But the Rumanian Cabinet, very naturally, says nothing about the biggest culprits of all—the Rumanian Communists themselves and their Russian masters. The poor technical skill of the present oil workers is due to the drastic purges of all "politically unreliable" workers. The poor state of the present equipment is due partly to the Russian action in carrying off large quantities in 1944; and partly to the Rumanian Communists' policy towards the foreign oil companies which, while it succeeded in its object of driving them out of business, led to a catastrophic deterioration of wells, refineries and equipment.

Ability or Seniority?

The Acton Society Trust has done well to raise, in the third of its pamphlets on the nationalised industries, the thorny question of promotion policy.* In theory, ability should be the only governing factor, but in framing a practicable policy account has to be taken of the traditional trades union insistence on promotion by seniority. Promotion by ability is uncomfortable and inequitable since it rewards the gifted and the energetic man: promotion by seniority places the value of general security—in the short term—above the value of individual effort. The newly nationalised industries hardly seem aware that conflict is important, although in the Post Office they can see a painful object lesson of the result of yielding to the trade union demands for promotion by seniority. It would be disastrous if the staff policy of all the new corporations were to become equally rigid.

The report is at pains to emphasise the fears and suspicions which underlie the unions' pressure for a rigid method of promotion—suspicions of favouritism, of nepotism and of back door entry. Nationalisation was hailed as breaking the stranglehold of the boss class and the beginning of equal opportunity. The strength of this idea makes it peculiarly difficult to introduce a sensible promotion policy. Ability is not a standardised article, and the problem of who shall size up and select ability is no nearer solution. There are indeed two distinct strands to unravel. The one is concerned with political control: the struggle between worker and boss (and with it the attempt to protect the worker by seniority rules) has changed to a struggle to secure workers' participation in nationalised industry. In the sphere of promotion this means participation on promotion boards. The second strand concerns the motives which underlie the individual's desire for promotion. To promote the wrong

* Problems of Promotion Policy. 2s.

man may mean a serious loss of efficiency. Can the advantages of higher pay or prestige be secured by other means than promotion—by increments or proficiency allowances or stripes as in the army? If honour and a modest increase in income can be secured for the rank and file as a reward for solid work, genuine promotion can more easily be reserved for ability.

Higher Pay and Recruiting

The latest quarterly statement, issued by the Ministry of Defence, on Recruiting for the Armed Forces which gives the figures for the period October-December, 1950, is interesting, since it shows the effect upon recruiting of the pay increases which came into force in September. The figures for October were considerably above those of previous months for all three services, but in the case of the Navy the effect was short-lived, and for the whole quarter naval recruiting was lower than either of the first two quarters of 1950. The effect on the Army was more noticeable: in the last quarter it attracted 8,303 recruits as against 5,065 in the third and 3,584 in the second quarter. But the effect on RAF recruiting was very considerable; in the last quarter the RAF took in 10,513 men, nearly double the figure for the third quarter and five times the figure for the last quarter of 1949. By the same token, the WRAF alone of the women's services showed any significant rise in recruiting after the increases in pay.

Regulars or Conscripts?

Government is placed between two fires. On the one hand Mr Cobden, Mr Hume, and the Financial Reformers abuse them for the extravagance of their army expenditure, and loudly demand a reduction in our naval and military force; while Sir Francis Head and the *Quarterly Review*, backed, as they affirm, by all the great authorities in both professions, declare that our standing army is wholly inadequate for our defence, and ought to be immediately augmented. The subject has of late occupied a large share of public attention, and now that Parliament has met, probably demands still more. . . . The regular standing army of Great Britain at present consists, with the ordnance force, but without the East India Company's troops and the native West India regiments, of 135,000 men. Of these 30,500 are in the employment and in the pay of the East India Company, and may therefore be thrown out of our estimate; 23,500 more are serving in our American, African, and Australian colonies; and 8,000 in outlying military stations in Europe. Including our colonies, therefore, we have an effective force of 104,500; excluding them, we have available for home service and the defence of Great Britain only 73,000 men. . . . While we are far from giving in our adhesion to those who advocate an augmentation of our standing army, as necessary for the defence of the country; we object in the strongest terms to the proposal of providing for that defence by the embodying of the militia, or by any other of the suggested substitutes for a regular military force. . . . In the military art, as in every other, division of labour is necessary to perfection. A man who is half a soldier, half a peasant, half an artisan, will be a poor soldier, a clumsy labourer, an unfinished artisan. To be good in any calling, a man must devote himself to it altogether. More especially is this the case in the military art, where the value of the man depends upon the perfection of his discipline. A few weeks' drill in the year, though it may enable men to go through common manoeuvres without blundering, can do no more; and this is only a part and the smallest of the education requisite to make an available soldier.

Letters to the Editor

Eight Pennyworth of Planning

Sir,—In your issue of February 3rd, you state: "To begin with, contrary to the general belief, it is not rising prices that cause inflation, but inflation that causes rising prices . . . inflation should be tackled at its source; which is an excess of demand in general over supply in general." Your intention is to deny the dominant part played by rising import prices in increasing living costs today. But surely it is the rise in import prices which, at any rate up till now, has caused the rise in internal prices? Are you suggesting that disinflation at home would have helped this?—Yours faithfully,

MARGARET HALL

Somerville College, Oxford

[Mrs Hall has fairly completely missed the point. We were not attempting any such difficult task as to prove that rising prices played no part in increasing living costs—which would indeed require the talents of a master of paradox. Nor were we trying to assert that domestic disinflation was a cure for rising import prices (though it would help to prevent such things as rises in freight rates and coal prices, which are surely at least as important in pushing up the cost of living). We were simply trying to say that if Mr Webb refuses to put up the price of meat because that would be "inflationary," he is mistaking the nature of inflation. Indeed a rise in the price of an imported necessary, *taken by itself*, is an anti-inflationary factor, since it helps to absorb purchasing power in this country without adding to the flow of incomes.—EDITOR.]

The Gold Coast's Election

Sir,—The article on the Gold Coast in your issue of February 3rd makes interesting reading. Nevertheless, it leaves out many recent developments and fails to bring to light the real sources of strength of the Convention People's Party. Unless the African viewpoint is first studied, notwithstanding its disapproval by critics here, any criticisms will be of no avail.

As a son of a Gold Coast chief I assure your correspondent that the chiefs do not see anything wrong in the British withdrawal from India. "Abandonment" is indeed a wrong word to use, for it was well known that the British would be true to their word and leave India one day. Truly, the chiefs look to the British for support, but only do so with the consent of their people and when it is needed.

Those of us who do not belong to the CPP respect their leaders for their honesty, modesty and devotion to their cause. There is apathy in the villages because the inhabitants are not sure whether "all the pother" will put an end to the dictates of the District Commissioners. Certainly if they see any improvement in the government they will no doubt co-operate.

Your correspondent may be interested to learn that the CPP has changed its slogan from "Self-government NOW"

to "Dominion Status now" and has declared that it would support any motion put forward to increase taxation, provided that the money would be used in the best interest of the people.—Yours faithfully,

KOBINA EBO

Edinburgh 10

Fiddling With Federation

Sir,—I cannot see why, in your issue of February 3rd, you described the Strasbourg Protocol as "Fiddling with Federation," unless it was that you were set on finding an alliterative title for your comment. It is not like *The Economist* to condemn an honest attempt at a compromise merely because it does not give the advocates of the extreme views all that they want.

You praise the protocol as being skilful, as carrying out the mandate which was given to the Committee of Seven, and as going some way towards the British position. But then you add that it will not do, but that "it may be difficult and embarrassing to explain why not." Why "difficult," and why "embarrassing"? And why is the damage done once the Council becomes a legislative body? Britain has often been accused of using her veto in the Committee of Ministers because the Assembly was going beyond the powers which it was given under the statute. Once the powers of the Council of Europe are enlarged to the degree suggested by the protocol, this question, at any rate, will not arise. The European Payments Union creates a precedent for this proposition. While the British at first were not very favourable to that idea, they were quite willing to take part in discussing a document to secure such a purpose; and as a result of the discussion, agreement was reached.

Why should not the same thing happen in the future when the Committee of Ministers receives Bills sent to it from the Assembly? The British representative may differ from some of his colleagues on many of the clauses in these Bills, but if his objections are well founded he ought to have no difficulty in convincing his colleagues to that effect. Why should this be embarrassing or even difficult? Does not the embarrassment arise because the protocol, based as it is on the public utterances of the Foreign Secretary and other senior members of the Cabinet, is entirely in keeping with the policy of His Majesty's Government, and that now the Government is quite unable to justify any real objection to the amendments proposed by it?—Yours faithfully,

IAN MIKARDO

House of Commons

Profits and Replacement

Sir,—The inflation of recent years has affected us all, for the most part harmfully. For many commercial concerns the harm has been mitigated for a time by adventitious profits; but the idea, suggested in *The Economist* of January

27th, that such profits should be put in inverted commas, and thought of rather as a fund for use in meeting higher working costs and not taxable in the same way as other profits, seems to involve an assumption that such concerns have a right to be relieved of their share of the harmful effects of the general inflation. Why should they? And how can they, except at the expense of the rest of the community?

An inevitable consequence of inflation is that the capital previously used by each undertaking has shrunk and has to be replenished to make it adequate once more. If the undertaking has accumulated reserves it can divert them to this purpose and avoid increasing its issued capital: otherwise, the new capital required to replace the shrinkage requires to be obtained from outside.—Yours faithfully,

London, N.6

J. O'MAY

The Sardines Return

Sir,—You will perhaps allow me to answer the points raised in the letter you published in your issue of February 3rd. "Clupea Stratus" should, of course, have read "Clupea Sprattus," the Norwegian brisling being indeed the same fish as our sprat, or the French "esprot."

As regards the sardine being either a baby herring, a pilchard or a sprat before it has been canned, I may perhaps refer your correspondent to "Everyman's Encyclopaedia" (1913 edition), which states quite definitely that the term "sardine," though used especially in connection with canned fish of the pilchard species, and by extension even with young sprats thus processed, applies in point of fact to a baby pilchard alone. And why should one necessarily bring in the ultimate fate of the young pilchards? After all, large numbers of them are daily fried and consumed in all producing countries, and always as "sardines."

It is quite possible that law, or custom should have at one time laid it down that only sardines processed in olive oil should be known as such in England, but the fact is that, for the last ten years at least, nearly all the sardines shipped to Britain from Portugal were canned in peanut oil. This may have been due in the first place to the shortage in olive oil which prevailed during the war, but also to the fact that in those days and the hard times that followed—and under the system of Government bulk buying—no European nation could afford to pay the higher prices of the olive oil variety. Incidentally, as is often the case, tastes changed accordingly, with the result that the pattern of consumption, even in relatively well-off countries like Belgium, has moved considerably away from sardines canned in olive oil, the latter tending more and more to be considered as a comparatively expensive luxury product. Only in the United States is olive oil still sacrosanct.—Yours faithfully,

DANIEL SEPULCHRE

Ocean crossroads

When the sooty terns visit Ascension, the island resounds with their screams — "wide-awake, wide-awake, wide-awake". This cry symbolizes the island's Cable and Wireless station; for it is awake night and day speeding messages to and from London and Cape Town, Buenos Aires, Rio and Africa's West Coast. From being an insignificant dot in the South Atlantic, Ascension's status has been raised by Cable & Wireless Ltd. to that of a major junction in their complex system of communications.

The Cable and Wireless Company own and operate 155,000 miles of submarine cable supplemented by an efficient network of wireless channels. Theirs is the world's biggest communication system, with stations in seventy-five countries, providing an instant, secure and highly efficient medium for the passage of Government, press, commercial and social messages.

Long before the Festival

LONG BEFORE the Festival of Britain, long before the new Concert Hall and the Dome of Discovery arose on the South Bank, London boasted an amenity unique among cities—the famous Connaught Rooms. Here, grouped together beneath a single roof, are twenty separate banqueting rooms, capable of accommodating anything from an intimate party of a dozen to a gathering of over a thousand guests. The excellence of its cuisine is proverbial: its service is quietly discreet. Many of our visitors from beyond the seas, returning to the capitals of their native lands, will carry with them the story of London's unique institution—the Connaught Rooms.

Books and Publications

Behind the Curtain

I Believed. The Autobiography of a Former British Communist. By Douglas Hyde. Heinemann. 303 pages. 10s. 6d.

This book might well have as its subtitle "How it is done." As an autobiography of Mr Douglas Hyde and an account of his soul's pilgrimage through Leninism to Catholicism it is indeed full of interest, and the flair of the former news editor of the *Daily Worker* ensures that it abounds in good stories entertainingly told. But the importance of the book—and for anyone concerned with contemporary politics, whether as an "activist" or an ordinary citizen, it is very important indeed—lies in the account it provides of the state of mind, methods and devices of the British Communist party. There have been a number of reminiscences by ex-Communists in various countries which have provided material for knowledge of that strange and secret world, as mysterious and inaccessible for outsiders as was Tibet in the days of our grandfathers, but no revelation of the workings of the British party has yet come from anyone so well qualified to tell of them. Here we have the whole bag of tricks exposed to view, like a conjurer's outfit. The difference is that, whereas the spectators at a conjuring performance know that they are being deceived even though they cannot quite see how, there are still great numbers of British people who, without being at all converted to Marxist-Leninist doctrine, invariably fall for the ingenious "fronts" carefully devised in King Street for harnessing their enthusiasms and their loyalties, even their devotion to principles of fair play, to the Russo-Communist chariot.

Mr Hyde describes in detail the methods of organising "crypto-Communists" and of infiltration into trade unions, local trades councils, constituency organisations of the Labour Party and Government departments. The Communist attitude to espionage is explained at length and illustrated by numerous examples. In the author's own words:

It was taken for granted that any Party member coming into possession of information useful to the cause of communism or the Soviet Union (which meant the same thing) would pass it on. It would be treachery not to do so. . . . A civil servant working in a Government department in which internal memoranda circulated freely would keep an eye open for anything which affected Party policy or the interests of the USSR.

Yet there are still intelligent people who speak of efforts to remove Communists from key positions in the state as "witch-hunting" and persecution of political opinion. Incidentally, if Mr Hyde's picture of British counter-espionage incompetence is not greatly exaggerated, it affords no grounds for confidence that even now the task of weeding out Communists in the civil

service has been well done. The failure to cope with the Communist spy which was revealed in the cases of Dr Nunn May and Dr Fuchs seems to have been general, and the story of how the *Daily Worker*, when banned during the period of Communist opposition to the war against Hitler, successfully carried on in Fleet Street itself as a news agency under the title of Industrial and General Information does not make pleasant reading. At this time also (early in 1941) Mr Hyde relates that a Communist shop steward in an aircraft factory boasted that he "could get a strike over a cup of tea" and proved it by working up an agitation over the quality of tea in the canteen.

Perhaps most interesting of all is the story of how the Cominform was founded without the British Party being told anything about it, so that the *Daily Worker* for some days did not know what to say about it; how the new "line" was gradually disclosed and the faithful were instructed that "the solution of production problems would no longer be our concern," because the aim must now be to frustrate economic revival in Western Europe. If it is asked how it is possible, even with doctrinal conviction, for the great majority of Communists to accept without question these total reversals of policy, the key to the answer seems to be contained in the statement, abundantly exemplified in these pages, that "the Party is so organised as to make Communism the whole life of its members."

Dissatisfied Keynesian

A Reconstruction of Economics. By Kenneth E. Boulding. Chapman and Hall. 311 pages. 36s.

Professor Boulding is well known for his widely used textbook on "Economic Analysis." The present book is the outcome of his growing dissatisfaction with contemporary economic theory, and represents an attempt to reformulate that theory in a more useful and self-consistent way. While the sources of his dissatisfaction are several, his "reconstruction" largely takes the form of a reworking of the major topics of economic theory in terms of the balance sheet and its identity of assets and liabilities. The results, while not completely satisfactory, are often fruitful and always stimulating.

The first part of the book is concerned with the theory of the market, the firm and the household. Dissatisfied with the exclusive concentration on the income account in the traditional treatment of these matters, Professor Bould-

ing develops an alternative analysis in terms of the capital account and preferred asset ratios. So far as the market and the firm are concerned, this analysis, while interesting and useful, produces nothing unexpected; but for the household it leads to the rather surprising "principle of minimising consumption" as the goal of rational behaviour. The surprise, however, is the result of Professor Boulding's unorthodox definition of consumption as the destruction rather than the enjoyment of assets: the "principle" merely restates the desirability of conserving resources.

In the second part of the book Professor Boulding proclaims himself a Keynesian—a description partly redeemed by some penetrating remarks on the dangers of aggregates and the problem of index-numbers—but he is dissatisfied with the Keynesian theory on two counts. The first is its failure to distinguish between the circulation of assets in the payments process and the circulation of goods in production and consumption: Professor Boulding outlines a theory of the payments process in terms of velocities, but fails to link this process adequately to the circulation of goods. The second is the absence of a general theory of distribution: Professor Boulding makes an ingenious effort to fill the gap with balance sheet identities, but does not take sufficient care to ensure that the items in his identities can be treated as independently determined. Hot in the pursuit of "macroeconomic paradoxes," he trips over his own tautologies.

The second section of the book is therefore not up to the analytical standard of the first, although it is equally stimulating. Indeed, this is one of the most provocative theoretical books to appear in recent years, not merely because the balance sheet approach is an important theoretical advance towards realism, but also because the author sprinkles his text with many challenging suggestions not related to his main themes.

Security and Annexation

Germany's Drive to the West. By Hans W. Gatzke. The Johns Hopkins Press, Baltimore. London: Geoffrey Cumberlege. 316 pages. 40s.

The subtitle of this solid, intelligent book, "A Study of Germany's Western War Aims during the First World War," is better than the title, for it does not tell the story of an expansion, but of a sustained debate about the aims of such an expansion. This struggle over war aims was closely connected with domestic political issues; the rise of parliamentary government, the temporary dictatorship of Ludendorff, and last, not least, William II's abdication. The author has thoroughly mastered the intricacies of German political life, even though he

sometimes goes astray. He does not put enough emphasis on the debate over the "Fourteen points" before the great Spring offensive of 1917, or stress sufficiently Tirpitz's sinister influence, Kühlmann's equivocations, Ludendorff's desperate efforts to deceive public opinion about the actual conditions and later on to rehabilitate himself by launching the "stab in the back" legend. Nor does he fully recognise the difficulties of making public peace proposals; they must not discourage one's own people and not repel the adversary. Bethmann's position was never quite as strong as the author imagines, for the Kaiser could not be depended upon.

The mainspring of German annexationism (apart from Pan-German rantings and industrial concupiscence) was a craving for security. The army had counted on a short war and was quite unprepared for the strain of a long one. The blockade, which the Navy, having challenged Great Britain, could not break, would have strangled Germany rapidly if it had not been for her territorial conquests. The effect was to transform claims for strategic frontiers into demands for more ruling and living space. The services stood in the way of a "peace without victors," and a *status quo* which would, in another war, expose Germany to the same dangers and hardships she was undergoing. It was easy to make people believe that, without adequate annexations, no amount of heroism could in a future war save them from starvation. Military annexationists never realised that complete security for Germany would imply complete insecurity for her neighbours, and that only a "peace without victors" could make her safe. Colonel von Haefen, Ludendorff's representative in Berlin, saw this; he was even of the opinion that Ludendorff would have accepted such a peace, giving up Belgium, had the civil government compelled him to do so. He could then say that the pen had lost what the sword had won. But after he and Hindenburg had forced William II to dismiss Bethmann under threat of their resignation, no civil government could have done this. By giving in, William II had practically abdicated. Mr Gatzke has written a very stimulating book, which deserves the serious attention of every student of modern Germany.

Middle East Oil

Wells of Power. By Olaf Caroe. *Macmillan*, 240 pages. 15s.

It is said that the archives of the Foreign Office, on the subject of Persian Gulf affairs, contain more than one reference to the former British Government of India as "the enemy." The story may be apochryphal, but it illustrates an important fact. It shows that British officials based on India looked at the Gulf's affairs with different eyes from British officials based on London. "It is necessary," pleads Sir Olaf Caroe, "that this habit of mind should endure." He argues that, now that six years of staggering oil developments have turned the Gulf into a key point of the Old World, it is

foolish to think that it can be defended from Suez.

Possibly the truest conception of the Middle East is one which sees it as the lands between Indus and Euphrates, leaving the Levant coast to look towards Europe, and peninsular India to the ocean which washes it.

Seen in this light, the continuance of the Kashmir dispute—with its absorption of Pakistan's thought and manpower—is the gravest of handicaps to defence of the Middle East's oil.

So far so good. The basic theme of the book is important and well conceived. Most unfortunately, little more can be said in its praise. For a combination of out-of-date statements, of strange omissions and of an imperfect grasp of the workings of the world's oil trade render the book as a whole a sad disappointment to the expert, and misleading to the common reader.

Every writer on current affairs must face the drawback that if his book takes a year to publish, some of his work may be outpaced by events. But some correction in proof is always possible. Sir Olaf gives the impression that—a year ago—he posted off his manuscript with a thankful sigh, and thereafter brought it up to date only on one or two points that caught his interest. Thus he inserts an unimportant Islamic Economic Conference that happened in October, 1950, but omits all the principal oil events of the same year, including the Anglo Iranian Oil Company's negotiations with the Persian government for a supplemental oil agreement, which began in 1949 and were common property by May, 1950. The chapters on oil fail to grasp the fact that sterling oil has a dollar content or that dollar oil can be sold for sterling; they also fail to understand the significance of the Marshall Plan, and the part played by the Economic Co-operation Administration in producing oil for Europe from sources outside the United States.

Of many omissions, the worst is the failure to cite the terms of any of the Middle Eastern oil concessions. Negotiation between concessionaire and landlord on the subject of these was a major feature of 1950 and will be so for some time to come. Satisfactory terms and good public relations between the one and the other are a major factor in the stability of the area; so are the royalties paid. Yet Sir Olaf slides over both with the airy statement that "the pitch of the producers' obligations, or of the States takings is a standard too ephemeral with which to measure the bearing of the industry or regional stability."

Many other facts given are plainly wrong. For instance, Sir Olaf dubs Turkey a dictatorship, which is to ignore the elections of May, 1950. He states that Russia, when Israel won the Palestine war, dropped the Arabs and took up with the Israelis, whereas the fact is the other way about.

Mr Lionel Curtis contributes an affectionate preface, in which he justifiably commends the angle of vision—from east as well as from west—from which Sir Olaf surveys the strategic problem of defending the Gulf area. But Mr Curtis

goes too far when he compares the book with Lord Hailey's monumental *African Survey*. To make so extravagant a claim for so slight a book is to let heart run away with head.

Rationalising Wages

Wage Determination Under Trade Unions. By John T. Dunlop. *Blackwell*, 230 pages. 20s.

This second edition of Professor Dunlop's unique and suggestive theoretical study will be welcomed by students of labour economics, for whom the book has already become a classic. It also makes stimulating reading for anyone interested in the practical application of economic theory.

The central thesis to which most of the book is devoted is that collective bargaining is essentially a process of economic maximisation. Professor Dunlop recognises, and discusses with insight and examples, the practical limitations of this conception; but he believes that for analytical purposes the union is best described as seeking to maximise the wage bill for its total membership. On this theoretical plane, his major contribution—the contention that the traditional view of the union as an institution primarily concerned with raising wages by restricting the supply of labour—is unhelpfully narrow. The ability of unions to influence wages depends on conditions in the whole "cluster" of product, labour, and raw material markets, over all of which the union can and in practice often does exercise influence. This contention is supported by a brilliant (though difficult and not technically impeccable) theoretical analysis of the influence of various product-market and labour-market constellations on the "bargaining power" of the union—defined as its ability to get more than it would under perfect competition—and by a chapter of illustrative cases.

The remainder of the book is devoted to a detailed statistical analysis of the behaviour of wage rates and labour's share of the national income over the trade cycle. These chapters should be of considerable interest to trade cycle theorists, since they cast doubt on many assumptions of accepted theory in that field.

In the new preface to this edition, Professor Dunlop defends his thesis that collective bargaining is essentially economic against a recent American tendency to interpret it entirely as a political process. In America, "political" refers to internal union politics, and Professor Dunlop's judgment is probably correct; for this country, however, political factors in the broader sense would have to be assigned considerably more weight, perhaps enough to call Professor Dunlop's economic emphasis into serious question. Nevertheless, the economic factors are important, and his analysis of them is a masterly combination of theory with fact.

AMERICAN SURVEY

Headaches at Home

Washington, D.C.

FOR a modern President of the United States, the fashionable affliction, the disorder likeliest to excite public interest and sympathy, is the critical international headache. The common domestic variety, though it once compelled respectful attention, has come to be placed on a different and lower plane. There is a tendency now to regard it with as little patience as a busy psychiatrist could be expected to give to a client who was complaining that his feet hurt. Columnists and leader-writers, who would once have rolled up their sleeves and applied themselves to analysing what was wrong, now show a disposition to advise Mr Truman irritably to take an aspirin and get on with the important things. Yet the President himself may well feel that he is personally suffering a good deal more from his unfashionable home-produced headaches than from the more momentous throbs of world crisis.

Since the beginning of this month, Mr Truman's domestic headaches have been recurring at uncomfortably short intervals. Sharp attacks have been brought on by the railway strikers, the Reconstruction Finance Corporation, the Federal Reserve Board and, continuously, by Congress. There would be more sympathy for the sufferer in the White House if it were not for the suspicion that some of these afflictions might have been avoided by taking proper precautions and the certainty that Mr Truman's hasty retorts to his tormentors, however understandable they may be, have made matters worse.

The present malaise began with the onset of the railway switchmen's strike on January 30th. The switchmen, enginemen, firemen, conductors and trainmen—the 300,000 workers on whom America's 130 railroads very largely depend—long ago put in a claim for reduction of their working week from 48 to 40 hours without loss of wages. The non-operating unions had already won such a concession. The Railway Labour Act is designed to prevent the swift paralysis of the United States which railroad stoppages bring, and its machinery used to work; but it has lately been so loaded with White House interventions, layers of overlapping "emergency" boards and unskilled political peacemaking that it has lost respect and authority.

The seizure of the railroads last August (which made the railwaymen technically employees of the government and subject to court injunctions if they tried to strike) has produced two epidemics of "sickness," the first in December. Appeals to the men's patriotism, effective then, were beginning to bring them back once more, when Mr Truman, in one of his famous spur-of-the-moment asides at a press conference, observed that the railwaymen's leaders, in repudiating the agreement reached in December, had behaved like a bunch of Russians. The Army then gave the remaining strikers the choice of returning within two days or being dismissed, with the loss of pension and promotion rights. Having sent that shot echoing down the trade union corridors, the President turned his bazooka upon a duly-constituted subcommittee of the Congress. He said that a report it had just produced on the Reconstruction Finance Corpora-

tion was asinine. Then, before the smoke had cleared away, Mr Truman sent to the Senate, for confirmation as directors of the RFC the names of the same five men the Senate had declined to accept during the last session.

Congress itself was in a rebellious mood. The House Appropriations Committee had just dealt the Administration a smart blow. After only one trial, it had scrapped the new system of dealing with all appropriations in a single Bill (which showed up pork-barrel funds for this state or that district) and restored the old method of dealing with appropriations piecemeal, in a dozen different Bills (in which a little federal fat that would do a Senator or a Representative a lot of good back home tended to slip past with much less fuss). While arranging this joyful return to normalcy, Congress was making its customary righteous threats to cut the "non-defence" items in Mr Truman's budget and showing no signs of quickly screwing its courage to the point of voting the extra tax money which everyone knew to be necessary. It was, however, busily producing reasons why it should not sanction the sort of compulsory military service the Administration was urgently requesting.

*

There were also indications that a new hunt for Communists within the Administration might be stimulated by the conviction on perjury charges of Mr William D. Remington, a former economist in the Commerce Department. Mr Remington had earlier been cleared by the President's Loyalty Board, under the chairmanship of Mr Seth Richardson, whom Mr Truman has nominated to head the new Subversive Activities Control Board. And Congress was plainly getting ready to echo the public cat-calls that were already ringing about the ears of Mr Truman's price freezers and wage stabilisers. In these circumstances the critical report on the RFC by a subcommittee headed by Senator Fulbright, a critical Democrat, plainly struck Mr Truman as a personal affront. The report concluded:

There has been improper use of the Corporation's vast authority in response to the influence which persons outside the RFC have over individual members of the board. . . . Only a drastic action can restore the integrity of the RFC.

Space is lacking here for details of the charges the subcommittee brought, or the names it named, or the curious chart it issued showing which secretaries, aides, expeditors, lawyers, businessmen and former employees of the RFC were somebody's father or daughter or husband or wife or close personal friend and had, or might have had, direct or indirect access to RFC directors. There were fewer complications, however, in the President's comments. He said it was an asinine report, and he accused Senator Fulbright

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

(unjustly, according to the Senator) of leaving Washington rather than face Presidential interrogation.

The account of Mr Truman's domestic headaches is not yet complete. For there require to be taken into consideration also the rifts and stresses within the Administration itself. One of them—the struggle between Mr Tobin, the Secretary of Labour, and Mr Wilson, the Director of Defence Mobilisation, for control of the defence manpower programme—was resolved last week by the President in Mr Wilson's favour. Another looked, for about twenty-four hours, as though it had been settled—until Mr Marriner Eccles, a member and lately chairman of the Federal Reserve Board, made public on his own authority a memorandum of a White House meeting which seemed to show that Mr Truman had reached the wrong conclusion about what had been decided there.

Mr Truman thought that the officials of the Board had agreed, at this meeting, as he said in a subsequent letter to Mr McCabe, the Chairman, that the Board would fully support the Treasury's defence financing programme, so that "the market on government securities would be stabilised and maintained at present levels." Such an undertaking would have signalled the end of a long-standing difference of opinion between the Board and the Treasury. The question, which may soon receive serious Congressional attention, is whether Mr Snyder, the Secretary of the Treasury, is right to require Federal Reserve purchases to support the market price of government securities, or whether Mr Eccles and his supporters on the Board are right to argue that these securities should find their own level on the market, freeing the Reserve Board's hands to regulate the supply of credit. In fact the published memorandum shows that Mr McCabe had agreed only to consult frequently with Mr Snyder and to appeal to the President if they cannot reach an agreement. That headache has thus returned; and it could grow a good deal worse.

The Gulf's Man-made Ports

[FROM A CORRESPONDENT IN TEXAS]

ONE of the phenomena of world commerce during the past thirty-five years has been the rise of the ports along the Texas coast of the Gulf of Mexico. There are thirteen that may be classed as deepwater ports, that is, with controlling depths of 25 to 35 feet. They lie along 370 miles of seaboard between the mouths of the Sabine and Rio Grande rivers. Between 120 and 130 million tons of commerce have moved through the ports of this relatively short section of tidewater during each of the past three years. Only one other group of ports in the United States exceeds it in tonnage—the Middle Atlantic Coast group—which includes such cities as New York, Philadelphia and Baltimore. Houston, the leading port of Texas, ranked second to New York in tonnage in 1949, and unofficial figures for 1950 indicate that it will hold that place.

All of these ports are man-made, even the four that lie on the open coast of the Gulf—Galveston, Freeport, Port Aransas and Port Isabel. On a map, the deeply indented coastline of Texas has the appearance of affording excellent natural harbours. But its bays are silt-laden, with only about five feet of water on an average. Very costly excavation has been necessary in the case of all of the thirteen ports. Nine of them are at the ends of channels which cut across the shallow bays and, in several instances, through the level coastal plain. Houston and Beaumont each lies

more than fifty miles from deep water in the Gulf. An observer a short distance from one of these channels cannot detect its presence on the coastal prairie, and travellers on the highways are often startled at the apparition of an ocean-going vessel steaming through a sea of grass.

There is no great navigable river flowing down from the interior to bring commerce to the Texas coast. Long ago New Orleans was picked for the leading role in Gulf trade because of its position at the mouth of the Mississippi, and a huge port still stands there. But today the greatest shipping activity anywhere on the circle of the Gulf is along the Texas shore. A main source of this activity is the productiveness of the southwest region in raw materials. The hinterland of the Texas Gulf ports, including Texas, Oklahoma and portions of Louisiana, Arkansas, Kansas, Colorado and New Mexico, probably produces a greater tonnage of raw materials, over and above what it can consume itself, than any other comparable area in the world. The

earliest argument for the development of Texas ports was based on the need of an outlet for cotton exports. With domestic mills consuming most of the cotton grown in the eastern half of the cotton belt, which runs right across the southern states, the western end became the logical exporting area for cotton. Galveston, the oldest Texas port, attained its early prominence in cotton commerce. But petroleum and petroleum products have supplied more than two-thirds of the tonnage on which Texas ports have been built. In 1950, 44 per cent of the oil produced in the United States came from Texas, and within the natural hinterland of the Texas ports is 55 per cent of United States production, and 60 per cent of the known reserves, of petroleum.

Natural gas, Texas's second-ranking mineral in value, has indirectly had much to do with the area's economic growth, by encouraging the building of the great chemical and other industries that ring the coast. It is the ideal fuel for modern chemical processes and the plentiful supply has kept the price below that of coal, on an equivalent BTU basis. The technique of movement by high-pressure pipeline had to be perfected before this gas could be made available to other regions. Recently, pipeline building has gone forward rapidly, but gas at about 4 cents a thousand cubic feet over a long period contributed inestimably to developing the industry of Texas and building its ports.

A geographical cause of the growth of ports in the western Gulf has been the absence of a navigable tributary to the Mississippi river in the lower half of the Western Plains. Neither the Arkansas nor the Red rivers—the principal

west-east tributaries south of the Missouri river—have added much to Mississippi-borne trade. Had nature given them a more bountiful water supply, the history of port development, as between New Orleans and the Texas harbours, might have been different. People interested in the future of New Orleans are now encouraging westward extension of navigation on the Red river, whose waters have been increased by impounding Lake Texoma near Denison, Texas. The completion of such a project would throw trade toward the Mississippi. A counter-project is the canalisation of the Trinity river, which would connect the Houston-Galveston-Texas City group of ports by barge line with the two principal cities of North Texas, Dallas and Fort Worth. In the absence of a navigable stream in the Gulf southwest area, the gentle, downward gradient of its surface toward the Gulf coast has encouraged shipment by rail and petroleum pipeline to the Texas ports.

With the notable exception of Galveston, most of this port development has taken place during the past thirty-five years and work on practically all of them has continued steadily. Its primary purpose has been to increase the depth and width of the channels and to improve dock facilities. The cost of most of this work has been borne by federal and local governments, with indirect state aid through tax exemption. Some of the wharf development has been with public funds, though largely by private enterprise. At Houston alone more than \$100 million of public and private money will have been put into channel and port improvement when present projects are completed.

★

By the time that Port Brownsville was opened in 1937, total foreign and domestic cargoes moving through the Texas ports, inbound and outbound, had increased steadily to 60 million tons annually. In 1939-1941, immediately before America entered the second world war, it reached an average of 100 million tons a year. With submarine warfare and the need for diverting coastwise tankers to transatlantic trade, the tonnage fell, but after 1943 increased steadily to a peak of 134 million in 1948. It declined in 1949, chiefly because of restrictions on oil production in the Texas fields, but official figures for 1950 are expected to show an increased tonnage. Houston dealt with nearly 37 million tons in 1949. Next, but far behind, came Port Arthur, Beaumont, Texas City, Corpus Christi and Port Aransas, in that order. The older port of Galveston ranked only seventh with 7,000,000 tons, though the value of its total cargo was relatively much greater, because of the high proportion of cotton, wheat, flour and diversified products that went across its wharves. The trade of the Texas ports is more impressive on the basis of tonnage than on the basis of value. However, the total value of the port's commerce at Houston in 1949 was over \$1 billion, and that of the traffic through all Texas ports was estimated at more than \$3 billion.

Of the tonnage going through all Texas ports during the three years 1947-1949, 65 per cent was ocean-going coastal trade, 15 per cent was foreign trade, 15 per cent was Intra-coastal Waterway and interstate trade, and 5 per cent was local traffic. The coastal trade is principally with the upper Atlantic ports, though there is an appreciable exchange with the Pacific ports through the Panama Canal. The outbound movement consists chiefly of petroleum and petroleum products, sulphur, scrap metal, cotton, wheat and miscellaneous crop and livestock products, fertilisers and chemicals. The incoming cargoes are made up of machinery and various iron and steel products, a diversity of heavy and light manu-

factured goods, coffee, tropical fruits, molasses, newsprint and miscellaneous consumers' goods.

The greatest growth recently has been in traffic through the Intra-coastal Waterway of Louisiana and Texas, a 12-foot-deep canal which extends from the Mississippi river westward along the coast to Brownsville, giving all the Texas and Louisiana ports barge-line connection with St. Louis, Chicago, Cincinnati, Pittsburgh and other points on the Mississippi Waterway system. In 1936, the tonnage carried on it was under 800,000 tons, but by 1949 it had increased to over 18 million. The Intra-coastal Waterway trade is fairly well balanced, with inbound somewhat exceeding outbound commerce, but in the foreign and coastal trade the outbound exceeds the inbound tonnage by more than ten to one. The remedy for this serious economic weakness lies largely in the development of industry, which will have the stabilising effect of balancing outbound and inbound, foreign and coastal trade. The future of the Texas ports depends to a great extent on this.

American Notes

Putting the Question

The six weeks' debate on the sending of American troops to Europe is almost over, though Senator Taft and Mr Hoover, who returned to the attack last week, still refuse to concede defeat, and a group of Republicans in the House of Representatives has collected their proposals into a six-point programme for American foreign policy. The lifting of the shadow of a Korean Dunkirk, under which Mr Hoover's "Gibraltar" theory was launched, has made the defence of Europe seem a burden which can be hopefully shouldered. Mr James Reston, the acute observer of the *New York Times*, concludes that the storm has cleared the atmosphere and, despite all the thunder and lightning, has

shown how great the area of fundamental agreement on foreign policy really is.

The question is now being put to the Foreign Relations and Armed Services Committees, which opened joint hearings on Thursday. Technically, these are on the Wherry Resolution, which would forbid the President to despatch more troops to Europe until Congress had considered the issue. Senator Connally has high hopes of substituting for it a simple affirmation of the desirability of stationing more troops in Europe, which would in no way compromise the President's powers to act alone if necessary.

Noting the way that General Eisenhower swept everyone before him—except Senator Taft, who insisted that his report was “hazy” and too full of generalities—Senator Connally is bringing up his big guns to wind up the debate: General Marshall and General Bradley will be among the first to testify, and General Eisenhower himself may be recalled. On an issue of this kind, there is no doubt that the American people, who have never had a profound respect for politicians, put more faith in the balanced judgment and integrity of a General Marshall than in anyone who may, like Senator Taft, be keeping one eye on potential rivals in 1952. A contention which may find an authoritative answer in these final hearings is Mr Hoover's obstinate insistence that the United States should put its main reliance on sea and air power, and refrain from sending land armies to be lost in the “quicksands of Asia and Europe.” Mr Dewey, the titular head of the Republican Party, ridiculed such a notion last week, pointing out that overwhelming air and sea power, by themselves, failed to decide the battle in Korea.

Another contention is Senator Taft's proposal that Congress should limit the number of men to be sent. He suggested that the United States should not contribute more than one division to every nine supplied by the European nations and that not more than 20 per cent of its ground strength and 10 per cent of its air strength should be committed in Europe. Every American, of course, wants to be assured that Europe is pulling its weight, but General Eisenhower made it clear that he did not want to have his hands tied in advance, and General Bradley and General Marshall should be able to convince the committees of the dangers of imposing a rigid ceiling. In any event, while the United States has so few soldiers to send, such an amendment would be meaningless.

Freezing Labour Out ?

The trade unions, which since 1933 have usually found welcome on the mat when they go to Washington, are convinced that they are being frozen out of the mobilisation effort. During the last war they had a hand, through Sidney Hillman, in directing production and a spokesman who could always be sure of the President's ear and the attention of the press. But Mr Charles Wilson, the former president of the General Electric Company, to whom Mr Truman has delegated control of mobilisation, has steadfastly refused to appoint a labour representative to his own top policy staff, apparently on the ground that no top administrator should have a continuing stake in any group whose interests might be affected by his decisions. This is a refreshing change from the usual level of political morals in Washington; but such high-mindedness—and high-handedness—may cost the Administration the co-operation of the unions in the defence effort and stabilisation policy.

What the United Labour Policy Committee would like—and it represents all the big unions except the coal miners—is the appointment of a labour man to a post level with those held in Mr Wilson's office by his two assistants, General Clay and Mr Sidney Weinberg, both of whom have business connections. The unions are, in their eagerness for repre-

sensation, said to have sunk their own rivalries and agreed on Mr Walter Reuther, the automobile workers' leader, for the job. Another door was slammed in the unions' faces last week when Mr Wilson appointed, as chairman of the Manpower Policy Committee, Dr Arthur Flemming, the president of Ohio Wesleyan University and an acknowledged non-partisan expert. The unions had appealed in vain to Mr Truman to retain manpower authority in the hands of the friendly, if less expert, Mr Tobin, Secretary of Labour.

Mr Eric Johnston, the Economic Stabiliser, opened the door a crack when he appointed as his assistant Mr George Harrison, of the American Federation of Labour. This will not satisfy labour's demand to sit down at the policy table, but it may help to enlist labour's co-operation in stabilisation measures. At present both the AFL and the Congress of Industrial Organisations are busy denouncing them; in their view, wages are to be stabilised while prices—already at their highest point in history—are allowed to advance. The Wage Board is having such difficulty in agreeing on a formula which will permit laggards to catch up with the procession that in the end, like the wage freeze, it may have to be issued at a higher level. Some speedy decision is necessary, for wage negotiations all over the country are being held up. But a formula imposed from above would add to labour's sense of grievance and set the stage for a series of costly strikes and slow-downs.

DiSalle Goes to Market

Mr DiSalle, head of the Office of Price Stabilisation, has taken meat by the horns: he is setting up quotas for livestock slaughterers, and requiring them to register and to mark the carcasses they deliver. By this means and by strict enforcement of the regulations, Mr DiSalle hopes to prevent the black market in meat that defeated the price controllers in the last war. But he is showing a tendency to side-step some of his other agricultural problems, and may thus perhaps avoid being trampled to death by the Congressional farm bloc. In spite of earlier indications to the contrary, he now seems disinclined to ask Congress to authorise effective control of food prices, and resigned to the inevitable rise in the cost of living.

Mr DiSalle admits that, in spite of his price freeze, the general price level will go up at least five per cent during the next few months, although he hopes it will be checked by midsummer. One of the chief reasons for this is that the law forbids price ceilings on agricultural commodities, or on products made from them, at levels below parity, the price that is supposed to give the farmer a fair return in terms of the things he buys. Farm prices are going up, but few of them have yet reached parity, and parity levels are themselves rising, as a result of the flexible formula for calculating them that was introduced in the Agricultural Acts of 1948 and 1949.

Meat can be controlled because most livestock prices are above parity. So are raw cotton prices and it is here, where his predecessors suffered another defeat, that Mr DiSalle will probably have to make his first great effort to sell himself to Congress. No attempt has been made to control any agricultural prices at the farm; ceilings are put on them only at the first processing; in the case of cotton, this is when it is ginned and baled, according to price control officials. According to the cotton growers, whose Congressional representatives have already carried their case to the President, output of cotton, now in short supply, will be discouraged if prices are controlled before it reaches the mill. It is admitted, however, that, if baled cotton were unfrozen, prices would rise by 20 or 30 per cent in the next few months. Such a rise would inevitably bring an increase in prices of cotton textiles.

This dispute has delayed the fixing of specific ceilings for the various grades of baled cotton, without which it is impossible to resume trading on the cotton exchanges, closed since the price freeze began on January 26th. That order fixed prices at prevailing levels for each individual trader, which meant such wide variations that the commodity exchanges found it impossible to carry on. Although trading in rubber, pepper and hides, as well as cotton, is still suspended, most of the other commodity exchanges have been enabled to reopen by amendments to the price regulations. Specific ceilings were fixed early this week for coffee, cocoa and vegetable oils, and all price controls were removed for exchanges dealing in farm products, such as wheat, maize and butter, which are selling below parity.

Trade Pacts in Peril

The first important test vote in the new Congress has given the Administration an unexpected jolt. The House last week passed the Bill extending the Reciprocal Trade Agreements Act for another three years until June, 1954. But the Republican minority, with the assistance of more than 40 Democrats from districts where competition from imports has been keenly felt, wrote in four protectionist amendments. The blow is the sharper because trouble was anticipated, not in the House, but in the Senate, where the Democrats have a majority of only two. The trade agreements programme, begun in 1934, permits the Administration to reduce tariffs by 50 per cent, and in some cases by 75 per cent, from the 1930 level. Before it was adopted, Congress wrote the tariff under pressure from interested industries and regions; the President might only accept or reject it as a whole.

One of the amendments revives the "peril-point" provision adopted by the Republican Eightieth Congress and removed by the Democrats after their victory in 1948. This provides that before any concessions are made the Tariff Commission must tell the President how far they may go without endangering home industries. The President may disregard such a warning, but only on pain of explaining his reasons to Congress. Now, in addition, the House has written an escape clause into the basic law itself, instead of leaving it to the State Department to embody one in each individual agreement, as it has done since 1943. Under a third amendment, there would be no tariff cuts on farm commodities whose price is supported in the United States unless the imports would still sell above the American support price. (This was prompted by memories of Canadian potatoes crossing the border when American potatoes were being destroyed to keep the price up.) The Administration will attempt to defeat these three proposals in the Senate. It has reluctantly accepted a fourth, excluding Russia and her satellites from any concession in future trade pacts, whether granted directly or through the operation of the most-favoured-nation clause.

This revival of protectionist sentiment is the not unexpected consequence of the growth in imports, which in 1950 were 33 per cent higher than in 1949 (at \$8.8 billion, compared with \$6.6 billion). Manufacturers of watches, pottery, glassware, shoes and gloves protest they can hardly keep their heads above the flood. The Senate, hearing these cries of distress, is very likely to join the rescue party. The State Department itself has decided it would be wise to go slow; Mr Acheson recently stated that the next three years would be devoted to consolidation and adjustment; there would be no big tariff-cutting conferences such as those at Geneva and Annecy. The danger in adopting new restrictions is not so much that it would imperil present trade pacts or prevent the immediate lowering of further barriers, but rather that, by arousing suspicions of America's long-term attachment to freer trade, it would encourage a revival of protection everywhere, and prejudice what has already been accomplished.

Atomic Explosions

The Atomic Energy Commission lost ~~the~~ time in using the permission, given to it in January, to share the Air Force's bombing range, 5,000 square miles of desert near Las Vegas, Nevada. A series of five early-morning detonations about a fortnight ago brought the number of atomic explosions for which the United States has been responsible up to thirteen. Las Vegas's all-night gambling does not seem to have been interfered with, although some of the larger blasts were seen and felt in west-coast towns several hundred miles away, and radioactive snow fell on the east coast. Eniwetok, the Pacific atoll earlier set aside for experiments with atomic bombs, will probably still be used, but in present circumstances the naval escort needed to protect such an operation would be difficult to provide.

It is also thought that a small island, while a suitable target for bombs dropped from aircraft, would hardly have been adequate for the recent trials, which, according to the chairman of the AEC, were "authentic nuclear detonations," but were not caused by bombs. The general belief is that these tests were concerned with the evolution of smaller, simpler and more effective atomic bombs, and the adaptation of atomic charges to other weapons, such as artillery shells and guided missiles. As General Lawton Collins, the Army's Chief of Staff, pointed out in an interview, such

MAJOR ATOMIC ENERGY CENTRES

All information taken from public documents of the US Atomic Energy Commission.

developments may enable atomic explosives to be used tactically, in close support of troops, instead of only for indiscriminate mass bombing. This has encouraging implications for the defence of Europe against aggression, especially since it is generally believed that America is still ahead of the Soviet Union in atomic knowledge. The recent explosions, even if they were not timed with that in mind, can hardly have failed to draw Russian attention to this point.

The AEC presumably also wanted a testing ground nearer home than Eniwetok, now that it is concentrating on the development of atomic weapons. Most of its greatly increased appropriations will be spent on the defence aspects of its work; industrial and medical research, while still continuing, are now playing a comparatively minor part. At the end of last year, plans for two important new installations were announced: one, at Paducah, Kentucky, will provide for an expansion in output of uranium 235; the other, on the Savannah River, in South Carolina, will make tritium, from which it has been guessed that the hydrogen bomb is coming along well. Progress is being made with the construction of an experimental breeder reactor at Arco and activity is being stepped up at the major atomic centres already in operation. New subsidiary installations are also being planned, to supplement the many existing ones.

FESTIVAL OF BRITAIN 1951

MAY 3—SEPTEMBER 30

This map shows the official Festival centres in England, Scotland, Wales and Northern Ireland. In each of these 25 famous places, on the dates shown, an important chapter in the story of Britain's contribution to civilisation will be unfolded. But besides the Exhibitions and Festivals of the

Arts in these official centres, hundreds of towns and villages throughout the land will celebrate 1951 in their own traditional way. Marking the centenary of the historic 'Crystal Palace' Exhibition of 1851, the Festival of Britain will be the greatest national event of its kind ever planned.

THE WORLD OVERSEAS

Canada's Contribution in Strategic Raw Materials

(From Our Ottawa Correspondent)

AT the end of the last war most people would have thought that food was Canada's main material contribution to the alliance. Today it is non-ferrous metals. Nearly all the free world's nickel comes from Canada; its copper output follows that of the United States, Chile and Northern Rhodesia; it is high up on the list of zinc and lead producers; its reserves of power and its relative proximity to Central American bauxite resources make it a natural supplier of aluminium. Potentially it could become one of the chief suppliers of iron ore to both the United States and the United Kingdom. Its petroleum reserves are already supplying a proportion of domestic needs, and might eventually become an important factor in total world oil supplies. In the present shortage of strategic metals the main pressure is on nickel, zinc, copper and aluminium.

Nickel comes from the huge ore bodies at Sudbury, Ontario, owned largely, but not exclusively, by the Inter-

The same is true of Canadian copper production. This year's output will be down by about 10,000 tons from last year's level because of the closing of the Sherridon mine. The biggest new deposit in sight is on a property of Noranda mines in the Gaspé peninsula of Quebec. There are known to be at least 50 million tons of ore there, with an average of 1.2 per cent of copper, which is enough to permit economic operation. But again development has not yet started.

The high price of zinc has stimulated some small British Columbia properties into production. A new smelter is coming into operation at Flin Flon in northern Manitoba, and Consolidated Smelters are building one at their fabulous Sullivan mine, which by next year will be treating ores from other properties. Canadian output may be up to 210,000 tons this year and to 225,000 or 230,000 in 1952.

Aluminium production, also, may be pushed substantially above the 400,000 tons estimated for 1950. This depends on increased power in northern Quebec. The British Government has recently entered into a contract to increase 1951 purchases above the contract level of 150,000 metric tons, and it is promising to buy 220,000 tons in 1952 and 1953. The Aluminium Company of Canada is reopening its wartime smelter at Beauharnois with assurance of 100,000 additional horsepower from the Quebec Hydro Commission. Other plans will provide power for up to 60,000 tons a year more within two and a half to three years. But the really big aluminium development is the British Columbia project, which is still in the air. The Aluminium Company has cleared the way by signing an agreement with the British Columbia Government which would enable it to exploit water-power resources in a huge area in the northern part of the state. After spending more than \$1,000,000 on surveys and studies the company has a two-stage plan for damming the upper lakes of the coastal range, which now drain inland into the Fraser River. The waters would be diverted and tunnelled through the Coast Range so as to provide a power site near tidewater. The first stage of the project would take three years to build, cost some \$200 million and provide an annual output of about 330 million lb. In another two years the second stage could be completed, costing another \$400 million, and providing more than 1.5 million horsepower. This is the equivalent of 500,000 metric tons a year, which would double Canadian production and equal nearly three-quarters of present American production. The United States Government may be interested in a deal with the Aluminium Company to get this project under way. Without some such assurance of a market the company might be chary of the scheme, particularly after seeing what protectionist feelings the American aluminium companies are capable of arousing.

Canada's biggest iron-ore projects have the same sort of timetable as this aluminium development. It will be 1954 before the huge deposits on the Labrador-Quebec border start flowing to market. This winter preliminary work is being done on the 360-mile railway from the centre of the ore zone down to the north shore of the St. Lawrence. The

national Nickel Company. The problem the company faces is that of treating large quantities of low-grade ore, and the small quantity of high-grade ore available has to be used as a sweetener. Production may be raised a little this year, but there is no way of obtaining any significant increase. That is what the company says, and Mr C. D. Howe, the Minister of Trade and Commerce, has confirmed this view. Some addition might be hoped for from the properties of Falconbridge Nickel mines, particularly if anything were to stop this company from shipping its matte to the Norwegian refineries. But the largest new development in sight is, like so many of the other Canadian possibilities, a longer-range prospect. It is a property at Lynn Lake in northern Manitoba, with a rated capacity of 9,000 tons annually, which looks relatively small beside the Sudbury output. But there are also deposits of copper and cobalt, which increase the attractiveness of the development. It can, however, only be opened up by building 160 miles of new railway and moving the company's mill from the Sherridon copper deposits which are nearly worked out. This means that new production could hardly be expected until well on into 1953.

necessary capital has all been raised from private sources, and the development is being undertaken by a new company in which some of the big American steel firms hold a large interest. They are among the people who will be most anxious to push the St. Lawrence Seaway plan through the present Congress, because the deepening of the canals between Montreal and Lake Ontario would enable the Labrador ore to move economically by water to the Lake Erie ports. In the meantime development is also going on at the more accessible iron deposits in Ontario. By 1953 Ontario's output may equal the 10 million tons planned from Labrador.

The world shortage of sulphur may tempt Canadian mines into production. Noranda has a reserve in northern Quebec, which it is estimated could produce 20,000 or 30,000 tons a year within two years. The nickel mines at Sudbury are installing a flash smelter which will come into operation this year, and could produce 30,000 tons of sulphur equivalent in the form of hydrogen sulphide. Better still is the prospect of extracting sulphur from Alberta's natural gas. As soon as the provincial and federal governments can make

up their minds to permit gas to be piped to the Pacific coast, 100,000 tons of sulphur could be extracted a year at the ridiculously low cost of about \$2 a ton.

Alberta oil will be reaching the East soon after the opening of Great Lakes navigation this spring. The pipeline from Edmonton to Superior, Wisconsin, will be carrying about 95,000 barrels a day, of which 55,000 will be delivered to the Lakehead and shipped by water to Sarnia in southern Ontario. Over the whole year deliveries to Ontario will average about 35,000 barrels a day, which is only half the requirements of the region; and points further east will still be dependent on outside supplies. It is nonetheless reassuring to know that the Alberta reserves are available, and if there were better and cheaper transport facilities Canada could probably be raising as much as 200,000 barrels a day from its own resources without unduly depleting the fields.

The mineral resources of Canada are likely to be of increasing importance to the western powers. Many of the materials most urgently needed for rearmament are here awaiting development. The problem may be to decide how much manpower, money and material should be put into developments which will produce rich results only three or four years hence. It is obviously a problem which Canada cannot solve alone.

The Soviet German Offer

ONCE again the Western German political leaders have to decide whether to meet representatives of the Eastern Democratic Republic for talks prior to a four-power conference. After all party leaders had jointly rejected Herr Grotewohl's invitation of December 1, 1950, a new approach was made from Communist headquarters in Berlin. On January 30th the East German People's Chamber appealed over Dr Adenauer's head to the *Bundestag*, with a proposal that representatives of the two parliaments should contact one another. No answer has yet come from Bonn.

To describe such talks as a conference on the "unity" of Germany is misleading Soviet propaganda, since at no time has there been any suggestion from the Soviet German side that they would touch upon the territories east of the Oder-Neisse line. On the contrary, the frontier between Eastern Germany and Poland has just been formally ratified by the leaders of the two Russian satellite states; and Herr Grotewohl, the East German premier, categorically stated in his speech to the People's Chamber on January 30th: "Every German must realise that an attempt to reopen this frontier question would mean the beginning of another war."

Herr Grotewohl's letter of December 1st suggested conversations on the lines of the so-called Prague resolution. The two governments were to set up a Provisional All-German Council, in which equal numbers of representatives from East and West would sit, despite the fact that the Soviet zone has only 17 million inhabitants compared with 47½ million in the Federal Republic. This body would make preparations for free elections, and approach the Powers for the purpose of concluding a peace treaty, followed by the withdrawal of occupation troops. Dr Adenauer issued the Western reply in the form of a public statement to the Press supported by all parties. In the most forthright terms he went over to the attack. He denounced the traitorous Grotewohl Government and its infamous "peace law," which imposes penalties including death on anyone who opposes, or prepares to oppose, the Soviet policy for Germany. He rejected the proposal for a nominated Council on a basis of parity between the unequal parts of the country, and declared that elections must be held at the outset in order to establish a representative assembly.

Soviet Tactics Exposed

The Social-Democrat leader, Dr Schumacher, has also opposed the Soviet tactics. He has pointed out that before every four-power conference, the Russians have put up a German "National Front" spokesman to induce the Western Germans to confer with representatives of the Pieck Republic. In order to grasp the point of this manoeuvre, he said:

It is necessary to understand the aim of all policy which Russia has ever had with regard to Germany—which is that there can only be a united Germany if it is a Russian Germany, that is, a part of Russia inhabited by Germans. If the circumstances necessary for the achievement of this aim do not, or do not yet, exist, then Russian policy is and remains to hinder German unity.

The Social-Democrat leader warned his fellow-countrymen that they would in fact be negotiating with Russians,

Which would mean having a partner in the discussions with whom one was by no means equal in strength, and whose aims and methods very many German politicians do not even understand. Russia aims to be the only member of the four powers which is in touch with and influencing the whole of Germany. Everyone who takes the slightest step towards helping the Soviets... is sliding dangerously away from the only path to German external and internal freedom.

Both the main party leaders agree that the four Powers had better hold a conference and clarify their stands before the Western Germans step into the quagmire to which Herr

Grotewohl invites them. They are not only uncertain about possible Russian concessions; they are confused about the attitude of the Western Powers on the question of German rearmament and neutrality, which appears to be uncoordinated and unstable. They are disappointed at the continued failure of the West to grant the Federal Republic full equality. Dr Adenauer fears that Britain and France, as well as the Germans, may be enticed by a Russian proposal for a demilitarised, neutralised Germany from which occupation troops would be withdrawn. At the same time, the bulk of the people have made it unmistakably clear to the West that they do not intend to lend themselves to what the Russians call "MacArthurism in Europe." They are by no means convinced that Dr Adenauer is right in declaring that a contribution of 10 to 15 divisions to Western defence means a safeguard against Russian attack. As long as Soviet propaganda continues to present the alternative as "unity and peace, or division and war," the Western Germans will lend their ears to it. Their attitude towards unity has been well expressed by Herr Jakob Kaiser, the Bonn Minister for All-German Affairs, who said that the Eastern Germans long for liberation, while the Western Germans long for an end to the constant threat from Russia. A strong body of Western German opinion would therefore support talks with Herr Grotewohl. Many feel that it is time Germany itself produced its own national policy. Even Dr Adenauer's Cabinet is divided on the subject.

An examination of the text of the proposals made by the People's Chamber to the *Bundestag* indicates that no real concessions have in fact been offered from Pankow, with the possible exception of Clause 3. The proposals are still based, like the Soviet Notes to the Western Powers, on the Prague resolution. They are that the East German representatives on an All-German Constituent Council—which is still to be established on a basis of parity—would be authorised to:

1. Conduct concrete negotiations concerning conditions leading to German reunification and the establishment of a constitutional order based on the rule of law.

2. Discuss amendments of the Peace Protection Law with a view to extending its scope to the whole of Germany.

3. Agree at an early stage on the establishment, armament and stationing of police throughout Germany, and if necessary even before reunification, reduce the establishment of the East German police in accordance with principles which would also apply to Western Germany.

4. Issue a joint declaration on behalf of the entire German people banning remilitarisation and simultaneously take steps designed to enforce this prohibition.

5. Consult on holding free, general, equal, secret and direct elections throughout Germany, taking into account the proposals of the two German Governments.

6. Consult on steps calculated to induce the occupying Powers to conclude a peace treaty and withdraw troops.

7. Discuss joint measures for the expansion of internal German trade and for ensuring free access for German goods to world markets—meanwhile Eastern Germany to try to gain free access for West German products to Eastern and South Eastern markets.

8. Discuss any other proposals calculated to further unity.

Even now, the Soviet Germans do no more than offer to discuss conditions for elections. It is well to recall that the nominated government of the Democratic Republic also "prepared" elections. It took a year to do so, and then held them on a single list, which included representatives of all the various Communist-controlled "democratic organisations," in addition to the well-purged parties. Seats were divided in advance, and the voting was only theoretically secret. Nevertheless, Communist propaganda termed the elections of October, 1950, the "most democratic that Germany has ever held." It may be noted that the Moscow journal *New Times* has declared in its latest issue that, to maintain peace in Europe, "it is essential to create a single

Germany on a democratic basis. This is precisely the import of the proposals submitted by the Government of the German Democratic Republic for the formation of an all-German Constituent Council." The world should know well enough by now what Communists mean by "democratic."

Socialist Planning in Sweden—II

[FROM OUR STOCKHOLM CORRESPONDENT]

AFTER the temporary breakdown of Swedish planning in the face of the serious foreign exchange crisis of 1946-47, much valuable time was wasted before a change in policy could be agreed on. Gradually, however, a strict control of imports was instituted. Investments were also controlled in various ways and the production of houses fell from about 58,000 in 1946 and 1947 to from 42,000 to 43,000 in 1949, which, however, was still a high figure. In the autumn of 1948 wages were "frozen" by agreement between employers and wage earners but that could not prevent a continuous, if slower, "gliding" upwards of wages. Under the combined influence of these restrictions and the bond purchases of the Riksbank a point was reached towards the end of 1948 where the Riksbank could largely discontinue purchases.

In 1949 there was an over-all surplus in the balance of payments. There was still a dollar gap but it was covered by Marshall aid, chiefly conditional aid. It has been estimated by the Swedish Business Institute that exports, which in 1947 were no more than about 80 per cent of the 1938 volume, had in 1949 risen to about the 1938 level. Imports had followed an opposite course, falling from not quite 120 per cent to less than 90 per cent. There was a recovery to, perhaps, 110 per cent in 1950, exports rising at the same time to something like 120 per cent.

In September, 1949, the Swedish krona was devalued to the same extent as the British pound. The government disregarded the advice that devaluation ought to be accompanied by some tightening of the internal restrictions. The official policy was based on the assumption of a fall in prices on the American market and restrictions were not tightened but eased. Investments increased to some extent and the balance of payments became a little less strong than in 1949 which was largely due to changes in the terms of trade.

Need for Restrictive Policy

Towards the end of the spring of last year it was quite evident, however, that the revival of business in the United States had acquired considerable strength and that prices were once more rising. The inflationary tendencies were greatly reinforced by the Korea crisis and everybody agreed that there had to be a far-reaching reconsideration of the economic policy of Sweden. An appreciation of the Swedish krona was advocated in some quarters but the idea has so far failed to gain much support. The gold and foreign exchange reserves of the Riksbank have no doubt increased from the low level of 1948, but they are still too weak to sustain any very considerable and prolonged pressure. This being so, an appreciation would presuppose a restrictive policy which would have to go far beyond what the Government seems ready to accept for the time being. Even if the present exchange rates are maintained, there is, however, great need for a restrictive policy. The more so as wage ceilings have been abolished and a number of price subsidies, which were introduced in 1949 to bridge over the period until the expected fall in American prices, have been discontinued. The wage negotiations now going on seem likely to bring average wage increases of 10 to 15 per cent. The government programme has so far included a tightening of credit conditions by an increase in reserve requirements in the commercial banks. The new Minister of Finance, Mr Sköld,

has also been willing to let the long-term interest rate rise from 3 to from 3½ to 3½ per cent although he has so far protested his adherence to the general principle of an easy money policy. But at the beginning of last December the discount rate of the Riksbank was raised from 2½ to 3 per cent.

The housing policy has long been ripe for reconsideration. But at present it seems likely that housing production will be controlled in general in the same way as in recent years. Industrial investments on the other hand will probably be restrained by new methods. They will in all probability be subject to special taxation. An attempt is also being made to "sterilise" a large part of the exceptional income which present conditions are bringing to the forest industries.

It is very doubtful if these measures will prove sufficient to bring conditions under satisfactory control. The budget situation also causes some apprehension. In addition to the large expenditure for social purposes decided upon during recent years, the Minister of Finance has also to find room for a very considerable increase in the defence appropriations. The aggregate expenditure for defence purposes in the year 1951-52 is at present estimated at about 1,400 million kronor, i.e., about twice as much as was considered a "normal" figure five years ago.

During the financial year 1949-50 the Treasury ran into a deficit on current account. For some time previously there had been a surplus on current account but it was not sufficient to cover other state expenditure, particularly investment outlay. During the present year the most that can be hoped for is that current expenditure will be balanced by current income. Mr Sköld is planning measures for creating a surplus in 1951-52 sufficient to pay for some of the outlay on capital account. It is very uncertain, however, if he is going to succeed. Any deficit will, of course, have to be financed by borrowing. Mr Sköld has strongly disavowed any intention to use the dangerous expedient of borrowing at the Riksbank but he has, so far, failed to give any detailed account of his financial and monetary programme and the means by which he intends to maintain the low interest rates.

Economic Troubles in Hungary

If the Hungarian people have paid anything like as much attention as they are supposed to do to the reproaches and exhortations of their leaders, they will have embarked upon the labours of 1951 in a chastened and sombre mood, which food shortages and the recent return to bread-rationing will have done nothing to alleviate. They have been bluntly told that their standard of living cannot go on "rising as precipitously as in the last few years"; that "instead of iron discipline, fortitude and readiness for sacrifices, laxity, love of comfort and exaggerated pretentiousness have appeared

in our ranks"; and that their tasks in this second year of the five-year plan will be more difficult than in the first. They must make every effort to overcome the shortcomings which prevented last year's plan—in spite of its alleged over-fulfilment—from being an unqualified success.

The planners themselves seem to have been far from efficient. They were late in completing the plan for 1950, and in many sectors of industry they set targets which were too low to make full use of the available resources. According to Mr Zoltan Vas, the President of the National Planning Office, many planners "have thought to do good work . . . by peacefully and meekly acquiescing in targets so low as not to require special exertion or to mobilise anybody." They have, in short, acted on the principle that the only good plan is the one that can certainly be overfulfilled. Mr Vas was no doubt quite justified in complaining that many planners had been inexperienced, irresponsible and, not infrequently, hostile. But part of the trouble is also due to the fact that the Hungarians have embarked on a rearmament effort for which they had not originally planned and which makes their original targets appear inadequate.

Lack of skilful and thorough planning has also led to extravagant and wasteful investment of funds in capital development and has been partly, at least, responsible for the disproportionate development of different branches of industry. Within heavy industry, the production of basic materials and electric power has not kept pace with the development of the processing industries. While the output of heavy machinery in 1950 went up by 46.5 per cent, coal output rose by only 12 per cent, iron and steel production by only 17.8 per cent, electric power by only 18.4 per cent and the crude oil industry did not manage to reach its targets at all. Moreover, within the processing industries themselves there have been great inequalities in production. Although the manufacture of machine tools, for instance, rose in 1950, the increase was not nearly as large as it should have been. The Hungarians have, in consequence, been anxious to remedy this deficiency by imports from western countries, such as Germany, for which—in spite of food shortages—they have been willing to pay with poultry and other foodstuffs.

It is clear that the inequalities in production have been due even more to shortages of raw materials than to the inadequacy of the planners. With the exception of bauxite and, to a lesser extent, coal, Hungary is not rich in essential raw materials. Most of its needs in non-ferrous metals, coke, cotton, etc., must be imported, and although they would never admit it, the Hungarians have been hard hit by the stoppage of all supplies from Yugoslavia. Their ability to import what they need from the West has been hampered by restrictions arising out of the cold war, as well as by the general rise in world prices. But, in spite of the urgent need for economy, it appears that materials have been carelessly squandered and no large-scale effort has been made to replace imported raw materials by synthetic products manufactured

HOLIDAYS ABROAD

COST YOU LESS THIS YEAR!

Once again a wonderful selection of Holidays is available to you through Dean & Dawson, and this year prices are lower so that value is better than ever! Make your choice from the synopsis for 1951—*"Holidays Abroad."* In it you will find hundreds of attractive suggestions for inclusive holidays. Any branch will supply you with a copy of *"Holidays Abroad"* and give that personal attention to your plans for which Dean & Dawson have been known for so many years.

★ If unable to call write for a free copy of *"Holidays Abroad"* to Dean & Dawson Ltd., Dept. 49/H.A., 81 Piccadilly, London, W.1.

DEAN & DAWSON

BRANCHES IN PRINCIPAL TOWNS

inside the country. According to an official statement, "the processing and utilisation of waste and residuary products is in a stage of infancy." The Cabinet has now decreed that a real effort must be made to develop synthetic manufactures and that investments on experiments to that end must be given priority. Elaborate measures have been instituted for the collection of scrap and other waste materials. It has also been decided to draw up and apply "raw material economy norms" on a large scale. The first were introduced on January 1st and three weeks later it was reported that these norms had been fixed for 400 articles which were principally made of materials imported from abroad.

In a decree issued at the end of December, the Hungarian Cabinet tried to secure the more economical use not only of raw materials but also of machines, manpower and money. Machines are wasted because the general unwillingness to introduce shift work means that they are not used all round the clock. A determined attempt to overcome this unwillingness must be made. Manpower is wasted because so much of it is used in superfluous administrative jobs. In future certain types of administrative work are only to be done by old and disabled people and the young and healthy are to be directed into more productive work. Lastly, money is wasted because of the failure to bring down investment and production costs and because of the apparent inability of administrative workers to keep their expense accounts down to reasonable proportions. Lavish receptions, the unnecessary use of office transport and "the light-hearted spending of State money in many other ways" have all assumed proportions which, according to the Hungarian Cabinet, are "intolerable in a country which is building socialism." In future, better financial discipline will be maintained and it is hoped that "the rules of orderly and economic finance" will be applied "without bias and free from unauthorised influences."

Norway's Defence Effort

NORWAY'S views on defence went straight to General Eisenhower's heart. They felt, so he told a relatively remote Congress, that "resistance to the point of destruction" was preferable to occupation. The Government's plans for building its defences show a remarkable determination to match their words with deeds.

At the end of September the Norwegian Storting approved the Government's proposals for accelerating defence preparations. They agreed that a rearmament programme involving additional expenditure of 250 million kroner by the middle of 1953 should be superimposed on normal military expenses, now running at about the rate of 300 million kroner per annum. Of this, they specified that at least 100 million kroner should go to increasing the 1950-51 defence budget (July to June) making a total of 378 million kroner for the year.

Measures to raise the additional finance were promptly passed. These included a defence tax equivalent to 10 per cent of existing taxes on income and capital; a 50 per cent increase in taxes on sweets and spirits; a reduction of 10 per cent in the rate of public and private investment, meaning, among other things, a cut in the State roads, schools, building and railway programmes; and limitations on bank loans for private investment.

As at present announced, the 1951-52 defence budget will include normal expenditure of 305 million kroner, and a further 100 million kroner extraordinary expenditure on rearmament, making a total of 405 million kroner. But the Government is not proposing to stop there; it has already prepared, though not formally introduced, new proposals which include raising the period of compulsory service from nine to twelve months, and which will involve expenditure in 1951-52 of another 100 million kroner (500 million

NOTE: 20 kroner approx. = £1.

in all). This would make the 1951-52 defence budget 20 per cent higher than the expenditure at present scheduled for the 1950-51 period.

In the new budget, whose shape is still highly flexible, retrenchment rather than new taxation will be the order of the day, though the Government has not apparently settled how it will find the extra 100 million kroner for its new proposals. The additional revenue for 1951-52 is at present planned to come from (a) the continuation of measures imposed last September, with a further 5 per cent slice out of State investment; (b) a reduction of price subsidies from 600 million kroner to 450 million kroner; (c) new export levies on certain goods which will in part replace the reduced subsidies; (d) increased rates for mail, telegrams and railway fares; and (e) pruning the administrative costs of some government departments. By these means it is hoped to balance the new budget at only 150 million kroner more than 1950-51, including a provision of nearly 300 million kroner for part-payment of the national debt. Thus, the Norwegian Government is proposing by strict retrenchment to ensure a strong fiscal basis to counteract the inflationary pressures of its rearmament effort.

Increased Military Training

It is not yet clear what this financial effort will mean in terms of arms and men. Norway's total population is little more than 3,000,000 in all. By far the greatest share of the expenditure—well over half—will go to the army, whose present strength is already somewhere in the region of 45,000 men. In addition, local defence companies, standing at present at about 70,000 men, form reserves of trained and semi-trained soldiers, and an active home guard numbers about 100,000.

Nine months' military service between the ages of 18 and 55 is now compulsory. If the Government's new proposals are approved—there is little doubt that they will be—this will be raised to twelve months. Lack of equipment and officers make it difficult at this stage to increase the period of training any further. The immediate objective is thus to increase the officer cadres and the potential output of training establishments. In the meantime, the Storting has already agreed to the introduction of repeat service, for periods ranging from two months upwards, for men who have already done their training.

As for equipment, there is no immediate prospect that Norway will produce weapons for the common pool, though ultimately it hopes to have some surplus capacity for MTB production which it could offer to Nato countries. At the moment it is, and must remain, a large importer of military equipment, including ammunition. Its main material contribution will be in its export of strategic raw materials—aluminium, chemicals, iron ore and sulphur. Expansion schemes for nitrate and other electro-chemical industries are already under way, and the big iron ore deposits at Kirkenes should be exporting again by 1952 after total destruction by the Germans. These, together with power development and other export industries, are the notable exemptions from the investment cuts introduced in September.

Despite its far-reaching powers of control and planning, which enable it to concentrate resources to the maximum, the demands of the defence programme face the Government with formidable economic problems. Externally, rearmament is bound to impose a severe strain on a balance of payments which is at best precarious. A favourable year was 1950; freight rates were high and the rising costs of imported materials had not made their full impact; the volume of imports was only five per cent higher than in 1949, and exports rose by 33 per cent. Yet Norway still ran a balance of payments deficit on current account of 140 million kroner. This was in fact covered by ERP and credits under the EPU (in the first six months Norway used \$51 million of an initial credit of \$60 million) and by raising credits on

CALCIUM

NEXT to coal, the most important mineral mined in Britain today is limestone. Like chalk and marble, limestone is a form of calcium carbonate. Calcium itself, though not found naturally in the metallic state, occurs widely in the form of its compounds. Alabaster, anhydrite, gypsum, dolomite and fluorspar all contain calcium. In the human body, a deficiency of calcium sometimes causes rickets. Calcium metal is made commercially by passing an electric current through fused calcium salts, or by reducing lime with aluminium. The metal itself is not much used, but limestone, and the lime made by burning it in kilns, are vitally important.

At Tunstead Quarry, near Buxton in Derbyshire, I.C.I. operates the largest and most up-to-date limestone quarry in Europe. The quarry face is over two miles long and the limestone it produces is over 98 per cent. pure. Minerals containing calcium are used in the manufacture of cement, fertilizers, iron and steel and heavy chemicals. "Slaked lime"—calcium hydroxide—is one of the chemicals used in tanneries to strip the hair from hides. The farmer uses lime to control the acidity of his land.

ships built abroad. The annual economic survey just published, forecasts a slightly smaller deficit of 1,000 million kroner for 1951. It is hoped to cover this in the same way (ERP for the year is estimated at about \$100 million), but this will only be achieved by a rigorous import policy. The volume of imports is to be cut by 6 to 8 per cent, though their value is expected to rise by about 30 million kroner.

Internally, Norway is particularly vulnerable to the rising import prices, which, combined with the demands of rearmament on production, and the cut in imports, constitute a serious threat of rising prices and wages. Norway is dependent to a very large degree on imports for the manufactured goods, food and raw materials which it needs; in 1950 its import bill was rather more than 4 billion kroner. It is also already in a state of full, or over-full, employment; the number of unemployed last summer was only 2,800 out of a working population of over 1.5 million. Finally, 1950 saw the beginning of a steep rise in internal prices, following devaluation. From 1945 to September, 1949, prices and wages were kept comparatively stable; but between the end of 1949 and December, 1950, wholesale prices rose by 25.2 per cent and the cost of living index by 11.6 per cent. As a result, wage rates were increased last autumn by 8 per cent for adult workers, and if prices continue to rise they are bound, under the present agreement between employers and workers, to be increased again within the next few months. It is against this background that the importance of the government's anti-inflationary fiscal policy can be most clearly seen.

Can Australia Remain White?

[FROM OUR MELBOURNE CORRESPONDENT]

A SHORT Ministerial statement announced this month that in future the Federal Government will not use officially the term "White Australia." This statement passed almost unnoticed in the daily press, but it has more than usual significance coming as it does at a time when mass migration from Japan threatens to become more than an academic issue. It has been emphasised in Tokyo that Japanese migration will not form part of any peace treaty. There is, nevertheless, grave concern in Australia that some attempt may ultimately be made to allow the Japanese population overflow to spill into New Guinea or other Australian territory.

Officially, Australia is substituting the term "immigration restrictive policy" for the more provocative "White Australia policy," which has done so much to cause offence to eastern peoples over the last half century. But a change of name betokens no change of policy. Despite its new title Australian immigration policy is still designed, almost without exception, to keep Australia white. Australia's immigration policy is indeed one of the few issues on which all political parties (the Communists excepted) have been able to agree. Differences of opinion have arisen only about the administration of the policy and not about the policy itself.

It has always been realised that a discriminatory immigration policy, tacitly directed against the peoples of South-east Asia, could be provocative. In an attempt to soften the offence, the expedient of a "dictation test" was adopted by which people not acceptable to the Commonwealth could be refused admittance if they failed in a test in a remote foreign language. This dictation test was later used to exclude other individuals for reasons other than mere race or nationality (those politically unacceptable had to undergo it)—all of which tended to classify Orientals with "undesirables."

The basis of Australia's immigration policy has been clearly stated by the Prime Minister (Mr Menzies) when

speaking in the House of Representatives. Mr Menzies said:

Australian migration policy is to maintain the homogeneous character of the Australian population by limiting new migrants to people who are assimilable—those of European blood and descent.

This sets out succinctly the attitude of both Government and Opposition to the type of people which will be allowed to enter the Commonwealth as permanent residents. Negatively, the policy operates against Asiatics (and other coloured people) who are automatically refused admittance for permanent residence. The restrictions are so strict against Japan that even Japanese merchants and tourists cannot be admitted. Positively, the policy is translated into a vigorous drive since the war for new settlers of European origin. Italians and people from the Baltic States have been freely accepted and more recently the Government decided to admit 25,000 Germans a year, a move which has been strongly criticised.

Land-Hungry Asiatics

The policy of limiting immigrants to peoples of European origin was maintained without serious challenge during the period when Britain was in a position to resist any Asian nation which might have sought to reverse it. As Mr Menzies has said, if the policy is challenged by direct demand from Asiatic countries, accompanied by open or tacit threat of armed compulsion, Australia could then not successfully defend the policy without the active aid of powerful friends—the British Commonwealth and the United States.

Australia is taking no action to meet the challenge of the land-hungry peoples to its north-west other than by speeding up the immigration of new settlers from Britain and Europe to an extent which is already making excessive demands on the capital resources of the country. Because it is a strong contributory factor in aggravating inflationary pressures, there is already criticism that the Commonwealth is trying to do too much in too short a time. Nevertheless, Australia urgently needs more people to provide for its defence needs, to develop its unused resources, and to help solve the acute shortage of labour in industry.

