus the decline in the Board's profits has proceeded much faster than the decline in export earnings. In the fourth quarter of the year exports were 800,000 tons lower than in the third; moreover, a wage increase worth £4,000,000 a year was made retrospective from the beginning of October. This meant £1,000,000 extra in wages for an output of 53 million tons, or nearly an extra fivepence on labour costs a ton; with the higher material costs Mr Noel-Baker reported, and prices generally unchanged, it seems unlikely that even the third quarter's profit of 1s. 6d. a ton could be repeated. But the fixed charges for interest and other items upon NCB profits, allowing for profits from ancillary operations, require colliery profits of perhaps 1s. 5d. a ton. All of which suggests that in the fourth quarter of 1950 the Board will have been very fortunate indeed to avoid another deficit, and that the final surplus for the year will be less than the £3,000,000 realised on the first two quarters.

* * *

Substitute for Policy

Mr Noel-Baker's second important decision—to prolong opencast working of coal—was to be expected. It might have been unavoidable as a minor part of a long-term fuel policy; but it is in no sense a substitute for one, and taken by itself it seems a questionable expedient. The former programme (itself an extension of an earlier original) was due to run down by the end of 1953, removing about 38 million tons of coal in the period; by the change of policy it is hoped to get an extra 12 million tons by extending operations for two more years. The Treasury has agreed to the spending of more dollars upon big earth-moving equipment—this time by contractors, who will presumably have to amortise the total costs of this specialised machinery over the very short periods of extended or additional contracts. The existing programme had already dispensed with dollar purchases; much of the machinery would have gone out of service as contracts came to an end, and the limited further needs by the end of 1953 could have been provided from the small output of large-bucket earth-moving equipment that British firms can spare from export demands.

Financially, the increased coal prices should make it possible for the extended programme to be carried through upon the Minister's principle that opencast coal production must pay for itself. Recently, the Ministry's Directorate of Opencast Production has been doing its ugly job with growing efficiency; from the days of losing 17s. 8d. a ton in 1945-46, it has reached the position that in the current year so far it is doing rather better than its estimate of breaking even. The full costs, including the destruction of amenities and fertility cannot be estimated—and in any case there is natural pressure from farming interests for better restoration. To date, 60,258 acres have been requisitioned for opencast mining, and 18,382 acres released; 15,208 acres are being restored or ready for restoration, and 26,768 acres are

"coaling or preparing to coal." The total yield of the programme from 1942 to the end of last year was 78,125,000 tons, and the average yield per acre about 1,500 tons. The volumetric ratio of overburden to coal, which mainly governs the physical difficulty of working any site, has been rising until at present the average is about nine to one; but with an increase in prospecting, it may be that the additional coal required can be located. Vague estimates suggest that there might be 70 to 80 million tons on workable sites; allowing for "freezing" of sites by interested departments and for

other difficulties, this might enable 50 million tons to be removed. Even assuming a further growth in production costs (which include restoration), the present level of coal prices should afford the opencast producer—that is, the Ministry of Fuel and Power, not the Coal Board—fairly generous profits in the next two or three years. This is more likely to be gathered in by the Treasury than applied either for improved restoration or to offset the losses on the American coal the National Coal Board has been ordered to buy.

* * *

Railways and the Coal Cuts

To save 10,000 tons of coal a week out of their total consumption of 290,000 tons, British Railways have been compelled to withdraw well over three thousand services. The third instalment of these debilitating and discouraging withdrawals takes effect on Monday next, and will involve a number of long-distance services that were presumably paying their way satisfactorily. At this time of the year about 65 pounds of coal is consumed per engine mile; an exercise in proportion therefore suggests that a saving of 10,000 tons a week would call for a reduction of 290,000 engine miles a week (in practice, probably rather less) out of a total passenger engine mileage of roughly five million. For the

sake of a little coal—about 3 per cent of the total weekly consumption of 290,000 tons on the railways—track and stock will be used to less advantage, though their indirect costs will continue. The normal economics of railway operation have to be turned upside down because coal (which costs relatively little in the total of direct and indirect railway expenditures) is insufficient to allow the railways to run their business in accordance with commercial commonsense.

This feeling of frustration has certainly made its mark on the railway administration. It has also created a considerable amount of suspicion in the minds of locomotive and operating staffs. The unfortunate Railway Executive can depend on getting plenty of kicks from the travelling public for cuts that have been imposed on the railways from above (exactly how this has been done seems to be in doubt), and perhaps they could have done more to explain how the curtailment in services has come about. Some of the men prefer to find the explanation for the cuts not in the professed need for saving 10,000 tons of coal but in a dark scheme by the Executive for getting rid of surplus staff. This is not so, but it hardly helps the Executive in its present difficulties about staff relations. Obviously, the only reasonable assumption that the Executive can make is that the savings will not be demanded as soon as the risk of a fuel crisis has been averted—even this means apparently some time after Easter. In the last few weeks there has been great difficulty in finding locomotive crews and maintenance staffs because of sickness. No doubt it would be easy to exaggerate the chances of absorbing all the displaced passenger crews on freight services, but some transfers can be made. But what happens on the London Transport railways where cuts in services have now been made—in order to save, apparently, a mere 700 tons of coal a week? Can the train staffs be absorbed on other duties? And will the saving be genuine, in the sense that boilers can be banked and generating sets taken out of service while the cuts are in force?

Ceiling for Scrap

Maximum prices for non-ferrous scrap metal came into force this week. The Ministry of Supply has approved the revised list of prices proposed at the meeting of the Scrap Advisory Committee on January 9th, with one or two minor amendments; part of this list was given on page 285 of *The Economist* of last week. On the face of it, it is difficult to see how the new order will bring more scrap on to the market. Scrap prices have recently been well above those for virgin metal, but the new limits are quite appreciably below the Ministry's selling prices of new metal, and in any case these are too low in view of the present scarcity of metal. It would have been more reasonable to have raised the prices of virgin metal above the corresponding prices for scrap. To reduce the prices for scrap, as the Ministry has done, is

NO FISHING

... only rows of idle trawlers moored in the docks... idle men waiting for the day when they will go fishing again... all because bad weather made it impossible to put to sea; or fishing gear was damaged or destroyed by storm.

The fisherman faces weeks of unemployment from time to time. He needs badly the Deep Sea Mission and all that it means to him—wholesome companionship, good food, recreation, books—and opportunities for worship. Contributions, or requests for the free pamphlet *Fishermen Ashore* are welcomed by the Secretary, J. W. DONALD—

unlikely to relieve the present metal shortage and may even intensify it.

The test of the new control will be whether it maintains the supply of scrap coming forward; there is reason to believe that the amount of scrap available at the new maximum prices will decline. First of all, the incentive to disgorge hoarded stocks has been reduced. The maximum price for No. 1 copper wire, for example, has been fixed at £175 a ton; last week it was selling at well above £200 a ton. Admittedly, since exports of scrap metal and secondary ingots are virtually forbidden, certain supplies will continue to come forward even at the new reduced prices. But the marginal quantities, which at the present time are very important, come from non-regular suppliers and these firms will only be encouraged to go through their surplus stores if the return they get from selling scrap more than compensates them for the cost and effort involved.

Secondly, the new control does not impose maximum prices for secondary ingots; that is a serious weakness. Any manufacturer or merchant can now buy scrap at controlled prices, convert it into secondary ingots and sell them at any price that metal users are willing to pay. In any case there is no scientific method for determining the quality of scrap and the number of people who have the necessary experience and expertise must be very limited; the order might therefore be easily contravened through ignorance as well as through connivance.

Expanding Nickel Output

Nickel is a vital strategic material, as well as an important raw material for a peacetime economy. Last year, despite the increase in nickel output, supplies to civilian consumers had to be curtailed so that the defence requirements of the United States, Britain and Canada (including stock-pile purchases) could be fully met. The president of the International Nickel Company has stated this week that deliveries of nickel in 1950 reached a record level for any peacetime year. They totalled 256 million lb., nearly 47 million lb. more than in 1949. This large volume was maintained only by drawing on reserve stocks, for the increase in output that took place last year was insufficient in itself to meet the increase in demand.

At the outbreak of war, surface mining of nickel ore was developed. Between 1942 and 1945, out of a total annual ore production of 11,400,000 tons, over half (6,000,000 tons) was mined on the surface. These deposits, however, are now being worked out, and last year the surface mines yielded only 4,100,000 tons out of a total of 9,800,000 tons. A project to extend underground mining capacity was started over ten years ago. Full conversion is expected to be completed by 1953, when the total output of ore mined should reach 13 million tons a year—all of it coming from underground pits.

Learning from the Doctor

The City in recent weeks has been watching with interest the speed with which the American authorities have been creating a pattern of economic and financial controls that became all too familiar in this country in the early post-war years. The latest move in this direction has been the declaration by Mr Snyder, after a conference with Mr Truman and the Federal Reserve Board, that the Government's refunding and defence needs will be financed "within the pattern" of the existing 2½ per cent rate for long-term bonds. This statement bears an interesting resemblance to the Daltonian utterances of 1945-47, for the US Government authorities appear to be fully aware that the continued pegging of the long-term rate will scarcely be achieved without a further large "monetisation" of debt and a consequent creation of credit. There is, however, one

important difference in this context between Mr Snyder's position and that of Dr Dalton. How far the Bank of England differed from Dr Dalton's tactics has never been disclosed; but he certainly did not have to face, as does Mr Snyder, an open conflict with the central banking authorities. And this declaration from him is merely the latest round in a struggle that (as a Note on page 322 shows) is certainly not over yet, even though it puts the Treasury in the lead. Mr Snyder's contention (like Dr Dalton's) that small movements in interest rates could have little effect in restraining excessive spending of course misses the main point in the Federal Reserve's argument: it is the creation of credit to sustain low rates, rather than the lowness of rates as such, that does the damage.

This attitude towards monetary policy is at least consistent with other lines of US Government policy: the attempt to freeze prices and wages and the spread of physical controls reflect a forsaking of the rules of the market-place that implies a hope that rationing and direct action will do the work of the price mechanism. It is scarcely surprising, therefore, that systems of selective and "qualitative" controls are steadily gaining favour with the monetary authorities themselves. The most important of the restraining effects that the Federal Reserve authorities have been able to take since Korea have been those embodied in regulations W (control of instalment credit) and X (a new control of real-estate credit). But, more recently, there have been restrictive moves towards qualitative control of bank lending in general. The authorities are exhorting the banks, and other lending agencies, to minimise and screen their loans "in the national interest." It is being pointed out—in the words of the Federal Reserve Bank of Cleveland—that "in time of expanding activity and rising prices, almost everyone's credit, at least short-term credit, is good, and it is very difficult to distinguish between the essential normal needs of business, and those of an additional and speculative nature." The priority certificate, it seems, is destined to become a principal weapon in the battle against inflation. It is to be hoped that America will not discover, as Britain did in the early postwar years, that all such weapons become very blunt indeed in any conditions short of total war.

Rhodesia's Gold

The Minister of Mines of the Southern Rhodesian Government has announced in Parliament at Salisbury that permission has been asked from the International Monetary Fund to allow a proportion of Southern Rhodesia's gold output to be sold in the open market at premium prices. This statement promises the addition of yet another source of supply of newly mined gold reaching the free gold markets. The Government of Southern Rhodesia decided in 1948 to pay its gold producers a subsidy of 27s. 6d. per ounce of fine gold. This measure was found by the IMF to be inconsistent with its rules for gold dealings, which seek to prevent international gold transactions at other than official prices. By agreement with the United Kingdom this straight subsidy was set aside and replaced by other arrangements under which subsidies were given not on gold produced but on the basis of tonnage mined and grade of ore mined. This, apparently, passed muster at the IMF. These special aids to Rhodesian gold producers were withdrawn after the devaluation of sterling; these producers have been selling the whole of their output to the Bank of England at the official price. They cannot have ignored the happier fate of their neighbours in South Africa who, with IMF sanction, are able to dispose of up to 40 per cent of their gold output at premium prices, though they have to go to the inconvenience of having this gold fabricated before it becomes eligible for this privileged treatment. The concessions granted in the past by the IMF to South Africa can hardly be withheld from Southern Rhodesia, or Canada, which is making a similar request. A situation is fast arising

'What is their commercial standing?'

THE WESTMINSTER BANK can, in many cases, give you an immediate reply; or, if the required information is not already available in the extensive and up-to-date records of the Foreign Branch, it can very quickly be obtained. The provision of reliable confidential information as to the reputation of your prospective overseas customers is part of a comprehensive service which the Westminster Bank provides for those who trade abroad. This service is described in a booklet which can be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank*.

COFFEE: The earliest witness to the tonic effect of coffee was possibly an Arabian goatherd who noticed that whenever his flocks fed on a certain shrub the effect on their behaviour was immediate and remarkable. Greatly daring, he ate a handful of the berries and found the effect so exhilarating that he ran non-stop to his village to break the news of his discovery.

Although the popularity of coffee was well established by the middle of the nineteenth century, it was only at the beginning of the twentieth that Kenya Colony began to grow it. To-day Kenya specialises in the *arabica* variety which is the finest quality grown.