It is for the military expert to decide if Australia will be more secure against attack with a population of 11 million (the 1960 target) compared with its present population of 8 million. But strength is only relative, and while Australia is building up its own population, other countries—particularly those from which attack is feared—will be building up theirs also. It is true that Australia will be stronger economically and militarily if the present expansion continues. It would be rash to assume, however, that Australia's position will necessarily be strengthened *vis-à-vis* other nations.

Australia's attitude toward the southward drift of eastern peoples is shown in its uncompromising opposition to Indonesian attempts to obtain sovereignty over Dutch New Guinea. Again, in this opposition, both the Government and Opposition parties are at one. This attitude represents in some ways an extension of the "White Australia policy." White occupation of contiguous territories tends to cause no qualms. Suggestions of sovereignty passing to an Asian people immediately raises questions of security, ethnology and economics.

The overwhelming consideration facing political parties is whether White Australia can be preserved. Everyone, except the Communists, is agreed that it *should* be preserved, but everyone has the gravest fears whether it *can* be preserved indefinitely. No Australian Government is likely to reverse the immigration policy which has been enforced with remarkable consistency for 50 years. But Australia may be forced to concede some compromise in the way of quotas on the American model as a gesture to those countries whose growth of national consciousness since the war has been accompanied by increasing sensitiveness to acts of racial discrimination.

THE BUSINESS WORLD

State Steel

THE law has had its way, and public ownership of the major steel-making companies is now in being. For the securities of these companies, holders are to receive the appropriate amounts of steel stock imposed by the Act or since agreed after negotiation. The stock carries $3\frac{1}{2}$ per cent interest, and is of maximum thirty-year life, being finally redeemable in 1981 and optionally from 1979. It fits neatly and inevitably into its proper compartment, leaving no complaint about the Treasury's power of reason or taste for fairness. The days of the forcing tactics of a 3 per cent 40-year stock have long since passed. On this occasion there has been no preparation of the market at all; on the contrary, it has been allowed to slide to such an extent in recent weeks as to cut some twenty years off the life of the new stock.

By the time this article is read, dealings will have started in steel stock. There will be many investors, including the institutions, with stock to sell; as for buyers only the public bull is likely to enter an appearance, at least in the early stages. It is his responsibility to ensure a reasonable dealing basis for the new stock, for the Treasury's view that it has been issued in reasonable line with existing conditions in the gilt-edged market would be made to look very odd if the stock were to be cynically cast adrift and left to find its own discount. Some time will be needed before steel stock settles down. The recent disturbances to gilt-edged and equity prices caused by the steel take-over leave awkward questions still to be faced, such as the impact of defence expenditure on gilt-edged prices and the pressure of inflation on equities—with a Chancellor already casting his mind forward to the April budget. In these circumstances, the steel issue may not be an easy stock to float off. It was expected that the authorities would be willing to insert a peg at a two-point discount, but if there were plentiful sellers still to be accommodated after the lucky ones had been able to divest, the result might well be too great a volume for the authorities to absorb—for they are already well provided with their own wares.

But the issue of steel stock is almost a formality; it is the fourth compensation issue in just over three years, and it goes by precedent and brings into operation the same market reflexes. What distinguishes it from earlier issues is the doubt, which survives even after the hour has struck, whether the exchange of steel securities for the new stock may not be reversed by the overthrowing of the whole Act for nationalising steel. That would indeed set a pretty market problem, but the prospects of such an unscrambling operation depend upon the lease of life remaining to a weak but still undefeated Government. An early election might grant the steel industry a stay of execution followed by a firm decision to proceed or to go into reverse which both sides would be obliged to honour. But the Iron and Steel Corporation can proceed only upon the assumption that it is setting up a permanent regime (though it must ensure

that it does not disrupt the current activity of the industry in doing so). The public is entitled to examine the Corporation's acts and projects as they conduce towards what its chairman has described (using his own capitals) as "a Fundamental Change."

But little else in Mr Hardie's lengthy statement upon the eve of vesting day suggested that the Corporation has seriously begun to think about the reorganisation that his words—and his mien—imply. He provided an up-to-date estimate of the proportion of each division of the steel industry that will come under public ownership. He repeated the none too explicit description of the Corporation's relations with its dependent companies that had already been allowed to appear. His explanation of the interim and long-term relationships between the Cor-

poration and the British Iron and Steel Federation was not as obscure as Mr Strauss's "accurate, perfectly clear, and simple picture" last week; Mr Hardie talked of "our industry" and "our associations," which does not suggest that his intentions about control are any less ambitious than the Minister's. He disclosed that home and export sales organisations were among the "individualities" that the Corporation proposed to leave to its wholly owned subsidiaries, and that the Corporation had already arranged to pay £20 million for first instalments upon development schemes of constituent companies, which this year may amount to £100 million. Mr Hardie described the total capital commitments (perhaps £500 million by the time the financial provisions for the industry's second development scheme are approved) as "a large and onerous capital obligation"; other people would say that the Corporation has secured fixed assets and cash reserves at bargain prices. He hoped that the future "might bring prosperous years as well as lean years"—this of an industry that since the war has

successively been surpassing its output records. The Corporation's one entirely new item of policy was its declared intention—to which Mr Hardie evidently attaches great importance—to "have progressive long-term planning for 25-50 years ahead for the main raw material supplies upon which our steel industry is founded." It is difficult to know what is implied in a plan of this duration. The first question that obviously has to be asked is what level of steel output is contemplated in A.D. 2001, but this remains one of the many matters which "the Corporation has actively under consideration."

*

Such remote planning as far as the eye can see and "from a much wider national angle" can obviously have little meaning at present. Of the measures to be taken by the Corporation to discharge its responsibilities about development, supplies of materials, production and prices Mr Hardie had little to say. This may not be entirely the Corporation's fault. A few hours before the Corporation formally entered upon ownership of the major part of the industry now centrally administered by the Federation, no working arrangement, even of an interim character, had finally been agreed. There have been signs that the issue was developing into one of personalities between Mr Hardie and Sir Andrew Duncan, who are both industrial co-ordinators of great determination and experience. With the vesting date out of the way, the discussions become more complex and entangled in implication. The Corporation's member firms account for roughly 100 per cent of the tonnage produced by member firms in two of the Federation's eleven sectional "conferences," for more than 90 per cent of three others and for 65 to 90 per cent of four of the remainder; only in the conferences dealing with the production of crucible and high-speed steel (37 per cent) and bolts, nuts, screws and rivets (2 per cent) are they in a decided minority, according to a tonnage yardstick. Mr Hardie interprets this to mean that "the 80 firms we own (with more than 100 subsidiaries) practically are the Federation." In the same way, according to Mr Strauss, 30 of the 33 members of the Federation's executive—which is negotiating with Mr Hardie—are directors of publicly-owned companies (though they hold office as individuals and not as representatives of their companies). Sir Ellis Hunter, for example, who has been most prominent in these negotiations, now becomes the chief executive of a subsidiary company of the Iron and Steel Corporation—and he, like other leaders of the industry, is not disposed actively to support

the attempts of his holding company's chief executive to gain control of the Federation, of which such publicly-owned subsidiaries are the predominant members. In many ways, therefore, there is justification for the comment by Mr John Freeman, Parliamentary Secretary to the Ministry of Supply: "In the last analysis, if this comes to a fight, the Corporation hold the big guns, and the Corporation will win." In the present analysis, however, it appears that the Corporation, which is desperately bargaining for the services, if not as yet the good will, of the men who have run,

and can run, the industry, is not prepared to fire its big guns. Whether it can control the Federation through its predominant membership—exercised through the directors of individual companies, many of whose services it has retained at least partly because they hope eventually for its abolition—is not by any means certain. Its desire, even during an interim period, for special delegates on every conference and committee of the Federation, whether dominated by publicly owned firms' representatives or not, does not display real confidence. On the other hand, the Federation's view, in its latest *Statistical Bulletin*, that "the problem for the present

would seem to be how the Corporation can best reconcile and fulfil its own powers and responsibilities within the general structure" would seem to be over-sanguine and may not completely take account of the calibre of Mr Hardie.

Such a temporary, dangerous impasse is not a happy opening for State ownership of the second of the country's two most important basic industries. It might in present circumstances be a good thing for the Corporation to remain ineffective through restraint; it would be ominous if it should remain ineffective through incapacity to assume its practical responsibilities. Some *modus vivendi* should have been worked out before now; and the issues concerned in working out a continuing organisation for the whole of the industry or for its public and private sectors should be disclosed more clearly than in one shadowy sentence from Mr Strauss.

State steel is no longer a theoretical issue; the Corporation's first job is to produce a clear blueprint for the developing organisation of the industry. The more closely this can be dovetailed into the existing structure that has served the industry so well during the last five years the better; but the vagueness of the Corporation's present barely-formed notions does not necessarily suggest that the changes it envisages will be moderate or well-conceived. Mr Hardie's earnest preoccupation with

securing iron ore supplies that later generations will make into steel should not conceal from him that the country already requires answers about the immediately important questions now facing the industry. How will the Corporation discharge the responsibilities it has assumed for securing iron ore and scrap in the coming year, when raw materials will be short? What measures will it take to give the private sector of the industry "special consideration" and "represent and protect its interests" in whatever organisation is ultimately set up? When it assumes power to fix prices (for the present left at its request with the Minister) will it undertake not to use these powers to discriminate against its customer-competitors in the steel finishing trades? When does it hope to recruit to its members, to its staff, or to any shadowy "Council" and "Executive" that it might set up, the reserve of steel-making experience it at present so painfully lacks? What financial policy will the Corporation, as a holding company, adopt regarding the operations of its 80 subsidiaries? What practical part will it and its staff undertake in the preparation, already begun, of the second stage of the industry's development plan? Until it has begun to answer such practical questions, the titular existence of the Corporation can only menace and hamper the current operations of the industry.

Gold Price under Pressure

THE attack on the official dollar price of gold has recently been gathering weight. For the time being, it has left the field of polemics, where until recently most of the conflict took place. On that front the South African attempt to induce the International Monetary Fund to sanction a general writing-up of the world price of gold—by a uniform and simultaneous change in currency parities—has been repelled at least twice and is not being pursued. When it was last defeated, Mr Havenga, the South African Minister of Finance, gave warning to the Fund and to the world that South Africa "reserved all rights to sell gold at premium prices, safeguarded to her by the Fund's Articles of Agreement." Mr Havenga has been as good as his word. The offensive against the official price of gold is no longer an academic debate conducted within the four walls of the International Monetary Fund; it is a much more practical affair, involving an increasing diversion of newly mined gold, and even of existing monetary stocks, from the world supply of monetary reserves into the free gold markets where gold is quoted at a premium on the official price.

The extent of this movement may be gauged by comparing changes in the world's monetary reserves of gold in recent years with corresponding figures of world gold production. The table opposite, which gives such a comparison, has been compiled from the comprehensive data published by the International Monetary Fund; for obvious reasons it excludes information relating to Russia. The difference between gold produced and the changes in holdings measures the gold that has gone into industrial uses, has disappeared into hoards, or has been added to the considerable amount of gold that circulates in the Middle East as a normal standard of currency. In 1948 and 1949, it will be seen, some \$744 million

of gold, or about 21 million ounces, disappeared into industry or hoards. The provisional figures suggest that this rate nearly doubled in 1950. Gold output last year amounted to about \$840 million, while monetary reserves rose by only \$120 million, leaving \$720 million, or about 20 million ounces, as the amount of gold diverted to industry or hoards. Thus, of the 1950 production of gold, only one-seventh fed the reserves held by central banks, exchange accounts and

treasuries, and six-sevenths took other and more devious paths. This is not to suggest that six-sevenths of the newly mined gold was directly canalised to the free markets; the proportion was certainly very much lower. But the figures indicate that the newly mined gold sold in the free market plus the gold withdrawn from official reserves and either hoarded or sold for industrial purposes amounted to the equivalent of six-sevenths of new production.

This diversion of gold from monetary reserves to the free markets increased steadily during 1950. It is likely to be further accentuated in the months to come. This is because more producing countries are obtaining permission from the International Monetary Fund to convert

newly mined gold into fabricated articles, which may be sold in the international markets at premium prices. The growth of this business is inextricably linked with the IMF doctrine on the subject of gold dealings at other than official prices.

The basic IMF articles of agreement set out the perfectly justifiable thesis that member banks should not be allowed to deal in gold except within comparatively narrow margins—analogueous to the "gold points" of gold standard days—on either side of the official parity price. Had any appreciably greater latitude been allowed by the agreement, it would have threatened a fundamental undermining of the structure of stable exchange rates that the IMF was intended to maintain. This doctrine soon came under pressure, however, because in the post-war years gold in the free markets commanded a substantial premium over the official price. The IMF eventually yielded to this pressure in two ways. First, it decided "not to object to domestic transactions in gold at prices above the official parities unless they have the effect of establishing new rates of exchange or undermining existing rates of other members or unless they result in a significant weakening of the international financial position of a member which might affect its utilisation of the Fund's resources." This concession, intended to be limited to dealings within each national economy, allowed the opening and legal functioning of "tolerated" free markets for gold, in Paris and other capitals of member countries. Secondly, and of greater importance, was the recognition by the Fund that member countries had a right to export gold at premium prices if this gold was needed for *bona fide* industrial purposes. This right has been generously used—some might say abused—by producing countries. All producing countries are allowed to sell gold at a premium against affidavits from the importing countries testifying that the gold in question is required for industrial purposes. Some of these affidavits are easier and cheaper to procure than others. In some countries they are issued with a due sense of responsibility; in others the standards have proved less exacting.

Gold has been exported from South Africa, Canada, the United States and Australia against affidavits of this kind. Some of the producing countries have gone further, and have allowed the setting up in their own territory of manufacturing firms that fabricate the gold in the desired way and then export it at premium prices. The outstanding example of this is South Africa, where two firms have been authorised to process newly mined gold into articles or into semi-manufactured form. After this process of conversion the gold can be exported and sold at premium prices. In South Africa about 40 per cent of the current output of about a million ounces a month is processed and exported in this way. For South African mines, therefore, the average current price of gold is appreciably above the official figure of 35 dollars or 248 shillings per ounce. Canada and Southern Rhodesia have recently asked for an extension of facilities for selling gold at a premium, and one may assume that before long the facilities given to certain producers will not be denied to any others, including Australia and West Africa.

The main gold producers all have access to the free market, and the evidence suggests that they have been using this selling route to an increasing extent in the past few months. Russia, the unknown factor in these

calculations and estimates, is bound by none of the IMF doctrines on this issue. There have been recent indications of appreciable sales of Russian gold both in the Zurich and Amsterdam markets. Naturally, when Russia has to export gold to supplement its foreign currency resources, it does so by sales in the open market at a premium and not by sales at official prices to other central banks or Treasuries.

The result of this increased diversion of newly mined gold from the normal channels feeding the monetary reserves of the world to those that irrigate the far-flung free markets must be increasingly to nullify the IMF policy on gold operations and to make increasingly artificial the existing structure of official gold prices. It is interesting to speculate how long the present trend can continue without seriously undermining that structure. This diversion of gold will be inevitable so long as there is any appreciable margin between official and free market prices. The pull of the free market has become irresistible when the price has risen above the equivalent of \$40 per ounce.

The demand for gold in the free markets is very largely a hoarding demand. The greater part of the metal that is sold ostensibly for industrial purposes is in fact remelted into a shape in which it can be conveniently dealt in on the free markets and sold for hoarding purposes. This hoarding demand for gold does not, of course, arise merely, or even mainly, from the proportion of current savings that seeks a resting place in this particular barren medium. It arises also from the flight from currencies, from the movement of existing savings. As inflation gets under way in the United States and elsewhere, a substantial amount of "funk capital" will be tempted to make its way out of currencies into gold. If, however, an increasing amount of newly mined gold finds its way to the free markets, the potential hoarding demand for the metal may be severely tested. Since the 1949 currency devaluations, the free market price has fluctuated between the extremes of \$50 and \$37 per ounce. The main break, which occurred in the early part of 1950, followed the Communist occupation of Canton and the disturbance of the normal distributive mechanism operated through Hong Kong, Macao and Canton by which gold used to reach the interior of China. In the past few weeks this particular mechanism has been functioning smoothly again, and this may have contributed to the substantial recovery in the free price of gold that occurred early in the New Year.

At around \$40 per ounce there appears to be a virtually unlimited demand for gold. In the Indian market, which is insulated from normal arbitrage traffic by prohibitions on the import of the metal, the present price for gold is about \$63 an ounce calculated at the official rate of exchange and at about \$70 if the prevailing sterling-dollar cross rate is used. Although the Indian market is nominally insulated from the rest of the world by the import-licensing system, a considerable amount of gold finds its way to that country—smuggled by aircraft, sailing vessels and through other devious channels. The Bombay market is estimated to handle a daily turnover of about 5,000 ounces. Most of this is incoming gold, as very little metal has recently come out of hoards. Once underground, it tends to stay there. The appreciable influx of new gold makes the present high price quoted in the Indian market all the more significant.

The emergent problems are readily discernible, though not readily soluble. It appears probable that the amount of gold flowing into the free market will increase further. The IMF discipline on this issue is breaking down. The concessions given in some directions will have to be extended to others. Either the free market price will, as a result, tend to return towards the official price and thus dam the flow of newly mined gold to the free markets, or else the IMF structure of official gold prices will come to appear more and more artificial and will be brought increasingly into disrepute. These are problems that merit close attention from the authorities in Washington, London and elsewhere. It may be assumed that the United States, in its present mood of anti-inflationary endeavour, will not gladly assent to any

Business Notes

No More Targets for Coal?

The National Coal Board is not at present prepared to make its usual yearly estimate of total output for the year — because it cannot be sure how many miners it can command during 1951. Lord Hyndley this week was less cheered than Mr Noel-Baker had recently been by the “great recruiting drive” which has brought in 10,000 men since mid-November; he commented, warily, “We do not know how long this improved trend will continue . . . for thirty years the manpower of the industry has been falling by something like 20,000 a year, so we are not dealing with a new development.” As to exports, Lord Hyndley said that the Board was doing its best to honour its obligations of arrears on last year's contracts; but arrears of certain classes of coal might not be completely cleared before the third quarter of this year. At present exports and bunker supplies are barely 150,000 tons a week; but Lord Hyndley was not prepared to say that even this rate—which is less than 8,000,000 tons of coal a year—could be maintained throughout 1951.

Clearly, the Board is not to be inveigled into any optimistic target practice for the year, and it will be interesting to learn how the planners of the *Economic Survey* work out this reticence in tons. The Board appears a little disillusioned with short-term verbal planning, though it is carrying out the first parts of the capital development programme contemplated in its long-term production plan, including the sinking of a new pit in the West Midlands division. This is reasonable enough: though the Minister has not yet approved the plan, some irreducible minimum of development must be carried on whatever plan is adopted, even to

maintain output; the long periods involved in coal development are illustrated by the fact that the new mine will not begin to raise coal until 1957 and will not reach its full output of 1,500,000 tons a year until 1963. No estimate was forthcoming of the Board's financial results for 1950, though it

adjustment of the official price of gold to the level indicated by free market quotations. Yet, if a situation emerges in which no appreciable amount of gold is flowing into central banks and Treasuries but in which the metal is draining down the ratholes of the world's free markets, something will have to be done to withdraw from an obviously untenable position. Meanwhile, those countries that are consciously aiding and abetting this undermining of the present structure of official gold prices should realise that they are destroying the basis on which rests such stability of exchanges as the world now possesses. The immediate advantage they may obtain from this growing anarchy in the world gold situation may ultimately prove to have been very dearly won.

seems to have entered 1951 with part of its remaining deficit (a legacy of 1947 losses) still outstanding. The increase of 4s. 2d. a ton on coal prices, Lord Hyndley emphasised, would probably do no more than allow the Board to break even in 1951; if materials rose in price at their present rate, he could not promise that this would be the year's only increase in coal prices. Already its consequences have been felt this week, in promises of higher prices for electricity and for steel (which Mr Strauss just managed to announce before vesting day); they will continue to spread outward throughout the economy.

Counselling the Chancellor

This year's stream of advice and pleas to the Chancellor about the shape of his budget has already started to flow—and will evidently comprise the usual mixture of the sound and unsound, the possible and the impossible. The letter addressed to Mr Gaitskell this week by the Associated Chambers of Commerce contains much that is sensible. Its appraisal of the broad economic problems of rearmament does, indeed, parallel the version given recently by Mr Attlee and other governmental spokesmen—that the productive resources required for defence must be provided mainly at the expense of civil production for the home market, but not at the expense of investment outlays that promise any early increase in productivity. The Association emphasises—and here, of course, its emphasis differs from the Government's—that the first candidate for the necessary retrenchment should be the expenditure of central and local Government. It instances, among “real” outlays, work on new towns and surveys for national parks; considers that housing should have priority (in the interests of labour mobility) over schools and hospitals; and advocates both a relaxation of housing specifications and an increase in the proportion of houses built for sale (this last point being made mainly in the hope of thereby stimulating savings by house-purchasers).

As for the Government's financial outlays, the Association advocates a progressive reduction in transfer payments and “all forms of State benefits, except education, which are given without passing through the wage structure”; and that this should be done before considering any increase in the tax load. It believes, too, that a drive for voluntary savings should come before tax increases—a much more questionable proposition in practice, given the public's fear of rising prices and shortages (which the Association itself acknowledges)—and that such extra taxation as is necessary should be aimed mainly at the general body of consumer spending. Taxation of the higher income brackets or of company reserves, it is pointed out, would be paid mainly

or wholly out of savings—a consideration that leads the Association into an astonishing flight of optimism, a proposal that Profits Tax should be completely repealed. More realistic politically, though probably not administratively, is the suggestion that the reduced rate “steps” for income tax should be increased to eight, to promote incentive by a smoother progression.

Most of this is sound counsel in principle. More is the pity, therefore, that the Association's comments on the budgetary problem as a whole should have been founded on a particularly confusing fallacy—the supposition that the pressure on the nation's savings could be relieved by a change in the mere methods of financing, or even of book-keeping. The need for taxation, it is implied, would be reduced if local authorities borrowed from the market instead of from the Government. Alternatively, an “overall” balance on the budget should be computed after excluding “all loans which are repayable.” The simple fact, unfortunately, is that a house requires bricks and mortar and labour however it is financed.

A Railway Strike?

The report of the Court of Inquiry into the dispute between the Railway Executive and the three railway unions has been rejected outright by two of the unions: the National Union of Railwaymen and the Associated Society of Locomotive Engineers and Firemen. The possibility of a national railway strike cannot be ruled out, and strike action has already been proposed at some of the larger depots.

The issue is perfectly clear. The Court have fully supported the contention of the Railway Executive that higher wages can only be paid if the railways are worked more efficiently, and the award of an increase of about five per cent in wages has been specifically linked with the abolition or modification of certain practices that have added greatly to the working cost of the railways. For their part the men refuse categorically to accept any conditions attached to the award—as they refused them when the Executive's offer was made last November—and they further contend that the award itself is far from sufficient to bring their wages into line with wages in other major industries.

As far as the public interest is concerned, the Court have expressed the only rational opinion that may be held. The railways continue to lose money. At least part of the loss is caused by the waste of labour involved in restrictive practices. It is therefore entirely reasonable to ask that the cost of increasing wages should in part be met by putting an end to restrictive practices and eliminating wasted labour. The only alternatives are either to accept a larger deficit—in the three years ending in December, 1950, the accumulated deficit was already £50.6 million—or to increase freight and passenger rates with a consequent further general rise in prices. As it is, the Court estimate that their award will cost the railways a further £7,000,000 a year; in addition, there are separate claims of 149,000 railway shopmen and the increased cost of coal to be met. But costs apart, it is high time that the principle that higher wages should go hand-in-hand with improved efficiency should be established. The railway industry is not the only one that suffers from restrictive practices. In view of the unyielding attitude of the men, however, there seems little hope of a quick or even a peaceful settlement. There seem to be only two possibilities: either a strike or wholesale surrender on the part of the Government. Either event would have disastrous repercussions on the industrial life of the country.

Railway Revenues and Charges

The report includes estimates submitted by Mr Victor Radford, the Chief Financial Officer of the Railway Execu-

tive, showing the course of railway revenues last year. These are summarised below:—

Railway results £mn.			
	1948	1949	1950
Gross receipts	344.8	334.1	348.1
Working expenses	322.5	325.1	325.0
Net traffic receipts	22.3	9.0	24.1
Share of British Transport Commission central charges	35.0	35.0	36.0
Approximate deficit	12.7	26.0	11.9

An adjusted estimate on the basis of 1950 working, but taking a full year's yield at the increased freight rates that began to operate from May 15th, would show a rise of £10 million in net traffic receipts, but would still leave a deficit, after provision for the railways' share of central charges of £2,000,000. To this will have to be added in the current year £3,000,000 for higher coal prices, £7,000,000 for higher wages (if the award is accepted, which seems distinctly doubtful) and extra costs for steel, power, materials and stores. And in this year, of all years, a start is to be made on the introduction of charges schemes to put the Commission's revenue account in balance. It may be wondered if, in present-day conditions of rising costs and prices, formal charges schemes can be expected to produce the net revenue that the Commission so urgently wants.

Washington Prepares for Action

The new commodity organisation in Washington is beginning to take shape. The Chancellor of the Exchequer announced this week that invitations have been sent by the United States Government, acting on behalf of Britain and France, to a number of the major producing and consuming countries to form the first standing commodity committees. One committee will examine copper, zinc and lead; another molybdenum and tungsten; and a third manganese, nickel and cobalt. Separate committees are also proposed for cotton, wool and sulphur. Tin and rubber are for the time being outside the scope of the Washington organisation. There is no immediate problem in tin because exports to potential enemy countries are negligible, though if its price continues to rise as it has done in the past few days, the matter might be reconsidered. Rubber is at present being dealt with at a special conference sitting in London. The intention is that the first committee (for copper, zinc and lead) will meet at the end of this month and that all will be functioning by the beginning of April.

The task of the standing committees is to consider and to recommend to governments specific action necessary “to expand production, increase and conserve supplies and assure their most effective distribution and use among consuming countries.” Each committee will be autonomous

Commercial History and Review of 1950

This week's issue of the *Records and Statistics Supplement* to *The Economist* includes the first part of the Commercial History and Review of 1950—the 88th of the series which began in 1863.

Part I provides a general review of British economic developments last year, and special articles on finance, investment, overseas trade and agriculture. Part II, to be published on March 3rd, will contain articles on all important British industries, and Part III, consisting of overseas economic reports, will appear on April 7th.

The *Records and Statistics* supplement is obtainable by subscription only, at £2 10s. a year; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.

and will decide its own procedure. It will report direct to the governments concerned and not to the central group, though clearly the central secretariat will have to co-ordinate the work of the different committees. Countries that are not members of the standing committees will be allowed to put their points of view before them.

These arrangements are intended to enable swift action to be taken internationally. But it remains to be seen whether countries can settle their differences in a short space of time. The well intentioned principles of international commodity control embodied in the Havana charter of the International Trade Organisation are to be jettisoned. International study groups will become moribund and international commodity policy will tend to be decided in Washington. In present circumstances, that may be inevitable, but it is a step that may have important repercussions in the commodity markets in future years, if the world is not flung into total war.

It is a welcome fact that the first committee will be for non-ferrous metals. Last week the American Government informed copper and zinc producers that deliveries for the stockpile contracted for June 31st may be spread over the remainder of the year. This slackening in the tempo of stockpiling should enable Britain to buy some American zinc. The Ministry of Supply's hope that supplies would be made available by the United States seems to have succeeded. But it has also shown that the United States appreciates that the new committees will be effective only if member countries are prepared to make sacrifices.

Britain's Dwindling Stocks

Britain's raw material stocks are seriously depleted, and the Government is showing signs of anxiety. The volume of stocks fell by 15 per cent during 1950 although their total value increased by over 25 per cent owing to the sharp rise in prices. It will be a stupendous task to build up stocks during the current year—at a time when all countries will be trying to increase their reserves. The British Government has also decided to stockpile. The supplementary estimates submitted to Parliament this week showed that the Ministry of Food is to spend £3,000,000, the Board of Trade

* Tin metal

£3,300,000 (of which £1,300,000 had already been voted) and the Ministry of Supply £7,700,000—a total of £14 million (£12,700,000 extra) for purchases for strategic reserves. These additional expenditures will not, however, appreciably raise the year's estimates for total expenditure;

the supplementaries were in fact requests to Parliament to authorise the use of money, previously voted for other purposes, to be devoted to creating a strategic reserve. But it will mean that the demand for strategic materials will increase by about £10 million.

The accompanying table shows imports of certain raw materials during the past four years and in 1938 and the changes in stocks that took place last year. These latter figures are provisional and for certain items are partially estimated. There was no general decline in raw material imports last year; much smaller quantities of certain goods were received and larger quantities of others. But although the volume of raw material imports may not have declined, it clearly did not keep pace with the higher level of consumption, and stocks were reduced quite alarmingly. Of the non-ferrous metals, lead was the only case in which stocks were larger at the end of the year than at the beginning. Copper declined by 26,000 tons, zinc by 22,000 tons (though stocks of zinc concentrates were 30,000 tons larger) and tin by about 5,000 tons. Stocks of raw cotton were 25 million lb. lower and of raw wool 90 million lb. lower. Stocks of softwood fell by about 190,000 standards and those of hardwood stocks by some 3,000,000 cubic feet. Sulphur stocks declined by 20,000 tons. It is clear from these figures that the level of activity in many industries in 1951 will be governed by the volume of imports.

Cost of Government Trading

The Government trading departments are at last trying to conform to best commercial practice, and this year the first batch of accounts and balance-sheets* has been published less than eleven months after the close of the financial year, 1949-50. But the commentary by the Comptroller and Auditor-General makes sorry reading, even though it is treated with the diplomatic restraint that is customary in such documents. In a number of instances, quite large expenditures were incurred through the miscalculations of the Ministry of Food, while, as usual, the techniques of Government price-fixing have the effect of supporting inefficient producers; the cost-variations in many cases are very wide.

Storage of meat in refrigerated ships during the winter of 1949-50 cost £609,000, an outlay that arose because the Ministry's system of distribution proved too inflexible to cope with the large deliveries of home-killed and imported meat (partly caused by the heavy slaughtering in the hot summer of 1949). Again, £202,000 was paid to Dutch suppliers of strawberry pulp to cancel a contract because the Ministry's forecast of manufacturers' demand was badly awry. Or, again, the bill for subsidies is inflated by £1,000,000 a year for food purchased by ocean-going British and foreign ships because "owing to administrative difficulties no straightforward method of recovery had proved practicable." In margarine and cooking-fat, although the industry was working well below capacity, orders were spread over inefficient firms—some with costs three times the level of the most efficient. The price paid is based on the weighted average costs per ton of all firms in the industry; the resultant "excess" profit made by the efficient producers is therefore large. The Ministry spent £7,500,000 in 1949-50 on processing oilseeds and oils and another £9,000,000 on the manufacture of its own fats and oils into margarine and compound cooking fat. The total net cost of the Ministry of Food in 1949-50 was £394½ million, or £59 million less than in 1948-49. This decline was largely due to a reduction in customs and excise duties—£22 million on sugar and £11 million on tea—that was not passed on to the consumer. The Ministry made some £26 million profit on certain items

STABILITY IN CHANGING CONDITIONS

A customer of the Three Banks Group has the comforting knowledge that however rapidly trade conditions may change either at home or overseas, he has at his disposal the combined skill and wide experience of a Group in touch with financial and business interest in all parts of the world, and the benefits of a Banking Service that is adaptable, individual and complete in every detail.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches

GLYN, MILLS & CO.
Founded 1753 London

WILLIAMS DEACON'S BANK LTD.
Founded 1771 Manchester, London & Branches

ASK THE MAN WHO KNOWS

Business men and bankers who have visited
Australia or New Zealand will tell you that the best
medium for facilitating trade with those countries
is the Bank of New South Wales — largest
commercial bank there.
You are invited to use our specialist services
through your own bank.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA

LONDON OFFICES: 29 Threadneedle Street, E.C.2,
and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
Manchester Branch: 52 Mosley Street, Manchester 2.
Liverpool Branch: 27 Derby House, Liverpool 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE BRITISH LINEN BANK

INCORPORATED BY ROYAL CHARTER 1746.

LONDON OFFICES:

City Office:

38, THREADNEEDLE STREET, E.C.2.

West End Branch:

198, PICCADILLY, W.1.

OVERSEAS BUSINESS

Special Departments at the Bank's
London City Office, at the Principal
Glasgow Office, and at the Head
Office are fully equipped to handle
every description of Overseas Bank-
ing Business. Enquiries are invited.

Principal GLASGOW Office:

110, QUEEN STREET, C.1.

BRANCHES THROUGHOUT SCOTLAND.

HEAD OFFICE:

AFFILIATED TO BARCLAYS BANK LIMITED

—nearly £15 million on sugar, £5,000,000 on coffee and cocoa and £3,000,000 on fresh fruit and vegetables.

The Ministry of Supply figures less prominently, and more happily, in the C. & A.-G.'s report. The only questionable matter was the difference between the levies received by the Iron and Steel Federation from steel produced in Government "agency" factories and its contribution (£250,000) towards the loss of £882,000 incurred. On non-ferrous metals, surprisingly, the Ministry made a loss of £1,209,000, despite devaluation. Copper showed a profit of £1,761,000, and tin, £1,381,000; the loss on zinc amounted to £1,209,000 and on lead to £1,982,000. Aluminium yielded a surplus of £2,612,000 and chrome ore and magnesite £103,000. Imported finished steel involved the Ministry in a loss of £6,282,000—deliberately incurred as a matter of price-fixing policy. The Board of Trade showed profits on timber (£8,876,000), jute (£2,029,000) and leather (£1,086,000) and losses on paper (£2,010,000), molasses and industrial alcohol (£964,000) and flax (£571,000). The accounts of the Fertilisers Directorate are now available for 1948-49, but the board's examiners "are unable to satisfy themselves as to their accuracy."

Sulphuric Acid from Anhydrite

Talks have been going on for some weeks about a new project to produce sulphuric acid without reliance upon natural sulphur. Imperial Chemical Industries has a plant at Billingham, the biggest of its kind in the world, which derives sulphuric acid from anhydrite by a process yielding about one ton of acid and another ton of cement clinker for every 1½ tons of anhydrite. The present capacity of the plant is about 250,000 tons of sulphuric acid a year. The anhydrite comes from beds under the gypsum deposits worked at Billingham; there is no shortage of anhydrite resources in this country and there are several large deposits in the country, apart from those at Billingham, that could be worked. The capital cost of a plant to make sulphuric acid from pyrites, the other alternative to sulphur, is much lower than the cost of an anhydrite plant; a number of acid plants have always used pyrites and more are being converted to using pyrites.

Recent talks have surveyed the possibility of building anhydrite plants on the basis that the acid users would provide the finance and ICI the technical assistance. A capacity of about 150,000 tons of acid has been suggested for the first plant, which would cost about £3,500,000 to build. It would make a useful contribution to the country's sulphuric acid supplies, which are expected to fall from 1,800,000 tons a year to less than 1,500,000 tons as a consequence of the fall in imports of elemental sulphur from America.

The economics of the anhydrite process depend very much on the price obtained for the cement clinker. Since the acid produced from anhydrite is more costly than that produced from sulphur or pyrites, the possibility of recouping the difference in costs by the sale of clinker is of great importance. ICI grinds the cement clinker produced in its plant and markets its own cement, but it is less likely that the association of acid users who would own the new plant would want to do this. On the other hand there would be a limit to the price at which the cement industry might be prepared to take the odd 150,000 tons of clinker off their hands, even though the tonnage would form a very small fraction of the 10 million tons of cement produced in this country annually. If more than one anhydrite plant were built, this question of cement clinker prices could become distinctly important. Since the acid users will presumably seek to avoid the complications of embarking on the manufacture and marketing of a comparatively small tonnage of cement, a compromise with the cement industry ought not to be impossible.

Britain's Surplus with Europe

The January operations of the European Payments Union reveal that Britain was once again the major creditor. In that period the sterling surplus for Britain amounted to £17,595,714. Of this, £6,000,000 was covered by the use of existing resources, i.e., sterling balances held by other member countries at June 30, 1950. Of the balance one half, or £5,797,857, was taken in gold and the other half added to the United Kingdom's balance with EPU. At the end of January Britain was in surplus with EPU to the amount of £94,180,714. The gold receipt in January has brought the total gold influx to Britain from EPU to £18,466,071. Complete details of the January operation of EPU had not reached London at the time of writing, but preliminary indications from Paris suggest that France was the second largest creditor, coming after Britain, while on the debtor side Western Germany again dominates the scene.

World Bank's Dollars

The International Bank for Reconstruction and Development has now committed all but \$10 million of its available dollar resources. It has in hand some \$420 million of undisbursed cash, but virtually the whole of this is earmarked for loans already made. It is the rule of the Bank to make no loans unless uncommitted funds are available for them. It follows, therefore, that the Bank can make no further substantial dollar loans unless it can previously reinforce its dollar resources by an issue of bonds in the American market or by sales of its debtors' obligations—with or without its own guarantee—to institutional investors in the United States. Some such mobilisation of resources is likely in the near future, as the Bank is studying a number of projects calling for dollar loans. An important potential source of activity for the Bank lies within the whole range of capital development schemes envisaged under the Colombo Plan. The International Bank has an observer at the meeting now taking place in Colombo; this is discussed in a note on page 362.

The President of the Bank, Mr Eugene Black, has this week passed through London and seized the opportunity for talks with the Chancellor of the Exchequer. Among the perennial topics that may have been discussed by them was the possible lending by the Bank of the sterling represented by the 18 per cent of United Kingdom's capital quota paid up in sterling and temporarily left deposited in this country in the form of non-interest-bearing securities payable on demand. It is not only sterling that the International Bank would like to see added to the currencies made available by it. Plans are also afoot for selling its bonds in the Swiss and Canadian markets, to reinforce the Bank's holdings of these two currencies.

Agreements on Dollar Oil

New agreements announced this week between the British Government and two American oil companies, the Standard Oil of New Jersey and Socony-Vacuum, have given a degree of freedom to the international oil trade. In the words of Mr Howard Page of Jersey Standard, "sterling became convertible tomorrow, it would not necessarily make any difference in our operations." The two American companies have agreed to reduce the dollar content of their oil to the average gross dollar content of oil produced by companies. In return the Government has ended its "substitution" policy by which American companies were required to buy oil from British companies for

operations in the sterling area, and no restrictions are to be placed upon the trade of American oil companies in the sterling area that are not also applied to British undertakings.

The estimated gross dollar content of British oil is put at 30 per cent (though this can be only a rather rough and ready calculation of what is, in the operations of the British controlled companies, a shadowy—not to say metaphysical—concept.) The American firms have agreed to reduce their own dollar costs to that proportion by 1954. When the oil negotiations began in 1949, the average dollar content of American companies' oil was put at 75 to 80 per cent, but by now this is already down to some 40 per cent for Jersey Standard at least. The sterling area's net dollar outgoings on oil in 1950, which were originally forecast at \$625 million (\$350 million for American oil and \$275 million for British-controlled oil), appear in fact to have been less than \$500 million. The substitution policy and the agreements that partially replaced it saved \$45 million upon oil supplied in the sterling area by American companies; and substantial savings also resulted from the attempts of British oil concerns to economise in dollar expenditure and to increase their dollar earnings.

The new agreements follow and complement those made last year with the same two companies (concerning their share of Iraq oil), with Standard Vacuum, and with Caltex. They finally dispose of the unpopular and unworkable substitution policy, which as first planned meant a virtual ban on imports of American fuel oil and a 30 per cent cut in imports of dollar petrol, but had during the past year been gradually whittled down in importance. Nobody will regret the passing of this policy, which forced American oil companies to buy "sterling oil" if they wanted to keep a market in the sterling area; the British companies prefer a steady expansion of business upon commercial lines (such as the long-term contracts for supplying Middle East oil from British-controlled sources to the Fawley refinery now being completed by the Anglo-American company), to Government discrimination against their competitors. Practical steps by the American companies to bring down the "dollar content" of their oil include large purchases of oil for sterling, the building of tankers in Britain and the operation of others under the British flag, the acceleration of refinery building (the "second stage" at Fawley will follow directly upon the first from the end of this year), and enlarged purchase of materials and equipment for sterling. So-called "dollar savings" upon the oil supplied to the sterling area by American companies will progressively increase; by 1954 this saving, on the 1949 volume of purchases, would reach about \$250 million a year. In fact, however, these American companies are likely to share in the expanding consumption of oil in the sterling area; this, by 1954, may be a third higher than in 1949.

Shortage of Textile Fibres

The shortage of textile fibres is likely to become more serious later this year. Cotton, wool and rayon are equally affected, and though British manufacturers may be adept in the use of substitute materials, the substitutes themselves will be scarce. The President of the Board of Trade has set up a textile fibres advisory committee under the chairmanship of Mr Hervey Rhodes, the Parliamentary Secretary to the Board, to consider the competing demands from the textile industries for raw materials; the committee includes three members from the cotton industry, three from wool, three from rayon and two trade union representatives.

The shortages of wool, cotton and rayon are worldwide. Until 1949-50 the world output of all three showed a big expansion; indeed, as the recent survey of industrial fibres* prepared by the Commonwealth Economic Committee shows, the production of each was then larger than in 1938-39. But consumption was also well above the prewar level—for cotton and wool it was so high that it could be met only at the expense of stocks. In the latest season, world production

WORLD PRODUCTION OF FIBRES
(Million lb.)

	1938	1946	1947	1948	1949*	1950*
Cotton	13,711	10,229	12,184	13,651	14,462	12,582

* Preliminary. † Excluding production in India.
Note: Production of cotton and wool is for seasons commencing in years shown.
Source: "Industrial Fibres" (C.E.C.).

of cotton fell by 13 per cent because the American acreage was reduced, and although output may expand sharply in 1951-52, additional supplies will not be available to industry until 1952. Wool is likely to be short for a much longer period. Output this season is barely 1½ per cent up, and the wartime stocks of the Joint Organisation are exhausted; available supplies will be 10 per cent below last year's level of consumption of 2,650 million lb. (clean). It may take five years for world production to match last year's demand.

Rayon production, both as continuous filament and staple fibre, has expanded steadily each year since the war. Figures for 1950 are likely to be larger than for 1949. The limit to further expansion is set by shortage of sulphuric acid and of woodpulp and cotton linters. New rayon plants are being built or extended in various countries, but they will add, not to supplies, but to competition for basic raw materials. World production of rayon this year is not expected to rise much above last year's level. Production

Consequences for British Textiles

British textile outputs are bound to be affected by these shortages. Imports of American cotton this season will be very much smaller. Only 250,000 bales have been allocated to this country compared with an annual consumption of American-grown cotton of about 625,000 bales. There is no chance of making up this deficiency by increased imports of American-type cotton from other sources; to get another 350,000 bales would mean, say, more than doubling last year's imports from Brazil or increasing by 65 per cent the combined imports from Brazil and West Africa. Last year the cotton industry increased its consumption of rayon quite sharply. Some 20 per cent more yarn was used than in 1949 and over 33 per cent more staple fibre. Yet rayon used by the cotton industry represented only a fifth of the quantity of raw cotton consumed; the cut in American cotton is equivalent to over 15 per cent of Lancashire's home consumption of cotton last year, and the use of rayon would have to be nearly doubled to make good this quantity.

In the wool industry, too, the consumption of materials other than raw wool increased markedly in 1950. An article in the February issue of the Commonwealth Economic Committee's *Wool Intelligence* showed that whereas the consumption of raw wool by British woollen spinners fell by 1½ per cent in 1950, the consumption of other materials (chiefly shoddy, noils, cotton and rayon) increased by over 9 per cent; these other materials represent nearly 45 per cent of total consumption. In the worsted section the scope for substitution is more limited, but 27 per cent more hair and rayon tops were used in 1950 compared with 1949 whereas the consumption of wool tops increased by only 8 per cent. But taking the industry as a whole, the consumption of raw wool increased by 5 per cent—from 502 to 528 million lb.—and of other materials by 16 per cent, from 153 to 178 million lb. Of this latter quantity 133 million lb. consisted of by-products of the industry such as broken tops, noils, wastes, shoddy and mungo. Only 24 million lb. consisted of other fibres (cotton, rayon, ardil, etc.), though even that quantity was 50 per cent larger than in 1949. Retained imports of raw wool in Britain last year fell by 14 per cent and they were particularly small in the last quarter of the year. Stocks of raw wool at the end of the year were below 200 million lb.; Yorkshire must be working on a very narrow margin.

Output in both Lancashire and Yorkshire this year will thus depend on supplies of rayon and other artificial fibres. But the rayon industry has had to cut its production by nearly 15 per cent owing to the shortage of sulphuric acid and larger supplies of sulphur will be needed during the ensuing months if a further cut is to be averted. Rayon is used not only as an alternative material to natural fibres but also to cheapen the cost of the end-product. The price of raw wool is now twelve times its prewar level, cotton nearly eight times but rayon less than double. The prospect then is for a smaller output of textiles at a higher cost.

British Tankers' Big Programme

The largest single order for merchant ships ever placed with shipyards in this, or in any, country has recently been placed by the British Tanker Co., Ltd., shipping subsidiary of the Anglo-Iranian Oil Company. This order is for twenty-one tankers costing some £21 million to build; the new vessels will add some 426,000 tons deadweight to a

tanker fleet that already totals 159 vessels with a carrying capacity of about 2,000,000 tons. The orders have been distributed among the shipbuilding areas, and delivery is expected during 1953. The first keel will be laid in August; this will be for one of six 32,000-ton tankers included in the contract. These are the biggest tankers ever ordered by British owners, exceeding the previous giants by 4,000 tons. They will be driven by geared steam turbines, giving a loaded speed of 14½ knots in service. The other tankers will be motorships—12 of 16,000 tons with a speed of 13½ knots and three of 14,000 tons and 12 knots.

The British Tanker Company is at present taking delivery of its last big contract, which was for 29 ships totalling about 344,000 tons d.w.; since the end of the war, including the present contract, the company has ordered 95 tankers at a cost of about £64 million. Such ordering of "tankers in bulk" requires a considerably longer view of possible trends than when orders are placed individually, and shows confidence in the need for a much larger tanker fleet than exists at the moment, despite the already high proportion of tankers under construction. The size and speed specified also seem significant. This large order will ensure that the predominance of tanker construction in British shipyards will be continued for some time. The normal life of a tanker is only about twenty years, and nearly 700,000 tons gross (over 1,000,000 tons d.w.) of United Kingdom tankers are now of that age or exceed it. Tankers provide a certain amount of work for the finishing trades, but not as much as the two passenger liners of 28,000 tons gross each ordered by the P. & O. Line recently. Many shipyards not suitable for the building either of large tankers or passenger liners are at present able to accept orders for dry-cargo tonnage.

Revival in Furniture

The sale of furniture is seasonal and at the furniture exhibition now being held in London retailers are placing orders for goods to be sold next winter. Furniture manufacturers were encouraged by the rate at which they took orders on the first day to believe that the slump in their industry was over. At the end of 1949, rising stocks warned retailers that demand would soon settle to a normal peacetime level. It was then brought home to the manufacturers that most of them had exaggerated the size of this normal market and that they faced a serious problem of excess capacity. The Board of Trade index of production of utility furniture (1946=100) shows that the makers had to cut production from the high level of 184, reached in the last quarter of 1949, to 146 in the third quarter of 1950.

The respite may be temporary; utility upholstery prices go up by between 11 and 25 per cent next Monday, and rising raw material prices suggest that a general price increase is inevitable, for controlled prices have not changed for more

than a year. By placing large orders now, retailers may be anticipating these increases; if so, the industry might face another—and perhaps more serious—sales recession when the present volume of orders has been met.

The exhibition itself has some curious features. The exhibits suggest that fashion has little place in the market for medium and low-priced furniture and the peculiar means by which the utility scheme is worked almost entirely prevents the manufacturer from making innovations on his own initiative. Barely five per cent of the industry's output is non-utility and since, to qualify as utility, furniture has to satisfy structural specifications as well as a ceiling price, an article which is new in conception of purpose or in design rarely fits into them. The Board of Trade does modify the utility regulations from time to time but the proceedings are discouragingly slow and as often as not unsuccessful.

These factors add to the loss of flexibility introduced by mass production techniques and further stereotype the shapes and finishes for a particular article. Performance does not suffer, for the furniture shown is generally better constructed than before the war. But the industry sadly lacks the influence of the new ideas that used to be developed in high-priced furniture and found their way gradually into the cheaper grades. The incidence of purchase tax (which must give a negligible revenue because so little taxable furniture is made) has virtually killed the sale of best quality furniture in this country, with the result that the industry is sadly in want of experiment and aesthetic development. Some manufacturers of medium-priced furniture have tried to break away from traditional designs and finishes, but with no great success.

Prices and Cost of Living

The interim index of retail prices has had its full share of criticism. The index is suspect because it conforms

neither to the trend in prices experienced by the present-day consumer nor to the trends of wholesale or import prices. This lack of sympathy between the retail price index and the other indices is not due to any technical fault in the index of retail prices itself. It is a direct consequence of government policy. Food subsidies are paid on those foods that figure largely in the index, and there have been many years' experience of "adjusting" the subsidy paid on each food to minimise the impact of higher prices on the retail

price index. It has never purported to reflect the true increase in the cost of living. The question of carrying out a postwar survey of household budgets to replace the 1937-38 information now used in the index is being considered by the Cost of Living Advisory Committee.

The wholesale price index is also modified by the effect of the subsidies. The latter represent the difference between the Ministry of Food's purchase costs and its selling prices to the wholesale trade. Thus the wholesale prices of rationed

foods are their prices as reduced by the subsidies. For that reason, when the Ministry reduced its surcharge to butchers last month, in order to keep them in business on the smaller quantity of meat sold, the wholesale price of meat, as reflected in the Board of Trade's index, fell by 6 per cent. Such a procedure may well seem peculiar, even if it is statistically correct. The import price index reflects the impact of rising world prices on British imports; the graph shows that import prices conform closely with wholesale prices, especially since devaluation.

Piecework Dispute Continues

In spite of what the employers' associations and trade unions in engineering ten days ago considered an agreement, the dispute over piecework and overtime in certain Midlands industrial centres has only subsided. The joint statement, which was vague and ambiguous, merely conceded that further negotiations concerning piecework rates could be resumed at the local level, if the operatives returned to "normal working." Even before it, some firms had made individual factory-by-factory agreements with their pieceworkers, but had incurred the disapproval of employers in general. Since then, however, local negotiations have not in all cases persuaded the operatives to abandon their reversion to time rates and ban on overtime, and on the other side certain Leeds engineering firms are reported to have followed the example of Craven Brothers of Stockport in giving some of their workers notice on the ground that their factories could not be operated efficiently in such conditions.

The dispute arose out of the application of the engineering wages agreement of last November. This had granted an increase for lower-paid workers in the industry—of 11s. a week for certain skilled and 8s. a week for unskilled

day workers with corresponding piecework adjustments which would bring the 27½ per cent above basic rate that "average" pieceworkers were expected to be able to earn up to 45 per cent. It gave nothing to the men on piecework who were already earning 45 per cent or more. On behalf of these higher-paid men, a claim was made for a flat 17½ per cent increase in all piecework rates to bring them into line and maintain the differential; most employers refused this, whereupon the workers imposed a ban on overtime and changed over in large numbers from piecework to day work. This change in working practice dislocated the efficient operation of many factories; the consequent closing of plants by Craven Brothers and by other firms is regarded by the trade unions as "a lockout." While certain employers, since the national "agreement," have reached satisfactory terms with their employers, the workers' restrictions upon output are being continued, and spreading, where individual firms are not willing to concede piecework increases.

There is no disputing the right of an employer to close down his works or part of it if he chooses to; on the other hand, the unions have blandly told the employers that they cannot regard overtime as implied in "normal working," and that operatives cannot be forced to accept one form of payment as against another. The present confusion stems from an agreement on lines which, reflecting the muddled "minimum wage" philosophy popular some months ago, benefits less efficient workers without a corresponding advance for higher-paid men, and thus militates against what employers and operatives would both consider work of higher productivity. The deliberately vague terms of last week's statement have hardly assisted local negotiation; it may be that what will eventually be needed is a revision of last November's national agreement.

Sisal Shortage

Sisal, like wool, has enjoyed a boom since the end of the war. Its price has risen steadily from £45 a ton in January, 1946, to £210 a ton in January, 1951, interrupted only by a temporary break in July and August, 1949. World production of hard hems (sisal and manila) in each of the postwar years was quite appreciably smaller than before the war, but output of sisal in Tanganyika, particularly in the past three years, has been very much larger. The shortage of jute and manila hemp has extended the uses of sisal, though it is still mainly used in binder twine. East Africa is the only important region in the sterling area where sisal is produced; of the total output of 160,000 tons in 1949, 123,000 tons came from Tanganyika and the remainder from Kenya.

There is no substitute for sisal at present, and output is not expanding very rapidly. Mr E. F. Hitchcock, chairman of Sisal Estates, Limited, has shown in his latest statement to shareholders that new projects for the long-term expansion of sisal output are extremely hazardous, because of the high capital that must be committed for a period of anything from two to seven years while the plantations establish themselves. Mr Hitchcock added that "the rapid rise in price since 1949 has had little direct relation to the intrinsic position of supply and demand" for sisal. It has been influenced partly by the bareness of stocks, but still more by general world conditions of credit expansion; in due course, the inflationary demand may subside.

Mr Hitchcock warned his shareholders that there is more hard fibre in the ground than will be required to meet effective demand in a few years' time, though rearmament and the need to build up stocks would help to cushion the effect of any surplus. But this is a distant prospect; at present sisal is short, output is unlikely to expand to meet the present level of demand until 1952, and rearmament may postpone that date. Only thereafter may world production increase gradually at a greater rate than consumption.

NEW DEFENCE BONDS

Higher Rate of Interest

- Interest increased from 2½% to 3%.
- Interest paid to you half-yearly—Income Tax is not deducted at source.
- Repayable at par on the interest date next following ten years after purchase or at 6 months' notice.
- Maximum amount which can be invested £2,500 including previous issues.
- Buy them through Bankers, most Post Offices or through your Stockbrokers.

Company Notes

Tate and Lyle.—Under the threat of nationalisation Tate and Lyle last year divested itself of its holdings in subsidiary companies. Trading profits rose by some £357,000 to £3,387,780, but much of the benefit that equity shareholders might have expected from this successful result has been absorbed in the company's fight, which the shareholders warmly supported, against nationalisation. To combat this threat, £198,660, compared with £42,183 in 1949, was spent on advertising, including the anti-nationalisation campaign, while other reconstruction and reorganisation expenses accounted for some £148,000, against £13,000. But the ordinary shareholders have not been forgotten for the dividend has been raised from 18 per cent to 20 per cent, a rate which seems well justified by the rise in distributable earnings, after allowing for exceptional credits and the incidence of taxation on the years' profits, from 24 per cent to 28 per cent.

The balance sheet reflects the considerable accounting changes arising from the reorganisation of the company's share capital and the hiving-off of subsidiary companies. Investments in subsidiaries now amount to only £3,300, against £1,781,000. The book value of fixed assets after depreciation has increased by some £570,000 to £8,429,000. The value of total current assets has remained

* On ordinary capital £5,250,000.			

practically unchanged at approximately £9,330,000, but the rise in current liabilities from £5,363,000 to £6,321,000 has led to a marked reduction in working capital of nearly £960,000. Bank and other short-term loans stand at £1,952,000 and cash holdings have fallen from £516,219 to £36,451. As outstanding contracts for capital expenditure are estimated at £446,000, a considerable strain has been imposed on liquid resources.

Once, however, the threat of nationalisation is finally lifted, this strain should prove to be of temporary duration and shareholders should have few qualms about the future. The company is not one to limit the return on venture capital and the capitalisation of reserves to restore the value of the ordinary stock units to £1 may not be too remote a possibility.

Imperial Tobacco.—The fall in Imperial Tobacco's net profits in the year ended October 31, 1950, from £9,085,433 to £8,252,032 proved something of a disappointment to the market and the price of the £1 ordinary share was marked down by ½ to 5½. Apart from the setback in trading profits, the preliminary statement records a windfall inventory profit of £6,209,000, of which £3,135,545 had to be paid in tax. This special profit, which has been rightly separated from the year's trading results, arose from devaluation; all tobacco cleared from bond into sterling at post-devaluation rates of £1 to stock at pre-devaluation rates of £1.15, after tax, of £3,073,455, represented appropriated to a leaf replacement reserve; £1,500,000 was so reserved in 1949 from net

trading profits. The ordinary dividend has been maintained for the third year at 32 per cent; if specific reserve allocations are excluded from calculation, it would appear that the ordinary earnings of the parent company have been distributed almost up to the hilt, but no account has been taken in the table of any profits retained by subsidiary companies.

Imperial Tobacco, in common with other tobacco manufacturers, has to face the risk of an increase in the tobacco duty and to swallow a further dose of rising prices both of leaf and other materials. This will not make the heavy financial burden of carrying stocks any easier, but the still impressive financial strength of the company, and its wealth of business experience, are a source of consolation at a time when the cover for the ordinary dividend is too narrow for comfort. Rising costs may squeeze existing profit margins, and the growing habit of non-smoking—or more careful smoking—is likely to affect the total volume of sales. And there is the Budget in April. Is Imperial Tobacco now past its best years as a tax collector for the Exchequer and as an expanding equity?

Cable and Wireless (Holding).—The £100 ordinary stock units of Cable and Wireless (Holding) were changing hands at 99, in anticipation of a dividend of 5 per cent; the gratification of the market when a dividend of 6 per cent (against 4 per cent) was announced was measured by the jump in the stock of £10 to £10.9. The dividend is paid on £5,000,000 ordinary capital while the previous year's dividend was paid on £6,883,103 capital; the capital reconstruction scheme was completed in the early summer of 1950 by the repayment and conversion of £16,766,591 5½ per cent preference stock. Last spring, Sir Edward Wilshaw estimated the future rate of earnings at not more than 8½ per cent, before tax, in the early future and not less than 6 per cent later on when the 3½ per cent unsecured loan stock had been paid off. Sir Edward added that for an investment trust he did not see the need to plough back profits into the business to the extent that would be desirable for a trading company, and therefore it would be reasonable to distribute as much as possible of the annual earnings to stockholders. Until the full accounts are available it is not possible to calculate earnings, but if the company is to pay a dividend of 6 per cent at this stage, the directors are presumably confident that they will be able at least to maintain this rate in future years. But it might be well to await the full accounts and chairman's speech before this presumption is taken as a reasonable certainty.

Roan Antelope and Mufulira.—A series of errors crept into last week's note on Roan Antelope and Mufulira and must be put right. The estimated operating surplus for Roan Antelope for the six months to December 31, 1949, was £1,181,000 and not £1,811,000 as printed. Secondly, the estimated operating surplus of Mufulira for the six months to December 31, 1950, was £4,188,000 and not £4,118,000. Thirdly, Roan Antelope's production of blister copper in the second half of 1950 was 18,553 tons and not 18,533 tons.

EXCHEQUER RETURNS

For the week ended February 10, 1951, total ordinary revenue was £142,392,000, against ordinary expenditure of £59,651,000 and issues to sinking funds £690,000. Thus, including sinking fund allocations of £14,933,000 the surplus accrued since April 1st is £628,871,000 compared with £601,573,000 for the corresponding period a year ago.

COMPANY MEETINGS

CLYDESDALE AND NORTH OF SCOTLAND BANK LIMITED

AMALGAMATION WELL JUSTIFIED

MARKED CHANGE IN HOME TRADING CONDITIONS

SIR HAROLD E. YARROW'S ADDRESS

The one hundred and thirteenth general meeting of shareholders of Clydesdale and North of Scotland Bank Limited was held in the Head Office, St. Vincent Place, Glasgow, on February 14th, Sir Harold E. Yarrow, Bt., C.B.E., the chairman presiding.

The chairman in the course of his speech said:—

At this time last year, I gave an outline of the history of the Clydesdale Bank and of the North of Scotland Bank, and I expressed the view that the amalgamation of the two banks, which became effective on January 1, 1950, would result in improved service to the public. I am glad to report that the experience of the past year has justified my confidence.

You will see from the profit and loss account that our profit at £403,317 shows a reduction, as compared with the previous year, of £19,500, which can be attributed mainly to expenses arising from the amalgamation.

CHANGED PATTERN OF TRADING CONDITIONS

It was apparent by the early months of 1950 that a marked change had taken place in trading conditions at home. The new plant which had been installed under industry's postwar capital investment programme had resulted in greater production; the flow of raw materials and components was much smoother; quotation of fixed prices was returning; the knowledge that supplies of finished products were more plentiful caused the placing of orders to ease, and demand became more restricted as buyers exercised the greater choice available. Suddenly, the whole pattern changed as a result of the outbreak of war in the Far East and the announcement of the rearmament programme. Trading conditions of the earlier postwar years were soon evident. The fortunes of Scottish shipbuilders were in strong contrast with those of a year earlier, when the dearth of new orders for ships was causing anxiety. Not only did the volume of new contracts increase substantially, but a slightly better balance was restored in the industry as a result of the improved demand for dry-cargo vessels and the wider distribution of new orders throughout the yards. As a result of the recent spurt in ordering, the short-term prospects for the industry are much brighter.

FEATURES OF SCOTTISH INDUSTRY

An outstanding feature in Scottish industry during 1950 was the record level of output achieved by steelmakers. This industry has earned a high reputation for efficient management, and has been singularly free from labour troubles. Surely it is unwise, especially at such a critical time, to incur the risk of disrupting production by proceeding with nationalisation.

Heavy engineering firms were actively engaged and held substantial order books, but the outlook in the lighter section has become less clear as a result of the prohibition of the use of certain non-ferrous metals. Disappointment and anxiety continue to be expressed at the low level of coal production and the continued failure to achieve the target of 25 million tons, at a time when industry is so heavily engaged in maintaining exports and meeting the initial requirements of the expanded defence programme.

Our bank has a particular interest in the fortunes of agriculture and fishing, and in providing facilities for them we are contributing to the welfare of two vital industries which are essential to a healthy national economy, particularly in view of the contribution made by them in import saving.

THE WORLD SITUATION

The uncertain international situation has resulted in an intense world-wide demand for raw materials, and this development, together with the effects of devaluation, has led to a steep rise in prices of many raw materials which we have to import and to a deterioration in the terms of our international trade. By contrast, the inflated prices paid for sterling area raw materials have contributed to the improvement in gold and dollar reserves, but it would be unwise for us to ignore the implications of the contra entry of mounting sterling balances. Moreover, while acknowledging the determined and successful efforts of industrialists to increase direct dollar-earning exports, it is well to remember the contribution made to our improved gold and dollar reserves by the cut of 25 per cent. in the dollar imports of sterling area countries agreed in July, 1949. It is still too early to assess the effect of the suspension of Marshall Aid on January 1, 1951, but any curtailment of dollar-earning exports as a result of our rearmament programme will present new difficulties in the balance of payments problem.

Many difficulties will have to be surmounted as the defence programme is stepped up. If, as is now indicated from official quarters, exports in certain industries are to be restricted to meet the more pressing needs of rearmament, then a greater quantity of consumer goods will have to be sent overseas to make up the balance, with consequent scarcity at home. We also have with us the fear of continued inflationary pressure, the control of which is primarily the responsibility of the Government. Heavy taxation already plays its part in curtailing private spending, and the success of further anti-inflationary measures must come mainly from a substantial reduction in the level of public expenditure. Last month, when discussing the economic developments of 1950, the Chancellor of the Exchequer indicated that, despite the progress achieved, the prospect for our standard of living was gloomy. If our standard is to be maintained, increased productivity is essential at all levels. Despite the need for greater output, it is not generally realised that, with a five-day week in operation in a number of our industries and allowing for holidays, many factories are at a standstill for about 120 days in the year. Shortage of operatives is another limiting factor, and if increased production is not to come from more man-hours, greater mechanisation in industry to raise output from available manpower becomes a matter of first class importance. This calls for additional capital expenditure, which in turn demands that Government policy in regard to taxation should be designed to enable the ploughing back of a greater proportion of industrial profits, so that adequate funds may be available for the modernisation of equipment.

The report was adopted.

MARTINS BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and twentieth annual general meeting of Martins Bank Limited was held, on February 13th, at the head office, Liverpool. Mr A. Harold Bibby, D.S.O., D.L., chairman, presided.

The notice convening the meeting and the auditors' report were read.

Mr Bibby said that since the report and accounts for 1950 were issued the proposed absorption of British Mutual Bank Limited had become an accomplished fact and was advantageous to all concerned.

The report and accounts for 1950 were adopted and resolutions were passed re-electing the retiring directors and fixing the auditors' remuneration.

A vote of thanks to Mr Bibby for presiding was unanimously accorded.

The chief general manager, Mr C. J. Verity, expressed thanks for the tribute to the general management and staff.

PATERSON, LAING AND BRUCE, LIMITED

CONSIDERABLY INCREASED SALES

The forty-ninth annual general meeting of Paterson, Laing and Bruce, Limited, was held on February 13th, in London.

Mr A. K. Graham (vice-chairman), in the course of his speech, said: The profit for the year, before provision for taxation, amounted to £188,838 as compared with £179,998 in the previous year, an increase of £8,840. This relatively small increase in net profit has been earned as a result of considerably increased sales during the year which have, however, been offset to a large extent by an increase in overhead expenses. Provision for Australian and United Kingdom taxation on the profits of the year absorbs the sum of £103,120, leaving a net profit for the year, after providing for taxation, of £85,718.

We are confident that the management which has built up your company's trade in such a remarkable way, will benefit to the full by the prosperity which is prevailing all over Australia, thanks to the high prices that her primary products, especially wool, are fetching in the world's markets.

The results for the year must depend on the demand at the enhanced prices, but, providing there are no setbacks on this score and that goods are available, I think we can look forward with calm confidence. Our chief anxieties will be financing stocks at the present high level of prices, the uncertainty of trade at these levels, and the cash required.

The report and accounts were adopted. At a subsequent meeting of deferred shareholders and at an extraordinary general meeting the Board's proposal to capitalise and appropriate £106,250 of the general reserve by increasing the existing 1s. deferred shares to 6s. 8d. shares was approved.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

SISAL ESTATES LIMITED

HIGHER NET PROFIT

BURDEN OF INCREASING STATUTORY OBLIGATIONS

CUSHION AGAINST PRICE FALL—MOST IMPORTANT ISSUE

CONFIDENCE IN IMMEDIATE FUTURE

TRANSFER OF CONTROL AND TAXATION

MR E. F. HITCHCOCK'S REVIEW

The fourteenth annual general meeting of Sisal Estates, Limited, will be held on March 7th in Tanga, Tanganyika, East Africa.

The following is the statement by Mr E. F. Hitchcock, C.B.E., which has been circulated with the report and accounts for the year ended June 30, 1950:—

This is the fourteenth annual general meeting of the shareholders of this company, and the first to be held in Tanga, Tanganyika, East Africa, following the resolutions for transfer of the control of the company passed at the extraordinary general meeting held in London on January 31, 1951. This is also the first time on which I have exercised the office of chairman following my appointment by the reconstituted board of directors in East Africa. I would refer to the distinguished and able services as chairman of this company over the last 14 years of Colonel C. E. Ponsonby, T.D., D.L. His experience, you will be glad to know, will not be lost to the company, of which he remains a director.

ACCOUNTS

The audited consolidated accounts for the year ended June 30, 1950, have been circulated, and show in some detail the accounting particulars concerning your company and its wholly owned subsidiary, Bird and Company (Africa), Limited. The final net profit for the year was £301,318 compared with £232,095 for the year to June, 1949, after providing for all replanting and maintenance of immature areas, depreciation, directors' and auditors' fees, administrative expenses, and taxation, including the sisal export tax.

Apart from the depreciation, etc., allowed for the purpose of arriving at assessable profits on which taxation is based, the plantation industry in East Africa is under an increasing statutory obligation to provide on a considerable scale facilities for the housing, health and welfare of its staff and labour which, certainly in the United Kingdom, is no part of the financial responsibility of the employer, especially in respect of the capital expenditure involved. In principle we support this extension of the functions of the employer under African conditions, but contend that adequate means to do so should be recognised on a more realistic basis under the taxation provisions. East African taxation is largely based on the United Kingdom model, and in my view inadequately takes East African conditions into account. Out of our so-called profits this abnormal provision has to be met, while from the taxation which we pay we derive few services or benefits. Instead, we ourselves carry out many of the functions which it is usual in more settled communities for Government to finance or undertake.

A good deal has been said about the risks and costs which the British Government discovered to be inherent in large-scale tropical agriculture under the ground-nut scheme. The sisal industry has had to meet

precisely similar conditions, the only difference being that they have built up gradually but surely over a period relying mainly on local personnel of all races, and have thus successfully surmounted these difficulties and achieved a sound and prosperous industry.

POLICY OF PRUDENCE

We have to recognise that costs of replacement of our assets today greatly exceed the past provision which we have been able to make by way of depreciation based on original capital values, and, moreover, that these costs continue to rise. It is true that under the Tanganyika Taxation Ordinance we have the option of setting off against current revenue the full expenditure incurred in the year in replacing and maintaining our planted areas, and of this we have taken full advantage, instead, as was the practice in the past, of placing such expenditure to a capital account to be written off at an agreed figure per ton against production costs in the future as the areas come into production. That, of course, will reflect advantageously on our future costs, although I am increasingly dubious of the advantages of large-scale heavy mechanisation in tropical agriculture in Africa. It is necessary, however, in respect of buildings, plant and equipment, to make a replacement provision in excess of that allowed under taxation, and this is an increasing burden on what is, I think fallaciously, termed the profit. In other words, the profit which we make is not all available for purposes of dividend but a part has to be retained in the business and applied in the manner which I have described. We also have to make some reserve against the future. Such expenditure goes to build up the strength of our position and our assets, but is a present burden and to that extent affects the return to shareholders. I have been an ordinary shareholder in this undertaking since it first started in 1920, and have experienced more than most of the present shareholders the long bleak dividendless years. I hope that the prudent provision that we are now making will assist in our establishing a more reasonable and consistent dividend policy than was possible in the past, and I also consider that, as far as we can, we should make as adequate a return to shareholders as possible to bring up the average return on their past investment and to sustain and augment the capital value of their holdings. Only by this means can financial confidence be created in sisal enterprise, and more reasonable access be obtained to the capital market. As the leading sisal group we have a responsibility in this matter.

You will see from the accounts that out of the profits for the year of £301,318, after taxation, £232,908 is retained in the accounts of Bird and Company (Africa), Limited; £68,410 is shown as profits of Sisal Estates, Limited, and, after adding the amount brought forward from the previous year and deducting dividends paid amounting, less

tax, to £68,475, a sum of £897 is carried forward in their accounts. Of the amount retained by Bird and Company (Africa), Limited, £156,895 has been appropriated to reserves, leaving £76,013, to which is added the amount brought forward from the previous year of £293,144 and £9,761 for adjustment of taxation in respect of previous years, thus increasing the carry-forward to £378,918. The general reserve is increased by £75,000, and the special development and cultivation reserve by £71,895, bringing the respective totals to £125,000 and £150,000. £10,000 has also been added to the staff fund.

PRODUCTION

The year 1949-50 coincided with one of the worst droughts experienced for the last 26 years, and this retarded sisal leaf growth, resulting in a 12 per cent. reduction on the estimated line fibre yield for the year, the production being 9,611 tons. The recent development of our flume tow fibre, however, added during the year a further 1,109 tons, making a total fibre output for the year, including line fibre and tows, of 10,720 tons, compared with the previous year's total of 10,350 tons.

The production estimate for 1950-51 is 12,000 tons, and the proportionate output to date has somewhat exceeded this rate, production for the seven months to the end of January, 1951, being 7,697 tons. Comparative monthly outputs will in future be published in the Press.

PRICE

As mentioned in last year's statement, Bird and Company (Africa), Limited, had sold the greater part of the year's production forward and did not derive any immediate full benefit from the rise in fibre prices resulting from devaluation of sterling. The average price received by us for line fibre in the year under review was £91 5s. per ton, f.o.b., after deducting freight, insurance, selling charges, overheads, and sisal export tax. Since then prices have advanced considerably—from £117 per ton for No. 1 grade, f.o.b., in March, 1950, to over £200 per ton at the end of January, 1951.

It is impossible to forecast the future of prices. I can only say that the Tanganyika Sisal Marketing Association Limited—Tasma—of which I am chairman, has sold our sisal well ahead of our next financial year ending June 30, 1951, at a very substantially higher level of price than in the year under review. Prices on the present level are apt not only to have some effect on consumption, but to increase world production of hard fibres, although the setting up of new long-term agricultural enterprise on the high capitalisation required for sisal production at present capital costs is an extremely hazardous undertaking, especially as the period of immaturity of areas is anything from two to seven years. Moreover, the rise in the world price of all primary commodities still leaves the hard fibre group in the more moderate priced group of textiles. East Africa is the only hard fibres producing area of any appreciable importance within the Commonwealth, or, indeed, within the sterling area. I know of no adequate substitute for sisal procurable at the required price and in the required quantities. For many years before the war two tons of sisal were consumed for one ton of manila. Manila production is unlikely to reach its prewar production for some years. The attempt of the Colonial Development Corporation to develop the manila plantations in North Borneo, where it was given the monopoly of the ex-Japanese plantations on specially favourable terms, appears to have met with little success. Obviously, the rapid rise in the price since 1949 has had little direct relation to the intrinsic position of

supply and demand of the commodity, but has been influenced partly by bareness of stocks, but still more by general world conditions of credit expansion. In due course it will also be influenced by world credit contraction. There is, in my estimation, more hard fibre in the ground than will be needed to meet effective demand in a few years' time, although rearmament and the need for building up stocks normally required for the proper functioning of industry will partly cushion that effect. Sisal supplies are, however, still tight, and world stocks have still to be replenished, apart from the moderate amount of stockpiling of the United States Government. It appears to me, therefore, that the gap between supply and demand, though not as serious as that of a variety of other strategic commodities in short supply, is unlikely to be closed at the earliest till some time in 1952, and rearmament may postpone that date. After that, world production is likely gradually to increase at a greater rate than consumption. World inflationary influences may still sustain the abnormal price level, but the finance required will become an increasing burden on all parties to transactions. The ability of both sellers and buyers to devise arrangements to cushion the price fall is probably the most important issue before the future of the industry. Meanwhile, we can regard with some confidence our more immediate future.

ASSETS

The properties of Bird and Company (Africa), Limited, at June 30, 1950, excluding the leased estate of Hale (referred to below) comprised 21,629 hectares (54,072 acres). This was made up as follows:—

	Hectares
Mature areas being cut	7,294
Immature areas	4,539
Cleared or in preparation for planting	2,616
Balance, forest or villages, buildings, etc.	7,180
	21,629

In 1948-49 the mature areas were just over 5,000 hectares and the immature just over 4,000 hectares.

The estate of Hale leased from the Custodian of Enemy Property throughout the war totals about 3,650 hectares (9,124 acres), of which about 1,176 hectares are planted and mature.

As announced in January, Bird and Company had the opportunity of taking a 99 years' lease of this property from the Tanganyika Government. As it is adjacent to the other properties and has been operated by the company throughout the war, and fits conveniently into the picture from the point of view of labour and control, it was considered advisable to take the lease.

With this acreage, the total area owned by the company will be 25,279 hectares (or 63,196 acres), or nearly 100 square miles. On our estates we operate 10 factories and 150 miles of railroad, besides stores, villages, hospitals, shops, etc.

With the object of reducing future costs by increasing production, which should now rise progressively, Bird and Company have increased their assets (1) by the purchase of the Kerenge-Mulemua Estate at a total cost of £315,000. This has been financed by a bank loan repayable out of the net proceeds of the sale of sisal produced on the estate. This loan stood at the end of December, 1950, at £170,000; (2) by substantially completing the development of the Lwengera Estate, which includes a modern factory, estate buildings, staff and labour housing, water supplies, roads and 12 miles of graded railway; (3) by opening up an extension of the Geiglitz Estate, which will be called the Furaha Estate; (4) by the purchase from

Government on a 99 years' lease for £218,000, of which £67,000 is payable in royalty on the assessed production, of Hale Estate. This is being financed on the same basis as for the Kerenge-Mulemua Estate; (5) by the completion of the carding factory referred to below. It is estimated that these extensions will ultimately yield 7,000 tons.

During the year the value of our assets according to book values increased by £530,000, and at June 30, 1950, stood in the books at £1,390,000. Present replacement costs would probably be double this figure if it were indeed possible to replace them. But I would venture to point out that the true test of value in such a case is net earning capacity, and that depends on future production, which in our case is certainly rising, and on the level of future prices and costs. The bulk of our capital extension programme has now been achieved, and we can look with some confidence to a gradual increase in our output, and with it a lowering of our costs.

CARDING FACTORY

During 1948-49 Bird and Company (Africa), Limited, bought this small factory for £15,000. About £6,000 was spent in new machinery and the capacity is being doubled. The profits for 1949-50 were £23,700. This in itself is satisfactory, but it is equally satisfactory to be able to convert into a graded carded production of guaranteed cleanliness and quality the sisal waste (short, dirty and tangled fibre) which in previous years had gone down the flume and been left to decompose. The tow produced has a good market for padding for motor-cars and other upholstery, especially in America. The factory is the only one of its kind in Tanganyika.

CONTROL TRANSFER AND TAXATION

In accordance with the special resolution passed at the extraordinary general meeting of the company held on January 31, 1951, the control of the company, as I have stated, was transferred to Tanga, Tanganyika, as from that date.

Prior to the transfer the company was liable to United Kingdom income tax and profits tax in respect of the dividends which it received from its wholly owned subsidiary company, Bird and Company (Africa), Limited.

Since January 31, 1951, it is no longer liable to United Kingdom taxation, except on income arising in the United Kingdom, which is negligible. Dividends payable by the company to shareholders resident in the United Kingdom are, however, subject to deduction of United Kingdom income tax, as mentioned later.

On the basis of existing rates of tax in Tanganyika and in the United Kingdom the transfer of control will result in an annual saving of tax. Assuming that the company were to pay gross dividends of £100,000, which is somewhat less than the dividends payable in respect of the year ended June 30, 1950, the net saving would amount to about £26,000, and such saving will vary in direct proportion to the actual dividends paid by the company. It is intended that dividends should in future be paid through a paying agent in London, who would deduct United Kingdom income tax at the appropriate rate.

So far as those preference and ordinary shareholders are concerned who are liable to profits tax, the dividends received from the company have hitherto been treated as having already borne profits tax. In the future, however, such shareholders will be liable to bring such dividends into account for profits tax purposes.

Taxation is an extremely technical and too complicated subject. What is important is not only the rate of tax, but the basis on which it is assessed, and in this connection I have already referred to the inadequate Tanganyika rates of allowance in respect of

welfare expenditure and to meet the rising costs of replacements. Further, those private companies or partnerships or individuals who come under section 21 of the Tanganyika taxation ordinance pay taxation in Tanganyika up to 14s. in the £, or 70 per cent., a rate of tax devised to restrict consumer income and, in my view, not appropriate in respect of producer income, especially in a pioneering country with the hazards of tropical agriculture. However, public companies in Tanganyika such as you own, pay instead a company rate of 4s. in the £. Both of the above rates are more favourable than they are in Kenya, where the company rate is 5s. and the personal taxation maximum 16s. in the £, or 80 per cent.

I am afraid that, owing to the operations of the fated ground-nut scheme, Tanganyika has a bad Press among investors. In my view, it is the coming country in East Africa, so long as productive enterprise is not only well managed, but is gradually built up, and no attempt is made to accelerate development beyond the scale and tempo of conditions of sun, water and soil of "tropical Africa." There are few more promising countries today than Tanganyika for the prudent investment of long-term capital, so long as good management and knowledge of local conditions are secured.

At present there is no Dominion share register in Tanganyika, but I understand that an application has been made for an Order-in-Council that one shall be established.

EXPORT TAX

In March, 1950, a sisal export tax was imposed of 5 per cent. on the f.o.b. price of sisal, and this has been continued during 1951. While the amount paid by us on shipment for the last few months of 1949-50 was just over £12,000, during the full year 1950-51 it is likely to exceed £100,000. This tax is strongly objected to in principle by the industry, and the grounds of our objection have been clearly stated to Government, including the discrimination between Tanganyika and Kenya exercised by the Colonial Office in this matter. We must, however, I think, recognise that the extra revenue obtained by Government, having regard to the present level of prices, is not unreasonable to the industry, especially as I understand some proportion may benefit economic development in the industry itself. The Tanganyika Government has in this matter adopted a more reasonable attitude than has the Malayan Government in the case of rubber, and, although basically and in principle the two taxes are the same, the incidence of their application is entirely different.

DIRECTORS

From February 1, 1951, this company has been located in Tanganyika. I should like to take the opportunity of saying goodbye to those directors, Major R. D. K. Curling, M.C., Mr H. G. Judd, C.B.E., and Mr S. I. E. Crouch, who retire from the board, and to thank them most heartily for their past services. May I at the same time welcome our new East African directors, Major F. H. de V. Joyce, M.C., and Mr Humphrey Slade. I have already referred to our former chairman, Colonel C. E. Ponsonby, T.D., D.L., and I would like to make particular reference to the specialist knowledge on finance and accountancy of Mr A. A. Lough, F.C.A., which will be a source of strength in the future.

AUDITORS

Bird and Company (Africa), Limited, have been fortunate in the help and guidance they have consistently received from their auditors, W. Bain and Company, of Tanga, recognised as the foremost accountants in the East

African sisal industry. I wish particularly to thank Mr Wm. Bain and his staff for the indefatigable manner in which they have watched and checked the accounting of Bird and Company (Africa), Limited, not only at the end of the financial year, but every month on the estates as well as at central office. Binder Hamlyn and Company have similarly watched over the Sisal Estates, Limited, accounts, and although they have now resigned as auditors owing to the transfer, and are succeeded in East Africa by Deloitte Plender Gill and Johnson, they will in future act in London in connection with share transfers.

SECRETARIES

For 14 years John K. Gilliat and Company, Limited, have most efficiently carried out their duties as secretaries to Sisal Estates, Limited. Although they now relinquish their function in this capacity, I am glad that Bird and Company (Africa), Limited, will still have the benefit of their experience and organisation on the buying side. I would like specially to thank Mr John Prideaux, O.B.E., for his unfailing help on any matter referred for his advice.

STAFF

I should like to put on record my sincere thanks to my colleague, Mr C. A. Bartlett, C.B.E., deputy managing director of Bird and Company, the estate managers and office staff in Africa, and also pay a tribute to the loyalty of over 10,000 African employees who, under able managers, have materially assisted the satisfactory results. Many of the latter have been with Bird and Company (Africa), Limited, for many years, and in our staff bonus payments we have been able to include some hundreds of our African workers, many of whom were born on our estates.

RATANUI RUBBER, LIMITED

DIVIDEND OF 10 PER CENT.

The sixteenth annual general meeting of Ratanui Rubber, Limited, was held in London on February 13th. The following is an extract from the circulated statement of the chairman, Mr Jack Addinsell:

For the third successive year I must place on record our sincere admiration for the way the members of our estate organisation have continued their arduous and dangerous duties, with the improved results shown.

You may have noticed that the crop for the year under review fell short of the quantity harvested for the previous year by some 109,000 lbs. Nevertheless, the year's working resulted in a profit of £17,928 as compared with £5,623 last year. The increase in the price of rubber was mainly responsible although the rise to the high values of the past two or three months did not really commence until towards the close of our last financial year.

Expenditure on rehabilitation required £434 only, making a total of £13,664 since the reoccupation. The War Damage Commission is at last showing signs of getting to grips with the situation and there are prospects that by the date of our next meeting I may be able to report the receipt of at least part settlement of our claim, but how this will compare with the total we have spent is quite impossible to forecast at this stage.

The heavy incidence of taxation can be seen in the necessity for providing £8,572 under this head or nearly four times the sum required in respect of the previous year's working. Your directors are pleased to recommend a dividend of 10 per cent.

The report and accounts were adopted.

RALEIGH INDUSTRIES LIMITED

A RECORD YEAR

The seventeenth ordinary meeting of Raleigh Industries Limited was held on February 13th at the company's offices, Sir Harold Bowden, Bt., G.B.E. (the chairman), presiding.

The following is an extract from his statement, circulated with the report and accounts:

This time last year I had the happy privilege of informing you that the Raleigh Group had achieved another record in its history, the increase in turnover then being 17½ per cent. This year we have gone one better, the new high level representing an increase of approximately 20 per cent. over last year.

We have made a record profit this year of £1,452,805, as against £1,206,966 last year, and this in spite of the fact that we have continually been absorbing increased costs. I feel, however, that unless a halt is called to these rising costs, it will be impossible to maintain our existing prices, and this in turn may jeopardise our large and competitive export markets.

This achievement can be attributed largely to our record turnover, and reflects the greatest possible credit on those who control our organisation, which I am satisfied is maintained at a level of efficiency surpassed by few other companies. It is of interest to record that, of this profit, income tax and profits tax absorb no less a sum than £764,041, leaving £688,764 for reserves and dividends.

Production of bicycles and tricycles is now in excess of the rate of one million machines per annum and the output of Stumey-Archer gears, Dynohub lighting sets, gear-cases, etc., has increased proportionately, the company taking its full share in the export drive. If we are able to obtain over the next year adequate supplies of raw materials necessary for our cycle and gear production and the maintenance of the standard of quality for which our products are famous, the outlook for our trade for the next 12 months, and for a further period, should be bright indeed. Never have we had more orders on our books than at present.

NEW FACTORY EXTENSION

The new factory is now in full production and is being devoted solely to the manufacture of our patent Dynohub. Considerable progress has already been made in the major factory extension covering an additional 10 acres, which it is hoped will enable the company to meet the increasing demands from its overseas markets which up to now we have been unable to satisfy.

Because of severe import restrictions, Mr Wilson, in company with Mr Clarkson, our works director, visited South Africa, where arrangements were completed to open a cycle factory at Vereeniging, near Johannesburg. Work on this factory has already started, and production will commence in the spring of this year.

Severe import restrictions have also been imposed in India, and so, in conjunction with our Indian agents, a company has been formed under the title of Sen-Raleigh Industries of India Limited. A factory at Asansol, near Calcutta, is accordingly being erected, and it is hoped that production will commence before the end of 1951.

I would like to place on record my appreciation of the hard work, enthusiasm, team spirit and devotion to the company's interests, of all our staff and workpeople, both in the factory and on the commercial side of our business, without which these most excellent results could never have been achieved.

The report and accounts were adopted.

NEWCASTLE BREWERIES LIMITED

SUCCESSFUL RESULTS

MR ALEX. McCONNELL'S REVIEW

The sixty-second annual general meeting of The Newcastle Breweries Limited was held on February 15th, at the registered offices, Haymarket, Newcastle-upon-Tyne, 1.

Mr Alex. McConnell, chairman of directors, presided.

The chairman, in the course of his speech, said:

As far as trading results are concerned, I am glad to report that we have had a satisfactory year. The brewery, the beer bottling factory, and wines and spirits, and the maltings, all increased their gross profits. The managed houses whilst having an increase in turnover, show a slight decline. In this case, the Catering Wages Act still influences the figures, particularly in establishments where the provision of food forms part of the trade.

Expenditure of every description was much heavier during the year under review, and I am afraid that with the present inflationary conditions, must still increase. Raw materials, including malt, the principal ingredient of our mash tuns, are all dearer. The barley harvest was greatly affected by the miserable conditions under which it was got, and we have had to pay much higher prices for it, which will no doubt increase the cost of beer by several shillings per barrel.

The profit for the year after providing for income tax and profits tax on the profits to date, debenture interest and directors' fees, and provision for equalisation of taxation, amounts to £184,231. To this figure must be added the carry forward from last year of £270,327 (less provision for equalisation of taxation, £22,500) £247,827, making in all, £432,058. Interim dividends paid, account for £8,800, so we are left with £423,258.

DIVIDENDS AND ALLOCATIONS

It is proposed to make the following allocations.

1. To pay a final dividend of 3 per cent., less tax, on the preference stock ... £3,300
2. To pay a final dividend of 12½ per cent. and bonus of 3 per cent., less tax, on the ordinary stock ... £34,100
3. To add to reserve for contingencies ... £80,000
4. To place to reserve for depreciation off special expenditure on buildings ... £30,000
5. To carry forward to next year a balance of ... £275,858

An analysis of the disposal of the total revenue of the company works out, as follows:—

Duties, taxes, and licences	61.2 per cent.
Materials and services	23.2 per cent.
Wages, salaries and pensions	10.2 per cent.
Reserves	2.8 per cent.
Debiture holders and shareholders (gross)	2.6 per cent.

After dealing extensively with the proposals for the redistribution and reduction of licensed premises in the two Licensing Planning Areas, Sunderland and South Shields, and after reporting on trade conditions during the first three months of the current year, the chairman continued:

It has been the object of the board, while looking ahead and keeping abreast of the times, to place the concern on sound economic foundations. Making allowances for circumstances as they exist today, we look forward to the future with a certain amount of confidence.

LILY MILLS LIMITED

MR S. S. HAMMERSLEY ON INCREASED EFFICIENCY

The annual ordinary general meeting of shareholders of Lily Mills Limited will be held on Thursday, March 1, 1951, at the registered office of the company, The Mill, Shaw.

The following is an extract from the statement by the chairman, Mr S. S. Hammersley, which was circulated with the report and accounts for the year to December 30, 1950.

The trading profit of the Lily Mills Group for the year ending December 30, 1950, is £336,963 18s.

The net profit is £133,565 3s. 7d. which compares with a net profit of £86,267 15s. 8d. for the year ended December 31, 1949.

Your directors recommend a final dividend of 17½ per cent. less tax, which, with the interim dividend of 12½ per cent. paid on July 22, 1950, will absorb £42,191 11s. 5d. net.

MODERNISATION

During the year under review, the modernisation of Lily Mill No. 1 has been completed. 122 ring frames of the latest type are at work; the cardroom machinery has been respaced; certain surplus machines eliminated and additional preparations introduced; the new mixing and blowing room plant has been installed and is running at full capacity. We believe that the equipment and layout of this mill is second to none in the trade, and the increased production, with decreased labour loads now obtainable, constitute effective evidence in support of this contention.

The planned re-equipment of Devon Mill is now completed. 48 ring frames are spinning Fibro.

The group has purchased new machinery at an approximate cost of £385,000. Of this £365,000 is expected to rank for subsidy. £31,790 was received from the Board of Trade in 1949, and in 1950, £21,914 was received in respect to the Lily Mills and £18,155 in respect to the Devon Mill.

TRADE UNION CO-OPERATION

The results of our re-equipment up to date show a definite increase in mechanical efficiency and a substantial lightening of the labour load. We feel convinced that the increased production thus far obtained by no means exhausts the potentialities of our new equipment. With the co-operation of the Trade Union leaders, and a less conservative

attitude towards outmoded rules and regulations, it is possible to obtain a greater production per man employed to the material benefit of all concerned.

As a country we cannot afford to obtain other than the utmost from our industrial equipment. The disparity of incomes between wage earners in the United States and wage earners in other countries is due more to the greater application of science and technology than to greater natural resources.

NEW SYNTHETIC FIBRES

Shareholders may feel satisfied that we are by no means unmindful of the impact of new synthetic fibres on the textile industry. We keep in close and practical touch with current developments, though the number of synthetic textile fibres additional to rayon staple that are available in this country for commercial processing is small in comparison with those available to United States textile producers.

It has been a year of steady progress in which we have succeeded in combining the requirements of increased production with the necessity to install modern machinery. It is greatly to the credit of the management that these divergent considerations have been so harmoniously reconciled.

I have again to record the excellent working spirit which exists at all the mills, and to thank most warmly the management, staff and employees for their services.

CARRERAS, LIMITED

HIGH REPUTATION OF PRODUCTS

The forty-seventh annual general meeting of Carreras, Limited, was held on February 12th in London, Sir Edward Baron, chairman and managing director, presiding.

In the course of his speech, the chairman said: When I addressed you at the last meeting I referred to the careful control, improved manufacturing methods and our good relations with labour by which, together with the strictest economy, we had offset rising costs to a considerable degree. During the twelve months under review these have had their maximum effect and our net earnings have been expanded in consequence. However, we have almost reached the limit of any major economies we can effect.

We have had an extremely difficult year. Costs have risen consistently and once again shortages are being experienced in many

essential materials required for the proper packaging of our products. The allocation of dollars for the purchase of leaf tobacco during 1950, while less than that of 1949, was based on the assumption that manufacturers would be able to purchase at a certain average price level and so secure a definite, though reduced, quantity.

As it turned out, the supplies available were bid for so strongly that prices rose beyond all expectations and representations had to be made to the authorities concerned for further allocations of dollars to enable the anticipated purchases to be made. Fortunately these representations were successful.

Even so the total allocation did not enable purchases to be made in accordance with our actual usage, with the result that we shall be drawing on our stocks which in my view are already too low for safety and practical working purposes. We were fortunate in being able to obtain increased supplies of leaf tobacco of Empire origin of excellent quality. These will, to some extent, reduce the deficiency with which we are confronted.

EXPORT TRADE

Our export trade was again restricted by the limitations imposed on the allocation of dollars for purchases of leaf for that purpose, nevertheless our profits increased for the reasons I have already mentioned.

In September I visited our Canadian company and was greatly impressed by the improvements they are continually making in their manufacturing methods, as well as by the development that is taking place in their sales, which have surpassed all previous achievements.

Taxation has again taken a severe toll, the amounts provided this year being some 55 per cent. of the parent company's earnings and some 53 per cent. of the consolidated earnings. If this state of affairs is allowed to continue, still more if its exactions are increased, industry is bound to suffer from the lack of funds so badly needed to maintain it in a state of competitive efficiency.

I devoutly hope that there will be no upward change in the duty on tobacco, already at a figure which has retarded consumption. Any increase would, in my opinion, be disastrous from all points of view, especially to the national revenue which would suffer not only directly through a drop in sales but also from the reduction in taxation on profits.

We lay great stress on the maintenance of the high quality of our products for which our reputation is second to none.

The report and accounts were adopted.

NOTICES

HIS MAJESTY'S COLONIAL SERVICE NIGERIA

A vacancy exists for a statistician in the Department of Agriculture on the staff of the Oil Palm Research Station at Benin, Nigeria. Duties will be to assist in planning and interpreting field experiment and progeny trials in connection with the Oil Palm Research programme and to organise the recording and treatment of routine statistical data.

The appointment will be on three years' probation for permanent and pensionable employment. Salary Scale, including pensionable gratuity pay, is £660 per annum to £1,300 with an efficiency bar at £860 and a promotion step at £1,140. War service and professional experience will determine the point of entry into the scale. In addition, a temporary cost-of-living allowance is payable. Where Government quarters are provided a sum varying from £60 to £90 a year is deducted for rent. Free passages are provided for the officer, his wife and up to two young children on first appointment and on leave. Income tax is at local rates, which are very much lower than those in the United Kingdom. The tour of service is 18-24 months. Leave on full salary is granted at the rate of seven days for each completed calendar month of resident service.

Candidate must be under 40 and must possess a good Honours degree in an appropriate subject, preferably statistics, or mathematics with statistics. Practical experience in design of experiment work is desirable. Forms of application can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, to whom completed applications should be submitted within two weeks of the appearance of this advertisement.

HIS MAJESTY'S COLONIAL SERVICE MAURITIUS

Woman Nutrition Officer required to investigate and advise on nutrition problems and to instruct local personnel. Selected candidate will be engaged on agreement for three years. Salary scale £375 to £660, point of entry according to age, qualifications, and experience. Appropriate cost of living allowances. Free passage. Income tax at low local rates.

Candidates should hold the Diploma in Dietetics. Experience in scientific or educational work and in dietary problems of a large hospital or educational institution is desirable.

Further particulars and application forms available by writing to Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting reference 3/2321/2/50.

GOVERNMENT OF IRAQ

Statistician required to take charge of the Principal Department of Statistics for one year in the first instance. Salary is 225 Iraqi Dinars a month, plus high cost-of-living allowance between I.D. 10 and I.D. 14 a month, according to dependants. (1 Iraqi Dinar—£1 sterling.) Free passages. Candidates should hold a degree in economics or statistics, possess a wide knowledge of official statistics and have had extensive experience in the administration of statistical work. Experience of working abroad an advantage. Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents, 4, Millbank, London, S.W.1, quoting M.27389.E on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

I.L.O. INVITES APPLICATIONS from men and women of British nationality, aged from 23 to 35 years, for a post of Member of Section in the Legal Division of the International Labour Office, Geneva, Switzerland. Qualifications required: (1) good general legal training; (2) good knowledge of international law and a knowledge of constitutional law; (3) mother tongue English; (4) sufficient knowledge of French to read and compare texts; (5) knowledge of other languages will be taken into consideration. Closing date for applications is March 31, 1951.

Further particulars and candidature forms may be obtained from the International Labour Office, 38-39, Parliament Street, London, S.W.1.

LEADING IRON ORE MINING GROUP with Foreign and Colonial Interests has opening in London Head Office for ambitious young man, age about 25, who is proficient shorthand typist, as personal assistant to Director. Appointment offers considerable scope for advancement to right man. Salary according to experience and qualifications. Pension scheme. Write, with full particulars, to Box "T.J.O.", c/o 95, Bishopsgate, E.C.2.

COST REDUCTION.—Production and Business Executive offers his services for developing and controlling industrial undertakings for increased productivity at reduced cost. Experienced. Standard Costs and Budgetary Control; Wages Systems and Incentives; Time and Motion Study; Methods and Factory Layout; Design; Sales and general commercial work. Appointment at or near Board Room level, or would consider acting as Consultant. London area or South preferred.—Write Box 580.

PURCHASING.—SENIOR EXECUTIVE as Deputy to General Purchase Manager at large light engineering factories in Midlands. Essential qualifications are a high standard of education, sound industrial purchasing background with considerable experience at executive level, extensive knowledge of light engineering materials, processes and supply sources, proved commercial and administrative ability, preferably some technical training or practical experience in engineering. Age 36 to 45 years. The appointment will carry a minimum of £1,000 per annum, and there is a profit-sharing scheme and good pension scheme. Applicants should write in strict confidence and must, if they wish to be considered for a short list, give full particulars of education and training, experience and positions held, with all relevant details.—Box 581.

RESEARCH MANAGER required by leading international food manufacturing company. An experienced executive is needed to develop and control the work of existing department in collating and analysing sales and supply statistics and market trends, as a basis for planning future operations. The post will require familiarity with relevant statistical sources and knowledge of modern market research techniques; ability to present findings and recommendations to a board of directors is essential. Salary commensurate with responsibilities.—Applicants, who should not be over 40, should write in the first instance to Box 582.

UNIVERSITY OF CAMBRIDGE

UNIVERSITY APPOINTMENT OF ASSISTANT DIRECTOR OF RESEARCH IN ECONOMICS

The Appointments Committee of the Faculty of Economics and Politics give notice that they hope to appoint an Assistant Director of Research in Economics to take office from October 1, 1951. The appointment will be subject to the Statutes and Ordinances of the University. Further particulars can be obtained from the Secretary of the Faculty, The Marshall Library, Downing Street, Cambridge, to whom applications should be sent so as to reach her not later than March 14th.

Eight copies of the application should be sent and, if so desired, at least one copy of any published work or unpublished writings. Testimonials are not required, but a candidate should give the names of two persons to whom reference can be made.

THE UNIVERSITY OF MANCHESTER

RESEARCH FELLOWSHIP IN ECONOMIC STATISTICS

Applications are invited for the above Fellowship, normally of the value of £1,000 per annum and tenable for two years. Regulations governing the award of the Fellowship may be obtained from the Registrar, the University, Manchester, 13, to whom all applications should be sent, not later than April 1, 1951.

UNIVERSITY COLLEGE, SOUTHAMPTON

JOINT COMMITTEE FOR ADULT EDUCATION

Applications are invited for the post of Resident Tutor for work in Hampshire and the Isle of Wight. Candidates should have a good degree in Economics and be able to take classes of good standard in economic and social problems. Salary: £450—£800, according to qualifications and experience (plus F.S.S.U. benefits). Applications (six copies), containing copies of three recent testimonials and the names of two referees, should be sent not later than March 3rd to the Secretary, University College, Southampton, from whom further particulars of the post can be obtained.

RHODES UNIVERSITY COLLEGE, GRAHAMSTOWN, SOUTH AFRICA

(To become Rhodes University on March 10, 1951)

Applications are invited for the posts of:—

SENIOR LECTURER IN HISTORY

LECTURER IN ECONOMIC HISTORY

from July, 1951.

Salary Scales:—

Senior Lecturer (Men): £600 x £25—£850 p.a.

(Women): £550 x £25—£700 p.a.

Lecturer (Men): £550 x £25—£700 p.a.

(Women): £425 x £25—£575 p.a.

plus a variable cost-of-living allowance, at present about £82 p.a. for single persons and £200 p.a. for married persons. Previous experience and academic qualifications may be taken into account in fixing the initial salary.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is April 15, 1951.

THE CIVIL SERVICE COMMISSIONERS invite applications for permanent appointments as Senior Scientific Officer and Scientific Officer to be filled by competitive interview during 1951. Interviews began in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1951, may eventually be announced. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree with first or second-class honours in a scientific subject (including engineering) or in Mathematics, or an equivalent qualification, or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer posts taking their degrees in 1951 may be admitted to compete before the result of their degree examination is known. Age Limits: For Senior Scientific Officers, at least 26 and under 31 on August 1, 1951; for Scientific Officers, at least 21 and under 28 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1951. Salary Scales for men in London: Senior Scientific Officers, £700 x £25—£900; Scientific Officers, £400 x £25—£650. Rates for women are somewhat lower.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. 3399.

APPLICATIONS ARE INVITED for a senior position in a well-known company engaged in the manufacture of proprietary and bulk chemicals, detergents, sterilising agents, etc. This is a new position being created to relieve the Managing Director, who is also responsible for the control of other companies in the Group. The position calls for a man of personality and initiative, able to work with existing senior staff, some of whom have had long service with the company. The qualifications required include comprehensive experience of production, distribution, marketing and general control at management level. The position will provide outstanding opportunities for increased responsibility and remuneration. Commencing salary £1,500. Age 38-45.—Apply, with full details of experience and qualifications, to Box 579.

EX-REGULAR ARMY OFFICER, with 16 years' mercantile experience in U.K., U.S.A., and business/Government connections in India/Pakistan, now located in Karachi, is open for engagement by leading commercial or industrial enterprise operating in Far East.—Box 578.

THE greatest "names" in business are those whose directors realise—and apply—the power of advertising. Under the direction of highly skilled and experienced Agency executives, Samson Clark's advertising brings results.—Museum 5505.

PRINT Consultant, London—offering independent and personal print service—invites inquiries for production, design and printing of high grade publicity and public relations literature. Adequate facilities for long or short runs, artwork, photography, etc.—Box 563.

NOTICES

STAFFORDSHIRE COUNTY COUNCIL COUNTY PLANNING DEPARTMENT

Applications are invited for the appointment of a Junior Planning Assistant (Research), A.P.T. Grades I-IV. Salary £390 to £525, on the established staff of the County Planning Department.

Applicants should have a degree in Geography or Economics and should have had research experience.

Canvassing directly or indirectly will be deemed a disqualification and relationship to any Member or Senior Officer of the Council must be disclosed.

Particulars and conditions of the appointment (including lodging allowance) may be obtained from D. W. Riley, County Planning Officer, 41a, Eastgate Street, Stafford, to whom applications should be submitted not later than March 7, 1951.

T. H. EVANS, Clerk of the County Council.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

"STATE AND SOCIETY IN JUDAISM."—Two Lectures by E. I. J. Rosenthal, M.A., D.Phil. (Lecturer in Hebrew, Univ. of Cambridge). Sundays, February 25th and March 11th, at 3.30 p.m., at the Liberal Jewish Synagogue, 28, St. John's Wood Road, N.W.8 (opposite Lord's Cricket Ground). All welcome.

ANGLO-IRANIAN OIL COMPANY require one mathematician, one mathematical physicist and one physicist with some mathematical ability, with First- or Second-Class Honours Degree, for posts at a new research and development centre on the Nottinghamshire Oilfield. The work will involve theoretical investigation of movement of fluids in oil reservoirs and problems connected with recovery of oil. Methods and equipment will be developed for electrical recording at surface of a wide range of physical observations on oil and gas-bearing formations penetrated in deep wells. The observations include resistivity of formations, radio activity, temperature, pressure, fluid velocity, well diameter, etc. The equipment will also be used for actuating sample devices and special bottom hole instruments. The mathematician will be concerned with oil reservoir future production performance and the mathematical physicist with the allied survey research and development work. The physicist will be responsible for interpretation of records and laboratory experiments, both electrical and physical, bearing on interpretation. Men with some years' practical experience of electronics preferred for the two latter posts.

Applicants, aged from 27-35 years, should be prepared to go abroad for periods extending to six months.

Write, giving full details and quoting Department M.1415, to Box 6125, at 191, Gresham House, E.C.2.

MARKET And Opinion Research Expert of International repute with world wide contacts is available for consultation on Market or Opinion Research problems arising in this country or overseas. Setting up and supervising client's own research units a speciality. Box 574.

Wages and Work

AS *The Economist* went to press the decision between settlement or strike on the railways was still in doubt. While railwaymen in several areas were hampering traffic by working "to rule," and some thousands had already gone on strike, the Government was trying to find a basis for agreement after direct negotiations between the Railway Executive and the three unions had broken down. The Executive had offered the workers more than the Court of Inquiry recommended, and the unions had retreated some way from their previous demands, but a gap of £2,750,000 between offer and demand remained.

It is possible that by the time these words are read the country will be facing the calamity of a national railway strike. As in issues of peace and war, there can sometimes be a worse calamity than that. If the dispute is settled peacefully, it will not be possible to sigh with relief and forget. The two points of principle involved in this dispute are of major importance for industrial relations in general and for the nationalised industries in particular. The first is that the discussion of wages and of working methods cannot be divorced. The unions have now offered, as a compromise from their original position, that in return for pay increases they will undertake to speed up separate negotiations about changes in working conditions. This will not do: it has proved difficult enough to get such changes carried out in practice even when they have been agreed on with the unions (as in the case of the redundant employment of van guards), and a mere undertaking to negotiate quickly does not even begin to face the problems. The basic point is simply that improvements in working methods are the one source from which the railways can pay higher wages. They cannot put up their charges without driving yet more traffic from rail to road and thereby reducing still further the real efficiency of an already bankrupt railway system.

That there is plenty of scope for organising work on the railways more efficiently is not open to dispute. It is not a matter of finding the present practices wanting by some ideal standard. The comparison with prewar operations is clear enough. The Railway Executive estimates that in themselves increases in wage-rates and changes in working conditions would have increased the total cost of wages for footplate and engine shed staff to 205 per cent of the cost in 1938; but the actual bill is 216 per cent of that in 1938. It is a pity that the Court of Inquiry did not point out the implication of these figures more clearly. What they mean is that the real services performed by this section of railway workers are—quite apart from the reduction in the length of their working week—5 per cent smaller per hour than those rendered before the war. This is the consequence, chiefly, of the inflexibility now insisted on in the arrangement of turns of duty. It is an inflexibility quite inconsistent with the standard of living that the railway workers very properly expect from their employment and that everyone wants them to have—if only they will themselves permit it. The improvements in working methods for which the Railway

Executive is pressing are modest. The wonder must be simply that the Executive has been so timid as to operate without them for so long, and there ought to be no question of compromise now that the issue has been brought to this stage.

An increase in wages and an improvement in efficiency must go together. This is the principle to be insisted on. It cannot mean in practice that the two are precisely related—that the increase in wages can be no bigger than the savings in railway costs achieved by changing methods of work. Realistically, it has to be expected that the net result will be to raise costs. The second principle is that if this happens the solution must not in any circumstances be found by any sort of state subsidy for the railways. It is now being suggested that the Transport Commission should be freed for a limited period—say, five years—from the obligation to pay its way. It would have so long to set its house in order.

Such schemes always have a certain specious reasonableness and their real effect is almost invariable; it is to ensure that the house never will be put in order. No doubt occasional exceptions to this rule—cases where a subsidy serves its purpose and is afterwards abandoned—can be found. No one can seriously suppose that the railways would be such an exception. The psychological resistances to the improvement of efficiency on the railways are too strong for even the most courageous management (which the Railway Executive is not in a position to be) to tackle them firmly unless it must. Any subsidy would quite certainly reduce correspondingly the effort put into attempts to lower railway costs. It would be a direct bolstering-

up of inefficiency at the expense of the taxpayer. To permit it in one case would be to open the door wide to the entirely indefensible principle that the workers in a nationalised industry are entitled to establish as a prior charge on the community their claim to a standard of living in line with that of comparable groups of workers in other, but more efficient, industries. A Government retaining some faith in nationalisation is the last that should be prepared to consider so disruptive and discrediting a principle. A further rise in railway charges would have ill-effects, both for the railways themselves and for the economy as a whole, too obvious to require emphasis. But if it is the only alternative it is far preferable to a subsidy.

No settlement of the railway dispute will be satisfactory unless it is based firmly on these two principles. An increase in wages must be directly tied to an improvement in working methods on the railways, and there must be no subsidy. No one who reflects for a minute will take lightly the prospect of a railway stoppage at the present moment. But to surrender either or both of these principles would in the long run (and not the very long run either) do very much more damage to the country. To say a final goodbye to efficiency in transport would do more than any other single thing could to make Britain an inefficient country—and that means a poor country for all its inhabitants. To make the basic industries pensioners of the state would corrupt the whole economy. Whatever happens in the next few days this is the test by which it should be judged—not by whether or not a stoppage on the railways is averted, but by the degree to which these cardinal principles are upheld.

Towards a Japanese Peace Treaty

AFTER a long period of vague discussion and speculation about a Japanese peace treaty, the journey of Mr John Foster Dulles, as Mr Truman's personal representative, first to Japan and then to Australia and New Zealand has brought the matter close to the stage of actual negotiation. Mr Dulles appears to have made good progress, both in his talks with Mr Yoshida, the Japanese Prime Minister, and in his conversations in Canberra, which were directed to achieving a closer co-ordination between the policies of the United States and of the two Dominions towards Japan than has existed hitherto. A statement issued after the Canberra discussions declared that the three nations were agreed on the desirability of bringing Japan into the United Nations, the importance of not allowing Japan to become a vacuum, which "might be filled by unfriendly forces," and the need for preventing any resurgence of Japanese militarism.

There are, however, certain difficulties ahead on the way to a peace treaty with Japan. The problem of Japan differs from that of Germany above all in the fact that what is being proposed for Japan is a peace treaty and not an arrangement of the kind which the western powers have in view for conclusion with the West German Government. Because of the division of Germany and the non-existence of a single government representing the whole of the nation, there is at present no question of a formal peace treaty with Germany. Japan, on the other hand, has a unified state administration, and it is claimed by the Japanese and admitted in

Washington and London, that the time is now ripe for a formal peace treaty. This at once raises the question whether to go ahead with the negotiation of peace treaties between Tokyo and the non-Communist ex-allies of the Pacific war or whether to strive to bring Russia and China into a joint treaty at the cost of major concessions on vital matters.

To some extent, indeed, the absence of zonal occupation divisions has simplified the problem. As Russia has never occupied any part of Japan, there is no Pieck-Ulbricht-Grotewohl puppet regime on Japanese soil claiming to be the one legitimate government of the country, no opportunity for Communist sponsorship of nationalist propaganda against "partition," and no threat of civil war from Communist armed forces already organised as state police. With the monarchy surviving and still sustained by a strong popular loyalty, and with a parliament and cabinet which have emerged from free democratic elections, Japan has a political order which may be reckoned fairly stable unless confronted either with an acute economic crisis or with aggressive interference from outside. It is with these possibilities rather than any prospect of civil war in Japan that the western powers have to reckon in framing their policies for a peace treaty.

Strategically also, Japan confronts the west with a far less formidable defence problem than Germany. Being entirely insular, it cannot be directly invaded overland by the military forces of the Soviet bloc, as West Germany can. In Japan it would not be necessary to

provide against an initial rush of armoured divisions across a land frontier. Naval and air forces to defeat an attempt at invasion can be more easily provided by the western powers than large land armies. On the other hand, the defending naval and air forces would have to possess suitable bases defended by ground troops against sudden seizure, and there would have to be substantial military forces for dealing with enemy units which might get through the sea-air screen and be reinforced by fifth-column guerilla elements within Japan itself. For the United States to provide all the forces required for the defence of Japan in future would be to impose a severe strain on American military capacity at a time when priority has to be given to the strengthening of Atlantic Pact forces in Europe, and the burden on America would be all the heavier in that there are no partners close at hand to share it. Inevitably, therefore, the American military authorities want some contribution to the defence of Japan from the Japanese themselves.

*

Already a beginning has been made, without directly raising the question of Japanese rearmament, by the enlistment of a National Police Reserve, 75,000 strong, armed with light weapons. In authorising the creation of this force General MacArthur took a leaf out of the Soviet book, for it corresponds, not to the proposed West German army, but to the East German *Bereitschaften*, and is not formally classified as military. Regular military or naval forces are forbidden by Japan's own postwar constitution, which was adopted under pressure from General MacArthur's Headquarters at a time when it had not yet occurred to anyone that Japanese soldiers might be needed. But the defence units required could probably be obtained simply by expanding the Police Reserve and providing it with heavier weapons.

In the publicity given to Mr Dulles and his proposals in Japan it is noticeable that the emphasis has been laid not on Japanese rearmament, but on the protection which America is prepared to give Japan if it is willing to co-operate politically. There can be little doubt that this emphasis is primarily for the benefit of Japanese public opinion and reflects the rather disconcerting experience which American policy has had over German rearmament. It was too easily assumed in Washington that West Germany would be eager to have an army of its own if permitted to do so, and it was something of a shock to find that the Germans appeared to regard it as a favour on their part for which America and Britain must be prepared to pay a stiff price. Learning from this experience, Mr Dulles seems to have been anxious to avoid giving the impression in Tokyo that America is in desperate need of a Japanese army; he has rather taken the line that he is offering the Japanese an excellent bargain of American protection at trifling cost.

This is certainly good tactics, for there appears to be even less enthusiasm for rearmament in Japan than there is in Germany. Financial and business circles generally take the view that serious rearmament would impose an intolerable burden on Japan's slowly reviving economy, unless it were to be wholly financed by America—which would involve a greater degree of dependence than patriotic Japanese wish to see after a peace treaty is concluded. Further, Japanese democrats are very nervous lest any revival of the Japanese army may bring back the old militarist interference in politics and, per-

haps, lead to a dictatorship. Finally, there is a wide vogue of "neutrality" in Japan, which takes the form of a belief that Japan should remain as passive and detached as possible in the present world conflict and avoid definite commitment to one side. The Socialists, who are now in parliamentary opposition, reject both the rearmament of Japan and the retention of American bases in the country; they are apparently prepared to leave Japan absolutely defenceless. This attitude may be partly due to the influence of fellow-travellers in the Socialist party, and partly to the expectation that the party is not in any case likely in the near future to be in a position to carry out the principles it professes; in the main, however, it reflects a mood of pure pacifism which the American occupation authorities only three years ago were doing their best to encourage.

*

The care which Mr Dulles has been taking to walk softly in Tokyo has had the additional advantage that he has avoided stimulating the alarm which is caused in Australia by any talk of Japanese rearmament. His visit to Canberra was, no doubt, largely for the purpose of allaying suspicions that policy-makers in Washington may be planning to let loose the djinn of Japanese aggression from the bottle in which four years of war in the Pacific so recently confined it. Australia in relation to Japanese rearmament plays much the same role as France in relation to Germany, and in return for any scheme for giving Japan a capacity for self-defence is likely to press for concrete American commitments for Australian security.

Australia and New Zealand have, however, agreed that Japan must not become a power vacuum. They are also reported to have agreed that some form of Japanese rearmament may become necessary in addition to the retention of American bases in or near Japan. As these questions now come to a head, there are three things which must be assured before the proposed treaty can be made a reality. First, it would now be wrong to stick rigidly to the principle that Japan must not in any way rearm; before the last war the Japanese had to stockpile both steel and oil, and there is at present no possibility either of their doing this again without being clearly observed, or indeed of their being able to recreate armed forces of any menacing size—particularly a navy—for several years. In other words, rearmament can be controlled if there is the will to do so. Secondly, it would be dangerous to hold up a treaty any longer because Russian and Chinese agreement cannot be obtained to its terms; the Russians will certainly be given a chance to adhere, and so should the Chinese, but the British would make a serious mistake to press for more than this. Events must move forward without the participation of either of these Communist powers should that be their own choice. Thirdly—but perhaps most important of all—the time has come for Washington to give Australia and New Zealand publicly some form of definite security guarantee. The integrity of both territories is a vital American interest, and indeed is well recognised to be. But nothing has ever been said in public to this effect—as, for instance, it has about the security of the Philippines. Without this Washington can hardly expect to secure the necessary support and unhesitating co-operation of Australia and New Zealand for the vital steps now proposed in regard to Japan.

The Measure of the Burden

THE expanded defence programme of £4,700 million has now been discussed for almost a month. It has commanded an encouraging, and perhaps surprising, measure of support. The bill has this time been presented with some bluntness: the Government has at last emphasised that adequate rearmament will cut into present living standards. And the opponents of rearmament are no more numerous as a result. They are still confined to the same narrow fringe of the extreme Left that has been criticising defence policy for longer than the British Government has been discharging its commitments with the United Nations in Korea. Everyone else is prepared to accept the heavy burden of the new programme as about the right thing for this country to undertake. The proper scale of the defence effort is agreed. This is a fact of first political importance. It provides the psychological basis from which a government possessing no more than normal powers of political leadership can go forward with a realistic economic policy for defence.

Whether the Government in fact possesses even such powers of leadership is still open to doubt. The Budget will show. In last week's debate the Chancellor of the Exchequer sketched the economic problem of defence competently, clearly and sensibly. He reached with conviction the orthodox conclusion that there must be "a strict fiscal and monetary policy to restrain civilian expenditure." This is common ground. The practical question is how Mr Gaitskell—carrying the Cabinet with him—will interpret the necessities of restraint. By how much must consumption be cut? This is the crucial act of "planning" for 1951: the writers of the Economic Survey will be able to do little more than assemble some of the data on which the decision has to be based. Though the practical complications and uncertainties are baffling, what is involved is essentially a very simple sum about real resources. It has two elements. On the one hand, there is the rate at which defence can be expected to make increased calls on the country's resources of men, machines and materials; on the other hand, there is the increase, if any, that can be expected in the resources available for use at home. The difference between the two measures the real burden that rearmament will impose on the British people.

★

The arithmetic of the various adjustments that rearmament will impose on the statistics of the national income is worked out in some detail in an article on page 444. For the layman in these matters it is the result that is of concern, and that can be summarised by saying that, in the financial year that begins on April 1st next, defence will absorb a total of real resources amounting, at the present level of prices, to £500 to £550 million more than in the current year. By the year 1953-54 the increase will be as much again above the datum line, even on the surprisingly moderate estimates of the growth of the programme that are now put forward. The economic problem of defence is to provide an extra £500 million or more of real resources—men, materials and machinery—for defence in the coming year and an extra £1,000 to £1,200 million in 1953-54. These two figures,

in the roughest proportions, represent about 5 per cent and 10 per cent of the present output of the country.

There are only two ways in which a larger slice of the cake of national output can be provided for defence. The first is by producing a larger cake. The second is by reducing the other slices. As an introduction to the problem of the next few years, it may be instructive to recall how the very much larger problem of the war years was solved in this country. The cost of the war—that is, the excess of defence expenditure in the six years 1939-45 over the pre-war level—was met in roughly the following proportions * :—

By larger output	40	per cent
By foreign trade (i.e., by not paying currently for imports) ...	18½	„
By reduced Government non-war expenditure	1½	„
By reduced domestic capital expenditure	20	„
By reduced consumption	20	„
	100	„

Virtually the whole of economic policy in the next few years consists of the two questions, first, at what distribution between these elements is it right and possible to aim, and, secondly, by what methods shall the object be pursued.

Under the head of larger cake, the Chancellor of the Exchequer last week estimated that there would be an increase in industrial productivity of 4 per cent next year. This would provide about £250 million of resources, or nearly half the total needed. This is an optimistic figure. It is true that industrial productivity has been increasing even more rapidly than this in recent years. But these large increases have been due, more than to anything else, to the much more normal flow of materials and of work in progress. If now many key materials are going to be scarce and the pattern of production is to be disturbed—without the war-time willingness to work long hours and endure unfavourable conditions of work—then there must be a slowing down in productivity. Mr Gaitskell's 4 per cent is an optimistic figure for next year, and it is out of the question that there should be a 12 per cent increase by 1954. If we say that half of what is required, either in the next twelve months or throughout the whole three years of the programme, can come by way of a larger national cake, that goes fully as far as, and perhaps much further than, reasonable optimism ought to allow itself.

It was possible during the war to add considerably to the size of the British war effort by foreign trade—either by running down existing capital or by running up new debts. In the next few years, very little of either will be possible—and none at all of either will be desirable. The Chancellor's realistic expectation is that foreign trade will, on balance, neither help to meet the burden of defence nor add to it. This judgment applies to the next twelve months. But it can stand for the whole three years. Certainly it would take either incredibly good fortune (in the form of a sharp favourable turn in the terms of trade) or incredibly improvident

* See *The Economist*, April 13, 1946.

policy for foreign trade to provide any substantial help; that it should impose an additional burden is perhaps more likely.

Fully half, and perhaps more, of the addition to the defence slice will therefore have to be cut off the other three slices—the resources absorbed in the non-defence activities of the Government, the civil capital expenditure of the community and the consumption of the people. The amount of resources involved is £250 to £300 million this next year, rising to £500 or £600 million or even more in 1953-54.

There is no sign that the Government proposes to reduce its own claims upon the national resources, even apart from defence. There is, indeed, little enough sign of any serious attempt to cut financial expenditure, and if there were, the axe would fall on such items as subsidies, which are transfer payments. The rule-of-thumb test is whether the Government or the local authorities propose to dismiss any of their employees, and any politician can supply the answer.

Nor is there to be a frontal attack on investment. There will be some tightening up of controls and it is expected that some investment projects will be delayed, postponed or frustrated by shortage of materials and difficulties in getting delivery of machinery. The resulting economy in the use of resources might be between £100 and £150 million. If a larger contribution is to be found from this source in 1953-54 it can only be at the expense of housing—and that, again, is a question to which all politicians would at the moment give the same answer.

★

The rest will have to come out of the consumption of the people. The magnitude of the required cut in the resources consumed is of the order of £150 million in the next year and might be double—or perhaps much more, depending in the main on productivity and on the fate of the housing programme—in two years' time. (Of the flow of resources now going into consumption, £150 million represents about 2 per cent.) The cut will have to be imposed either by reducing money incomes (which is politically impossible) or by a great increase in

voluntary savings (which seems unlikely) or by rising prices (that is, prices rising faster than incomes) or by higher taxation. But there is a complication here. The reduction needed is a reduction below the present level, and if the total national output is to go up, then the people will have larger incomes than they have now, part of which they will, in the absence of counter-measures, try to spend. If Mr Gaitskell wanted to reduce consumption by £150 million worth of resources, and if he wanted to do the job entirely by taxation, he might have to take something like £275 million a year more out of the pockets of the people than the present level of taxation would do.

To mention such a figure is to suggest how little chance there is of such drastic assault upon the problem in April's Budget. Mr Gaitskell sounds as if he means to be courageous—but not as courageous as all that. There are, in fact, a number of expedients ready to his hand that would enable him to balance the books with a much smaller total of taxation this year. But ever looming up on the horizon is the problem of 1953-54. There are no expedients strong enough to shrink that problem to manageable proportions. If the rearmament programme does not cost more than is now estimated, if investment can be cut without permanent damage to the national efficiency, if the abnormally rapid increase of productivity of the last four years can be kept up—even if all these favourable assumptions come true, there is still a very direct and considerable cut in the standard of living of the people to be made before 1954.

It is as well that minds should be clear about the magnitude of the burdens. But there is another aspect of the matter to which minds are only just beginning to turn. The burden is smaller than in wartime; but it may well be more permanent. It is not two but three permanent prior charges that the community is imposing upon its annual resources: a formidable apparatus of government, a comprehensive programme of welfare, and a panoply of arms. It is doing this, not for a few years' emergency, in which all manner of means can be excused by the end they serve, but for a generation. How, in such circumstances, can society best ensure that it remains both efficient and free? That will take much thought; and a long time, to answer.

Recognising Italy

LAST week's meeting at Santa Margherita between the French and Italian Prime Ministers directs fresh attention to the importance of Italy. How great this is can perhaps best be appreciated by examining the opposite to the truth rather than by looking straight at the facts. If, for instance, the Italian Communist party were now in power in Rome, if Signor Togliatti and his flinty henchmen, Secchia and Longo, now occupied the Viminale instead of Signor De Gasperi and his Christian Democrat, Socialist and Republican Ministers, the Atlantic Pact powers would have a very serious strategic and political problem on their hands in the Mediterranean.

Happily, history has not in fact taken such an ugly twist, and there is every hope that the crucial verdict of the Italian elections of April, 1948, will never now be reversed. The Communists of France and Italy were defeated in their bids for power during 1947 and 1948,

and neither country has so far looked back from the sharp improvement in its political stability and economic strength which began in that period. But it should never be forgotten that, in Italy at any rate, the price of security is constant and vigorous leadership. And while Italians already owe a great deal to the political skill of their Prime Minister, Signor De Gasperi, so does the rest of the western world. As a corollary, both inside and outside Italy, the defenders of freedom still need to do all in their power to support and sustain the present democratic government in Rome.

The success which Signor De Gasperi has achieved in reconstructing his country from the ashes of the war begins to bear some comparison with the achievements of the founders of modern Italy. Signor De Gasperi is a different stamp of man from Count Cavour, but, as with Cavour a century ago, an understanding of the part De Gasperi has played is essential to assessing the develop-

ment of the present strengths and weaknesses of the Italian republic. In 1851 Cavour began the last and most important decade of his life in which, as Prime Minister of Piedmont except for two short periods, he so manoeuvred events both at home and abroad that the union of Italy gradually became inevitable. In 1951 Signor De Gasperi finds himself in his sixth continuous year as Prime Minister of a united Italy and leading the sixth government over which he has presided since he first came to power in December, 1945. During this time Italy's relative progress has been, as the head of the ECA Mission to Rome said last month, "beyond the dreams of even the most optimistic of its planners."

On the other hand, it is true that the Prime Minister remains no more than a symbol of the continuity of this recovery rather than its actual architect in every joint and outline. He himself is a politician rather than an economist, and his government's achievements have been negative rather than positive. He has certainly held the fort, given Italy internal security and a stable administration, and at least made a start in tackling some of the desperately needed reforms. But no one could pretend that Rome has more than scratched the surface of what needs doing to bring social justice and even a modest degree of economic equality into the lives of the Italian people. From the point of view of long-term economic policy, Signor De Gasperi's contribution—dictated admittedly by the uneasy balance of political forces in the government—has been no more than to evade the ultimate choice between individualism and collectivism. The Prime Minister has played, in fact, the role of an admirable chairman, and if he had failed to do so Italy would almost certainly be in a more difficult position than it is today. This is not statesmanship so much as an admirable example of the politician's art.

★

Perhaps Signor De Gasperi's main claim to a place in history is that his qualities have enabled the Italian governmental system to survive in its present form. It has often been he alone who has kept the unwieldy Christian Democrat party together and effectively resisted political pressures from both left and right. On the left, one of Signor De Gasperi's greatest successes was to manoeuvre the Communists into resigning from his coalition government in 1947, so that they were out of the administration when the 1948 elections came along. On the right, the small reactionary Liberal party resigned from his government last year rather than accept its measures for land reform, and the Prime Minister, along with Signor Scelba, in charge of home affairs, has lately taken up a resolute stand against the unfortunately growing swing towards such neo-Fascist groups as the MSI (*Movimento Sociale Italiano*). How long these pressures can be resisted, however, depends in part on the success which the government can achieve in its almost desperate struggle with the many-headed hydra of Italy's permanent long-term economic problems, in its efforts to bring home to the electorate the real political issues of the present day, and in its attempt gradually to regain something of Italy's pre-war international standing.

For behind the imposing brickwork of the new Italian democratic structure lie several serious political weaknesses. One, of course, is the deep split right through the country created by the very size of the Communist

party—two and a half million members and a voting strength considerably above that—and by the Communist hold even now on the bigger trade unions. Others are the fact that the unity of the multi-coloured Christian Democrat party is severely strained and that clericalism is still so strong. In the long run, anti-Communism will not be enough to hold together indefinitely men of such varying opinions as those to be found among the Christian Democrats today. Signor De Gasperi's occasional hints of resignation have so far always brought his pack to heel. But he is 69 and one day must be succeeded by someone who, even if as competent, energetic and courageous as a man like Signor Scelba or Signor Gonella, does not have and cannot at once have the kind of following and personal prestige which now belong to the Prime Minister.

On the economic front, a remarkable feature of Italy's present position is that the country's gold and dollar reserves, standing—so far as the latest figure shows—at \$567 million, are higher than at any previous time. In fact, leaving aside the appalling and ever-present dilemma of over-population with limited natural resources, the short-term trends of the Italian economy have not been unfavourable. During the past year the foreign trade deficit was considerably reduced, inflation was held broadly in check, industrial production rose to 16 per cent above that of 1938, budget revenue and expenditure ran very nearly in balance for the first time since the war, and the gross national income continued to show an increase. On the other hand, immediate and serious economic problems are never far below the surface in Italy, and the present time is no exception. Nowhere do politics depend more on economic success than in Italy. Today, the De Gasperi government is threatened with a renewal of the inflationary spiral, owing to the prices of raw material imports and the needs of rearmament. There is also a risk that Italian exports, a good many of which are classified abroad as inessentials, will fail to keep pace with the earnings required to maintain the present volume of imports as world prices rise. The government has a bill up its sleeve granting new powers to control profits, prices, supplies and wages, but this is only sidestepping the basic requirement which is, in the long run, to keep prices down by gearing the economy to higher scales of production.

★

This, then, is the Italy with which the Atlantic powers have to deal. It is a country that has very largely recovered from the physical and moral ravages of war: that, at least for the moment, has attained a fair degree of political stability under a system which, in spite of the obvious cracks in the structure, is thoroughly democratic in character: and that—partly as a result of the gift of \$2,000 million from the United States during the past five years—has made considerable economic progress against immense temporary as well as permanent disadvantages. It is, in fact, an Italy which deserves to have its problems more generally and publicly appreciated in the western capitals.

These problems are certainly great. On the home front, Signor De Gasperi's task is to develop and keep moving a progressive policy which will tackle Italy's long-standing social and economic ills. This is a profoundly difficult assignment when his administration is based—as it is bound to be based at present—on so much support from right wing elements in the Christian

Democrat party. But Italy is still a long way behind most other Western European countries in narrowing the extreme differences between rich and poor, in removing class and sectional differences, and in dissolving its hard core of nearly two million permanently unemployed. The problems of foreign policy are less acute, though they certainly look serious enough in Rome. For the Italians, occupying an important position in the ranks of the medium powers, feel that they lie on the exposed frontiers of the western bloc and that they have run genuine risks in joining the North Atlantic Treaty Organisation.

They thus stand committed to all that the western powers may do, although they themselves occupy no place in the inner hierarchy of the Atlantic Pact. It should be remembered that the Italians have no direct say, for instance, on the three-power Chiefs of Staff Committee in Washington and, unlike the French, no special position in the discussions on raw material allocation. At the same time, their influence in Europe is considerable and likely to grow, they have a predominant strategic and political position in the Mediterranean,

On the Beat

TRADITIONALLY, a constable patrols his beat at two-and-a-half miles an hour. It is a leisurely, almost an awe-inspiring pace. He remains on his beat for eight hours a day, six days a week, making his "points" and reporting back to his police station by telephone about once an hour. His visible presence is a comfort to the law-abiding citizen and a deterrent to the criminal; little should escape his notice during his slow and steady progress. For very many years, therefore, it has been held that there is no adequate substitute for the constable patrolling a beat on foot.

During the last few years, however, a number of drawbacks to the traditional beat system have emerged. First, the shortage of policemen since the war has meant that in most police districts beats have had to be made much larger and they are no longer patrolled as thoroughly as before. Secondly, the rapid development of police specialists has made the constable in urban areas little more than a reporting agency; the monotony of his work has increased and as a result his efficiency has tended to decline. Thirdly, the larger beats and the long intervals between the constable's reports to his station have meant that he is seldom available for emergency calls which have had to be handled more and more by police cars in wireless touch with headquarters. Finally, the boundaries of the beats themselves have tended to remain fixed for months on end, regardless of the fact that the amount of police work that has to be done in any particular area varies during different periods of the day and different days of the week.

All these factors together have certainly contributed to the increase in crime since the war. Persons and property have not been adequately protected, and, in spite of the shortage of policemen, manpower has been wasted. During the past two or three years, therefore, a number of chief constables have broken with tradition and have tried out new methods of policing their boroughs or counties. The most revolutionary experiments—and the most successful—have been carried out by the chief

and it is important that their relations with the Jugoslavs across the Adriatic should continue to improve. For all these reasons, the interest of the western alliance is that positive thought should be given to making Italy's passage in it as smooth as possible. For the first time for a long while, units of the British Mediterranean Fleet have just been visiting Genoa—second only to Emilia as a Communist stronghold. It may be that flag-showing naval cruises nowadays make little serious difference to the relationships between nations; but the idea was a good one. The people of Italy need to know better and to understand the growing strength of that west to which their destiny is now bound. Equally, their own position and problems need to be known and understood and appreciated in the rest of the western world, both for the contribution which they themselves can be encouraged to make to the common security, and in order that Signor De Gasperi's government may receive the proper credit for his positive foreign policy. This is not only his due but will strengthen his hand in the ceaseless internal fight against those who take their orders from Moscow.

constables of Aberdeen and Salford. The Salford system, which is a development of that used in Aberdeen, is being tried out this year in London. It promises to become widespread throughout the police forces in Britain, and it is undoubtedly the most important innovation in police methods in recent years.

The Aberdeen experiment was to abolish fixed beats worked by single constables and to substitute much larger patrol areas worked by a team of constables under a sergeant. Each team was given a police car which the sergeant used to move his men from one part of the patrol area to another. Patrolling was still carried out on foot, but the time which would normally have been wasted moving between vulnerable points was much reduced and it was much easier to know where individual constables were. The car, fitted with wireless, was available for emergency calls, and the constables were encouraged to follow up any incidents themselves without calling on specialist help except in cases of real difficulty. The main features of the system were its mobility and the fact that constables acted as a team rather than as individuals. The results were good; there was a substantial saving in manpower and the efficiency of the force, measured by the number of criminals who were caught, greatly improved.

In Salford, the idea of a team of constables operating from a police car was retained, but it was linked with a novel conception of the beat system. The city was split into divisions in the usual manner, but the patrol areas in each division were kept flexible. Rough boundaries were laid down for beats during each of the three general phases of the city's activity—working hours, entertainment hours, and sleeping hours—so that there were enough constables where they were most likely to be needed. In effect, the boundaries of beats are changed three times a day, but the inspector in charge of each division is also given wide powers to change the beats even more often if circumstances make it necessary. A beat covering dockside streets, for example, would be

made much smaller during a dock strike, with its abnormal possibilities of trouble, than during normal working conditions.

Each police team in Salford consists of nine constables with a sergeant in charge and one police car fitted with wireless. No special driver is carried, the constables themselves taking it in turn to carry out this duty. Before each team starts its tour of duty, which lasts for eight hours, the inspector and the sergeant review the work that is likely to arise. They take into account the recent incidence and locality of crimes and street accidents, complaints from the public of general nuisances, property which needs special protection, and other matters which might require police work. The sergeant then draws up a list of "operations" for each man. Two or three will be detailed for point duty, others will be given particular streets to patrol, and one man will probably be kept with the sergeant and the driver in the car, which will also be used for patrol duties. The whole team is told what to look out for and what sort of incidents are likely to occur. The car serves the dual purpose of a mobile police station and a quick means of moving the constables about from one beat to another. The sergeant knows within narrow limits where his men are, and he is able to pick them up and take them to an emergency call, say, in a matter of minutes. As in Aberdeen, the constables are encouraged to handle as much of the work as they can without calling for help, and from time to time, for training purposes, a constable is put in charge of the team and directs the operations of his colleagues.

The importance of this method of working the system is that, as in the traditional beat system, the constable remains individually responsible for a definite area or duty. The responsibility does not fall on the team as such and the police do not operate in squads. The chief difference from former beat systems is that the beat can be changed immediately to fit in with any situation.

The advantages of the Salford system are that it retains the benefits of orthodox systems while at the same time it meets most of the needs of a modern industrial community. The public gets much more rapid attention to its calls for police help, and criminals are kept guessing

where the constable's beat is likely to be. Areas and premises which in the past could only be cursorily examined are now properly supervised. There is far more contact with the public whose confidence is being won by the more efficient service it now receives. It is true that the advantages of speed and mobility are also obtained by superimposing mobile patrols on orthodox beats, but where that is done, the constable on the beat tends to be excluded from the more interesting incidents in his area. The constable's local knowledge is not used, sometimes to the detriment of the people concerned, and there is, moreover, a waste of manpower which few forces can afford. Under the Salford system, the interest and keenness of the policemen are greatly increased. There is no longer the monotony of patrolling the same area week after week, waiting for something to turn up. The constable gains more experience in a shorter time than is possible under orthodox systems, and in Salford the improvement in morale has been outstanding.

The measurable success of the system has also been remarkable. In spite of the fact that in Salford the police force is 25 per cent under establishment and that crime has increased during the postwar years as much as it has in other parts of the country, in 1950 more than 60 per cent of all indictable offences were cleared up. This figure compares with an average of 44 per cent for the whole of England and Wales for 1949. The uniform branch made nearly twice as many arrests as it did in 1947, before the system was introduced, and the work done—that is, according to the number of reports of incidents—has increased by nearly 50 per cent.

There can be little doubt that the general principles of the Salford system are better suited for policing urban districts under modern conditions than the traditional beats. Obviously, the system will have to be modified to fit in with the needs of much larger areas such as London. The greater density of traffic, the different character and habits of the population, and the special duties which are imposed on the Metropolitan Police will all have to be taken into account. There must be a period of experimenting first. But of all recent suggestions for improving the police service, none holds out better hopes of success.

tion is of some importance; if there is to be—as the Russians wish—a meeting of the council, they will be legally correct in insisting that discussion be restricted to matters concerned with the peace settlement and not stretched to include, for instance, complaints about Soviet—or American—policy in general. If it is to be a coming together of the ministers for more general purposes, then the discussion could, in theory, range far wider; but there is no sign that the Russians want this.

When the deputies meet to discuss the agenda next month this is one of the first matters with which they will come to grips. Whatever the prospects of their agreeing, it is of vital importance that the western deputies should have at the back of their minds a clear-cut, firmly agreed policy for Germany. For there are signs that Moscow is made uncomfortable by all evidence that the initiative is being taken out of its hands.

Stalin Gives the Line

This discomfiture over western complaints of heavy Communist armaments shows itself strongly in Stalin's interview with *Pravda*, which made the headlines of

the Soviet press last week-end. In answer to the first question put to him, Stalin argues at great length that the social and economic policy of his government is entirely incompatible with the picture of Soviet rearmament drawn by Mr Attlee in the House of Commons. The argument amounts to saying that a nation cannot simultaneously have guns, shoes and hydro-electric stations. In fact it is not difficult to understand how the Soviet Union gets all three when it is recalled that the pick of its army—twice the size of General Eisenhower's present force—has lived largely on the East German economy, and that standards of pay and amenity are much lower than in western forces.

There has been much fussy speculation about the timing and significance of this interview. It seems clear that it was intended mainly to give the line for two important occasions: the elections to the Supreme Soviet of the Russian Republics and the meeting of the World Peace Council in Berlin. Hence the statement that world war "at least at the present time . . . cannot be regarded as inevitable," and the great emphasis on the need for "the peoples to take into their own hands the cause of the preservation of peace and defend it to the end." With his strategy of all mischief short of war, Stalin naturally regards the Party's subversive peace campaign as "of paramount significance."

Two other points were noteworthy. First, the suggestion that the United Nations' troops must be defeated in Korea, because their men have no faith in the cause for which they are fighting. This way of committing the Chinese ally to victory is hardly balm for the sore wounds that Peking must be feeling. Second, there was a much more detailed and angry attack on the United Nations than is usual in Soviet statements, without the usual assurance that the Russians will go on trying to make it work. Indeed, Uno was said to be "taking to the inglorious path of the League of Nations" and "thereby dooms itself to disintegration." As Moscow has always rejected proposals for revising the Charter, it may be considering the idea of boycotting Lake Success and using the World Peace Council as its platform instead.

Tory Diversions

The series of Conservative challenges to the Government in the House of Commons has ended for the moment. Although there was some criticism of Mr Churchill's decision to make defence policy a party issue, most of the Conservative back benchers feel that boldness and aggressiveness are the best tactics for the moment. Although some of the longer headed Conservatives would as soon delay their arrival in power until the present wave of industrial unrest has passed, the majority are baying for power—or, in other words, conforming to the central meaning of politics.

Various groupings are discernible within the Conservative party, but they are much less clearly defined than those in the Labour party—or, for that matter, in the Conservative party when it was in power—simply because the Tories are in opposition. Back benchers become much more vocal and active in the party councils when there is a chance of influencing government policy or securing office. In the wartime Parliament, for instance, there was not only the Tory Reform Committee, with its liberal tendencies, but also the Progress Trust to oppose it by standing firm as the "hope of the stern unbending Tories." Both these groups have fallen into obscurity, but their counterparts would spring up again if the Tories secured power with a substantial majority.

Under the relatively unruffled surface—for the Conservatives are a highly disciplined and very "secure" party—one can detect at least three main groupings of opinion. Setting aside such individual diehards as Sir Waldron Smithers and Sir William Darling, there is a distinct right wing group.

Sir Herbert Williams, Sir John Mellor, Major Guy Lloyd, Mr Kenneth Pickthorn might well emerge as leaders of this Old Guard, to whom Mr R. A. Butler and his views are anathema. Against them one can set the progressives—young men most of whom were trained in the Conservative Central Office during the postwar years—Mr Alport, Mr Maudling, Mr Orr Ewing, Mr Fort, Mr Ian Mcleod. They are the Tory counterpart of the Fabian Society intellectuals, though not necessarily of the Labour dons. The true opposite numbers of the dons are the young executives who would almost certainly go straight into junior Ministerial posts, and some into senior posts—Brigadier Head, Brigadier Low, Mr David Eccles and Mr Birch. They are more interested in administration than in the manipulation of men's wills which is so large a part of the day to day work of politics. The businessmen on the back benches are themselves worth study. The hard-faced man who got into politics as the spokesman of big business between the wars is no longer a distinctive figure on the Tory benches. Many of the more vigorous back benchers who are in business are self-made men with relatively small interests—Mr Harris the food manufacturer from Croydon, or Mr Marples the builder. They are unlikely to gain high office in a Tory Government, but would occupy the same kind of positions as the less important trade union officials in the present Government.

There are genuine divisions of emphasis and outlook among the Conservative back benchers, but the ground that is common to almost all of them is a poor opinion of their own front bench, on which only four or five men command real respect and confidence. A Tory Government which did not draw heavily on the services of new men would find its own rank and file extremely critical and restless.

Writing Off Groundnuts

The Government had its narrowest majority for some time in Tuesday's division on the second reading of the Overseas Resources Development Bill. The Bill gives effect to the decision to write off the £36 million advanced to the Overseas Food Corporation for the East African groundnut scheme, and transfers responsibility for the corporation from the Minister of Food to the Secretary of State for the Colonies. (The Minister of Food will, however, have direct responsibility for the Government's interest in the Queensland-British Food Corporation, which was set up by Queensland legislation, as a subsidiary of the Overseas Food Corporation, to grow sorghum and raise pigs and cattle in Queensland.)

The Opposition's amendment to the Bill was to the effect that good money should not be thrown after bad in Tanganyika until there has been an impartial inquiry and reliable estimates have been obtained. The Government's reply was, first, that to abandon the scheme altogether now would cost as much as it is planned to spend in the coming seven-year experimental period. This argument by no means answers the Opposition's case, since if the scheme has eventually to be abandoned, it would be cheaper to do it at once than after another £6,000,000 has been spent. There is much more substance in the Government's second point—that a fresh inquiry could hardly elicit any more reliable estimates than those already put forward on the basis of the reports of the two working parties, composed partly of independent experts, which visited the groundnut areas. Whether crops can be grown profitably in the areas that have been cleared at such cost can only be found out by experience, and it is this experience which the corporation is now buying for a relatively modest £6,000,000. Moreover, the fact that the money will in future be provided by annual votes will give regular opportunities for calling a halt.

The purpose that an independent inquiry would usefully serve is to reconsider the whole question of colonial develop-

NOTES OF THE WEEK

When Foreign Ministers Meet

Looking back over the stubborn diplomatic exchanges between Moscow and the western capitals of the last four months, a significant pattern emerges. At one moment in November the Russians had the initiative with their insistence that the proposed rearmament of Western Germany must be discussed in the Council of Foreign Ministers. At another the West regained it by insisting that there were wider causes of international tension than disagreement over Germany, which could not be properly discussed within the limits usually observed in the council's agenda. When Moscow tried to shy away from the proposal of a more comprehensive discussion, the West came back with its declaration that the high level of armaments in the Soviet Union and satellite countries was at the root of most current fears. In short, as the discussion by note has shifted away from the limited point of Germany to the broader one of relative strength in armaments, so the Russians have become less eager for an early meeting.

The question now to be asked is whether we shall see this spring a meeting of the Council of Foreign Ministers or just a conference of four foreign ministers. The distinc-

even if you have to borrow a copy

the civil estimates of £193 million, compared with 1950-51, bringing their total to £2,383 million. In fact, however, almost the whole of this increase is accounted for by what is really defence expenditure. Expenditure on strategic reserves by the Ministry of Food, the Ministry of Supply and the Board of Trade will amount to £143 million, compared with under £13 million in the present year. Nearly £17 million of the increase of £52 million in the Ministry of Supply's general estimate is also attributable to the defence programme.

If these amounts, and the increase in the estimate for civil defence, are subtracted from the total, the increase in the civil estimates proper is only some £40 million, of which £11 million is accounted for by a higher vote for Foreign Office grants and services. Of much more interest is the comparative stability in the estimates for the social services. For some of these, notably education and the Exchequer's grants to the national insurance fund, annual increases are at present inevitable. The health service has, however, apparently achieved financial stability—a matter which is discussed more fully in the following note. The increase in the Assistance Board's vote reflects a full year's payment of assistance grants at the higher scales approved last May. It is not possible to obtain an exact estimate of the food subsidies from the vote on account, but the Ministry of Food's vote rises from £398 million to nearly £405 million, while the food production services of the Ministry of Agriculture and the Department of Agriculture for Scotland show an estimated fall of nearly £18 million.

The following table gives some idea of the cost of that part of the social services which falls on the Exchequer, although it should be remembered that in the vote on account this cannot always be distinguished from the general departmental estimates.

	1950-51	1951-52
Ministry of Food (incl. food production services)	443.3	432.3
National Health Service	392.9	398.0
Education (incl. Grants to Universities and for Science and the Arts)	246.8	255.8
Ministry of National Insurance (incl. family allowances)	214.6	219.4
National Assistance Board	91.3	97.1
Housing	60.7	60.3
Child Care (incl. approved schools)	7.8	8.0
	1457.4	1470.9

The general policy for 1951-52 seems to be one not of retrenchment but of stability in non-defence expenditure.

Wot, No Supplementaries?

A year ago, the country was presented with an additional bill, amounting to nearly £100 million, for the cost of the national health service. This year, Sir Stafford Cripps's ceiling on social service expenditure has proved to be more firmly fixed. The supplementary estimates issued last week, amounting to £13,836,000, are almost entirely accounted for by an increase in the Assistance Board's vote of £7,305,000, and by the Treasury's purchases of the silver recovered from the withdrawn silver coinage, which accounts for an extra £2,000,000. Additional sums are, it is true, needed to pay dentists and chemists in Scotland, but these have been offset by savings in other branches of the Scottish health service, with the result that the supplementary estimate for the health service as a whole is the modest sum of £10, instead of £100 million.

Yet the stability that has been achieved in the cost of the health service this year—and apparently for next year as well—should not be taken to mean that its finances are now in a healthy state. Apart from the fact that it is impossible to estimate accurately the cost of a service for which

the public demand is so unpredictable, the most unsatisfactory feature of the present system of financing is that a straitjacket is being placed on a service that must be flexible to be successful. It is impossible to see how full advantage can be taken of the progress in medical science with the existing rigid control of hospital budgets and the strict limits to expenditure on other branches of the health service. The only way in which relief for the taxpayer can be reconciled with the need to improve medical care is by making people pay as they use the service. Otherwise, the Government may find itself in the ridiculous position it has got into over meat—and drugs like cortisone will have to go unused because they would add too much to health service costs.

Pre-Crisis in France

With its debate on electoral reform, which has been given priority over infinitely wider economic issues, the French parliament has entered a period of what the newspapers call "pre-crisis." The situation is as usual ticklish and the outcome obscure. Apart from the Communists, who cling ferociously to the proportional system, all parties desire electoral reform. The crucial rift is between the MRP, which wants a departmental majority system with one ballot, and the other parties which want the same system, but with two ballots. If under either system there is no absolute majority in a department for a party or association of parties, the seats are, as in 1946, to be allotted proportionately to the votes cast.

The burning question is: Will M. Pleven insist on a vote of confidence on the two-ballot system? If he does, he will fall, for on this issue and this issue alone, the Prime Minister will find an absolute majority of MRP and Communists against him. In that event, M. Pleven is entitled to ask for a dissolution, but may not do so (a dissolution before the end of the Assembly's life would entail the advent of a caretaker government with Communist Ministers, which would scarcely be palatable to France's allies). If M. Pleven calls for a simple vote the two-ballot system may prevail; for the Council of the Republic will certainly amend the bill, and upon its return to the Assembly in several weeks' time there will be an opportunity for a final compromise between the two factions in the coalition.

But what seems most improbable is that France can afford to wait six weeks for decisions regarding its economic future. This stubborn fact may well indeed dissuade M. Pleven from staking his government on a vote of confidence. Here again the parties, excepting of course the Communists, are broadly agreed with M. Buron, Minister for Economic Affairs, that the prices of key products (coal, steel, gas, electricity) must be pegged in order to avoid repercussions throughout the whole economy. Disagreement ranges over the amount of inflation permissible on account of the rise in world commodity prices. One optimistic estimate is that the increase in the price of coal could be limited to 5 or 6 per cent by subsidies to the nationalised industries—coal mines and gas and electricity. This measure would entail, it is believed, a transfusion from the Exchequer of 60 billion francs. These funds might be found half by loans floated by the public utilities themselves, and half from consumer taxes on cars, petrol, tobacco and other luxuries. M. Faure, Radical Minister of the Budget, while declaring himself against subsidies that would increase the existing deficit for 1951, has proposed the creation of a price stabilisation fund to be applied to the key products.

The sole alternative to this policy of controlled inflation via key subsidies is, it seems, to allow prices and wages to find their level, perhaps 25 per cent higher than the present

ones. To go to the polls after such a policy would be tantamount to mortgaging the governing power of the next parliament. In any event some decision must be taken without delay. Already steel and iron manufacturers are holding back their stocks in anticipation of the government's raising their price. If this goes on production will fall and unemployment soon follow.

Rock of Contention

It is high time that the Foreign Office began to take the question of Heligoland seriously—before there is a tragedy or an incident that will have a quite disproportionate effect on German relations with the British. Those who insist that the RAF cannot practise its bombing anywhere else, or that it is unwise to give way to the Germans in angry mood, do not seem to realise that they are up against a highly organised campaign to squeeze every drop of propaganda value out of public feeling over the devastated rock. Now the conspirators have publicly declared their intention to repeat some time in the next fortnight the *Aktion*, or foray, on to the island that provided a lead story for the German press on New Year's Day.

A motley group of resisters has gathered under the leadership of Prince Hubertus zu Loewenstein, including representatives of Moral Rearmament, the "Group to Fight Inhumanity," the European Movement, and the powerful organisation of those who were driven westward across the Oder-Neisse line in 1945 and after. Their arguments in favour of allowing fishermen, excursionists from Hamburg, tourists and inhabitants to have access to the island are of less importance than the fact that this group's agitation is weaving together the nationalism of the eastern refugees, the sentimental sympathies of many western Germans and a peculiarly German version of the feeling for a united Europe. The prince's slogan is "a free island, in the free Germany that is to be, in a united Europe." In other words the harmless are being shepherd into alliance with the harmful in an agitation against British authority. It is hardly fair to expect these people to understand that there is some connection between the security of free Europe and the precision of British bombing; and there is now a real risk that somebody will be killed and become a martyr overnight.

Difficult Mood in Madrid

Although the question of the ambassadors has now been settled between Spain and the leading western powers there is no lack of difficulties in the way of a genuine rapprochement. A great deal of water has still to flow down the Manzanares before Madrid will regard either London or Paris in a benevolent light. In a speech at the turn of the year General Franco gave it as his view that 1951 is the decisive period in civilisation's struggle with Soviet imperialism. In that he certainly stands in good company. But the Spaniards' reactions to tentative suggestions that they should enter into closer and more friendly relations with the North Atlantic Treaty powers are apt to be deliberately unhelpful, indeed provocative.

Even in his appointment of an ambassador to London General Franco appears to have done his best to twist the lion's tail. After British rejection of Señor Castiella, a man with a notable Falangist record, and after the distinct possibility that General Franco might have nominated his brother Nicolas, he has now sent—in Duke Miguel Primo de Rivera, the second son of the famous general who ruled Spain in the nineteen twenties—someone whose sound and uncompromising Falangist background will not smooth his path in London. In Madrid, too, it is questionable how much the new British ambassador, Sir John Balfour, will be able to contribute to the improvement of relations if—as is rather

expected at present—General Franco will receive him when he arrives and then not again except on very special occasions. This would not be the way to repair broken links.

In replying at some length to a recent leading article in *The Economist* the Madrid newspaper, *Ya*, which usually reflects Catholic political opinion, made these two points—amongst others. First, the western powers now owe Spain reparations for the long period of their hostility; until these are made Spain cannot offer them any help or alliance. Second, disapproval of the Spanish regime is unwarranted interference in other people's business; who is asking liberals to support a "totalitarian situation" anyway? Neither point shows a sense of realism. If progress is to be made in the rapprochement, which is now in the interests both of Spain and of the western powers, two things must be clearly understood: first, that the west has no need or intention to buy Spanish favours; secondly, that in the democracies Spain's experiences during the last fifteen years have come to stand for something which cannot be forgotten overnight. If the new relationship is to prosper each side must contribute.

Rabbi and Immigrant

Whether President Weizmann and the outgoing Prime Minister of Israel, Mr Ben Gurion, succeed in their efforts to reform the Government or are forced to a general election, the basic issue which faces them remains. The present crisis concerning religious education is symptomatic of a clash of wills which has been occurring for some time (the last cabinet crisis turned on the same issue). The trouble is the pull between the young worker who wants a bus to go on his Friday evening hike and the Rabbi who doesn't.

The religious bloc is becoming increasingly defensive and strict in face of the opposition of Jews from Western Europe who have been brought up with a more liberal attitude towards the observances of their faith. In fact, the Israel politicians are discovering that to administer a modern state which is half-way to being a theocracy is a wellnigh impossible task. King Ibn Saud nearby still maintains a theocracy because his government is entirely autocratic, and it has not yet suggested to the Beduin that there is any reason why their hands or feet should not be severed as the punishment for theft dictated by the Koran. Other more enlightened Moslem states have over a period of years gradually dropped the more outmoded customs of their faith and adopted liberal laws to govern their citizens' behaviour. But they all still have many legal reforms to undertake. Israel may have to follow suit and attempt to solve this issue before it has absorbed too much of the time and energy needed for constructive work.

The Liability of Hospitals

It is hard to credit that for forty years the Courts have been in doubt whether the governing authority of a hospital is responsible for the negligence of its staff, and, if so, of which sections of the staff. In other fields of activity the employer is responsible without question for the acts of his servants done in carrying out their duties. Just as the London Transport Executive is liable for the results of carelessness on the part of a bus driver, so an accountant is liable for the professional carelessness of his clerk. But in 1909 the Court of Appeal decided that St. Bartholomew's Hospital, while it was responsible for choosing its professional staff with care, was not responsible for the way in which the staff discharged its duties. In 1942 the Court of Appeal found itself unable to follow that line of thought through to its logical end; it held the Essex County Hospital liable for the negligence of a nurse on a hospital staff, but one member of the Court would not extend that ruling to a surgeon or an anaesthetist on the hospital's staff.

Last week the Court of Appeal went one step further. It held the Ministry of Health, as the authority now responsible for all hospitals, liable for negligence in a Liverpool hospital. If a patient engages his own surgeon, a hospital authority is not responsible for the negligence of that surgeon, although the patient may be in a ward of the hospital and receiving nursing care from the authority's own staff. But, as Lord Justice Denning said, where the doctor or surgeon, consultant or not, was employed and paid by the hospital authorities those authorities were liable for his negligence in treating the patient.

The decision is of considerable practical importance. It is often difficult, and sometimes it is impossible, to identify what is the particular negligent act which has produced the injury or who is the person individually responsible for that act. In this last case before the Court of Appeal, the patient had an operation to relieve stiffness in two fingers of his left hand. When the bandages were removed fourteen days later, the whole hand was stiff. Something had gone wrong, but what? The cause may be one doctor will argue over interminably, but it is hardly satisfactory for a patient to be told by his legal adviser: "If we can prove the cause of the damage was something done by a ward sister, the hospital will pay; if it was something done by a theatre sister, we cannot succeed." The common-sense view is that a patient entrusts himself to the combined resources of the hospital team. If the teamwork is not adequate, then their employers should be liable for that failure. That, in short, is the view now taken by the Court of Appeal.

* * *

The £1,000 House

The architectural competition recently organised by *The Builder* may have an important influence on current thought about the cost and size of council houses. The competition was for the design of a terrace house to accommodate a family of five at a ceiling cost of £1,000 based on prices ruling at January 1, 1951. The winning design was for a house of traditional materials costing £950 with a superficial floor area of 781 square feet.

The price is more than 25 per cent below that of the average three-bedroomed council house. The floor area is also some 25 per cent smaller, but a mere reduction in size would not have reduced costs proportionately. A good part of the economy is due to the omission of elaborate fittings, the second lavatory, the outhouse and other less necessary amenities. The price is very attractive: the reduction in size is likely to raise a storm of protests. Yet here is a solidly built and constructionally sound house, providing the essentials for a good home at a price that the working-class family can afford. The total cost of the house with proper allowance for land and site preparations is £1,144, which gives an economic rent of 19s. 8d. a week, or 11s. 3d. a week if the full £22 subsidy is allowed. With rates this would mean a gross charge of, say, 25s. a week unsubsidised or 16s. 6d. a week subsidised. What is more, this is in no sense a freak house. Of the 322 entrants to the competition, almost all kept within the £1,000 limit and a fair proportion produced designs as practicable, cheap and serviceable as the winning design.