Full and up-to-date information from our branches in Kenya on the coffee industry and on general market conditions in the Colony is readily obtainable from our Intelligence Department.

in which a very substantial proportion of the newly mined gold will be feeding, not the monetary reserves of the world, but the free markets that serve not only industrial requirements but the hoarding demand for the metal.

Season for Trade Talks

The Treasury is keeping a full programme of financial and commercial negotiations in train. The discussions with Switzerland reveal no difficulty on the question of payments—these matters always go well when Britain is the creditor—but have bogged down somewhat on the trade side. Switzerland, as a latter-day debtor to Britain and to the European Payments Union as a whole, is somewhat impatiently awaiting evidence of greater liberalisation in British import policy. The talks with Jordan have entered their third week. The tidying up of the financial relics of the old Palestine mandate has taken some time. The main problem that remains to be discussed is the release of Jordan balances for the current year. The talks with Egypt are completely deadlocked. The latest news from that quarter is that a secret debate on Egypt's financial relations with Britain is to be held next week in the Egyptian Senate. Pending this debate, no further moves can be expected from the Egyptian Government. A Treasury representative is in Baghdad to discuss with the Government of Iraq the problem of hard currency allocations from the sterling area dollar pool. An agreement negotiated in 1947 provided for releases from Iraq sterling balances over a period of five years, but separate yearly agreements have to be made on hard currency allocations. Trade and payments discussions are looming up with Spain and Portugal. They will probably be held in London so as to ease the burden carried by that increasingly peripatetic species, the British higher civil servant.

World Bank Income and Expenditure

The International Bank for Reconstruction and Development is acquiring increasing weight. Its latest half-yearly report puts it in the class of the billion dollar giants, its total loans over its four-year life having now crossed that milestone. The bank's income has kept pace with the increase of its commitments. Gross income for the last six months of 1950 amounted to \$13,370,710 after deducting loan commissions of \$3,114,702 appropriated to the special reserve. This reserve receives the yearly 1 per cent commission levied on all loans issued by the bank and earmarked in a special fund to provide for losses on loans and guarantees: by the end of 1950 the reserve had been built up to \$34,752,901.

The bank's net income for the second half of 1950 totalled \$7,754,631: outgoings on bond interest absorbed nearly \$3,400,000, while the administrative expenses amounted to \$2,408,907. The administrative budget, now running at the rate of almost \$5,000,000 a year, is beginning to look generous in relation to income and turnover of business. The International Bank necessarily incurs heavy expenditure in the course of its far flung activities. Teams of investigators have to be sent out to "vet" projects and once loans are granted the bank takes inordinate but justifiable care to "follow through" and control the expenditure of the funds it makes available to borrowers. This is all the more reason why the elaborate and effective mechanism that the bank has devised to supervise the expenditure of its loans should also be used to screen its own administrative budget.

Fewer New Cars

The expected cut in the home market quota of cars and commercial vehicles has been announced by the Ministry of Supply. The original figure of 110,000 cars (the same as in

1949 and 1950) has been reduced to 80,000 and the quota of commercial vehicles has been reduced from 95,000 (81,500 in 1950) to the same level as for passenger cars. Should the industry's output during the year exceed 460,000 cars and 230,000 commercial vehicles, half that excess may be sold on the home market.

The Ministry of Supply has made the frank, if unusual, admission that "it is not possible to estimate with any assurance the likely output of vehicles in 1951." On present evidence it seems possible that 60,000 fewer passenger cars might be produced this year than 1950's total of 522,500. This represents a fall in output over the whole year of about 11 per cent, on the assumption that the reduction of 15 to 20 per cent in the first half of the year may be mitigated by some recovery of output in the second half of the year. It will be divided "equally" between the home and export markets, 30,000 cars being taken from the home market allocation and the remaining 30,000 from exports. This means that deliveries to the home market will be cut by 27 per cent and those for export by about 7 per cent.

There is some chance that the Ministry's estimate will be exceeded. Vauxhall Motors is the latest firm to go over to a four-day week, but others, including the Austin and Ford companies, are maintaining employment by making a higher proportion of chassis. For allocation purposes, the Ministry is prepared to count a chassis as one vehicle. The extent to which chassis can be substituted for exports of complete cars depends on the quantities of sheet available for body pressings in the countries of destination and on sufficient supplies of materials, including non-ferrous metals, to maintain chassis output in this country. There are no reports yet of sheet becoming scarce in Australia, which is the chief market for chassis. Short-time working by part of the industry may improve deliveries of materials to other manufacturers, but early in the year, before the cuts in sheet steel supplies were announced, it was estimated that shortage of other materials would reduce the motor industry's output by between 10 and 15 per cent in the first half of the year.

Working in a Vacuum

The Director of the Royal Institution, Professor E. N. da C. Andrade, spoke last week of the remarkable way in which the esoteric laboratory technique of vacuum processing was quickly becoming standard practice in a number of industries. The object of the vacuum is to remove as many air molecules as possible, so that they do not interfere with the process being carried out. Modern vacuum treatment dates from the development within the past forty years of the diffusion pump, an ingenious apparatus which relies on a mechanical pump to produce a "rough" vacuum and then on a vapour pump which reduces the pressure in the chamber until a "high" vacuum has been created.

Professor Andrade described a number of industrial processes which are now being carried out as a matter of routine in a "high" vacuum. The evacuation of valves and cathode tubes, and the vacuum distillation process in the fine chemical industry, have been used for some years. More recently, the moisture in heat-sensitive pharmaceutical products such as blood plasma, penicillin and some vitamins, which cannot be removed by ordinary heat treatment, has been removed by evaporation under vacuum conditions after preliminary freezing. This process, adopted by the pharmaceutical industry from necessity, has been taken up by the food industry from choice. In the United States, vacuum-dried orange juices, milk and coffee preparations are being sold on a growing scale in competition with those prepared by conventional methods, and their introduction in this country is expected.

The technique of metal shadowing of microscope specimens and of metallising mirrors for astronomical and

scientific purposes is carried out in a vacuum for technical reasons. Exactly the same method is being used by quite small firms to give a decorative metal coating to cheap plastic sequins, buttons, sheets of paper and plastic and to coat condenser papers; the process gives a better and cheaper product. Vacuum coating technique has been used with such success that it is replacing other methods of plating. For convenience and longer working life, matrices of gramophone records are similarly coated. Other vacuum processes involve the production of gas-free metals of exceptionally high purity, and of high precision castings.

The atomic energy authorities are still the best customers for vacuum equipment, and are covering much of the development costs. Although vacuum techniques are sufficiently simple to be used by workers without scientific training, manufacture of the equipment calls for highly specialised engineering skill, which only a handful of firms can claim. One leading British firm in this field, W. Edwards and Company, might be thought small by ordinary industrial standards, but it has built up a business in the past thirty years solely by developing vacuum equipment and probably commands the highest concentration of vacuum engineering knowledge in the country. Another firm, British-American Research Ltd., is a newcomer set up to produce equipment developed by American vacuum specialists. Metropolitan-Vickers includes among its manifold activities a range of vacuum equipment—perhaps the nearest approach to mass production in this highly specialised field.

* * *

The Trend of Stocks

Of all the dubious half-knowns in economic statistics, the measurement of inventories and work in progress is one of the most important and perplexing. The evidence of the latest analysis of balance sheets received in the last quarter of 1950 goes some way to support the impression that indus-

	1,468,158	1,582,215		1,468,158	1,582,215

try's inventories, reckoned in real terms, have fallen, but it is not as conclusive as one could wish. The latest balance sheets for 646 companies show a rise in stocks from £315.6 million a year earlier to £339.6 million—the latter figure relating to an average accounting date midway in July, 1950. To decide about the physical movement of stocks would require much more evidence than this—matters such as rates

of stock turn and the bases of valuation are involved and on these there is little or no information. The book figures, conventionally valued "at cost or market, whichever is lower" reflect the full impact of market prices only after an interval during which stock is turned over. But it can probably be said with fair safety that a rise in book values of inventories of 8 per cent reflects no more than the rise in prices during the latest notional financial year to which the figures apply.

Another perplexity, on which no light is thrown by published accounts, is the division of the stocks figures into primary raw materials or incoming partly finished manufactures on the one hand, and work in progress on the other hand. In recent months, a fall in the first would not have been inconsistent with a rise in the second—that is, the pipeline might have become more tightly filled with intermediate products even though it was receiving fewer raw materials. But this is only a speculation. There are some indications that work in progress has lately been increasing, and firmer evidence about falling stocks of raw materials. The balance between the two factors cannot be established, but it will have a crucial bearing on industry's efforts to carry the immense burdens of defence, exports and essential output for use at home.

* * *

British Merchant Tonnage

At the end of 1950 the British merchant fleet totalled 19,626,000 tons gross, according to Ministry of Transport figures published in the *Digest of Statistics*. This total comprises all vessels of over 500 tons gross registered in United Kingdom and Commonwealth ports, and compares with a total of 18,608,000 tons at the outbreak of war in 1939 and 19,382,000 tons at the end of 1949:—

BRITISH TANKER AND NON-TANKER TONNAGE
Vessels of 500 Tons Gross and Over—'000 Tons Gross

Date	UK and Colonial			Total Commonwealth		
	Tanker	Non-Tanker	Total	Tanker	Non-Tanker	Total
Sept. 3, 1939 ..	3,064	14,313	17,377	3,236	15,372	18,608
Dec. 31, 1949 ..	3,701	12,953	16,654	3,872	15,510	19,382
Dec. 31, 1950 ..	3,962	13,600*	17,562*	4,149	15,477	19,626

* Including 641,000 tons gross transferred from Canadian registry, but excluding 34,000 tons of foreign tonnage on bareboat charter.

The grand total is now about 1,000,000 tons larger than in 1939; nine-tenths of this increase is accounted for by tankers. Ships registered in the United Kingdom and Colonies barely exceed the 1939 total, and then only because of the transfer of some 641,000 tons of Canadian-owned tonnage to the British register in the past year. Even including this group of ships, vessels other than tankers on the British register are 700,000 tons fewer than in 1939, while the British tanker fleet has increased by 900,000 tons gross. It is perhaps significant, in view of recent movements in tramp freight rates, that the total of British dry-cargo tonnage fell slightly during 1950.

More tankers than dry-cargo vessels will be built in 1951 also, to judge from the Admiralty shipbuilding returns published in the *Digest*:—

BRITISH SHIPBUILDING, 1946-50
Vessels of 100 Tons Gross and Over—'000 Tons Gross

Year	Laid Down		Under Construction at End of Year		
	Tankers	Non-Tankers	Tankers	Non-Tankers	Total
1946	208	1,100	242	1,547	1,789
1947	291	853	414	1,570	1,984
1948	409	811	620	1,363	1,983
1949	608	605	855	1,005	1,860
1950	753	604	1,050	811	1,861

Well over half the tonnage under construction is now tanker tonnage, of which 50 per cent is intended for British

NEW STEEL FROM OLD

Every extra ton of scrap returned means another ton of new steel.

There is still a lot of scrap not coming back into production quickly enough.

The British Iron and Steel Federation appeals now, in the national interest, to all industrialists to speed the return of iron and steel scrap through scrap merchants who can assist in dismantling and collection however difficult. Steel is serving you well—now is *your* chance to help steel to help you.

Improved scrap supplies have helped to raise steel output by 3,500,000 tons in the last 3 years.

In fact, the Timber Control bought only very small quantities of softwood from North America in June and July. The period of heavy buying was spread over the three months, August to October. In this period the Timber Control bought at varying prices—at first at high prices and later, when the break occurred at the beginning of October, at lower prices. Stocks of softwood in Britain at the end of June were run down to a mere 170,000 standards and the Timber Control would have been compelled to buy minimum requirements almost irrespective of price. Its gamble on the market nine months earlier failed and was directly responsible for the dearth in supplies in the middle of the summer. The choice was thus blunt—dear timber or no timber at all and the Control had at last learned that it would have to pay to get what it wanted. The break in the American market, when it occurred, was unexpected and the Timber Control made sensible use of its opportunity. But if it had postponed all its buying until prices fell, the timber trade would have been in a sorry plight. It is, indeed, true that private trade should not be blamed for the recent rise in timber prices. But if the Timber Control had not built up British stocks of timber before private importation was resumed, the rise in prices might have been even sharper.

The trend in agricultural prices in recent weeks has been conflicting. Grain prices fell quite sharply in the middle of January but subsequently recovered and this week reached new seasonal peaks. Sugar, on the other hand, has been falling steadily though moderately since January 10th. The winter world crop is at last beginning to tell on the market.

[illegible]

The British Government is gradually being forced to take steps to conserve Britain's dwindling supplies of raw materials. As from next Monday export licences will be required for all destinations for antimony, vanadium and zinc (and certain types of their alloys) nickel ores and concentrates, cobalt compounds, certain types of steel materials, sulphuric acid, naphthalene, anthraquinone and even feathers, down and candles. The coal shortage and the power cuts are said to be responsible for the ban on the export of candles.

In order to accelerate deliveries of imported American coal more than 264,000 tons of which has now been landed at British ports, a number of large American vessels have been chartered to carry coal to Rotterdam for transhipment to Britain. This decision, which will add something to freight charges, has been explained by the National Coal Board as due to the limited facilities British ports possess for discharging coal from large ships. The Board's spokesman held that "whether the operation saves money or not is of far less importance than the pressing need for coal now." For the next few weeks at least, this principle is undeniable; but the expedient, for which the Ministry of Fuel and Power is responsible, will worsen the financial situation of the Board.

Two more motor manufacturers raised their prices this week. Vauxhall Motors has increased the price of its cars by £20, so that the Wyvern now costs £415 and the Velox £470 (both plus purchase tax). The price of the company's Bedford trucks has been increased by between £25 and £80, the new price of the 10-cwt. van being £365 and of the 7-ton lorry £850. The Austin Motor Company has also raised its prices. The new figures are not yet definite, but the A.40 is expected to go up from £392 to £420, and the Sheerline from £1,250 to £1,340. The price of the 25-cwt. truck is expected to rise from £645 to £685 and of the 5-ton lorry from £678 to £773. These increases are in line with those recently announced by other manufacturers. The Rootes' Group Hillman, for example now costs £425, the same price as the Ford Consul, while the new price for the Ford Anglia is £280 an increase of £23.

Company Notes

Roan Antelope and Mufulira.—The revenue accounts of Roan Antelope and Mufulira for the six months ended December 31, 1950, provide impressive justification for the recent activity in Rhodesian copper shares. Estimated profits before taxation of Roan Antelope have risen substantially from £678,000 in the second half of 1949 to £2,695,000 in the six months to December 31, 1950, and those of Mufulira from £1,623,000 to £3,796,000 for the same periods. Both companies, however, report lower profits in the 1950 December quarter than in the previous three months; estimated profits of Roan Antelope have fallen from £1,601,000 to £1,094,000, and Mufulira from £2,021,000 to £1,775,000.

This easing of profits in the last quarter was not accompanied by a fall in the production of blister copper; Mufulira production was up from 20,763 tons to 21,855 tons and that of Roan Antelope from 17,795 tons to 18,333 tons. This rise in production is in distinct contrast with the announcement of a 10 per cent cut in production, made necessary by the shortage of coal, which was to take effect from October 11th last; the companies have had long practice in showing ingenuity in meeting fuel shortages and perhaps their effect was over-estimated. But the rise in production would certainly have been much greater if fuel had been plentiful. The high level of profits in the last six months reflects the high prices of copper in a world short of non-ferrous metals.

Roan Antelope		6 Months to Dec. 31, 1950
Blister copper sales (long tons)	1949	35,648
Revenue	1949	5,904
Operating expenditure	1949	2,837
Added to value of stocks	1949	138
Estimated operating surplus	1949	3,205
London expenditure	1949	60
Replacements	1949	450
Estimated profit before taxation	1949	2,695
Mufulira		6 Months to Dec. 31, 1950
Blister copper sales (long tons)	1949	41,118
Revenue	1949	6,735
Operating expenditure	1949	2,778
Added to value of stocks	1949	231
Estimated operating surplus	1949	4,118
London expenditure	1949	42
Replacements	1949	350
Estimated profit before taxation	1949	3,796

The confident expectation that the ordinary dividends of these companies will be increased is supported by these results, particularly after the news that the labour disputes in Northern Rhodesia have been settled. It must be remembered, however, that fuel shortages remain and that neither Roan or Mufulira has transferred to Rhodesia; this fact may not greatly alter the ordinary shareholder's net return, though it may affect the market's view of the shares in comparison with Rhokana. The 5s. ordinary stock units of Roan Antelope on the present dividend of 25 per cent give a yield of nearly 6 per cent, at 21s., and the 5s. units of Rhodesian Selection Trust, which controls Mufulira, yield over 6½ per cent on the 50 per cent dividend and at the present price of 38s.

Liebig's Extract of Meat.—The rise in group trading profits of Liebig's Extract in the year ended August 31, 1950, from £1,348,000 to £1,659,476 may be attributed in the main to the expansion of trading of the company's European subsidiaries, particularly in Belgium and Italy. Profits earned at home by Oxo Limited dropped considerably; sales of this product fell off in the summer months as consumer's demand slackened, but improved considerably in the

last quarter of 1950. Trading profits have shown a welcome improvement in the River Plate and have been sufficient to absorb the losses on exchange, which are shown in the accounts, after crediting certain exchange profits from other sources, at £207,818, against £53,006. The fall in the British taxation provision from £610,364 to £384,058 arises "rather from a change in policy than from any other factor" as the company will no longer provide for any taxation liability on the earnings of foreign subsidiaries until these profits are brought into the parent company's accounts. "To pave the way for still greater efforts" the European subsidiaries have conserved the major part of their very satisfactory earnings, so that retentions by subsidiary companies are shown at £267,092, against £119,289; in 1949 these retentions were drawn on considerably by the transfer of £115,490 from subsidiaries' general reserves in order to build up the parent company's contingency reserve. The ordinary dividend of 9 per cent, tax free, has been maintained, so that the gross yield on the £5 stock units, at the current price of £14, is some £5 17s.

F. W. Woolworth.—The impressive rise in trading profits of F. W. Woolworth last year by nearly £1,000,000 to some £12,260,000 was only accomplished, according to the chairman's statement, by obtaining a considerably increased volume of sales. This increase has been achieved by "better buying at a lower ratio of profit mark up" and "much improved store operation." Last May the company decided to build up a reserve of good selling merchandise; the shrewd timing of this policy can be measured by the rise in the book-value of stocks from nearly £6,700,000 to over £10 million. The foresight of the directors in stockpiling in a period when further rises in the price of consumer goods were clearly to be expected contrasts favourably with the running down of stocks by the Ministry of Food in the same period. The company are now well placed to sustain the rising turnover which is "an absolute necessity in view of continually increasing expenses, of which not unnaturally wages are by far the biggest item." The chairman also discloses that the present net current assets of a little over £18 million are sufficient to meet all foreseeable additions to fixed assets and to finance any likely increase in stock values.

Mr. B. E. Uffindell joins other leading industrialists in tilting his lance at the purchase tax, and in particular its automatic increase each time the cost of goods rises. To avoid this adding fuel to the inflationary bonfire the chairman suggests that purchase tax on essential and semi-essential goods should be frozen if the percentages cannot be reduced.

Central Line Sisal Estates.—The directors of Central Line Sisal Estates have recommended a final dividend of 20 per cent to make a total payment for the year of 25 per cent. This compares impressively with a total dividend of 10 per cent in 1948-49 and provides the equity shareholders with a due share of the jump in profits in the year ended June 30, 1950, from £95,802 to £136,625; this latter total includes £15,500 of provisions no longer required. The policy of building up revenue reserves continues for £30,000, against £20,000 last year, has been transferred to general reserves. A provision of £15,700 is made for past years' taxation still in dispute. The rise in profits, accompanied by the increased dividend, follows a period of considerable activity in sisal shares in recent weeks.

EXCHEQUER RETURNS

For the week ended February 3, 1951, total ordinary revenue was £180,346,000, against ordinary expenditure of £55,683,000 and issues to sinking funds £340,000. Thus, including sinking fund allocations of £14,243,000 the surplus accrued since April 1st is £546,820,000 compared with £504,170,000 for the corresponding period a year ago.

COMPANY MEETINGS

JONAS WOODHEAD AND SONS, LIMITED

OUTPUT AND SALES RECORDS

CAPTAIN ALLAN KYLE'S REVIEW

The thirty-first annual general meeting of Jonas Woodhead and Sons, Limited, was held on February 8th, at Leeds.

Captain Allan Kyle, the chairman, in the course of his speech, said:—The group's accounts are again presented to you in booklet form. It gives you your company's balance sheet, a consolidated balance sheet and the consolidated profit and loss account. Every endeavour has been made to simplify them within the requirements of the Act. With your permission I will take them as read.

I have often wondered whether the constructive and sincere efforts of the Cohen Committee have in fact achieved all that they attempted to do. The requirements of their recommendations certainly take up a great deal of time which could be more profitably employed in the running of your business. This would be of no moment if you could read and understand more easily the annual accounts as now drawn, but I understand from many that this is not so. If you lean on the reviews of the Press experts, you will find many draw different conclusions to a bewildering degree. Furthermore, I see a greater load of responsibility and detail thrown on to the shoulders of the auditors—surely they could be relieved of some of it without prejudicing the main essentials? Maybe the time has come for the results of this Committee's work to be reviewed in the light of experience.

I spoke to you at some length last year on the losses that had been incurred by a subsidiary that was not wholly owned by your company. These losses have had an abnormal effect on the results, but I pointed out that if this subsidiary became wholly owned, then with good weather, we should reap a better crop. The subsidiary has become wholly owned and the weather has at long last shown signs of real improvement, though not without some residual growing pains.

Coming now to Woodheads, your parent company, it is my privilege to report to you that once again we have broken all past records in both tonnage output and sales value. In fact our output is well over three times that of ten years ago. It is an achievement of which all may well be proud, and which can be attributed to the grand efforts of my colleagues, to the hard-working staff and to the magnificent team spirit of our workpeople. There are many within our works who are sufficiently old-fashioned to be proud of their product and of their efforts. May this simple background of this country's tradition be maintained.

AN INDUSTRIAL BOOM

This country is, in one sense, in the throes of the greatest industrial boom of all time. Even the periods of the great industrial uplift of the Victorian era become puny in comparison, not only in volume of demand, but in period of time. This boom of today had its birth some 15 years ago; so long ago in fact that many people, many who should know better, have forgotten that "the law of supply and demand" is a law unto itself, not subservient to any government, nor to any planned control. You can hold it or smother it for a time but eventually it will assert itself.

I am bringing this point of view forward so that you may be aware of some of the unknown problems which face your board of directors. There is hardly a member of your group whose order book is not full to the

brim for many months to come. This is not due to any sudden surge. In fact it has become normal since it has been going on for a long time. How therefore can one train the younger executives of, say, our sales staff to what is really required of them in ordinary or in slump times? It is like explaining to any young man or woman of 30 years or less what this country was really like before the advent of rationing and control; they just cannot believe you.

TWO PROBLEMS

Alongside this, there is a problem rearing an ugly head—steel supplies, whether in billet or in a more basic form. It is not really the fault of our suppliers. Here again, they have been and indeed are still experiencing a period of industrial demand which it is impossible to satisfy. They are doing their utmost (may they be forgiven for the quality sometimes supplied) but from our vantage point as a customer, we have recently felt that lack of vitality; that incentive to satisfy the customer; that spirit of private enterprise. May it not be that coming events cast their shadows before?

These are two phases of our problems, but there is another which to me is alarming and desperately serious. It is something outside of our scope but it concerns our workpeople, in fact everyone. They are delighted with their greater pay-packets, with all the promised joys of Utopia and its beautiful future, but is it fair to them not to point out that this boom has become a sham prosperity of a superficial character? With inflation round the corner, the future is grim and unknown.

These problems, together with those of an international character, make it difficult to deal with future prospects. Current prospects are good and we are all of good heart. If the problems and the unknown difficulties of the future are within our power to solve, then the future of your company and its subsidiaries is, to say the least, bright. I might add here that the requirements of the rearmament programme itself as it affects the Woodhead group of companies will be taken in our stride, although, of course, our output for civilian needs will have to be curtailed.

EXPORT TRADE

Your company is playing a very important role in the export trade. Of the total output of your group of companies some 60 per cent. is exported either directly or indirectly through the manufacturers of railway locomotives and carriages, buses, lorries and motor-cars. The volume of our direct export trade has increased to an encouraging degree following the appointment of agents in various countries in which we have not previously traded. We are now finding it increasingly difficult to secure shipping space and export stocks are piling up.

I paid a tribute last year to our three Sheffield companies on the trading results that they had achieved. They, in common with your parent company, have had many difficulties with which to contend, but they have done and are still doing well.

Our associated company, Woodhead-Kemp Springs, Limited, in South Africa, is now working at a greatly improved output which is only controlled by steel supplies. This very up-to-date plant has become a real industrial asset to that country, and they are now known as "the leading spring manufacturers of South Africa."

Coming now to the accounts, I think you will agree with the view that the finances of the group are on the whole satisfactory. With the ever-increasing cost of raw materials, wages, fuel, transport, together with the substantially increased production of the group, your company has become progressively short of working capital. Your directors are in course of arranging further finance by means of the issue of £200,000 redeemable ten-year unsecured loan stock to deal with this problem.

DIVIDEND POLICY

Finally, I come to the question of our dividend policy. This year we are proposing to pay out about £12,000 more than we have done in each of the past 10 years. When I compare this with an increase of £206,000 per annum in productive wages only during the same period, it makes me wonder where the shareholders come in. Some critics may say that this £12,000 has not been earned; this is quite untrue, as we have in fact during the year accumulated for the future £28,794 after nourishing our growing but as yet not fully productive children, and after paying this increased dividend.