This result is a direct challenge to government housing policy. Dr Dalton should certainly be willing to try the winning house in bricks and mortar. There is already a contractor ready to build fifty at £950 apiece. Four houses for the price of three should be tempting—and it would be interesting to see the response if they were offered at an economic rent of 19s. 8d. without subsidy. If, as is very probable, there are families—ordinary wage-earning families—who would be delighted to rent, at this figure, as many of these houses as can be built, what is the justification for the subsidy?

Shorter Notes

The Bill providing for the call-up of Class Z and other reservists—the Reserve and Auxiliary Forces (Training) Bill—was published on Wednesday. It follows the lines foreshadowed in Government statements but contains two additional provisions of some importance. The procedure to be used this year may be repeated in each of the three following years by Order in Council, without fresh legislation. Secondly, considerable penalties (up to 2 years' imprisonment and a fine of £500) may be imposed on anyone who incites reservists to evade or fail in their duties; to possess documents having this effect is itself an offence, and rights of search by warrant are provided. The provisions are similar to those of the Incitement to Disaffection Act, 1934, but the penalties are stiffer.

*

The text has now been published of the Government's Bill to extend its powers under the Supplies and Services Acts. It consists of two clauses: one adds a further string of generalities to the already wide array of objects for which defence regulations may be kept alive; the other, more sober and definite, extends the powers of the Minister of Transport to close or divert highways for defence purposes. (The second clause contains provisions for public inquiries and for compensation.) But it is satisfactory to be able to record that the Bill does not seek to change the present situation under which these emergency Acts are now renewable on an annual basis only.

Prosperity and Honour

Such, then, is now the flourishing state of the empire. People everywhere fully employed, poor rates decreasing, revenue increasing, taxation in progress of reduction, military and naval forces to be diminished, and tranquillity in every part of the country, particularly in those large towns the growth of which has alarmed even some of the advocates of Free Trade, are the distinguishing features of the times. We have, as the result of Free Trade, prosperity at home and honour abroad. England is, as formerly, "teaching the nations how to live," and they have no higher ambition, though they mistake the source of her greatness, than to follow in her footsteps and be prosperous like her. . . . Now we may perhaps realise to our imagination what would have been the condition of England at present had free trade in grain been refused. Marriages, those signs of a people prosperous at present, and full of hope for the future, calmly pursuing domestic happiness, there would have been comparatively few. . . . The number of paupers and the amount of poor rates would have increased, and having no richer England to help us, they would have swallowed up the rent of the landowner and the profit of the capitalist. Trade would have been paralysed and shipbuilding suspended. As it can scarcely be expected that the people of England would have patiently suffered starvation, the probability is that our great towns would have been foci of sedition and insurrection, and many of those whom famine spared would have been cut down by the sword. . . . For a timely rescue from impending disasters, almost unexampled in history, the nation has not yet learned to be sufficiently grateful to the Great Disposer of all events, and to the statesman whom He inspired with wisdom to do, and to that portion of the people to whom He gave skill and courage to demand the performance of, the right thing at the right time. The Corn Law was appropriately abolished in an hour of need and peril, and the abolition has saved the nation from unspeakable calamities.

The Economist

February 22, 1851

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship.' But . . . have you stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

*Introducing Harry Rolls, general foreman and chief colour-matcher in a London paint factory where he has worked for 53 years. Machines have replaced men on most paint processes, but a trained eye and skilled judgment will always be in demand for colour matching. Paint and Varnish are leading items among our list of Exports.**

But . . . does craftsmanship mean only hand-craftsmanship? Consider the production of the pigments, plasticizers and other materials which are blended into paint. If there

has not been craftsmanship in their production also, then the skill of the paint maker and of the painter will surely be wasted. And if the finished article is to be a masterpiece must there not be craftsmanship at every stage of its production?

Monsanto think so and they follow this rule in making chemicals for a long list of British industries. Monsanto plasticizers, preservatives and basic chemicals play an important part in the preparation of paints and finishes for goods of many kinds.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

Letters to the Editor

Fiddling with Federation

Sir,—On August 3rd, 1949, the Committee of Ministers, by letter, asked the Assembly

to consider any necessary change in the political structure of Europe to achieve greater unity between members, and to make effective European co-operation.

The Assembly responded by adopting unanimously the resolution that "the aim of the Council of Europe was a political authority with limited functions but real powers." It then proceeded to define what the resolution meant, and the protocol is the result. Thus, the protocol stems from the request made by the Committee of Ministers to the Assembly to consider necessary changes in the political structure of Europe.

You suggest that the specialised authorities "have received little more than passing mention." The protocol embodies all the resolutions passed by the Assembly on that subject, and, moreover, by enlarging the competence of the Council by giving it rule-making powers and creating a joint executive, the protocol provides the only adequate and necessary machinery for the proper creation, co-ordination and development of the specialised authorities.

You say that in its essentials the protocol is federalism not functionalism. The former presupposes the creation of a political authority; the latter leads to it. I think we might bury both phrases. The Council of Europe exists. The question we have to consider is whether it fully serves the needs of the peoples of Europe, or whether it fails to serve those needs. And whether its competence and its organisation can be improved. As constituted, the Committee of Ministers has really nothing to do, except curb the excesses of the Assembly. So long as all political and economic matters of any importance are under the control of other European or Atlantic organisations the Council of Europe is impotent, and it is doubtful whether the Assembly can even serve as a sounding-board for Europe.

The commonsense of the protocol is that it does create a political authority; makes sense of the Council of Europe; and meets the different points of view of all its members. The British want unity to proceed by co-operation at Government level; most of the Europeans want a parliament. Under the protocol the council becomes a parliament; its competence is very wide, but before it has any legislative or executive powers a Bill must be approved by the Assembly and the Committee of Ministers, the latter voting unanimously. All European organisations are merged with it; an Executive Council for the Assembly and a Joint Executive for the Council as a whole are created, so that the foundations are laid for the development by agreement of an effective European political authority.—

Yours faithfully, R. W. G. MACKAY
House of Commons

Greeks at Peace

Sir,—An article in *The Economist* of February 3rd says that "the high prison figure of 25,000 is explained by prolonged detentions for political reasons." The total number of persons now in prison in Greece serving sentences after trial and conviction does not exceed 21,000; most of these are cases of ordinary crimes of common law.

As regards internees, the civilian internment and re-education camp at Makronissos was closed some time ago. Since the commencement of the guerilla war, 23,471 civilians against whom the authorities had very strong evidence that they were supporting the rebels, were deported to Makronissos; of these 20,180 were subsequently released after a review of their cases. The remaining 2,800 men and 485 women have been adjudged by successive tribunals as irreconcilable Communists and as a threat to national security. The men have been transferred to Aghios Efstratios and the women to Trikkeri. The only internees still at Makronissos are 200 irreconcilable officers and other ranks, and 610 persons awaiting trial or appeal.

Suggestions that consumptives are living in the same conditions as healthy prisoners are quite untrue. Such allegations regarding the prison at Yioura, for example, were investigated by the Research Institute of Chest Diseases, which found that the proportion of persons with tuberculosis symptoms was less than 1 per cent. Full medical facilities are of course available in all internment camps and cases requiring clinical attention are transferred to the Soteria Sanatorium in Athens.—Yours faithfully,

A. A. PALLIS
Minister Plenipotentiary
London, W.2

A Railway Strike?

Sir,—In your Business Notes of February 17th, in reference to the findings of the Court of Inquiry into the railway dispute, you conclude that the issue is perfectly clear—that higher wages can only be paid if the railways are worked more efficiently.

Broadly speaking, I do not disagree, but when you go on to argue that it is reasonable to ask that the cost of increasing wages should be met by putting an end to restrictive practices, it is prudent to ask what are the restrictive practices of which the Railway Executive complains.

An extension of lodging turns of duty would effect a further use of manpower, but at an increased cost on account of the mileage rate and lodging allowance. Other changes proposed include extended rosters of 9 hours or more—usually more. Why talk about extended rosters when men are already working 9, 10, 11 and 12 hours per day, when traffic conditions warrant? When men object to

an extended roster it is usually because they have performed an effective 8 hours' work and need a hot meal and a rest. It is often on these full and exhausting duties that the railway official wants to tack a bit more, because the man is already on the road and relief means sending men—usually available—out from the depot. Another proposal, the reduction of rest time between duties to 9 hours instead of 12, would again effect a greater availability of manpower.

You will see that the emphasis is all the time on the greater availability of manpower and has very little to do with efficiency. There is, without question, considerable waste of manpower on the railways through sheer bad organisation. What in fact the Railway Executive is asking is that the improvements of recent years, which have at last given us engine-men a minimum of leisure for home life and recreation, should be nullified. I use the term "minimum of leisure" to compare with the large mass of workers who have every week-end free and who have the opportunity of following connected social and recreational activities.

The proposal to abolish "knockers-up"—a custom by no means universal and which could be settled by local agreement—gives one the impression of a desire to "hit the headlines" and suggests that the whole batch of the Railway Executive proposals is nothing more than a counter-attack to the men's claims, and a defence of an outworn system of management that is unable to adjust itself to modern needs. What is perfectly clear is that a worsening of conditions will accelerate the already considerable flow of first-class drivers and firemen from the job, for better pay and conditions easily available outside the railway service.—Yours faithfully,
Surrey ENGINE DRIVER

Housing Figures

Sir,—I agree with your correspondent that national statistics on housing are hard to come by. I have, however, made some investigations in Northampton that may be of interest.

Population, approximately 100,000; almost exactly one house to every three people, including the latest born baby; over 1,250 houses built since the war, and no significant increase in population; 4,700 on the waiting list; 2,700 families without a separate home; 5,800 houses that do not adequately house their inhabitants. Each of these last three figures is worse than in 1945. In spite of 1,250 new houses the housing situation is worse.

The cause of the trouble is that maldistribution of population amongst existing houses is going on faster than the building programme. More rooms are being emptied and wasted than are being built. I believe that there are a number of causes. As Mr Bevan observed, people can now afford more. Social insurance—and in particular national

assistance, which pays rent—has enabled old people to stay in houses where they could not previously have stayed, and there are more old people.

The main cause, however, in my opinion, is rent restriction. Occupation has become a vested interest which nobody will part with if they can help it. The price mechanism for distributing houses has been removed, and nothing has been put in its place. Tenure has become rigid. The cost of repairs has trebled and the landlord can get virtually no income profit from his houses. His sole interest is to obtain vacant possession and take a capital profit. He therefore does his best to get his house emptied. Sub-tenancies and lodgers are discouraged, and alterations to make the house available for more people forbidden. The privately owned houses are, therefore, becoming progressively more thinly populated. Of 12,500 houses of this type in Northampton, 2,000 are overcrowded and 9,000 occupied by two people or less.

I myself believe that the only cure for this problem is to give the local housing authority management of the rent restricted houses in its area. You would then get a proper organisation for repairs and you could get alterations

done. You would substitute a management which desired to get houses filled for one which wanted to get them emptied. This, I think, is the vital point. For instance, in Northampton, on the council housing estates, each house accommodates an average of nearly five people; whereas the privately owned houses accommodate an average of considerably less than three people.

I do not think any compulsion would be necessary. Many people are uncomfortable because they are over-housed, and would be only too willing to move if one could get away from the present rigidity.—Yours faithfully,

House of Commons R. T. PAGET

Russia's Agro-Towns

Sir,—I have seldom read a gloomier report than the very interesting article of your correspondent on Russia's agro-towns. It seems obvious that the technical and labour-saving aspects of the amalgamation should bring considerably smaller advantage to the Soviet Government than it advertises, because reorganisation and the building of the new agro-towns will need much additional manpower, and the net gain will be only the somewhat reduced number of

bureaucrats. The redundant farmer will be far from a satisfactory asset to the industry, especially in Russia, where technical skill is not one of the best points of labour. The true reason for this ghastly idea of depleting the countryside and the transfer of the peasant population to agro-towns with "beautiful houses and asphalted streets" seems to be that the Russian farmer is still in some sort of clandestine opposition. The only way to deal with him is to eradicate all remains of individualism, to sever all ties that bind him to his native land, and to create in this way a new addition to the cruelly artificial society of the Marxist state.

As the free world is unable to fight this menace, it should at least retain the lesson that the hard core of free mankind is the peasant. Everything should be done, therefore, to help these true pillars of free society. To create by land reform as many individual farming units as possible is not enough; their economic success is just as important. Economic, technical and financial aid as well as thoughtful agricultural policy should be the first aim of all countries, but especially of the so-called backward ones.—Yours faithfully,

C. DE FELLNER

Books and Publications

The Planned Miasma

Planning in Practice. By Ely Devons. Cambridge University Press. 231 pages. 15s.

This is an important book. It is true that the general lessons learned by academic economists from their wartime experience in government departments have by now been pretty fully absorbed into current thinking. But what has appeared in print has been much less the direct analysis of this experience than its distillation. The aim—as in Professor Robbins's *The Economic Problem in Peace and War*—has been to restate broad principles of economic policy in the light of wartime experience. Professor Devons himself made a useful contribution to this distilling, in a paper on planning in general, as long ago as 1947. It seems probable, however, that the academics would have enforced more of the attention that their generalisations deserve, particularly from the government departments themselves, if they had not tended to neglect the intervening stage in the argument—the study of wartime planning and controls in specific cases. Mr Devons has written a book sufficiently good to be partial compensation for the lack of the many parallel studies that ought to have appeared by now. It is concerned solely with aircraft planning by the Ministry of Aircraft Production, of which Mr Devons had four years' experience, but his sharply drawn analysis of one case should help to clarify understanding of the way in which planning worked in practice for other kinds of production.

Mr Devons wisely has not tried to write a formal study—still less, a history—of MAP. His book is a personal analysis of the Ministry's planning activi-

ties as they appeared to an economist engaged in them and intellectually anxious to fit them together as a system. It is hard to decide how far the unorthodox form of the book is a success: in effect, its chapters are nine essays (the appendix deserves the dignity of that title with the other eight) on various aspects of aircraft planning. The result is certainly to emphasise conclusions that are reached twice or more from different approaches. On the other hand, the defect of the method is that it involves some compulsory repetition of fact and argument; and Mr Devons's defect as a writer is that, in the search for clarity, he sometimes runs into voluntary repetitiveness. But this is a small weakness; no one should allow himself to be deterred by it, or to be misled into thinking that he can get what is important without reading all the "essays."

Many of Mr Devons's conclusions deserve long discussion. What stands out, however, is the impression that wartime planning was much more inexact than is even now realised. Generally the planners' facts were wrong, their estimates of cause and effect were crude guesses, and their programmes were out of date and out of joint even when they had been anything but impossible "targets" from the start. All this has, of course, been demonstrated before. But it is still not only in local Labour party resolutions that the existence of any shortage or waste in a free market is taken automatically to be something that more planning would put right. Mr Devons's great service is to show with

unusual detail and force what misallocation and waste of resources is likely to occur under planning; and that is when total war makes the overriding priorities few and obvious. The implication is not, of course, that planning much like that practised by MAP could be avoided in another war; it is most definitely that such planning is not to be thought of as a main instrument of rearmament policy in a situation well short of war.

The Impossible Shaw

Thirty Years with G. B. S. By Blanche Patch. Victor Gollancz. 256 pages. 12s. 6d.

In "Thirty Years with G.B.S." Miss Blanche Patch has drawn upon half a lifetime spent with one of the liveliest personalities of the century to write one of the stuffiest books of the year. It would not be a just criticism to state that the book simply supports the axiom that no man is a hero to his secretary. Miss Patch seems to bear no malice against Shaw; in fact, she seems to have formed no real opinion of him at all. Her book clacks on like an office typewriter, while she waggles her head in amazement at goings-on which would never have been tolerated in her father's rectory at Winchelsea.

One of Miss Patch's most irritating gambits is her confession on one hand that she took no real interest in Shaw or his work, and her simultaneous persistence in passing every sort of imaginable judgment on him, including the depth of his affection for his wife. Although the bulk of Shaw's work had been written before 1920, she "knew nothing of his writings" when he hired her, and her

interest quickened only slightly over the years; for example, she never listened to a complete broadcast of a Shaw play. This does not stop her from the smug pronouncement that she read "Jitta's Atonement" in manuscript and correctly predicted that it would be a failure. Again, she placidly admits a complete disinterest in political affairs; this does not deter her from curling her lip at the old man's panic when he saw his income eaten up by the Socialist Government which he had helped to bring to power.

Viewed through the small end of Miss Patch's telescope, Shaw seldom emerges as much more than a bearded bundle of eccentricities. She may well have respected and admired her late employer, but "Thirty Years with G.B.S.", as she has written it, is a mean book about a mean man.

The American Solution

The World in Crisis. By J. Salwyn Schapiro. McGraw-Hill. 429 pages. \$4.50.

This book is an evaluation of the political and social movements of the first half of this century of the "common man"—who is no longer distrusted as the upholder of revolution, but cherished as a safeguard against it. The author examines the reasons for the passing of liberal capitalism, and finds them in the application of science to industry; the introduction of mass production methods to colonial peoples, which converted suppliers of raw materials into competitors for finished goods; and the creation of national cartels, which nullified free enterprise. Abuses of economic despotism resulted in the rise of socialism, and the planned economy of the depression and world wars was carried over into the welfare state of today.

Professor Schapiro stresses the anomaly of an international economy in a world of national politics, and poses questions which are crucial to the Western way of life. Are democracy and liberal capitalism indivisible? Can democracy secrete its own antidote to ills arising in the body politic? Will the wider distribution of wealth resulting from the abandonment of *laissez faire* mean greater production? Greater production, obtained by American economic hegemony and "know-how" is the panacea. He is convinced that if

all the world enjoyed a standard of living comparable to that of the United States, our welfare would be accomplished and our iniquity pardoned.

This useful summary of contemporary affairs suffers from repetition and an over-simplification which sometimes distorts the author's conclusions. For him, the granting of dominion status to India is "the debacle of colonial imperialism" due to the economic exhaustion of India's "enemy." No account is taken of the Simon Report, the Round Table Conferences, the Government of India Act, and other landmarks in the evolution of British-Indian relations. Nor has he any qualm lest the Atlantic Pact, instead of being "novel in the history of diplomacy" should prove a new guise for the balance of power of the bad old European days, when "because of the military might of the Great Powers it became the practice for all the other European powers to dance to whatever tune the Concert played."

Professor Schapiro is unhesitatingly censorious in pointing out the faults of Europe, and lyrically unashamed when glorifying the American role in world affairs: "The daughter who, in 1776, left her mother's house, slamming the door, now returned a friend, rich, powerful and generous" . . . "the dramatic entry of America as champion of democracy" . . . "the immense prestige of the greatest power in the world." Phrases like these recur with almost mechanical regularity, and one feels a nostalgia for the quiet and powerful dignity of Lincoln's Gettysburg speech, or Roosevelt's sober statement of the Four Freedoms.

The strongest part of the book is the summing up of the struggle between two rival revolutions; one in support of world organization based on an international bill of rights, and the other on totalitarian hegemony over satellite states. The conclusion would make a good text for the New Year:

An old world is dying, and a new world is struggling to be born. . . . It is, therefore, of the greatest importance for the present generation not to expend any effort in defending what is already dying. It should, however, exert all possible effort to maintain intact those values bequeathed by the past that continue the "chain of being" of Western civilization.

The Root of Evil

The Industrial Development of South Wales. By A. H. John, Ph.D. University of Wales Press. 201 pages. 12s. 6d.

Detailed regional studies in the history of industrialisation are an invaluable means of testing the generalisations of the economic historians. How important were the local banks in providing industry with capital in the early nineteenth century? How far was the movement to the new industrial areas a drift by short stages from parish to parish and how far was it a more purposeful long-distance migration? Dr John applies these and many other questions to the period 1750-1850, the era of the dominance of iron in South Wales, dealing particularly with problems in the financing of industry, the development of a labour force, the markets of the coalfield, and the techniques of production. His analysis is no rehash of accepted views and facts but is based on extensive documentary material hitherto untapped, notably on estate records and the papers of such magnates as the Crawshays.

The South Wales coalfield, lacking an industrial tradition and a large merchant class, was characterised by the immigration of enterprise and capital, and the merchants of Bristol, "the Welsh metropolis," and London, attracted by the appetite for iron of the wars of the late eighteenth century, were the first to come. The author emphasises that this "foreign" enterprise remained largely dependent on Welsh labour, even skilled workmen being only rarely imported. The gap between master and man, accentuated by the linguistic difference, was thus exceptionally wide, the more so as a substantial middle class failed later to develop. The essay illuminates particularly the methods of countering capital shortage on the coalfield, demonstrating the degree of importance of loan capital, frequently raised on the security of a mineral lease.

We are continually reminded here of the dangers of a too easy exploitation of mineral resources; economical, even reasonably safe, mining techniques were introduced only slowly, while lighter industries were stillborn. The reader sees developing before his eyes the ground of the region's later economic vulnerability. This study in industrial

Mass Produced Man

Enter Citizens. By Alexander Clifford. Evans Brothers. 280 pages. 12s. 6d.

In this book, Mr Clifford takes a quick tour around postwar Europe. He himself knows Europe extremely well, having lived and worked all over it as a foreign correspondent since the nineteen thirties—except when he was a successful war correspondent. Mr Clifford is a master at his own trade. But it is doubtful whether he brings any new message. He summarises ably and points a moral in a number of pithy passages. But his book manages to leave the impression that, while it provides an entertaining and valuable introduction for those who know relatively little or indeed nothing about postwar Europe at first hand, it does not have a great deal to offer the more experienced observer.

Part One, the first fifty pages, is the best of the book. It is the personal story of how Mr Clifford and his wife, Jenny Nicholson, arrived and established themselves in the Rue de Combray—an excellent description of the mood and atmosphere of Paris immediately after the war. The author calls this section an overture. His opera goes on to describe the mass-produced man of the present day, a distasteful creature who has emerged from the war as the new sovereign in contemporary European politics. This man is self-satisfied and smug, always blames others for his misfortunes, has a distaste for work, tends to resort readily to violence, pursues ordinariness as a cult because he is himself of such poor quality, seeks a good life in this world rather than the next, and has "a passionate interest in the products of the civilisation he is taking over, but little or none in the principles or mechanics of it." Severe though he is, Mr Clifford undoubtedly hits a good many nails on the head. He goes on to describe the influence of democracy, fascism, communism, and religion in the world which the mass-produced man now inhabits. It also includes a round-up of Europe's economy on the lines of a Marshall plan report, and descriptions of places such as Albania, Italy and Germany, on which Mr Clifford has been reporting these last few years.

History of the Motor

Horseless Carriage. By L. T. C. Rolt. Constable & Co., Ltd. 204 pages. 20s.

The author truly says in his introduction that any book which aimed to give a complete and detailed history of the road revolution occasioned by the coming of the horseless carriage would necessarily be a weighty tome. It must be admitted that Mr Rolt has done his best to provide a broad outline of the evolution in Britain of the private motor car within a brief compass; as such it may appeal to a number of people who wish to acquaint themselves with the general history and progress of the self-propelled vehicle. The reader who hopes to find any serious contribution to his knowledge of the origin and development of the motor car will, however, be disappointed at the superficial manner in which various important events in the history of motoring are treated.

The author covers a very wide field, starting off with a lengthy description of the steam carriages which were the rather fruitless subject of much experimentation in the late 18th and early 19th centuries. He then proceeds to trace, more briefly, the introduction of the internal combustion principle on which all present-day motor cars operate. The book recounts a good deal of already published information about the development of the motor car through the Edwardian era, and also details models of the 1920s, of which many have vanished from the market. A chapter dealing with "The age of mass production and monopoly" shows how the methods of Henry Ford profoundly affected the British automobile industry, but the author's strictures on quantity produced cars are a little alarming. He is evidently a believer in the hand craftsmanship type of car building, which, of course, has produced some excellent results: it is difficult, however, to give whole-hearted support to his statement, that "with the recent death of Ettore Bugatti, quality lost its last champion."

Racing has a chapter to itself, with, naturally, emphasis on the Continental car. The author mentions that England has been predominant in land speed records, but no modern figures are given. The absence of accents in the printing of the book makes familiar words such as "Mercedes" look strange, while an

"e" which has been missed out of Henry Sturmeys name has found its way into "Roots" as applied to superchargers.

Perverse Yesterday

Contemporary Jewry. By Israel Cohen. Methuen. 410 pages. 25s.

This book is a painstaking work of scissors and paste. Most of the information which it gives is easily accessible—the tale of Jewish cultural development, of Zionism and the Palestine mandate, of the dreadful era of Hitler's persecution, and of Jewish services to the allies in the war. On the other hand, it omits two topics about which all interested Gentiles, and many Jews, would like to know more. One is the effect of unlimited immigration upon the living standard of Israel. The other is the machinery whereby the immense Jewish community of the United States annually collects and disburses its wonderfully generous charity, and the extent to which the donors think they should have a voice inside Israel. The United Jewish Appeal (annually feeding millions of dollars into the United Palestine Appeal, the United Service for New Americans and the Joint Distribution Committee) is not even mentioned. Only the last named gets a passing tribute. Mr. Cohen signed his introduction in April, 1950, by which time much information on all these topics was available. Since he fails to impart it, he misleads when he calls his book "contemporary."

He gives some revealing diagrams and statistics which show how the world's Jewish population has waxed and waned in our century and how greatly it has shifted in our generation. Over 51 per cent now lives in the Americas, and eighty-five per cent of American Jewry lives in the United States. He also gives some little known facts about the "Jewish autonomous territory" of Birobidjan in Soviet Asia. His account of the activities of Jewish organisations at the 1946 peace conference, where they were "careful not to concentrate upon" either the Slav bloc or the Western bloc is also new and interesting. But the book as a whole is disappointing. It strikes the note of a perverse yesterday, and scarcely conveys a breath of the zest that inspires contemporary Israel.

Can you tell me if any there be

Who will give to me employ

For to plough and to sow, to reap and to mow

And to be a farmer's boy?

The Farmer's Boy. TRADITIONAL

THAT FINE OLD SONG was bellowed at Rent Suppers and Harvest Homes long before Marshalls of Gainsborough were ever heard of, and Marshalls have been going for over a century. And in that century Marshalls have been largely responsible for changing the face of British agriculture. Gone or going are Dobbin the Percheron or Blossom the Suffolk Punch. We plough, sow, reap, mow, harrow, roll and bulldoze by tractor and crawler. The thresher has out-moded the flail, and the combine harvester is fast displacing the thresher.

Sentiment bids us sigh for the past, but reason and economics make us more than thankful for the products of Marshall's skilled teams of agricultural engineers. Not that Marshalls are specialists in agricultural implements alone. Industry knows well their Fowler diesel locomotives wherever, up and down the world, there is shunting to be done. Road rollers from Gainsborough smooth the roads of five continents. Marshall boilers and lofty steel chimneys cluster in the grimy manufacturing belts which are the backbone of Britain.

Again, in Crook, County Durham, the Marshall Richards Machine Company continues to meet today's requirements of producers everywhere for a wide range of Wire and Tube Drawing Plant. The Marshall Organisation has stamped its name indelibly on the map of the world.

THE MARSHALL ORGANISATION

HOTELS

personally and independently

recommended by

Ashley Courtenay

"Our pages understand human nature." I like to feel that this saying is applicable to the 1951 edition of my book, "Let's Halt Awhile in Britain." Now available price 5/6d. from all good book shops. It describes some 550 of my personally recommended Hotels, a few of which are listed in my "Shop Window" below. Next week's address: 63, St. James's Street, London, S.W.1.

BEMBRIDGE, I.O.W. for your holiday. ROYAL SPITHEAD HOTEL offers comfort and good food. Direct access to beach. Sports. Family parties welcomed. Fully licensed. Brochure on application. S. C. Selwyn, resident Managing Director.

BROADWAY, Wores. THE LYGON ARMS. Always in season, though there are many who feel its dullness is enhanced when the curtains are drawn, for it is then they appreciate the log fires, cooking in the best English tradition, and a pleasantly warmed bedroom complete in its comfort. Tel.: 5.

HAWKHURST, Kent. COLLINGWOOD HOUSE, HOTEL. In this historic and lovely Georgian house, the art of gracious living is still practised. Warmth, unusual comfort and a high standard of catering will be your lot. For Brochure write, N. Allan-Smith. Tel.: 353.

HYTHE, Kent. HOTEL IMPERIAL. Holiday this year on the Kentish Coast, at this magnificently equipped hotel facing the sea. 50 acres garden, private Golf Course. A large number of rooms with private bath; some private suites. Fine Ballroom and Cocktail Lounge. A.A., R.A.C. Tel.: 67411.

JERSEY, C.I. ST. BRELAD'S BAY HOTEL. (44. Register). 14 hrs. flight from London. Flowers, sunshine and an equable climate. Completely sheltered, facing the sea and the south. Now looking for spring. Details with pleasure from R. H. Colley. Tel.: St. Aubin 1.

MINEHEAD, Somerset. NORTHFIELD. Situated in 3 acres of grounds, aims at high standards of catering and comfort AT ANY TIME OF THE YEAR. Convalescence? A honeymoon? Or just in holiday mood? Lxmoor, the sea, and Northfield make a happy combination. Tel.: 894.

NR. NEWQUAY, Cornwall. GLENDORGAL. Nigel Tange offers you the perfect holiday by the sea. Private steps to Atlantic surf-bathing and golden sands. 10 acres of private coastline grounds. Own farm produce: cream, milk. Children's paradise; comfort and rest for adults. Tel.: Newquay 2949.

ST. MAWES, Cornwall. HOTEL TRESANTON. Lovely Country House in sheltered Bay. Beautifully furnished, every modern convenience. First-class cuisine; Club bar. Re-opens March 19th; terms from 20/- per day. Trains met. Truro. Resident Manager, A. Miles Huntbett. Tel.: 522.

SALCOMBE, S. Devon. TIDES REACH HOTEL. What a lovely address for a seaside holiday! Here, on the edge of a sandy beach, with boats, fishing, safe bathing and fine walks, are added the finishing touches of comfortable accommodation, good fare and ample garage space. Tel.: 238.

SIDMOUTH, Devon. BELMONT HOTEL. A.A. Appointed. A first-class luxury hotel, noted for its excellent food, and occupying the finest position extending to the sea front. Through-coaches daily from Waterloo. Private Suites. Gas fires. Private bathrooms. Lift. Fully licensed. Tel.: Sidmouth 1291.

RAVENSCAR,

Scarborough.

RAVEN HALL HOTEL

A completely self-contained, fully licensed holiday hotel. Heated sea-water Bathing Pool, 9-hole Golf Course, Putting, Hard Tennis, Bowls, Billiards, Dancing (Orchestra)—all free to residents. Riding available. Fully inclusive (terms 35/- to 47/6d. per day. Tel.: Cloughton 253.

SCARBOROUGH, ROYAL HOTEL

Planning a sunny, bracing holiday this year? Write Tom Loughton, Resident Director of this superbly situated hotel, providing excellent food, delightful surroundings, light music, dancing and comprehensive holiday amenities. Early application is essential. Terms 28/- to 39/- per day. Tel.: 1948.

EASTER is EARLY

this year, but not too early to enjoy the Spring sunshine and flowers at

TORQUAY'S

GRAND HOTEL

Now booking for Easter. For tariff write E. Paul, General Manager. Tel.: 2324.

How wide is your window?

Each of us has a window with a view of the contemporary scene.

How wide that window is, how much of the scene it reveals, depend, in these days of the broadcast and printed word, on what the observer hears and what he reads. Chiefly, no matter how loud his neighbour's radio, on what he reads.

Let the Manchester Guardian Weekly widen your window. Here are the happenings of the week selected with an adult appreciation of what makes news. Here too is comment that follows an honoured tradition of editorial freedom. And here are intelligent and readable reviews of books, music, art and the theatre. Good panes for the mind's eye to see through.

AMERICAN SURVEY

Clearing Military Skies

Washington, D.C.

THE present preoccupation of the American amateur, who has, over the last few decades, taken up, and dropped, water-colour painting, psycho-analysis and the Popular Front, is with geopolitics. Hardly a day goes by without the publication of one or two ponderous articles accompanied by large maps on which swirling lines define the extremities of the Eurasian land-mass or the defence perimeter of the Western Hemisphere. It is essentially amateur geopolitics—and its application to military strategy—on which Mr Hoover and Senator Taft have been engaged during the past six weeks. Both have been addicts for some years and both remain unmoved by past failures.

"We would need five million to eight million American boys, in addition to the British," Mr Hoover announced portentously on November 19, 1941, "to invade Hitler's Europe. . . . No military expert believes we could land such an army in Europe." Undaunted by the collapse of this assertion, he affirmed, nearly ten years later, with equal certainty that "Communist armies can no more get to Washington than any allied armies can get to Moscow. . . . No responsible military man denies these two conclusions." As far as the first of them is concerned, it is to be hoped that, for once, Mr Hoover is right; as for the second, he is certainly irrelevant.

Nobody has suggested the raising of allied armies for such a purpose, but he made it necessary for Senator Lodge to get an assurance from General Marshall that "no vast American land army," such as would be needed for an offensive, was contemplated. And Mr Taft, who thought in March, 1941, that "war is even worse than a German victory," told General Eisenhower recently that he "somewhat exaggerates the danger of an unsuccessful war in Europe," since it does not follow that "because of a Russian success on the continent we should be cut off from any raw materials, either in the Belgian Congo or in Indonesia."

The inability of these two once more to spread their qualms all over the country, as they did six weeks ago, can probably be traced largely to the achievements of General Ridgway in Korea. He has done more than stabilise the line and seriously hurt the enemy; he has got the campaign back into the pattern of pre-Korean wars and made it comprehensible—and, therefore, less frightening—to the public. As long as General MacArthur was uttering his alternating cries of triumph and anguish, as long as the communiqués were being written by advertising copy-writers ("fighters roared into the air to resume destructive attacks on Com-

munist targets" was a typical example quoted in the *Christian Science Monitor* by Mr Joseph Harsch), there was a general feeling of unreality, a sense that, in some unexplained way, supernatural powers were aiding and abetting those "Chinese hordes" to which Tokyo referred with such relish.

All that has been changed. General Ridgway's tactics (which have been described as "homicidal rather than geographic") are understandable and deeply satisfying to a people who have suffered 50,000 casualties in a "police action" which they undertook from a profound belief in the value of collective security. European opinion may have grown testy and apprehensive under the unending stream of blunders which emerge from Mr Truman's press conferences or the more lasting political errors into which the opposition has led the State Department since June 25th. But Europe should not allow itself to forget the idealism from which sprang the national support for the President's action, even though some of its manifestations may have been inconvenient at times at Lake Success. The heavy casualties inflicted on the Chinese are some consolation for the unexpected failure of right to win a clear-cut decision over night.

More credence has been given to the news from the battlefield since the 8th Army took over the writing of communiqués, returning them to the realm of cold, factual statement, and since the Air Force gave up counting its efforts to the nearest Chinaman killed. The method adopted for arriving at these figures—that of counting bodies against the snow from reconnaissance planes—seemed to be one which was unlikely to provide an over-estimate. And so it proved. Where the retaking of ground has allowed them to be checked, they have been shown to be under-estimates—sometimes, indeed, no more than 10 per cent of the real total. But it is now realised that "more than 300 . . ." makes a better air force communique than "306 . . ." and these claims are now being accepted without derision. It is sober men in the Pentagon, not the publicists in Tokyo, who are now confident that the ratio of Chinese to United Nations casualties is in the region of 18 to 1.

There are still plenty of worries about the Korean campaign, one of the main ones being exactly how and when it can be finished. But the attitude towards it in Washington is now more relaxed and attention has been turned to the problem of building up American—and Atlantic—armed strength in other parts of the world. General Marshall told the Senate committees last week that it is not a question today of having large bodies of troops ready to march down

"Who Does This Eisenhower Think He Is?"

Herblock in the Washington Post

to the docks and embark for Europe. Our problem is the creation of troops. The limiting factor today, by far the most critical factor, is the long time yet required to do this.

By the beginning of 1953, he confirmed to Senator Lodge, the United States would have 18 divisions and 18 combat teams—roughly equivalent to 24 divisions in all—which will be no more than existed on the day of Pearl Harbour. When he was Secretary of State a little more than two years ago, he said grimly, there were only 1½ divisions in the whole continental United States. But he gave the impression that he intended the new divisions to be far better trained and more battleworthy than those he had available in December, 1941.

It has never been the intention of the Defence Department to produce and maintain, let alone send to Europe, a "vast land army." (In attacking such a conception Mr Hoover was barking up an imaginary tree.) Not even the American economy could support permanently such an army; armies in the United States invariably are expensive—the cost was recently stated to be \$10,000 a year for each man. But a vast air force is a different matter. In a war against Russia, the American army would not be, certainly during the early stages, more than a small component of the total Atlantic forces. But the air force which is planned—one of 96 groups—is imposing by any standards. Without help, it should be enough to outfight anything the Soviet Union could put into the sky. And it has been the strategic concept that Atlantic air power would be able so to harry and confound Russian armies advancing across Europe and so to smash their lines of communication that fifty or sixty divisions on the ground would be able to contain any offensive which could be mounted after the ordeal by air.

*

One of the most disturbing lessons of the Chinese attack at the end of November appeared at first to be that one man with a rifle, and with twelve pounds of rice and three days' supply of ammunition on his back, was a match for one fully trained and expensively equipped Western soldier. If this had proved to be true, the whole of the planning of the Defence Department would have had to be changed. Again General Ridgway came to the rescue. He showed that the reliance on fire-power on which the Pentagon planners had counted was not misplaced. (General Ridgway himself was one of the most influential of those planners until he was hastily sent to Korea on the death of General Walker.) That is not to say that some weaknesses in western methods have not been shown up. American technology is producing weapons which are too complicated. An American weapon has been found to need eight men to operate it while the Russian equivalent, undoubtedly inferior but not so inferior that it is less than 25 per cent as efficient, only needs two. But General Ridgway has demonstrated that there is nothing wrong with the basis of the planning of the last few years and there have been, as a result, some sighs of relief. Korea is now providing information which is valuable without being too disheartening.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Giant Money

[FROM A SPECIAL CORRESPONDENT]

AMERICANS in general regard their giant industries with pride even when they break them apart under the hammer of the anti-trust law. They recognise that their financial institutions are useful, but they are not so likely to admire them. Long before the Communists discovered the uses of Wall Street as a whipping boy, certain popular newspapers had found it profitable to exploit the fear, suspicion and plain dislike with which that symbol of the financial community was, and is, regarded throughout the country. These national attitudes, being deep-seated and complex, do not change easily. They have by no means caught up with the shift which, during the last decades, has taken place in the comparative size of American industry and finance.

When, in 1930, Mr Gardiner Means and Mr Adolf Berle made their important study of the American corporation,

* Estimated.

their list of non-financial companies with gross assets exceeding \$2 billion contained five names—the telephone company, three railroads and a steel firm. To these may be added three banks and two insurance companies with equivalent assets, making ten in all, five of them industrial and five financial. By 1950 the list of \$2 billion companies had almost doubled in size, and shifted notably in balance. Given the productive surge which accompanied and followed the war of 1941-45, it is not surprising to find nineteen companies where in 1930 there were ten. But the great growth is reflected not only in the productive industries but also in finance.

The telephone system has more than doubled in size, and still heads the list. The Standard Oil Company of New Jersey is now included in the first ten and the General Motors Corporation has also been added. In these twenty years the US Steel Corporation has dropped from fifth place

to thirteenth and all railways have slipped from among the first ten; only one of them—the Pennsylvania Railroad—is among the nineteen giants. Industry's score, which was five out of ten in 1930, is in 1950 five out of nineteen. The other fourteen are financial institutions, handlers of private capital. Seven of them are banks (with total gross assets of \$26 billion) and the other seven are insurance companies (with total gross assets worth \$35 billion). Accepting gross assets as a measure of size and power, it must now be recognised that 73 per cent of America's giant private enterprises are engaged, not in the making of goods, but in the handling of money.

So concerned has the country been with the increase in public capital investment that the implications of this other change in private capital have yet to be analysed and understood. In the light of it, two current developments take on added significance. The first is the government's suit, under the anti-trust laws, against the investment bankers. The second is the plea of life insurance companies incorporated in New York State to be allowed to invest their funds in a wider variety of securities.

*

The suit against the investment bankers which began to be tried last November, three years after it was filed, marks the first time that the government has attempted to bring this financial "industry" under the censure of the Sherman Act. The defendants are the seventeen leading investment banking houses and their trade organisation, the Investment Bankers' Association. Because ten of these houses are co-partnerships, all their 132 partners are named in the complaint. The list reads like a "Who's Who" of American finance. The government is charging both conspiracy in restraint of trade and monopoly. The ground of the complaint goes back as far as the handling of the Anglo-French loan of 1915 by a syndicate of banking houses, but the syndicate method is only one of many points of attack. In general, the plaint is that the defending companies conspired to monopolise the handling of security issues, to assign them to various firms by agreement instead of through competition and to prevent the issuer from selling his stock in a free market and the investor from purchasing in one; furthermore, it is alleged that they do actually monopolise the management of underwritings. The suit, similar to a British suit in Chancery, asks not for punishment but for the mending of practices alleged to be illegal.

Students of economic phenomena and development in the United States owe a large debt to the device of public hearings—before committees of Congress, state legislative

groups, judges on the bench—and this case promises to add a long and important chapter to the volumes collected earlier. The government may use testimony presented before the Pujo Committee of 1912, the Pecora inquiry of 1932, and the hearings of the Temporary National Economic Committee in 1939. With this as background, the Anti-Trust Division of the Department of Justice has, since 1944, been making its own inquiry into the business practices of the leading investment bankers.

For the defence, the case provides a chance to reply to the long series of earlier charges made without benefit of court procedure. Here, if ever, investment bankers can be presented as heroes, and the complex fabric of their business can be shown to play a vital part in the building of the country. In making the opening statement for Kuhn Loeb and Company, one of the seventeen defending firms, its counsel traced the transplanting to New York of mid-nineteenth century German banking traditions by the founding partners, the enlisting of funds from London, Paris and Berlin, the underwriting of rail and industrial ventures which, at great risk, were opening up a raw and empty land for future profits. He sought admiration for his clients as men of courage and determination who played a decisive part in creating modern America. The judge queried his use of the word "courage," the government counsel smiled. The presenting of evidence has not yet begun. The case promises to be a long one, and there is every reason to assume that it will be carried to the Supreme Court.

*

It is a provocative coincidence that the life insurance companies of New York should at the same moment be asking a state legislative committee for the right to purchase more kinds of the security issues that investment bankers deal in. Contrary to British practice, American insurance companies have been (since the airing of scandals in 1906) closely controlled in their investment programmes by the various States in which they make their homes. In New York, regulations now in force date from 1940, when permissible types of investment were newly defined and the percentages of funds which could be invested therein were fixed. The companies are now asking for more leeway. Specifically, they want to be allowed to invest in ordinary shares (a form of investment permitted to trustees since 1947, for 35 per cent of their funds) and to make loans to small business.

In both instances a troublesome factor is the size to which modern financial institutions have grown. The seventeen investment houses are charged with absorbing the management of more than half of all securities issued on a negotiated

...requires a well planned and executed sales program. Irving Trust Company will put you in touch with competent organizations in the United States to help you develop or expand your sales there.

IRVING TRUST COMPANY

ONE WALL STREET • NEW YORK 15, N. Y.

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

basis during a fifteen-year period. The insurance companies, individually and as a group, have outgrown the garment of investment within which they do business, and seek to add new material. The question with which both groups are faced is that of how big America will allow its new giants to become. For years the Supreme Court refused to consider mere bigness an offence unless it was demonstrably accompanied by dirty work. Then in 1945 came the decision in the anti-trust suit against the Aluminium Company of America, in which a lower court, acting with the delegated authority and subsequent approval of the Supreme Court, decided that in certain instances size itself might hold danger for the nation. The Aluminium Company was judged to be too big for the public good, and was ordered to break itself into pieces. That precedent, set in regard to an industry, hangs like a threat over the giants of finance.

American Notes

Senator Lodge Presents the Bill

General Marshall led the Defence Department's team of witnesses into the Senate hearings on the dispatch of ground troops to Europe and took the opposition's most promising wicket with his first ball. He announced that present plans call for only four divisions, about 100,000 men, to be sent to Europe to join the two divisions already there. This figure, well within Senator Taft's limit, disposed of the rumours of an expeditionary force of perhaps one million men so effectively that it seems a pity it was not published long ago. The Administration was, however, reluctant to give it, not only for security reasons, but also for fear that Congress, if given an inch of information, would try to take an ell and entangle the Administration in commitments for a still uncertain future. The questions later asked of General Bradley and other Defence Department witnesses showed that these fears were not groundless.

Senator Wherry and Mr Hoover are now trying to rally their side by suggesting that the White House is "gagging" military leaders who disapprove of sending American troops to Europe. Mr Hoover wants the committees holding the joint hearings—the Armed Services and Foreign Relations Committees—to carry out their own investigations in Europe and to hear "experienced and independent" witnesses; after that, he will himself be glad to "reappraise the whole question" for the benefit of the committees. Defeat may perhaps be postponed by this manoeuvre, but it remains inevitable.

The attack on the Republican "retreatists" is being led by the Republican internationalists, but they do not have enough confidence in the Administration's judgment and good faith to give it the free hand for which it asks. Senator Lodge has now presented their bill, in the form of a compromise resolution. He would permit the sending of a limited, but unspecified, number of troops to Europe, provided that the Joint Chiefs of Staff certify that this is essential to the security of the United States and that its allies have definitely undertaken to develop their capacity to resist aggression. Furthermore, a joint committee from the Senate and the House would be created to supervise the carrying-out of American commitments under the Atlantic Pact. Not only does this resolution contain the germ of further Congressional attempts to restrict the President's constitutional powers as Commander-in-Chief, but it also brings the House of Representatives into a picture that until now has contained only the Senate. Senator Connally, presumably speaking for the Administration, objects to the delays which this would inevitably cause. His own draft resolution calls only for Senate approval of the sending of troops abroad; it sets no limit to the number, but asks the President to

consult the relevant committees of both the House and the Senate, as well as his military advisers, before sending men to Europe.

* * *

Labour Walks Out

The three labour members of the Wage Stabilisation Board walked out last week. This was not only a protest against the wage formula adopted by the majority, but an attempt to dramatise the other grievances of the trade unions and bring pressure upon the Administration to remedy them. For the first time in history, officials of the American Federation of Labour, of the Congress of Industrial Organizations, and of the independent railway workers' and machinists' unions are working together to ensure that labour speaks with a single voice on wages, prices, controls and taxes, and that it is listened to with respect. Their bitterest complaint is that in the Office of Defence Mobilisation it has been drowned out by a businessmen's chorus.

The wage formula adopted by the public and industry members of the Wage Board permits increases of 10 per cent above the levels prevailing on January 15, 1950. This, it is believed, more than compensates for increases in the cost of living since then, and is adequate to allow those left behind in the wage procession to catch up. The Board promises to review the position in May, when the next index of consumers' prices is published. The unions had pressed for a 12 per cent ceiling, but their real objection is to the requirement that cost-of-living and productivity bonuses (the so-called "escalator" clauses), as well as the value of pensions and other non-wage gains won after January 25, 1951, must be reckoned in the 10 per cent. The automobile workers have already announced that if their escalator contracts are not honoured, they will no longer regard their contracts as binding.

The hesitation of Mr Eric Johnston, the Economic Stabiliser, to approve the formula, as he must before it becomes effective, is understandable. The packing-house workers of the CIO, who were granted a rise in the autumn, have just won another which the application of the formula would deny. The textile workers of Mr Emil Rieve, one of the labour members of the Wage Board, have already gone on strike for increases, both in wages and other benefits, which would not be allowable. Mr John L. Lewis, himself frozen out of the labour policy committee, has made it hard for the other union leaders to be conciliatory, even if they wished to, by rubbing it in that his miners have won increases totalling 20 per cent in the past year.

The walk-out of labour's representatives paralyses the Wage Board; the threatened withdrawal of its agents from other defence bodies would weaken seriously the whole-heartedness of the defence effort. Mr Truman is also aware that to alienate his labour supporters would mean the Democrats entering the next election races under a heavy handicap. Mr Charles Wilson, the Defence Mobiliser, has consequently decided to capitulate on at least one front. He has offered to grant the demand of the unions that he should appoint a labour man to his policy staff, if he will serve virtually full time. The letter conveying this offer was, however, an olive branch with thorns, for it insisted that the offer had been made previously—something the unions hotly deny. The question now is whether the unions will be satisfied with this victory or hold out for further concessions.

Wheat upon the Waters

The suggestion that the United States might allow the people of India to starve to punish Mr Nehru for his friendliness to the Chinese Communists has been indignantly repudiated. Among the sponsors of the Bill to authorise the shipment of the 75 million bushels India needs to maintain

its meagre grain ration are not only members of both parties, but even Senator Knowland and Representative Judd, both champions of the Chinese Nationalists and hence Mr Nehru's sharpest critics. Senator Taft himself climbed aboard at the last moment, after the President had enlisted the aid and political influence of Mr Herbert Hoover.

No political strings are attached to the wheat thus cast on Asian waters. But the Administration proposes that although the whole amount should be authorised, Congress should only appropriate funds for the first million tons, and that a mission should be sent to India to supervise the distribution of the grain and investigate the need and other sources of supplies. India will be required to establish a counterpart fund in rupees, to the value of the wheat (about \$190,000) to be used to increase its productivity. These provisions, similar to those accepted by the Marshall countries, should do much to meet Congressional criticism. This is rooted not only in resentment of the Indian role at Lake Success, but in suspicions that India has cut off some of its own food supplies to spite Pakistan, both by refusing to buy Pakistani wheat and by growing jute and cotton on food lands in order to avoid buying these crops from Pakistan. Another point which troubles Congress is that though India offered to accept a long-term credit, the Administration prefers that the wheat should be a gift. This is because, even if India could repay the loan, repayment would delay India's programme of development.

The wheat itself can be spared from the American reserve of about 375 million bushels, much of which is held by the Department of Agriculture. There has been a run on the cheap wheat subsidised under the International Wheat Agreement, and the Department has withdrawn the subsidy, temporarily, to make certain that what remains of the year's quota is fairly distributed. But wheat is available at American market prices, if only the box-cars can be found to bring it to the ports and ships are taken out of the reserve to carry it to India in time.

It would be quite wrong, however, to attribute any part of America's generosity to a desire to be relieved of surpluses. The burdensome stocks held by the Department of Agriculture before the Korean war have run down rapidly; most of what remains is sanctified as an emergency reserve; and Mr Brannan has appealed to farmers to grow all the wheat, maize and cotton they can, at the expense of crops not essential to defence. Production controls imposed, but fortunately not everywhere observed last year, have been lifted from all commodities except peanuts and tobacco. Maize producers in particular are being urged to increase their harvest to 3,500 million bushels from 3,130 million last year, to compensate for the large consumption by livestock.

No "Miracle" for New York

The State Board of Regents, the highest educational authority in New York, has revoked the licence for the showing of the Italian film "The Miracle" which, grouped with two others under the title "Ways of Love," was judged the best foreign offering of 1950 by the New York film critics. The step was taken unanimously, on the ground that the film was sacrilegious. Earlier it had been denounced as blasphemous by authorities of the Roman Catholic Church, Cardinal Spellman had asked all Catholics to boycott it, and the theatre had been picketed. In January the Commissioner of Licences in New York, Mr McCaffrey, tried to ban "The Miracle," but was prevented from doing so by the courts. Two other films have suffered recently from Catholic action: a showing of the prize-winning "Bicycle Thieves" was withdrawn after a march of protest by the Knights of Columbus, and in Albany the police closed "Bitter Rice" after complaints from the Legion of Decency.

In New York, the licencing of films is the province of the Motion Picture Division of the Department of Education;

appeals, when a licence is denied, are addressed to the Regents. The "Miracle" case is, however, the first time the Board has been asked to revoke a licence already issued; the power to do so is not specifically granted in the law, and is to be disputed in the courts. In the meantime New Yorkers will not see "The Miracle."

Licences are withheld from films which are immoral, obscene, inhuman, or sacrilegious. The last standard is the difficult and dangerous one to apply, for what is offensive to one faith is not necessarily so to another. A group of Jewish rabbis and Protestant ministers have defended the right of non-Catholics to form their own judgment of "The Miracle" and even the judicious *New York Times* has concluded that where such doubts exist, it is essential to "lean away from censorship."

Two years ago when Mr Paul Blanshard published his book on "American Freedom and Catholic Power," arguing that the second was endangering the first, fear of Catholic resentment and reprisals led to its going almost unreviewed in many newspapers and magazines; those which touched it wore gloves. Yet despite what the *Nation* called the "silent treatment"—or perhaps because of rumours of the boycott—the book stayed on the best-seller lists for many weeks. The surest way to feed the religious intolerance which is always a danger in the United States and which Catholic writers claimed to find in Mr Blanshard's book, is for the Roman Catholic authorities to attempt to use the state to impose censorship on Americans not of their own faith. Even the Vatican's attempt to discourage American Catholic laymen from joining Rotary and other clubs caused such criticism that the order had to be modified as it applied to the United States.

Shorter Notes

The Export-Import Bank has granted the first credits to Spain out of the \$62.5 million included in the last Marshall Plan appropriation. Three of the four credits, which add up to \$12.2 million, are to help Spain build up its agriculture, but the fourth and largest, for \$5,000,000, is to buy cotton. Spain used to be an important buyer of American cotton, but has not had the dollars recently; it was Congressional representatives of cotton-growing states who were primarily responsible for the passage of the loan authorisation over the Administration's protests.

*

The Air Force, expressing its regret, has dropped its charges of disloyalty against a Negro officer in its reserve, Captain Charles Hill, who has an outstanding war record. The allegations, which carried "guilt by association" to new depths, were that he had been seen reading the *Daily Worker* and that his sister and father had Communist connections. Captain Hill insisted that an enquiry be held before he would resign his commission; he argued that even if the charges were true, which he denied, they would hardly constitute evidence of disloyalty.

*

The State of Maryland has just completed a check of the famous Mason-Dixon line, named after the surveyors who, in the seventeen-sixties, marked it with sandstone monuments at intervals of a mile. The line is the boundary between Maryland, the most northerly of the "southern" states, and Pennsylvania and Delaware. Many of the monuments are still there, although so weathered and overgrown that they are difficult to identify.

*

The National Association of Coloured Graduate Nurses has disbanded, because it feels there is no longer any point in a separate group to look after the interests of Negro nurses. Nowadays, these nurses are welcomed by the white nurses' associations in all but four states—and, of course, the national capital, where racial discrimination is almost as bad as anywhere in the country.

THE WORLD OVERSEAS

Soviet Economic Progress—I

Production under the Postwar Plan

(By a Correspondent)

THE statistical office of the Soviet Government has published its report on economic development in 1950, without insisting on the fact that this was the last year of the first postwar Five-Year Plan. Thus the Plan has reached its end without the Soviet authorities having drawn up a general account for the period. This is the more surprising because the Plan has been, on the whole, successful. It may be that the overall balance will still be officially announced with the appropriate publicity and ado. In the meantime, a fairly clear picture emerges from a comparison of the five annual reports published between 1947 and 1951.

The first two years of the Plan were taken up by painful efforts at rehabilitation accompanied by bad harvests. In the third year the prewar levels of output were reached and slightly exceeded. At the end of 1949 the targets set for the end of 1950 were nearly reached. But it was not decided to proclaim the fulfilment of the Five-Year Plan in four years: instead, the final objectives of the Five-Year Plan were

the Soviet Union has not gone back to the five-day week and seven-hour day which were in force before the war.

The rise in employment and the lengthening of hours have resulted in an increase of man-hours worked by about 45 per cent. A rise in efficiency by 10 per cent over the last ten years would account for the claimed increase in the national income. On the other hand, Soviet sources claim an increase in productivity of labour by 40 per cent. Whatever "productivity of labour" may mean, it certainly does not mean sheer efficiency; for if it did, the rise in the national income should have been much steeper, in view of the higher employment. Incidentally, although Soviet statistics lump together workers and employees, Soviet economic theory considers only the former to be productive.

Industrial production was rising pretty steeply during the five-year period, particularly in its second half; according to the index in the accompanying table gross industrial output in 1950 was higher by nearly three-quarters than before the war.

This index also shows the rising tempo of development, and it indicates that 1948 was the year in which the prewar level was reached and exceeded. Yet, while for the whole of Russia that year's output was 18 per cent higher than before the war, output in the territories formerly occupied by the Germans was only three-quarters of the prewar volume. This shift from west to east, accelerated by the war, continued. Its strategic implications are clear.

For the first time it is now possible to compute a table showing in *absolute* figures, and not as has been customary in enigmatic percentages, the production of basic materials since the war. Here, too, the increase was relatively slow up to 1948 and was gaining in tempo from then onwards. In iron and steel the rate of increase approximately doubled in 1948.

Generally speaking, the output reached by 1950 does not differ considerably from the targets set before the war for the end of 1942 which was to be the last year of the third Five-Year Plan. In other words Soviet industrial output has reached only now the level it should have reached by 1942, if the war had not intervened. Even so, the USSR has now an output of basic materials superior to the German production of 1938. Obviously output a head of population is incomparably lower; and this affects the Soviet standards of living. From the power-political angle, however, aggregate output, rather than output a head, is decisive.

Basic Industry Moves East

Another glance at the table shows that, while coal output has risen by roughly three-quarters during the Plan and oil and electricity have nearly doubled, pig iron and ingot steel have more than doubled, while rolled steel has risen by nearly one and a half. The latter point indicates the great emphasis placed on the production of machinery.

The extent of the shift to the east is reflected in the following figures: Before the war the "West," i.e., the Donbass and the Moscow basin, produced nearly 100 million tons of coal out of a national total of 166 million, thus accounting for roughly 64 per cent of the total. In 1950 total output

rose by nearly 100 million tons and the East (the Kuzbas, Kazakhstan, the Urals and Siberian basins) was responsible for most of this increase. In fact, eastern output rose twofold from 70 to 140 million tons and now accounts for more than half of the total.

The same is true of steel. The Ukraine (the Donbass) produced before the war more than 8½ million tons of steel, while total output was slightly over 18 million tons. For 1950 the Plan foresaw a rise of some 7 million tons over that figure (this was in fact exceeded), but output in the Ukraine was to increase only by 200,000 tons.

The output of oil in the strategically vulnerable Caucasus has declined both relatively and absolutely. Before the war the Caucasus produced 27.5 million tons, nearly 90 per cent of the total. At the end of 1950 the Caucasian output was 6,000,000 tons less. Oil extraction in the east, on the other hand, rose to some 16 million tons. These came from the so-called "Second Baku" (the region between the Volga and the Urals), Central Asia (Turkmenia and Uzbekistan) and from the Far East (Sakhalin, which is, of course, highly vulnerable).

In spite of this substantial increase in oil extraction the Soviet Union still has less oil than it was planned to extract by 1942 according to prewar targets. An ever-growing number of tractors needs fuel; "save oil" is the order of the day and the shortage is one of the major motives behind the present electrification drive. By the end of 1950 one-third of the Soviet collective farms were to be electrified. Plans also exist for the introduction of electrically, instead of petrol-driven, agricultural machinery. The output of electrical current was nearly doubled during the five years, but 90 billion kWh fall far short of requirements; and the Soviet authorities plan to press electrification with the utmost vigour.

For cement and timber no absolute figures of production are to be found. For cement a very steep rise is claimed: between 1945 and 1950, according to Soviet sources, output has increased five and a half times. To this rise the transfer of East German cement works to Russia as reparations may have contributed. The timber target of 280 million cubic metres, on the other hand, has not been reached, since the Ministry of Timber and Paper Industry was almost every year censured for not fulfilling its plan. Timber output was slightly more than doubled during the five years, but development is hindered by shortage of manpower in the far north, by insufficient mechanisation and by transport difficulties.

(To be continued)

Fight for a Free Press in Argentina

[FROM A CORRESPONDENT IN BUENOS AIRES]

PRESIDENT PERÓN appears to have achieved a success recently in his efforts to control what is left of an independent press in Argentina. *La Prensa* has at last been compelled to suspend publication—not by direct action but by the subtle expedient of the politically-inspired strike. This success comes after an apparent setback in the middle of last year, when the pressure of public opinion—foreign and especially American, as much as domestic—induced Perón to shelve the "Anti-Argentine Activities Committee." Its chairman, Visca, and his immediate associates had made themselves notorious in the political witchhunt throughout the republic which brought about the suppression or suspension of some 150 newspapers—most of which, if not all, have since been allowed to resume publication.

After the opening of the 1950 congress last May Visca and his committee were replaced by another, which adopted an attitude of masterly and innocuous inactivity.

But the replacement of Visca's committee did not entail any curtailment of the holocaust of calumny and execration in the Perónista press, supplemented from time to time by the Government-controlled radio. Since Perónista interests acquired ownership or control of nearly all Argentina's newspapers, this campaign has centred on the three dailies led by *La Prensa* of Buenos Aires (the others being *La Nación*, also of Buenos Aires, and the provincial organ *La Capital* of Rosario, which has several times had to suspend publication for short periods due to restriction of newsprint supplies). All have been, and still are, the targets of the Perónista shafts but the brunt of the attack is usually borne by *La Prensa*.

La Prensa's premises, indeed, have time and again been the object of the fury of the Perónista mob; bombs—it is true, of the squib-like kind known in Argentina as petards—have on various occasions been surreptitiously placed in its offices; and on at least one occasion, after a demonstration in Plaza de Mayo, its staff were called on to "repel boarders" with the office fire-fighting equipment. The paper, which had large stocks, suffered more than other journals through the Government's expropriation of newsprint, however necessary and expedient this may have been in view of Argentina's short supplies; and payment for the stocks impounded, based on arbitrary and unrealistic valuations, involved it in considerable financial loss. But *La Prensa*, like Talleyrand in the Terror but by no means through resort to similar expedients, obstinately continued to live: more than that, it thrived. Reduced to twelve pages (enviable by present-day British standards but a mere fraction of its former size), forced through its policy of clinging to traditional standards of layout and reporting to print many columns in almost microscopic type and to adopt a weird-looking system of abbreviations in its classified advertisements, the great Buenos Aires daily, under the able and forceful direction of Dr Gainza Paz, greatly increased its circulation.

Boycott By Newsvendors

But, in December and January the paper, in common with its independent colleagues, exasperated the regime by allowing objective reporting of the railway strikes, which had been branded by the Government as the work of extremists and denounced in the Perónista press. The newspaper-sellers' trade union, which had, or was alleged to have, grounds for dissatisfaction with *La Prensa's* system of distribution, was persuaded to declare a boycott, after presenting demands which no self-respecting journal could consider even as a basis for negotiation. The boycott, although hampering the machinery of distribution, would not necessarily have forced the paper to close down, as it has its own chain of distributing centres—this being ostensibly one of the newsvendors' grievances. The boycott, however, was reinforced by a "sympathetic" strike of printing-house employees and truck drivers, decreed by the CGT (*Confederación General del Trabajo*), a body which is closely identified with the Peronista party and the Government. The paper's premises were picketed, its staff intimidated and appeals for police intervention proved fruitless.

The end of this latest phase of *La Prensa's* troubles is not yet in sight. At least a majority of its employees are not in sympathy with the strike decreed by the CGT, and offered to stay on their jobs even without police protection, an offer which the management declined on the grounds that it did not wish to expose its staff to the risk of injury. A deputation of the staff tried to interview the President, but failed.

The interests of the remaining independent papers in Argentina are, needless to say, bound up with those of *La Prensa*, for if that paper is forced out of existence, the others' turn will come sooner or later. *La Nación* has already been threatened, in a violently-worded manifesto signed by the secretary of the newspaper-sellers' union, with reprisals for

COMPARISONS OF PRODUCTION

* 1938=100.

† Planned target.

raised but no details were made public. A comparison between the considerable overfulfilment of the original targets and the modest claims made for 1950—which were obviously related to the new targets—suggests that the raising of the sights was of the order of 10 per cent, at least in the output of basic materials.

The general progress is shown in the increase in the national income, which is claimed to be 60 per cent higher than in 1940, compared with a planned increase of 38 per cent. This is a startling claim; but it appears less so when it is compared with the huge rise in employment since the war. Total employment is said to exceed now 39 million, which is some 8½ million more than in 1940, although another computation shows the increase as amounting to only 6.7 million. The number of workers and employees has certainly grown by about 25 per cent, which may be partly explained by the continued employment of great masses of women. To this must be added the lengthening of working hours; for

allowing reproduction in its columns of foreign press comment on the *La Prensa* affair. But the matter does not end there. *La Prensa* is widely read and respected beyond the confines of Argentina; and Perón, always sensitive to criticism and peculiarly sensitive just now to criticism from abroad, is said to be unenthusiastic about—or to have had his hand forced by—the CGT activities. And the fact that the CGT is very much in Señora Perón's pocket has aroused speculation in Argentina.

Reforms in Yugoslavia

[BY A CORRESPONDENT]

THE abolition three weeks ago by the Yugoslav government of the State Control Commission is an important step towards a more efficient and less rigid administration. The commission, introduced in April 1946, was modelled on the Ministry of State Control in the Soviet Union, itself the offspring of the Workers' and Peasants' Inspection, an organisation which played its part in the rise of Stalin to supreme power in the 1920's. It not only audited public accounts, but supervised the working of government departments. It was entitled to see all official archives, and to send its members to watch the efficiency of bureaucrats at work. It was also entitled to examine complaints and denunciations by individuals or groups. It was highly centralised. The Yugoslav government has evidently decided, after five years' experience, that the commission did not serve a useful purpose, that it duplicated other work, maintained an excessive number of employees at a time when every able-bodied person was needed in production, that it unsettled rather than encouraged civil servants, and that its excessive centralisation prevented it from taking local conditions into account.

The years of Cominform hostility have taught the Yugoslav Communists a great deal about the bad features of the Soviet regime. Their leaders now freely admit that they copied too quickly and too enthusiastically its institutions. They are now especially keen to avoid undue centralisation and to humanise the bureaucracy, to give local people greater initiative and to recruit local talent. It is of course true that in the Soviet Union itself verbal attacks on bureaucracy have been a feature of the regime ever since Lenin's day. But in practice all that has usually resulted from such attacks has been the replacement of individuals. The system itself has remained inhuman, rigid and overcentralised. The Yugoslav leaders seem much more sincere and much more earnest than the "self-critics" of the Soviet Union. Moreover they have a great deal of practical experience of enlisting local ability and giving able persons their chance. During the war of liberation of 1941-5 the "People's Committees" on liberated territory were led by men who were not afraid to take responsibility or to make decisions, and who knew how to win popular support in their areas. After the war the best traditions of the liberation movement were often forgotten in the fervour of imitation of all things Muscovite. Now the evidence suggests that they are being revived.

The abolition of the State Control Commission will almost certainly be followed by further reforms. Another institution which is being reconsidered by Yugoslav experts on legislation is the procurator's department, also a highly centralised body based on the Soviet model, which greatly limits the freedom of the law courts. Every action of the Yugoslav government which makes the administration more efficient and more human, and which shows that the Communist leaders are willing to trust the people and to seek their genuine co-operation, will of course be welcomed by Yugoslavia's friends in the West.

More Electric Power for France

[FROM OUR PARIS CORRESPONDENT]

IN 1938 France's consumption of electricity stood at 20 billion kWh, in 1945 at 19 billion kWh and in 1950 at 33 billion kWh. This development is perhaps the most remarkable feature of French industrial expansion since the war. When the Monnet Plan was drawn up in 1946, a total production of 40 billion kWh was aimed at for 1951-1952. Owing to certain reductions in credits for 1951 resulting from the rearmament programme, this target will not be attained. Nevertheless, the coming years will certainly see a steady increase in production, which is made necessary by the ceaselessly rising demand. France's coal shortage (which increases relatively as its heavy industry develops) has prompted not only an expansion of electrical production but also, within that policy, a partial switch from thermic to hydraulic power.

METROPOLITAN FRANCE

	Millions of kWh	1949	1950
Hydraulic production.....	11,076	16,170	
Thermic production.....	18,950	16,900	
Imports.....	774	230	
Consumption plus losses.....	30,800	33,300	

A switch to hydraulic production demands, however, a guaranteed production well above the highest known con-

sumption if a country is to be safe from droughts and other disturbances to the electricity supply. In France, the last ten years have seen no less than eight years in which the flow of water to the hydro-electric installations was less than the average calculated over the last thirty years. Given also the desirability of turning the present small deficit in international exchange into a fairly large surplus, it is clear that many new barrages must be put into operation.

The three main regions in which hydro-electricity is produced are the Alps (60 per cent), the Massif Central (21 per cent) and the Pyrenees (19 per cent). 55 per cent of the power-stations are driven by running water and the rest by lake water and lockage water.

Although hydro-electricity is being expanded more rapidly than thermo-electricity, the latter's importance is very great in regard to maximum production at peak hours. Thus, while the total production in kWh of the thermic stations fell between 1949 and 1950, the maximum thermic power obtainable during the daily 15-hour peak period rose from 3,800,000 kW in 1949 to 4,100,000 kW in 1950. French thermic production is divided about equally between *Electricité de France*, whose power stations are in the heavy-consuming Paris region and in the west where there is no hydro-electricity, and the mines and ironworks of the north, east and south centre. In the production of French thermo-electricity there was consumed in 1950: 490,000 tons of oil, 710,000 tons of brown coal lignite, 11,630,000 tons of coal (in French "*charbon marchand et bas produits*") and 8,400 million cubic metres of gas.

The most interesting of French hydro-electrical projects are those undertaken by the *Compagnie Nationale du Rhône*. As early as 1921 the Chamber of Deputies passed a law authorising the regulation of the river Rhône for its better navigation, for the harnessing of its potential water-power and for the irrigation of its arid valley. Nothing much happened until 1933 when the *Compagnie Nationale* was formed. Two years later Génissiat, 31 miles below Geneva, was chosen as the site of the first of the operations to be carried out in the Rhône valley. Preliminary works were put in hand in 1937, and in 1939 the river was diverted from its natural course into two prepared concrete tunnels and its bed cleared for the construction of the permanent dam and the power plant. The first erections were swept away in June, 1940, when the command was given to flood the area in order to impede the German advance. Yet during the occupation the French managed to proceed with the work on the dam, building a huge concrete factory to feed the workshop and arguing the Germans out of thousands of tons of scrap-iron and many tons of copper. Génissiat began to generate current in 1950 with an annual production of 1,600 million kWh. Driven by four Francis turbines, each of a 100,000 h.p., the power station is one of the largest in the world. It has been calculated that 150,000 tons of coal went into the making of all the steel and concrete of which the dam and power station is composed. On the assumption that a kWh=a kilogram of coal, this amount of fuel is recovered in four months' electrical production by only one of Génissiat's six alternators.

Rhône Navigation Improved

If Génissiat is monumental, Donzère-Mondragon is gargantuan. The purpose of the Donzère project is to divert the Rhône from its natural course over a length of 30 km.; to canalise the river in concrete and, with a world-record head of water of 26 metres, drive six huge turbines. The annual average production of this power-station is to be 2 billion kWh. Donzère will begin to produce current in 1952. The canal will greatly facilitate the upstream navigation of Rhône shipping which has hitherto had to struggle violently with eddies in the narrows where the riverbed shelves steeply. The *Compagnie Nationale du Rhône* has already embarked upon a systematic irrigation of the Camargue, the wild and romantic area which lies between Arles and the Mediterranean. Oversalted from its contact with the sea and from lack of fresh water, the region has for the last century been almost lost to agriculture. Now it is fast becoming a major source of rice—a welcome substitute for war-ravaged Indochina. By the use of bulldozers, many rice fields have been cleared in the Camargue, the project having received some 100 million francs of government funds. What with this rice-farming, the cultivation of reeds for paper manufacture and prospecting for petrol the Camargue is fast ceasing to be merely a bird sanctuary and bull-breeding province.

The development of French electrical power has, of course, been enormously aided by ECA counterpart funds,

of which over 170 billion francs had been allotted to *Electricité de France* and the *Compagnie Nationale du Rhône* by January, 1951. Marshall Aid and French investments proper are in this respect transforming the country's industrial complexion. The electrification of the railways continues. The main lines already completed are Paris-Le Mans, Paris-Bordeaux-Irun, Paris-Toulouse. The line Paris-Lyons, is at present under construction of which the stretch Paris-Dijon was finished last year. (On this line the SNCF are running one of their admirable "sports" trains with a top speed of 125 mph. By all accounts this novelty is well up to the standard of the Paris-Strasbourg express on tyres or the *ultra-rapide* Paris-Bordeaux.)

If the Third Force can achieve Electrification Without Communism it will have taken a feather out of Lenin's cap.

How Strong is Formosa?

[BY OUR HONGKONG CORRESPONDENT]

THE question of how great is Formosa's ability to resist attack by the Chinese Communists cannot be answered in terms of material strength alone. The morale of the Formosans must also be considered; and this depends, not only on the effect of Kuomintang rule, but also on the history and traditions of the islanders. The Japanese regime was oppressive, politically and socially, and resistance to it continued to a varying extent throughout the fifty years of its existence. But the Japanese did promote industrial and commercial development and public and social services, and they did leave behind them a full framework of law and order, common security and efficient administration. In none of these respects have the Chinese Nationalists maintained the standards necessary to avoid acute disillusionment. The economic resources of the island are strictly limited, and the long and involved traditions of local unrest, separatism and spiritual independence (only partly offset by adherence to Chinese Nationalism) as well as the Formosans' readiness—unlike other Chinese—to call in foreign help, makes it unlikely that the present regime will endure without close supervision and heavy material aid from the Americans.

The troops of the first Kuomintang Governor, Ch'en Yi, created a bad impression as soon as they landed in 1945; eyewitness accounts describe them as heading straight for the shops ashore, looting stocks and bullying the civilian population. Corruption, indiscipline and uncertainty spread rapidly, in startling contrast to the orderly, though totalitarian, exploitation under the Japanese. It is reported that currency manipulation began at once over the question of withdrawal of the Japanese yen and its replacement by Chinese notes; official statements merely note that there was "prolonged uncertainty" about this. The note issue doubled in the first six months, and increased sixfold in the first 18 months, according to official returns. Confiscated Japanese assets were sold off at the latter date to influential interests, at prices fixed when the inflation was just beginning. Under the avowedly single-party system of the Kuomintang, there was widespread nepotism. The Formosan budget under the Japanese had divided expenses between "salaries and office costs" and "running expenses of public undertakings" in the ratio of 30 per cent and 70 per cent respectively; the official figures under Ch'en Yi's governorship show a reversal of these proportions, and on the revenue side a vast increase in direct taxation. A vast swarm of speculators and "carpet-baggers" descended on the island; smuggling and lucrative intrigue, running all through the political and administrative machinery, were major activities. There was a vast influx of civilians from the mainland, with no significant investment in productive activities, or even adequate maintenance of the existing facilities. Governor Ch'en Yi was removed from his post in May, 1947; he was recently reported executed for treason.

in June, 1950, having allegedly surrendered the Shanghai area to the Communists in return for his own safety and fortune.

The next Governor, Wei Tao-ming, succeeded Ch'en Yi in May, 1947. Some effort was made to counteract the hostile feeling remaining from his predecessor's time, which had ended in a period of violence—described by opponents of the government as an armed rebellion after a massacre of oppositionists, and by official sources as widespread rioting (February 28, 1947). Minor offices appear to have been "purged" by Wei, but there was no sweeping change in the senior ranks. The continuing influx both of troops and civilians put a heavy strain on the economy of the island; many new offices were created, and existing offices enlarged. The Railway Bureau, for example, increased its staff by 25 per cent at this time. Bank loans increased enormously, more than in proportion to the cantering inflation, and activity was predominantly speculative. Not only was there no new investment in fixed capital, but existing installations were rapidly deteriorating; the serious floods of 1947, for example, were at least partly due to the total neglect of the irrigation system. Food production was

unsatisfactory, for these general reasons, and also because of a shortage of fertiliser. Governor Wei left at the end of 1948, showing some signs of disappointment, but none of impoverishment.

The succeeding Governor, Ch'en Ch'eng, announced plans to build up Formosa as a powerful base for the reconquest of China. In contrast to the "Japanese collectivism" and "American liberalism" of his two predecessors, his own approach was declared to be that of "Fabian Socialism" [sic]. At this point ECA having ceased operations in China proper, Formosa became the main heir to the allocations for the "general area of China." The quip was therefore made that the first achievement of Fabian Socialism was to enable leading officials to acquire American automobiles of the new year's model; but distinct improvements were shortly to come. The fertiliser situation began to improve. ECA also stimulated a degree of industrial re-equipment, and provided technical supervision. Agrarian reforms also began, in which American aid and technical advice played a notable part; rents were restricted, and procedures improved.

The Fabian Governor was succeeded, at the end of 1949, by K. C. Wu, a man of high reputation, well known as a progressive former Mayor of Shanghai. Under his governorship the improvements, with American co-operation, appear to have continued. But the strain on the island is great.

The civilian population, which was just over 6,000,000 in July, 1946, was 7,450,000 in March, 1950, and 7,620,000 in October, 1950. As much as half of this may be natural increase (in which Formosa has one of the highest rates in the world), but these figures mean that one in eight or ten of the present population are recent political immigrants, few of whom are direct producers. After the fall of Shanghai (May 25, 1949) 300,000 Nationalist troops are said to have reached Formosa. This sudden increase in the garrison (apparently by as much as 200 per cent), which continued—the authorities now claim 600,000—thus comes on top of a 20 per cent postwar increase in the civilian population of the island. It is pointed out that Formosa is maintaining one soldier and one "non-productive" official per ten of the population, whereas Communist China (so far, though the present war situation may change this) has had only one soldier and one official per hundred of the whole population. A currency reform was effected in June, 1949; inflation has since resumed, but at a milder pace. The new yuan has recently appeared fairly stable at about 10.25 to the US dollar, compared to the rate of 5 fixed in June, 1949.

In spite of some signs of improvement many observers feel that the previous record of speculation, depredation, delapidation and uncertainty has done irreparable harm. The age-old unrest in Formosa is ineradicable by force, and can be soothed only by spectacular social and economic reforms, which may be unattainable at the present time; the possible effect of fifth-column activities is incalculable. A popular Formosan saying is that "we have (since the war) exchanged the rule of the dogs (the Japanese) for that of the pigs." Lately the participation of the Americans (unkindly described, in continuation of the saying just quoted, as "the swineherds") has effected considerable improvements. The "rule of the bear" does not yet appear to local people as a desirable alternative, but there is, all the same, deep disillusionment and some apathy.

Soviet Economic Interests in Austria

[FROM OUR VIENNA CORRESPONDENT]

FIVE years of occupation have given the Soviet Union quite a considerable stake in Austria's economy. Although a substantial part of it will remain in Russian hands after the peace treaty comes into force, the Soviet Union certainly stands to lose financially when this oft-deferred event takes place. Most of the Soviet Government's economic assets in Austria spring from the confiscation of property which belonged either to the German Government or to individual Germans when the German occupation ended and the Allied occupation began in 1945. By this time, of course, the process of aryanisation had placed all former Jewish property in German hands. In the Soviet zone it requires the approval of the Soviet High Commissioner before even an aryanised property can be returned to the original Jewish owner or his heirs. The great majority of such properties, therefore, are still in Soviet hands. Altogether, through arbitrary and unilateral interpretation of the phrase "German property," the Soviet Union has taken possession of over 1,200 concerns, some big, some small; some essential to the Austrian economy, some making luxury articles; some lucrative, some the reverse. In the other three zones these properties have been returned to Austrian control though the question of ownership remains technically in abeyance till the peace treaty comes into operation.