The report and accounts and the proposed dividend of 10 per cent. and a bonus of 5 per cent., both less income tax, were unanimously approved, and the proceedings terminated with a vote of thanks to the management, staff and workpeople.

F. W. WOOLWORTH AND COMPANY, LIMITED

INIQUITOUS PURCHASE TAX

The forty-second annual general meeting of F. W. Woolworth & Company, Limited, will be held in London on March 2nd.

The following is an extract from the statement of the chairman, Mr B. E. Uffindell, circulated with the report and accounts for the year 1950:—

Your company for 1950 has paid, or is due to pay, a total sum of £12,718,703 in respect of Purchase Tax. What is so iniquitous about this Purchase Tax is that as the cost of goods increases, the sterling amount of Purchase Tax also increases and, in my view, it is high time that the percentages of tax applicable on all essential and semi-essential goods were reduced, or if this is not possible, steps should at least be taken to prevent the spiral of Purchase Tax rising as the prices of goods increase with the advancing cost of raw materials. To be specific—freeze Purchase Tax to be paid on such goods to the sterling amount at, say, January, 1950.

If this suggestion were adopted the vicious spiral of Purchase Tax rising with the increased cost of goods would not increase the prices to the consumer public still further, as it does at present. The Purchase Tax increase is almost as much as the manufacturers' cost increase, but whereas the manufacturer has justification, by reason of the increase in the cost of raw materials, there is absolutely no justification why the consumer public should have to pay increased Purchase Tax.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

*The Reporting Manager,
The Economist,
22 Ryder Street, S.W.1*

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The fifty-sixth Ordinary General Meeting (being the Annual General Meeting for the year 1951) was held on February 8th at the Head Office of the Bank, 54, Lombard Street, London, E.C.3.

In the absence, owing to illness, of the Chairman of the Bank, Sir William Goodenough, Bart. LL.D., the Deputy Chairman, Mr Anthony Tuke, presided.

Mr H. G. Tickle (the Secretary) read the formal Notice convening the Meeting and the Report of the Auditors.

With the concurrence of the Stockholders present, the Report and Accounts were taken as read.

The Chairman moved:—

"That the Report of the Directors of the Company now produced, together with the Accounts annexed as at December 31, 1950, duly audited, be received, approved and adopted, and that a Final Dividend of 5 per cent., making 10 per cent. for the year, on the "A" Stock, and a Final Dividend of 7 per cent., making 14 per cent. for the year, on the "B" and "C" stock respectively, less Income Tax in each case, be declared, payable on the 23rd instant to the Stockholders registered in the Books of the Company on the 15th January last."

Mr Cuthbert Fitzherbert (a Vice-Chairman) seconded the Motion, which was carried.

The retiring Directors were re-elected, and other ordinary business was transacted.

A Special Resolution adopting new Articles of Association was carried.

A Vote of Thanks to the Staff and a Vote of Thanks to Mr Tuke for presiding at the Meeting were unanimously accorded and the proceedings terminated.

RADIO RENTALS LIMITED

CONTINUED PROGRESS

The fourteenth annual general meeting of Radio Rentals Limited was held on February 5th in London.

Mr H. F. Hunt, the chairman, in the course of his speech, said: The new record net profit of £153,256 emerges after providing for all expenditure, and compares with £138,654 for the previous year. The consolidated profit shows an increase over the previous year of £21,790. I must stress that the increase in profit comes from growth of trading, and not from larger profit margins. Up to the present, television is not materially responsible for increased profit.

On the balance sheet I shall make but few comments, because the figures speak for themselves, and its soundness needs no emphasis. The total reserves now amount to some £390,000, which is £85,000 more than the issued capital.

We are faced with considerable additional outlay on such items as new office machinery, more motor vehicles, and additional works for television, and additional service works. To assist in financing these commitments,

NOTICES

TWO BURROUGHS BILLING MACHINES FOR SALE. Calculate cost and selling prices and type invoices in one operation. Specially adapted for Woollen Trade, calculating in eighths. Both good condition, one unused. For further details and appointment to view in London.—Apply Box F 5122, A.K. Advtg., 212a, Shaftesbury Avenue, W.C.2.

PSYCHOLOGIST (female) required for Personnel Department of engineering organisation at London Headquarters. A degree including Psychology and Statistics is essential and some industrial experience desirable. Age 24-31. Write details training, experience and salary expected to Box 573.

we propose to make another share issue to our ordinary shareholders, of one share for every seven held, at a price of 10s. per share.

On dividends, year by year your directors have given serious thought to recommending an increase, and it is now felt that a small increase of 5 per cent. is fully warranted. The total dividends of the company represent approximately 7½ per cent. on the total capital and reserves of the group attributable to the parent company.

Since the end of the financial year our volume of new business, both radio and television, has been highly satisfactory, rising to a record peak in the pre-Christmas period. The report and accounts were adopted.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED

LARGER PROFITS

The eighty-sixth annual general meeting of Liebig's Extract of Meat Company, Limited, will be held on March 1st in London.

The following is an extract from the statement of the chairman and managing director, Mr. Kenneth M. Carlisle, circulated with the report and accounts:—

The consolidated profit and loss account opens with a large increase of £311,000 in profits less losses on trading. The parent company's results in the River Plate show a welcome improvement as compared with last year, largely in consequence of the realisation of Argentine manufactured products from 1949 production at the higher prices introduced by I.A.P.I. with effect from January 1, 1950. Our Belgian and Italian subsidiaries have made great strides during the year and their contribution is a major one. The profits of the Argentine subsidiaries expressed in sterling were down, owing mainly to the fall in value of the Argentine peso, and I have to record a considerable drop in the profits earned at home by Oxo Limited.

FEATURES OF YEAR'S WORKING

Broadly speaking, it may be said that results recorded by our factories in the Argentine and Paraguay show, in terms of local currencies, a great improvement over last year, but have been almost wiped out in terms of sterling by currency devaluations which affected not only the year's profits, but also the values of net current assets held in those countries at the close of last year's trading.

Profits realised by our Argentine subsidiaries were slightly higher than a year ago, but their sterling value has been adversely affected by the fall in value of the Argentine peso.

The profits of our Uruguayan subsidiary, which are remittable have been brought into account at a lower figure than in recent years.

Better results were obtained from Africa, although our new factories in Tanganyika and the Sudan had not yet reached the revenue-earning stage. Continental trading profits show a welcome increase, which has

been assisted by movements of exchange rates in our favour, but these companies have conserved a large proportion of their profits in order to strengthen their resources for the future. Home trading results were disappointing and a considerable decrease in profits was recorded.

OXO SALES

Sales of Oxo Cubes continued on the high war-time and post-war level until April, at which date they showed an increase over the previous year. However, with the approach of the summer months, sales to the trade decreased compared with previous years in line with a general tendency for traders to reduce stocks to a minimum, when manufacturers were at last equipped to supply promptly on demand. There was also some evidence of a decrease in consumer demand during the summer months, due probably to the greater variety of goods available in the shops. We are pleased to say, however, that for the period September-December, 1950, trade sales have been well above the previous year, an indication that the public maintain their confidence in the merits of this our principal proprietary product as a valuable warming beverage in the winter months and as an economical supplement to a great variety of meat and vegetable dishes.

LUMUT RUBBER ESTATES

SIR ERIC MACFADYEN'S ADDRESS

The annual general meeting of Lumut Rubber Estates, Limited, will be held on March 2, 1951, in London. The following is an abstract from the circulated address of the chairman, Sir Eric Macfadyen:—

Work progressed steadily on the estates, and both divisions—Lumut and Dusun Durian—are in an improved condition of upkeep. The replanting programme on Dusun Durian was pushed on, and we now have 386 acres of oil palms planted there. In addition, the company has 8,312 acres planted with rubber.

On the liabilities side of the balance sheet issued capital is unchanged at £485,482. We are proposing that the authorised capital, now £494,000, be increased to £750,000. As the replacement of planted areas reserve, after charging up expenditure during the period in connection with replanting, would have been exhausted, it has been replenished by an allocation from profit which raises it to £20,000.

In the profit and loss account you will see we have harvested a somewhat reduced crop—3,188,747 lb. against 3,302,000 lb. last time. The shortfall was seasonal. There was a large rise in costs due to wage increases, but the higher prices realised—an average of 1s. 9.93d against 11.92d.—gave us a surplus, before taxation, over three times as large as last year's—£138,722 against £43,967. Taxation brings that down to £68,069 as compared with £21,759. The directors propose the payment of a final dividend of 10 per cent., less income tax, making, with the interim of 5 per cent. paid on October 31, 1950, 15 per cent. for the year, and if this is approved the amount to go forward will be £26,286 against £24,357 brought in.

HIS MAJESTY'S COLONIAL SERVICE

MAURITIUS

Woman Nutrition Officer required to investigate and advise on nutrition problems and to instruct local personnel. Selected candidate will be engaged on agreement for three years. Salary scale £375 to £660, point of entry according to age, qualifications, and experience. Appropriate cost of living allowances. Free passage. Income tax at low local rates.

Candidates should hold the Diploma in Dietetics. Experience in scientific or educational work and in dietary problems of a large hospital or educational institution is desirable.

Further particulars and application forms available by writing to Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting reference 3/27321/2/50.

The Foreign Secretary

THE debate on foreign affairs in the House of Commons on Monday elicited from the Prime Minister one of the best statements of British foreign policy that have been made for some time past. It was strong; it was clear; and it was sensible. All through the winter the fear had been growing that the Government, under pressure from its own restless left wing, was slithering away from the spirit, if not yet from the letter, of the engagements it had taken with its allies and was entering once again, in Europe as well as in Asia, on the slippery path that leads from temporising through appeasement to surrender. Mr Attlee has set such fears at rest, at least for the present. Both in the European and in the Far Eastern passages of his speech he said things that badly needed saying. He spoke of "sham peace propaganda" and set against it the "real fact" of Soviet armaments. This, he told his own left wing, was the major cause, though they did not mention it, of the "international tension, fear and suspicion" with which their motion was concerned. He recalled how the Korean war had started; "it is no good accepting principles, acting on those principles, and then running away from the results." He paid tribute to American efforts and said, quite flatly, "there is no doubt that China has committed aggression." On German rearmament he was equally sensible and equally deflating to the hysteria among his own followers.

It is good to have so reassuring a speech. But some of the reflections to which it gives rise are less comforting. If it is possible for the Prime Minister to give so much comfort with a clear statement of his policy, why on earth was it not done months ago? The reason, of course, is that for many months the country has had no Foreign Secretary. It is not enough for the departmental duties to be attended to, and for a ministerial body to occupy the chair marked "United Kingdom" at international conferences. The making of just such speeches as Monday's, to guide and enlighten public opinion, is one of the major duties of the Foreign Secretary; indeed, it is his prime duty, for it is the only thing that nobody else can do for him (save, of course, the Prime Minister acting as Foreign Secretary). Mr Bevin has never performed this duty well; for many months past he has not been able to perform it at all, and nobody else has performed it for him. The Prime Minister's own statements, until this week, have been infrequent, ill considered and off-hand—patently the drafts of his subordinates. It is almost as if, amid his many other preoccupations, he has only just been able to get around to the Foreign Office and think out for himself what its policy ought to be.

This interpretation is supported by the fact that Monday's speech, good as it was, was almost entirely backward looking. Its strong points related to the past; what he had to say of the future could hardly have been more vague. In the Far East, the Chinese would be wise to negotiate, and there would have to be some thought about the 38th parallel. In Europe, there might be a conference, but the agenda

would have to be thought out. Mr Attlee has found time to catch up with events; but he has not managed to get ahead of them; and Heaven only knows what will happen in the interval while he goes off to look after defence, or coal, or food, and before the Foreign Office's turn comes round again.

In short, the very excellences of the Prime Minister's intervention show up clearly how badly the country needs a Foreign Secretary. For the gallantry of Mr. Bevin's fight against ill health, there is nothing but admiration. But the fact remains that he has not been performing the duties of his vital office for a long time, and that he is obviously now going to be less, rather than more, capable of carrying the full burden. There must now be a new appointment. Yet who can it be? It is said that Mr. Herbert Morrison wants the post, and his seniority in the party is such as to give him an almost indefeasible claim to it. Mr Morrison, as has freely and frequently been acknowledged in these columns, is one of the most capable members of the present government. But a Foreign Secretary, and most particularly a Labour Foreign Secretary, needs to be a man who is very clear in his own mind about the principles of his policy, and who has the character and the authority in his party to stand like a rock against the waves of sentiment and fright that may rage against him from his own party followers. This is not a description of Mr Morrison. There is no evidence that he has settled views on foreign policy, and there is no ear in either

party quite so keenly attuned to the faintest rumour of dissent within his party. It is to be hoped, if only for the sake of his own reputation, that Mr Morrison will not go to the Foreign Office. If a successor to Mr Bevin has to be found within the Parliamentary Labour Party, the best choice, though not a very inspiring one, would be Mr Chuter Ede.