In addition to seizing these undertakings the Soviet authorities concerned who are known as USIA—the Administration of Soviet Properties in Austria—have arrogated to themselves the right, in spite of Austrian protests, to open new businesses in competition with existing Austrian ones. In some respects

Aspects of enterprise

No. 9.

In Turkey two complete new coal preparation plants are to be built by Simon-Carves for a group of collieries. They include two of the largest coal washeries in the world, with dirt handling plant for dumping the washery discard into the Black Sea over distances of up to a mile. This £2-million order was secured in competition with the United States, France, Belgium and Germany, and it is significant that the Simon-Carves tender was not the lowest; the contract carries stringent performance guarantees and was placed on the strength of the Simon-Carves designs, specifications and reputation.

**"...even surviving being
thrown upside-down..."**

From the first desperate battle with erratic winds at take-off, the pioneer Atlantic flight by Alcock and Brown was a question of stretching their aircraft's capabilities to the limit. Not that the Vickers Vimy and its Rolls-Royce engines behaved anything but magnificently—even surviving being thrown upside-down by storm. But comparison with the present-day speeds—and regularity—of Atlantic flights gives clear evidence of the improvements not only in design but in materials as well. Among them, nickel alloys have aided many an advance in engineering and have helped to make production simpler and cheaper. Greater performance with longer life, reliability to a required standard and with something in reserve—these are the material problems in which our Development and Research Staff can help.

these concerns, of which there are about 200, most of them retail shops, are the most galling of all the USIA properties and their number is growing. Thanks to the fact that no USIA concern feels obliged to pay taxes or social insurance contributions unless it wishes, and thanks also to the happy practice of avoiding payment of customs duties by importing their wares as though they were the property of the Soviet Government, the USIA shops are able to undersell their private enterprise competitors who have no such opportunities of straying from the path of financial and administrative rectitude. Austrian purses being extremely empty, it is hard for the Austrian consumer to resist the temptation to patronize these establishments in spite of appeals from the Federal Chancellor, Dr Figl, and others, not to do so. Some of the USIA shops are scarcely recognisable as such and whether in such circumstances they have converted many of their patrons to Communism is hard to say, but they could be used for this purpose if the Soviet Government wished. Meanwhile they represent a still small, but potentially serious, menace to the private shops in their vicinity.

Oilfields and Danube Shipping

When the peace treaty comes into force most of the ex-German USIA concerns will go back to Austrian ownership on payment of \$150 million in quarterly instalments of \$6,250,000. The oil wells and refineries, however, remain in Soviet ownership unless the Soviet Government is prepared to sell. So do the assets of the Danube Shipping Company in the Soviet zone of Austria, Hungary, Roumania and Bulgaria. Owing partly to the Cominform-Tito quarrel, partly to Soviet interference with Austrian river traffic (especially to Germany) and partly to incompetent management, the Danube Shipping Company is at present more or less moribund. In prewar days it had considerable assets in land, buildings, etc., outside Austria—in Budapest, Belgrade and elsewhere. The loss of the extraterritorial assets was to be expected. But the Soviet Government will continue to retain the company's wharves and property in the Soviet zone of Austria in spite of the fact that it is making practically no use of them. From the Austrian point of view this means that either the property will have to be bought back or rented from the Soviet Government—probably at an inflated price—or that new wharves, warehouses and shipyards will have to be built for the use of Austrian-owned river vessels.

The Soviet-controlled oil wells, unlike the river Danube, are being ruthlessly exploited. Though production at Zistersdorf is believed to have declined from 3,500 tons a day in 1944 to 2,000 tons a day this year, a considerable number of new wells have been opened up. Approximately 6,000 tons a month of this oil are released for Austrian use against payment of schillings. But to cover the whole requirements of the country, Austria has to import a further 3,000-4,000 tons and pay in hard currency.

Nobody outside USIA really knows what oil is now being produced in Lower Austria. But there is no doubt that a good deal is exported to Czechoslovakia, Poland and elsewhere—again to the sole profit of the Soviet Government. When the treaty comes into force, the Soviet oil organisation will become a commercial concern subject to Austrian law—a very different status from the one it enjoys at present. These rights lapse after 30 years except in regard to certain refineries which remain Soviet property in perpetuity. Apart from the developed and developing oil areas, the Soviet Government also has the right of exploration in the present fields under its control for a period of 8 years after the peace treaty comes into force and to exploitation for a further 25 years if oil is found. Thus, for a good many years to come, Austria sees itself far too closely tied to the Soviet Union in the matter of oil and does not relish the prospect. No doubt the Soviet Government on its side does not relish the prospect of having its oil dealings put under the control of Austrian law.

The other USIA industries include steel works, forests

and many kinds of factories producing copper wire, sulphuric acid, electric equipment, railway engines and other indispensable articles. It can be assumed that a considerable part but by no means the whole of their output is sold inside Austria especially if there is no hard currency demand for it. Alternatively these products can be exchanged in Austria for goods which the Soviet Government needs either for the Soviet Union itself or to re-sell to other countries. But the quantity produced and what happens to the output is a secret. So is the state of the equipment. This is a fact which arouses a good deal of understandable indignation among Austrians who already know exactly how much they have been charged for the USIA concerns in the peace treaty and do not see why they should not be allowed to inspect the goods they are buying before they have to pay. There is, for example, no doubt that a good deal of the equipment that was there in 1945 is there no longer, that a good deal of "cannibalisation" has been carried on among USIA factories in the Soviet zone and that equipment which the Soviet authorities ruled was of German or satellite origin has been requisitioned from non-USIA firms without payment and installed in USIA ones. Factories now in the British zone which were in Russian hands until the present zones of occupation agreed in Potsdam actually came into being in July, 1945, also suffered in this way. The new blooming mill installed recently in Donawitz and paid for out of ERP funds replaced one which had been dismantled by the Russians in 1945 and carried off—in this case to the Soviet Union. Many other Austrian concerns have an equally unhappy recollection of the acumen of Soviet technicians in judging the value of western machinery.

Possibilities of Trouble-Making

It is thus impossible to make a reliable estimate of the value of the economic assets acquired by the Soviet Government. But they are certainly worth tens of millions of pounds and they represent a considerable proportion of Austria's capital equipment. They are also a means by which Communist propaganda can be disseminated among workers and they were deliberately used to provide strike fodder during the Communist-inspired demonstrations in September and October last year. Their use in this way, however, was spasmodic and some USIA managers apparently withheld pay for the days during which their works were closed on account of the strike.

There is also reason to believe that some of the USIA factories have armed factory guards of the kind that were used to over-awe Prague during the Communist Revolution of February, 1948. But the number of such guards in Austria does not appear to be great and there is no reason to think they would represent a serious menace to the regime if the Russians signed the treaty and went home. A much more real danger is the present fact that so much of Austria's economy is in the hands of a Government which regards economics as its chief weapon for bringing about social and political revolution. USIA is big enough and strong enough not only to cause Austria extreme economic discomfort but to dislocate the political life of the country by egging on the workers under its control to take direct action against the Government. The fact that USIA has not used its strength for this purpose should not be allowed to distract attention from its ability to do so. The only reason it has not done so is that the Soviet Government thinks the disadvantages outweigh the advantages. The possibility that it will change its mind exists and will continue to menace the Austrian horizon until the peace treaty has come into force.

★

Correction.—In the article on Norway's Defence Effort on page 382 of *The Economist* of last week, Norway's balance of payments deficit on current account in 1950 should have been 1,130 million kroner, not 140 million.

THE BUSINESS WORLD

Wherewithal for Defence

Mr Gaitskell's carefully reasoned speech in the defence debate last week revealed in quite unexpected detail much of the Government's planning in the economics of defence. Precisely because his exposition and arguments were so well supported by figures, it is perhaps desirable to emphasise at the outset that most of the quantities involved have as yet no great solidity; they are statistical patterns worked out by the back-room boys, and, even so, the result is something less than a completed blue-print. But it is heartening that in the short time since the enlargement of the whole programme was announced by Mr Attlee such progress has been made in breaking it down into its main components, in relating them to industrial capacities, and in estimating the broad readjustments that must take place in industry and in the export trade. This information, incomplete though it still is, will be of great value to industry and to the public in estimating the part they have to play; at this stage rough indications given promptly are much more important than precise estimates disclosed only after long delay.

I—The Burden and the Budget

BEFORE scrutinising this detailed material, it is well to glance at the general picture that is taking shape and at the main lines of policy that seem to be in contemplation. On these matters, which are surveyed broadly in an earlier article in this issue, the Chancellor added little to what was already known or deducible from Mr Attlee's statement a fortnight earlier. But it is now possible to make a fair estimate of the extent of sacrifices that the defence programme will involve, at all events in its first year. The estimated outlay of £4,700 million for the three years, it is now confirmed, is based on present prices, and is spread over the period in amounts of roughly £1,300 million in 1951-52, £1,600 million or less in 1952-53 and £1,800 million or more in 1953-54. The estimate for the coming year represents an increase of fully £450 million on the actual expenditure for 1950-51, and in addition £140 million is to be provided for stockpiling (which, in so far as it comprises imported supplies, the Government is prepared to finance by running down gold reserves or by borrowing abroad). It also excludes expenditures on new plant incurred "with substantial Government assistance" by private industry. If these capital expenditures, plus defence work in progress financed by private industry, are put at £50 to £100 million, the total new burden to be shouldered by the national economy in this coming year would be between £500 and £550 million.

Towards meeting this, the Government hopes to be able to count upon a further increment of industrial productivity—although it fully recognises that any notable intensification of shortages of key materials could cause "a dislocation or slowing down of the entire production machine." If productivity improved by a further 4 per cent, as the Government hopes, aggregate industrial production would rise by about £250 million; it is thought that not much additional output could be secured from the effort to expand the total effective labour force—by tapping the tiny pool of unemployed, by recruiting women or by extending overtime.

Despite the high rate of surplus achieved on Britain's external balance of payments during 1950 (and especially in the second half of the year), there is no scope for

easing the pressures on the domestic economy by deliberately curtailing the volume of exports or by increasing the volume of imports. The prospective further rise in import prices this year (which the Chancellor estimated some weeks ago at £400 million) will extinguish most of that surplus automatically—even though there will be some offset from rising export prices and, probably, from a continued expansion of invisible income. The Chancellor now guesses the net deterioration at £300 million, and confirms the suggestion made in these columns recently that the Government will not aim at making this good by expanding the volume of exports. For the duration of the defence programme, the target will be mere equilibrium on the external account as a whole—except to the extent of any stockpiling, which might force the account into corresponding deficit. According to present plans, it is clear that the external balance is expected neither to ease nor to aggravate the domestic problem.

Nor, apparently, is there any intention to make any large deliberate cuts in the programme of capital outlay for civil purposes. Apart from the possibility of minor prunings—the nature of which Mr Gaitskell did not specify—any contraction of investment will apparently be allowed to occur either "involuntarily," through sheer inability to get supplies, or through a specific holding-back of individual building projects that are in direct competition with particular defence works. The greater the area of industrial dislocation, the greater will be the "savings" under this head. It is easy to envisage a decline in fixed investment for civil purposes by, say, £100 to £150 million on this account. Given the severe depletion that has occurred in stocks of raw materials and food, ought any allowance to be made in this reckoning for an increase in floating capital? This is a difficult question, because the answer depends not upon what is desirable but what is possible. Given the certainty that stocks of non-essentials will be further run down, the chances are that it will not be possible to raise total stocks by more than the £140 million allowed for stockpiling plus the amount (noted above) for defence goods financed by private industry.

On these several assumptions, the £250 million incre-

ment of productivity plus the £100 to £150 million reduction in civil fixed investment would provide £350 to £400 million of the real resources needed to meet the total additional defence demand of £500 to £550 million. There would thus be a "real" gap of £100 to £200 million. If the defence outlays are in fact to take place as planned, this gap has to be filled, willy-nilly, by a curtailment in the Government's own current absorption of goods and services for civil purposes and/or by a cut in personal consumption. Mr Gaitskell, like Mr Attlee before him, gave no hint that any notable Government retrenchment is in contemplation, and the Civil Estimates now confirm this; but in any case retrenchment, even if it were really courageous, would be most unlikely to reduce perceptibly the Government's expenditures on real resources—other than those that are merely State-provided consumption, such as the health service. Apart from such services as these, the scope for cutting is virtually confined to the so-called transfer payments, which are personal consumption at one remove. In any event, therefore, the consumer must be the real victim.

*

The financial sacrifices to be imposed upon consumers as a whole must, moreover, be appreciably larger than the amount of "real" goods and services they have to forgo—because, while the goods available to them are less, their spending power will be increased by the additional incomes earned in producing a bigger total output. If half of the £250 million paid in incomes for the officially assumed increment of production is reckoned to be either taken by the State in taxation or immediately saved (notably in additional undistributed profits) then the other half will represent new expenditure on consumption for which no new goods will be available. This would raise the "real" gap of between £100 and £200 million to a "financial" gap of £225 to £325 million. And this figure would be raised still further if it were considered necessary to allow for an inflationary gap already existing—a gap filled either by the savings enforced by rising prices or temporarily bridged by drafts on stocks.

Mr Gaitskell, anxious not to anticipate his Budget, did not make his own estimate of the financial gap. But

II—Industry's Changing Tasks

The Chancellor's estimates of the changing configuration of industry that the defence programme now demands leave many gaps in what is essentially a tentative pattern. They are most precise—and then only within fairly wide margins—for the coming year. The broad assumption that productivity will make its contribution of a 4 per cent increase over the results of last year rests on two further conditions: first, that there will be sufficient raw materials to avoid the risk of industrial dislocation and, secondly, that the change-over of production lines can be made with the minimum of confusion and delay. Neither of these points was minimised by the Chancellor; indeed, his warnings about raw materials, and particularly about sulphur, were dramatic in their seriousness. This shortage, and others ranging from non-ferrous metals to clothing and industrial fibres, have for several weeks been a major preoccupation of wide sectors of industry. They call in

he did indicate quite plainly that he intends to try to close it. He is under no illusions that the task of extracting the requisite goods and services could be left to a spreading apparatus of physical controls working without the aid of financial measures aimed at extinguishing the surplus of spendable incomes. On the contrary, in his brief survey of ways and means, he gave pride of place to "fiscal, monetary and credit policy." This does not mean, however, that this year most of the job of imposing financial retrenchment upon consumers will have to be done by the budget. If the Chancellor sticks to the principle laid down by Sir Stafford Cripps after devaluation, that the cost of living subsidies must not be increased beyond their present ceiling of £410 million, and that any increase in prices of the underlying goods must therefore be passed on to the consumer, he has already available a very powerful weapon of restraint that will work automatically. This weapon is the fast rising cost of imports. If the whole addition of £400 million to the import bill is allowed to fall on domestic purchasers of imported goods (whether directly or at one remove), a very drastic cut could be imposed upon their ability to purchase other things, so that total consumption, in real terms, would fall. Beyond doubt, there will inevitably be some cutting, and probably substantial cutting, by this means—though its extent will depend less upon official policy than upon the rapidity with which wages follow the new pressure on the cost of living and upon the size of the cushion that is afforded to consumers by existing stocks of goods offered at the lower prices.

Each of these elements in the equation presents wide limits of uncertainty. At one extreme, it might be assumed that this price weapon will do nearly all the cutting that is required at this stage, leaving much less need for cutting by tax increases; at the opposite extreme, it might be felt that the degree of present inflation on the one hand and the prospective delays in the operation of the price weapon on the other are such as to put the main responsibility on the budget. It is too soon yet to guess where the official mind will come to rest. But perhaps the best guess, in terms of additional taxation, of the mid point between these extremes would be about £100 million.

question the possibility of maintaining industrial output as a whole at the average level of the end of last year—which is what an increase in productivity of 4 per cent in 1951 in fact implies. Last year's stride in productivity by industry as a whole would not have been possible but for the truly spectacular progress in the motor, cycles and aircraft industries, and in certain other metal-using trades. The towering increase in output achieved in these sectors showed how higher productivity can be gained by continuous output, by a smooth flow of raw materials and components and by a relatively modest increase in manpower. Given the present outlook for raw materials and the competition of defence orders for capacity that has been intensively used for civil output and exports, these conditions must now be regarded as distinctly qualified. Mr Gaitskell put this increase of 4 per cent as the maximum expectation; no one would deny the possibility that the actual results may be less

favourable. The spectacular performers in increasing productivity have been those industries that are likely to be most directly affected by the switch to defence production and by difficulties in obtaining sufficient raw materials and components.

The Chancellor's outline of the arrangements that have to be made between the Government and various branches of industry in order, first, to ensure that defence is given first choice in any conflict of demands and, secondly, to secure increased exports from industries other than engineering and metal-working is clearly not the last word on a task that bristles with administrative difficulties. Arrangements for guidance and consultation can be expected to work at their best where the decision concerns a clearly defined end-product for which the defence departments, export buyers and home customers are all clamouring. But only a little way down the industrial scale from the final assembly of an identifiable product there is a richness and diversity of intermediate products and components that will make for delay, and also confusion, in reaching the right decisions about the part that each concern should be playing in the defence programme. There can be no dispute that the decision

not to promulgate any overriding priority for defence is right. But perhaps the most urgent of all the complex tasks in making the changeover of these vital sectors of industry as smooth and as waste-free as possible is the creation of an effective service of regional information and guidance. To the individual industrialist the defence effort does not present itself as a global problem—the replacement of £x million of civil business by defence orders or a switch of £y million of output from the home market to the export trade; it involves existing contracts, long-standing trade connections, continuing responsibilities for technical services and spare parts, and an increasing element of discrimination between one customer and another. The issues have to be judged according to their importance in the defence programme or in the supply of essential raw materials, and the average manufacturer cannot be expected to have complete knowledge of these complex matters.

Engineering.—Nearly 60 per cent of the expenditure upon "production, research, and works" in the Chancellor's estimate (a classification which shows some differences from the Defence Minister's figures for "production, research, and development") will be spent upon output by the engineering and metal-using industries. Any definition of this group is bound to be arbitrary, and there is no information about the value of current output for many of its sections; this makes even a provisional estimate of the impact of the defence programme upon its present activity extremely difficult. But Mr. Gaitskell, who in this context defined the group as

including also the vehicles, shipbuilding and aircraft industries, did provide the basis for rough calculations. He said that the £1,700 million to be spent upon production by the engineering industries in the three-year programme would "represent a load on the average of only some 20 per cent of the engineering industry's output, compared with at least 80 per cent in the middle of the last war." This implies an output over the three years of roughly £8,500 million, or £2,800 million a year without allowing for any increase of production. The first year's spending of £350 million would on this basis represent roughly 12½ per cent of the industries' total output; and whatever guesses may be made about the "rising curve" in the two following years, it is apparent that at the end of the programme defence production may account for 25 per cent or more of their total output. It is not clear whether Mr Gaitskell's "percentage average load" estimate allowed for any yearly increase in productivity (which in these industries has risen much more since the war than in all industries); but the adjustment would make little significant difference to these rough approximations. The numbers employed in the metal-using and engineering industries are just under

THE DEFENCE PROGRAMME (£ Million)

towards ordnance, vehicle, and radio production that was already apparent last year, and reversing the decline during the first three-quarters of 1950 in the aircraft industry's manpower. The scarce skills will presumably be those of which engineering has been short since the war: high-grade fitters and draughtsmen. These are not to be found in the general consumer goods and service industries, as Mr. Gaitskell recognised; a proportion may be drawn from those sections of engineering making metal consumer goods that are not able to switch over to defence production, but both involve absolute shortages of technical ability.

Aircraft.—Comparisons of defence expenditures with total current output cannot be made for the aircraft industry. But this is a special case—an industry maintained in peace primarily for its defence potential, at only secondarily for its civil production. Roughly £y million will be spent on military aircraft in 1951-52; it will enable current production, in Mr Shinwell's words to be "nearly doubled." By the end of the three-year programme, the Prime Minister indicated earlier, milds aircraft output may be "more than four times the current rate." The industry's only problem of capacity is—

aircraft gas turbines, for which new production lines are to be laid down; insufficient output of power plant might thus delay the delivery of aircraft ordered under the defence programme. Apart from this, the main difficulty will be in gathering the necessary skilled labour—last year its labour force was hardly a tenth of the total it commanded at the height of wartime output. The effect of defence upon civil aircraft output and development work may be seen mainly in this transfer of skilled men, at any rate for some considerable time; the general aim will presumably be to enlarge the industry, taking in some of the large reserve of spare capacity that has been maintained since the war. Exports of military aircraft, and to some extent of civil, are thus likely to be curtailed, except of course to satisfy any special military production arrangements that may be made between the Atlantic powers. Materials will presumably be assured for military aircraft production that may thus divert from civil aircraft production supplies of components and of special alloy steels.

Shipbuilding.—Of expenditure upon equipment for the Navy, which Mr Shinwell indicated might be about £140 million in 1951-52, some £60 million will be spent in the shipbuilding and marine engineering industries. Current output of merchant shipping last year was in the region of £120 million. The increased naval building and refitting programme may be expected merely to lengthen the deliveries of ships upon the industry's order-book (which is perhaps worth £285 million at present) and to give extra work to certain yards that specialise in reconditioning work (the Royal dockyards are already full to capacity); but the industry expects that the already considerable difficulties in the supply of materials will further delay production this year.

Radio and Television.—The consumer goods industry most directly affected by defence orders during the first year of the programme will be the radio and television industry: the £25 million of such orders mentioned by Mr Gaitskell amounts to about a third of the value of its current total production. The industry has never been entirely free of defence commitments since the war, as is shown by Mr Shinwell's disclosure that stocks of radar equipment have already been increased by 45 per cent. But the coming year's defence work must inevitably make inroads into the current output of domestic radio and television receivers—to what extent will depend upon the measure of pre-emption of components commonly used in both civil and defence equipment.

Vehicles.—The Chancellor's indication that some £60 million would be spent upon "vehicles" in the coming year presumably includes both armoured and "soft" military vehicles. Tanks are built mainly by the Royal Ordnance Factories, apart from one private manufacturer, and two new production lines for them are to be laid down. For tank production there is not the spare capacity in the ROFs that exists for other branches of defence production. It is impossible to estimate from the disclosed figures what share of the motor industry's current output (nearly £350 million in 1950) will need to be diverted to defence production; but the magnitude of the expenditure does not at first sight suggest that defence orders will themselves seriously deplete the output of cars for civilian purposes—which means largely export. But output is in any case already being curbed by shortages of sheet steel and non-ferrous metals.

Building.—Total output of the building industry was valued at about £1,300 million in 1950, so that the £120

million to be spent in 1951-52 upon building for defence (including civil defence) will take roughly ten per cent of the industry's total output. This will involve reduction or postponement of expenditure upon "works services" already projected, and the full use of existing space. The Government's intention is that the present house-building programme of 200,000 a year will be maintained, though there will be unavoidable local interference with housing programmes in certain areas where building for defence purposes imposes particular strains on local resources.

Machine Tools.—In only one section of industry would defence requirements, as such, overwhelm the whole of existing capacity, in the absence of special measures. This is the machine tools industry. The establishment of new factories for aircraft engines and tanks, and the re-tooling of other Government and private engineering factories, will require £115 million worth of machine tools in the next two years; the capacity of the existing British machine tool industry allowed of an output of roughly £40 million last year, when it was fully engaged. Orders for metal working tools have been placed abroad in Germany, Switzerland, France, Italy and Belgium, as well as very large orders in the United States; for the present, British machine tool companies have not been diverted to any considerable extent from their work upon export and home contracts. The American authorities, having taken considerable powers of control over the machine tool industry, are giving formal priority to British orders for those tools that can only be obtained in the United States; the application of this definition is probably a matter of national interpretation, but the Chancellor "very much hopes" that the remainder will be obtained "in good time." Machine tools are of an immense variety, and in many cases it may be simpler and quicker to obtain special-purpose tools from foreign firms that specialise on them than to switch (in time) to their production in Britain.

The foregoing summary gives only the barest outline of the potential effects of a defence programme that itself may be subject to considerable changes of timing and content. Only the broadest indications emerge of the necessary industrial changes that must be made and of their true extent. One cannot yet venture into speculation about the further steps that may be necessary, apart from industry's own contrivance and co-operative adaptation, to secure the ends of the programme. It is a first indent upon industry, but it leaves no doubt of the big demands that will be made on particular sectors of industry. Since these are narrowly based and supplies of the critical raw materials they need are narrowly poised, the defence effort will involve a strain upon them bigger than anything they have ever known in any period short of actual war.

Food Stocktaking

LAST year, the British people consumed more food than in any year since the war, though still appreciably less than they consumed immediately before the war. The cost of food, as measured by the official index of retail prices, rose by only 4 per cent while the prices of primary commodities (food and raw materials) traded on the American markets rose by 50 per cent. The former index is heavily influenced by subsidised food prices, while the latter calculation (based on Moody's index) gives an impression of the trend of prices on world markets. The British consumer escaped—last year at any rate—the major burdens inflicted on the rest of the world by inflation. He ate more, but in doing so he seems to have cost the Exchequer no more in subsidies than the stated limit of £410 million. This result is not a defiance of all economic laws; it has been brought about by the simplest of economic dodges since the days of Cain and Abel—by living on stocks.

The background to last year's rationing policy is worth study in some detail. Last April, the Chancellor of the Exchequer put a limit to the total cost of food subsidies of £410 million a year; any variation in the Ministry's purchase prices on which the subsidy bill was based was to be passed on to the consumer. After the Budget, butter was raised from 1s. 6d. to 1s. 10d. a lb. and bacon from 2s. 3d. to 2s. 5d. a lb.; later last year butter was raised by a further 2d. to 2s. a lb. and bacon by 2d. to 2s. 7d. a lb. These prices reflected increases in the prices that the Ministry had to pay. But, on the other hand, there was great pressure to prevent retail prices from rising in order to maintain the partial effectiveness of the wage freeze. If stability of retail prices of food was all that was required, this prescription should certainly have worked. But such stability was possible only because the Ministry could afford to take a firm line with suppliers that were asking for higher prices; instead of importing at higher cost, it used up stocks at old cost. The Ministry seemed so simple-minded as to suppose that a Canute-like attitude towards the tide of world inflation would induce suppliers to sell more cheaply; and it was mortally afraid that the offer of a higher price to one supplier would mean higher prices to all suppliers and for all foods.

Apart from this fear and its inhibiting effect on buying

policy, it is also true that the long-term contract—whatever advantages may be claimed for it—puts very great restraints upon a buyer who is anxious to avoid charging higher retail prices for food. A large part of the Ministry's purchases are still obtained under long-term contracts. At each price review last year, the Ministry fought hard against paying producers appreciably more than in 1949—despite devaluation, despite the American inflation and despite the boom in commodities that followed Korea. For a time, it even attempted, unsuccessfully, to secure lower prices. Most of the long-term contracts stipulate a maximum price variation of 7½ per cent in either direction in any one year. If the Ministry had realised after the invasion of Korea, if not before,

that the turn of prices was not downward as it had vainly hoped but upwards, it could have obtained more food by paying 7½ per cent more for supplies under these contracts. But the Ministry's maximum offer was an increase of 5½ per cent, and having fixed that limit it could make no greater offer to one country unless it made the same offer to all other producers.

The result of this policy was not marked by a drastic decline in food imports last year, but certainly they did not increase commensurately with the scale of rations. Imports of wheat and flour last year fell by as much as a third, not because purchases were reduced but because of delays in shipments from Canada. Despite the stoppage of supplies from Argentina, imports of carcase meat

were only 6,000 tons lower than in 1949 while arrivals of bacon and ham were up by 60 per cent. Butter imports increased by 5 per cent, but there was a fall of more than 25 per cent in cheese and shell eggs. Imports of tea also fell by nearly 25 per cent, while imports of sugar were only slightly reduced. In contrast, consumption of most of these foods last year was appreciably larger than in 1949. Twenty per cent more carcase meat was consumed, 80 per cent more bacon, 25 per cent more butter, 3 per cent more cheese, 10 per cent more shell eggs and 4 per cent more tea. All these were record postwar figures.

This high rate of consumption could not have been achieved except at the expense of stocks. Twelve months ago, the cold stores were bulging and fifteen refrigerated ships were held in port to increase the avail-

able storage space. Today, the larder is seriously depleted and there is no hope of repeating last year's relatively high level of food consumption. The measure of the depletion is shown in Table I. Any figures that purport to show the movement of food stocks must be treated with caution; the Ministry of Food never discloses its stocks in the belief that it thereby protects its bargaining power. The estimates given in Table II for food stocks for the past four years have been calculated from official statistics. Stocks of all commodities except sugar fell last year. Wheat stocks were reduced by 228,000 tons and flour by 111,000 tons. But at the beginning of this year there was 12 weeks' supply in store and large quantities had been bought forward which had not arrived. Meat stocks fell by 90,000 tons and amounted at the end of 1950 to 4 weeks' supply. Butter stocks were 22,000 tons smaller at the end of the year, though it should be noted that the bulk of New Zealand and Australian shipments is due in the first quarter of the year; these two countries supplied nearly 60 per cent of British imports of butter in 1950. Stocks of cheese fell by 18,000 tons, though at the beginning of this year the emergency purchase of 10,000 tons of American cheese was beginning to arrive in this country. Stocks of tea fell by 33,000 tons—a poor prospect for the reopening of the London tea market in April, though mitigated, perhaps, by the welcome increase of imports in January. Stocks of sugar, exceptionally, increased by 32,000 tons. Consumption of shell eggs, margarine and cooking fat in each case exceeded available supplies.

These figures pose the question whether the offer of the disputed 2 per cent under the long term contracts would have been an act of wisdom. It is easy to be too wise after the event, but at the very moment when the Ministry was making its stand, there were indications that its only result would be lower imports, even of commodities under long term contracts. The Ministry of Food has a long term contract with the Netherlands for shell eggs, but because the price offered last year to the Dutch was not acceptable, none came to Britain at all. Again, Australia, New Zealand and Denmark were dissatisfied with the price of butter under their long term contracts. All these countries have abolished the rationing of butter with the result that more is now being consumed at home and less is available for export to Britain. The Netherlands fulfilled only the minimum quantity (20,000 tons) of their long term bacon contract; the extra 15,000 tons under contingent contract that might have come to Britain went instead to Germany. The high price of wool has encouraged New Zealand

farmers to keep their sheep to clip rather than slaughter them for meat; in this calculation, they weighed Britain's refusal last July to pay more for New Zealand lamb, though recently a retrospective increase of 5½ per cent has been agreed to. No contracts have been signed for Canadian bacon and cheese; Canada asked for higher prices and the margin in dispute, though small, caused the breakdown. The story of Argentine meat is well known, but again it illustrates the point that if this country wants larger quantities of meat or other foods it must match with its offers the rise in world food prices and compete also with high prices offered by domestic consumers.

*

The Ministry's efforts to heave the terms of trade in its own favour have failed—and the terms of trade are still worsening. This fact greatly adds to its difficulties this year in increasing its scale of imports to replenish stocks—or at least to prevent further depletion—and in maintaining last year's level of food consumption. In addition, it has been authorised to spend £3,000,000 towards accumulating a strategic reserve of food in the current financial year and it will have £72½ million to spend on stockpiling next year. The figures sound impressive, but the prospects of finding supplies are not bright. Messrs Lovell and Christmas have estimated that butter supplies this year will total 340,000 tons against 350,000 tons in 1950; this would be sufficient for a four-ounce ration, whereas last year the ration was kept at six ounces for 4½ months. Cheese supplies (excluding unrationed varieties) are unlikely to reach 200,000 tons unless large quantities are purchased from the United States or Canada; a two-ounce ration would require almost 220,000 tons, but the ration was raised temporarily to three ounces a week from the end of January to offset the reduction in meat. Even if agreement is quickly reached with Argentina, imports of carcase meat are unlikely to reach 750,000 tons, which would give a total supply of barely 1,700,000 tons. Without assistance from Canadian supplies, Britain cannot expect to have more than 400,000 tons of bacon this year. Two bright spots are wheat and sugar. The United States is hoping for a bumper wheat crop this year if the weather is kind and much is expected of the Canadian harvest. If these crops materialise, it should be possible to buy more wheat, though more than the maximum price fixed under the international agreement would have to be paid. The world sugar crop is the largest on record and for the past six weeks prices have been falling steadily. Here at least the Ministry of Food should have scope to show some buying finesse.

	Imports	Home Production	Available Supply	Total Consumption	Changes in Stocks during year

Business Notes

Steel Stock Makes its Bow

The opening performance of the new steel compensation stock—its formal title is British Iron and Steel 3½ per cent Guaranteed Stock, 1979-81—has conformed pretty closely to the forecasts current in the City on the eve of the issue. Like other nationalisation stocks—with the notable exception of Gas stock—it opened in the market at a discount. The opening price last Friday week was 98, and there was a momentary slide to 97½, but by the end of the first day's business the price had been brought back to 98½. This recovery, however, was mainly due to private institutional buying. A notable feature of this whole operation has been the virtual inactivity of the departments. They made no attempt to resist the decline in the gilt edged market in the weeks preceding the issue (and thereby allowed the prospective life of the new stock to be shortened by some 20 years); and when the stock made its bow they merely gave it modest support until the wider audience began to show interest. The volume of selling by former holders of steel shares has been larger, in the first few days, than had been generally expected some weeks ago; the protracted switching proved to have discounted only a moderate part of the whole pressure to be expected. In consequence, the volume of business in the early dealings was very large; and although there has been a big demand from the institutions, the pressure against the stock has persisted. The discount early this week was 2 points, and not until Wednesday did the stock succeed in showing a net gain—to 98½.

Since the stock had to be warranted to be worth par at the moment of issue, when judged by the general yield structure of the market, the persistence of a discount has made other stocks look dear. The most closely comparable stocks—the 3½ per cent Electricity issue, 1976-79, and the 3½ per cent Coal stock, 1977-80—were, indeed, marked down by ½ forthwith, but although they have since fallen by a further ¼ point, the disparities in the yield structure have still not been fully eliminated. Similar, though less substantial, adjustments have naturally been taking place throughout the gilt-edged list, notably, of course, in the longer-dated and irredeemable issues. Consols, at 68½, have lost a further ¼. By the middle of this week there was the first sign that the remaining adjustment required to restore equilibrium might be achieved rather by a lifting of the price of the Steel stock than by a further fall elsewhere. But there is undoubtedly still an appreciable volume of Steel stock that is likely to come on the market—notably the blocks held by industrial companies with former large interests in steel production. And it is possible that investors may be becoming less indifferent to the fundamental and longer-run pressures on the gilt-edged market than they seemed last year. On the other hand, the approach of the budget and the growing fears of industrial dislocation, have instilled the first doubts into an exuberant market in industrials. After advancing this week to 123.1—its highest level for three years—the *Financial Times* share index dropped by fully a point as investors took note of the threat of a rail strike. The pull-devil, pull-baker influences in both equities and gilt-edged will present an interesting spectacle in the next few months.

Steel Prices Follow Coal

The general increase in steel prices that took effect this week clearly illustrates how a rise in the price of coal ripples outward through the economy. Higher road transport charges and the cost of the recent engineering wage award also contributed to the steel price increase, but the most important factor was the recent rise in the prices of

coal and coke. Steel and electricity have thus already passed on their increase in fuel costs, and it is certain that the railways will also have to do so shortly; it is most unlikely that industries consuming these other basic materials and services, as well as dearer coal, will be content to absorb any large proportion of such increased costs.

The impact of this rise in steel prices upon other industries can be appreciated the more clearly since the British Iron and Steel Federation has just issued for the first time greatly improved statistics of steel consumption by industry. When official allocation of steel came to an end last May the Federation took the opportunity of putting

ESTIMATED DELIVERIES OF FINISHED STEEL TO U.K. INDUSTRIES (ANNUAL RATE BASED ON OCTOBER AND NOVEMBER, 1950)		
Consuming Industry	'000 Tons	Per cent of Total
Shipbuilding and marine engineering	946	8.8
Building and constructional engineering	1,430	13.3
Mechanical engineering	1,644	15.3
Electrical engineering	451	4.2
Motors, cycles and aircraft	1,161	10.8
Railways and rolling stock	871	8.1
Collieries	602	5.6
Hardware, hollow-ware, etc.	1,129	10.5
Rivets, bolts, nuts, springs, drop forgings, etc.	957	8.9
Other	1,559	14.5
TOTAL	10,750	100.0

delivery statistics upon a more useful basis. Former statistics of consumption by industry had to be based upon a classification of deliveries by Government departments; orders for steel are now required to bear a symbol representing the consuming industry to which the customer's main business belongs. The first figures available upon the new basis (which conforms to that suggested by the Iron and Steel Committee of the International Labour Office some years ago) are summarised in the table: they show that the largest consuming group is mechanical engineering, which is currently taking about 15 per cent of finished steel deliveries. Building and constructional engineering takes a slightly smaller share, while the "motors, cycles and aircraft" group and the hardware and hollow-ware industry each account for just over one-tenth of the total.

Responsibility without Power

No responsibility for this increase in price, obviously, can be attached to the Iron and Steel Corporation (though it will later, quite correctly, be counted as part of any aggregate change in prices since the nationalisation of steel). It is difficult to define, indeed, any practical responsibility that can at present justly be attached to the Corporation, except those concerning its financial relations with its subsidiary companies; and since the Steel Act places upon it wide and onerous responsibilities, its present inability to discharge them puts its chairman, Mr Hardie, in a patently difficult position. The impasse in negotiations concerning practical control of the industry foreshadowed before vesting day now appears complete; the Federation is refusing the Corporation the right to appoint members to its council, executive, and financial committees—which are, after all, the inner councils of the remaining privately-owned steel industry and of that sundered section whose leaders hope it may return. For the moment, the negotiations that had become almost weekly are at an end. The Corporation is obviously unlikely to accept formally the Federation's concession of seats upon the conferences handling sections of

the industry in which the Corporation has a major interest—and whether it will in practice appoint such members still seems uncertain.

The Corporation, it can be assumed, is now concentrating upon its own plans for long-term organisation of the industry; the arrangements, concerning which negotiations have broken down, were in any case intended to operate only for an interim period, possibly as short as three months. There seems nothing to prevent the present impasse from continuing throughout such an interim period or even longer. But it seems unlikely that the Corporation will long rest content with a situation in which its responsibility for fixing steel prices has by agreement been left with the Ministry of Supply and in which its practical responsibilities for securing supplies of iron and steel, for development, training and research, for labour relations, and for carbonisation development are left—in default of any agreement—in the hands of the Federation. It may be that the counsel that the Corporation cannot obtain from the industry's experts as members of the Federation could be sought from them as employees of its subsidiary companies. For a period Mr Hardie will presumably seek amicable arrangements; but in the long run he will no doubt be tempted to fire his "big guns"—unless political developments in the meantime produce a different kind of detonation.

Britain's Record Trade

The effect of world inflation is certainly to be traced in the British trade figures. Imports and exports both reached record values last month. Imports totalled £298 million compared with the previous peak of £239 million in December. They were, in fact, some 37 per cent larger than the monthly average for 1950, though their volume is estimated by the Board of Trade "very roughly" at no more than 12 per cent above last year's average; thus the cost of imports has already risen by over 20 per cent compared with 1950, most of the increase being due to dearer raw materials. Imports of raw materials (including non-ferrous metals and petroleum recorded in the trade returns as manufactures) rose by over £80 million compared with January, 1950. Raw cotton cost £15 million more and only 28 million lb more was received. Imports of raw wool and waste rose by £23 million in value but by only 15 million lb in quantity, while imports of rubber increased by 5,000 tons to 24,000 tons and their value by £8 million to £11 million. Among the non-ferrous metals much larger supplies of aluminium, manganese and tin were received, and more copper, zinc, nickel and molybdenum, but much less chrome ore, tungsten and lead. The rise in import prices is serious, though there is some comfort in the larger quantities of raw materials received last month.

Exports in January totalled £214½ million, some £2,500,000 more than the previous record reached in November. Their value was 19 per cent higher than the average for 1950 and their volume 12 per cent higher. But January was a long working month—27 days compared with the usual 26 days—and if allowance is made for the extra day, the rate of exports was lower than in November and the volume some 3 per cent below the average for the last quarter of 1950. Textile exports amounted to £48 million, a rise of 40 per cent above last year's average. Almost half of this increase was due to the very marked increase in shipments to South Africa, following the easing of import restrictions by the Union. Cotton goods totalled £18½ million, 18 per cent more than the high level in the last three months of 1950, while wool textiles amounted to £17 million, a rise of 20 per cent compared with the fourth quarter average. Vehicle exports rose by 11 per cent to nearly £40 million, though the value of new cars was about the same as in the fourth quarter of 1950. Machinery exports increased slightly to £29½ million, while iron and

steel manufactures declined slightly to £14 million. Exports of coal were greatly reduced and amounted to only £2,250,000 compared with £5,250,000 in January, 1950.

Shipments to the United States and Canada did not maintain the high level of the last quarter of last year. Exports of iron and steel, non-ferrous metals, wool and cotton goods to the United States, and of wool and cotton goods to Canada showed no reduction, but exports of all other products to these two countries were smaller. Only £1,250,000 worth of vehicles were sent to Canada, equal to one half the average for the last quarter of 1950; the number of new cars sent was only 2,547, compared with 6,039 a month in the last three months of 1950. The sharp rise in the total value of imports in January caused the adverse balance of trade (imports valued at c.i.f. and exports at f.o.b.) to increase from £43 million in December to £75 million, the largest deficit for any month since August, 1947.

Rubber Conference Adjourns

The special rubber conference that has been sitting in London for the past three weeks has adjourned, and expects to resume within a month. In the words of one delegate, the conference "agreeably decided not to agree"—and that is the perfect setting for a disagreement. The problem of re-directing rubber exports to increase supplies to the western powers does, indeed, bristle with difficulties. Export licensing and international allocation have both been rejected as politically impracticable. The only other possibility is a multilateral contract similar to the international wheat agreement—and, according to certain reports, the conference was adjourned to enable delegates to obtain their governments' views on this topic.

The rigidity of any long-term contract—particularly one between a series of countries—creates many pitfalls for producers and consumers. But the purpose of a long-term contract of this kind for rubber would not be so much to ensure stability of prices for producers or the assurance of specific supplies for particular consumers, but rather to encourage supplies to go to certain countries and to prevent them from going to others. The governments of the major consuming countries could, for example, contract to buy the entire output of certain large rubber estates for, say, three to five years hence. This would guarantee them a minimum supply for defence and civilian purposes. But it would not prevent supplies outside the contracts from going to Russia or China. A multilateral contract similar to the wheat agreement, guaranteeing a market for the entire rubber output of Malaya, Indonesia, Ceylon and Thailand at an agreed minimum price and at the same time guaranteeing supplies to the chief importing countries at an agreed maximum price could, indeed, reduce to a minimum the leakage of supplies to potential enemy countries.

But such an agreement would not be easy to administer. There would still be the problem of ensuring that small-holder supplies would be sold within the agreement and not smuggled across the border. The agreed minimum price would clearly have to be attractive and it would have to be fixed for some years. The rubber markets would still be able to function in a limited capacity, as the price could fluctuate freely between the agreed maximum and minimum limits. It would be the responsibility of the governments of the producing countries to see that their export obligations were met. If the real purpose of such an agreement were to redirect supplies, then the question of price would be of secondary importance. If the consumption trends in 1950 both in the United States and Europe are any guide to future developments, world civilian consumption of rubber might exceed 2,000,000 tons in a few years' time. On this ground producers could bargain for a high price. Consumers, on the other hand, could claim that if the price of natural rubber rose much above 3s. a lb., synthetic production would be a very attractive proposition. But perhaps their more powerful argument is that a long-term contract would relieve producers of their fears of the effect of large strategic stock-piles that one day would have to be liquidated.

State Trading and Shipping

The disruptive effect of government trading on the shipping industry is one of the principal points dealt with in the annual report of the Chamber of Shipping of the United Kingdom. Normal commercial trading, the Chamber argues, is far more sensitive to market conditions than any Government department, and adjustments are made more rapidly by individual firms than is possible under the slow machinery of bulk buying. Furthermore, these adjustments are made without the disturbance of the tonnage markets that inevitably follows the discovery of a "short position" by a Government purchaser—the shipping industry finds it disconcerting that these "discoveries" are being made so often and with such mystifying suddenness. The diversion of tonnage *en masse* on long voyages in ballast to satisfy belated Government import requirements prevents tramp shipping from exercising its proper economic function, reduces its carrying capacity and forces freight rates up in an international market. The cessation of meat exports, too, has caused the diversion of costly refrigerated ships to carry general cargoes on routes for which they were not designed.

It would clearly be uneconomic for the shipping industry to build sufficient ships to meet peak demands, for this would lead to violent fluctuations in the amount of employment for ships and crews. Freight rates are bound to rise when there is a sudden pressure of demand, and for this the Government trading departments are too frequently to blame. The rise in freight rates, as the Chamber points out, is no more within the control of the British shipowner than of his foreign competitor; and no artificial restriction can be imposed on such an international industry except by international control.

Meanwhile, the restoration of the British merchant fleet to a more balanced condition by the replacement of older and obsolete vessels remains one of the more serious long-term problems of the industry. High rates of taxation, and the effects of the present basis of computation of profits are steadily diminishing the power of the industry to maintain the modern and efficient fleet by which alone it can meet competition and continue its services to the nation. On grounds of national security, the shipping industry argues, it deserves consideration as a special case, but apart from special treatment (which other industries might be able to claim with little less justice) there can be few industries that require such huge sums to maintain capital equipment that itself is subject to such rapid obsolescence.

Shipping and Exports

One of the many factors that helped to underline the shortage of dry-cargo tonnage towards the end of last year was the number of tramp ships taken up on time charter by liner companies to help carry the unprecedented volume of British exports of manufactured goods. The urgent demand for ships to bring American coal to Western Europe, and for the transport of grain to India and grain and timber from North America to the United Kingdom, revealed that the Government buying departments had failed to cover their commitments by forward chartering. The most urgent requirements were, in fact, covered only by releasing ships from charter to the liner companies and sending them on long ballast voyages to the North American continent to load coal, grain and timber. As a result, tonnage is now short for the export trade from the United Kingdom; as was expected, and export consignments, particularly of motor cars, are once more piling up in the docks to such an extent that some shipping conferences have been compelled to re-introduce registration systems for calling forward export consignments. Labour trouble at the docks is adding to the congestion in the flow of exports.

Meanwhile, owing to an unusually high demand for tramp tonnage for bulk shipments, time charter rates of hire have advanced so much that the liner companies are being forced to pass on some of the higher costs to the shippers. When charter rates were low last year, liner companies could employ tramp ships at a profit without altering their own freight rates; but the recent trend of tramp freight rates, illustrated in the accompanying chart, has now made this

impossible. At the request of the Ministry of Transport, the Chamber of Shipping has issued a circular to owners stressing the importance, in the national interest, of maintaining a steady flow not only of bulk imports to the United Kingdom but also of vital exports. Partly to offset increased operating costs, and partly to enable them to resume the chartering of tramp ships as they become available, the liner companies have already advanced their conference rates.

* * *

Allocating Non-ferrous Metals

The Ministry of Supply is at present allocating only three non-ferrous metals, zinc, copper and lead. Supplies of virgin zinc to industry in March will be the same as in February—that is, 50 per cent of the average monthly consumption in the first nine months of 1950 of good ordinary brand for galvanising, brass and zinc oxide; 80 per cent of electrolytic zinc for brass and 70 per cent for rolled products and zinc oxide; and 80 per cent of high-purity zinc for die-casting alloy. The allocation of imported virgin copper during March and April will also remain at the February rate of 85 per cent of the monthly average consumption in the first six months of 1950. Consumers may now order for delivery in both March and April, subject to the usual premium where applicable.

Martins Bank acts as Executor and Trustee and provides security, skill and continuity of management at moderate fees.

The Trustee Department of the bank was formed over forty years ago, and a descriptive booklet may be obtained at any of the branches.

THE TREASURER'S HOUSE YORK
(Property of the National Trust)

The recorded history of this famous house dates back to the Conquest, and the foundations may well be Roman in origin. The present building is seventeenth-century on a thirteenth-century undercroft. A succession of bishops bought the place in turn, and King James I was entertained there by the son of one of them.

TWO CENTURIES OF ENTERPRISE

Nearly two centuries ago, when Glyn, Mills & Co. was founded in 1753, commercial and industrial enterprise depended on a handful of pioneers—the 'gentlemen adventurers' of the history books. With the highly individualised businesses of the past, so with the large combines and national corporations of to-day, Glyn, Mills maintains its tradition of a private Banking House offering the most advanced and comprehensive banking facilities.

ANNUITIES

—THE MODERN METHOD

In these days of low interest yield on investments and continuing high rates of income tax, an annuity offers the solution to the problem of diminishing incomes. A Guaranteed Annuity with the Norwich Union has many advantages over the ordinary simple life annuity. It avoids the former major objection to annuities since during the guaranteed period of, say, 10, 15 or 20 years, **INCOME TAX IS NOT PAYABLE** on the portion of each instalment which represents return of capital.

Send now for full details of this modern and attractive scheme to:

NORWICH UNION

INSURANCE SOCIETIES

18-30, Surrey Street, NORWICH, Norfolk

Without obligation, you may send details of Guaranteed Annuities to:—

M. _____ Date of Birth _____

Address _____

E.5.

NEW DEFENCE BONDS

Higher Rate of Interest

- Interest increased from 2½% to 3%.
- Interest paid to you half yearly—Income Tax is not deducted at source.
- Repayable at par on the interest date next following ten years after date of purchase, or at 6 months notice.
- Maximum amount which can be invested £2,500 including previous issues.
- Buy them through Banks, most Post Offices or through your stockbroker.

YOU CAN ALSO HOLD 500 OF THE NEW 15/- SAVINGS CERTIFICATES

*over and above permitted holdings
of all previous issues*

Issued by the National Savings Committee

Lead is the third metal to be restricted. The Ministry's stocks have declined because of delays in shipment from Australia, but consumers' stocks of lead have increased quite appreciably in recent months. For the time being, purchases of virgin lead from the Ministry will be limited to 90 per cent of the average monthly consumption for 1950. Through this system of allocation the Ministry should save 7,000 tons of zinc a month, 5,500 tons of copper and 1,350 tons of lead, compared with the average monthly consumption for the whole of last year.

Meanwhile, the Ministry has at length reached something approaching a final decision about the details of the prohibition of manufacture of non-essential goods from zinc, copper, and their alloys; orders will be made by next week by the Ministry and the Board of Trade (for articles for which it is the production department), and the ban will come into force from March 1st. The list of prohibited articles has been amended, with some deletions and a few additions. Until July 1st, however, manufacturers will be able to continue to make any stocks of fabricated and semi-processed metal into these banned goods; and the question of production of such articles for export is still "under consideration at a very high level."

No move has so far been made to restrict consumption of the alloy metals, though discussions on the prospective supplies of nickel, molybdenum and chrome are taking place. These three metals are sold privately and rationing is carried out by the suppliers. If it is found to be necessary to curtail nickel consumption (and since the Government intends to create a strategic stockpile, which must clearly include nickel, such a decision would seem to be inevitable) the Ministry of Supply would no doubt wish to control nickel supplies and also, no doubt, to prohibit its use in certain products.

Gatt for Ito

Mention was made in Parliament last week of the position that has arisen as the result of the now virtually unanimous decision to bury the Havana Charter of the International Trade Organisation and to substitute for it a somewhat reinforced version of the already existing General Agreement on Tariffs and Trade. The President of the Board of Trade re-emphasised the point that the General Agreement is at present subject to provisional application from which any member may withdraw on giving sixty days' notice. If, as is quite probable, there is any question of adhering to the General Agreement on any other than a provisional basis, Britain, at least, would have to arrange for the issue to be debated in the House of Commons. Mr Harold Wilson repeated an earlier assurance that, since the United States Administration had decided not to proceed with the ratification of the Ito Charter, the British Government would do likewise. The discussions on the General Agreement in Torquay ended before Christmas, and will not be resumed at the Torquay meeting. The question of reinforcing the General Agreement, embodying in it some of the chapters of the now moribund Ito Charter—notably those on development and employment—together with the possibility of giving the General Agreement a more permanent character than it possesses at the moment, will have to be deferred to the next meeting of the contracting parties.

Meanwhile, the tariff negotiations continue in Torquay. They are likely to be brought to a conclusion by the end of this month. It will take a few weeks to sort out the results. Their presentation in the form of the usual voluminous new schedules of tariffs should appear before the end of March. Mr Harold Wilson was questioned in the House about the concessions on tariffs and preferences that had been offered by representatives of the United

Kingdom at the Torquay Conference. He maintained discreet silence, pointing out that it was an established practice that, while such negotiations were taking place, there could be no disclosure of what offers were being made. It is strange that this very obvious fact should not have been evident to the questioner.

Coal without Miners

Experiments in underground gasification of coal at Newman Spinney, near Chesterfield, have produced sufficiently promising results for the Scientific Advisory Council to recommend their expansion and further research in coalfields with differing geological characteristics. The Ministry of Fuel and Power, which is responsible for the experiments, has spent £50,000 upon two methods that it believes will be preferable to the experiments in the United States, Belgium and French Morocco, and the practical work in Russia, all of which appear to involve the preparation of shafts and tunnels by miners working underground. The Ministry's aim has been to produce the gas by working from the surface.

Any system of underground gasification involves igniting the coal seam in a current of air and drawing off hot gas: it therefore needs downward and upward draught shafts, linked by some horizontal channel through which air and gas can flow across the coal surface. One method, used by the Ministry in the first experiment at Newman Spinney, involves drilling the two vertical shafts on the side of a slope and driving a horizontal adit at the level of the seam to join the shafts. This method, which is suitable only in hilly districts, has been producing gas since July, though the quality from the original borehole has now deteriorated; a second, larger borehole has now been prepared there in the same way. A second method, and potentially a more widely applicable one, is to make vertical drillings below the surface of the seam and connect them by pneumatic pressure slightly greater than the pressure exerted by the overburden, opening up natural fissures in the coal to allow the hot gas to escape. This system has been successfully operated between vertical drillings 33 feet apart and has been producing gas for four months.

The gas produced—so far in tiny quantities—has been of an average of about 75 BTU per cubic foot (from a wet seam of very dirty coal only 18 inches thick). This would not be of sufficient calorific value for town gas supplies; the Ministry hopes to burn it under boilers for steam-generating plant, or as a fuel for gas turbines. One square mile of coal 3 feet thick, it is estimated, could produce enough gas to generate at least 25,000 kW for at least ten years—equivalent to roughly one million tons of mined coal required at present. The system offers opportunities of utilising low-grade coal that is economically not worth mining—and possibly, in the long run, hopes of working coal seams several thousand feet below the surface, where temperatures would not permit ordinary mining. Its use in gas turbines is connected with another possibility of gaining fuel from the mines without raising coal—the use of methane ("firedamp") which even in the weak mixture found in the normal updraught from coal mines could be burned in a gas turbine if pre-heated. The complementary use of both sources of feeble gas might be combined in pithead turbines; colliery generation of power, which is at present not altogether acceptable to the electricity supply industry, might then be a far better economic proposition.

Europe's Next Coal Crisis?

With the worst of this winter perhaps over, anxiety about current coal shortages in Europe is now being partly

replaced by forebodings about another and perhaps worse coal crisis next winter. The National Coal Board's manpower problems find a melancholy parallel in most coal-producing nations on the Continent. Miners' wages throughout Western Europe have been increased in recent weeks, with the same accompaniment of promised priority in housing and better working conditions, but the shortage of labour continues. Production remains at about the 1950 level in France and Belgium; in Germany it is still rising, though at a lower rate than a year ago, but the Ruhr is getting near the technical capacity of its existing collieries, and their owners protest that they do not command the money to carry out considerable extensions. In these circumstances further orders are being placed for American coal for delivery later in the year; France may order much more (probably more than Britain's original 1.2 million tons), and Italy is placing large orders.

The current European coal account (which showed a deficit of 5 million tons of coal and a million tons of coke for the first quarter of 1951) is not likely to alter materially before the middle of the year. Britain will probably be able to maintain through 1951 the heavily reduced exports it is sending Europe in the first quarter (just over a million tons of coal and coke, compared with 2½ million tons in the same period last year). The Ruhr Authority has ordered the German industry to export 6.2 million tons of coal in the second quarter of the year, instead of the 4.9 million tons at most that the German Government considered possible. The Germans complain that even their suggested figure would have left them two million tons short of fulfilling home demand; it seems possible that, as in the present quarter, they will obtain some reduction of the export requirement during the next few months. Poland is continuing to supply Western countries, but at prices now well up to American levels. With the continued rise in freight rates, certain nations buying American coal are running short of free dollars, and it seems probable that ECA will allow some of the deliveries to be charged against dollar aid. The Coal Board is fulfilling arrears of 1950 orders at prices cheaper than those of any other country in Europe—except for Germany, where a rise in export coal prices is likely. It regards the prospect of Marshall Aid being used for American coal with some reserve; Britain will not qualify for any such assistance, and one of its effects may be to drive freight rates up even further.

Binding Cases

Binding cases for THE ECONOMIST and RECORDS & STATISTICS can now be supplied. These cases, made by Messrs. EASIBIND LTD., are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding. The case for THE ECONOMIST will hold 26 issues and the half-yearly Index; that for RECORDS & STATISTICS will hold 52 issues. The year can be stamped on the spine. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.,

(Dept. E), Pilot House, Mallow St., E.C.1.

A binding case can be sent on approval, if required.

Canadian Wheat Price

The once esteemed Anglo-Canadian wheat contract, which expired last July, is a long time a-dying. When Mr Strachey was Minister of Food he declared in defence of government trading that this contract enabled Britain to buy wheat at prices well below those in world markets. Canadian farmers have not forgotten that remark. Nor have they forgotten that the contract contained a clause, thought at the time to be a form of words of no great consequence, that if the contract price was substantially below the world price—as it was—Britain would make good the difference. This has long been a sore point, and the soreness has broken out again. Mr J. G. Gardiner, the Canadian Minister of Agriculture, arrived in London last weekend to discuss this point, among others, with the British Government.

The official British contention is that for the two seasons 1948-50 it agreed to pay Canada \$2 a bushel even though the maximum price for wheat under the international agreement (which was operating in 1949-50) was only \$1.80 a bushel. But the real point does not concern dollars; it raises the whole nature of governmental trading and long-term contracts. When the international wheat agreement was negotiated in the early months of 1949, there was fair reason to believe that the agreed maximum of \$1.80 was high and indeed during the first season deals were concluded at prices below the maximum price. Only last September, the Canadian Wheat Board reduced its "free" price to the same level as the agreement maximum; now the "free" price again stands well above this \$1.80 maximum. In Chicago, wheat is selling for \$2.51 a bushel, and there are suggestions that the United States is dissatisfied with the maximum price as fixed by the agreement until July, 1953.

It is only by sheer chance that any price fixed for a period of time proves reasonably fair to both buyer and seller. The wheat agreement was intended to be an insurance policy providing cover for both wheat exporters and wheat importers. If the world price of wheat had fallen to \$1.20 a bushel importers would have paid the agreement minimum of \$1.45, which was still above exporters' costs of production. In fact, the importing countries are now getting the benefit of the agreement. But with the large expansion in American wheat production planned for the summer and the expectations of a bumper crop in Canada, who can guess the price of wheat in two years' time? It seems fairly certain that if countries are going to amass large strategic reserves of grain, importers might well keep the price of "free" wheat above the agreement maximum, since supplies guaranteed to them under the agreement provide only part of their total peacetime requirements. Britain has already bought wheat from Canada at market prices above the agreement maximum and it will no doubt do so again. But this fact—as the Canadians will no doubt argue—has no connection with the terms of the old wheat contract with Canada.

Potash Pay-out

Holders of Potash Syndicate bonds, Series A, B and C, are being invited to approve a distribution of £35 10s. per £100 bond. Although holders of these bonds in Switzerland, Holland and Sweden received interest payments up to various dates between 1944 and 1946, while holders in Britain and the United States received such payments only up to 1940-41, the proposed distribution will have to be made without discrimination, and on capital account; it will not be treated as discharging any particular percentage of the face value of the bonds, but will be taken into account at a later date when it becomes possible to determine its value in terms of the bondholders' rights to receive either sterling or dollars at the fixed exchange rate of \$4.86 to the £.

The distribution will be made out of the £2,477,778 now in the hands of the paying agent. This sum is the sterling

equivalent of a fairly large sum in Dutch guilders, and of smaller sums in Swiss francs and Swedish kroner, which became available as a result of German sales of potash to these currency areas during and immediately before the war. Under the terms of the original loan, it will be remembered, bondholders secured a first charge on the proceeds of German potash exports. Apart from the £2,477,778 now to be distributed, bondholders have claims on sums of US \$1,100,000 now in Holland, of Swiss francs 3,300,000 now in Switzerland and of \$5,700,000 now in the United States. Negotiations to secure the transfer of the first two of these sums are in train, but legal proceedings will be necessary if the \$5,700,000 now in New York is to be wrung out of the American Office of Alien Property. Apart from possible enforcement of their claims on these sums, the prospect of further disbursements to bondholders does not seem promising. The occupying powers have so far refused to allow any portion of the proceeds of postwar German exports of potash to be paid over to bondholders; the Potash Syndicate has been deprived of its monopoly in sales of German potash as a result of the anti-cartelisation laws; and most of the potash mines are in the Soviet zone, where they have been nationalised without compensation to the mortgagees.

* * *

Recovery in Wool

The wool market has recovered from its temporary setback of the past three weeks and once more looks set for a further rise. The London sales last week closed firm and on the last day of selling buyers were no longer hesitant. Prices for merino rose by 5 per cent and medium crossbreds by 10 per cent. This week prices have risen in both Australia and New Zealand. Merino prices are now virtually back to their high level of January, and medium crossbreds are even slightly above it. Fine crossbreds, however, which remained firm in recent weeks, when merino prices were declining, are beginning to drop.

The most important event in the wool market is, perhaps, the re-appearance of American buyers. It now seems to be taken for granted that the price-freeze in the United States will not be rigidly applied, so that American manufacturers are again willing to commit themselves at present high prices. Another development that is not without significance is the clear indication that the Australian clip will not be anything like as big as was expected. The official estimate has already been reduced from 1,190 million lb (greasy) to 1,175 million lb and the final figure is likely to be even smaller.

* * *

No More Canadian Loan Drawings

The Chancellor of the Exchequer announced in the House of Commons this week that there would be no further drawings on the Canadian line of credit of \$1,250 million that was put at Britain's disposal in March, 1946. There have, in fact, been no drawings since last June. The unutil-

ised balance amounts to \$65 million. Since the amount of the loan outstanding will be \$1,185 million, the first instalment due on it at the end of this year will amount to \$37,600,000. This annuity will have to be repeated 49 times before the liability is extinguished. The amount of the annuity would, however, be reduced if the waiver clause in the agreement were invoked by the British government. The waiver applies to interest payments only; they loom relatively large in the early years. The decision to make no further drawings on this credit reflects the recent and presumably continuing improvement in the gold and dollar reserves. There is no advantage to be gained in adding to the accumulation of this reserve by the fairly expensive process of getting further into debt. Mr Gaitskell rang down the curtain on this first and least-painful chapter of the operation with an appropriate tribute to "the spirit which prompted the Canadian Government and people to afford us this very generous measure of help in our time of need and so to speed our economic recovery in the last four years."

* * *

The Enigma of Tin

The tin market has often behaved contrary to expectations and its oddities in the past fortnight are quite in character. On Wednesday morning of last week the London spot price reached £1,615 a ton, having passed the £1,500 mark on the previous day; in the afternoon the price fell and closed at £1,550. But by the following Friday it was down to £1,437½ a ton, showing a net fall of £17½ on the week. This

week it rallied again and at one point reached £1,517½ a ton, but on Wednesday it closed at £1,477½. Backwardation narrowed appreciably last week but is now back to £70 a ton, which is even wider than a fortnight ago. Up to the invasion of Korea tin hovered around £600 a ton. A price of £1,500 must be well beyond the wildest expectations of producers; it certainly exceeds the worst fears of consumers.

The factors influencing the tin market have not altered

materially in the past three weeks, which makes the swings in price all the more enigmatic. Output in Malaya declined last month because heavy rains interrupted loading and one smelter decided to take stock. But that fact alone could not explain the sudden rise in price to £1,600 a ton. In recent months China has become an importer instead of an exporter, though the quantity involved is very small. Russia and countries of Eastern Europe are buying no more than they have done in recent years—if as much. The American stockpiling requirements are met mainly by contract shipments from Belgium and the Netherlands. The ceiling price for tin in the United States is equivalent to £1,460 a ton. At current levels, no American merchant could afford to import tin.

The sudden squeezes in the market must be caused by either speculative dealings, which is unlikely, or by stockpile purchases, particularly by some of the smaller importing countries. Since British tin merchants have undertaken not to export any metal as soon as current contracts are liquidated, Malaya is virtually the only source of supply for the rest of the world. Much larger quantities were sent by Malaya last year (particularly in the second half) to South America, India, France, Germany, Italy and the Netherlands. Shipments to Italy increased, for example, from less than 1,000 tons in 1949 to 7,600 tons in 1950; Italy was in fact Malaya's second largest market after the United States and Britain came third with 7,200 tons. The fear of another world war clearly encouraged the smaller importers to stockpile, and now Britain appears on the scene, determined but a little late.

Abbey National's Expansion

The total assets of the Abbey National Building Society increased by £18.2 million to £122.2 million in 1950. Within this total the amount due to the Society on mortgages rose by £14.3 million to £104.5 million and the liquidity ratio (i.e., the ratio of trustee securities and cash to total assets) increased slightly, to 13.7 per cent. The Building Society movement is plainly still proving a popular savings medium with the general public. New share subscriptions to the Abbey National, at £23 million, exceeded withdrawals by £14.3 million in 1950, compared with an excess of £13.4 million in 1949; new deposits, at just under £4,800,000, exceeded withdrawals by £1,300,000. On the other side of the balance sheet, total new advances on mortgages by the Society amounted to £29.4 million in 1950, compared with £28.1 million in 1949; repayments of past mortgages, at £19.3 million, were some £1,500,000 higher than in the previous year.

It is difficult to say how far the continued expansion in all mortgage business in recent years is due to increased purchases of pre-1939 houses at increasing prices and how far it is due to the fact that many existing house-owners are cashing in on the rise in property values to raise mortgage loans as a fairly cheap medium of capital consumption. It is also difficult to say how much of the expansion in shares and deposits outstanding is the counterpart of genuine new saving and how much of it simply represents a switch, often by large investors, out of Stock Exchange securities and other accumulated savings. A year ago, when there were some signs that a moderate degree of deflation might set in, many building society leaders were apprehensive lest the increase in "sitting tenant" business and in the volume of relatively "hot money" among building society funds might prove a source of strain if money became perceptibly tighter. Those fears must seem a good deal less urgent now. Meanwhile, the financial strength of the movement is almost certainly increasing. After allowing for management expenses, depreciation of office premises, interest on deposits, income tax and profits tax, the Abbey National was able to carry £2,254,716 to appropriations account last year, compared with £1,843,838 in 1949.

Shorter Notes

The first full week of offerings of the new and higher-interest Savings Certificates and Defence Bonds—the week to February 10th—achieved sales of £7,000,000 of Certificates and £1,090,000 of Bonds. These figures compare with £1,700,000 and £290,000 respectively in the week before the new issues were announced. The increased sales, however, were achieved partly at the expense of increased withdrawals from existing savings—notably from savings deposits. Total withdrawals for the week amounted to £18,916,000, compared with £15,165,000 a fortnight earlier. The week's net savings amounted to £4,955,000.

Arrangements have recently been made with Iraq for meeting its scarce currency requirements in the year to September 30th next. Iraq's working balance of sterling is to be raised from £2,000,000 to £4,000,000 and from now until mid-July, 1952, sterling will be released up to a total of £6,000,000, whenever Iraq's number one account falls below £6,000,000.

The recent Anglo-Swiss commercial negotiations that made new arrangements for the year to end-February, 1952, were concerned mainly with quotas for goods not yet placed on the "open general licence" list. Quotas are relatively new devices in Swiss commercial policy, and it is a sad reflection on the times that in sheer self-defence the Swiss should have been compelled to apply them in their import trade. They have, however, been generously framed, so that their appearance will not be followed by a contraction of trade. The British Government, for its part, has substantially increased the quotas on such goods as watches, instruments and embroideries.

Special trade talks between Denmark and Britain are due to commence next week. They are not the usual annual negotiations, but are to be conducted at ministerial level and will cover all aspects of Anglo-Danish trade. The Danish delegation is to be led by M. Loe Bjorn Kraft, Minister of Foreign Affairs, and M. Thorkil Kristensen, Minister of Finance. The Chancellor of the Exchequer, the Minister of State, the President of the Board of Trade and the Minister of Food will represent Britain.

Gillett Brothers Discount Company made a gross profit of £198,400 in the year to January 31st compared with £167,389 in the previous accounting year. On the balance sheet date total current assets, at £77.5 million, were some £1,200,000 higher than a year before; a small fall in bills discounted was more than offset by a £2,000,000 rise in the bond portfolio.

Last month's wage increases, as shown in the Ministry of Labour Gazette, bring the aggregate increases since November to roughly £100 million a year, for nearly 5,700,000 workers. In January wage increases amounted to about £564,000 in the weekly wages of 1,849,000 workers. The largest change was the wage award to the miners, conceded under Cabinet "guidance"; wage rises in the cotton industry (10 per cent), the road transport industry (7s. to 12s. a week), iron and steel, and the Yorkshire wool textile industry also took place. About £334,000 a week of the wage increases resulted from direct negotiations between employers and operatives, and about £88,000 followed arrangements made by joint industrial councils. The month's increases put the index of wage rates (June, 1947 = 100) up by one point to 119.

To Electricity Supply Authorities Everywhere

RIPPLE CONTROL DIVERTS 'PEAK' POWER TO INDUSTRY AND EARNS REVENUE

Power "cuts" for industrial users can be reduced substantially, and their effects on domestic consumers can be minimized. Ripple control achieves this. With its aid, the Authority can shed non-essential load at the touch of a button at any time with comparatively slight inconvenience to the consumer. Such load comprises water heaters and the like which have thermal or other storage capacity.

The capital cost of ripple control is recoverable over a few years because the equipment improves the earning capacity of generation and distribution plant by making it possible for the Authority to accept additional load for profitable use at "off peak" times. Ripple control is therefore a continuously profitable investment.

Company Notes

Imperial Tobacco.—A preliminary view of the trading results of Imperial Tobacco was given on page 400 of last week's issue. The full accounts show that the problems that have beset the group in recent years—the high tobacco duty, the struggle to maintain its substance intact against the depredations of successive Chancellors, and the matching of rising costs against a turnover that is no longer increasing as fast as it did—all these factors are evidently of as great concern to the board as at any time in the past.

For example, last year (to October 31, 1950) witnessed another substantial rise in the value of stocks by no less than £16½ million to £106.4 million. It is to be doubted whether the directors altogether relish the achievement of a "century" for this figure. To the extent that the increase reflected an improvement in physical stocks, it may not have come amiss, for in earlier years the company had been working with stocks too close to the minimum for its comfort. But to the extent that the increase reflected a further increase in leaf prices it could clearly have been less welcome; before and since devaluation the group has been steadily increasing its purchases of non-dollar tobacco, and the prices of such leaf have responded vigorously to this switch in demand. It may be a fair guess, therefore, that the increase in stocks (valued of course at cost) owes more to the rise in prices of Empire growths of leaf tobacco and rather less to an increase of physical stocks.

Movements of this kind illustrate the continuing financial problem of the group—how to maintain at ever-rising prices and extremely high rates of duty the physical stuff and turnover of the business. Stocks and debtors (the latter being stock at only one remove) now exceed £152 million in the parent company's balance sheet, and of this total a large slice must consist of duty on stocks of leaf cut of bond or manufactured. For years past Imperial Tobacco has been struggling to make good this erosion of its substance. It is not alone in the struggle, but it was perhaps the first to experience the most acute form of it—the wartime combination of sharply increased tobacco duty and 100 per cent EPT.

	Years to October 31, 1949	1950
Consolidated earnings:		
Trading profit	19,571,199	18,411,679
Depreciation	21,282,750	21,701,623
Income tax	10,573,945	10,089,091
Depreciation	922,715	1,081,375
Profit after depreciation	1,500,000	3,073,455
Group earnings for ordinary shares	7,101,168	7,189,993
Ordinary dividends	6,511,096	6,511,096
Added to reserves and c/f	490,312	578,396

	Years to October 31, 1949	1950
Consolidated assets:		
Fixed assets, less depreciation	14,847,497	15,334,135
Stocks	95,022,540	111,061,963
Debtors	397,340	430,771
Revenue reserves	45,142,841	50,548,304
Ordinary capital	37,565,043	37,565,043

To-day's problems are the same in kind and only somewhat less dire in their result. The adventurous "profit" resulting from the use of dollar tobacco at the post-devaluation rate of exchange amounts to £6,209,000; in no sense is this a true profit, for in substance it represents the higher replacement value of tobacco that has been used during the year after devaluation. But, none the less, it attracts more than 50 per cent in tax as if it were a true profit, and the net amount that the directors have very properly transferred to leaf replacement reserve (which should have been fortified by the whole amount) barely exceeds £3 million.

So the group is forced to finance the con-

tinuance of its existing scale of operations by means of new capital, since the tax-gatherer defines "profits" in a way that admits a serious consumption of capital. Although at the date of the balance sheet there were still £15 million to be called on the issue of 4 per cent loan stock made last October, this can hardly be sufficient to quench the continuing need for external funds. Bank overdrafts which stood at £28.1 million at end-October will have to be further expanded or more permanent capital sought if the burden of stocks continues to increase—as it well may. And as between different forms of permanent capital the deterrent effects of profits tax on issues of share capital are evident. Evidently the effects of rising prices have not worked themselves out fully, but the directors record that the manufacturing economies achieved last year go a long way towards meeting the full increase in costs resulting from devaluation. That at least is a favourable sign in a year that has borne its full share of trading and financial difficulties.

Bowater Paper.—A year ago Sir Eric V. Bowater looked forward to a higher level of operations in Britain and to an ever-widening diversification of business, with the prospect of at least as good trading results in the year ending September 30, 1950, as in 1948-49. The remarkable jump in Bowater Paper's group profits from £3,693,202 to £5,395,488 clearly indicates that Sir Eric erred on the side of caution. A substantial part of this rise, as the accompanying table shows, can be attributed, as in past years, to the impressive earnings of subsidiaries, particularly those overseas, whose ordinary stock is wholly owned by the corporation. At home, paper mills have been operated substantially at full capacity for the first time since 1939; this has been added to output and the spread of overhead expenses has made an important contribution to earnings.

	Years to September 30, 1949	1950
Consolidated earnings:		
Group profits	3,693,202	5,395,488
Depreciation	9,067,919	14,444,888
Income tax	1,001,484	1,890,688
Retained by subsidiaries	934,396	1,084,644
Parent company's net profits	442,426	545,384

Profits have been absorbed by the rise in the provisions for depreciation from £920,679 to £1,444,888 and for taxation from £1,007,384 to £1,890,688. Computation of earnings is impossible, but a rough estimate of distributable earnings suggests a rise that provides impressive cover for the increased ordinary dividend of 15 per cent, compared with 12½ per cent for the previous year. The issue of £300,000 £1 shares in September, which increased the ordinary capital to £1,800,000, ranks *pari passu* with the old stock; subscribers to this issue at 37s. 6d. must feel well satisfied with a yield of some 5½ per cent at the current price of 54s. 6d. No ordinary dividend was paid before 1947 for more than a decade, and after the lean years the relative modest increase in the latest dividend should not be received amiss. If some shareholders may be impatient, they might bear in mind that a bumper Bowater dividend and four-page papers would make an odd contrast in Fleet Street.

EXCHEQUER RETURNS

For the week ended February 17, 1951, total ordinary revenue was £137,033,000, against ordinary expenditure of £109,766,000, and issues to sinking funds £70,000. Thus, including sinking fund allocations of £15,003,000 the surplus accrued since April 1st is £656,068,000 compared with £600,951,000 for the corresponding period a year ago.

COMPANY MEETINGS

R. A. LISTER AND COMPANY, LIMITED

The annual general meeting of R. A. Lister and Company, Limited, was held at Dursley, on February 19th. In the absence of Sir Percy Lister, the Chairman, due to indisposition, his statement was read by Mr F. H. Lister.

Your directors' report and the audited accounts are submitted herewith, together with a consolidated balance sheet and a consolidated profit and loss statement, both of which reflect not only the steady progress, but the growing strength of your undertakings.

From the consolidated accounts it will be observed, when comparing the profits for the financial year under review with those for the previous year, that there was an abnormal exchange profit accruing in the previous year of some £66,000, which does not recur during the year under review.

You will also observe from the consolidated balance sheet that, despite a marked increase in the turnover, the stock figure is down by some £300,000, and this satisfactory accomplishment has been made possible by the greater volume of production flow going through your factories. I would like here to express on behalf of all concerned with the company our thanks for the valued co-operation of our many suppliers. Both your company and its suppliers will be faced with greater problems during 1951 under the changing conditions.

From the figures before you, you will observe that the fixed assets during the current year have increased by some £263,000, and net current assets have decreased by some £141,000, and that there is a capital commitment figure outstanding of approximately £390,000, all of which indicate the progress which has been made in connection with the new production facilities during the period under review, as forecast in my speech last year.

The demand for your company's products, both from the home and overseas markets, is greater than ever, and, despite the substantially increased output in our major lines, the demand still remains considerably in excess of production, and continues to grow.

DOLLAR MARKETS

We have endeavoured to play our part in the development of the dollar trade, and Mr Robert Lister, who is not with us today, is now on a business tour of Canada and the U.S.A.

It is pleasing to be able to state that our efforts have met with very encouraging results—not only has a very satisfactory percentage of the turnover in the year under review been secured from the dollar markets, but over 25 per cent. of our outstanding orders emanate from the Western Hemisphere.

I would like to add here that the need must be appreciated for ensuring that all those who have developed dollar trade shall continue to export their goods to the dollar markets and be afforded, if needs be, the requisite priority to do so—to lose these valued markets once more may well mean to lose them for ever.

The sales of your Marine Propulsion and Auxiliary Engines, distributed by your Marine Sales Company, are increasing the world over.

Your Australian subsidiary continues its expansion in a most encouraging manner, and during my recent world trip I was able to see at first hand the progress that has been made not only with the extensions to your Australian factory at Sydney, N.S.W., but also with the building and equipping of your new foundry there.

With wool at its present prices, the important part played by your company's sheep shearing machinery division, whose products are now shearing approximately half the world's sheep population, will be readily appreciated.

It is also encouraging to note that the latest product being manufactured in your Dursley works and sold by your associated company, Lister-Todd Engineering Corporation, Limited, namely "TIFA," that unique machine for producing fog, which is itself the newest vehicle for the conveying of insecticides, disinfectants and repellents, has been successfully applied and is being readily accepted for utilisation with flocks of sheep, as opposed to the more laborious and expensive methods of dipping and the like hitherto practised.

RECORD FIGURES

The turnover and profits figures for the year under review, the 84th year of your company's history, establish a new record—still further evidence of the steady and sound progress of your undertakings and the careful planning by your board.

GROWING COSTS

Looking to the future, one cannot over-emphasise the dangers of the growing costs of so many of our basic materials—I refer particularly to those non-competitive and uncontrolled prices which we in industry are obliged to pay for the products and services of our nationalised industries.

In this regard it is interesting to note the following increases since 1945:

Gas, per therm	40%
Smithy coal, per ton	47%
Foundry coke, per ton	48%
Railway transport, price per ton for an average journey of 150 miles	55%

In conclusion, you will appreciate that the wonderful progress and results to which I have referred have only been made possible by the loyal co-operation and support extended to the board by the executives, staff and employees in the service of the Lister group of companies in all parts of the world.