This week's debate, however, has shown what an absurdity it is if a Foreign Secretary has to be sought within that narrow constituency alone. The Prime Minister's quarrel was exclusively with his own followers; the Opposition gave him no trouble—indeed, Mr Eden's admirable speech was a perfect complement to Mr Attlee's. Much the same thing was repeated later in the week on defence; here again there is weak ministerial leadership, and deep dissension in the Labour party, and though the Opposition decided in the event to divide the House on Thursday night, there is clearly more agreement on the principles of defence between the Government and the Opposition than between the Government and many of its supporters. The Labour Government is without a majority in the country; it is desperately short of competent ministers; on the two vitally important topics it is subject to constant sniping from its own followers; on the principals of these same two topics it is in agreement with the Opposition; and yet it is only within its own narrow ranks that a Foreign Secretary can be looked for. If this is the logic of party politics, give us the logic of Bedlam.

A Policy for Germany

IT looks as if the policy of the western powers on Germany is coming slowly and reluctantly towards a time of decision. It is not simply a question of whether or not the Germans should rearm; the form of that question has entirely changed in the last three months, and it will obviously be decided sooner or later by the Germans themselves. Nor is it simply a matter of doing or not doing certain things for fear that the Russians may find some respectable pretext for what is called a "preventive" war. It is rather a question of knowing and deciding now what kind of Germany it is in the western interest to have, say, ten years hence; and then to see what steps can be taken in that direction within the limits set by the present situation. Nobody will pretend that this is the ideal moment for such decisions; indeed, the Foreign Office, the State Department and the Quai d'Orsay face a stern exercise in the art of the possible. For something more is involved than a further stage in four-power exchanges—west *versus* east; in any conference on Germany henceforth the voice of Germany itself will be powerful. And it is part of the function of policy to win and tune that voice.

What are the dominant facts in the situation, in the German question as it now is? Five can be picked out as particularly relevant to western policy. First is the reluctance of the western Germans to rearm; which means that they will make no contribution that matters to western defence for at least a year, probably two years. Second, they can be persuaded to help only if the western powers take military measures for their defence, and make political concessions to their government, which would demand not only more time but

more effort than there is to spare. Third, the Russians want, and will almost certainly get before the spring, a four-power conference mainly about Germany; their purposes in that meeting will be to stop German rearmament and to press on the three western governments a programme for bringing together the two parts of Germany into what they call "unity." Fourth, Dr Adenauer, speaking for the Western Germans, rejects utterly the Russian proposal for a "reunited" and neutralised Germany from which all occupation troops would be withdrawn, because he knows that it would quickly become a Communist police state. But finally, very large numbers of Germans are being frightened away from Dr Adenauer and the west by the propaganda barrage from the east, which says quite plainly that German unity on Russian terms is the only alternative to war. Unified Germany means peace, they say, divided Germany means war.

Here, then, is a situation in which everybody expects something to happen, in which a sense of crisis is being worked up among the Germans by methods described in an article on page 378. To put off much longer, or to refuse, a conference with the Russians on Germany would be unwise, for it would be taken to mean that the western governments can find no long-term policy, are more interested in military strategy than in diplomacy, and are refusing to take notice of Russian anxieties about German rearmament. If reasonable unity of parties and public opinion is to be maintained in the western countries such objections cannot be ignored. Before the present plans of the western powers for Germany, with all their dangers, go ahead there should be one more search for

an alternative. And whether it is to be the present plans or an alternative, in either case the western governments need what they have never yet had, a clear and realistic long-term policy for Germany.

In drawing up such a policy the first obstacle to be removed is the idea, attractive to many people, that any scheme for the neutralisation of Germany could be worth the paper it was written on. For a great industrial nation in the centre of the European plain between Russia and the Atlantic cannot remain neutral. Either, if weak, it will be dominated by one side or the other or, if strong, it will make its own terms for taking sides. If Germany cannot be neutral, then either it goes completely one way or the other—into the Communist world or into the free world—or it remains divided. The first alternative means a major political reverse either for Moscow or for the western powers, and must therefore be ruled out for the immediate future in any circumstances short of war.

*

Logic thus leads inexorably to the conclusion that Germany will have to remain divided for some time to come. There is really no escape from this. But for the western powers simply to stand pat upon this negative position, however compulsory it may be, is to give the Russians the great propaganda advantage of posing as the sole champions of German unity. It would be very unwise to underrate the appeal to the Germans of the ideal of national unity; it is only the more sophisticated among them who can be expected to look such an attractive gift horse in the mouth. And when the western powers not only appear to oppose unity but can also be represented as forcing upon the reluctant Germans remilitarisation leading to war, then the Russians can reap a harvest of all the longing for peace as well as for unity. The western powers' position is logically unassailable, but it is in danger of being psychologically outflanked. Is there nothing they can do to attract the legitimate aspirations of the German people and to escape from the purely negative and almost reactionary position into which circumstances and Russian propaganda have pushed them?

The answer may lie along lines that have already been sketched in these columns. When one says that Germany must for the time being remain divided, the meaning is that it must remain militarily divided and occupied. Austria is militarily divided and occupied and yet has one government and parliament, freely elected by the whole nation. Why should not the western

powers propose an Austrian solution for Germany? There would, of course, have to be a clear understanding of the necessary conditions. In an Austrianised Germany there would have to be real individual freedom under the rule of law. The conditions in which elections would be held for a constituent assembly and a government would have to be precisely defined and enforced. There would have to be four-power supervision of the elections—not simply, of course, each occupying power supervising the poll in its own zone. The voter would have to be guaranteed not only the secrecy of his vote but his personal safety. There would have to be agreement that all German police and armed forces should be under the control of the new German government (free elections would ensure that there was not a Communist Minister of the Interior). Complete freedom of movement across Germany for people, goods and ideas would have to be established by stages.

The main virtue of an Austrian plan is that it would make some progress towards the re-unification of Germany in conditions which the western Germans would feel to be safe. With the three western armies still in Germany and building up their strength, with a new agreement between the Russians and the other three governments, a single German government sitting in Berlin could feel some sense of security and power. It could at least begin the most difficult and delicate task of bringing into contact the completely divergent political and economic systems of the two Germanies. It could likewise begin the even more vital task of making parliamentary government and democratic institutions work in a situation where Communism would still be active but the occupying powers would see fair play. In the long run the superior political and industrial strength of the western zones must be expected to assert itself; and that strength would grow as Western Europe grew in strength. In short, the Austrian solution—it is a makeshift rather than a solution—would provide those features of the Russian programme that are most attractive to the Germans—namely, the beginning of the end of division and the return of a central government to Berlin—without those that are most frightening—namely, the withdrawal of the protection that the western troops of occupation provide against Communist revenge.

All this, however, assumes that the Russians would accept an Austrian solution, and it is almost certain that they would refuse. Their own proposals for "unity" are based on an equality of representation between their own zone on the one side and the three western zones

together on the other; they could hardly afford to have their own zone forced into a minority. Still less could they afford to have free elections in the Soviet zone or to disband their "People's Police." They could hardly, in short, run the risk of letting freedom advance (even under Russian occupation) to the Polish border. But the fact that the Russians would almost certainly turn down an Austrian proposal is not an argument against making it; quite on the contrary, for to make it and have it rejected would effectively turn the propaganda tables. It would then be the west that was advocating German unity and the Russians who were turning it down. If thereafter it was necessary to come back to the policies of division and rearmament, the record would at least be clear.

Nevertheless, western governments, with their uncontrolled public opinions, cannot put forward such a proposal simply as a bluff. They must be sincere about it, and they must therefore be clear in their minds that they would be content with an Austrian solution if, by chance, the Russians should accept it. And there is just one chance that it might be accepted, for clearly an Austrian solution would involve a postponement of the rearming of Western Germany. It need not involve any retreat from the principle accepted at Brussels in December; there is no reason why the new Germany, like other enemies, should not have an army; but the whole matter would have to be discussed with the all-German govern-

ment that would emerge from the free elections. If the Russians really attach as much importance as they say they do to preventing or postponing the re-emergence of a German army under any but Communist control, they might conceivably be willing to pay all the heavy prices that an Austrian solution would imply to gain this one point.

Before they could propose an Austrian solution, the western powers would have to weigh very carefully this one military disadvantage it would have for them, if *per mirabile* it were accepted, against the many political advantages it would bring them in the struggle for the soul of Germany. That would involve them in making an estimate of how realistic their present plans for recruiting German armed contingents are. It is not as if the prospect of a German army for General Eisenhower were either certain or immediate; it might be that, under the Austrian plan, the prospect would not be significantly less clear or more remote than it is now.

One thing, however, is reasonably sure. If the western powers—or it would be better to say the Americans and the British, since the French are uncertain starters in all German concerns—go into a conference with the Russians without prior agreement among themselves on a positive programme that seems to the Germans to be leading them forwards, they will be asking for trouble. The Austrian plan has its defects; it is very much better than nothing at all.

Housing Figures

A RECENT political broadcast gave Mr Bevan the opportunity to take a backward look at housing achievements under his care, with which he did not appear to be dissatisfied. Recalling that the Conservative Government in 1945 estimated immediate needs at some 750,000 dwellings in order to give every family in Britain a separate home (without mentioning the further 500,000 stipulated as necessary to clear the worst of the slums) he pointed out that over 1½ million homes had by now been provided since the war. Claiming that there were today more houses per head of population than before the war (throughout this article the word house is taken to mean "dwelling unit"), Mr Bevan asserted that the still prevalent demand for houses was evidence of the higher standard of living of the workers.

Curious though it may seem at first sight, not even Mr Bevan can say with any surety just how many houses exist today. No count has been made since the 1931 census and although it is possible to make additions and subtractions from that starting-point, certain links in the chains are missing. The publication of the 1950 housing statistics seems a suitable time to see in broad terms how much of the general housing picture can be pieced together.

Of the homes provided since the end of the war, about 800,000 are newly built permanent houses, including those houses, completely destroyed in the war, which have been rebuilt. Table I shows how the level of postwar building compares with that between the two wars. Naturally enough, the usual yardstick for measuring present-day housing progress is the level of activity just before the last war. This is reasonable, provided it is remembered that the British building industry had

never been busier than it was then. The output of about 350,000 houses a year in the late 1930s was not only high in relation to previous years but also in comparison with other countries. Indeed, among countries for which comparable records are available, none showed a higher building output in 1938 for its size of population than Britain. Today Britain is well down the list, but there is still no recorded figure of houses completed per thousand population which exceeds that of 7.77 in Britain in 1938. Completions in 1949 and 1950 were little more than one-half the high prewar level. The output of local authorities was double the prewar level, but private builders were producing only one-tenth as many houses as in 1938. (These figures, it should be added, are for Great Britain as a whole and there is some incongruity in adding figures for Scotland to those for England and Wales. Scotland, for special reasons—of which the differences in rating law were among the most important—never had in the 1930s a building boom comparable to England's. One result of this was that the proportion of overcrowded houses in Scotland in 1938 was nearly six times that of England. Another consequence was that the number of houses built in Scotland in 1949 and 1950 exceeded the prewar figures.)

In addition to these 800,000 new permanent houses built, the total of rather more than 1½ million homes provided since the end of the war is completed by temporary houses, conversions and adaptations of existing houses, those repaired after being unoccupied through war damage, and a small amount of special accommodation built by Government departments. Statistics about all these are virtually complete and there is also an official estimate of losses through war damage. There

TABLE I—PERMANENT HOUSES BUILT IN GREAT BRITAIN

Period of Completion	England & Wales		Scotland		Great Britain	
	Number in Thousands	% Built by Private Builders	Number in Thousands	% Built by Private Builders	Number in Thousands	% Built by Private Builders
Years Ending March 31st						
1920-24 average	67.6	50.1	6.2	29.8	73.8	48.4
1925-29	187.3	63.1	15.3	36.1	202.6	65.7
1930-34	210.8	71.7	18.1	35.0	228.9	68.8
1935-39	334.0	79.3	23.9	30.2	357.9	76.0
Years Ending December 31st						
1945	1.4	64.8	1.6	9.0	3.0	35.8
1946	51.0	58.4	4.3	11.6	55.3	54.8
1947	127.1	31.9	12.1	11.3	139.2	30.1
1948	203.8	16.2	21.1	7.4	225.0	15.4
1949	167.8	15.5	25.4	4.6	193.1	14.1
1950	167.5	16.8	25.2	3.5	192.7	15.0

Flats are included throughout as single dwelling units and also war-damaged houses rebuilt after the Second World War. Houses built by Government departments (for police, prison staffs, etc.) are excluded, as also are temporary houses of which altogether 156,611 were built in Great Britain by local authorities between April, 1945, and March, 1949, when the programme was completed.

TABLE III—COSTS AND PRODUCTIVITY IN BUILDING (Index Numbers)

	Wholesale Prices of Building Materials	Average Hourly Earnings	Average Hours Worked	House-building Costs in England and Wales per sq. ft.	Building Productivity
Prewar Comparison	1938 = 100	Sept., 1938 = 100	Sept., 1938 = 100	1938-39 = 100	1938 = 100
1946	167	163	96	...	67
1947	196	173	99	240	67
1948	210	196	100	...	71
1949	216	206	100	260	75
1950 (April)	215	211	101	...	...

All the material in this table is taken from official sources. The wholesale price index is the one published by the Board of Trade; the earnings and hours are derived from the twice-yearly surveys made by the Ministry of Labour; the house-building costs are those published by the Girdwood Committee and the productivity figures are those estimated by the Ministry of Works for the building and civil engineering industry as a whole. The productivity figure for 1949 is a provisional one and there is likely to be a small revision upwards.

TABLE II—ESTIMATES OF HOUSING PROGRESS IN ENGLAND AND WALES (All Figures in Thousands)

	Additions to Housing	Reductions to Housing	Total Number of Houses in Existence	Number of "Families"
1931 Census	...	...	9,400	10,154
April, 1931 to Sept., 1939:-				
New houses built	2,447	...	...	...
Slum clearances	...	260	...	...
Other wastage (net)	...	(250)	...	...
Sept., 1939, estimate	...	...	11,337	11,284
Oct., 1939 to March, 1945:-				
New houses built	160	...	...	...
War damage	...	460	...	...
Requisition	...	40	...	...
Other wastage	...	(20)	...	...
Mar., 1945, estimate	...	...	10,977	11,954
April, 1945 to Dec., 1950:-				
New and rebuilt houses	731	...	...	...
Conversions and repairs to unoccupied houses	274	...	...	...
Temporary houses	125	...	...	...
De-requisition	36	...	...	...
Wastage	...	(50)	...	...
Dec., 1950, estimate	...	...	12,093	12,115

The number of "families" is measured by the total of all married women, all widows below age 65 and 20 per cent of single women between 20 and 45. The calculations are those published by the Economics Committee advising the Royal Commission on Population with some small adjustments made to fit the particular dates.

TABLE IV—EMPLOYMENT IN BUILDING AND CIVIL ENGINEERING IN GREAT BRITAIN (Male Operatives aged 16 and over)

	1938*		1950	
	No. ('000)	%	No. ('000)	%
New housing	330	32	255	24.1
Other new work	375	36	276	26.1
All repair and maintenance	325	32	525	49.8
Total	1,030	100	1,056	100.0

* Approximate official estimates.

are, however, two main gaps in the figures which create a difficulty in estimating the number of houses in existence today. First, there are no records for the years between 1931 and the outbreak of war for conversions of single houses into two or more dwellings. And, secondly, on the other side of the picture, there is a lack of information about houses which have been pulled down or have been abandoned as uninhabitable and about transfers of houses to non-residential purposes. Between 1921 and 1931 it is known that the total net wastage—that is, demolitions and transfers less conversions—was 200,000 houses. But there appears to be no sensible way of adapting this information to the differing conditions of later years.

Any estimate of the number of houses in Britain today must therefore be approximate. But it is possible to make what is hoped are not unreasonable guesses at the missing figures. In doing this and setting out the various stages of the arithmetic in Table II (for England and Wales only) the figures which are pure surmise have been put in brackets; it is unlikely that any changes in them would invalidate the conclusion that, on the bare count of houses and families (as defined in the footnote to the table), the housing situation is nearly the same today as it was in 1939. (The apparent excess of houses in 1939 is accounted for by the 2.9 per cent of vacancies that then existed.)

*

If, then, the housing situation is restored, or nearly so, to that of before the war, why the long waiting lists? There are, of course, obvious qualifications to be made to any general statistics such as have just been put forward. Houses must be where they are wanted and of a suitable size. Nevertheless the demand is much too widespread to be dismissed in those terms. It must be accepted as a fact that the demand for houses per head or per family in this country is larger than it was.

Mr Bevan gave for this phenomenon the single explanation that the standard of living of the working class is now higher than it was. Undoubtedly this is true; but it is not the only explanation, and it is important to make clear in what sense it is true. There is a great deal of evidence from past experience that expenditure on housing is one of the most elastic marginal elements in the expenditure of the British people. When their total real income increases, their willingness to spend money on housing increases more than in proportion. (It can, for example, be demonstrated that the increase in real income presented to the British people by the great fall in world food prices in the early 1930s stimulated the British building boom of subsequent years.) The rationing of food and the large subsidies given to keep food prices down have had the combined effect of considerably reducing the proportion of the average working class family's net income that has to be spent on food—possibly by as much as 10 per cent. The money thus spared is being spent, or is trying to spend itself, on housing.

At the same time, the cost of working class housing is being kept down by rent controls and subsidies. The average income per family, after tax, was about 80 per cent higher in 1949 than in 1938, and for working class families alone the figure would be considerably higher. But rents, rates and water charges had risen only 13 per cent. This figure for the price level of housing is certainly not borne out by the experience of

a large number of people and, according to the Government statisticians who compile it, it does not take "adequate account of rents in excess of Schedule A income tax valuations." It is, however, a fair enough measure of the increase in average working class rents for prewar houses. As for houses built since the war, the local authority three-bedroomed house completed in 1949 had increased in area over its 1938 counterpart from 800 square feet to 1,050 square feet and was better equipped. The actual cost of building was more than three times as great for, as Table III shows, a lowering of productivity has put house-building costs well in excess of the increase in the prices of labour and materials. But as a result of subsidies from the Exchequer and from local authorities (who are unwilling to see the rents of new houses rise too far above those of "comparable"—that is, prewar rent-controlled—houses), the average rent charged for new houses has risen only from 7s. 7d. a week in 1939 to 16s. 5d. in 1949. In short, the representative family, with more of its income to spend on housing, can get a prewar house (if it can find one) for a much lower rent (relatively to income) and a much better and larger new house for about the same rent (relatively to income) as before the war. To record these things is not to imply that there is necessarily anything very reprehensible about them. But it should be enough fully to explain the apparent shortage of houses. It is really not very surprising that the law of supply and demand still operates in housing. Part of the increase in demand is the fruit of the real increase in the general productivity of the British people, leading to a raising of the real national standard of living. But it is considerably intensified by rent controls, housing subsidies and food subsidies—the last probably being, indirectly, the most potent influence of all.

House-building in Britain is now about to enter a new phase. Instead of being concerned in the main with meeting the demands of an increasing number of families, this source of demand is now rapidly dwindling. Indeed, according to the estimates of the Economic Committee of the Royal Commission on Population, the number of families in England and Wales will start to decline from the middle of this decade and by 1984 will have fallen by about 500,000 from the present level. It is not possible to compare exactly the total housing labour force now with that before the war, but the most comparable figures, which are given in Table IV, show that employment in the whole of the building and civil engineering industry has risen to a higher level than in 1938; about half of this labour force is engaged on some type of housing work. In spite of the present demand, the long-term problem is likely to be that of keeping this labour force employed. There is an obvious need for replacement of many unfit houses and for the improvement of housing standards. Something of the order of 4,500,000 houses are believed to be more than 60 years old, though it does not, of course, follow that they are all unfit for habitation. But the economic problems of replacing old houses, which still have a value, by new houses that must inevitably cost, in rent and subsidies, many times what the old houses can be let for, have hardly begun to be thought out. If replacement is to proceed rapidly, heavy new subsidies will have to be paid, and housing subsidies already totalled £75 million in 1949 compared with £23 million in 1938. It is apparent that the results of the 1951 Housing Census will have to be put to careful scrutiny and that some clear thinking will have to be done on the subject of housing subsidies and rent controls.

Facts about Fiction

THE free public libraries last year celebrated their centenary, and this excellent but unobtrusive social service has been basking in an unaccustomed limelight of popular interest. But what about all the other libraries that not only lend books but do so at a profit? Little is known or written about commercial libraries: their total membership or turnover of books cannot even be guessed, but it is obvious that from the social point of view their influence is substantial. They are second only to the public libraries themselves as a source of supply to the book-reading public as a whole, and in their own particular sphere, that of contemporary fiction and light literature, they are very likely more important.

The circulating libraries are in some ways peculiar to Britain. In the United States, for instance, they have never enjoyed the same popularity as the book clubs which sell books on special terms instead of hiring them out. The effect of widespread book-club membership is seen in the much larger circulations attained by best sellers in the United States, and their shorter subsequent life. No doubt unflattering conclusions about the others' literary tastes could be drawn by the champions of either the library or the book-club habit, but probably the effect on the members is much the same in both countries: that is, they become accustomed to a systematic dosage of the latest fiction, whose vintage varies from a few days to a few months according to their pocket. As a result the new is confused with the good, and the natural desire to get value for money prevents all but the most voracious readers from exploring the broader fields of literature.

There are three kinds of circulating library: the high class subscription library which carries a larger percentage of non-fiction books than the others and concentrates on prompt service; the popular subscription library; and the non-subscription library. Of all these Mudie's library was the prototype. It developed an enormous stock over nearly a century of growth and became nearly all things to all readers, but it failed to specialise and consequently tried to give greater service than the balance sheet would permit. Among thousands of ordinary readers, the discerning handful who requested new publications before their popular success was assured could at one time be accommodated without serious difficulty. When this habit became general, however, the attempt to meet it ruined the business. Using Mudie's experience, other libraries grew up to serve the same taste for new books and have made it pay.

There are perhaps half a dozen high class subscription libraries today, of which the Times Book Club is a good example. Probably none is as big as the old Mudie's and they specialise almost entirely in providing up-to-the-minute reading for students of the weekend book reviews. Subscriptions alone do not cover the cost of doing this. For about three guineas a year—less than the cost of reading *The Times*—a member can demand a new one guinea book every few days. What is more, any number of members can be moved by a merely transitory interest—a mention on the wireless or a squabble in the press—to demand the same book simultaneously and the library must supply copies to all its subscribers who pay the "guaranteed rate," even when it knows that in a few weeks' time no one will want to borrow that particular book. Such libraries depend,

therefore, on selling the stock successfully. No library may sell a new book at less than its full published price until it is at least six months old, by which time the general demand may have slackened considerably. For these high class libraries, therefore, a good network of salesmen and customers in the background is as necessary as a long list of subscribers in the shop.

The popular subscription libraries form a much larger group. Boot's and Smith's have about a thousand branches between them and carry many millions of books, but there are other sizeable chains, and many single libraries of perhaps five to ten thousand books. Here, too, new fiction predominates; but except for the handful of members who pay special rates for the privilege of ordering books on publication, the members choose books from the shelves, while waiting their turn for best sellers. This gives the management more control over the choice of stock and enables it to please most of the people most of the time.

Stocks have to be renewed about once in twelve months, but most books are either well-thumbed or a failure after a year on a subscription library's shelf and sell for an old song to ships, prisons or hard-up institutions. These libraries depend on a wise forecast of demand, which minimises special requests and keeps the maximum number of readers satisfied with what is provided.

*

It is often alleged that the leading subscription libraries wield a big stick to publishers and dictate fashions in literature by their enormous purchases of new books. In fact, their role is very much more passive than is usually realised. The books their readers want are determined, not by the libraries' recommendation, but by advertisements and reviews and the subtler processes of publicity: the subscription library that fails to meet the demand will soon be out of business. Before the war, one London publisher used to advertise its books with the slogan "Demand this book from your library tomorrow" and, indeed, all advertising carries the implication. Once books are published the subscribers call the tune. But the influence of subscription libraries in determining what shall be published is still considerable. By their mere existence they enable far more titles to be produced than would ever see the light of day if they depended on retail demand. If some masterpieces are overlooked among the fifteen thousand odd indifferent books that appear every year, at least the arbitrament is that of the public rather than of the publisher, while there is no proof that the modern appetite for entertaining books has diminished the taste for more serious literature.

The third kind of commercial library, the pay-as-you-read variety, is by far the biggest as well as the most interesting. The twopenny libraries that started in the late twenties were regarded as something of a stunt. The entrusting of new books in bright dustjackets to complete strangers for twopenny and no deposit was a curiosity, but experience soon showed that public morality could stand the strain and that people brought back their books and their tuppences like clockwork. The idea prospered. Cheap reprints, with a leavening of new novels by well-known authors, averaged two

shillings each to the trade, and usually each one earned well over £1, or even several pounds, before being abandoned. (Recently a publisher's competition for the most-borrowed library copy revealed a book, bought for 1s. 8d., which had been issued 740 times, while the average of all the entries was 165 issues.) Even allowing for a heavy labour cost, the return on such small capital was very good. Small independent libraries of, say, 5,000 books, or sidelines of about 500 books in news-agents' or tobacconists' shops, represented one of the few paying businesses that required no special training, and they sprang up everywhere in the 'thirties until the market was overcrowded. Love and adventure stories were their mainstay: Ethel M. Dell and Edgar Wallace with a sprinkling of "serious" novels by famous names like J. B. Priestley or Ethel Mannin.