Over the years we have been able, not only to provide employment for increasing numbers of men, but also to give them continuity of employment. A large number of our employees have been with us for many years, and many are the sons and grandsons of former employees.

Relations between management and employees have continued contented and cordial in the year under review, as they have been for many years previously, and I hope will be for many years to come.

It gives me the greatest pleasure to express to them all—managements, staff and work-people—your sincere thanks.

The report and accounts were adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

BARROW HEPBURN AND GALE

RECORD TRADING RESULTS

PROBLEM OF RAW MATERIAL COSTS

The thirtieth ordinary annual general meeting of Barrow Hepburn and Gale Limited will be held on March 15th in London.

The following is an extract from the statement by the chairman and managing director, Mr George W. Odey, C.B.E., M.P., circulated with the report and accounts for the year, 1950:—

It is with very great pleasure that I am able to report to the shareholders a most successful year's trading, which represents a record for our group of companies. The trading profit for the year of £1,277,587, as against £635,862 for 1949, is an indication of the further expansion that has taken place in production and turnover. The effect of de-control has been to free our group of companies from the many restrictions on progress and expansion which are the result of control, accompanied as it inevitably is by a system of allocation of raw material based on performance over previous years.

We have set aside £575,140 for taxation, which leaves a balance of net profit for the year, after taxation, of £636,458. If we add £308,207 brought forward from the previous year, we are left with £944,665 for disposal.

After detailing the various appropriations, the statement continues: We are thus left in the excellent position of having capital reserves of £289,676 and revenue reserves of no less than £914,195. Having regard to the fact that the ordinary dividend was maintained at 6 per cent. throughout the war years, and has stood at 20 per cent. since 1946, your board felt that it would not in any way contravene the requirements of national policy to increase the ordinary dividend from 20 per cent. to 25 per cent.

It is your board's intention, if the rate of ploughing back profits can be maintained and subject to the necessary permission being granted by the Capital Issues Committee, to restore to the ordinary shareholders a further portion of the capital that was written off and so establish a proper balance between the preference and ordinary shareholders.

The board has recently increased the share capital of the company by a bonus issue of £50,000 of ordinary shares. An application recently submitted to the Capital Issues Committee for a further bonus issue of £100,000 ordinary shares has been refused. An application will be re-submitted at a later date, when conditions appear to be more favourable.

THE OUTLOOK

With regard to the immediate trading prospects of 1951, it is again quite impossible to make any reliable forecast. The recent steep advance in the cost of our raw material has created a very grave problem. The price of the hide is by far the most important factor in the price of leather. Tanners in this country view the position with the greatest concern, but a return to control with a resumption of Government bulk purchase of our raw material, and a re-allocation of supplies, would appear to be no solution to our problems unless, of course, the Government were prepared to re-introduce a substantial subsidy on leather prices, which is surely a most remote contingency. We have, therefore, no alternative but to continue to use our utmost efforts to reduce the cost of our raw material to more reasonable levels and at the same time to maintain leather supplies for both civilian and service requirements.

TEACHER (DISTILLERS) LIMITED

GRATIFYING TRADING RESULTS

MR R. M. TEACHER'S SPEECH

The second annual general meeting of Teacher (Distillers) Limited was held on February 20th in Glasgow, Mr R. M. Teacher (the chairman) presiding.

In the course of his speech the chairman said: The trading profits for the year ended September 30, 1950, amounted to £714,828. Taxation requires £372,000. There is "ploughed back" into the business £217,985, and the ordinary dividends take £68,750.

Fixed assets and investments are practically the same as at the end of the last accounting period, but our current assets show a considerable increase, stocks now standing at £1,552,009, and other current assets, including cash, at £408,584. The heavy direct and indirect taxation make it essential to maintain considerable cash assets. On the other side of the balance sheet, £150,000 has been placed to general reserve, and the carry forward increased by £67,985 to £148,171.

I believe that the shareholders will be very gratified with the result of our trading for the year. The achievement of the outstanding results for last year can principally be attributed to two factors, firstly, the continued expansion of sales in our export markets where, in line with our Government's wishes, we have done everything in our power to earn as much as possible in the hard currency markets, particularly in the United States of America and Canada; secondly, devaluation of the pound resulted in increased sterling prices to the United States and Canada with consequent increased profit margins.

As to the future, we anticipate a continued greater demand for Highland Cream than can be satisfied. I understand that it is fully anticipated that the United States of America can increase production to such an extent that it will be possible to provide for requirements and yet maintain the living standards of 1950. If that is true, the outlook for Scotch Whisky in America is quite encouraging.

Notwithstanding, I regret that the general outlook suggests that there is little hope of last year's high rate of profit being maintained unless some altogether unforeseeable favourable development occurs.

It is now proposed to increase the duty on whisky in the United States of America whereby the cost per bottle may be substantially increased. This increased charge will naturally restrict sales. Another important factor is the steady and substantial increase in all production costs. Labour and material have reached fantastic prices.

Since the start of the distilling season we have found it necessary to pay prices for barley which are much higher than ever before on our records. At Ardmore Distillery we have been enabled to maintain output on the highest possible level, and the results have been very satisfactory.

Owing to the great falling off in the spending power of the public in the home market, and the continued unjustifiably high rate of duty of £10 10s. 10d. per proof gallon, sales through our retail interests have been steadily declining, and we see little hope of an improvement until this extortionate rate of duty is reduced.

Notwithstanding these "dull spots," I am pleased to be able to assure our shareholders that your company is well placed to meet any difficulties which may arise, and that you may rely on the best efforts of your board of directors to maintain the highly successful history of the business.

The report was adopted.

SOUTH WESTERN INDUSTRIAL AND WATER CORPORATION

GREAT CHANGE IN ACTIVITIES

The adjourned sixteenth annual general meeting of the corporation was held on February 20th in London.

Mr C. G. Bowers presided. The following is an extract from his circulated address:—

The principal businesses now owned by your corporation through its shareholdings are the Midland Metal Spinning Company Limited, the National Pressure Cooker Company (England) Limited, Glow-Worm Boilers Limited, and the Keele Street Pottery Company Limited and its subsidiary companies.

MIDLAND METAL SPINNING COMPANY GROUP

This group of companies, specialising in domestic hollow-ware, is believed to be the largest producing unit in the industry, responsible for approximately 25 per cent. of the total trade of the country in their particular products and for 44 per cent. of the total export trade in such products. This company also owns and controls the National Pressure Cooker Company (England) Limited. Early in 1948 Mr Webster, the managing director of the Midland Metal Spinning Company, visited the U.S.A. for the purpose of seeking an opportunity of linking up with a pressure cooker manufacturer for the British and Dominion markets. He succeeded in obtaining the sole rights to manufacture in this country and to distribute in this country, the Dominions, and the Colonies, and also in a number of foreign markets, the famous "Presto" pressure cooker.

Here again the export side of the business is being given its rightful place and approximately 55 per cent. of the total production is diverted to the export markets. Although both Midland Metal Spinning Company Limited and National Pressure Cooker Company (England) Limited have a material shortage problem, the board confidently expect to overcome this by following plans carefully worked out for such an emergency.

GLOW-WORM BOILERS LIMITED

This company manufacture domestic cookers, oil fired and solid fuel ranges, domestic boilers, and are also large contractors to the Government. The company's factory, which is situated at Derby, is at present fully extended and the company has large orders on hand.

THE POTTERY GROUP OF COMPANIES

At the present time the demand for the products of this group heavily exceeds supply, and all indications would suggest a continuance of this state of affairs for some time to come. Our export sales are being steadily increased. Despite rising costs the profits of this group are being maintained, and I have every confidence that the pottery section of your corporation's investments will more than justify our high hopes.

SIX MONTHS' TRADING PROFIT

I am in a position to say that the aggregate net trading profits of the group for the six months to December 31, 1950, amount to not less than £160,000 after charging depreciation and working and administration expenses of the subsidiary companies, but before providing for any taxation (the incidence of which for the current year will, so far as can be seen at present, result in a charge in excess of what would normally be considered to be a fair charge for taxation for the year) or for the administration expenses of the parent company.

The report and accounts were adopted.

ATLAS STONE COMPANY

The twentieth ordinary general meeting of the Atlas Stone Company, Limited, was held in London on February 21st, Mr Bernard Davis, chairman and managing director, presiding. The following is an extract from his circulated statement:—

The accounts for the year under review show a trading profit of £69,924 as compared with £50,749 for the previous year. The results, which are the best so far achieved in the history of our company, will, I am sure, be considered satisfactory, in view of the difficult and uncertain conditions of trading that apply today.

We are fortunate in having been permitted to complete a year's trading in which there has been no drastic alteration in the Government's building policy, and we have played a useful part in connection with this all too inadequate programme.

We have during the year under review increased our deliveries, by comparison with the previous year, in all departments of the company with the single exception of asbestos cement products, where the shortage of suitable asbestos fibre continues to be a source of difficulty, and prices continue to rise. In addition to the manufacture of asbestos cement roofing materials, our products include concrete paving slabs and road kerbs, architectural stone masonry, pre-cast and pre-stressed concrete to varying specifications, precision-made light-weight building blocks and wall and bath panelling with decorative finishes. Further progress has been made this year in the manufacture of pre-stressed concrete.

What the future for our industry holds out it is impossible to say. That a large and increasing amount of constructional work remains to be done cannot be denied, and to which must now be added the requirements of Civil Defence.

The report was adopted.

LLOYDS BANK LIMITED

ANNUAL GENERAL MEETING

The ninety-third ordinary general meeting of Lloyds Bank Limited was held on February 16th at the Head Office, 71, Lombard Street, London, E.C. The Rt. Hon. Lord Balfour of Burleigh, D.C.L., D.L. (the chairman), presided.

With the concurrence of the members present, the report and accounts and the statement by the chairman, all of which had been previously circulated, were taken as read.

The report and accounts were adopted and the other ordinary business transacted, and tribute was paid to the past services of the retiring directors, Sir Peter Bennett, O.B.E., M.P., Sir Harold Bowden, Bt., G.B.E., Lt.-Col. R. K. Morcom, C.B.E., Sir William Verdon Smith, C.B.E., Lt.-Col. The Rt. Hon. Lord Teviot, D.S.O., M.C., Sir Henry E. S. Upcher and Sir Evan Williams, Bt., LL.D., D.L.

Votes of thanks were passed to the chairman and directors and to the staff.

INDEX

The Index to Volume CLIX of *The Economist* (July to December, 1950) is now ready. Copies, price 2/6 post free, may be obtained from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1

let this go on at a time of buoyant demand would be to accept transport's financial problem as insoluble. If it happens, the Commission will in practice be absolved from the statutory obligation to pay its way "taking one year with another." The only sense in which transport will not be subsidised is that the fact will not be acknowledged in advance. That this will be the actual effect of last week's settlement appears overwhelmingly probable.

It is no easier to take an optimistic view on the application of the second cardinal principle. The unions have by no means accepted the specific changes in working methods that the Railway Executive wished to write into the agreement on wages. They have promised their "fullest co-operation" in a joint committee to consider the Executive's proposals. To have so much in writing is an advance, and no doubt the railway workers will be sufficiently pleased with their higher pay to take more kindly to such proposals than they have done before. But it would be very rash to assume that any large economies in manpower, making an appreciable contribution to the finance of the wage advances, will soon follow without any more trouble.

★

These arguments are not intended in themselves to condemn the railway settlement. They are to say that, while its positive merits are highly doubtful, the evil consequences of the method by which the settlement was achieved are inescapable. The main consequences can be discussed under two heads: they affect the working of nationalisation in general; and they affect the course of wages, inflation and financial policy. Under the first head, the railway settlement drives one more nail into the coffin of the public corporation; it is probably a nail stout enough to ensure that the lid will never be prised off again. The whole basis on which nationalisation in Britain has been advocated and accepted—the theory that by entrusting them to independent boards the affairs of the nationalised industries could be kept out of politics—has been seriously weakened if not destroyed. Ministers will say, of course, that the railway unions reached their wage settlement with the Executive, not with them; direct negotiations between employer and employed had broken down but were resumed after Mr Bevan had by talking to both sides miraculously restored good will. No one—least of all any trade union—is going to take this interpretation of what happened seriously. It is true only in the formal sense that the final details of the settlement were agreed between the unions and the Railway Executive. What chiefly concerns the unions is the general scale of the wage advances obtained for their members. And for all practical purposes it was the Government which decided that scale. It accepted responsibility for finding money to meet the unions' serious demands in full, after the Executive had insisted that it was unable to do so. In precisely the same spirit the Government two months ago decided that the miners' demands should be met by putting up coal prices after the National Coal Board had negotiated on the principle that the industry's ability to pay higher wages was limited by the existing prices.

The implications of these two cases are beyond any mistaking. No union in a nationalised industry will ever again accept as final either the "no" of a public corporation as employer or the recommendations of an arbitration tribunal or industrial court. The union will

always appeal over their heads to the Government. Harassed and overworked ministers have now brought upon themselves, on top of everything else, direct responsibility for the level of wages and for industrial peace in the nationalised industries. And if they are responsible for matters so cardinal as wages and prices their concern with every other aspect of management will necessarily become even closer than it is already. It is not even a matter of real power passing from the corporations to the responsible departmental ministers—for Fuel and Power, Transport, and so on. With wage questions occupying the crucial place that is inevitable in inflationary times, the Minister of Labour, of all people, may well become in practice a sort of grand co-ordinator for the affairs of the nationalised industries. It requires a sanguine temperament to rate the prospect as no worse than disturbing in its implications for the future efficiency of Britain's basic industries.

★

The implications for wages and general economic policy are neither less important nor less unpleasant. And here the chickens will come home to roost more promptly. The 5 per cent rise in railway wages recommended by the Court of Inquiry could have been regarded as the completion of this winter's general round of wage advances. By yielding to the unions' demand for half as much again—for a 7½ per cent increase—the Government has made the railwaymen's advance much more significant. It is not only the end of the first round of wage increases since restraint broke down; it is also in itself the beginning of the second round. Workers who got proportionately smaller increases three or four months ago, before the recent rise in living costs, are most unlikely now to be content with them for long. Whether a new policy of restraint would be desirable if it were possible is now an almost entirely irrelevant question. The policy is not possible. The trade unions accepted restraint three years ago in the belief that real wages could be improved by a reduction in prices. They stuck to the policy for more than two years partly out of loyalty to the Government and partly from inertia, but chiefly because the disappointment to their hopes was not very sharp; though prices did not fall, their rise was fairly slow. This basis for restraint has now been completely destroyed. Prices have risen fast and everyone knows that this year they will go on rising. By appearing itself to endorse the justice of a 7½ per cent wage advance, at the cost of raising railway charges (and therefore of an additional increase in other prices), the Government has made it quite certain that there will be no long pause this summer in the spiral of rising costs and prices.

It is too late to argue about the wisdom or the morality of this. It is necessary realistically to measure the consequences. If a second round of wage advances had been delayed, the higher prices that Britain must pay for imports would have helped powerfully to restrict consumption and hold inflation in check; the extra £500 million of resources required for defence might have been found without taking away much more of private incomes in taxation. Now it has to be assumed that wages will lag little behind prices and the relief to the budgetary problem will therefore be small.

But the implications are wider than that. Since 1947 Government policy has rested on the possibility of a middle way between open inflation and the use of the

old-fashioned monetary compulsions to keep demand in check. Trade union restraint over wages, controls on prices and distribution, and moderation in dividend increases have together kept the economy from the extremities of inflation without the need for a financial discipline politically too harsh for the Labour Party. What the railway settlement has helped finally to destroy is this middle choice. Wage restraint is not going to be renewed and prices will not be kept down by controls. The Government is faced at last with two choices only. The resources for defence can be found by cutting consumption in one of two ways: savings can be enforced, with great social inequity and at heavy costs in economic

Affair of Admiralty

AFTER the fuller explanation of it that the Prime Minister gave at the second attempt (and which he should have given at the first), it is apparent that the appointment of an American Admiral to be Supreme Commander of the allied naval forces in the North Atlantic is appropriate to the circumstances and that it comports no insult to the traditions of the Royal Navy. But that is not by any means to say that the angry discussions in the House of Commons were a storm in a teacup. On the contrary, the first unofficial and incomplete report—coming from Copenhagen of all places—caused a sudden upsurge of anger and surprise in the House of Commons, which was fully echoed in the nation at large. It is true that Mr Churchill played on patriotic feelings with more guile than statesmanship: he put the worst possible construction on a matter that was still obscure by suggesting that the claims of British admirals to the command had been "brushed out of the way" and British policy allowed to fall far "into the walks of humility." And Mr Attlee made things worse with a casual, ill-informed answer to the effect that the twelve governments of the North Atlantic Treaty Organisation had discussed and approved the appointment—and that was that. But if Mr Churchill showed too keen a sense of party advantage in the way he pressed and phrased his questions, the Prime Minister showed too dull a sense of national dignity and tradition in his manner of parrying them. Between them they got the House boiling in a way that has left a sediment of anti-American feeling which only informed debate can disperse.

More important in the long run was the sudden realisation that six months can pass before a vital strategic decision is made known, and that the workings of Nato seem to elude the grasp and the eye of Parliament; for it is said that Mr Shinwell agreed in principle to this appointment last October and that Mr Bevin gave it his approval in December. Henceforth the House of Commons will want to be told—within the limits imposed by genuine military security, not by political caution—what is going on in Nato before, not after, it leaks out through the American or continental press. It will also want to be told clearly where the political authority for important joint decisions lies and how the interlocking hierarchy of committees scattered between Washington, London and Paris does its work. (Mr Shinwell says that criticism of the organisation, such as Lord Ismay expressed in the House of Lords last week, is ignorant; on the contrary, it is well informed and finds echoes among the officials and officers of Nato itself.) It will expect—and in this public opinion will support it—that

inefficiency, by open inflation; or competing demands on the national resources can be cut down at their source by retrenchment, taxation and monetary policy. Until now the compromise of a semi-controlled economy has worked after a fashion. It is now not merely undesirable, as it always has been; it is no longer possible. Wage restraint will no longer provide the basis for a middle way. If the Government will not recognise the necessity for deliberate and effective retrenchment in either private or public consumption, then rearmament will be financed only by frankly inflationary policies. Mr Figgins and Mr Bevan between them last week finally slammed the door against compromise.

personal merit and a fair balance of responsibilities, just as much as preponderant national power, should determine appointments within the alliance. It is fortunate that the outburst of feeling in this country has been provoked in an instance where Americans were fully prepared to admit that, on the surface appearance of things at least, there was cause for British resentment.

But there are other lessons to be learnt from the incident. There is the lesson that the essential must be distinguished from the inessential in criticising the policy of the allies in Nato. There is the lesson that the working of the Atlantic Pact must bring painful reminders of the restriction of national sovereignty that it imposes. And there is the lesson that too much time and paper are being spent on committee politics and too little on the mobilisation of forces and the production of their war material.

★

The first lesson stands out clearly in the fuller statement that the Prime Minister made on Monday. The western approaches to the British Isles from the Atlantic Ocean, and the home waters around them, remain under British control with joint forces operating in slightly altered traditional commands. That is the vital fact, more important for the security and trade of this country than the nationality of the Supreme Commander. It is now clear that the latter is to be a land-based co-ordinator, controlling a vast area where the task in war would be to get American and Canadian forces and supplies across the sea to bases in Europe and elsewhere. There may be arguments against such co-ordination (although no one has stated what they are); but once it was agreed to create the job there were obvious practical and political reasons why it should be done by an American, and why the western half of the Atlantic should be under the command of an American and the eastern half under the command of a British admiral. For British and American interests in these areas are not—even in war—identical. Mr Churchill appeared to argue that the Supreme Commander will have excessive powers to dispose of non-American forces; in fact he will be responsible for the use of his powers to the Standing Group of American, British and French staff chiefs in Washington, to which the strategic direction of Nato has been entrusted. Moreover, Mr Churchill cannot seriously argue that the identical organisation which carried Americans and British through the last war is suitable for an alliance of twelve nations. It is certainly not acceptable to them in present

conditions, for the Dutch, French and Norwegians all have cherished naval traditions. Nato is something more than an Anglo-American alliance.

There is far more reason for legitimate complaint in the uncertainty about the Mediterranean command. There it is hardly possible to challenge the view that Britain's special responsibility for the Middle East and for the line of communication with the Commonwealth, and its chain of bases along the imperial route, constitute a claim that a supreme naval commander should be British. Indeed, the arguments that should make an American Supreme Commander in the Atlantic acceptable to the British and other allies should make a British Supreme Commander in the Mediterranean acceptable to the Americans and the other allies. Mr Attlee should press this view.

The second lesson of the week's controversy is that the main rubs of Nato membership have yet to be felt; and it is important that everyone should feel that they are shared equally. If the reported appointment of the French General Juin to command the land forces is to give him real powers, it should mean that he commands American and British troops in war. If there is to be an American supreme commander in the air, then he will wish to have a say in the disposition of Britain's fighter forces and the condition of bases in Italy, Belgium and Holland. If there is to be a beginning with the standardisation of weapons—for which a Nato committee exists—then some national industrial interests must be affected and prejudices overcome. There was friction and jealousy on many technical and operational matters in Lord Montgomery's Western Union headquarters; but little was heard about them. They will reappear on a larger scale in Nato, and Ministers in every country must be able to answer questions about them. The twelve allies have, after all, undertaken to produce balanced, integrated forces; and balance and integration cannot be achieved without effort and sacrifice.

The third lesson is that the streamlining of Nato is overdue. To the layman it seems obvious that it takes much too long to reach and execute a decision: the appointment of Admiral Fichteler is a case in point.

Aid for Asia

THERE is a tendency for the Colombo Plan to drop out of the news. When it was first launched last October it got off to a flying start. Good publicity put aid for Asia into the mind of the man in the street. He had heard of the Colombo Plan. Now, however, the position is very different, and it is scarcely surprising to find that the recent fourteen-nation conference in Colombo, from February 12th to 20th, has had a relatively poor press in this country; American papers certainly covered it better than the British. It is all wrong that this great idea for helping the East to raise its living standards should fail to receive adequate publicity, for not only is public support desirable in order to keep the Plan moving forward, but the whole conception is something of which the Commonwealth may well be proud.

The recent conference in Ceylon marked a definite step in the progress of operations designed to turn the Colombo blueprint into reality. It reviewed developments since October and made recommendations for future action—including the proposal that similar meet-

It also seems apparent that too many high level committees go over the same ground—defence ministers, finance ministers, production board members, chiefs of staff and so on. In the lower ranks of the hierarchy equality of representation between governments runs riot. The barriers that interpose themselves between decision and action must look to the staff officer like a steeplechase course. It is not clear whose fault this is; but there is reason to believe that the blame can be apportioned between the American fondness for large, overall blue-prints, the Continental preference for talking rather than acting, and the British eagerness to see at least five moves ahead. One is tempted to think that Nato needs not only a Supreme Commander but a Supreme Comptroller armed with a pruning knife.

There is a further point of vital importance for the British people. It is that the pressure of events and economics is forcing on them a changed emphasis and balance in defence policy. More and more is being demanded of them on land and in the air by the paramount need to defend Europe—at any rate in the immediate future. British policy is being forced into a position in which the assistance of American naval power must be taken for granted, in which there must be planned division of labour between the two fleets, in which the British naval estimates and building programme must be planned with an eye to what Washington is planning. The full implications of this change have not been perceived. But they will have one day to be studied and explained by a First Lord who has the vision and the intellect to look forward at least a decade. How little the House of Commons is aware of Britain's declining sea power—and the reasons for it—was shown last week. Mr Churchill would do a great service to the nation if, when the time comes to discuss the naval estimates, he would expound, regardless of party advantage and polemics, the limits within which British naval power must work now and in the predictable future. For he is the only man in the House of Commons who could explain the deeper significance of this unfortunate affair of admiralty, which was much more than an acrimonious chapter in Anglo-American relations.

ings should henceforth be held twice a year and that an annual report should be published about the Plan. The conference was between officials only, and decisions on their recommendations may now be taken either in the course of normal diplomatic interchange or possibly at a second conference, to be held quite soon between Ministers in either Colombo or New Delhi. What were the developments discussed and how in fact does the Colombo Plan really stand today? Broadly, the facts are by no means discouraging. The conference laid bare certain disputes and difficulties, it is true, but there can be no question of slackening effort at this stage. To let the Colombo Plan flag now would create a far worse effect on public opinion in South and South East Asia than if the idea of helping these countries had never been born at all.

On the assets side, it may be said that the passage of time has crystallised both the nature of the problems to be met in putting the Colombo Plan into operation and some of the facts about the available finance. On the

question of organisation, for instance, the conference discussed at some length whether there should be a central secretariat and, if so, what its size and functions should be. The British want a secretariat as soon as possible, based on Ceylon and headed by an able and energetic secretary-general who could put life and movement into the Plan. Other delegates, on the other hand, felt that it would be better to wait until the amount of external finance is fixed, since on this would depend much of the scope of the secretariat's work. Uncertainty then arose whether the bulk of external aid might in any case be negotiated bilaterally between the giving and receiving countries, thus by-passing the secretariat. In the event, a very small and provisional continuing organisation has been set up; final decisions have yet to be taken.

★

A further problem discussed by the conference was that of membership. The meeting was held under the auspices of the Commonwealth Consultative Committee, but during the conference its name was changed to the International Consultative Committee. This was typical of the shift in emphasis from an external, Commonwealth sponsored idea to a scheme of self-help adopted by the area as a whole. Although some delegates attended the conference as observers only, all were encouraged to speak and act as full members if they had anything to say. The fourteen states attending consisted of the Commonwealth—except South Africa—Burma, Siam, Indonesia, Viet Nam, Cambodia, the Philippines, and, most notably, the United States. Unfortunately, several of these Asian states—the most important are Burma and Indonesia—still hesitate to join the Colombo Plan for fear of prejudicing their neutrality; but they will need to make up their minds soon if they are not to forgo the foreign assistance now on its way.

The crucial question about the Colombo Plan, as the conference found, is how to finance it. In this respect, three favourable factors have emerged during the past few months. First, Commonwealth countries have embarked on precise commitments; it is now known that, of the £1,000 million needed in foreign aid, £400 million will be found from Commonwealth sources. Secondly, the commodity boom resulting from the Korean war has very much improved the economic position of many parts of the area; India, Pakistan, Ceylon and Malaya, for instance, have all made significant gains, particularly Ceylon and Malaya. Ceylon, indeed, having estimated its original position on the basis of rubber exports at only 1s. 6d. a pound, could now itself finance much of the programme for which it has requested external aid. Thirdly, the World Bank has taken a favourable view of a number of the projects included in the Plan. It sent a representative to Colombo, Dr Basch, and his relations with the conference were particularly good. The World Bank has already made loans to India and Siam and is negotiating with Pakistan. If all goes well, it is not impossible that, in the course of the six years covered by the Colombo Plan, the Bank may account for some £200 million of the external finance required—making, with the Commonwealth contribution, £600 million out of the £1,000 that is needed.

It should not be forgotten that the biggest contributor to the Colombo Plan is still Britain. Of the Commonwealth's £400 million, Australia is producing £25 million

and Canada has suggested beginning with just over £8,000,000 for the first year. The balance is made up of Britain's agreed releases of £35 million a year to India from its sterling balances, £5,000,000 a year to Ceylon, a probably fairly similar figure to Pakistan and contributions to the colonial territories of Malaya and Borneo—for which, incidentally, the British have undertaken not to ask for any other foreign aid. It is also possible that a small British contribution may later be made to the non-Commonwealth countries as well, if they come in.

In addition to this, Britain has put up the biggest share in the Commonwealth's combined £8,000,000 fund at the disposal of the Council of Technical Co-operation. This body, which is part of the Colombo Plan and is already functioning, is charged with the supervision of a special scheme to get several hundred foreign technicians working and teaching in southern Asia. It is to be hoped that some of these experts will come from France and the Netherlands, both countries with special experience of Asian and tropical conditions and neither so far associated with the Plan—although they would probably like to be. The Germans and Japanese should also be drawn on for technical skill. It is a pity, in fact, that the Japanese have so far been left out of much of the thinking that has gone into the Plan. Japanese industry played an increasingly important part in the economic life of South East Asia before the war, and it is likely to do so again after a peace treaty has been signed with the western powers.

★

So much for the asset side of the balance sheet. The debit side consists mainly of one big item—the lack of an American contribution, and, indeed, Mr Acheson's statement last week that the Americans do not at present intend to contribute directly to the Colombo Plan. It would be wrong, however, to take this too much to heart, discouraging though it undoubtedly is. For one thing, most of the money coming from the World Bank will be American in origin. The gap of £400 million, when spread over a six-year period, is not so very great in terms of the rest of the money already accounted for—and the Americans might yet come in at a later date. For another thing, they are already helping southern Asia in several ways—their contributions under Point Four and ECA come to some \$85 million—and there is a good chance that a further sum of \$250 million, to be used on an independent programme of American aid to the area, may be included in the Foreign Aid Bill due to be laid before Congress in a month's time. In addition, if the whole of the recent gift of 2,000,000 tons of wheat is shipped to India, that would be worth about £70 million—which is in itself roughly a sixth, or one year's share, of the £400 million gap in the Colombo Plan. Moreover, a rupee counterpart fund, set up in respect of this wheat, would help to meet one of India's primary difficulties in the Colombo Plan, that of internal finance.

Nevertheless, it cannot be denied that the final absence of any positive American contribution to the Colombo Plan would be very regrettable. The states of southern Asia have certainly done little enough to deserve American bounty, claiming, as indeed there may be arguable grounds for doing, that American policy in the Far East has not always shown great understanding of their present moods and aspirations. But if America is going to send aid to southern Asia for political or humani-

tarian reasons, or a mixture of both, it would be a great pity for it to do so entirely independently of the Colombo Plan. This Plan takes account of all the major projects already either started or about to be started in the countries concerned. It is not based on bridging gaps in balances of payments—as the Marshall Plan was. Its aim is to foster and to finance long-term investment. It would seem that any American financial aid devoted to a similar purpose should at least be very closely co-ordinated with the priorities drawn up in the Colombo Plan. As Washington has already recognised in the discussions which have led up to the present draft of the Plan, these priorities are based on the views of the most experienced technical experts in this part of the world.

After finance, the biggest problem is that of supply—indeed, this is likely to increase rapidly in importance as western rearmament gets under way. There is little direct similarity, however, between the methods proposed for raising the standards of living in Asia under the Colombo Plan and those adopted in Europe under ERP. Economic improvement in southern Asia does not depend on mutual trade within the area. Nor do the local industries exist which can provide the capital equipment required. There is, therefore, no reason to adopt in Asia the precise methods of the Marshall Plan, and the British have justifiably felt that there is a strong case for asking that if any new American aid is granted to southern Asia—either under the Colombo Plan or in

association with it—this money should consist of free dollars, expendable anywhere. For the big question will be that of obtaining the necessary capital goods not only in the cheapest market, but where delivery dates for the most important items are the shortest. This may mean buying in Britain or America or elsewhere. But it will certainly increase the desirability of not tying any strings to the available funds. And for Britain, at any rate, as one of the chief sponsors of the Colombo Plan, there is a clear duty to go on ensuring that goods destined for any of its projects retain a high and adequate export priority.

This, then, is the present background to the Colombo Plan. Officially the Plan starts operations in July. By the time it is, say, three years old and half completed, the world may either have moved into a quieter period of stalemate or have relapsed into war. In either event the teething troubles of this great undertaking will quite probably look small and far away. But none of these possibilities detracts from the obligation now resting on the statesmen of the Commonwealth and of the Asian countries themselves to do all in their power to bring the Colombo Plan to its full fruition. Least of all can they afford at this stage to let it drift into being regarded, either in the West or in the East, as a cross between a nine days' wonder and a rather humdrum failure. It will need all the idealism and drive that went into the Marshall Plan—and more.

The Town Planners' Dream

AMONG the schemes of social improvement which won approval in the aftermath of war, a high place was accorded to those connected with town and country planning. A series of outline plans for rebuilding the blitzed cities of Britain stirred the public imagination. Schemes for the creation of new towns and of national parks coloured the vision of a brighter future. It was agreed that the mistakes of earlier years—urban congestion, suburban sprawl, and rural spoliation—should not be repeated; and, much more important, that they should be set right as quickly as possible. A trio of famous reports—Barlow, Uthwatt, Scott—had made out the case for establishing a new central authority armed with extensive powers. Accordingly a new Ministry (now the Ministry of Local Government and Planning) was created, and Parliament conferred on the town planners all the powers for which they were asking.

In less than five short years the town planners' dream has faded—or would have done so, had they not been too busy making and remaking plans to notice their unreality. Schemes for individual towns have been followed by broad regional blueprints which will be in turn superseded by the development plans that it is the duty of every local planning authority to produce by this summer. This plenitude of plans has been matched by a multiplication of controls (the student of the use and abuse of delegated legislation will find town planning a fruitful field) and by the establishment of a hierarchy of officials having a vested interest in the planning process. But of concrete results, in the shape of an improvement in the living and working conditions of the people, there is little—pathetically little—to show. Popular enthusiasm for this brand of planning is turning rapidly to disillusionment, and it is time that the official

town planners took cognizance of the fact. What then has gone wrong with town and country planning?

First and foremost, it is a victim of economic stringency. Many planning schemes can produce great and tangible benefits in the long run, but almost all involve a high initial cost. The redevelopment of a city centre, for instance, requires a heavy outlay on site clearance, street improvement, and rebuilding and necessitates much disturbance of existing occupants. The eventual gains, unfortunately, must be paid for in advance; and it is just this which the nation, under present conditions, finds it so difficult to do. This is why the grandiose schemes of road and rail improvement have been “modified” almost out of existence; and why the attempt to shift industry out of congested areas (on which the success of so many plans depends) has been temporarily given up because of the costs of disturbance. Again, the planners' schemes for new housing are bound often to run counter to the political pressure to build houses quickly and to the financial pressure to build them cheaply—and the plans suffer accordingly.

But economic exigency is by no means the whole explanation. The strategy of the planning authorities has been such as to produce the minimum of results for the maximum of friction. Most bad development between the wars was the result of private enterprise. Accordingly, the planning administrators have bent all their energies towards clamping the tightest possible controls on all forms of private development—without, seemingly, observing that all major projects (and many minor ones, too) emanate no longer from private, but from public, sources. It is an almost classic case of belated stable-locking. Thus the citizen has been treated to the absurdity of seeing his own modest plans for a

hen-coop subjected to rigid scrutiny by planning experts, while Ministries and public corporations engross whole stretches of the countryside for their pet projects, cheerfully handing off the local planning authority with talk of national necessities. There is, of course, “prior consultation” over public projects in Whitehall, and now that the Minister of Local Government and Planning is in the Cabinet and has housing under his wing, this consultation will presumably be much less of a formality. Nevertheless the emphasis remains wrong. The growing impression that town planning is a process at once restrictive and ineffective will be hard to remove.

Finally, everyone agrees that the peculiar financial provisions concerning compensation and development charge contained in the Town and Country Planning Act of 1947 are working badly. The uncertainty and arbitrariness over both sides of the equation (the compensation to be paid and the charge to be levied) would be a serious deterrent to private enterprise, were enough enterprise to be allowed. The compensation proposals are widely considered unfair. Development charge acts primarily as a tax on enterprise rather than as a device for scooping off unearned increments in land values. It is not popular even in Labour circles, where it is thought to catch the wrong persons, and it must cause Henry George and the land taxers to turn in their graves. These financial arrangements were conceived by the Labour legislators as wholly secondary to the aim of establishing effective planning control over private development. Rarely have the means chosen been so utterly disproportionate to the end in view.

★

The catalogue of faults and difficulties is long, and the beginning of wisdom must be to recognise the mistakes of the past and the limitations of the present. The 1947 Act—for reasons of which some could not be foreseen but others were foreseen very clearly—has turned out to be one of the worst legislative blunders of the century. There is much to be said for scrapping it root and branch, and approaching the subject with a fresh mind and a clean slate. At the very least, its financial provisions will have to be drastically amended. How this could best be done is a question outside the scope of this article. All that can be considered here is what policy the planning authorities (central and local) will have to follow in order to be saved.

The nursery lesson which they should take to heart is that it is better to do a few things well than a lot of things badly. Town planners have greatly over-emphasised their role as “co-ordinators” of all forms of land use. The very people who define their functions in these grandiose terms recognise the complexity of the social and economic factors which must be taken into account.* There is not the necessary knowledge nor ability in the country, certainly not in the present Ministry, to determine the “best” use of each piece of land by administrative action. In any case these questions are being settled in practice less by the pure light of planning reason than by the balance of power between different departments and interests. Thus, where a new town shall be built depends not a little on how effec-

* See for example a recent booklet by two planning officials, “Some Principles of Land Planning,” by F. B. Gillie and P. L. Hughes. (Liverpool University Press, 5s.)

tively the local farmers are organised. This very fact does in theory increase the need for impartial arbitration by a central department; but, at any rate until the Ministry is better equipped for the job, the best course would be to give a freer play to the economic factors which the 1947 Act has smothered.

The second lesson for the planners is to count the cost of their proposals in terms of the resources likely to be available, as was done in Mr Max Lock's plan for the Portsmouth area. They must make reasonable assumptions about the mobility of industry and local opportunities for employment, as was done in the outline plan for the north-east coast. Too many plans still ignore these first principles, pay little attention to costs, and assume that industry can be moved about to the planners' orders. Plans for the development areas, for instance, often fail to strike a proper balance between the social desirability of bringing work to the workers and the economic desirability of moving workers to towns which are convenient for industry.

★

So far this article has been exclusively concerned with what town planners should not do. That is a reflection of the present situation. Half the trouble is that, frustrated in the pursuit of constructive objectives, the planners have increasingly fallen back on the wholly negative role of stopping other people from doing what they want to do. This explains their unpopularity. But it is no solution—or at any rate, one not likely to be entertained—to suggest that instead they should do nothing at all; that they should justify their Parliamentary vote only by such things as the preservation of Pope's oak and the improvement of rural footpaths.

The only alternative is for the town planners to rediscover their social function. They gained their present powers, not because they were thought suitable persons to co-ordinate all forms of land use (which they are not), but because they showed ways of securing better and healthier living conditions for the mass of the people. This initial aim has today got buried under a mass of regulatory and taxing powers which were originally secondary to it. The means has become the end. Town and country planning started modestly and has quickly acquired an overlay of functions far beyond the original conception. Planning authorities cannot hope to justify their powers and controls (even on a much smaller scale) unless they become the instruments of a policy at once more modest and more constructive.

It is time to face the fact that all major development schemes involve a high initial cost which can only be paid for by sacrifices in other directions. Is the nation prepared to have a rather slower rate of house-building in order to get the houses built in the right places? Will it forgo building in new communities in order to make a start on the redevelopment of city centres? Even if questions of this sort are answered affirmatively, there is a very strict limit to what planners can accomplish in the next decade; but if they are answered negatively, then the outlook for positive planning is very bleak. There is much to be said, even today, for accepting still more sacrifices in return for greater social benefits later. But unless the Government (and the nation) will take that view in practice—and not just in theory—the new planning machinery will lose its *raison d'être*.

NOTES OF THE WEEK

Stalinist Strategy

The oracle having spoken through the columns of *Pravda*, the Stalin line is now being plugged as hard as the Communist Party knows how. The troops of the United Nations cannot win in Korea—it is said—because they do not believe in their cause, because their morale is bad; therefore, said Stalin, they must lose. This is tantamount to saying to the masses of Asia and to the party everywhere that Russia expects this year every Asian to do his duty—which is to drive the Americans and their allies into the sea and demonstrate once for all that a people's army of peasants with faith in Stalin can everywhere sweep all before it. It might be thought that Mao Tse-tung and the now almost forgotten North Korean leader, Kim Il Sung, would feel they were being committed to endless fighting on their own, with Stalin emulating the Duke of Plaza Toro who

... led his regiment from behind
He found it less exciting.

To console them they are told by Moscow Radio that "people resolutely fighting a just war for freedom and independence and enjoying the immense moral support of the whole of progressive humanity cannot be conquered."

It is becoming increasingly clear that the purpose of Stalin's political strategy is to gain time: by stimulating "colonial liberation movements," by turning the desire for peace to subversive ends, by postponing the settlement of the problems arising out of Hitler's war, by seeing to it that every Communist action—whether in Malaya, or the Balkans, or the docks of Australia, or the streets of Paris—is carried on regardless of defeat or casualties.

Stalin's point about morale is none the less worth some thought. There is a persistent tendency, even in quarters sympathetic to the Uno cause, to forget that the issue in Korea is not precisely what it was last June. Chinese intervention was primarily intended to wipe out the impression made by the overwhelming defeat of the carefully trained and indoctrinated North Korean army. It was intended to show Asia that Communism must be victorious on the field of battle if it followed the strategy laid down by the party. What the United Nations troops are doing in Korea, therefore, is to fight a campaign demonstrating that aggression by proxy does not pay, that free men have their own sources of good morale, and that the service of Soviet imperialism is costly and unrewarding. Indeed, it is time that this last point was made quite clear by a Uno appeal to Kim Il Sung over the heads of his Chinese and Russian masters.

French Cabinet Crisis

M. Plevén's resignation on Wednesday evening marked the failure of a series of Byzantine manoeuvres in which two partners in the Third Force coalition tried to cajole the third into accepting their project of electoral reform. The government, which has been in office since last July, staked its life on three votes of confidence. On the second of these the Assembly rejected the opposition amendments proposing a single ballot system by 311 votes to 295. This vote, although technically a victory for the government, made quite certain the withdrawal of the MRP ministers from M. Plevén's team. The President of the Republic has initiated inter-party consultations which threaten to be extremely long and difficult.

A dissolution is now constitutionally eliminated since the government did not lose the vote of confidence. With the electoral law unchanged there is little advantage, moreover, to be gained for the majority parties by debating the alternative procedure of curtailing the parliament's life by a simple

vote of the House. The only possible solution seems to be a genuine compromise between the MRP and the Radicals on electoral reform. All serious political and economic issues have indeed been put on ice meanwhile on the assumption that such agreement was indispensable. The abandonment of electoral reform altogether risks, as the coalition well knows, the election next autumn of an Assembly in which Gaullists and Communists have an absolute majority. The coalition determination to prevent this happening will be measured by its willingness to compromise on electoral reform. In the present situation it will doubtless have occurred to French politicians that they have a duty to their allies, as well as to their people, to see that France has a government capable of fulfilling its international responsibilities.

Maliciously and Advisedly

Although the House of Commons has in recent years lost many of its functions as a law making body, it can on occasion most vigorously reassert its guardianship of civil liberties. On Monday, the Government not unnaturally expected an easy passage for the Reserve and Auxiliary Powers (Training) Bill, which provides the necessary legal sanctions for the recall of Class Z and Class G reservists; there had been no serious disagreement about the measure. But it was not the military arguments which provided the centre of the debate, although members in all parties were clearly uneasy about the effectiveness of the 15 day recall. The House was far more concerned with the drafting of Clause 6, which makes it an offence to incite people to evade the call-up. The question was first raised by a Conservative member, Mr Henry Strauss, who pointed out that although the clause was modelled on the Incitement to Disaffection Act of 1934, it had left out the words "maliciously and advisedly" from the description of the offence and had therefore made it too broad for satisfactory legal definition. Mr Grimond, for the Liberals, argued that the clause as drafted would make it possible to suppress not only Communist agitation but genuine pacifist movements, and that it gave powers of search even where an alleged offence had been committed three months before the laying of the information.

When transferred to the Labour benches, the attack took on a different aspect. Mingled with the dislike of such a badly-drafted clause were remnants of the old animosity against the 1934 Act itself, which had been bitterly opposed by the Labour Party at the time and against which Mr Attlee had once made an impassioned speech. In the end, the Secretary of State for Air promised that the Government would reconsider the clause in committee. The arguments against the clause were for the most part sound lawyers' arguments; but beneath the surface there was discernible the old current of Labour fear which breaks out from time to time. It is a group myth inherited from the revolutionary days of the Labour Party, a fear that the law is really a Tory instrument and that one day its powers may be turned against Labour. Any measure of restriction, even one aimed specifically against the Communist Party, produces this feeling of vague malaise among older members of the Labour Party, who are bitter opponents of Communism. It will presumably be extinguished with the passage of time, but meanwhile it unfortunately gives the Communist Party an opportunity to pose as the champion of civil liberty.

Writing Off Eggs

The failure of the Gambia poultry scheme, coming so soon after the decision to write off the £36 million

invested in the Overseas Food Corporation's groundnut scheme, will inevitably strengthen the misgiving already felt about the activities of the Colonial Development Corporation. The amount so far advanced was £825,000, and it is a tribute to the courage of the corporation's new chairman, Lord Reith, that once the scheme had proved a failure he should decide to abandon it forthwith rather than to wait until the loss was doubled. It is worth noting that the loss is, so far, only to the corporation, which remains liable to the Government for both the capital and interest on it.

But the failure illustrates once again the particular hazards of investment in the colonies through public corporations like the Overseas Food Corporation and the Colonial Development Corporation. Little purpose is served by saying that no normal commercial enterprise would undertake such a risk at such a cost. The whole point of the Colonial Development Corporation is that it should undertake enterprises outside the range of private investment. Some of them are bound to turn out failures; what the Overseas Resources Development Act requires is that, taking one year with another, the Corporation should show a profit over its activities as a whole. The root of the trouble is that when mistakes are made by a public corporation of this sort they are dragged into the political limelight. The scheme then becomes a matter of prestige; the truth tends to be hidden; and the inevitable decision to write off the loss is delayed longer than it should be. Doubts have been expressed about the wisdom of the Gambia poultry scheme for some time. But when the Corporation's report appeared last summer its account of it was permeated with optimism.

The undertaking has progressively overcome all its difficulties so far; the health and fertility of the flocks is [sic] excellent and the output is expected to work up within 18 months to its maximum of 20,000,000 eggs and 1,000,000 pounds of dressed poultry per annum.

Moreover, even when detailed questions were put in the debate on the Corporation last October Mr Dugdale, Minister of State for Colonial Affairs, still put forward the estimate that ten million eggs would be forthcoming in 1951. Lord Reith will have to show himself less sensitive to criticism than was his predecessor, and remain readier to admit mistakes, if public faith in the value of his Corporation—for, rightly handled, it has a value—is to be restored.

New Ministries for Old

The House of Commons debate last week on the transfer of functions from the Ministry of Health to the new Ministry of Local Government and Planning produced some interesting backbench criticisms of departmental organisation. Most members appreciated the logic of grouping housing, water supply, and sanitation with town and country planning instead of with health. Medical opinion in the House made rather heavy weather of the danger of separating the responsibility for environmental and personal health services. It was also suggested that the Ministry of Health, having less now to do, would extend its control over the local administration of the health service. In fact, however, general supervision of the health service together with responsibility for the developing welfare services is quite enough work for one Ministry.

There were also fears from another angle that the Minister of Local Government and Planning, now that he has housing under his wing, would cease to be an impartial arbiter on conflicting claims for land use. One answer is that he never did or could perform this role successfully—partly because of his own impotence to overrule other repartments, partly because of the inherent difficulties of the task. At least, he will now be able to integrate town planning with the main forms of physical development—which in fact is a sensible step backwards to an earlier position. Most of the objectors on this score represent rural constituencies, and seem to sup-

pose that nothing matters except maximum protection for good agricultural land.

These two sets of objections—the medical and the agricultural—can be largely dismissed. More interesting was the suggestion that loan sanctions for local government projects (and why not the district audit and other local financial matters?) should be transferred to the Treasury, thus recognising the power of that department and preventing a duplication of central controls. Besides such particular questions, there was a natural curiosity as to what wider ends the new dispensation is intended to serve. Mr Herbert Morrison managed by his flippant reply to dissipate the good reasons for the Government's action. He contended that the Ministry of Health was being dismembered because it was too big—thus ignoring the fact that another large Ministry was being created. If a reduction in departmental size is the Government's aim, it would do better to put housing into the Ministry of Works. Mr Morrison's facetiousness lent colour to those who see the arrangements as a device for shifting Mr Bevan and inflating Dr Dalton. He justified them as a matter of logic and departmental convenience, but held out no hope that they would assist local government, health, or housing. The administrative problems at issue are too important to be dealt with so casually.

Prague's Purge

The month-old mystery which has surrounded the whereabouts of the former Czechoslovak Foreign Minister, Dr Clementis, has at last been solved. He has been arrested as a spy and a traitor in the first major purge of "Titoists" that the Czechoslovak Communist party has undergone. He, and the most important of those who were arrested with him, must now expect to follow Rajk and Kostov to the gallows or prison.

From Moscow's point of view the Czech Communist party has always been unsatisfactory with its exceptionally large membership and its absence of "steel-hard cadres." The western outlook of the Czech people and the disgraceful tendency of the Czech worker to value bourgeois comfort have aggravated Moscow's suspicions. The conversion of the Czechoslovak economy to serve Soviet interests has not been proceeding smoothly. The proportion of trade that should go respectively to West and East is a subject of perpetual friction between Prague and Moscow; so are the scale and speed of agricultural collectivisation. Several of the Czech Communists now under arrest are accused of opposing a policy of "liquidation of the kulaks."

Dr Clementis and his colleagues on the former Slovak Board of Trustees, Drs Husek and Novomesky, who have been arrested with him, are also accused of "trying to separate Slovakia from the Republic." It was, indeed, primarily for their Slovak nationalism that these men got into trouble a year ago. Whatever their other differences, both Prague and Moscow will combine to crush the separatist aspirations of the Slovaks, who are growing more and more resentful of the strictness with which they are now controlled from Prague. A Czechoslovakia split into two weak and vulnerable halves would only be a liability to the eastern bloc.

The present purge may extend to more important people; so many of the present ministers committed the error of not spending the war years in Moscow. Even among those who did, there are some, like President Gottwald himself, who do not seem to be regarded as completely reliable. What does appear unlikely is that Zapotocky or any of the other "nationally-minded" Communist leaders will risk an open breach with Moscow. Their past record shows that they are much more likely to intrigue against each other, each hoping to get the support of "the inspired teacher of humanity" until in the end he picks them off one by one and destroys them.

Tension Inside China

One feature of the Chinese Communist victory over the Kuomintang which aroused strongly favourable comment abroad, and appeared to support the contention that the Chinese comrades were of a different species from the Russian, was the mildness of their behaviour in the newly "liberated" areas. The absence of proscriptions and terror was in marked contrast to the ruthless violence of the early days of the Chinese Communists and corresponded to the Popular Front tactics they adopted during the period of the Japanese invasion. By forming the widest possible combination of political forces against the Kuomintang, and by making suitable promises to all classes except landlords and "bureaucratic capitalists," the Communists created a temporary situation in which their victory was generally welcomed and they could afford to make a show of clemency and moderation. Yet the Communist determination to obtain and hold absolute power implies that terror must be employed as soon as initial popularity wanes, or steps are taken which forfeit the support of former political allies. This stage was bound to come soon in China, but it has now been precipitated by the Korean war, and particularly by the reverses which the Chinese army has recently suffered.

On February 19th the Central People's Government Council enacted a decree which prescribed penalties of death or life imprisonment for "those who work with imperialism against the fatherland," ringleaders of counter-revolutionary guerrilla units, spies and saboteurs, agents who try to "tempt and buy over" soldiers or civil servants, those who disseminate "counter-revolutionary propaganda and rumours," and persons stirring up disunity, disturbing financial markets or inciting "serious resistance to grain tax collection, labour service, army service and other administrative orders." All countries in time of war take measures to suppress enemy agents and subversive elements; but the extension of the death penalty to so wide a range of offences indicates either extreme ruthlessness or else an internal situation of a very alarming kind. An official statement issued to justify the decree does, indeed, paint a picture of widespread disturbance and resistance to the new regime. It was asserted that "in many places" railways and bridges had been wrecked, factories and mines damaged, and warehouses set on fire; members of local peasant associations had been murdered, groups of peasants transporting requisitioned grain for the army had been attacked, and in the province of Kwangsi alone 3,000 "cadres of the People's Government" had been killed. Such admissions seem to support the claims of widespread anti-Communist guerrilla activity put out by Chiang Kai-shek from Formosa. It may be that both sides, from different motives, are exaggerating the extent of the resistance; but there seems to be no doubt that the exacting demands of war against the United Nations have begun to produce cracks in China's national solidarity.

* * *

India and Pakistan—Limited Optimism

The new trade agreement just signed between India and Pakistan after a week's negotiations in Karachi shows that even the darkest night gives place to dawn. At first sight the puzzling aspect of this agreement—the terms of which appear on page 509—is why it should suddenly have been possible for Delhi and Karachi to reach a settlement now, when for seven months already each side has clearly been willing to cut off its nose to spite its face. But the fact is that the economic reasons for breaking the deadlock have been growing stronger with time, and that India's economic plight had grown very serious. Yet so long as the two countries were politically so irreconcilable it seemed that the hopes for commonsense were slim. Now, however, that an alarming economic situation has produced a settlement, what are the chances for political agreement?

The answer probably depends on the course of events outside India and Pakistan as much as on a change of

political climate occurring in either capital. While the new agreement will naturally remove a grave source of friction, there is unfortunately no sign which points to a settlement of the crucial dispute over Kashmir arising out of the more friendly economic relations. India and Pakistan have settled profound differences before—the Bengal agreement a year ago came at a very critical moment—without managing to turn a local truce of this nature into a general peace. At present, the Kashmir deadlock is as complete as ever, and both sides have given a very frosty welcome to the British and American proposals now before the Security Council. Either Delhi or Karachi might suddenly again reverse its whole attitude, deciding this time that the Kashmir struggle is not only rather ridiculous but financially, militarily and morally intolerable; but it may yet take some external agent like the direct pressure of Soviet imperialism or a further Chinese advance into Tibet to turn India and Pakistan into real friends. The economic agreement at least shows that big changes, once in train, can take place very quickly, and that the day must come eventually when the Kashmir dispute becomes only a nightmare of the past.

Order 1305

It is now almost certain that the wartime legislation against strikes will be abolished. On Wednesday the TUC strongly recommended Mr Bevan to repeal the order which prohibits strikes and lockouts unless 21 days' notice has been given to the Minister of Labour and no action to settle the dispute has been taken. (This is part II of the Conditions of Employment and National Arbitration Order, No. 1305 of 1940.) No decision will be taken until April, but there is widespread agreement with the TUC's proposal—as also with its recommendation that the National Arbitration Tribunal, which was set up by the Order, and the clause requiring the observance by all employers of "recognised terms and conditions" of labour should be retained.

To abolish the Order at this precise juncture is to run the risk of appearing to give still further encouragement to wage claims. But in fact the Order has never prevented strikes. Indeed, it is always very difficult, if not impossible, to enforce strike legislation universally; the choice of when to enforce it consequently depends on political rather than legal considerations. In any event it is hard to ensure that the real, as opposed to the apparent, instigators of illegal strikes are caught. There is, of course, a strong case for prohibiting strikes in a few essential services—the police, gas, electricity and water undertakings—but for these adequate legislation already exists.

The proposal to retain the National Arbitration Tribunal, although arbitration will no longer be compulsory, is also wise. There will always be a need for a competent, impartial authority to settle those disputes where the two parties genuinely disagree, without wishing to go to extreme lengths to get their way. It should be pointed out that the great majority of industrial disputes in Britain are in this category, and the tribunal has a long record of successful settlements in a mass of minor cases seldom reported in the press.

The main criticism of the proposal to abolish compulsory arbitration is that it was not made sooner. The relevant section of the Order might easily have been repealed three or four years ago. As it is, the recommendations follow hot on the heels of Communist agitation, and they will inevitably be represented as a triumph for the agitators.

* * *

Patriotism by Proxy

Both the TUC and the FBI have now decided on their advice to the Chancellor about this year's Budget. The TUC offers an amiable set of expedients supposedly designed

to pay for defence and yet to make almost all wage-earners better off: the rest of the community will patriotically bear the burden. (It should be said that the FBI's proposals, which are discussed in detail on page 504, display something of the same spirit). The TUC's ideas are unusually ambiguous. It urges the Chancellor to increase the food subsidies, "as far as is practicable," in order to cushion the consumer from rising import costs. It can hardly be unaware that if expenditure on subsidies were in fact increased on any scale, offset only by some undefined "administrative" economies, the Budget problem would be very much bigger than its own suggestions for taxes can be supposed to meet.

No doubt it is politically inevitable that the trade unions should urge the Chancellor to increase the tax on distributed profits. But the economic education of the past few years has been remarkably unrewarding if they still naively suppose that the transfer of resources to defence will in any way be helped by a bigger extraction to the Treasury of the money that companies save through undistributed profits. The proposal to shift purchase tax from essentials to luxuries is even more obviously unrelated to the real tasks of rearmament. Such luxuries as are consumed on any scale are already taxed to or beyond the point of diminishing returns, and to lower the rate of purchase tax on the more necessary goods (which are just the things—household equipment, and the like—that rearmament will necessarily make scarce) can only ensure that queues are longer and the country's sacrifices more indiscriminately distributed.

On one point—an increase in the standard rate of income tax—the TUC's advice will command fairly wide agreement. But it converts even this necessity into an instrument of class war by proposing to combine the higher tax on the middle classes with relief for trade union members: the exemption limit for income tax would be raised. The suggestion that the reduced rates of tax should be more gently graduated is a sensible, if limited, recognition of the fact that it is high marginal taxation on additional income that deters effort; but again the practical effect would presumably be to reduce the amount of tax paid by most wage-earners—and so to offset the yield of the increased standard rate. All this amounts to a recipe for other people's patriotism that can only complicate both the country's and the Chancellor's tasks.

Quiet Life for Monopolies

The Board of Trade published on Wednesday its appropriately brief report on the operation of the Monopolies and Restrictive Practices Act during 1950. It will be read not for what it reports but for what promise it holds out of more liveliness in 1951. The promise is in fact regrettably slight. Plainly Mr Wilson's reference of two more cases to the Monopolies Commission as early as last December was no more than a concession to the feeling that something ought to be happening by now. Although its staff increased in numbers from 37 to 61 last year, the Commission does not hope to do more by the end of this year than complete the six original inquiries (referred to it just two years ago) and "make a start" on two or three others.

The report does give a useful explanation of the principle on which future subjects for inquiry by the commission will be chosen. The aim is

to build up a programme of study which will enable the commission to bring under review, in the early years of their work, representative examples of all the common types of restrictive practice and monopolistic influence in British industry.

The impression of leisurely, academic research is no doubt accurate if unintentional. Though it is naturally not explicit, there could hardly be a more effective admission that Mr Wilson has no intention of taking any thoroughgoing action against monopoly practices. The choice of inquiries is being "directed chiefly to subjects which may be expected

to break new ground." The result will be, therefore, a series of isolated findings on separate cases. It would be quite wrong for the Government to legislate for these individual industries when they have been chosen merely as examples of what is known or suspected to exist elsewhere. It also seems unlikely to take the examples as a sufficient basis for general legislation against monopoly. The Board of Trade's report goes out of its way to emphasise that the establishment of the fact that there are monopolistic conditions or restrictive practices in any trade "cannot prejudice the further question whether these conditions or arrangements are contrary to the public interest." It could be supposed that Mr Wilson is deliberately seeking to make the Monopolies Act even more ineffective in administration than it was inadequate in conception.

The Board of Trade's decision that the commission should investigate isolated examples of different types of monopoly is the more surprising because one-third—10 out of 29—of the further studies suggested from outside are concerned with restrictive arrangements in distribution, which have already in part been officially examined by the Lloyd Jacob committee on resale price maintenance. If the Government really wanted to make what use it could of the Monopolies Act, the reasonable policy would surely be to concentrate on investigating a few more cases in this field as a basis for general legislation against restrictions on competition in the distributive trades.

The Strain in Malaya

Tuesday's debate on Malaya in the House of Commons drew a statement from the Secretary of State for the Colonies, Mr James Griffiths, that confidence is slowly and surely growing, although progress with the Briggs Plan has not been quite as good as had been hoped. On paper this is true enough. While the number of incidents sometimes ebbs and flows disconcertingly, the trend is now in favour of the security forces. On the other hand, there is still no prospect whatever of ending in the foreseeable future the well-nigh intolerable tension throughout Malaya. The emergency has now lasted two and three-quarter years, and—to consider for the moment only the European community—this long-drawn-out strain is having an increasing effect on Malaya's planters and civil servants.

It is very fortunate that the emergency now coincides with an economic boom in Malaya. For, if the bottom dropped out of the rubber and tin markets, it is hard to see either how the estates could continue to be manned by adequate white staffs, or how the administration could continue satisfactorily to finance its abnormal expenditure. Even as it is, companies are finding it harder and harder to get managers in the bad areas, more of the older planters are going into retirement, and the type of young man needed to keep the Malayan enterprises going is not coming forward from Britain. Nor is the civil service very much better off. The worst possible effect has been created, particularly among the senior and more hard pressed officials, by the indefinite and prolonged suspension of leave—a recent temporary measure designed

to step up government efforts to deal with the emergency. And, from the point of view of encouraging young entrants, the probable compensation, if anything should happen to their jobs in the future, is still unsatisfactory. It is clear that, should the Malayan emergency be prolonged at its present intensity, both the government and private firms will have to consider making their terms more attractive if they are going to recruit the necessary staffs.

One of the considerations also to be taken into account by the British Government is the deterrent effect of the casual statements sometimes made by its members, about self-government for Malaya. Until the time is ripe for this move it does only harm to give the impression that British authority may be surrendered tomorrow.

* * *

Poulet Rideau de Fer

The plump Polish fowls and geese now lying alongside emaciated British hens on the poultrymongers' slabs tell a better tale than statistics. It is easy to see why the Warsaw authorities are anxious at the extent to which the peasants are feeding grain to livestock instead of delivering it to the state, and why they should wish to speed up the slow tempo of collectivisation.

In the last few days officials in Poland have sounded a new note of alarm. The people, it seems, are eating far ahead of schedule. The increase in meat consumption in Poland is said to be "really incredible." In Polish towns, meat consumption per head was 36.4 kilos (80.26 lb.) in 1949, and 51.3 kilos (113.12 lb.) in 1950. In Warsaw it was 48 kilos (105.8 lb.) before the war, and 61 kilos (134.5 lb.) in 1950. (In Britain, meat consumption, including bacon and ham, was 108.2 lb. in 1950.) Consumption of bread and flour is said to have risen in much the same way.

The Polish authorities are concerned because the Six-Year Plan did not provide for agriculture to produce so much or the people to eat so well, so soon. Consumption of meat and flour has reached the figure envisaged by the Six-Year Plan for 1953. Incomes were supposed to be kept down, and investments directed to heavy industry and the armed forces, not to ham and cakes. The Warsaw spokesmen complained that:—

It means hardship to build socialism. We have immense factories to erect and we have to show every concern for the security of our frontiers. All this must cost money. We cannot consume for 1953 or 1955 and produce for 1950.

Communist planners, it is evident, find it even more difficult than the British Government to guide their public back to austerity. They have to contend not only with ordinary human frailties but, as the Polish speaker pointed out, with "the hostility of the class enemy." This mysterious force was said to be responsible for rumours of rationing (well-founded in Prague) which sent the Poles and Czechs rushing to the shops. Temporary panics may be stopped by official threats; but it will be interesting to see how the Communist planners deal with the constant propensity of the public to make hay before the sun shines.

* * *

Health in Industry

It is possible to sympathise with the main object behind the report of the enquiry into the industrial health services (Cmd 8170) and yet deplore many of its recommendations and the Government's decision to accept them. The committee was appointed to examine the relationship between the health services provided for the general population and the industrial health service and to consider what measures should be taken to ensure the economical use of medical and nursing manpower. It is therefore well aware of the danger of overlapping and examines it—though by no means fully. But it is so convinced of the advantages, indeed the

necessity, of an industrial health service that it regards overlapping as of secondary importance. For instance,

The general burden of evidence is that where the doctor or nurse is fully occupied at the factory the overlap in these matters [medical treatment] is justified as benefiting productivity.

Again,

Within reasonable limits overlap [of medical examinations] may well be justified in the interests of the efficiency and welfare of the workers.

Everyone wants to improve the efficiency and welfare of factory workers. But it can seriously be questioned whether much of the paraphernalia of an industrial health service will necessarily improve industrial efficiency one jot. The factory doctors appointed under the Factory Acts, whose functions are mainly concerned with the examination of young persons and of other persons employed in unhealthy processes and with the investigation of some accidents, serve a limited and clearly defined purpose. There is also an obvious place for the specialist in purely industrial diseases. But doubts arise when the committee recommends the widespread appointment, by employers, of industrial medical officers, and nurses, whose functions would include such vague matters as "personal and group morale" and the promotion of "general and personal hygiene." Much of all this sounds like creating work to justify an appointment whose recognised, definite purpose is very limited.

The country is already spending over £400 million a year on the national health service. It is very questionable whether, above all this, there should be additional expenditure, even though from private funds, on a full industrial health service. It is even more questionable whether this should, as the committee hopes, eventually be extended to become a comprehensive occupational health service for establishments of all kinds, large and small.

* * *

Cheaper Nylons

The motives behind last week's official reduction in the price of nylon stockings are decidedly mysterious. One used to learn that price movements equated supply and demand; but not even the old price brought the supply and demand for nylons within shouting distance of each other. Outside the black or grey markets, nylons are obtained not by paying for them—that is an essentially irrelevant flourish on the transaction—but by inscribing one's name on a waiting list only less formidable than that for a new car, or by watching like a cat at a mousehole for the arrival of a local consignment, then knocking twice and asking for Joe. Doubling the price of nylons might be useful; the knocking off of a shilling can only be regarded as a symbolic gesture, relating to the almost entirely notional value of an almost entirely fictitious commodity, standing in the popular mind for Glamour, Achievement, the entry-pass to that magic world inhabited by the advertising artist's lovelies and their adorers; a revaluation of the £ in terms of the Unattainable. A new stratum of the feminine population can console itself, amid ever-increasing domestic perplexities, with the thought, "If I could find a pair of nylons, I could afford to buy them." A little consumer research would probably show the Board of Trade that their psychology is, on this occasion, as dotty as their economics.

* * *

Shorter Hours on the Rocks

Lighthouse keepers are by vocation solitary men and it must be seldom that they are driven to take corporate action. But the 210 principal, assistant and supernumerary keepers recently presented a demand for a 48-hour working week. It can be seldom that the dull proceedings of the industrial court are enlivened by such fascinating and

unusual evidence. The lighthouse keepers complain that they sometimes work a week of between 80 and 90 hours, and that their conditions of employment have not been altered since 1850. "It was submitted," said the evidence with masterly understatement, "that one hundred years was a long time between changes, and showed that the lighthouse keepers have stood still whilst all other workpeople's conditions have improved." The keepers complain that they are not only overworked but understaffed. At rock stations men spend two months on the rock and one month ashore, and the effect on their health is not good. At land light stations, mostly in remote places, "it is practically impossible for the men to have any cultural or recreational pursuits at all," which should dispose of any idea that lighthouse keepers are possessed of immense leisure to read Gibbon and Macaulay.

Their employers, that esoteric body of men, the Elder Brethren of Trinity House, oppose the claim for a fixed 48-hour week. (Does anyone remember a case of his elder brother conceding a point?) They admit in their evidence that lighthouse keeping is a hard life, that the incidence of hardship is greater in some stations than in others. They concede that fog and bad weather impose strains which make the job incapable of comparison with normal employment. "Furthermore, nights are longer in winter than in summer. In fact, lightkeepers' hours are beyond the control of the Elder Brethren, being dictated almost entirely by climatic conditions." The first phrase will be treasured by social historians as one of the finest platitudes in industrial history, while the second would make the hearts of Unitarians bound with joy.

In the end the Industrial Court, faced with such unusual evidence, found itself unable to give judgment, while inclining towards the lighthouse keepers' side. It ordered the two sides of the "industry" to resume negotiations, and if the spirit of elder brotherly love produced no results, to bring the case before it again. Perhaps the court will wait in pleased anticipation for a breakdown in negotiations, in order to be able to hear again evidence smelling of spray driving on granite rocks.

* * *

A Stone in the Wind

Scotland has lately had a sad and humiliating time. In the same week that the Scotch Whisky Association found it necessary to increase the cost of living by 1s. 8d. a bottle, the committee considering, under Lord Morrison, the Scots law of inheritance, made public its report, and grim reading it is. Primogeniture should, the committee recommends, be largely abolished; so, too, the preference given to males in the inheritance of all heritable estates save hereditary titles. Adopted children should be placed on the same footing as the lawful children of the adopter (even, apparently, when the adopted child may not be of Scots blood) and the surviving spouse, where there is no will, should be entitled to a cash payment from the estate free of duty. Such recommendations are not only proposals of a mercantile kind, likely to have originated in the smug suburbs of Glasgow and Dundee; they were anticipated south of the border as long ago as 1925.

As the committee says in its report, any such reforms can only be carried through by Act of Parliament. If the proud Highland race can bring itself to contemplate any such legislation through the alien machinery at Westminster, some humble advice may perhaps be offered. The committee suggests that the proposed new provision giving all children the right to share equally in the heritable property of a man or woman dying intestate should not apply where the deceased was the owner-occupier of his or her croft (or farm). In that case the eldest son should take the holding, providing he suitably compensates his juniors. For thirty years

now the courts at Westminster have been struggling to interpret the section in a 1920 Act which allows a statutory tenancy of a house to pass to a "member of the family" of a deceased tenant and the number of cases in which someone has put forward a plausible claim to be considered as a "member of the family" is by no means yet exhausted. If the definition of what is and what is not an owner-occupier of heritable property is not mulled over with the greatest possible care, any Act for the placing of the law of intestate succession in Scotland on the same footing as that prevailing in England and Wales may prove to have been passed for the principal benefit of the Writers of Edinburgh.

* * *

Responsibility on the Gold Coast

The Gold Coast's new Executive Council has now been appointed. The three *ex-officio* members are the Colonial Secretary, the Financial Secretary and the Attorney-General, who will be in charge of, respectively, defence and external affairs, finance and justice. Of the eight unofficial members, six will belong to the Convention People's Party and will be headed by Mr Kwame Nkrumah, who will be leader for government business and Minister without portfolio. Of the other two unofficial members, one will represent the Ashanti Council of Chiefs and be in charge of local government, and the other will represent the Northern Territories. Thus, the Convention People's Party will have a majority in the Council, and will consequently bear the responsibility for government.

The Need for Western Union

The triumph of despotism seems complete. The reaction in favour of tyranny of 1851 seems as irresistible and excessive as was the reaction of license in 1848. From every part of Italy and Germany we hear of nothing but a relapse into the old path of clumsy, brutal, and mediæval oppression. The old armour is burnished up. The old weapons useless from rust, and ridiculous from their antiquated fashion, are called forth from forgotten arsenals. All the obsolete and discredited expedients of kingcraft are again resorted to with no visible distrust of their efficiency. Constitutions are proscribed under any form or in any degree. The press is subjected to censorship, the admission of foreign works prohibited, and the sale of any unauthorised books visited with the severest penalties. The most respectable friends of freedom are visited with ignominious punishments. . . . The alarming disposition shown by Austria, Prussia, and Bavaria towards the utter extinction of constitutional freedom throughout Central Europe, seems to call for a still closer union between the only Representative Governments which remain, viz., France, England, and Sardinia; for Spain and Portugal, notwithstanding their forms, can scarcely be considered as genuinely such. If these Governments will steadily and honourably hold together, and refuse to permit any interference with the rights and independence of Switzerland, at the same time, discountenancing the practice of allowing it to be made a hotbed for the nourishing of plots against friendly powers—a barrier, effectual and immovable, will be opposed to the further advance of arbitrary designs, and a harbour of refuge and security provided where the oppressed may find a shelter, a welcome, and a home, and whence such freedom as alone is fit to be desired and capable of being maintained, may gradually spread as time and maturity may afford an opening.

Letters to the Editor

The Importance of Tito

Sir,—I have no quarrel with your article of February 3rd but I noted with especial interest the following:

Finally, there is the general obligation. The Charter of the United Nations is concerned with aggression by one state on another; it is not concerned with the internal politics of its members. An aggression on Yugoslavia would be a perfectly clear-cut case under the Charter, and failure to act would see the end of the United Nations.

Let us turn back a moment to Korea. Here was a case of clear-cut aggression by North Korea—and it was recognised as such by the United Nations. Then Red China came to the armed support of the North Koreans and attacked the United Nations forces. But the Commonwealth Governments were reluctant to call that action aggressive. True, the British government finally voted for it—but would have preferred to avoid the issue. And India took a positive position on the other side.

If failure to act in the event Yugoslavia is attacked would "see the end of the United Nations," how can it maintain any strength or standing by running from the issue raised in the Orient? And if Western Europe looks to America for forceful and quick action in case of aggression against Yugoslavia, do you think that the experience in regard to China has encouraged it?

I am not disputing your point of view on Yugoslavia. But if principle is worth fighting for anywhere it is just as important to uphold it in Korea as in Yugoslavia—especially when the South Korean government had been recognised by the United Nations and to a degree was under its protection.—Yours faithfully,

OLIVER J. KELLER
Illinois, USA

[We entirely agree.—EDITOR.]

Tory Diversions

Sir,—The assertion in your Note of last week with the above title that "Mr R. A. Butler and his views are anathema" to me is quite wrong.—Yours faithfully,

KENNETH PICKTHORN
House of Commons, S.W.1

[The statement that Mr Butler, as well as his views, was anathema to any of his colleagues was unjustified and is withdrawn.—EDITOR.]

Greeks at Peace

Sir,—Mr Pallis does his country an injustice. Members of the British Police Mission have long stressed the low rate of civil crime in Greece. The daily average population of the prisons and Borstals of England and Wales in April, 1950, was 20,420—and that was the highest for forty years. It is uncertain if any accurate figure can be obtained for the whole of Greece when gendarmerie commanders often admit to ignorance of the exact number of prisoners in their own areas. But whether the figure is 21,000 or 25,000, it is inordinately high

for a population less than one-fifth that of England and Wales, and cannot be explained by attributing it simply to an excess of civil crime.

Such a large proportion of prisoners is not and cannot be suitably housed in existing prison accommodation. Medical facilities are inevitably lacking for prisons in a country where often none exist for whole areas.

As the only democracy in south-east Europe Greece has much to offer by her example. But it is to play into the hands of her enemies to deny facts that are evident to anyone who troubles to investigate them. It also deprives the friends of Greece of the opportunity to speak on her behalf in this matter.—Yours faithfully,

GEOFFREY CHANDLER
Newdigate, Surrey

Overseas Lending Again

Sir,—To the familiar arguments against repayment of sterling balances you have recently added another which surpasses in novelty all others. In your article in your issue of December 30, 1950, you have assumed away the difference between lending abroad and liquidation of external debt and then proceeded to demonstrate how the latter is less remunerative because it "yields" an interest saving of only $\frac{1}{2}$ per cent. It follows that a higher rate of interest, say 5 per cent, would have been more acceptable to Britain, since it could have earned more by liquidating the balances. It should have been easy to get the creditor nations to agree to this rate, especially as the capital previously exported by them would have yielded a substantially higher return. Indeed, their development plans could have been financed out of the interest on the sterling balances and no drawings from the balances would have been necessary!

May I also point out a slight factual inaccuracy in the above article? Apropos of the rise in the sterling balances in 1950 you state, "part of the British export of capital has taken the form of release of sterling balances owned by countries such as India, Palestine and Pakistan." India had a balance of payments surplus and it did not draw on the sterling balances last year as some readers of your article might be led to believe.—Yours faithfully,

Bombay S. KUMARASUNDARAM

Nationalisation

Sir,—Green as I am, I have always swallowed the argument that nationalisation is necessary because the free operation of the profit motive in certain basic industries is incompatible with the best interests of the country as a whole. Now, however, I see our nationalised Coal Board buying dollar coal at fantastic prices mainly because they have tried to conform to the strict profit standards of business efficiency. I do not under-

estimate the importance of these standards, but they have their limits. In my own district we see the possibility of the nationalised steel industry going short of vital coke because the nationalised coal industry considers that the local pits, which produce some of the finest coking coal in the world, are uneconomic. When both industries were privately owned the Consett Iron Company did not consider those same pits uneconomic.

Perhaps this is rather a narrow and imperfect example, not quite fair to the Coal Board since it is true that these coal measures are gradually being worked out, but it provides a simple and convenient illustration of my point that one of the principal virtues of national ownership is lost if the national need is sacrificed to departmental bookkeeping. Is it not an attractive possibility to reduce the cost of living by subsidising such chronic "losing" industries as coal and railways (which appeared to require subsidies under private ownership) from the profits of those more fortunately placed?

True, some other measure of efficiency must be found, and perhaps this is an insoluble problem, but surely it is time that Socialists, at least, faced it and applied themselves to its solution.—Yours faithfully,

JAMES TINN,
Lodge Secretary, National Union
of Blastfurnacemen, Ore Miners,
Coke Workers and Kindred
Consett Trades

A Decimal Currency?

Sir,—Knowing how much those who do not live in England curse at the present time-wasting and cumbersome system of £ s. d. let us hope that the days are few before a change will be made not only in Britain but naturally also in those of her colonies and Dominions where the same process is in use.

The suggestion is very simple as only one change is essential, making ten pence instead of twelve to equal a shilling, the other figure being ten shillings to equal a half pound. Thus one has 10 pence equal 1 shilling and 10 shillings will become equal to 100 pennies.

The tremendous advantage of a decimal system in all money transactions is surely sufficient to overcome the very small disadvantage which may occur to a few of the older persons, but that will be for only a short time as the present £ will soon disappear; when the new ten shillings is accepted as the top coin the £ will become two ten shillings by whatever name it is known.

I would like to suggest that you advocate this proposal in *The Economist* and have the suggestion brought up during the coming Festival of Britain. This seems a very suitable time as it should make a very useful change, showing the British amenable to all sensible change.—Yours faithfully,

Montreal J. RAWSON GARDINER

Books and Publications

Encyclopædia of the Atom

Sourcebook on Atomic Energy. By Samuel Glasstone. Macmillan. 495 pages. 24s.

The somewhat contradictory descriptions of this book given in the foreword and on the cover are both misleading. The former describes it as a comprehensive sourcebook for the use of textbook authors and editors; this cannot be taken too seriously, for though names are given lavishly, there is hardly a single reference giving the location of the original source. At the other extreme, the sensational "blurb"—"The authentic story—all that can now be told"—also gives the wrong impression of the contents, which are solid, matter-of-fact and, for the most part, drawn from past history. What Dr Glasstone has produced, in fact, with the full benefit of authoritative backing, can best be described as an expanded version of a first-class encyclopædia article, comprehensive without being profound, and understandable by anyone who wishes to take sufficient trouble. It describes the present-day knowledge of the structure of atoms and of the characteristics and behaviour of atomic nuclei, as developed from its 18th-century beginnings; the main part of the story naturally lies in the present century, and the bulk of it is drawn from the learned journals of the twenties and thirties; there are no hitherto unrevealed disclosures.

The treatment is patient and lucid, and no reader with sufficient perseverance should find any difficulty. Dr Glasstone seems to avoid demanding of the reader any of the flights of imagination needed to grasp, without recourse to mathematics, some of the conceptions of modern physical theory. This is a pity, since he thereby excludes some of the legitimate glamour of the story. Few specialists will consult this book, save to refresh their memory of a sequence of investigations; but there is probably no better book for the serious layman old-fashioned enough to want a thorough grounding of knowledge rather than a "digest."

The chapter on the "Utilization of Nuclear Energy" will probably be

approached as the culmination of the book, but it will come as an anticlimax; Dr Glasstone is unenthusiastic. The difficulties are formidable, the costs discouraging, the raw materials scattered. But, if we could only forget the bomb, with its prodigious and sinister power, we should find our interest turned far more to the other new developments contemporary with, and arising out of, the harnessing of nuclear energy. After all, the process of uranium fission, which was an unexpected piece of luck for the physicists, releases only a crumb of nuclear energy, and it can only be turned to useful account in very clumsy ways. While uranium supplies last, it will be exploited, but science must do better if mechanical power is to persist as the basis of our economy. Perhaps uranium fission will only be remembered for the inspiration it gave in showing that the thing really could be done.