Gradually even these readers have become more sophisticated. Nowadays second-hand best sellers published at 8s. 6d. and 10s. 6d. are demanded and with a widening of tastes goes a greater difficulty in choosing the stock well. Now, therefore, the independent shops tend either to rely upon books hired in bulk from wholesale libraries whose experts know the ropes or to yield the business to the chain libraries with their bigger resources. Average rates of issue are now 3d. for old and 6d. for new books, but profits are not so big as before the war. One reason is increased overheads. Another is the steady recession from the high point of book reading reached during the war years; books are at a premium in years of depression and austerity, but come to be less appreciated when other forms of entertainment become available or the cost of living begins to absorb the bulk of the household budget.

The increase in reading between the two wars jolted the public libraries out of their cast-iron system of

supplying books from a printed catalogue into allowing the borrowers to browse about among the shelves. So long as numerous copies of a printed catalogue and an elaborate numerical indicator of books "In" and "Out" had been in use, the stock could only be altered at considerable expense, and, therefore, all the books were bound in the toughest of bindings and intended to last for a lifetime. "Open access," however, made it easy to refresh the stock of books as often as funds would allow and, in the fiction section, the minor novelists of the last century were rapidly withdrawn in favour of contemporary authors. Where the study of George Gissing or Mrs Humphry Ward had passed unnoticed, the sight of people emerging from a public library with a murder mystery in a gay dustjacket soon moved ratepayers to complain about the provision of "harmful trash" to the public at the ratepayer's expense. But the case against light reading in public libraries is largely based on a distorted notion of what these institutions are like. In even the biggest and most liberally provided public library the addict of one class of novel—be it "typist-marries-boss" or "riding-the-range"—can only find enough of them to whet his appetite. The selection is too wide and the turnover too slow to provide a full feast of any one style and the reader must soon either broaden his tastes or indulge his passion in a circulating library.

But although those who would confine public expenditure on books to serious works often sound like mere killjoys exaggerating their case, it is possible that they feel a quite reasonable concern for the effect of all the conventionalised nonsense that is published and consumed in such quantities. Is it possible, too, that the news has got about that the dignified users of the British Museum Reading Room can, if they wish, borrow "The Lamp in the Desert" by Ethel M. Dell?

NOTES OF THE WEEK

Defence and Tory Tactics

The Conservative decision to press the debate on defence to a division on a vote of confidence should have taken no one by surprise. It is on defence that the Conservatives feel quite sure of the country's confidence in them. The usually clumsy machinery of a vote of confidence or censure in this case happens to fit their intentions exactly, for what they are trying to establish is not opposition to rearmament but lack of confidence in Labour's ability to carry it out effectively. But it is nevertheless a very grave step, for it means that defence will join housing and meat as subjects to be bandied about on the hustings. If Mr Churchill and his colleagues do not keep the debate on a serious and sober level they will do far more harm than good to national security.

This decision of the Conservatives has coincided with the end of a period of intense debate within the Labour party about rearmament and foreign policy. This has found its expression in the confusion over the views of the Labour candidate at West Bristol and in three successive weekly meetings held by the Parliamentary Labour Party to discuss rearmament. In the end, the critics have been quietened, partly by the realisation that open opposition to rearmament would bring down the Government, and partly by Mr Attlee's hint that Britain will follow the American lead in soft pedalling the question of German rearmament.

But, what is more important, no one on the Labour back benches has been able to produce a realistic alternative to the present policy of rearmament. The fellow travellers

inside the Labour party dare not state their case openly. Even neutralism has few serious exponents at Westminster. Instead, the waves of anxiety about the dangers of another war have found expression inside the Labour party in the call for the immediate and specific objectives of no war with China, no rearmament of Germany, and a cry to "Restrain America." This amounts merely to a criticism of method: there is no figure on the back benches clever enough or strong enough to resolve it into a positive policy. Something more important will have to be put forward than what Mr Attlee described as "the little legal points" made by Mr Sidney Silverman from his seat below the gangway.

Mr Shinwell's opening speech in the defence debate seemed to reflect the Government's nervousness of criticism both from the Opposition and its own back benches. To the Opposition he was concerned to make out that the general rearmament plan, both for equipment and for manpower, is an immense stride forward and is accomplishing all that could be done in peacetime. Unluckily for him, the defence debate had been postponed for so long after the revised programme had been settled that all the important new measures which he announced—such as the decision to put a fourth division into Germany in the spring—have already been foreshadowed in the press. Where he was not giving stale news he was vague in the extreme. On the other hand, to his own supporters he was concerned to

minimise the hardship of the new programme—in particular the impact of the Class Z call up. The number may be scaled down, and no reservist mobilised this year will be called up again in subsequent years; this nullifies the whole point of refresher training. Neither he nor Mr Strachey was able to carry much conviction in defending the fifteen day period as adequate for effective training. Undoubtedly Mr Shinwell is an energetic Minister of Defence, but he will never be anything more if he goes on trying to please everyone.

Uneasy Lull in the Docks

Although all dockers in London and most in Manchester have returned to work, trouble in the docks is not yet at an end. The seven men who were charged at Bow Street last week for inciting the men to strike are due to appear again before the court on Tuesday, and unofficial port workers' committees have promised at least a token strike on that day. It was, indeed, only to be expected that the arrest of the seven men would stir up the dockers far more than the Communists had succeeded in doing, but it was also high time that a line was drawn between legal and illegal agitation. The present case is as good as any on which to test the law.

The only real cause for uneasiness about the case is that it places the dockers' trade unions in an awkward position. The official leaders of the dockers have been exceptionally successful in combating Communist influence, particularly in London, and there is a widespread—and possibly justified—feeling among them that, since they are now in a position to do so, it is far better to enforce discipline by persuasion and leadership than by the more sensational process of invoking the law. Anti-strike legislation has always been regarded by the unions as at best an unfortunate necessity only to be used in emergencies. The official leaders of the dockers will now be obliged to state their opinion about the present case; if they support the law—as they should—they may lose much of the ground they won during their bitter struggle with the Communists last year.

An unusual feature of the strikes has been the split between the Liverpool strikers and the rest. In Liverpool, where some 6,000 dockers are still on strike, the issue is solely concerned with the demand for higher wages; in London, the sudden stoppage during the week-end was merely a protest strike and there is little, if any, sympathy with the Liverpool strikers. Such a rift in the traditional loyalty of the dockers is a hopeful sign that in future disputes will be considered on their merits before sympathetic action is taken. In the past, the dockers have been far too prone to follow agitators blindly without thinking the cases out for themselves.

The Gold Coast's Election

The Governor of the Gold Coast was wise to release from prison Mr Kwame Nkrumah, leader of the Convention People's Party, after his party's success in last week's elections. Mr Nkrumah was serving a sentence for sedition; and he and his party have proclaimed that the Gold Coast's new constitution does not go far enough towards self-government. But the Governor's act of clemency will at least prevent relations between himself and the Convention People's Party from being vitiated from the start, while in the colony as a whole it appears to have promoted unusually friendly feelings towards Britain.

The Gold Coast's new Legislative Assembly will have 84 members, of whom three are ex-officio and six special members chosen to represent the Chambers of Commerce and the Chamber of Mines. (Only two of these special

members will be entitled to vote). Of the 75 other seats, five (two for Accra and one for each of the other big towns—Cape Coast, Sekondi-Takoradi and Kumasi) were filled by direct election. The Convention People's Party won all of these. Thirty-three rural seats in the "Colony" and Ashanti were filled by indirect election through an electoral college. Of these, the CPP won 29, and the United Gold Coast Convention (the more moderate party from which Mr Nkrumah

broke away) 3; there was one Independent. Thus Mr Nkrumah can count for certain on 34 members of the Assembly. It remains to be seen how much support he will find among the 37 seats filled by election in the territorial councils of the chiefs and their counsellors. (The nineteen members representing the Northern Territories were all chosen in this way.)

Mr Nkrumah already asserts that he has enough support among these traditionally elected members to give his party a clear

majority in the Assembly. He is therefore likely to press the Governor to give his party most of the eight seats in the Executive Council allotted to elected members of the Legislative Assembly. This would probably be the best course for the Governor to take. Responsibility for government would then be firmly fixed on the Convention People's Party. It would provide an incentive to Mr Nkrumah and his party to act responsibly and would also encourage the growth of an opposition party.

In a leading article last week on "Colonial Responsibility," the following sentence occurred:—

It will be interesting to see the results of the compromise reached in the Gold Coast, where the executive council is to be appointed by, and responsible to, the Governor, but will also require the approval of the Legislative Assembly appointed by the Governor.

The words in italics were inserted by a printing error. It should have been clear from the context that the Legislative Assembly is elected, not appointed.

France and Italy at Santa Margherita

This week's meeting at Santa Margherita on the Italian Riviera between the French and Italian Prime Ministers, accompanied by their Foreign Ministers, was one of those encounters which clear the air even if they do not accomplish any world-shaking agreement. A peculiar feature of the meeting has been that neither Paris nor Rome has been anxious to claim the credit for initiating it. Both M. Pleven and Signor de Gasperi have had many minor issues to raise with each other, but neither has produced any serious point of dispute between France and Italy. These two countries, indeed, containing nearly 90 million people, represent an increasingly coherent and influential unit in European affairs. Their rapprochement has gathered momentum with their respective recoveries from the war, till today the temptation is strong to try to pursue together a third force policy—built up, perhaps, in due course within a triangle of which the third corner would be Bonn. Fortunately, as Thursday's communiqué amply emphasises, both Signor de Gasperi

and M. Pleven are realistic and experienced enough to resist this insidious pull. They know that Western Europe's danger is too great, and each sees his country's salvation in the deep commitment to the Atlantic Pact which they themselves promoted.

Among the subjects discussed at Santa Margherita have been the part to be played in European defence by Germany—to which Rome attaches a good deal more importance than does Paris—Italy's position in the Schuman plan, and Rome's favourable attitude to M. Pleven's plan for a European army—both prime ministers agreed to press on hard with the lengthy technical discussions beginning in Paris this week. M. Pleven also agreed that the French should represent Italian views in the three-power steering group for discussing raw materials in Washington; he also gave assurances that Italy would have access to Algerian iron-ore supplies. Other topics have included the flow of Italian immigrant labour into French rearmament industries and the now almost defunct project for a customs union between the two countries. This has partly died as a result of industrialists' objections on both sides and because of the wider agreements made in OEEC. But it may be that, as Marshall aid tails off and the work of OEEC is partly superseded by that of Nato, the customs union project will one day be revived.

*

It is safe to assume that the meeting at Santa Margherita will produce no change in French and Italian foreign policies. This does not mean that Europe will feel no impact from it. The Italians suffer nowadays from the understandable feeling that their voice is insufficiently heard in other chancelleries; they know they have dropped from the ranks of the world powers but they still occupy a leading place in Europe. The French, too, have sometimes found it an uphill struggle to secure an adequate hearing in Washington and London. Accordingly, although M. Pleven has just returned from a triumphant personal visit to Washington, and Paris has now achieved an almost complete victory in its month-long struggle to bring reality into the decisions about German rearmament, the French are by no means unwilling to look to Rome for the diplomatic support which the Italians are more than ready to offer.

This was the fourth important Franco-Italian meeting since the war; the first three were between Bidault and de Gasperi in Piedmont in 1947, between Schuman and Sforza at Turin in 1948 and again at Cannes in 1949. Both countries now feel much stronger than on any of these previous occasions. They will now be determined jointly to restore to Western Europe more of the say in its own destiny that it was accustomed to possess before the second world war.

* * *

Propelling the Colombo Plan

It is now ten weeks since the Colombo Plan for Co-operative Economic Development in South and South-East Asia was published, following the Commonwealth Conference in London during the autumn. This week another meeting has taken place in Colombo. This is designed to review the developments since the publication of the Plan and to discuss future action to implement it. The meeting is also notable for being attended both by some of the South-East Asian countries which took no positive part in drawing up the original plan and by a representative from the United States. It is certainly to be hoped, as a result, that enough progress will now have been made to start operations under the six-year development plans of the individual nations by July, the date originally proposed.

Nothing could be more important at this stage than to begin translating paper ideas into practical work. Quite as vital as the conception of the Plan itself are the twin aspects of impetus and publicity. The modern world is full

of plans and planners and, even among the relatively under-developed communities of southern Asia, there is a latent scepticism about grandiose schemes for bringing the millennium down to earth. Already the man in the street in both the east and the west may be excused if he asks what has become of the Colombo Plan. There appears to have been little continuing publicity since its original launching, and, even though the present meeting in Colombo has been arranged as soon as was reasonably practicable, there is a danger that the whole scheme may lose impetus. It is not enough that this Plan, however well inspired, should constitute the free world's attempt to pull southern Asia up by its bootstraps. People must know and see that the Plan is succeeding. One of the first tasks of the secretary-general, who is expected to be appointed after the present Colombo meeting, should therefore be to ensure that the whole world knows what he and his colleagues are doing.

Failure of a Mission

The meat shortage has rattled the Ministry of Food but it has not changed its buying tactics. An unofficial feeler has found that Argentina was prepared to agree to a British request to resume negotiations on imports of Argentine beef. Meanwhile the Ministry sent two of its negotiators to Paris to try to save the British Government's face by buying pork for immediate delivery and arranging for supplies of bacon and frozen pork to be sent later in the year. The mission proved abortive and the discussion broke down on Wednesday evening because Britain offered France only £210 a ton for bacon and less for frozen pork. The French were annoyed because Britain had already agreed to pay Denmark £229 a ton for bacon. In any case, the French demanded £330 a ton for frozen pork and considerably more for bacon. Thus the prospect of a larger meat ration has again proved to be a mirage, for the simple reason that Mr Webb continues to think that he alone knows how much the British public is willing to pay for its meat.

* * *

Nigeria's Meat Industry

For a reason which is not apparent the report of the Nigerian Livestock Mission has only just been published (Colonial No. 266), although it was completed and signed in October, 1949. Its belated appearance today may, therefore, give the impression that it is concerned with finding another source of non-Argentinian meat for Britain. The mission was not, however, appointed to consider anything of the sort. Its terms of reference were to investigate the livestock industry which already exists in Nigeria, and in particular the production of meat—for domestic consumption, not for export.

The mission's findings and recommendations form, in fact, a colonial development and welfare project of a comprehensive kind. Setting out to investigate the condition of Nigeria's cattle, the means of improving it and the methods by which it is marketed, the mission soon found itself face to face with such formidable, and thorny, questions as the ownership of land, settlement and enclosure, the cattle tax, and so on. The two salient facts that emerge from its report are, first, that 90 per cent of the people of Nigeria obtain their living from the soil and, secondly, that 95 per cent of the cattle population is divorced from the soil because it is in the hands of the nomadic Fulani, who practise selective grazing which is endangering the herbage and soil of wide areas. The mission consequently recommends that the Fulani should be settled in the savannah country of the north, a large-scale experimental settlement being started immediately. A possible deterrent to settlement is the tax on cattle. For some reason the mission's views on the effect of this tax, and its recommendations, are not given in the report, but have been communicated privately to the

Secretary of State. One can only conclude that it found the tax a deterrent to settlement and livestock improvement, but that it was inhibited from saying so publicly because the tax is an important source of revenue for the Native Administration.

Some of the mission's other recommendations are likely to run into similar trouble. But the report gives the impression that, at comparatively small cost, a considerable addition to Nigeria's wealth could be made and the country's soil safeguarded and improved. It is not as though the cattle were not there—the report estimates the total cattle population at 7,000,000 to 8,000,000—and the export trade in hides and skins could be much more profitable than it is at present. But it will need considerable energy and determination on the part of the Nigerian Department of Agriculture if the recommendations are to be carried out, and the Department is very short of trained agricultural officers.

Farm Incomes

Much new information about economic changes in agriculture is provided by *Farm Incomes in England and Wales, 1944-48* (HMSO. 10s. 6d.), the first of a new series of publications. Its material is derived from the Farm Management Survey, which is carried out annually by the provincial agricultural economists and provides part of the data used in price-fixing negotiations.

At first sight, the appreciable fall in net farm income (which represents the return to the farmer, plus interest on his working capital) is surprising. The four-year average of net farm income of all farms covered by the survey, which was £986 for the wartime period 1940-44, was only £652 for the postwar period, 1944-48. These figures, however, include changes in the valuation of the farmers' livestock and machinery, which increased every year (except in 1944-45), but rose with especial rapidity during the war. Farmers' actual receipts were rather lower than the figures indicate and varied less from year to year.

The figures also help to bring out the important changes that have taken place in agricultural policy over the last decade. The first four years were the wartime period of high crop production and inflated prices. During the next four years, policy was based to some extent on the assumption that agriculture should return to its normal peacetime pattern. There was a fall in crop production and prices rose less than did farmers' expenditure (which went up by at least 25 per cent). This period culminated in the bad winter of 1946-47, which depressed farm incomes further. Later in 1947, the third major change in agricultural policy took place in the form of the four-year programme of expansion. The financial incentives then introduced have led without doubt to a higher level of farm incomes—changes which are not shown in the period covered by this document. This is now the last year of the expansion programme, and a further change in agricultural policy is due.

Europe's Economic Health

Europe's external economy is enjoying good health, but will need it, if it is to survive the epidemics of the coming month. This, briefly, is the theme of the Economic Commission for Europe's quarterly bulletin published on Wednesday. The report, which is careful and clear, was concerned with the third quarter of last year. Its comments have inevitably lost the first bloom of novelty, but they are a useful summary of known trends.

The bulletin concentrates on the improvement in the foreign exchange position of European countries with the dollar area. For the ten west European countries, exports to the United States during the quarter rose by \$90 million from

the second quarter's level to a total of \$284 million, despite seasonal factors. During the year September, 1949 to 1950, European countries as a whole added, as a result of transactions with the United States alone, almost \$1½ billion to their gold and dollar reserves, compared with a loss in the preceding year of \$300 million—and this, with Marshall Aid reduced by \$1.65 billion. Thus, in the year following devaluation, there was a total improvement on the previous year's performance of \$3.4 billion—not, the ECE hastens to add, wholly or even mainly as a direct consequence of devaluation.

On the other side, the Commission sounds two tentative notes of warning. First, the solution of the dollar problem is creating others in its wake, particularly in European payments to the outer sterling area. Secondly, it suggests that the increased dollar saving and dollar earning during the period may prove a not entirely unmitigated blessing in view of the scramble for raw materials. It points out that of an increase of \$54 million in United States third quarter imports from Britain, France, Benelux and Germany, no less than \$32 million was for increased purchases of raw materials, chemicals, iron and steel. It also finds that even in September, when raw materials had not yet become a bottleneck in European production, coal exporting countries were already setting a precedent for a ruthless home-market-first export policy as the shortage in that commodity developed.

In this connection, the last ECA quarterly report to Congress, and recent statements by Mr Foster in Paris show that the United States, too, is anxious about this problem. Both call for a closer integration of the European economy to reduce the ill-effects of rearmament. Britain might prefer to describe the need as one for closer co-operation; but, whatever the name and whatever the form, the necessity of a co-ordinated policy in the use of European scarce resources is certain, if the gains of Marshall Aid are not to become the victims of the Atlantic Pact.

* * *

Switzerland Makes a Stir

At the OEEC meeting on February 8th, quite a large stir was caused from an unexpected quarter. The discussion was about the provision of the European Payments Union that after a certain date all members should adopt a non-discriminatory policy towards imports which were still subject to quotas and controls. The quarter was Switzerland, represented by the imperturbable M. Bauer, who insisted that, with the shortage of raw materials, it could not possibly surrender this last bargaining counter in its trade negotiations until and unless the United States would specify what raw materials would be available for European countries.

Just before this outbreak, the Swiss Government had finally decided to grant Belgium a credit of 150 million Swiss francs at only two per cent interest, repayable through the EPU. In return, Belgium was to undertake to increase deliveries of Congo raw materials essential to Swiss industry.

The OEEC meeting broke up in slightly shocked confusion. All the other countries had promised in principle to comply with the EPU provision and are now busily assuring themselves that all will be sorted out in time. So it probably will be. But the incident is illustrative of the new currency which is emerging in the post-Korean world, more precious than dollars or even than gold—the currency of raw materials. It

INDEX

The index to Volume CLIX of *The Economist* (July to December, 1950) is now ready. Copies, price 2/6 post free, may be obtained from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1

is significant that the first to bring it out into the open was a country whose needs are purely commercial, and which is relatively remote from rearmament production and strategic stockpiles.

The Pflimlin Plan

On the continent, the plan for integrating European agriculture has recently put up some new shoots. The latest project would create a single market for selected agricultural products in much the same way that the Schuman Plan aims to pool west European coal and steel. French experts have been the prime movers in the scheme, which has accordingly been named after the French Minister of Agriculture and will henceforth be known as the Pflimlin Plan.

The idea of an agricultural pool first cropped up as a purely Franco-German affair at the Stockholm Agricultural Conference last July and got no further than an expanded trade agreement between the two countries, with France exchanging vegetables and fruit for German tractors and fertilisers. A few months later the Dutch and the Danes came forward with a sweeping proposal to integrate European agriculture through a network of long-term contracts; these would be uniform and negotiated jointly by member countries with the object of getting European importers and exporters to agree to buy and sell certain minimum quantities of food. Now the Pflimlin Plan suggests the establishment of a common market limited to three commodities—wheat, sugar and dairy products. It is argued for the project that since Western Europe has a deficit in the first two products, agreement should be reasonably easy to reach.

Negotiations over the Pflimlin scheme are not expected to begin until the Schuman Plan is concluded. When they do start, French planners will find themselves faced with a puzzled if not sceptical circle of delegates. Big producer-exporters like Holland and Denmark, while only too ready to discuss agricultural pools realistically, will be struck with the contradiction between France's ideals for integration and its practice which has been particularly restrictionist in the case of agriculture. They will be bound to put such penetrating questions as, "Does the Pflimlin Plan mean that the French market will be open to Dutch cheese and Danish butter?"

Another handicap with which the French initiators will probably start is an unresponsive Britain. Apart from Western Germany, Britain is the only large importer of food in Europe. But the British Government is likely to be even more chary of agricultural than of industrial pools because the intention of such schemes is often to undermine its bargaining power.

The Irish Banks and Mr Costello

After seven weeks the Irish bank strike has ended (writes our Dublin correspondent) and the officials have returned to work. A prolonged meeting of representatives of both sides, called as a result of the intervention of the Prime Minister, Mr Costello, agreed to arbitration; and the arbitrators unanimously awarded a slightly bigger increase than was last offered by the banks, but very much less than was claimed by the officials. On a vote, the award was accepted by, it is said, about 2,450 in favour to 1,550 against.

There is thus a substantial minority unreconciled to the settlement. But the bank officials have not gained much from the strike and both their action and their claims have provided examples that may be dangerous. The stoppage has given a golden opportunity for cranks and critics of the present banking system—classifications that overlap to some extent—to voice criticisms that are often extraordinarily wrong-headed and ill-informed. Both the banks and their staffs may suffer from the indirect effects of the strike.

The settlement of the bank strike and the collapse of the transport strike have enabled Mr Costello's Government to meet the Dail with a better front than appeared possible some weeks ago. It will have need of all its strength as the Social Security Bill will be the chief business of the session. Mr de Valera has announced his opposition, though his precise grounds have not been defined (and are not likely to be). As the Government's majority rests on independents, of whom some have already announced their dislike of the measure, it seems certain that Mr Costello's margin of safety will be very narrow indeed. On the other hand, few deputies relish the prospect of dissolution; and the coming weeks may see some nicely calculated nuances of outright opposition, abstention, and absence. It seems a pity that the influenza epidemic, which would have provided so admirable an excuse, has inopportunately abated.

Hospital Costs in Scotland

The Department of Health for Scotland is to be congratulated on its detailed analysis of hospital costs, which was issued recently. Two of the chief findings are set out in the accompanying charts. First, it is shown that every pound of running costs is made up of 3s. 10d., which is directly attributable to the patients (their food, laundry, drugs and dressings, etc.); 4s. 4d., which is attributable to buildings and overheads; and 11s. 10d., which is attributable to the salaries and wages of the staff and their keep. It should be pointed out that this high figure for the cost of staff does not include the cost of the salaries of the senior medical staff, which is met directly by the regional boards.

The second chart shows the comparison between the cost of running different types of hospital. But what is also brought out in the analysis is the big variation in the costs of different hospitals of the same type. Thus, whereas the average daily cost of running a mental hospital is 11s. 6d. per patient, the highest figure for this type of hospital is 16s. 9½d. and the lowest 7s. 5½d. As the department points out, the very low figure is as much a matter of concern as the very high, for it may well indicate a very poor standard of treatment.

Rumanian Oil Troubles

The Rumanian oil fields are among the most important economic assets acquired by the Soviet Union in its satellite empire. But recent reports make it clear that their output is unsatisfactory, and is likely to remain so for some time. It is openly admitted that the 1950 plan was only fulfilled by 97.4 per cent for extraction and 93.9 per cent for drilling. And it is indirectly admitted that oil production is still below the prewar level which, in 1936, reached a peak of 8,700,000

metric tons, for it was recently stated that by 1955 oil production would reach 10 million tons or 180 per cent of the 1950 output. This means that the figure for 1950 was only about 5,500,000.

At the beginning of this month the Rumanian Cabinet issued a statement on the reasons for the oil industry's failure to reach its targets and the remedies to be applied. The main reason was the failure of the Ministry of Mines and Petrol to exercise close and continuous control over every aspect of the oil industry. It had failed, among other things, to issue directives on the handling of equipment and the technological details of drilling, or to organise adequate repair and maintenance facilities; hence the large number of breakdowns and accidents. Local Party leaders, trade union committees and senior technicians are also severely blamed. They have done little to explain to the workers the seriousness of absenteeism or the causes of accidents and breakdowns. Nor have they made much effort to improve the admittedly low technical qualifications of most of the workers. The trade union committees have dealt feebly with poor labour discipline and have not helped managements to deal with "the anarchic and undisciplined elements who were contributing to the disorganisation of the labour teams."