But apart from the energy it provides, the nuclear reactor, or "pile" creates clouds of rapidly moving nuclear particles in numbers far greater than any laboratory could produce—and does so night and day, as it runs under its own steam. It is a wonderful research tool, and has opened up vast new fields of investigation. And the by-products of the pile, the artificial radio-elements now so prolifically produced, are working a considerable revolution in chemistry, biology and medicine, as well as finding innumerable applications in industry, mining, agriculture, and indeed in some of the most unexpected of human activities. Fortunately, this book does not confine itself rigidly to the subject of its title, but has plenty of information to give on these exciting developments.

Among Aborigines

Brown Men and Red Sand. By Charles P. Mountford. Phoenix House. 192 pages. 18s.

This is not an anthropological study in any scientific sense, as the author himself admits. It is the story of his journey among the desert aborigines of Central Australia and the experiences he shared with them. But neither does it belong to the dismal category of popular anthropology, since it is quite free from the distressing flippancy and supercilious smartness which vitiates so much writing of the kind. The author does not intrude himself, and there is no dramatic overstatement of hardship or debonair debunking of it. Even the style of writing is neutral, an instrument only for presenting the aborigines with verisimilitude as a people of inherent dignity whose survival is a precious link with the past, never an odd discrepancy with the present.

One might reasonably suppose that the island of arid wilderness enclosed by the

Central Australian desert would be a drab and mournful land, and a journey through its scorching wastes a monotonous and unlovely experience. But Mr Mountford sees the prospect through the eyes of his brown friends, not as "the land that God forgot" but as the background to the lives of a resourceful, kindly, stoic and cheerful people, who do as they would be done by, accept the stranger within the gate, and act in accordance with the imperative necessity of maintaining supplies of water, fire and food. The logical simplicity of some of their customs reveals the level of social awareness to which this Stone Age people, with an equipment of five simple tools, has attained. For instance, when meat is shared, the one who has caught it is served last and with the poorest portion, lest, by bartering their game for privilege and power, the hunters should upset the authority of the old men and the social balance of the tribe. Children fare well; they are uninhibited but obedient, and everybody shares the responsibility of caring for them. This may be a result of the aboriginal belief in the pre-existence of child spirits who choose for themselves the body through which they shall be born.

Mr Mountford has a flair for colour, movement and grouping, which enables him to present his pilgrimage as a panorama of changing beauty wrought on the bare bones of the original scene by wind and light and the evocation of the strange mythological men and beasts through whom the natives explain their particular aspect of the universe and provide themselves with rules for existing in it. The 60 splendid photographs are an added charm to a book which is instinct with sincere but unsentimental affection and an urgent desire to capture the fugitive essence of aboriginal existence before—as one of them foretells—"the white man kills us with his white flour."

A Mixed Bag

British Government Since 1918. By Sir Gilbert Campion and others. Allen and Unwin. 232 pages. 16s.

There is an obvious need for a balanced and authoritative survey of recent developments in British public institutions. The Institute of Public Administration enlisted the services of six authors (three university teachers, the deputy chairman of a public corporation, the late Clerk to the House of Commons, and the general secretary of the National Association of Local Government Officers), each of whom is well-equipped to handle some aspect of this important theme. The result is an interesting symposium which, nevertheless, fails to satisfy the readers' expectations.

The book's basic weakness is a lack of balance between the various contributions and a general absence of unity and

perspective. It would have gained from effective editing. Such things as the repetition of Pope's aphorism about government are minor irritants. More serious is the fact that two of the contributors stray into the same field of central-local relations and make opposite assertions about the effect of the Exchequer "block grant" on the independence of local authorities. The lack of proportion is shown in the cursory way that the key themes of Parliament, the Cabinet, and central administration are dealt with: they occupy between them no more than the space which is absorbed by administrative law.

Each contributor has clearly written as the spirit moves him, and the result is that some subjects are given a careful and weighty analysis (notably administrative law by Professor Robson) while the main themes receive no more than a fitful illumination. All the same, even the slighter contributors have something novel and interesting to say. Sir Gilbert Campion, for instance, is able to assert that "the most remarkable change (in Parliament) during the last forty years is the fall in the temperature of the party conflict." He argues, too, that the inter-war years, marked by long spells of coalition government and divided opposition, were an unsatisfactory aberration in the life of Parliament which showed "how intolerant it is of more than two occupants of its procrustean double-bed." The return to an effective two-party system is therefore, in his view, a return to healthy normality.

There is also too much smugness about the conclusions of most of the contributors. Sir Gilbert seems blandly certain that the "Parliamentary spirit" is effective in curbing the selfishness and intolerance of party strife. Dr D. N. Chester ends up with the belief that Mr Attlee has probably struck the "happy mean" in the size and design of his Cabinet—despite its known anomalies and inadequacies. Professor Mackenzie, after trying to bury the ghost of the Haldane Committee, pleads that what Government departments now need is a breathing-space and not talk of reform. The late Sir Arthur Street, though much of what he said is sensible and balanced, wrote like a civil servant who feels bound to justify down to the last detail every public body that has even been enacted. Only Professor Robson, who wishes to rationalise the pattern of administrative law, and Mr Wam, who regrets the loss of powers by local government, strike a dissident note in the eulogistic chorus. The rest seem bent on assuring the world that British institutions have emerged from their crises in better shape than ever.

Sir John Anderson, in an introduction, asserts that "every aspect of the subject has been fully treated, so that no student or general reader need look elsewhere for any information he may require." This is the opposite of the truth—it is indeed expecting too much of any symposium. What is presented here is a mixed bag of interesting jottings and informative minutiae which will be of great help to any author who tackles the constitutional history of this period in all its greatness—and all its difficulty.

Another Economic Anthology

Readings in the Theory of Income Distribution. American Economic Association Series. (Blakiston.) Allen and Unwin. 718 pages. 30s.

This latest volume in the American Economic Association's series of "Readings" aims, like its predecessors, to bring together for the benefit of serious students the most significant contributions to the specialised periodical literature of its subject, together with an exhaustive bibliography for further research. Like its predecessors it maintains an exacting standard. Considered as a self-contained volume, "Readings in the Theory of Income Distribution" suffers, compared with them, from the accident that much of the periodical literature consists of criticism of books (this is particularly true of the "Interest" section, over which the unseen presence of Keynes's "General Theory" looms like a magnetic mountain) and also from an incoherence in modern thought on the subject which the editors, in their preface, note and deplore. It is comparatively rare to find in any section either interlocking and mutually supporting findings by different writers or straightforward controversy in which opposing theories are explicitly confronted. This is not, of course, the editors' fault; but they might with advantage to the reader have emerged a little further from their self-effacement and expanded, with more particular references, the illuminating but too brief introduction in which they survey the field and sum up the nature of controversy.

The book is divided into six sections; the first two are general, dealing respectively with the concept of national income, the methods of statistical calculation and the measurement of distribution between groups and persons, and with the general theme of marginal productivity. (This section includes, among others, Mr E. H. Chamberlin's explosive essay on "Monopolistic Competition and the Productivity Theory of Distribution" and Mr M. Kalecki's paper on the "Distribution of the National Income," lately cited by Mr E. M. D. Little as an outstanding example of the illegitimately emotive use of technical terms.) The remaining four sections deal with the traditional classes of wages, interest, profit and rent, the last-named being, for reasons explained by the editors, considerably thinner than the rest. These traditional divisions fit the substance of their subjects less closely than they used to do; wage theory has become entangled with the theory of production on the one hand and monetary theory on the other, interest and profit concepts blend in the "marginal efficiency of capital," while rent, once firmly associated with land, has become amalgamated with surplus yields in general. Altogether this volume must have presented a difficult problem to the editors. While readers may conceivably find it scrappy, it is hard to imagine the problem better solved between a single pair of covers.

Revolution in Process

Passing of the Mill Village. By Harriet L. Herring. University of North Carolina Press, London: Geoffrey Cumberlege. 137 pages. 24s.

Like share-cropping and racial discrimination, poll taxes and demagogic politicians, hot biscuits and fried chicken, the "mill village" has been accepted in America as one of the peculiar customs of the Southern States. But unlike some Southern customs, the mill village—a community built by a textile manufacturer for the rent-free use of his workers—is slowly disappearing. Beginning in the 1930s, mills began to sell their houses to the tenant-occupants, and by the end of 1948 about 16 per cent of the 800 American mill villages had been signed over to individual owners.

For an institution long damned for its evil ways, the mill village started out with the best of intentions. Nineteenth-century observers of the Southern industrial scene looked on the mill village and found it good: the owner served up a ready-made community, complete with churches and schools; he excluded "undesirables" and forbade saloons; he paid cash wages to a population of marginal farmers. But by the turn of the century, when reformers began to attack the long hours and low pay in the textile mills, they also assailed the mill village. The mill owner kept his worker tightly under thumb: if a worker were fired for union activity, he not only lost his job but he was also automatically expelled

In "The County Books"

LONDON THE CITY

CLAUD GOLDING

This noble memorial to the City's greatness, its love of liberty, magnificence, traditions and benevolence may well be one of the last works on its subject, for the standardizers seek to bring the City low. Mr. Golding, who has explored its every alley and court, and is familiar with its pomp and ceremony, writes superbly. Beautifully illustrated. 15/-

EAST LONDON

ROBERT SINCLAIR

Author of "Metropolitan Man"

"There has never been such a good book about East London... fascinating and exciting... Beg, buy, borrow or, if need be, steal it, but read it!" Ian Mackay (News Chronicle). "Included in the fine County series, it searches out beauty spots and lovely buildings amid the part of the great capital so many Londoners never see. This book certainly has no equal." Joseph Taggart (Star). Beautifully illustrated. 15s.

from the community. And life in the village was a monotonous pattern of look-alike houses filled with people of the same racial stock, working on the same products, subject to the same ups and downs of the same erratic market—"homogeneity run riot."

Against social criticism, the mill owner put up a stout front, but when the Depression transformed many villages from an asset into a nagging overhead cost, the houses began to go up for sale. Miss Herring presents a detailed and often amusing series of case histories on the new problems thus suddenly created: How to get a fair purchase price which a mill hand can afford? What to do about the neighbour's unruly children, formerly curbed by the mill's private police? Taken together, they serve as a composite picture of a social revolution in process, drawn while the facts are still fresh and the eye-witnesses still living.

Belgium's Finances

Histoire des Finances Publiques en Belgique. Tome 1. Recueil Sirey, Paris: Bruylant, Brussels. 663 pages. 750 French francs.

This first volume of a history of public finances in Belgium, which is expected to run to two or three volumes, is due to the collaboration of the best specialists in the field: civil service officials, university lecturers, economists and several former ministers of finance. It is intended to extend from the *ancien régime* to the present day, and to retrace the history of the budget, of public debt, war finance, local finance and the financial history of the national bank, the railways and public services.

This work is especially valuable since the literature on the subject was very scanty. The Belgian public finances raise some problems of special interest, such as the financial influence of railways, which, in Belgium, were built by the state and whose accounts were confused with the state budget till 1921. The book gives a good idea of the development of state intervention in recent decades, even in a free enterprise economy like Belgium. This first volume is mainly historical and technical in so far as it deals with official control of public expenses by the *Cour des Comptes* or changes in rates and fiscal legislation.

Although there is nothing comparable in Belgium to the annual "White Papers on National Income and Expenditure" it is to be hoped that one of the chapters to come will be devoted to a general analysis of the economic significance of changes in fiscal legislation and national accounts from the point of view of social and technical progress, distribution of income, etc. The problems of financing of social security, unemployment, Treasury operations would deserve a special study. In fact it seems that the chapters still to be published will be largely devoted to these more strictly economic problems.

The exposition is satisfactorily critical, even of recent events, although every specialist tends to stick to his own individual, and sometimes debatable, opinion.

Ambitious Sociology

The Foundations of Social Anthropology. By S. F. Nadel. London: Cohen and West, 1951. 426 pages. 25s.

This is a formidable book. The lay reader may well be stunned by its weight of learning and its encyclopædic scope. The professional social scientist, to whom the book appears to be primarily addressed, will be filled with respect for the feat of sustained and exhaustive argument it represents. Though ostensibly concerned with social anthropology it is in fact a critical discussion of the concepts, method and premises of sociology. Criticism is not, however, Professor Nadel's main object. It is used to make openings for expounding his own versions of these concepts and methods and to lead up to what he claims to be a systematic theory of social behaviour. Professor Nadel pays homage and makes frequent reference to Max Weber and Talcott Parsons; and a crude description of the book would be to call it Weber-Parsons rehashed with trimmings, and with the addition of an eclectic psychological theory of motivation. But Professor Nadel also draws inspiration from Dewey, Whitehead, Eddington, Wittgenstein and the leaders of Gestalt psychology for his methodological analysis. The anthropologists chiefly quoted with approval are Radcliffe-Brown and Malinowski. It is interesting that, though he constantly insists on the empirical nature of social study as he conceives it, Professor

Nadel's criticism is directed largely at terminology, and his statement of his own views is highly deductive.

The scientific study of society, in Professor Nadel's view, deals essentially with standardised patterns of behaviour, or action patterns, which fulfil "tasks." Action patterns in series constitute "institutions" which are always normative and purposive, and therefore must be present in the minds of the actors. This issue is fundamental to the author's thesis. Where the actor's purpose appears in behaviour that is empirically sound to the observer we have rational means-to-end connections; and this "explanatory category" is also elaborately considered. This is one "dimension" of society. The other is seen in the "groupings" or social relationships visible in institutionalised activity. But whichever dimension we start from, explanation of social facts in terms of "mechanical-causal requiredness," which is the most significant form of explanation we can seek, is only possible by shifting to a "lower level of analysis" in terms of psychology.

Professor Nadel proceeds boldly to propound a theory of the psychological processes which "explain" social action patterns. His theory, based on Janet and the Gestalt School, is obscure and singularly uninspiring. He postulates the existence of innate "action potentials" of an extremely general kind (for example pleasure-displeasure) which find a way out in congenial cultural expressions—or may be blocked by social repression. The outcome for any society depends on something he calls mental energy levels. But as his exposition develops we learn that the broad result is to produce two types of society, the serene and the excited. This brings Professor Nadel to current views on the concept of function, which he analyses with great penetration, and finally to the American "pattern" theories. He is critically sympathetic to them and concludes with positing cultural "configurations" in which social purposes are integrated in accordance with a terminology which reconciles his psychological theory with the pattern theories.

The chief value of this book is on its critical side. It is also a warning against premature and over-ambitious attempts at systematisation, though the author's intention is to prove the exact opposite.

AMERICAN SURVEY

Labour on Strike

Washington, D.C.

THE present conflict between the leaders of organised labour and the managers of the national defence programme is best understood in terms of a strike, a strike at the very highest level. Collective bargaining has broken down and labour has walked out. As in most strikes, the issues are wages and working conditions—in this case for the nation as a whole. The wage issue concerns an acceptable national policy on wages and economic stabilisation. The question of working conditions involves the participation of the trade unions in the making and administering of wage and manpower policy during the emergency.

The dispute cannot be allowed to end with labour aggrieved, if only because the resulting situation would be politically intolerable for President Truman. Equally important, there is no substitute in a democracy for labour acquiescence in defence policy. The Administration cannot force the unions, against their will, to accept its decisions on manpower allocation, wage stabilisation and the handling of labour disputes. To frustrate them the unions would not even have to adopt a plan of active opposition; a decision merely to give "minimum co-operation" would be enough. And that is the decision they have taken.

Part of the present crisis, which has caused the support and participation of organised labour to be withdrawn from the defence mobilisation programme, has its origins in the stabilisation legislation itself. This was drafted, as if deliberately, to make labour's co-operation inordinately difficult. Most foods, which are the major element in living costs, were exempted from effective price control, while impossible rigidity was commanded for the exercise of wage control.

But even more of the trouble was manufactured gratuitously by Mr Truman's Director of the Office of Defence Mobilisation, Mr Charles E. Wilson. The former president of the General Electric Company, like many a brook-no-interference businessman before him, came to Washington failing to understand that the government is not always best run by methods successful in industry, and that a bulldozer is not the ideal instrument for levelling psychological barriers. When Mr Wilson arrived on the scene the trade union leaders were already unhappy. With one notable exception, a committee on manpower in the Department of Labour, their advisory groups in the defence agencies were mere window-dressing and their representatives in various mobilisation offices were far down in the hierarchy.

In early discussions, Mr Wilson terrified labour officials with intimations of what sounded to them like a compulsory, universal civilian draft, that is, mandatory direction of labour. On the heels of that, he fought for and won the vesting of manpower control in his office, stripping the committee in the Labour Department of an effective voice in policy. Mr Wilson then gave the screw a final turn and rejected, with hostility, labour's plea that the director of his manpower programme be a high union figure. He appointed an estimable gentleman to the job, but one with no labour connections or background.

The climax finally came in the Wage Stabilisation Board. This was a nine-man, tripartite body charged with recommending methods of stabilising wages to the Economic Stabiliser, Mr Eric A. Johnston, who is subordinate to Mr Wilson in ODM. The WSB blew itself to pieces in the process. The crucial problem was to devise a formula to permit those workers who had not received substantial wage increases in the last year or so to bargain for them and thereby catch up with those who had obtained rises before all rates were frozen. Actually, the issues ran far deeper, for in framing the formula the WSB could not escape determining much of the final shape of wage stabilisation.

★

Failure to agree on the percentage by which wages should be allowed to rise above last year's levels was the immediate cause for the break-up of the wage board. The three labour representatives walked out, on instructions from the United Labour Policy Committee, a new organisation reflecting the *de facto* unity of the American Federation of Labour, the Congress of Industrial Organisations, the machinists and the railroad brotherhoods. The union position was that workers should have the right to bargain for wage increases up to 12 per cent above the rates existing just before the Korean war. The public and industry members of the WSB agreed on the figure of 10 per cent above the levels prevailing in January, 1950.

But three other issues were more important:

1. The trade unions argued that if basic wage rates must be frozen during the defence emergency, as large an area as possible must be left open on other issues for future collective bargaining; otherwise the escape valve would be tied down and a catastrophic explosion would be inevitable. They proposed that fairly free bargaining be allowed for "fringe" benefits, including days off, vacations and employer contributions to health, welfare and pension funds. The management members of the WSB, however, also acting on instructions from higher authority, had succeeded in obtaining a rigid formula narrowing the scope of future negotiations on fringe issues; that was their price for having accepted the 10 per cent catch-up allowance for basic wage rates.

2. The majority formula gave what labour considered utterly inadequate promise of future wage adjustments to offset the increases in the cost of living, especially in food, certain to come in the next few months. A further complication arose from the fact that about 1,000,000 workers enjoy contracts providing for automatic wage adjustments to match changes in the cost of living; the WSB majority formula would force the abrogation of most of them by the summer or next autumn.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

3. American industry has taken a strong stand against the creation of government machinery to handle labour disputes, and has apparently convinced Mr Wilson. The arguments are involved, but the heart of the matter is labour's realisation that during the defence emergency public opinion will effectively prohibit the exercise of labour's ultimate bargaining weapon, the strike. The unions feel they must have a substitute in the form of a government disputes tribunal.

Mr Johnston attempted to reach a solution, at least of the wage issue, by simply capitulating to labour. He ordered the 10 per cent catch-up formula put into effect, but at the same time "requested"—in short, instructed—the Wage Stabilisation Board to modify at once other elements in the plan to give the unions what they wanted in the way of an unlimited right to bargain for health, welfare, and pension fund benefits outside the 10 per cent limit. Existing contracts, which already provide for future wage increases to match the cost of living or give labour a share in increased productivity, also would remain in effect.

The union leaders were in no way mollified. One reason for this was that Mr Johnson requested the wage board to reconvene and draft the modifications, whereas the labour leaders had insisted Mr Johnston put them into effect himself. Moreover, on the same day that Mr Johnston acted, labour had been engaged in a roaring row with Mr Wilson. He not only rejected their demands for restoration to the unions of a major role in determining manpower policy, but also refused to give them any assurance that he would not press for legislation authorising compulsory direction of labour. Labour replied to Mr Johnston and Mr Wilson not only by refusing to allow its representatives to return to the wage board, but also by ordering all labour representatives with-

drawn from the advisory and administrative posts they occupied in the mobilisation agencies.

On Wednesday night, hostilities had reached such a pitch that only the White House could end them. Some of the elements of an eventual solution are apparent. Labour must be given a role in manpower decisions which it considers adequate; the President must also provide for the creation of a national labour disputes mechanism. And most important of all, Mr Truman must either secure a change in the attitude of his Director of Defence Mobilisation or find a new one.

Equal Representation

THE Bureau of the Census will take a long time yet to sort out the harvest of facts which it gathered from the American people last April. However, the President was given the first fruits in time for him to report to Congress in January, as he was obliged by law to do, on the number of members of the House of Representatives to which each state is now entitled on the basis of its latest population figures. The Constitution provides for a decennial census in order to ensure that every citizen is equally represented at Washington. It is the duty of Congress to see that the necessary reapportionment of seats takes place after each census, but the actual redrawing of district boundaries is left to state legislatures.

Until 1910 Congress did its job the easy way and simply increased the number of seats. But when the total reached 435, Congress decided that that was as large as a democratic legislative assembly ought to be. A halt was therefore called,

although if new states, such as Alaska and Hawaii, are added to the Union, additional Representatives will probably be allowed for them. In 1910 each member of the House represented 210,000 persons, compared with 33,000 in 1790. On the basis of the latest census, which found 150,697,361 people in the continental United States, each of the 435 Representatives should have about 346,500 constituents. The increase of 19 million in the population during the last decade was by far the greatest in the country's history, and this is being used in Congress as an argument for loosening the self-imposed bounds of 1910 and adding to the membership. But this argument appeals only to the nine states which will

California, with the largest increase—53 per cent and over 3,000,000 people—of any state, maintains its record for breaking records by getting seven new Congressmen. Three of them are at the expense of Pennsylvania, which must also now share its proud position of having the second largest Congressional delegation with California, which has come up from fifth place.

The point is of great importance in Presidential elections, for the number of votes each state has in the electoral college depends upon the size of its Congressional delegation. New York still has the largest, even though it loses two Congressmen. So do Missouri and Oklahoma, while Florida gains two. The other changes, whether losses or gains, involve only one seat in each case. Virginia and Maryland have the unrepresented District of Columbia to thank for their new seats, for their growth is largely the result of being the dormitory areas of the expanding capital. On balance the conservative south loses seats by the reapportionment. Its general effect, like the movements of population shown by the census, is to give the west a louder voice in national affairs. It is a progressive voice, whether it speaks with a Republican or a Democratic accent.

Since the Reapportionment Acts of 1929 and 1941, the redistribution of seats amongst the states is automatic and there is therefore now no need for the bitter struggles of the past, such as the prolonged deadlock after the 1920 census which prevented reapportionment taking effect at all. But the President threw a new apple of discord into the lap of Congress by proposing that it should do as it always did until 1911, and set up standards for the states to follow in redrawing their district boundaries. Furthermore, Mr Truman thinks that Congress should see that such standards are actually complied with, as it has power to do under the Constitution.

Certainly many existing boundaries are out of date and fail to provide for equal representation. The classic case is in Ohio, where there is one rural district with less than 175,000 residents and another, which contains the city of Cleveland, with over 900,000. Mr Truman recognises that exact equality is not feasible but considers that it should be possible to arrange for all districts to have between 300,000 and 400,000 inhabitants. Such a drastic redistribution would upset the political equilibrium of at least one hundred Congressmen, and probably many more; few, if any, of them would deny that it is

desirable in theory, but in practice most of them are quite ready to let sleeping districts lie.

The House Judiciary Committee is about to hold hearings on a Bill, introduced by Mr Celler, which would do what the President wants. But even if Congress can bring itself to take the plunge, there is no guarantee that the state legislatures will follow its lead, or that any satisfactory method of pushing them can be devised. Those that are required to

lose Representatives, so it is not expected that such a change will be made.

Each state must have at least one Representative (in addition, of course, to its two Senators), but after that the size of its Congressional delegation depends upon its share of the total population. Reapportionment does not therefore necessarily mean that the states which have gained or lost the most inhabitants will gain or lose seats in Congress. But

make a change in their State's total representation at Washington will presumably do so, although even this is a controversial matter. In New York State, for example, the Republicans, who have a majority in the State Senate but not in the Assembly, would certainly like to take the seats the State must lose away from Democratic New York City; and in Michigan the Republican legislature will not want to give the State's new seat to growing but Democratic Detroit. If a State losing seats fails to redistrict itself before the next election, in 1952, all its Representatives must by law be elected "at large," that is, like Senators, by all the voters in the State voting in one constituency—and the whole delegation therefore following the majority, however small. If this were to be done in a populous and closely divided State like New York, it could mean a swing in Congress that bore no relation to the real opinions of the country's voters.

This is not likely to happen but, when it is a question of adding a Representative, legislatures have often been tempted to have the extra seat or seats filled by elections at large, instead of going to the trouble of carving out a new district. New Mexico and North Dakota both elect their two Representatives at large, and Ohio and Connecticut each choose one in this way at present. It is a practice to which Mr Truman especially objects; it certainly does not provide for equal representation, since the Congressman-at-large may have to speak for several million voters, and his election may give an unfair advantage to a party which has only a small majority in his State.

Political considerations would come even more to the centre of the picture if it were a case of remapping district boundaries. This inevitably offers opportunities for more of the "gerrymandering" which is responsible for the unsatisfactory shape and size of certain existing constituencies. The word commemorates Governor Gerry of Massachusetts and the notorious district, resembling a salamander, which he fabricated to suit his own convenience in the early nineteenth century. Instead of being composed of "contiguous and compact territory," which is Mr Truman's ideal, such constituencies stretch out tentacles to draw in areas supporting one party, and to isolate enclaves of voters of another. There are other similar but less obvious ways of making political hay out of a redistricting operation.

There are two more general considerations which complicate the redistribution of seats by existing State legislatures. Many of them are dominated by rural interests to a degree out of all proportion to the comparative numbers of town and country dwellers in the State. In 1900 65 per cent of the American people lived on farms; now fewer than 40 per cent do; yet even today only 25 per cent of the members of State legislatures are elected by urban voters. But the great increases in population have been in the cities, and these are where most of the new Congressional districts ought to be made. Furthermore, it is in the cities that most of the supporters of Mr Truman's Fair Deal are to be found; but State legislatures have, in the main, either Republican or conservative Democratic majorities. Any rearrangement of districts on the lines the President has recommended would almost certainly be to his political advantage and against that of the interests which rule in the State legislatures. It would be surprising if many of them preferred the idealistic shadow of equal representation to the practical substance which concerns them so immediately.

FACTS, FIGURES, AND OPINIONS

American Notes

Two-Term Limit

When Nevada ratified the Twenty-second Amendment this week, the 36th State to do so, a tradition almost as old as the Republic became part of the Constitution. All future Presidents will be limited by law to two elective terms of office. The Republicans introduced the amendment in 1947, the very day that they assumed control of Congress. It was then a trial of strength between those who revered and those who detested the memory of Mr Roosevelt, the only man who had ever succeeded in defying the two-term tradition launched by George Washington in 1796.

If a man has become President through the death of his predecessor (a not unusual occurrence in this man-killing job), but has not occupied the White House for more than two years, he may still seek two further terms on his own account. Such a provision would not permit Mr Truman to run again in 1952, for he was President for most of Mr Roosevelt's fourth term. But in 1947 it was not imagined that Mr Truman could win one, let alone two elections, and the then occupant of the White House was courteously exempted from the application of the amendment. It was thought desirable to dissociate any living person from the debate; not to do so might have rallied Democratic opposition.

Instead, as the roll-call of ratifying States shows, the general ebb in Mr Truman's popularity, even among Democrats, and the cordial dislike his policy of racial equality has inspired in the South have played a substantial part in securing favourable votes. The amendment, the first to be adopted since Prohibition was repealed, has taken longer to ratify than any other, longer even than that authorising the income tax, though the period allowed for ratification would not have run out until 1954. But this winter, it being an odd year, most of the State legislatures are in session; ten of them have ratified in the past month. In many of these States Democrats control one or both houses; in Nevada they are a majority in the lower house, in New Mexico they have large majorities in both. Among the southern States approving are Missouri, Virginia, Arkansas, Louisiana, Georgia and Mississippi. This is a public opinion poll which has no legal standing, but it is a broad hint to Mr Truman. It would be a powerful weapon in Republican hands should he decide to run again.

The fear upon which the Republicans and Southern Democrats have played is the old one that a President becomes so entrenched in three terms as to constitute a danger to American liberties. In 1940 the Republicans freely prophesied that if Mr Roosevelt won a third term, Americans would never go to the polls again. Such fears may not be wholly imaginary, but it seems a pity that they should be allowed to introduce a new element of rigidity into an already rigid Constitution. To outside observers, Mr Roosevelt's third term, so far from illustrating the dangers of flouting tradition, proves the value of being able to overrule it in an emergency.

Taxes Postponed

There is now little doubt that this year Congress will run true to form on tax increases, and the Budget for 1951-1952 will not be balanced. The Ways and Means Committee of the House of Representatives decided in the middle of February that it would examine all possible ways of raising additional revenue, rather than confine its hearings to the Administration's proposals; in other words, it rejected President Truman's request for a quick first instalment of \$10 billion in new taxes. It now appears that the examination of tax proposals will be thorough and leisurely; there will be no first and second instalments; and no tax legislation at all is likely to emerge from Congress before the middle of

THE  TIMES

Review of the BRITISH COLONIES

Few of us need to be convinced to-day of the importance of the British colonial territories, or of the bearing of questions of colonial development and administration upon current world problems.

THE TIMES published last year three special Surveys of the British Colonies, each of which reached a large public both at home and abroad. It has now been decided to establish THE TIMES REVIEW OF THE BRITISH COLONIES as a regular quarterly publication, which will appear on the first Tuesday in March, June, September and December.

Each issue of THE TIMES REVIEW OF THE BRITISH COLONIES will survey the progress of events during the previous quarterly period in all parts of the colonial empire and will discuss a wide range of colonial subjects — political, social, financial, economic, administrative, cultural.

The first issue in March will contain articles on West African railways; the position in Hongkong; British West Indies housing; pest control in colonial agriculture; plantation conditions in Malaya; development in western Uganda; secondary industries in Southern Rhodesia; African technical education; and big game.

Speck in the ocean...

Though a mere speck in mid-Pacific, Fanning Island has a place of importance in the affairs of the world. For it is here that the trans-ocean telegraph cable of Cable & Wireless Ltd. makes a brief appearance on land before continuing its journey along the sea bed. Day and night a small staff vigilantly watch the instruments as the messages pour through — messages of state, messages of commerce and simple messages of love and friendship to the ordinary people of many nations.

The Cable and Wireless Company owns and operates 155,000 miles of submarine cable supplemented by an efficient network of wireless channels. Theirs is the world's biggest communication system, with stations in seventy-five countries, providing an instant, secure and highly efficient medium for the passage of Government, Press and social messages.

CABLE AND WIRELESS LIMITED

the year—and probably later. This postponement is bound radically to affect the nature of the new taxes. Increases in personal income tax not passed until July can hardly be made retrospective to January 1st, as the President asked. And Congress will be very reluctant to treat corporations differently. This means, because corporation taxes are paid the year after the income is earned, that additional taxes will gather in 1951-52 appreciably less than their full yield in a normal year. Even if Congress raised tax rates as steeply as is implied in the President's request for a total of \$16.5 billion (in two instalments), it probably would not secure the revenue quickly enough to balance the budget for 1951-52. In fact this summer's tax Bill is unlikely to aim at raising so much even in the following year when its new rates are fully effective.

Congress can plead some good reasons for the refusal to rush through another "quickie" tax Bill. Its predecessor met the Administration's demands by imposing two sets of tax increases last year, and the instalment process has disadvantages. The American tax system has certainly developed its share of anomalies and weaknesses; in theory, at any rate, a pause to review the fiscal problem as a whole should make possible a rational choice of the taxes economically least damaging (and, it will be hoped, politically less unpopular).

The main hope of Congressmen, however, is the belief that Federal expenditure can be cut, so that they will never have to devise all the tax increases now threatening them. Some "Fair Deal" Democrats embrace this faith almost as heartily as conservatives, though it was the Republican Senator Bridges who declared the President's budget to be "as full of water as a field of melting snow." Figures of \$6 billion and more are still being suggested as possible economies, but there has been a significant shift of emphasis: it has been realised that non-defence expenditure totalling \$20 billion can hardly be slashed so severely as that, and Senators and Representatives are now casting their eyes towards "waste" in the defence programme. No doubt it is usual for such waste to exist—and just as usual for democratic assemblies to fail to find it among the complications and secrecy of military budgeting.

Congress, perhaps, has a better reason for going slow on taxes in the fact that the current year's defence expenditure seems to be running well below the estimates. It by no means follows, however, that this lag will continue when military production has got under way. The signs are that no really large cuts in next year's proposed expenditure will be found; but the admission of this will be put off long enough to make even a more stringent tax Bill than anything now contemplated by Congress inadequate to prevent a budget deficit in 1951-52.

* * *

Winding Up the Debate

The Senate Foreign Relations and Armed Services Committees have concluded hearings this week on the question of Congressional control of the American contribution to the "Eisenhower Army," and will take a vote next week. Mr Hoover has once more had his chance to warn Congress against "hopeless land war" in Europe and to urge it to pin its faith in the Navy and Air Force. Senator Taft has voiced his suspicions that the contribution of six divisions now proposed is only the thin end of the wedge and that the Administration secretly plans to send three times as many, thus requiring an intolerable increase in the size of the Army and a vast increase in taxes. Senator Wherry has done his best to resuscitate the Air Force's claim, now decently buried, that an overwhelming strategic bombing force was all that was necessary for American security. But the Chiefs of Staff, and most of the military witnesses, despite the temptation, were encouragingly unanimous in their belief that air power alone could not save

Europe from invasion and that Europe could and must be defended. The final obsequies over the Wherry Resolution, which would forbid the dispatch of any troops without Congressional assent, were delivered by two star performers of the Republican internationalist team, Mr Stassen and Governor Dewey. The Democratic role was hardly more than that of spectators of a Republican dispute.

The real question before the committees is whether they will recommend the Lodge or the Connally-Russell formula for associating Congress with the defence of Europe. One thing the debate has clearly shown is that any attempt to lead the Republican party back into isolation could succeed only at the cost of a disastrous split. The part Senator Taft has played guarantees that his path to the Presidential nomination in 1952 will be fought by half a dozen of the most influential leaders of his party.

Cuts for Cars

The automobile industry and other makers of durable consumers' goods, which together use about a quarter of the nation's steel, will have to curb their appetites after April 1st. The aim is to free about a million tons of steel a quarter for the defence programme and for small firms which have been left behind in the race for supplies. But Detroit is relieved that the National Production Authority, with one eye on trade union fears of unemployment, is wielding its shears with moderation. This first order restricting the use of steel, last of the major metals to be controlled, requires that consumption by each firm in the second quarter be held 20 per cent below the quarterly rate used in the first half of 1950. In the third quarter the cut will be 30 per cent; later, when the rise in defence needs and employment is sharper, it may reach 40 per cent.

The automobile producers were prepared for worse news. Priority demands for steel are so great that the amount which mills must reserve to satisfy them has been increased twice in two months. By the second quarter defence needs will be taking nearly half the supply in certain categories, such as steel plates; the supply can only be increased by reducing steel sheets, which are used in such quantities in cars. Even a 20 per cent cut in passenger car production from the first half of 1950 would allow a yearly production rate of nearly 5,000,000; a 30 per cent reduction, 4,300,000—more than in all but three previous years, 1929, 1949 (5,100,000) and 1950 (6,600,000). But ingenuity may devise ways of stretching the steel that is available. Detroit has already displayed a rather dismaying ingenuity in avoiding the cuts which the planners thought were inevitable when supplies of aluminium and copper were reduced. Indeed, in the months to come, supplies of copper, rather than steel, may be the limiting factor.

All that glitters is not chromium, but the new cars still shine, and so far this year they have been rolling off the assembly line almost as fast as they did last year. With shortages and heavier purchase taxes in the offing, they have been snatched up by eager buyers. Until the government stepped in last week, dealers have had no difficulty in disposing of new cars at hundreds of dollars above the controlled list prices, through the time-honoured device of running them a few miles and then offering them as "used."

If the automobile industry feels ill done by, some other observers criticise the cuts as too late and too little. They point not only to the flood of cars, but to the rise in the production index to a new peak in January (for which civilian goods must have been chiefly responsible) as evidence of a scandalous addiction to both guns and butter. But until the munitions factories are ready to go—and in Detroit most of the \$3.5 billion plans are still on paper—no purpose would be served and much harm might be done by creating premature pools of idle workers.

THE WORLD OVERSEAS

Bases and Treaties in the Middle East

(By a Correspondent)

THE Middle East was largely a British sphere of influence until the Americans entered the Second World War. Since then American interest has increased at a surprising pace so that, in less than a decade, thoughtful American politicians have grown to consider this "Bridge of Asia" as important to the United States as Disraeli thought it vital to Britain. The speed with which American policy developed was not only too fast for the understanding of the forty million odd Moslem inhabitants, but too revolutionary for the thousands of European officials, business men, and petroleum workers who reside in the area.

It is unfortunate that there has been little time to iron out the difficulties and misunderstandings that have arisen between Britons and Americans on the spot and the Arab Governments have enjoyed themselves in their attempts to play off one power against another. American political interest grew in direct ratio to the discovery and the acquisition by American companies of the rich oil deposits in the Persian Gulf. Its object now is to defend these valuable possessions and ensure that the maximum amount of petroleum from this corner of south-western Asia will be available to Atlantic Pact powers in case of hostilities.

During a recent meeting at Istanbul of American diplomats in the Middle East under the chairmanship of Mr George McGhee (US Assistant Secretary of State in charge of Middle East affairs) America's position in the area was reviewed. There is reason for concern. Of the three countries—Greece, Turkey and Persia—whose defence and administration have painstakingly been built up to form a protective roof over the region, Turkey only is likely to stand firm in an emergency. The fighting qualities of the Turkish soldier are well known. The difficulties here are that Turkey has until recently not wished to risk provoking Russia by allowing Britain or America facilities at air or naval bases on its territory. There have, in addition, been misunderstandings on the spot between the Americans, who have been training Turkish officers to use American equipment since 1947, and the officers of the British Military Mission who have been assisting the Turks to build strategic roads, bridges and landing grounds since 1942. These troubles have now been largely overcome.

After the meeting of American diplomats from Middle Eastern countries in Istanbul presided over by Mr McGhee, the Turkish Foreign Minister, Mr Fouad Koprulu, issued an official statement saying that his country would "co-operate in the common and collective system of defence of the Eastern Mediterranean." It is now thought that Turkey will allow the Americans to equip and man an air base in Anatolia, grant facilities for British and American naval vessels in Turkish harbours, and, most important of all, dovetail the strategy of the Turkish forces with that of the Middle East Command. The full details and implications have been explained to the Turkish High Command by General Sir Brian Robertson, who concluded a tour of his command in Istanbul and Ankara this week.

Fortunately for Anglo-American plans Turkey is not hampered in its defence arrangements either by membership of the Arab League or by having recently been at war with Israel; in fact, although a Moslem state, Turkey has established relations with Israel which approach cordiality. Unhappily the aftermath of the Palestine war still troubles Anglo-American action in many parts of the region. Egypt's land communications are broken with the other countries of the Arab Middle East. Jordan's sea communications with the Mediterranean are cut and there is no intercourse of any kind between Israel and its

neighbours. Foreign governments find it difficult to be on terms of cordiality with both Israel and the Arab states. The Israeli Government might be willing to consider entering into a system for the collective defence of the area and granting American and British forces naval and air bases. But the project is unpopular with the Israeli army and, if put into effect, would certainly make future treaty negotiations with Egypt and Iraq more difficult if not quite impossible for Britain.

Attitude of Arabs

Member states of the Arab League led by Egypt, whilst having every reason to fear Soviet propaganda or Soviet imperialism, adopt a strangely neutral position, which has been well described as "haggling with the bazaar on fire." They claim that the League's own collective security pact is

all that is necessary for the defence of the region at the moment. This pact, which owes its existence solely to fear of Israeli expansionism, is of little military value, and Jordan, whose army, the Arab Legion, is quite the best in the Middle East, is not a participant.

The Americans could without doubt obtain concessions in Jordan to build or merely add modern installations to air bases, already established there by the RAF. But would giant air bases be of value in this land-locked country? All projects at the moment wait on new treaties with Egypt and Iraq. Thus the immediate plans are to establish bases or modernise those already built in a semi-circle outside Israel and the Arab states. Their main object will be to protect petroleum fields, pipe lines, refineries and docks. The American and Anglo-American bases will also be within easy bombing range of one of the Soviet's most vulnerable areas—the Caucasian underbelly—and they will be supported by the RAF in Iraq and the Canal Zone of Egypt.

Aftermath of Palestine War

To the north-west of the petroleum area the United States Army Air Corps has since 1946 operated an efficient air base near Athens. It has naval facilities accorded to it by the Greek Government in the harbour of Piræus and use of the port and landing ground at Salonika. In the central Mediterranean at Malta the Americans are soon expected to join the RAF, and on the North African coast the American air corps has for several years operated a large air base near Tripoli whilst the RAF has smaller bases at Castel Benito (near Tripoli), Benghazi and El Adem (near Tobruk). The British Navy has full facilities in such harbours as still exist along the North African coast and there is every reason to hope these facilities will be continued by agreement with the independent Libyan Government when it is formed in 1952.

It is most unfortunate that no new treaty has yet been concluded with the Egyptian and Iraqi Governments and the failure of British diplomacy is due in no small measure to bitter feelings resulting from the Palestine war and the recognition of Israel. All efforts even to establish a joint command with the Egyptians for the invaluable air, sea and land bases in the Suez Canal Zone have so far failed and it would not now be politic for a third power—the United States—to join these discussions. It is, however, hoped that joint Anglo-American-Egyptian bases may ultimately be organised in the Canal Zone and Anglo-American-Iraqi bases in Iraq.

Unstable Internal Conditions

Of all the member states of the Arab League, Saudi Arabia is the only one which contains a large and important American air base within a few miles of the petroleum fields. This is at Dharhan on the Persian Gulf. It is superbly equipped for bomber and fighter units. The area immediately to the south of the Turkish bastion, through which the pipe lines run in their course from Iraq and Saudi Arabia to the Mediterranean, will be covered by an air base in Cyprus which it is believed will shortly be modernised and perhaps shared by the Americans. But unstable internal conditions in these countries have been the cause of serious alarms. There have been more hopeful reports recently and the Americans are proposing to make considerable dollar grants to Syria for irrigation and settlement projects which will have a stabilising effect if the Prime Minister, Nazim Kudsî, can retain his ascendancy over the army.

If the Kashmir dispute is settled there is little doubt that Pakistan will co-operate in the defence of the Persian Gulf area, and the collective defence plans will then be spread more evenly over the region and not remain concentrated in the western sector.

Progress of the Schuman Plan

[FROM OUR PARIS CORRESPONDENT]

M. MONNET's office is still confident that the German Federal Government will sign the treaty establishing the coal-steel pool. During the last days Dr Adenauer, who is more firmly than ever behind the Schuman Plan, has spoken with leading Ruhr managers about the contentious dissolution of the coal selling agency (DKV) and the determination of the amount of coal which steel works may own. In the last weeks the debate has switched somewhat from the theoretical maximum percentage concentration on coal and steel to the remoter question: what coal will be available to other regions of the Schuman community when the Ruhr has had its fill? French officials and "integrationist" American enthusiasts have become increasingly aware that even if the DKV is abolished and decartelisation imposed the deconcentration proposed by the High Commission will still leave Ruhr steel works with a good deal too much private coke. For if, as the Ruhr intends, each steel works, albeit decartelised, maintains for itself enough coal to produce steel to meet the higher demand, the hungry brethren west of the Rhine will surely go without. Under this dispensation, indeed, German steel production—with all occupation ceilings and the Ruhr authority removed—could soar to the 18 million tons of 1938 while French production might sink miserably to 6 or 8,000,000 tons. For France depends on the availability of German metallurgical coke, without which no French steel master can begin to think of building up capacity. Should the Ruhr, therefore, once be allowed to enter the Schuman single market with an economically detachable nest-egg of coke, M. Monnet's high authority would subsequently have no power at all to allocate it to other needy areas. This awareness has prompted further examination of German production assistance.

The Place of the Ruhr

Thus, after a very slow start, French, Belgian, Luxembourg steel masters, many of whom, as their recent memorandum has shown, dislike the Schuman Plan a good deal more than their Ruhr colleagues, are coming to see that if there must be a Schuman Plan instead of their own bureaucratic cartels it had better be a genuine one. For if the Ruhr is to gain relief from occupation restrictions and free access to the markets of Western Europe and its overseas dependencies (its pre-Korean objective) without sacrificing the monopolistic parts of *Verbundwirtschaft* (its post-Korean objective) it will be a very poor look-out for producers outside Germany. The French delegation, however, has no intention of signing any variant of the Schuman Plan whereby resources needed by all the participating nations remain—through price discrimination—the private raw materials of one of them. They do not admit the German contention that their control of iron ore resources places them in the same position as the Germans with their coke.

Apart from Dr Adenauer the German front against the Plan as it now stands seems firmer than ever. The Coal Control Board has again affirmed that the selling agency is absolutely essential for efficient marketing inside Germany, and has again been supported by the leader of the miners' trade union. Dr Schumacher has also reiterated the Socialists' opposition to the Plan if it involves changes which would harm the Ruhr and cause further unemployment. Finally, a new spanner has been thrown into the works by Mr Patterson, the former US Secretary for War. As a lawyer, Mr Patterson has been briefed by an association of German shareholders to oppose the deconcentration and decartelisation of the Ruhr and the IG Farben complex, and has appeared on the scene to plead

his clients' case with Mr McCloy. The extreme nature of the proposed anti-cartel measures which have been drawn up by American lawyers in the High Commission go beyond anything the Germans can be expected to accept. It remains to be seen whether Dr Adenauer's keen sense of the political importance of the Schuman Plan will overcome all the handicaps in its path.

Soviet Economic Progress—II

Capital versus Consumer Goods

[BY A CORRESPONDENT]

THE Soviet Government had promised an abundance of consumer goods for 1950. Yet from the figures now published on the Fourth Plan it is quite clear that during the last five years priority was once again given to capital goods; while from statements now made, it may be gathered that this emphasis on producer goods is to be continued in the years to come. Soviet citizens are still made to save for future benefits. The increase in the capacity of the industrial plants and the mechanisation of agriculture are still considered as more important objectives than the immediate satisfaction of the consumers' wants, and are granted first call on the existing resources. Soviet planners would certainly adhere to a slogan: "Machine tools, tractors and lorries before clothing."

This contrast may be partly seen in the following tables showing the growth over the last five years of the engineering and chemical industries on one side and the consumer goods industries on the other.

GROWTH OF SOVIET PRODUCTION, 1946-1950

	Index Numbers 1945=100					Planned (in '000s) for 1950
	1946	1947	1948	1949	1950	
Engineering & Chemicals						
Tractors	172	359	732	1,135	1,396	112

Retail sales	130	152	200	240	312	

*Production of Ministry of Machine Tools only.

For consumer goods, with the exception of sugar, 1950 indices range between 200 and 350. The real difference is probably even greater than it appears. Generally the high indices for 1950 are to be explained by the very low level of the base year (1945), when the switchover from war to peace had only begun and war damages were scarcely repaired. This, of course, applies also to engineering—e.g., the fourteenfold rise in the output of tractors can only be understood with this reservation in mind. But it is even truer for consumer goods. In wartime heavy industry is always more fully exploited. By 1945 the drop in the output of consumer goods was certainly much greater than for capital goods. For both producer and consumer goods Russian statistics are not lavish with absolute figures and the few data supplied are often contradictory. Soviet sources lead one to believe that for most branches the targets have not only been fulfilled but exceeded. Since the claims of

overfulfilment, however, are usually couched in ambiguous terms it is safer, in most cases, to assume that targets have simply been reached.

Among producer goods greatest stress is laid on machine tools. Outwardly the threefold rise in production since 1945 is small compared with other engineering indices. But the production of machine tools was very high even during the war. The Soviet press always emphasises any topic connected with these basic instruments of industrial development and it seems that it is in this sphere that greatest efforts are made "to reach and exceed America." In 1950 probably more than 74,000 tools were produced and, partly thanks to the lend-lease supplies, the Soviet Union may well have now 1,300,000 machine tools. This was the target set for 1950 by Mr Voznesensky, who claimed that with this number the USSR will have as many machine tools as American industry had in 1943. Of course, there may be very great variations in the size and the complexity of the tools. Still, in this sphere great progress has certainly been made.

Great efforts have also been made to build up the production of lorries. The Russians have drawn their conclusions from the bitter lesson of the war, when even in the army the shortage of lorries was painfully felt. Then the 400,000 lorries sent to Russia under the lend-lease agreement were invaluable. Now this year's output alone has probably exceeded that number. This is a good example of the advance made. Since 1945 output has risen more than fourfold. Since 1940 five new plants have been built, in Dnepropetrovsk, Minsk, Novosibirsk, Ulianovsk and Kutais. During the last Five-Year Plan diesel lorries have been produced for the first time in the USSR, as part of the general fuel-saving campaign.

The tractor industry was another branch treated with special care, but in spite of that, production here seems to have lagged behind the targets. True these are not clear, since it is not always known whether the figure is translated into units of 15, 30 or other horse power. The target for 1950 was 112,000 units of unspecified power. At the same time it was planned to supply 720,000 tractors, translated into 15-hp units, during the five years of the plan. It is this latter figure which was not reached, as will be seen in the following table of tractor supply:

SOVIET TRACTOR PRODUCTION
('000 of 15-H.P. Units)

1945	1946	1947	1948	1949	1950
13.2	22.5	47.5	56.8	150	184

The number supplied over the five years of the plan was thus only slightly more than 500,000 15-hp units. This figure, though inferior to the planned target, is very high and nearly equals the total Soviet tractor park of 1940. The figure is even more impressive, since demand for tractors should be falling with the progressive introduction of larger collective farms.

Achievements in consumer goods are certainly not so spectacular. In fact, the targets for cotton and woollen fabrics set for 1950 were actually lower than the end-targets set (though not fulfilled) for all previous Five-Year Plans. The discrepancy between the promises of great abundance and the relatively low targets, particularly for textiles, may have been partly made up by imports. Considerable imports from the west are obviously ruled out. But immediately after the war it became clear that the Soviet authorities were going to rely in their computations on the output of the light industries of east European countries. Commercial treaties to that effect were signed. For instance, according to the agreement with Poland, Lodz, the Polish textile centre, was to receive raw cotton from Russia and send cotton fabrics in return. Part of the raw cotton was to be left behind as payment for the manufacture. The size of the

Coventry Climax fork-lift trucks put production up!

This is a machine for cutting non-productive time. It carries, lifts, stacks and loads almost any material up to 6,000 lbs. at a time — swiftly, deftly, economically. Think of your present costs in moving and storing; the cost of handling and trundling by old-fashioned methods; and you will see how, with this machine, these non-productive costs may be cut and your output increased — forthwith.

COVENTRY CLIMAX fork lift trucks

imports of consumers' goods from the countries within the Soviet orbit is not known, but foreign observers in Moscow say that the Muscovite is now incomparably better clothed and shod. This is largely to the credit of the Czech shoe factories and the East German (Saxon), Polish and Czech textile mills.

According to the plan, Russian factories should now be producing annually more than one pair of shoes and somewhat less than three pairs of socks or stockings per inhabitant. This is very little by western standards. In Russia, on the other hand, where many peasants had only recently put on their first pair of shoes and where there is a large Asiatic population, this is quite an achievement. The share of sugar per person—over 2 lb. per month—would be quite considerable even by non-Russian standards. Another striking figure is that for soap. The average Russian should now be getting roughly 11.5 ounces of soap per month, i.e., not very much less than the recent British ration. Even if this figure has not been reached, but only approached, it certainly means a very notable rise in the level of Russian hygiene.

Generally speaking, Russia is certainly not yet a land of plenty and even the western standards are quite distant, whatever propagandists may say. On the other hand, over the five years of the Plan, and probably with the help of countries within the Soviet orbit, the supply of consumers' goods has been increased and the Russian consumer must have felt a real improvement after the very low postwar level.

(To be concluded)

Bonn's "Optical" Economics

A PICTURE of deplorable confusion has been presented by the Federal German Government and its economic experts in face of the latest crisis in the country's balance of payments. Though the *Bank Deutscher Laender* had pointed out three months ago that March would see a worse crisis than last autumn, nothing effective seems to have been done to forestall it. When the stark facts of imminent bankruptcy in the European Payments Union were publicly revealed a few days ago, the Government hastily announced that, with few exceptions, imports under liberalised trade lists would be suspended "for a few days" while the position was examined, but that existing commitments under treaties would be honoured. After the few days had passed, it declared that all imports from the countries in the European Payments Union would be suspended, whether they fell under current treaties or not. At the same time, the assurance was repeated that liberalised trade would not be abandoned, and that salvation would be sought in increased exports.

Similar confusion exists over the measures which have been announced to reform the Government's economic policy. The *Bank Deutscher Laender* broke up its meeting last week without having come to any conclusion about raising the discount rate again. The proposals put forward by the so-called *Niederbreisach* circle of economic advisers seem all to have been made last autumn. On Tuesday the Government announced that it was proposing to follow policies to please everybody; liberalisation together with the fostering of agricultural production at home, "no austerity" together with a cut in imports, no inflation together with higher rents for prewar dwellings, higher food prices as subsidies are gradually removed, and higher wages to meet the added cost. It might be asked, what happened to the recommendations which the OEEC made to Bonn at the time of the first balance of payments crisis last autumn?

The answers to these questions go to the root of some of the besetting troubles of postwar German life. One may begin with the faith in so-called "optical," or *optisch-*

politische, measures and declarations. Under the Nazi regime, Prussian integrity largely gave way to the Byzantine system of favourism, corruption and decrees designed to create illusions. This system has been continued as a means of dealing with the Occupation authorities as well as with the nervous German public. It has, in particular, been adopted to assure the Americans that the Bonn Government is prepared to impose controls, raise taxes, abolish subsidies and cut consumption in order that rearmament orders shall not result in inflation and the waste of American funds; and at the same time to prevent panic spending and a relapse into black market practices at home. To understand the Bonn Government's dilemma in face of the new world economic situation created by Korea, it must be borne in mind that the German public associates rationing with the disastrous hidden inflation that prevailed before the currency reform of June, 1948. Dr Erhard's policy of unrestricted trade at home and abroad has been abused by a people always inclined to exaggerations; but it was the best under the circumstances, and his effort to maintain an optical illusion that it still exists can be condoned.

Selfishness and Corruption

The second explanation of the present situation is to be found in the fact that official orders are almost always frustrated in the first instance by the individualistic *Land* Governments and thereafter by citizens who practise evasions varying from downright corruption to legal "wangles." The authority of Bonn and the central Bank—two bodies which are sometimes in opposition—is not fully accepted by the public. For this situation, the Allies are partly to blame; but the Government itself does little to assert its authority and is content to hide behind the screen offered by the High Commission. It is symptomatic of the situation that no German official body ever seems to prosecute a citizen for tax evasion. The regulation imposed last September to squeeze out the mushroom growth of importers was consistently evaded.

Draft bills tend to be long in emerging from the conferences of the coalition cabinet and to spend still longer in committee. The Finance Minister certainly proposed tax reforms last year, but nothing has yet come of them. The Chancellor is not convinced that it is necessary to curtail consumption in order to balance Germany's payments; the Minister of Finance is not convinced that he cannot raise a State loan carrying interest at only 5 per cent and opposes the men in the central Bank who wish to take drastic measures to restrict credit. Nevertheless, all are agreed on the need to prevent inflation by one means or another; and it is wrong to assume that the measures announced on Tuesday—if they are carried out—will inevitably prove inflationary. But the probability that Bonn will take really effective measures to meet its latest crisis seems still to be remote.

Uno Looks at Latin America

AMONG the most illuminating sections of the United Nations "World Economic Report" are those dealing with the so-called under-developed areas. The Report was specifically prepared for the current meeting of the Economic and Social Council at Santiago, Chile, where the topic of under-developed countries is expected to play an important part in the discussions. Very appropriately, the authors have chosen to give an especially full account of the economic position in Latin America—one of the most typical of these problem regions.

In general the nations of Latin America conform very closely to a familiar and disturbing pattern; the majority are producers and exporters of agricultural and mineral products and are often dependent for their prosperity on one product alone. For this reason their economies are painfully sensitive

both to harvest yields and to fluctuations in demand from the industrialised countries in Europe as well as North America. Therefore most of these nations are trying desperately to move in the direction of more balanced economies, a process that involves heavy programmes of investment.

During the period under review—1948 to 1950—Latin America ran practically the whole gamut of experiences which have become the normal lot of the under-developed countries. Throughout 1948 most of them continued to export on a large scale and to use the proceeds plus their war-accumulated balances to maintain a high level of imports. Then in the first half of 1949 exports began to fall. Brazil, which had had a favourable trade balance in 1948, ran a substantial adverse one. Chile's sizable balance of 1948 shrank in the first half of 1949, and in the same period Peru switched from a slight to an enormously unfavourable trade balance.

The reasons for this decline are to be found not so much in falling exports to the United States as in dwindling purchases by Western Europe. In fact, American imports from Latin America in 1949 were only a little smaller than in 1948. On the other hand, the export surplus of Latin America with Europe—over \$800 million in 1948—shrank to just over \$200 million in the following year; a reduction took place in both the volume and price of exports to Western Europe. What had happened was that production throughout the world had begun to catch up with postwar demand, home output was taking the place of imports, and larger exportable surpluses of food and raw materials also started to appear.

The decline extended to practically all of Latin America's leading exports—petroleum, grain, cotton, coffee, non-ferrous metals and nitrates, and sugar. However, the two nations whose exports fell most precipitously were Cuba (sugar) and, to an even greater degree, Argentina (wheat, maize and wool). Argentine exports—chiefly to Britain and Italy—dropped because of buyers' resistance to high prices, which in turn were the result of poor harvests and the short-sighted export policy followed by the Argentine Government. Chile's troubles, in contrast, were traceable almost entirely to the behaviour of the United States demand. Between 1948 and mid-1949 the volume of Chile's copper exports to the United States expanded by more than 10 per cent. But during the last six months of 1949 the volume fell by 30 per cent and prices by 25 per cent from 1948 levels.

Unfortunately the remedies adopted by the Latin-American countries—restriction of imports and increased public expenditure—were such as to lead to reduced living standards and to increased inflationary pressure. From mid-1949 onward, nearly all of the Latin-American economies were marked by growing budget deficits and a rising level of prices. Unemployment appeared for the first time since the war and in many cases production did no more than remain constant, sometimes actually decreasing.

Foreign investment, public and private, was of some,

though limited assistance. Of the two forms, private investment was often the least useful because it tended to fluctuate and to concentrate on a few products. The net outflow of American long-term capital to Latin America was \$275 million in 1948, \$450 million in 1949, and \$67 million in the first half of 1950; a substantial amount of this capital went solely to petroleum development in Venezuela. Such public institutions as the International Bank and the US Export-Import Bank advanced loans on a considerable scale and for more diversified purposes.

By the middle of 1950 the majority of Latin-American nations had eliminated the abnormal elements in their economic position—inflated demands from foreign countries and the spending of their own war profits—and had got back to their normal instability, namely, a precarious dependence on harvests and foreign trade. This achievement was due, in equal parts, to a recovery in exports and to a ruthless restriction of their imports, mainly from the United States.

Can Europe Send Capital Goods?

As 1950 wore on it looked as if Latin America would again be subjected to a violent change of still another kind. The Korean war created an insatiable demand for their goods, with the result that reserves of dollars and other currencies mounted rapidly; but at the same time rearmament also threatened to cut down the volume of imports available to the Latin Americans. Here the Report comments:

Should the impact of the rearmament programme be so severe as to curtail the supply of such goods, the under-developed countries would be again confronted with problems similar to those that arose during the last war. In the absence of adequate imports their highly liquid international financial position would add to domestic inflationary pressure. At the same time, their development programmes would risk being deferred for lack of essential imports.

No single answer to the dilemma of the under-developed countries is in sight. So far as Latin America is concerned, the report suggests that one solution lies in the restoration, with modifications, of its prewar pattern of trade. It is a solution in which Western Europe would play a significant role. Before the war, much of Latin-America ran a trade surplus with both the United States and Western Europe which it used for settling payments on foreign (mostly European) investments. Since the war, many of these European investments have been liquidated and with them has disappeared Europe's ability to pay for Latin-American products.

In any balanced system of world trade Latin America would acquire US dollars by means of an export surplus northwards; imports from the United States could be kept at very low levels, provided that the Latin-American countries could obtain capital goods from Western Europe. If, in fact, Western Europe were able to provide exports of this nature in sufficient quantity, it could acquire from Latin America both badly needed supplies of foodstuffs and minerals and

also dollars with which to balance its accounts with North America. Unfortunately the United Kingdom and Western Europe have traditionally concentrated mainly on the export of consumption goods to Latin America. Their ability to switch to exports of capital goods may largely determine the future economic health of both the Latin-American and European economies.

Denmark's Defence Effort

THE full measure of Danish efforts to rearm during the coming year cannot yet be gauged. On the financial issues, at any rate, much will depend on the future of their export markets for agricultural produce. This, at least, is the case which the Danish mission in London has come to present to the British Government.

Some decisions, however, have already been taken, and it is possible to present the minimum progress that Denmark plans to make by the end of April, 1952. Normal expenditure to maintain the existing armed forces runs at approximately 350 million kroner a year (April-March). In October of last year it was agreed to increase this by 300 million kroner to be spent during the remainder of 1950-51 and the whole of 1951-52. The effect of this will probably be to bring expenditure in the current year to about 400 million kroner, and in 1951-52 to 600 million kroner. In relation to a total budget for 1951-52 of just over two billion kroner, military expenditure will on this basis be 27-28 per cent, and it will represent roughly 3.5 per cent of the total national income.

In terms of manpower, the picture is less precise. With a population of a little over four million, the present military establishment totals 21,000 men (16,000 in the army and 5,000 in the navy and airforce). It is hoped to raise this figure ultimately to some 50,000 men. But the practicable rate of increase will be restricted not only by the amount of money that can be found, but also by the shortage of non-commissioned officers and of equipment. Although national service for ten to twelve months is already compulsory, these two factors have meant that far less than the full complement of eligible men have in fact been called to the colours. (Since the war about 100,000 men, or six-seven divisions, have actually done their military training.) The Government may yet decide to extend the period to 18 months or even two years, but only if it sees some chance of being able to officer and equip a larger intake.

So far as officers go, the only solution lies in making the regular army more attractive; higher pay and better conditions are under consideration. On the equipment side, the sum of Denmark's war potential is one large machine-gun factory, and a shipbuilding industry which can produce light naval craft ranging from corvettes to submarines. For the rest, the Danes must import, either under mutual aid or paid for out of their straitened foreign exchange resources. Since May, they have in fact been receiving some equipment from the United States—how much is, for reasons best known to themselves, kept secret. They also have 60 jet aircraft on order in the United Kingdom, about half of which have been delivered, and some pilots are already training with British squadrons. There is, however, a great wilderness to be recovered from the ravages of the last war. The Germans sank the entire Danish fleet and destroyed every piece of equipment that the army possessed, even down to the barracks and parade grounds.

So much for the immediate prospects and present plans, which are certainly not to be taken as the Government's final, or even penultimate, word on the subject. Further measures are now being discussed in the Government's defence committee. Any new plans, however, have got to be designed against an exceptionally difficult economic background. So far as internal finance is concerned, the position at the moment is not too unhealthy. The 1950-51 budget has been

more or less balanced, and present estimates for the 1951-52 budget aim at a slight surplus of about 100 million kroner on a total expenditure of 2.15 billion kroner. Until the beginning of this year, internal inflationary pressures were fairly well in hand, and there was a small margin of just over 7 per cent (50,000) unemployed. But the crux of the economic problems lies in Denmark's external position, which is already extremely serious.

Danish visible trade represents a high proportion of its total production and consumption. On 1949 figures, imports were 21 per cent and exports 20 per cent of the national income. At the same time, the terms of trade have been turning radically in Denmark's disfavour. Since devaluation in September, 1949, the cost of its imports (which include nearly all the raw materials consumed in Denmark) has risen by 100 points, or about 35 per cent, while the price of its exports has only risen three points or not more than one per cent. Largely as a reflection of this, the index of internal prices rose from 216 in September, 1949, to 234 in January, 1950. There it remained fairly stable until the start of the Korean boom in August, when it rose steeply to 275 in December. As wages and salaries are automatically linked to the price level, this presents the Government with a threatened inflationary spiral. It will almost certainly have to impose general wage, price and profit freezes in the near future. It is also planning to impose a system of raw materials allocations on the basis of (1) defence, (2) export industries, (3) investment.

Apart from the direct effect on internal prices, the Danish trading position has other unfavourable aspects. First, there is their overall deficit with the west European sterling and dollar areas. By the end of January they had a deficit with the European Payments Union of \$29.2 million as against no initial credit granted. For 1950 their visible trade deficit with the United States was \$427 million, \$40 million more than their Marshall Aid receipts. Secondly, there is the particular problem of Denmark's commercial relations with Great Britain (discussed in greater detail on page 505). Agricultural produce represents about 60 per cent of Denmark's total exports, including shipbuilding. Of its two main agricultural products, Denmark is contracted under a long-term agreement with the United Kingdom until 1952 for 90 per cent of its exportable surplus of butter and until 1954 for 75 per cent of its exportable surplus of bacon. Its foreign exchange position and the future of its main export industries are thus very largely in British hands—and so far have received rough treatment. Its sterling problem is made the more acute by the fact that it relies on the sterling area for a large proportion of its raw material imports, particularly fertilisers.

If these predicaments continue, they are bound to prejudice not only Denmark's capacity to purchase equipment and materials, but the Government's capacity to raise the necessary internal finance.

These are the material factors that must be taken into account in assessing the Government's admittedly cautious attitude to the needs of defence. To them should be added the psychological background. The Danes as a people are naturally non-militaristic; and geographically they feel that they are the last and least defensible outpost of the Atlantic Pact area. It was, indeed, something of an achievement that Denmark, unlike Sweden, joined the Pact at all. When it comes to the point, the Danes will be prepared to face the necessary economic sacrifices, but it would be a mistake for their western colleagues to ignore the growing pessimism in the country.

Correction.—On page 439 of *The Economist* of last week it was stated that the maximum speed of the "sports" train on the Paris-Dijon line was 125 mph. This should have read 112.5 mph. In practice the speed of this train does not exceed 90 mph on the Paris-Dijon track.

FLUORINE

FROM the famous Blue John mines in Derbyshire comes a mineral called fluorspar. For generations this has been mined in the North of England for use as a flux in metallurgical processes and for making enamels and glass. Today fluorspar has assumed a new importance. It is the chief source of hydrofluoric acid, the compound from which the element fluorine is obtained. Fluorine is chemically so active that it combines with glass and other materials normally used in chemical apparatus. Moissan, the famous French scientist who in 1886 first isolated it, used platinum apparatus which, though attacked, reacted sufficiently slowly to allow him to isolate some free fluorine gas. For over fifty years this elusive element remained a chemical curiosity, but during the war it was needed in large quantities for the manufacture of certain uranium compounds used for the atomic energy projects. The result was so to intensify the research on fluorine chemistry (a great deal of it in I.C.I.'s laboratories) that fluorine is now produced on an industrial scale. Certain fluorine compounds are astonishingly resistant to corrosion and decomposition, a property which is of great value commercially.

I.C.I. uses some of these in the manufacture of 'Arcton' refrigerants, which are non-toxic and non-inflammable, and 'Fluon', a new plastic material.

An Industry Poised for Productivity

IF the key British industries that brace themselves for the great double effort which armament imposes upon reconstruction, the aircraft industry, so recently at war, is well placed to expand. It is one of the free industries which have made strides in their manufacturing method and are ready to introduce the further improvements only justifiable by bigger batch ordering.

The pressure for machine tools, factory extensions and extra labour is now being applied. In particular the engine of the aircraft calls for much tooling, which cannot be finalised until the design of the product is well established. On this side de Havilland benefits from the momentum of an expansion that has been proceeding actively since the war ended. We enter upon a great new project of multiplying output from a period of practical training in just this task, for our turnover in turbine and piston engines and propellers has been mounting continuously since 1946 to fulfil orders secured overseas. Moreover the powerful Ghost jet engine has reached a stage of development ripe for large-scale manufacture, and has qualities of robustness and simplicity that appeal to the armed forces.

Perhaps the most vital need is for early delivery of necessary machine tools, a matter that is best expedited by the direct contact with suppliers which is not easy to ensure in times of national emergency and governmental negotiation.

Given practical aid in regard to these essentials of production it will be possible to maintain the export deliveries—almost equally important to overall security—as well as meeting the rearmament needs at home.

Those who harbour the sinister hope that the extra burden of rearmament will soften up our resistance to subversive doctrines misjudge the character of the British people and the ethical standards of competitive commercial industry as we practise it in this country.

DE HAVILLAND

THE 'BANK-INSURANCE' GROUP OF TRUSTS

British banks and insurance companies conform to the Three Golden Rules for investors: ONE—They provide essential services to trade and industry. TWO—They are managed with skill and prudence. THREE—They allocate a large part of profits to reserves.

A most convenient and economical method of obtaining a freely marketable investment in these high-grade equities is by a purchase of Units in the 'Bank-Insurance' Group of Trusts. Apply through any Stockbroker or Bank for leaflets, prices and dividend rates.

Bank-Units: 34% of the Trust Fund is spread over the 5 shares of the big Canadian Banks; 24% is in other Dominion & Colonial Banks and 37% in Home Banks and Discount Companies.

Offer Price, 1st Mar. 23/6½ x.d. Yield £3/9/2%*†

Insurance-Units: A spread over the shares of 30 British Insurance Companies; a considerable part of their premium income is earned in £ and the sterling value of their very large \$ investments has greatly increased as a result of the revaluation of the £.

Offer Price, 1st Mar. 23/6½. Yield £3/5/6%†

Bank-Insurance Units: 37% of the Fund is spread over British Insurance Companies; 17% over \$ shares of Canadian Banks; 14% in other Dominion, Colonial and Overseas Banks and 27% in Home Banks and Discount Companies.

THE BUSINESS WORLD

Can Transport Pay?

IN reaching last week's settlement of the railway unions' wage claims, the Railway Executive travelled by a route and reached a terminus that were by no means unfettered choices. The Executive has the misfortune of being compelled to play a protean role—the agent of its parent Commission, the “creature” in time of crisis of the Government, an employer burdened with problems of labour relations that it has yet to solve, and a trading concern operating one of the biggest industries in the country. Peace has had its price, and it is now time to measure the cost of the shotgun settlement for the Executive's customers—that is, for the community as a whole.

The agreement itself is in two parts, one precise and the other contingent. The three unions, having consolidated their claims into a single demand for a pay increase of 7½ per cent, got what they asked for, to be paid from January 1st. Thus the Court of Enquiry that began to examine the claims on January 4th and reported on February 8th might have been spared its labours. This settlement will cost the Executive (or, more accurately, the Transport Commission) some £12 million in a full year. The contingent part of the settlement depends on the co-operation that the unions will offer in future towards the improvement of efficiency on the railways. Their representatives “acknowledged the imperative need of the fullest co-operation” with the Executive for eliminating waste of manpower and for improving productivity. They have undertaken “to examine forthwith in that spirit any proposals which the Executive put forward” and there will in future be a joint committee of both sides for this purpose. The principle of co-operation is admitted, but even the union representatives have done no more than give a promise “to examine,” and it remains to be seen in practice how this works and how far the men are willing to be bound by what their representatives concede.

In the short run, co-operation towards greater efficiency can make only a small contribution—even if it is extended with the utmost goodwill. To dispense with the services of 2,700 vanguards in the London area and 600 “knockers-up” would provide useful rather than major economies, if the unions now agree to them. As for lodging turns, in 1939 some 4½ per cent of the total duty turns were worked as lodging turns; in January only 0.6 per cent were so worked. The Railway Executive has already proposed an extension of lodging turns (not to the prewar level) on conditions that sound reasonable. This would be a significant though far from decisive source of economy, because it would mean that locomotive crews would spend less time out of their average working day travelling home (at full pay) as passengers and more time on actual footplate duties.

But these advances towards greater productive efficiency, even if they are realisable at all, will not be gained in a hurry. Perhaps the way in which last week's

settlement was reached may itself weaken their chances of realisation. This leaves the Executive in a serious financial predicament. In addition to the £12 million promised last week, there is a claim from the railway shopmen that could easily add another £2,000,000 to it. The recent increase in coal prices will cost the railways £3,000,000 a year, and there are increases in steel and in every item of materials and stores on which it is difficult to put a precise figure. Already the Executive was failing to meet its full economic charges. Estimates furnished to the Court of Enquiry showed that a full year's gross receipts allowing for the increase in freight charges that came into effect from May 15th last year would be of the order of £359 million; working expenses were put at £325 million, leaving net traffic receipts of £34 million. But although this result for a notional year shows an improvement of £10 million over the estimated outturn for 1950, it would still fail by £2,000,000 to meet the railways' share of the capital charges and other items of central expenditure that have to be met by the Transport Commission. It omits, moreover, the increase in pay to lower-

RAILWAY EXECUTIVE RESULTS (£million)				
	1943	1949	Estimate, 1950	1950 Estimate Adjusted for Full Increase in Charges
Gross receipts	344.8	334.1	349.1	359.1
Working expenses	322.5	325.1	325.0	325.0
Net traffic receipts	22.3	9.0	24.1	34.1
Railways' share of Commission's central charges	35.0	35.0	36.0	36.0
Approximate railways' deficit....	12.7	26.0	11.9	1.9
Transport Commission's deficit...	4.7	20.8	15.1	2.4*

* Estimate for a future year.

paid workers made last September (£3,000,000) and other increases in costs that had already made themselves felt before the end of last year. It would probably not be far out to say that the Executive needs at least £30 million more revenue (or that amount discounted by such economies as might be realisable) to meet all the expenditures to which it is now committed and to cover its bare capital responsibilities—this quite apart from making any provision for the future.

This is a frightening sum. It is equivalent to 10 per cent of the railways' gross receipts last year, and there are those who assume that it cannot be found. Such assumptions can be safely dismissed; the demand for railway transport is not so highly elastic that to increase charges and fares would produce less revenue. The fact that they are being made at all is connected with the seductive attractions of a subsidy. The argument that transport is a basic national service that should properly be state owned is now being extended;

the state, it is said, should not merely cover the overhead, but also absorb the current loss. In other words, what the transport user cannot or will not pay should be paid by the taxpayer. It is on record that the Minister, the chairman of the Commission and spokesmen for the Executive have opposed this argument, and for this they deserve credit and support. Any subsidy payment, however small, would put the railways outside any calculus of making ends meet. They would then know that a deficit would be automatically made good, just as the unions are now entitled to assume that a wages claim that is not utterly outrageous has only to be pressed with determination to succeed. The compulsion of efficiency, such as it is, would be removed for ever.

But if the money can be raised, what is the least damaging way of getting it? The effective increase in passenger fares compared with 1938 is of the order of 75 per cent, while freight rates are just over 80 per cent higher than before the war. At these rates, the railways have been losing traffic; it is significant that the only increases recorded in the first eleven months of last year were for reduced rate passenger journeys (at excursion, cheap day or weekend fares) and in coal and coke traffic (which is virtually fastened to the railways). Last year's receipts are higher solely because of the increase in freight charges last May:—

RAILWAY TRAFFICS AND RECEIPTS				
	Originating Traffic Eleven Months to November 30th, 1950 and Change on 1949		Aggregate Receipts 52 Weeks (£ m.n.)	
	Million Journeys	Million Tons	1949	1950
Passengers	507	-8.0	113.7	106.5
Parcels	...	...	29.0	30.8
Merchandise	53	-0.9	79.6	86.1
Minerals	60	-0.2	29.6	32.5
Coal and coke	167	+2.7	67.9	77.7
Livestock	1	...	1.5	1.8
TOTAL RECEIPTS			321.2	335.6

An increase of one-sixth in freight rates would again be required to produce the amount of revenue that the Executive needs. The sum might be found by putting rather less on freight charges and undertaking the risk of frightening away passengers by an increase in certain fares. The Act requires the Minister to consult with and consider the advice of the Transport Tribunal, and it was as such a consultative committee that the permanent members of the Tribunal sat to consider the application for increased freight charges early last year and advised the Minister about it. Since the magnitudes that are at stake are roughly the same, and since the circumstances that have brought the need for increased receipts are of such peculiar public importance, a public inquiry is in every respect desirable. This will no doubt be an embarrassment for the Commission, for that body hoped to present the first of its charges schemes for the Tribunal's consideration later this year. The creation of a logical pattern of railway and road charges has been frustrated at each stage by the discovery that costs have increased faster than have revenues. It is on charges policy that the whole doctrine of integration of transport really turns; now, presumably, an attempt at a coherent charges policy will again have to be put aside in order to secure an expedient increase in receipts.

The settlement thus raises in acute form the question whether “integration of transport” now has any meaning. The purpose of the Transport Act (though the

Act was careful not to say so) was to reduce the excessive amount of capital invested in railway and road transport as a whole, and to run the two branches as a single transport service, using each to the best advantage to move each consignment. To do this, it was necessary to know far more about the comparative costs of road and rail transport, and some preliminary work has been done on these problems. It was also necessary to explain to transport staffs and transport users the changes that would be necessary; here also general statements of policy have been made and assurances given to the staffs. But after the fiasco at St. Pancras, where an attempt was recently made to transfer certain trunk road traffic to the railway, it must be concluded either that the Railway Executive failed completely to explain to the men what the changes involved, or that the men are determined to make up their own minds about what changes they will accept, irrespective of what their union leaders agree are reasonable. Integration means much more than the shutting down of branch lines that do not pay; it means changes in ways of handling traffic and in working practices and conditions. If there remains in future resistance to lodging turns and to handling by rail traffic that has “always gone by road,” the outlook for the fundamental changes in operation that are needed to produce an integrated transport system will be poor.

There might be better hopes of progress towards integration if the prospects favoured reasonably stable cost conditions during the next year or two. A charges scheme that sought to encourage integration between rail and road might then have some meaning. But it is quite clear that the Executive cannot hope for any respite in the increases that have dogged it for the past three years. Its labour costs are determined for it; it is caught, like the rest of the economy, in the wave of rising prices for coal, steel, and materials; its attempts at securing increased productivity rest mainly (though not wholly) on the goodwill that the unions and the men are prepared to offer. Thus the country now has exactly the same resources committed to transport as in the days before nationalisation, and they are not being so efficiently run. It is useless to talk of scrapping the Transport Act—if only because the railways and almost certainly the bulk of long-distance road haulage would remain in public ownership for want of outside bidders. There are certain changes of organisation that could with advantage be made, particularly in the relations between Executive and Commission. But when this is said, it is still true that the only hope of more efficient and cheaper transport lies along the path of integration. The alternative is to accept and maintain the various branches of transport as they are—sprawling, far less efficient than they should be, and oversized for the country's needs. It is important not to lose sight of these principles. They may be unattainable. It may be that the Government, casting its eye around the world, will conclude that the natural state of railway accounts is to be in the red, and that a subsidy amounts to nothing more than an entry to put the books straight. But this would be a monstrous abandonment of the purposes of the Transport Act. It would then be quite certain that public transport would never be made to pay. There is still a chance that the compulsions of economy and technical efficiency can at least limit the rise in transport costs.

Buying for Stock

AFTER allowing Britain's stocks of most foods and raw materials to reach a very low ebb, the Government is belatedly joining the search for supplies to build a strategic reserve. The first sign of this was given three weeks ago, when supplementary estimates for £13 million were presented for the current financial year for emergency purchases of food and raw materials. Ten days ago the Chancellor of the Exchequer announced during the defence debate that for the full year 1951-52 £140 million would be provided for this purpose. This is a substantial programme even by present standards of values. It is appreciably larger than the annual amount spent on stockpiling by the United States authorities in the financial years 1947 to 1949 and only slightly less than the \$425 million appropriated for 1950. Admittedly, current American expenditure on stockpiling has been raised to \$600 million, and no less than \$1,800 million has been requested for 1952. But when prices are rising fast, the amount of money spent gives little indication of the quantity of goods actually procured; still less does an appropriation indicate the quantities that may be procurable. Much more important than the figures in a programme, or even than the level of prices, are the sheer physical availabilities of supplies.

No indication has been given of the hoped-for composition of the British stockpile, and the form it will actually take is probably not predictable even by the Government itself. All that is known at present is that, of the total provision of £143 million, £72½ million is for the Ministry of Food, £22½ million for the Ministry of Supply and £48 million for the Board of Trade. And that is probably all that will be disclosed; the quantities purchased will, quite properly, be a well-guarded secret. The American authorities, by contrast, have always made known the commodities, though never the quantities, they are accumulating; the list covers 83 items ranging alphabetically from agar to zircon. The British departments are most unlikely to go even so far as that. The inquisitive outside investigator will be left to glean such information as can be deduced from market reports.

For him, as for the Government, the first imponderable is the likely availability of supplies. In the eight months since the invasion of Korea, all commodities have become scarce. A few would have been scarce even without Korea. In the first half of 1950, world output

of many products was only just keeping pace with the rising tempo of world consumption under the stimulus of renewed pressure of economic activity in the United States. In the second half of the year the attempt by governments and industry to build up stocks forced commodity prices up at a fantastic rate. Britain, as a belated stockpiler, will now have to pay these dizzy prices in any case; but its readiness to pay them will not, even so, assure it of more than limited quantities—or, indeed, of any quantities at all. Some goods will be available for stockpiling only if consumption in Britain is curtailed more or less correspondingly; others will be available only if the United States agrees to reduce its own stockpiling or to relax certain export restrictions.

★

It is at first sight surprising that the sum allotted to provide emergency stocks of food—£72½ million—should account for no less than half the total provision. Such a food reserve, if obtainable, would however represent only a small proportion of Britain's annual requirements. In 1949-50, when food prices were materially lower than at present, the Ministry of Food's total purchases for the year amounted to £1,450 million. Thus the provision for stockpiling represents only 5 per cent of that money total, and at current prices the physical volume of the emergency stocks would be no more than 4 per cent of the actual quantity of food bought by the Ministry in 1949-50. To put the comparison in another way, if the whole sum of £72½ million were spent on imported grain, it would buy less than half as much as Britain imported last year (when the imports were in any case small); alternatively, it would not even cover a year's purchases of sugar.

Small as this money provision is in terms of physical quantities, it may still be difficult to turn it into food. Only three of the staple foodstuffs are likely to be available in larger quantities this year. They are cocoa, sugar and possibly wheat, if the larger harvests expected in North America materialise. American purchases of cocoa beans recently have not been so large as was expected and Britain could, if it wished, buy quite substantial tonnages at anything over £310 a ton. If it bought four months' supply—50,000 tons—the cost would be over £15 million. This year's world sugar crop is an all-time record; an extra million tons would

be procurable without much difficulty, though the steadying of the sugar market in the past week or so suggests that producers might not be too eager to sell. Such a purchase would represent six months' supply at last year's ration level and would cost nearly £32½ million. Wheat will not be available until next September or later, but with luck the Ministry might be able to get an additional million tons, or about a quarter of last year's low consumption; the cost would be £30 million or more, as Britain would have to pay substantially more than the maximum price of \$1.80 a bushel fixed by the international wheat agreement.

Canned meat and dried eggs are two obvious foods for the stockpile. Supplies of both may be restricted—first, because of the high level of food consumption in the United States (a major source of supply for dried eggs and now an important alternative market for Argentine corned beef) and, secondly, because of the shortage of tinsplate. But if Britain were able to stockpile 150,000 tons of tinned meat (it would have to be withdrawn from the meat ration) the cost would be £30 million for the equivalent of only two months' consumption of carcase meat in 1950. An import of 10,000 tons of dried eggs (a third of Britain's import last year) would cost £2 million, and would provide a little over a month's supply of equivalent shell eggs.

Of the other main staple foods (carcase meat, bacon, ham, butter, cheese), supplies this year will be barely sufficient to maintain even a reasonable scale of rations. But if the British public would submit to further cuts, a small stockpile of these foods could be accumulated by the Ministry—by raising the average stock to, say, ten weeks' consumption. But present stocks are already below the "normal" average of six weeks. The Ministry may find in the end that its stockpiling in this range is limited to dried fruit and canned peaches.

★

The responsibility of stockpiling raw materials is shared by the Ministry of Supply, which will look after metals, and the Board of Trade. The Ministry of Supply was allotted £3 million in the supplementary vote for the current financial year and £22½ million for 1951-52. This latter sum represents 15 per cent of the Ministry's purchases of non-ferrous metals, including aluminium and chrome, in 1949-50; these purchases amounted to £150 million. If the Ministry spent all the money on copper, it could obtain not much more than 100,000 tons, or less than a third of Britain's annual requirement. Similarly, its provision might command 160,000 tons of zinc (two-thirds of last year's consumption) or 225,000 tons of lead (nearly a year and a half's supply) or 15,000 tons of tin (nine months' supply). But in addition to these metals, the Ministry ought to store aluminium, chrome, nickel, tungsten, molybdenum, cobalt and other alloy metals. What are the chances of getting reasonable quantities of such vital armament supplies?

World output of tin last year expanded by 12,000 tons to 173,000 tons and could expand this year to 180,000 tons. An additional purchase of 15,000 tons—at a cost of perhaps £22½ million—might be possible if the authorities were to outbid Italy, Germany, India, and Argentina. Lead supplies are not very short and world output this year is expected to rise by 60,000 tons to 1,600,000 tons. Consumption rose last year both in the United States and in Britain, but it was still well

below its 1948 level. Britain could possibly acquire an additional 40,000 tons (£4,500,000) without having to curtail home consumption. By contrast, copper is scarce and zinc almost desperately so. World output of both these metals reached record levels last year, and a further increase of, say, 30-40,000 tons might be possible this year. But defence requirements in the United States will exceed both this amount and the prospective saving from curtailment of its own civilian consumption. Hence the chances of stockpiling copper or zinc are slender—unless British consumption is cut back still more (which would not be easy to achieve) or unless American stockpiling is reduced (which now seems probable). On the most optimistic assumptions, Britain is unlikely to get more than 50,000 tons—if as much—of each metal for its stock; such a quantity would represent only two months' supply of copper and about two and a half months' supply of zinc. The cost would be about £17 million.

Some increase in stocks of aluminium should be possible if consumption this year is kept down to the present level of 15,000 tons a month. But the chances of getting nickel, tungsten, chrome, molybdenum or some of the other alloy metals are far from bright. The extreme scarcity of tungsten is revealed by its dramatic rise in price in the past eight months. It is now five times the level of last June, and has risen by nearly 70 per cent since the beginning of this year. Here the special influence has been a sharp reduction in the physical supply—because of the loss of the important exports from China. The markets for the other alloy metals have been influenced rather by the increase in demand than by decline in output; if the commodity negotiations now taking place in Washington are able to limit purchases by the smaller importing countries, Britain may be able to secure stocks.

Strategic reserves of the other raw materials will presumably be accumulated by the Board of Trade. Its £48 million allotted for 1951-52 represents about 20 per cent of its raw material purchases in 1949-50, but this comparison may be misleading, because the Board will clearly have to stock many goods that are at present in the hands of private trade. This total provision is equivalent, at present prices, to about a third of Britain's annual consumption of natural rubber, or about half the present restricted consumption of softwood, or 30 per cent of last year's imports of raw wool. In practice, the expenditure is likely to be extended to a variety of minor goods ranging from graphite to pyrethrum—if only because these will be more readily available than the basic commodities.

Among the more important raw materials, world production of natural rubber is expected to increase still further this year; if Britain is willing to pay more than 6s. a lb., it could perhaps stockpile some 50,000 tons (barely three months' supply) by bidding supplies away from China. But purchases of that size would cost nearly £35 million. Wool, like rubber, can also be bought at a price. But here the problem is to bid away supplies from the United States and Western Europe—and that would be very costly and very impolitic. If Britain managed to stockpile 50 million lb. (clean), equivalent to only five weeks' supply, it would have to pay at least £50 million. Increased supplies of cotton depend at the moment on the willingness of the United States to grant Britain a larger export quota. If a bumper American crop is harvested this summer, and

if output in other producing areas continues to increase, Britain might be able to stockpile towards the end of this year, but working stocks would first have to be replenished. In timber, the immediate problem is to secure an adequate supply to maintain even the present restricted level of consumption and to build up trade stocks; stockpiling will clearly have to take second place. Sulphur is also inadequate to meet current essential requirements, while the jute shortage may be intensified by the new trade agreement between India and Pakistan. Sisal, however, might be stockpiled, and so, too, might asbestos, hides and skins, and possibly molasses.

Procurement is not the only problem of stockpiling. Storage space, transport facilities and the turning over of stocks at regular periods all present their difficulties. The British economy has traditionally been based on the premise that overseas supplies would arrive with reasonable regularity; hence storage space has never been too plentiful. Additional capacity was built during the war; at the same time there was destruction of warehouses and cold stores. It would not be surprising if Britain had now no more total storage accommodation than in 1939; and few commodities can be stored in the open without deterioration. One mitigating factor is that commercial stocks are low, so that an acute shortage of space may not occur for some time.

Transport will be a less difficult problem to meet, if only because the actual quantities of goods secured for

the stockpile are likely to be small, and will be partly achieved at the expense of domestic consumption. In the initial period, supplies could always be held in producing countries. The third problem, that of turning-over stock, presents little difficulty for goods of a type already in government hands—cotton, jute and the non-ferrous metals. The appropriate department would merely have to hold a larger working stock. But for rubber and wool, where the trade is in private hands, the department responsible for the stockpile will presumably have to sell on the open market at various times. Fortunately, that is still some time off.

To embark upon stockpiling is no easy matter in the middle of the most startling commodity boom in history. Commercial stocks in Britain are low and would in many cases have to be built up before stockpiling can begin. In most commodities, supplies are simply not available; nor can they be made available by limiting exports to Russia or China—except in a few isolated instances, such as rubber. The British Government may find that this year it can do no more than buy for delivery in 1952-53. Much, of course, depends on the outcome of the international materials conference now taking place in Washington. It may be that supplies will be made available for the British stockpile, but that would be a very optimistic assumption. Failing that, a sizeable stockpile can be acquired only by curtailing consumption of food and raw materials at home or by bidding up prices to even more fantastic heights.

Business Notes

FBI and the Budget

Two more broadsheets about budgetary policy have this week been launched at the Chancellor. Since they come from opposite sides—from the TUC and the FBI—it is perhaps not surprising, given the habits of these bodies in such matters, that many of the arguments of the one set of proposals are neatly cancelled by those of the other. The TUC, whose views are discussed in an earlier Note (p. 474), is sure that steeply increased taxation is inevitable, whereas the FBI thinks that it might be wholly avoidable—even over the whole three-year span of the arms programme. The TUC plumps for increased direct taxation of income and profits, whereas the FBI (if its hope proves vain) would put the burden on indirect taxation.

It is a pity that the weight of such documents as these is so constantly diminished by weakness of argument and political colouring. The FBI memorandum, like that of the Associated Chambers of Commerce issued a fortnight ago, contains a great deal of carefully reasoned and sound advice on specific matters, of a quality not to be compared with some of its general arguments. Its hope that tax increases might be avoided assumes that much could be done by economy in existing civil expenditure. To this extent it voices what is now fast becoming a general view—accepted even by the TUC. But the FBI, having reckoned that £300 million a year could be secured in this way, then lends support to the spreading fallacy that an equal further “saving” could be got merely by switching the capital financing of local authorities from the central Government to the private capital market. Undoubtedly, as the FBI points out, such a change would tend towards economy in local government expenditure; but, apart from this, the need for a disinflationary policy would not be abated at all. In the circumstances, the FBI's plea for a complete withdrawal of profits tax—for all its objectionable features—is even more

unrealistic than its hope that taxation as a whole need not be raised.

It is to be hoped that the Chancellor will seriously ponder the remaining proposals. The FBI speaks for industry, but in effect it also endorses a great body of responsible opinion in the City and among economists, when it contends that, if the tax burden must grow still further, it is more than ever imperative that its impact upon industrial capital should be cushioned. On this aspect it makes two main proposals; first, that for the purpose of profits tax, fixed preference dividends should be treated, like debenture interest, as a charge against profits; and, secondly, that depreciation allowances for income tax should, in effect, be based upon replacement costs. Indeed, in this second matter it goes even further, by suggesting that a tax-free accumulation of reserves should be permitted to the extent of any increase in the replacement costs of stocks. This is important advice and it deserves a sympathetic hearing—equally with the many detailed proposals that the memorandum makes for minor adjustments and improvements in the tax mechanism.

Mission to Buenos Aires

Yet another stage in protracted negotiations for Argentine meat has been reached this week; a new British mission led by Mr John Edwards, Economic Secretary to the Treasury, has left for Buenos Aires. The mission includes the Deputy Secretary of the Ministry of Food, and is composed entirely of representatives of that Ministry and the Treasury. Its members can certainly be under no delusion about public feelings on the cut in the meat ration. In government to government negotiations, the problem is not only to discover a mutually acceptable agreement, but also

to save the face of both parties. In the new round of the meat talks, the question of remittances is to be discussed, and this topic could perhaps be used as a face-saving device. But the Argentine Government has already made it known that its price for chilled beef has risen from £140 to £150 a ton and that it wants guaranteed supplies of coal, petroleum and tinsplate—even in the event of a war. Britain's answer has been to cut exports of tinsplate to Argentina in the three months April to June from 7,500 tons to 4,500 tons.

This cut is entirely justified by the facts of the meat dispute and of Britain's tinsplate supplies; it might well have been made before. Two-thirds of the 19,500 tons of tinsplate sent to Argentina since July 1st last year was specifically exported to pack British imports of canned corned beef, which has not been sent here since September. It has taken until this month for the Government to decide on “a provocative act like breaking the agreement” in retaliation. Private contracts are involved here, and the canning plants concerned are owned in part by British and American companies; nevertheless, British food-canning companies in this country have had their tinsplate supplies cut, while production was increasing, to allow these and other increased exports. Apart from that part of tinsplate exports sent to “clothe” food shipped from the recipient countries to Britain, “free” tinsplate exports are a valuable bargaining factor in negotiating trade agreements; and it may be that a part of the price of resumed meat shipments would be the despatch of tinsplate exports to Argentina at the old rate. Such a condition would be highly unpopular with Britain's food-canning industry, which until the new mill at Trostre comes into production (and possibly even for some time after) will still be short of tinsplate.

Tinsplate Supplies

Tinsplate supplies for British canners in the rest of 1951, however, appear likely to be a little easier than in the last two or three months. Despite the additional cut in supplies imposed for the first quarter of the year, the Minister of Food was able to promise this week that they would receive as much in the whole of 1951 as they received in 1950—i.e., 270,000 tons. Total production should be slightly higher; exports to Argentina, Russia, and the Scandinavian countries are being cut very slightly; and the margin thus obtained will presumably be used for supplies to the armed forces (three times as high as in 1950) and for stockpiling.

The key factors in tinsplate supply are capacity and the supply of labour in the South Wales mills. In the coming year the continuous strip mill at Ebbw Vale will be producing at its full capacity of 200,000 tons; the hand mills in the area will probably turn out 520,000 tons and the new continuous mill at Trostre, coming into operation in the late summer, may produce about 40,000 tons, making a total of 760,000 tons, against 742,000 tons last year. For 1952 these output figures are estimated at 200,000 tons, 500,000 tons, and 250,000 tons respectively—a total of 950,000 tons. Even now the stated demand is about a million tons—400,000 tons for home food canning, 200,000 tons for other home requirements, and 400,000 tons for export; and if tinsplate were freely available demand would probably increase. In South Wales today the tinsplate industry employs about 17,500 workers, among whom just over 13,000 are engaged in production; it could use another 1,500 men immediately—and turn out another 100,000 tons of tinsplate—if they were available. The new mill at Trostre is likely to take some men from the hand mills—an official estimate puts this transfer at roughly 200 workers. The problem will be to attain this mill's full rated output without reducing the labour force in the hand mills. Trostre was originally designed as a replacement, but full output from the old mills—which offer hard and unattractive work

—will continue to be required to meet the expanding demand, whether or not it should in the future be decided to put down another continuous tinsplate mill in the country.

Winning Gamble?

Mr Noel-Baker was justified last week in describing a number of factors in deep-mined coal output since the beginning of this year as “encouraging.” In the first eight weeks of this year output from the mines reached 33.5 million tons, an increase of more than 900,000 tons compared with the corresponding period of 1950. Moreover, the increase over last year has been greater from week to week since early January. Last week 6,900 fewer miners than in the corresponding week of 1950 produced 276,000 tons more coal. There are today 699,100 men in the mines (286,900 at the coalface), an increase of 10,500 in the first seven weeks of 1951. Output per manshift (overall) this year has averaged 1.23 tons, compared with 1.20 tons in January and February last year (output was 1.00 for 1945 and 1.14 for 1938).

Mr Noel-Baker's reference to Saturday work was a useful encouragement to miners at the very large number of pits now working on Saturday; the actual value of Saturday working is a little less easy to discover. It is partly offset by increased absenteeism during the week; the number of shifts worked per wage-earner at present is not higher than it was during November, before the Saturday shift appeal was made. It is also too early as yet to forecast whether the recent signs of improvement—particularly in manpower—will be maintained, though the release of miners from the forces, and such recruitment of Italian miners as proves possible, are still to come. As for production, aggregate total output of coal (though not deep-mined) a year ago was showing as large an increase over 1949 as does this year's output over that recorded in the early weeks of 1950; and in the first two months of 1950 the industry was losing miners, not gaining them.

The welcome improvement in manpower and production, therefore, does not prove that the problem of coal supplies is on the way to solution. If the result should be only such an increase in total production in 1951 as was achieved last year, it will still be inadequate to meet a larger increase in inland consumption; in no week this year has inland consumption dropped below that in 1950, despite emergency cuts; in the first seven weeks consumption was higher by nearly 900,000 tons, compared with an increase of 600,000 tons in the same period of 1950 over 1949. There seems a good chance, however, that the drastic shortage of coal that was feared for this time may be averted; stocks are being drawn upon much less than in January, though they remain considerably lower than in 1950. It may well be that if exports are kept to a trickle, home stocks can be sufficiently built up for next winter: financially, however, that would be a costly prospect for the National Coal Board.

Trade Talks with Denmark

The trade discussions now taking place with the Danish Ministers in London are intended to cover all problems affecting trade between the two countries, but they pose one outstanding problem—the question of relative prices. The Danish economy is under strain. Last year Denmark had a large deficit on its external payments, and this, the Danish Government claims, arose from the sharp deterioration in the terms of trade. Before devaluation, the prices of leading Danish exports (butter, bacon and eggs) were higher compared with 1935 than the prices paid for imports (mainly coal and steel). Between September, 1949, and January this year, import prices had risen by 124 points to 414 (1935 = 100), while the export price index actually fell by one point to 307.

Denmark devalued its currency with sterling. But the bulk of the feedingstuffs imported by Denmark have to be purchased from dollar countries, and their cost in Danish currency has increased by fully 44 per cent; at the same time, the prices of British coal and steel have risen, though less sharply. In contrast, prices of Danish exports have remained almost steady, since most of them are governed by long-term contracts with Britain. The six-year contract for Danish butter dating from October 1, 1949, fixed the basic price at 27s. 6d. a cwt. This represented a sharp reduction from the previous price of 32s. 6d. a cwt. before devaluation, a reduction that Denmark presumably regarded as being worth while in order to obtain the security of a long-term contract. The contract allows for a maximum price variation of 7½ per cent each year, but last October the Minister of Food refused to pay any more than the original price. Under the terms of the contract Denmark has bound itself to send 75 per cent of its exports to this country; thus it cannot divert any large part of its exports to customers who would be quite prepared to pay more, such as Germany. Instead, Denmark has abolished its domestic butter ration and the Danish people are eating the butter that would otherwise have come to Britain. The four-year bacon contract dates from October 1, 1948, and this year after much haggling the Ministry of Food finally brought itself to concede a 5½ per cent increase in price. The egg contract might be better described as a long-term understanding by which prices and quantities are negotiated each year, but Danish egg prices have not risen since 1949.

Denmark's trade problems have a direct connection with the government's attempt to stabilise a notional cost-of-living index. The British public is enjoying relatively cheap butter, bacon and eggs (in smaller quantities) at the expense of Denmark's foreign exchange reserves. Other matters will also come up for discussion in the talks—among them the prices and supplies of British exports. Denmark is dependent on British coal, of which exports are to be reduced this year. It also requires British steel, of which supplies will also be short. The balancing of decision between what this country, with its present preoccupations of defence, can supply and the prices of food that would give Denmark a fair return will not be easy. But the discussions, it will be hoped, will not be marked by the kind of high-handedness that Denmark has been forced to accept in the past.

Commodity Groups at Work

The new international machinery to mitigate raw material shortages came into operation this week in Washington. The International Materials Conference, as it will be known, will consist initially of a central group representing the United States, Britain and France and six commodity committees. The committees are entirely independent; they

will determine their own procedure and will make their recommendations directly to the governments represented. The composition of five of these committees, all of which start work within the next fortnight, is shown in the accompanying diagram. Britain, the United States and France are represented on all five of the committees, Belgium and Germany on four and Italy on three. Spain, incidentally, is represented on the tungsten and molybdenum committee. Each committee has representatives of the main producers or exporters and importers, outside the iron curtain countries, of its particular commodity. Membership of the com-

mittees varies from eight for manganese to twelve for the two metal groups; in all, twenty-one countries are represented. The sixth committee, that dealing with wool, will meet on April 2nd; the member countries have not yet been announced, but, besides the three convening powers, it is likely to embrace Australia, New Zealand, South Africa, Argentina, Uruguay, Belgium, Germany, Italy and possibly Canada.

This new organisation has been set up with commendable speed. It now remains to produce results. In the first three committees, the United States is likely to take a leading part. Stockpiling, defence requirements and civilian consumption are to be discussed and the assistance that the United States finds itself able to give will have crucial consequences for the work of the conference. The other members would be greatly relieved, for example, if the United States would agree to slacken its stockpiling purchases of zinc and copper and to increase its export quotas for sulphur and cotton. But any such action would probably be coupled with undertakings by the receiving countries to limit or reduce their civilian consumption of these materials and to ensure that the supplies would be used for defence production or stockpiling. The British argument that the economic stability of a country should not be impaired by rearmament is sound, but not determinate. It would be difficult to gauge the level at which civilian production must be maintained to ensure that stability—and almost impossible to persuade American industry and people to accept it. There may be a certain amount of bitterness (particularly about British exports) before these complex issues of civilian and defence priorities are resolved.

More Sulphur?

Mr Harold Wilson's rumoured visit to the United States in search of sulphur is apparently not to take place, and the hint of a statement this week suggests confidence that more adequate supplies may be allotted to Britain without his personal intervention. It is to be hoped that this will happen, either by the increase of Britain's allocation of American

ASPHALT: A local legend at La Brea, Trinidad, describes how the famous pitch lake was once the site of an Indian village. The villagers offended the local deity by their persecution of the humming birds (which were animated by the souls of dead Indians) and as a punishment they were engulfed in the pitch lake with all their belongings.

In 1595 when on his ill-starred expedition to South America in search of El Dorado, Sir Walter Raleigh called at Trinidad. He made use of the pitch for caulking his ships and reporting that he found it 'most excellent good'—an opinion which has since been endorsed by road makers in Great Britain and in many other parts of the world.

Full and up-to-date information from our branches in Trinidad on market conditions and industrial trends in the island is readily obtainable on request. Please write to our Intelligence Department at the address given below:

ARMS—and EXPORTS

At the present time rearmament and exports are inseparable. The exporters look to defence to ensure conditions wherein more and still more goods may be made and sold abroad in freedom, while defence looks to the exporters for the wherewithal to buy essential materials. Thus may "guns and butter" be achieved.

The Bank is closely identified with all those schemes which help this twofold plan and to this end provides ample finance and practical guidance.

Commercial History and Review of 1950

This week's issue of the *Records and Statistics* supplement to *The Economist* includes the second part of the Commercial History and Review for 1950—the 38th of the series which began in 1863.

Part II provides a detailed survey of British industrial development last year, with special articles on manpower, coal and steel, textiles, transport, and the motor industry. Other sections are devoted to articles on primary raw materials and retail trade.

Part III of the Commercial History, containing overseas economic reports, will be published on April 7th.

The *Records and Statistics* supplement is obtainable by subscription only, at £2 10s. a year; a combined subscription to *The Economist* and *Records and Statistics* costs £5 a year.

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But, wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)
Head Office: 38 Bishopsgate, London, E.C.2.
Manchester Branch: 52 Mosley Street, Manchester 2.
Liverpool Branch: 27 Derby House, Liverpool 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

A network of 600 branches and agencies provides a regular flow of trade information of vital importance to British business houses. For details of this service write to the Information Department of:—

sulphur during the second quarter of 1951 or by the release of emergency shipments outside the allocation; the effects of the sulphuric acid shortage upon many sections of industry are already serious, but they have yet to be felt to their full extent, while the present quota system may be replaced by a more detailed allocation scheme.

This immediate shortage—which offers acid supplies of perhaps 1,500,000 tons this year, compared with 1,800,000 tons last year—can be met only by the provision of emergency supplies from the United States. The one other important sulphur producer, Italy, has higher costs (its sulphur is deep-mined, whereas extraction by steam solution is used in Louisiana), and its sulphur industry is in a severely disorganised condition; output is far below the prewar level and would take some years to recover. It is beginning to be accepted among British sulphuric acid producers that the use of crude sulphur to make acid in this country must progressively decline; and the available alternatives are being more carefully studied.

If pyrites from Spain and possibly North Africa is to become the most important source of sulphuric acid, as it was before the war, much more plant will require to be converted to its use than is yet being contemplated. Last year British acid producers used just over 200,000 tons of pyrites (to make 16.2 per cent of the total output of acid); if their requirements alone rise by 10 per cent or more this year, by 100 per cent in 1952, and by 150 per cent in 1953, pyrites mining output will need to be increased. Difficulties with mining equipment and manpower in Spain may make this a slow process, even though the pyrites reserves themselves are ample. Plant for production of acid from pyrites is more costly than plant that uses elemental sulphur in terms of capital equipment per ton of capacity; and it needs more room, which may make existing plants using elemental sulphur difficult to convert. Production from spent oxide (a by-product of the purification of town gas) costs roughly the same in capital outlay, though the oxide is obtained cheaply; stocks of oxide have recently accumulated, since output was greater than the acid industry could absorb, but a new plant nearing completion may take up this margin of supply. Sulphur from coke-oven gas is at present largely wasted, and a greater proportion could be recovered from town gas if the complete gasification of coal were to become practicable; and slightly more sulphur may be recovered from zinc concentrates as zinc smelting plant is modernised. Production from anhydrite (discussed in a note in *The Economist* dated February 17th) at present accounts for less than six per cent of acid production. Plant to produce acid from this form of calcium sulphate costs five to six times as much as acid plant using sulphur, though cement is produced as a by-product. Nevertheless, anhydrite is an indigenous raw material for sulphuric acid available in large deposits, and new plant to use it may eventually become strategically, as well as commercially, advisable.

* * *

Control of State Steel

In the fortnight or so since the Iron and Steel Corporation assumed title to the nationalised sector of the steel industry, public attention has been directed more to its "external relations"—with the British Iron and Steel Federation—than to its internal relations with its new subsidiary companies. Relations with the federation, however, are now uneasily in abeyance, while the corporation's liaison with the publicly-owned companies is more or less active. Mr E. H. Lever, chairman of one such company, the Steel Company of Wales, last week gave voice to misgivings concerning this internal liaison which are shared by the boards of many others. He felt that the corporation's expressed policy of reserving the right to approve appointment of publicly-owned companies' senior executives would "cut right across the avowed intention of letting the companies run their own

affairs, and if carried into effect could quickly create an intolerable position."

This reservation of power, made in the corporation's first statement of policy, certainly does appear to conflict with the statutory duty laid upon the corporation of "securing the largest degree of decentralisation consistent with the proper discharge of their duties . . . under the Act." Approving senior executive appointments in 80 large steel companies, and perhaps even in their more than 200 subsidiaries, would be as thankless a task as it was useless; it is difficult to imagine how a central board in London, even when clothed with the expert counsel it now lacks, could hope to make any contribution to the selection of such specialised staff. The consequence, apart from the delay to effective decision, might be to submit outstanding individuals to further "screening" of a kind that they would rightly resent.

Mr Hardie did indeed speak of "special" senior executives only, and this phrase opens up questions of interpretation and possibilities of misunderstanding. It is probable that the corporation would consider exercising its powers of approval only in the case of exceptional appointments of managers comparable in power with, or indeed likely to become, directors of the steel companies; and even so it may not find it necessary to act in more than a limited number of cases. This whittled-down interpretation, given the circumstances in which the corporation has taken over its duties, is more understandable, though the whole chain of responsibility will need to be clarified in any long-term organisation for nationalised steel. If this is so should it not be publicly stated?

Indo-Pakistan Agreement

After seventeen months of weary deadlock, India and Pakistan have had the good sense to come to terms for a resumption of mutual trade. Ever since September, 1949, when the Indian rupee was devalued in line with sterling but the Pakistan rupee was not changed, trade relations between the two Dominions have been aloof and bitter. The Indian authorities regarded Pakistan's decision not to devalue as an attempt to turn the terms of trade against India. They also believed, quite correctly, that if trade were to cease, it would hurt Pakistan even more than it would hurt their own people. It has taken seventeen months to rub in the obvious lesson that the prices of the principal commodities that are traded between the two Dominions depend primarily on the level of world demand and not on the ratios at which foreign exchange receipts are translated into local currency. India has now accepted this fact, which had become quite unnecessarily obscured by considerations of political prestige; the Reserve Bank of India will now deal in Pakistan rupees at the official cross rate of just under Indian Rs. 69½ to Pakistan Rs. 100.

The new trade agreement is to operate until June, 1952 and covers in detail only the main commodities. Pakistan has agreed to send to India 1,000,000 bales of raw jute in the next four months; the Pakistan Jute Board will sell its entire stock of 350,000 bales so as to ensure that supplies will move quickly. Next year India is to receive 2,500,000 bales or approximately half the quantity imported before trade was brought to a standstill, and Pakistan has agreed to limit its exports to other countries. Britain, it would seem, will have a lean time as far as raw jute supplies are concerned. India will also buy as much raw cotton from Pakistan as is available; only 100,000 bales are left of this season's crop, but next year the minimum quantity will be 400,000 bales, and presumably Britain and the other markets for Pakistan cotton will go short. Pakistan is also to send 1,500,000 tons of food grains, of which 120,000 tons is to be sent before the end of June. Among the other Pakistan exports listed are cowhides and sheepskins.

India is to sell in return 2,100,000 tons of coal and 25,000 tons of soft coke, 26,400 tons of pig iron and 100,000 tons of cement. The balance is to be made up of timber, cotton and jute goods, metal goods and rubber manufactures. An important feature of the new agreement is that many of the goods, particularly those traded between the two countries, will be placed on open general licence for both imports and exports and for both countries. This, indeed, is a step towards freer trade between the two dominions and it is likely to encourage an expansion that will be to their eventual benefit.

* * *

Germany's Mounting Deficit

Germany's current deficit with the European Payments Union has recently been going from bad to worse. Its deficit in January, equivalent to \$42.1 million, was covered by further drafts from the special credit of \$120 million granted by EPU. By the end of January, therefore, Germany had completely exhausted its EPU quota of \$320 million and had used up \$78.8 million of the special credit. Unofficial reports from Paris suggest that during February the German deficit was running at the rate of about \$3,000,000 a day. If these reports are true, the special credit will by now have been exhausted and Germany will have to meet any future deficit with the EPU entirely in gold; it is likely, indeed, to have to make another substantial gold payment to EPU at the February settlement itself.

This situation calls for drastic measures. It is getting them. Germany has already announced that it must temporarily go back on all trade liberalisation measures agreed under the OEEC programme—and the granting of any licences for imports from EPU countries has been stopped for the time being. Licences already granted may be used only if payments are due after May 1st. Exception will obviously have to be made for essential imports, but the hard facts of the situation must compel the German authorities to keep the exceptions to a minimum.

It has also been reported that a representative of the Bonn government is going to Washington to plead the case for immediate and substantial United States help by way of further credits. This assistance might take the form of a liberation of the substantial dollar balances held in Germany's so-called No. 2 account. This account, which comprises the dollar counterpart of the private expenditure of American soldiers in Germany, must now run into some hundreds of millions of dollars. It has hitherto been earmarked by the United States authorities against any postwar debts due by the Reich to the Western Occupying Powers. American insistence that these debts for postwar assistance and relief should exercise a prior claim on available German funds was originally a device for protecting Germany against reparations claims by other countries, notably by Russia. It is possible, therefore, that the dollars in the No. 2 account,

which do after all represent the proceeds of expenditure in Germany and therefore past drafts on German resources, may be freed in order to allow Germany to extricate itself from its critical difficulties on its balance of payments. Even this nest egg may, however, be rapidly dissipated unless the root causes of Germany's disequilibrium are remedied. The process of finding those remedies may be very painful for some of Germany's neighbours in EPU, who have for some months been propping up their balances of payments mainly by heavy exports to the Federal Republic.

* * *

Freight Rates and Taxation

The index of tramp freight rates for January rose to 151.9, compared with 115.7 for December last, 78.8 for July last, and an average of 100 for the whole of 1948. This sudden rise of 36 points in one month, which was announced at the annual meeting of the Chamber of Shipping, brings home most effectively the fact underlined in Mr C. E. Wurtzburg's presidential address—that there are at the moment "insufficient ships to meet abnormal demands suddenly and simultaneously thrust upon the merchant fleets of the world." The index for February is, in fact, likely to show a further rise, although the volume of chartering has not been quite so steady; tonnage is still urgently needed by Government charterers for American coal, timber and grain, while the needs of India for grain from the United States are also insistent. It is significant that a rate equivalent to 140s. per ton has been paid for grain from the Gulf of Mexico to the United Kingdom; this same rate has been accepted for grain from West Australia to this country, entailing a voyage twice as long. The Australian charterers can afford to wait; the North Atlantic charterers cannot.

Despite the upward surge of freight rates in recent months, the average level of the index for the whole of 1950 was no higher than 84, compared with 82.3 in 1949 and 100 in 1948. Operating costs, on the other hand, have risen considerably above the 1948 level, and ships are still subject to costly and unnecessary delays in ports all over the world. Shipping companies are finding it difficult to set aside the sums required for replacement of tonnage; yet without the adequate replacement of obsolescent ships the industry cannot be expected to satisfy the demands made on it for tonnage, particularly in the present abnormal circumstances or in the event of war. Thus it was not surprising that the Chamber of Shipping again devoted its attention to the serious problem of financing re-equipment. The industry's resources have been practically exhausted by postwar replacement at enormously increased prices, and by the very expensive repair and maintenance of elderly ships. Yet two-thirds of the tramp section of the industry, for example, now consists of ships built during the war, with an average expectation of life now of little more than 12 years. One-fifth of the tramp fleet is over 20 years old, and should be replaced immediately; the cumulative incidence of obsolescence remains a continual problem, with shipbuilding prices far above the original cost of building. The industry is preparing a case to put before the Royal Commission on Taxation; the resolution adopted by the Chamber expressed the warning that if British shipowners are prevented by taxation from setting aside the sums required for replacement, the industry must become steadily and inevitably less able to fulfil its vital role.

gold that was sold in the open market varied from time to time, but "in recent months had been about 40 per cent." This confirms unofficial estimates that have been current for some time and brings out clearly the exceptional importance of premium gold sales to the South African gold industry. The December quarterlies published by the producing mines showed that profits from premium sales had become a main source of revenue for certain mines. The March quarterlies are expected to show a marked further move in this direction.

Mr Havenga is still battling determinedly for the interests of gold producers. He announced recently that "he would make no apology for the action he had taken in trying to obtain a better gold price for South Africa." He had no intention of giving up the concessions he had obtained. Meanwhile, he still hoped that "the time would come when justice would be done to gold producing countries"—presumably by an upward adjustment in the world currency price of gold. Mr Havenga said that when he raised this question originally with the International Monetary Fund, South Africa stood alone. "It no longer stands alone; it now has friends."

* * *

Delays to Car Exports

The motor industry has known for some months that shortage of shipping space threatened to interfere with deliveries of cars to Australia. About 6,500 cars and 4,500 chassis were actually shipped to Australia in January, but several thousand cars are now held up at the docks and factories and no improvement in shipping facilities seems possible before April. At one time it was thought that manufacturers might take advantage of this temporary check to send a larger proportion of their reduced output to North America. But the decision to switch cars from one market to another has to be taken at the start and not at the finish of production. Many of the cars now held up could not be sold in North America; they have right-hand drive and in many of their details they would not satisfy local traffic regulations. About half of them are packed for assembly in the local markets and are likely to remain crated until shipping space can be found for them. To prevent deterioration of the fully assembled cars that constitute the remainder, most of them will be sold immediately on the home market on the understanding that they are part of the year's home quota and are not an addition to it. Meanwhile, some men in the body building sections of a number of firms, including Nuffield, Vauxhall, Singer, Rover, Rootes and Jaguar, are on short time, while others have been stood off.

* * *

Wool Stocks and Prices

The war-time stocks of wool held by the Joint Organisation had dwindled to 173,000 bales by the end of December, 1950. Most of this quantity consists of Australian wool; there were only 39,000 bales of New Zealand wool in stock and no South African wool. The rapid decline of this huge stockpile—at the end of the war it amounted to 10,407,000 bales—gives some indication of the world's almost insatiable demand for raw wool in the postwar years. In five and a half years 10,234,000 bales have been sold in addition to the annual world clips, and throughout this period wool prices have moved almost steadily upwards. The entire remaining stock of 173,000 bales is to be offered for sale in the six months, January-June, 1951; most of these wools are carbonising types and of inferior quality. In the first half of the 1950-51 season sales from the Joint Organisation's stocks amounted to 302,000 bales.

Wool prices have now fully recovered from their setback in February and are likely to rise to new record levels, but the rate of increase is much more modest than three months ago. But the difference in price between fine crossbred and

merino wools has narrowed appreciably and is now only a few pence a lb. Britain, the United States and European countries have been prominent buyers. Japan is reported to have bought a sizeable quantity this week but Russian

* * *

Rise in Trade Bill Rates

The biggest of the London discount companies last week raised its quoted range of rates for fine trade bills by a $\frac{1}{4}$ per cent all round. Its range of rates for three months' paper has risen from $1\frac{1}{4}$ - $1\frac{1}{2}$ per cent to $1\frac{1}{2}$ - $1\frac{3}{4}$ per cent, for four months' discounts from $1\frac{1}{4}$ - $1\frac{1}{2}$ to $1\frac{1}{2}$ - $1\frac{3}{4}$, and for six months' from $1\frac{1}{4}$ - $1\frac{1}{2}$ to 2-3. These rates, of course, do not apply to bank acceptances; the latter remain unchanged at $11/16$ per cent for three months' bills and $\frac{3}{8}$ per cent for six months' bills.

It would be wrong to suppose that this rise represents any sudden change in market policy. Many discount houses have for some time had more applications for bills than they can comfortably handle; they have accordingly discriminated more finely in their purchases and rates have generally drifted upwards towards the top of the published spread. The increase now announced may be little more than a recognition of this tendency. The increased demand for finance by trade bills springs partly from the rise in world prices and partly from the return of trading in certain commodities to private hands; the market is expecting, for example, a sudden flood of softwood bills at the end of this month. In addition, of course, the runaway increase in commodity prices has necessarily led to an increase in the risks run in financing the carrying of stocks; some people in the City believe that these increased risks will eventually have to be reflected in other rates besides those on trade bills.

Shorter Notes

Lloyd's underwriters and the marine insurance companies are to increase marine hull insurance premium rates by 10 per cent on the next renewal. Present renewal rates are themselves subject to a sliding scale increase dependent upon the claims experience during the preceding three years. The general increase in the cost of marine insurance is the first since the war. Hull rates were reduced in the autumn of 1945 in the expectation of decreased casualties, but in fact

the experience worsened, although there has been some slight improvement since the end of 1948. The devaluation of sterling itself put up the cost of repairs in hard currency countries by more than 40 per cent. Repair costs both at home and abroad have increased through rises in the cost of labour and materials: at home the ever-increasing demands on the shipyards have meant a further increase in the charges for repair work. Profits of hull underwriters have no doubt become too fine to make the business attractive at existing rates. A substantial part of marine premium income is for overseas account: to the extent that increased premiums are not absorbed by higher overseas repair costs, therefore, the country's invisible income will be increased.

Price restrictions on imported softwood were removed this week. Since the partial reversion to private trading in timber, buying prices necessarily vary from consignment to consignment, and in such conditions price control becomes unworkable. In future, timber traders will be able to sell privately imported softwood and softwood purchased from Timber Control at prices based on their purchase prices. The Board of Trade stated that it was fully aware that world timber prices had risen since last April, when the Control's selling prices were fixed, and that some rise in timber prices in this country was inevitable. The timber trade, however, has agreed to the suggestion of the President of the Board of Trade to set up a committee, including consumers' representatives, to deal with price and distribution problems. It has also assured the President that softwood would be sold at prices that would allow only a reasonable margin of profit.

The first insurance office to publish its 1950 accounts, the Scottish Widows' Fund, reports record net new sums assured of £12,043,097 and new annuities under staff pension

schemes of £716,340 per annum. The net yield on the life and annuity funds rose to £3 18s. 1d. per cent. Investments in ordinary shares jumped by over £4,500,000 to £16,297,444; this represents as much as 30.2 per cent. of the total assets (22.8 per cent. in 1949) compared with an average in 1949 of 10.3 per cent. for the leading offices. In his speech the chairman, Sir Ian Bolton, stated that in the past few years the Society has thought it wise to increase the proportion of the assets held in ordinary shares both in this country and in the United States.

A further list of steel compensation values includes the £1 ordinary shares of Steel Company of Wales, for which 25s is to be paid in Steel Stock, and of John Lysaght's Scunthorpe works £1 shares which are to be taken over at par. Compensation terms for some 114 securities have now been agreed, involving total compensation of £221 million.

The directors of United Molasses have been allowed by the Capital Issues Committee to make a capital bonus of one 6s. 8d. share for each such share held. They sought to make a 200 per cent. issue—in other words, to restore the cut that was made in the capital in 1934. This proposal was not acceptable to the Treasury. It would be interesting to know what scholastic arguments, based on the absurd directives under which the CIC is supposed to work, could be held to justify the half measure and to reject the full proposals.

On page 336 of *The Economist* for February 10th, the average monthly output of cotton yarn was given as 20 million pounds. This was actually the weekly production figure; monthly output is probably averaging 80 million pounds compared with 47 million for wool yarns and 34 million for rayon.

Company Notes

Leyland Motors.—Leyland Motors are to be congratulated not only on an excellent trading result, but also on the rich detail of their accounts. The advance in group trading profits from £1,993,929 to £2,187,686 has been achieved against the unhelpful background of the doubling of the fuel tax, the incidence of purchase tax on the selling price of vehicles, the revision of the permitted length and width of public service vehicles and the difficulties of road hauliers operating under "A" and "B" licences. Despite a progressive rise in costs—the wage bill of the parent company, for example, has risen from £2,975,517 to £3,112,731 while the number of employees has fallen—the company have reduced the burden of overhead costs, expanded total deliveries from 6,291 to 6,386 vehicles, and have increased turnover from £15,435,817 to a record figure of £15,721,213.

	Years to Sept. 30, 1949	1950

Ordinary capital	1,350,000	1,350,000
£1 ordinary stock at £5 yields £5 per cent.		

The chairman points out that today's replacement values are estimated at three or four times the book value of assets and expresses serious concern that the Inland Revenue cannot allow adequate provision for replacement before arriving at taxable profits.

The company have, therefore, been forced to appropriate £500,000, against £200,000, from net profits to make provision for replacement and to transfer £1 million from a stock depreciation reserve to replacement reserves which now total £1.9 million. In these circumstances, equity shareholders should feel well satisfied with the increase in the ordinary dividend from 20 to 25 per cent; this is coupled with the tax free bonus of 2½ per cent from the surplus on the sale of fixed assets, against a similar bonus of 5 per cent in the two previous years. A table in the report shows that the gross ordinary dividend represents no more than 4.5 per cent of the employed equity capital against 3.8 per cent for 1949.

Shortages of certain materials for civilian production will become increasingly serious in the future, but the chairman expects that the company will secure its fair quota of available supplies to meet the needs of home consumers and to maintain "in the national interest" the export programme. Orders received in the first three months of the current financial year are substantially higher than in the same period last year. The company, moreover, are prepared to accept—and, in fact, have already accepted—heavy responsibilities for rearmament work "at profit rates sufficient only to maintain intact the legitimate financial interests of stockholders."

English Electric.—After the preliminary results of English Electric were announced, the £1 ordinary stock units, which had previously changed hands around 53s., were bid at 65s. This jump is a fair reflection not only of record profits and of the substantial rise in the ordinary dividend but also of the directors' statement that output and earnings

are sufficient to support the new rate of 15 per cent in the likely trading conditions of the future. Group trading profits in the year ended December 30, 1950, have risen by more than £1.4 million to £4,153,553 and the directors, by raising the ordinary dividend from 10 to 15 per cent, have not disappointed equity shareholders in passing on some of the benefits of a remarkable year.

This is, in fact, the first change in the dividend rate since 1937; in the past shareholders have waited patiently while the company has augmented its reserves and now this policy has borne fruit. The dividend is paid on the enlarged capital of £4,128,520 and is handsomely covered more than three times by group earnings. The short fall of

	Years to Dec. 31, 1949	1950
Consolidated earnings:—		
Trading profit	2,725,480	4,153,553

Ordinary capital	3,538,731	4,124,520
£1 ordinary stock at 62s. 6d. yields £4 10s. per cent.		

depreciation allowances based on historical costs to meet actual replacement costs can be measured by the appropriation of £55,000 to a depreciation equalisation reserve over and above the normal provision of £848,818; in 1949 there was a supplement of £93,325 to the normal provision of £678,241.

English Electric's expansion is reflected in last year's expenditure on fixed assets of £702,048 and in the steady increase in turnover which has resulted in a rise in the group's stocks and work in progress by £4.2 million to more than £25 million and in debtors by £2.9 million to £12,678,342. Nor has the pace slackened for the £4 million of new money raised last year on the ordinary and debenture issues is still supplemented by bank overdrafts to the parent and its subsidiaries of £5.1 million, against £5.6 million in 1949. The financial burden of stocks is eased somewhat by the credit of £10,176,705, against £9,172,725, for payments received on account. Working capital has kept in step with this expansion and now stands at £11.5 million, while cash is also up from £416,964 to £924,058.

English Electric, as the record flight of the Canberra bomber shows, has an important role in the nation's defence programme. This may mean some changes of production, though perhaps fewer for a supplier of basic equipment—as English Electric largely is—than for the general run of engineering concerns.

Bowater Paper.—Although newsprint represented more than two-thirds of the paper produced by the Bowater organisation in Britain, profits at home were largely derived from other sources, particularly from businesses engaged in the conversion and processing of paper and boards. Overseas subsidiaries, especially Bowater's Newfoundland Pulp and Paper Mills, which found a ready market for its products in the United States, made an important contribution to the substantial rise in group trading profits from £3,693,202 to £5,395,488. The trading results of the Scandinavian pulp mills were not, however, so favourable, but their output, the whole of which is absorbed by the British paper mills, was of the utmost value in maintaining the production of these latter mills in the prevailing conditions of scarcity.

In view of the sustained improvement in the earnings, principally in dollars, of overseas subsidiaries, the dividend of 15 per cent on the enlarged ordinary capital, against 12½ per cent in 1948-9, was felt to be justified. As the dividend is covered more than seven times by distributable earnings, the increase may look modest, but the directors, who express considerable anxiety over the growing scarcity and rapidly rising prices of raw materials, have further strengthened the reserves to provide against price fluctuations. The strength of this buttress can be gauged by the rise in the book value of revenue reserves from £4,351,965 to £5,188,701.

The proceeds of the issue of 300,000 £1 ordinary shares at 37s. 6d. and 300,000 £1 preference shares at 30s. are reflected in the addition of more than £2,170,000 to group cash balances which now total nearly £4,208,000. Net current assets now amount to £12,757,000, against £8,710,000, but the financing of the growing volume of raw materials at rising prices calls for the employment of increasing amounts of working capital. In addition, the capital development programme makes a large claim on working capital; outstanding commitments are estimated at £1,215,000. The resort to acceptance credits, which with bills payable now total £2,128,746, underlines the persistent problem of financing stocks, which now stand at £9,930,299 against £9,199,156.

As for the future, the demand for newsprint is much in excess of available supplies. In the United States, annual consumption exceeds the 3,458,000 tons consumed in 1938 by more than two million tons. In Britain, despite the reduction in size, newspapers consume as much as two-thirds of prewar

consumption. The inadequacy of present supplies is due in part to the switching of mills and machines to the production of other more profitable grades of pulp and paper. To meet this difficulty Bowaters are speeding up and modernising existing machinery and installing new plant. It is probably, however, on the success of the corporation's policy of diversification that equity shareholders should pin their hopes of satisfactory dividends in the years to come.

Decca Record.—The accounts of Decca Record for the year ended March 31, 1950, reflect "the recession in profits foreshadowed in the chairman's speech," but references to the progress of the development programme in the directors' report suggest that the company is beginning to pull clear of the trading troubles of recent years. The active American buying of the ls. Ordinary shares early this year lends some support to this possibility. Comparison of trading results over the last two years may well prove to be misleading as the development accounts of London Gramophone and Decca Navigator were closed on March 31, 1949, and the results of the first year's trading have now been included in the group accounts. It must be recorded, however, that while group trading profits have risen from £301,204 to £349,707, trading profits in the parent company's accounts have fallen from £305,210 to £189,347. Whatever may be inferred from these results, the company have been able to maintain the Ordinary dividend at 112½ per cent.

The Decca group have concentrated on the development of several new ventures, including marine radar devices, navigational aids and long-playing microgroove records and on the cultivation of overseas, particularly American, markets. This programme has meant capitalising heavy development expenditure totalling £710,000 in addition to a goodwill and patents account of £340,000. These entries constitute a considerable proportion of group assets and entail important claims on future earnings. Finance for this expansion has come largely from secured bank accommodation, which now totals £1,131,763, against £854,477.

What then does the future hold? The hiring of Decca Navigator equipment showed "an increase in the year" and rental income from this source was more than 50 per cent above that of the previous year; the Navigator company, in fact, showed a net profit of £31,047 after capitalising £50,372 of development expenditure, as against £215,260 so capitalised in the year to March, 1949. In the current year contracts for hire of navigators have expanded to more than a thousand installations and the company's licensees, Telefunken, have received a contract to construct a chain of installations in West Germany as a navigational aid to civil aircraft. Since June, 1950, substantial contracts for Decca radar equipment have been placed by the Royal Navy, Swedish and other naval authorities and merchant shipping companies; up to date, orders to equip 750 ships have been received. Since August, 1949, large numbers of long-playing records have been exported to the United States and Canada and in the current year these records have been sold on the British and export markets. As a result, turnover in all sections of the business for the current year "shows a marked increase in comparison with that of the same period of the previous year" and "present indications point to a satisfactory outcome of the year's trading." The yield at the current price of 17s. 6d. of £6 12s. per cent reflects something of the risks that have inevitably accompanied this bold policy, but investors may regard the issue of one ls. share for every ten held at 5s. a share as an acceptable bonus.

Statistical Summary

EXCHEQUER RETURNS

For the week ended February 24, 1951, total ordinary revenue was £138,210,000, against ordinary expenditure of £44,502,000 and issues to sinking funds £100,000. Thus, including sinking fund allocations of £15,103,000, the surplus accrued since April 1st is £749,677,000 compared with £631,725,000 for the corresponding period a year ago.

COMPANY MEETINGS

THE ZAMBESIA EXPLORING COMPANY TRIBUTE TO FORMER CHAIRMAN

The annual general meeting of The Zambesia Exploring Company, Limited, was held on February 23rd at 20, Aldermanbury, London, E.C.

Sir Ulick Alexander, G.C.V.O., K.C.B., C.M.G., O.B.E., the chairman, who presided, said:

This is the first occasion I have had the honour of presiding at your annual general meeting and as the composition of the board has changed so markedly since your meeting last year, owing to the resignation of your late chairman, I feel it is one of my first duties to explain how these changes came about.

I do not think, however, they can have taken you entirely by surprise, as you will remember Mr Hely-Hutchinson fore-shadowed some such possibility at the annual general meeting last May. He already foresaw that in any capital reorganisation of Tanganyika Concessions there would be some conflict of interests between the preference and ordinary stockholders. Your company being a large holder of the preference, Mr Hely-Hutchinson decided he could not continue to be chairman of both companies, and that some member of your board who was not on the board of the Tanganyika Company, and would therefore have a free hand in any negotiations, should succeed him. He therefore resigned the chairmanship, but to the satisfaction of all his colleagues he consented to continue to serve as a director. In this way your board much hoped that they would continue to have the advantage of Mr Hely-Hutchinson's valuable advice, and it was a loss which was keenly felt by all his colleagues when he decided a little later his work and responsibilities in other spheres had so greatly increased that he reluctantly felt obliged to resign from the board.

I should here like to record the valuable services Mr Hely-Hutchinson gave to the company during his leadership. If you look back, you will find that during the period of his chairmanship there has been steady and undisturbed progress in the company's business, culminating in the present results, which I feel stockholders will agree with me are not unsatisfactory.

By his resignation your board feel that they have lost a very valuable colleague, whose guidance and handling of the company's affairs were of the highest order in the interests of stockholders.

THE YEAR'S RESULTS

The following are extracts from the directors' report and chairman's review circulated with the report:—

The profit, after deduction of £3,500 for United Kingdom taxation, arrived at after allowing £179,787 in respect of sale of shares to Tanganyika Holdings, Limited, as a loss for taxation purposes, and including an amount of £86,475 written off in respect of such loss on sale, amounted to £78,533, to which has been added the balance of £65,269 brought forward from 1949. From the resulting total of £143,802 an interim dividend of 3 per cent, less tax, has been paid and provision made for the proposed payment of a final dividend of 5 per cent. and a bonus of 5 per cent., both less tax. After these appropriations there remains a balance to be carried forward of £81,931; 361,659 8 per cent. cumulative redeemable preference shares and 216,995 ordinary stock units of Tanganyika Concessions, Limited, received in exchange for old preference stock under that company's capital reorgani-

sation scheme, have been sold to a wholly owned subsidiary company, the Zambesia Investment Company, Limited, to be held as a fixed investment.

The company's interests in Geita Gold Mining Company, Limited, Kentan Gold Areas, Limited, Rhodesia-Katanga Company, Limited, and Uruwira Minerals, Limited, have been sold to Tanganyika Holdings, Limited, and a 50 per cent. interest in the share and loan capital of the latter company is now held.

TANGANYIKA CONCESSIONS, LIMITED

For the year ended July 31, 1950, results showed a profit of £589,022, after providing £186,563 for taxation. Dividends were paid on the preference stock and the ordinary stock at the rate of 10 per cent. and 12 per cent. respectively, less tax, in October last. Union Minière du Haut Katanga paid, during 1950, a dividend of 480f. net per share for the year 1949.

GEITA GOLD MINING COMPANY, LIMITED

Gold production for the year ended June 30, 1950, was 30,524 oz., as compared with 28,038 oz. for the year ended June 30, 1949. For the six months to December 31, 1950, the output was 16,334 oz. of gold. The estimated ore reserves at June 30, 1950, were 2,280,456 tons, at 3.8dwt. per ton, compared with 1,612,684 tons at 3.9dwt. per ton at June 30, 1949.

The report and accounts were unanimously adopted.

SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY

RECORD VOLUME OF BUSINESS

The one hundred and thirty-seventh stated annual meeting of the Scottish Widows' Fund and Life Assurance Society was held in the society's head office, Edinburgh, on February 27, 1951.

Sir Ian Bolton, Bt., O.B.E., C.A. (chairman of the ordinary court of directors), presiding. In moving the adoption of the report and accounts, which were taken as read, the chairman said:

I am able to report that we have again completed a larger amount of business than ever before. It is worthy of note that not only the total, exceeding £12 million for the first time, but also the ordinary assurances of over £9,250,000 and the assurances associated with group pension schemes amounting to over £2,750,000 are all record figures for the fifth successive year.

The unique facilities afforded by life assurance are being increasingly recognised by the public but not everyone is aware of the special uses to which it can be put. For example, there is no better way of providing for death duties, and to those who are interested in the question our skilled staff will be pleased to give the benefit of their advice. For whole-life policies to meet death duties and for temporary assurances to cover the period of liability after the granting of an *inter vivos* gift, the society can offer terms which are among the cheapest on the market. Within the past few months we have introduced new and considerably reduced rates of premium which I commend to your attention.

PENSION SCHEMES

The demand for pension schemes arranged by the society continues to grow. It is now widely appreciated that there are many advantages to be gained by employers and their staffs in establishing a formal pension plan, and the Society, with its experience of

hundreds of schemes, is always ready to discuss the question with those who may have a scheme in contemplation, and to advise them on the plan which will best meet their requirements. Not the least of the advantages of introducing a pension scheme are the income tax reliefs which can be obtained by both employer and staff and which are granted by the Inland Revenue to encourage this form of provision.

COMPLEX INVESTMENT PROBLEMS

The continued progress of our Society presents the directors with many complex problems, and perhaps the most important is the investment of our expanding funds. Last year the premium income, as you will see from the report, rose by more than £550,000 to £4,600,000, and the funds increased by £3,2

MANCHESTER SHIP CANAL COMPANY

INCREASED NET REVENUE

The ninety-third ordinary general meeting of this Company was held, on February 26th, in Manchester.

The chairman, Mr. Leslie Roberts, C.B.E., in the course of his speech, said:

The net revenue for 1950 was £887,141, an increase of £12,492 over the previous year. To the net revenue figure must be added £24,138 brought forward from the previous year. After setting aside £165,000 for income tax and deducting £345,556 for loan and debenture interest there remains £402,723 for dividends and reserve.

After appropriating £35,000 to the reserve for contingencies, your directors recommend that, out of the balance of £367,723 the following dividends, amounting to £349,692, should be paid:—

3½ per cent. on the Manchester Ship Canal Corporation 3½ per centum preference stock.

5 per cent. on the preference shares.

3 per cent. on the ordinary shares.

This leaves £18,031 to be carried forward to next year's account.

RECEIPTS AND EXPENDITURE

Receipts from tolls, ship dues, traffic rentals, towage and sundry receipts increased by £147,249.

Expenditure also increased—by £62,895. Of this amount dredging accounted for £33,000, maintenance for £17,000 and traffic expenses for £20,000. Towage, however, showed a decrease of £23,000, the tug reconditioning programme having been virtually completed in the previous year.

RENEWALS OF PLANT AND MACHINERY

The total amount set aside out of the year's revenue in 1950 to cover renewals of plant and machinery was £350,402. That is £82,000 more than in 1949.

Those of you who have copies of the complete accounts will see on page 11 an additional section headed "Analysis of Repairs and Renewal Accounts, etc."

As the analysis shows, the total standing to the credit of these accounts is £1,797,000, against £1,745,000 a year ago. The increase of £52,000 is, of course, the difference between the amounts credited in 1950 and the amounts charged in that year for repairs and renewals.

But for the shortage of labour and materials considerably greater expenditure would have been incurred and charged against these accounts. You will realise that the deferment of expenditure on essential works in a period of rising costs makes it necessary for our provision accounts to be maintained at the highest possible level.

SURVEY

To conclude, I would say this: It is a commonplace that we live in a world beset with uncertainties of almost every conceivable kind. They add enormously to our difficulties. They make it rash to attempt any kind of forecast of the future. The essential facts are that our undertaking is a great and a growing one: that it is now on a sounder basis than ever before; and that the port's place among the major ports of the country has never been more substantial. We have to do two things. One—and very important—we must, as best we can, attempt what has been called the "masterful administration of the unforeseen." Secondly—and this is still more important—we must rely upon the old-fashioned and fundamental virtues of loyalty, integrity and hard work.

THE LAW DEBENTURE CORPORATION

MR ROBERT R. J. TURNER'S SPEECH

The sixty-first annual general meeting of The Law Debenture Corporation, Limited, was held on February 23rd at Winchester House, Old Broad Street, London, E.C.

Mr Robert R. J. Turner, O.B.E., the chairman, in the course of his speech, said: Turning to the accounts for the year, I will now run through the principal items in the balance sheet.

On the debit side capital authorised and issued remains unchanged. General reserve has been brought up to £300,000 by the inclusion of £5,000 from the profits of the year. No reserve is required for income tax, and, in fact, there is a credit of £3,075 for tax recoverable, which is shown on the assets side of the balance-sheet. Similarly, the provision for profits tax is less by £1,573.

INCREASED VALUE OF SECURITIES

On the assets side the book value of our securities has increased by some £27,600. There has, however, been a decrease of nearly 3 per cent. in our holdings of British Government stocks, bonds, debentures and notes, and in this connection it must be borne in mind that through the incidence of profits tax we suffer taxation to the extent of 6½ per cent. on interest from all such securities. Our total holding of sound Ordinary stocks at £394,000 has risen 8 per cent. and Preference stocks at £377,000 have been decreased by 6 per cent. Fixed interest stocks still amount to 70 per cent. of our portfolio. The market value shows an appreciation equivalent to 19 per cent. on the figure at which the investments are shown.

PROFIT AND LOSS ACCOUNT

The total receipts for the year were £122,802, or £5,498 less than in 1949.

Income from interest and dividends is up by £2,160. Trustee fees show a drop of £870, but in 1949 we received a payment of £1,500 representing several years' arrears; thus there was, in fact, a small increase of £630 excluding this non-recurring item. I am glad to say that present indications are that our revenue from this source should show a further modest increase for the current year, which is satisfactory. Profit on realisation of securities at £9,295 is lower by £6,716.

Income-tax and profits tax, which may be considered together for the purposes of this review, are less in aggregate by £4,461, which is the only change of any magnitude, and results from the lower profit on realisation of securities and from increased receipts from dividends from companies which have already paid profits tax.

DIVIDEND RECOMMENDATIONS

With the addition of £7,513 brought forward from 1949, we have a net sum available of £54,138. After allocation of £5,000 to general reserve, paying the dividend for the year on the 5½ per cent. Cumulative Preference stock and the interim dividend of 6 per cent. on the Ordinary stock, the directors now recommend payment of a final dividend of 8 per cent., making a total of 14 per cent. gross on the Ordinary stock for the year 1950, which will leave £1,200 to increase the carry forward.

While the year under review has not been an unsatisfactory one, the outlook for 1951 is uncertain in view of the international situation and the efforts of the Government to tackle the rearmament programme at home. However, in the absence of any major calamity no serious diminution in revenue is anticipated.

The report was adopted.

LEEK AND MOORLANDS BUILDING SOCIETY

RECORD LEVEL OF ADVANCES

The annual general meeting of the Leek and Moorlands Building Society was held on February 26th at Leek, Staffordshire.

Sir Ernest Johnson, J.P., the president, in the course of his speech, said: The year 1950 has gone, but has left its mark on our economy.

The clamour for increased savings is heard by the man in the street whose avowed purpose is to preserve the rights and freedom of a democracy. The Government has rightly appealed to the people for more savings.

What is the reaction of savers who are thrifty people but who continue to read of high Government expenditure—of deficits on nationalised undertakings—of waste and extravagance in the administration of Government departments? I urge—may I ask the Government of the day to set the nation an example.

CHAIRMAN'S ADDRESS

In moving the adoption of the report and accounts, Councillor Gilbert Tatton, the chairman, said:

During the year your directors advanced a sum of £5,068,000 on 4,500 mortgages. This sum is the highest figure ever advanced in any single year in the history of the society. I wish to assure you, however, that extreme care has been exercised in the selection of the mortgaged securities, and at no time in the history of the society have your directors been better pleased with the state of the mortgage accounts.

The society has continued its policy of endeavouring to satisfy first of all the demand for mortgages on private residential properties. Your directors do not accept for mortgage purposes industrial risks of any kind, and the large majority of our 21,649 mortgages comprise advances on private residential property mainly for own occupation.

Shareholders have been credited with interest at 2½ per cent., income tax paid by the society, and the net result of our year's workings is that there is a surplus of £73,000 which it is proposed to put to the general reserve funds of the society. From the "carry-forward" it is proposed to allocate a sum of £2,000 to the contingency account, bringing the contingency reserve to £25,000, and the total reserves and "carry-forward" now exceed £825,000.

So we finish the year with a balance-sheet strength of £19,558,000.

VICE-CHAIRMAN'S REMARKS

Seconding the motion, the vice-chairman, Mr F. Leslie Davenport, J.P., said: I should like to make one observation, and that is to refer to the serious item of profits tax which building societies, including our own, are called upon to pay.

It could never be argued that building societies are profit-making institutions in the accepted sense. The most that any building society seeks to earn is the modest rate of interest it has pledged itself to pay its savings members, plus a prudent amount to set to reserve. As profits tax was really imposed to mop up the very high ratio of profits which some concerns were able to, and are able to earn as a result of present-day conditions, I do hope that the Chancellor will look again and see whether or not some relief can be afforded to building societies which, after all, are voluntary thrift organisations performing a useful economic task.

The report and accounts were adopted.

HAMPTON TIMBER COMPANY, LIMITED

MR C. J. F. SAVILL ON THE PROSPECTS

The twenty-second annual general meeting of the Hampton Timber Company, Limited, was held on February 28th in London, Mr C. J. F. Savill, J. P., M.Inst.B.E. (chairman and managing director), presiding.

The following is the chairman's review which had been circulated with the report and accounts for the year ended March 31, 1950:—

Ladies and Gentlemen, I regret the lateness of the balance sheet and accounts due to factors beyond the control of the directors which, I am glad to report, have now been overcome.

During the year under review your company traded under difficulties caused largely by the disorganisation in production ensuing from the serious fire which took place at the mills in 1948. I am now, however, in a position to tell you that the insurance claim which was outstanding at the last meeting in respect of this fire has now been settled entirely to the directors' satisfaction.

This delay in settlement of the insurance claim clearly hampered trading throughout the year under review. Processing is now in full production, so I am now able to say from the trend of trading in the year 1950-51 that the company is going forward to its original profit-earning basis.

Your subsidiary companies naturally felt the effect of the parent company's difficulties, and in the circumstances I consider their results are satisfactory. Your subsidiary company in South Africa is making good progress.

GOVERNMENT CONTROLS

Your company, like all other members of the timber trade, has suffered from Government controls, but for some time now our trade has been granted partial freedom in buying. Several sources of supply are now open for us to negotiate our own purchases; hard-currency countries and countries behind the Iron Curtain, of course, being forbidden.

This has meant some improvement to the trade, although it is well for the public to know that these foreign suppliers are in a position to demand their own prices, and their prices are very much higher now than they were a year ago. This position would have been the same, however, in these directions, even if Government buying had continued.

I feel that the public are liable to misinterpret that now the trade is partially allowed to carry on its own buying, selling

NOTICES

NATIONAL BANK OF INDIA LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the Bank will be closed from March 14th to March 27th, both days inclusive. By order of the Board.

T. T. K. ALLAN,
General Manager.

26 Bishopsgate, London, E.C.2.
February 27, 1951.

MARKET RESEARCH

An exceptional opportunity exists in the rapidly expanding Market Research Department of a nationally known manufacturer. An Assistant to the Manager is required with market research experience, capable of initiating and controlling consumer surveys, and all other forms of research, including the writing of comprehensive reports. Please write, stating details of past experience and any qualifications in statistics or economics. All replies will be treated in the strictest confidence.—Box 532.

INFORMATION Bulletins, Journals of Societies or Institutions: editing, design, layout and finalisation of text for printer. Moderate fees. Inquiries from embassies, literary, social and industrial bodies.—Box 533.

prices in the United Kingdom are very much higher. This is not so; it is merely the circumstances of demand being much greater than supply, a position of which the Government were and still are fully aware.

The demand for processed timbers is greatly increasing, and your company, with its extended connections where freedom of buying is allowed, is fortunately in a position to procure the necessary raw materials for its increased trading.

CAPITAL STRUCTURE PROPOSALS

The directors, as you know, have had under consideration the wishes of the shareholders as to the possible reorganisation of the capital structure of the company; in consequence they propose for your consideration a revision of the capital reserves to increase the ordinary share capital by the sum of £40,000 and the distribution of these additional shares to the shareholders. The recommendations and the necessary resolutions applicable will be laid before you for your approval today.

Preference shareholders will readily notice that the directors have given every consideration to them by the allocation of four fully paid ordinary shares for every two preference shares they hold. They will, therefore, enjoy the benefits of this distribution with the ordinary shareholders; in exchange for which your directors recommend the surrender by the preference shareholders of their participating rights as at present existing in the company's articles of association. I feel you will agree that the distribution of ordinary shares very reasonably compensates preference shareholders for the rights they surrender.

We are almost at the end of another year of the company's trading, and figures for the period of nine months, ending December, 1950, distinctly show the upward trend in the company's trading that I have already intimated to you. This also applies to the trading of the subsidiary companies, and I consider that the extreme difficulties under which the company has been trading in the past two years have now been almost surmounted, and the future years appear to be definitely more hopeful than the past two years. Your directors are aiming to lay before you the accounts for the year ending March, 1951, at an early date following this meeting, subject, of course, to any unforeseen circumstances arising.

CHAIRMAN'S REMARKS

Addressing the meeting the chairman said: Comments are often made in the press regarding amounts paid to directors: may I say that regarding your company the directors are full-time working directors. For many years it has been the policy of your board to encourage the staff to become direc-

tors of the company. This policy has provided you with a board of directors who possess a thorough practical knowledge of their trade in their respective categories and the misfortune that happened to your company through the disastrous fire was primarily overcome by this asset and the keenness and energy shown by them, and also by the staff and employees of the company. I am proud to refer to and thank them on your behalf. Your company having now reverted to its normal activities, I feel sure that the next accounts to be laid before you will be far more satisfactory than those before you today.

The report and accounts were adopted and at separate class meetings and a subsequent extraordinary general meeting resolutions were passed reorganising the capital structure and amending the rights of both classes of shareholders.

KILLINGHALL (RUBBER) DEVELOPMENT

DIVIDEND OF 40%

The forty-first annual general meeting of this company was held on February 21st in London, Mr. Jack Addinsell, the chairman, presiding.

The following is an extract from his circulated statement:

Profit for the year, before deduction of tax, amounted to £32,960, showing an increase of £12,284, mainly accounted for by additional revenue from tin tribute, amounting to £4,564, and increased profits from rubber of £6,276. An interim dividend of 10 per cent. was paid on August 31st last; £15,928 has to be paid in taxes, and the board recommend a final dividend of 30 per cent.

Subject to there being sufficient labour and to security conditions, the programme provides for replanting a further 90 acres in 1951. There has, however, been a serious shortage of field labour during the year, and while the position has been partially met by mechanical methods of upkeep, there are still arrears of clearing up to be completed, and the rate of progress over the next few months will determine what new replanting is undertaken during the current year.

The outlook is promising provided no misfortunes arise as a result of the emergency situation. Benefits should be derived from the higher prices for rubber, although there must be some reduction in crop as a result of areas cut out for replanting, and the increased rate of export duty has to be taken into consideration. The revenue from our tin interest should show increase, subject to the high prices for this commodity also continuing.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR

Applications are invited for the post of Assistant Lecturer or Lecturer in the Department of Economics. Preference will be given to candidates with some specialist knowledge of Economic Theory. The salary of an Assistant Lecturer is £450 x £50 — £500 p.a. and of a Lecturer is £550 x £50 — £1,100 p.a. In addition there will be F.S.S.U. benefits and family allowances. The appointment will date from October 1, 1951. Twelve copies of the application should reach the undersigned, from whom further particulars may be obtained, not later than March 24, 1951.

KENNETH LAWRENCE,
Secretary and Registrar.

FOR SALE.—Economist, bound volumes from January, 1939, to June, 1942; unbound copies from July, 1942, to December, 1948 (18 copies missing).—Offers to Box 587.

YOUNG MAN (26), B.Sc.(Econ.), I.I.A. student, five years' engineering shop floor experience, at present in rut as progress chaser, seeks post with possibilities, pref. near London.—Box 590.

ECONOMIST and statistician, writing ability, long experience trade association work and negotiating with high business executives, good war record, seeks change.—Box 593.

THE BOND STREET STAMP AUCTIONS

The H. R. Harmer Saleroom is the Mecca of all serious Philatelists. The auctioneers of the "Hind and Roosevelt" Collections invite you to contact them if you have fine stamps or Collections for disposal. If you wish to buy, write for Catalogue subscription blank. Airmail editions of Catalogues are available six to seven weeks in advance of Sales. To all serious Philatelists, the H. R. Harmer Service is indispensable.

H. R. HARMER, LTD., 39-42, New Bond Street, London, W.1.
Te. No.: MAY, 0213. Cables: "Phistamsel London."

LITERARY LUNCHEON arranged by the London Conservative Union at 12.30 p.m. in the York Hall of the Caxton Hall, S.W.1, on Tuesday, March 6th. Mr. Roy Harrod will talk on his new book, "The Life of John Maynard Keynes." The Chair will be taken by the Rt. Hon. Richard Law, M.P. Tickets at 5s. each, including buffet lunch, may be obtained from Mr. Humphrey Berkeley, Trafalgar House, 9 Whitehall, S.W.1.

ADVERTISER (British) seeks administrative post requiring a practical knowledge international finance trade and commerce in Europe and Far East. Excellent German. Established contacts and experience import/export trade arising out of 25 years' experience London and residence Europe.—Box 591.

ASSISTANT SECRETARY—British Nylon Spinners Limited have an immediate vacancy for an Assistant Secretary at their Head Office at Pontypool, Monmouthshire. Candidates, aged over 30, should be Barristers or Solicitors with outstanding ability with a commercial flair and previous experience in industry or commerce. This is a senior appointment which is pensionable and will carry a salary and prospects in keeping with the rank and responsibilities of the position.—Write to Personnel Manager, Pontypool.

APPLICATIONS ARE INVITED for a senior position in a well-known company engaged in the manufacture of proprietary and bulk chemicals, detergents, sterilising agents, etc. This is a new position being created to relieve the Managing Director, who is also responsible for the control of other companies in the Group. The position calls for a man of personality and initiative, able to work with existing senior staff, some of whom have had long service with the company. The qualifications required include comprehensive experience of production, distribution, marketing and general control at management level. The position will provide outstanding opportunities for increased responsibility and remuneration. Commencing salary £1,500. Age 33-45.—Apply, with full details of experience and qualifications, to Box 579.

NO matter what product you have to offer, you will achieve a profitable enlargement of your market, through effective advertising. Why not discuss the matter with Samson Clark and Co., Ltd., 57/61, Mortimer Street?—Museum 5050.

FOR SALE—Economists, 1946 (two missing), 1947 (three missing), 1948 and 1949 complete, 1950 (two missing).—Offers to Box 588.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111, Broadway, New York, 6.—Saturday, March 3, 1951.

UNIVERSITY OF LONDON

A course of two lectures on "The Individual and the State" will be delivered by Professor Sir Alexander Gray (Edinburgh) at 5 p.m. on March 9th and 12th at London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. March 9th: The Individual and the State in Adam Smith; March 12th: The Individual and the State in Friedrich List.

ADMISSION FREE, WITHOUT TICKET.
JAMES HENDERSON, Academic Registrar.

THE UNIVERSITY OF MANCHESTER

JOINT SECRETARIES OF APPOINTMENTS BOARD

Applications are invited for the two posts of Joint Secretaries of the Appointments Board vacated by the appointment of the present Secretary to an industrial post and by the impending retirement of the other Joint Secretary. Candidates should be under the age of 40 years and it is hoped to appoint one Secretary with experience of a scientific and industrial nature and one with knowledge of administrative careers. A University degree is desirable. Salary from £550 to £1,200 per annum according to age and experience. It is hoped that, in one case, the officer could take up duty in April/May and the second in August/September. Applications should be made not later than March 15, 1951, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER IN ECONOMICS with special interests in the field of economic and industrial organisation. Salary scale £500 to £1,100 per annum, with membership of the F.S.S.U. and Children's Allowance Scheme. Initial salary according to qualifications and experience.—Applications should be sent not later than March 31, 1951, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF DURHAM

THE DURHAM COLLEGES

Applications are invited for the post of LECTURER IN ECONOMICS which will be vacant in October, 1951.

The salary scale attaching to the appointment will be £500 rising by annual increments of £50 to £1,100, and the initial salary will be fixed at a point on the scale according to the qualifications and experience of the successful candidate, but it will not in any case exceed £550.

Further particulars may be obtained from The Secretary, 38 North Bailey, Durham, to whom applications should be sent as soon as possible.

ANGLO-IRANIAN OIL COMPANY require one mathematician, one mathematical physicist and one physicist with some mathematical ability, with first or second-class honours degrees, for posts at a new research and development centre on the Nottinghamshire Oilfield. The work will involve theoretical investigation of the movement of fluids in oil reservoirs and problems connected with recovery of oil. Methods and equipment will be developed for electrical recording at surface of a wide range of physical observations on oil and gas-bearing formations penetrated in deep wells. The observations include resistivity of formations, radio-activity, temperature, pressure, fluid velocity, well diameter, etc. The equipment will also be used for actuating sample devices and special bottom hole instruments. The mathematician will be concerned with oil reservoir future production performance and the mathematical physicist with the allied survey research and development work. The physicist will be responsible for interpretation of records and laboratory experiments, both electrical and physical, bearing on interpretation. Men with some years' practical experience of electronics preferred for the two latter posts.

Applicants aged from 27 to 35 years should be prepared to go abroad for periods extending to six months.

Write, giving full details and quoting Department M.1415, to Box 6152, at 191 Gresham House, E.C.2.

PUBLIC Company requires solicitor or qualified accountant, with creative bent, preferably under 30, to train for an executive position in entertainment business. The post offers considerable scope for advancement. Please give details of qualifications, age, etc.—Box 556.

AN EXECUTIVE or Personal Assistant to Managing Director. Vacancy sought by single man, aged 30. B.Com.(Hons.), Grad. I.I.A. Broad management and consultancy experience; war commission. Opportunity more important than location. Preference small or medium-sized firm.—Box 553.

NO Capital Depreciation and a return of 21 per cent. (Income tax paid by the Society) are the terms offered for Share Investments by the 72-year-old Chelsea and Waltham Green Building Society. Write for Leaflet F to 110-112, Kings Road, Chelsea, S.W.3.

BOOK Lists: Please ask for our lists of secondhand and new books, specifying your subjects.—W. Heffer & Sons, Ltd., Petty Cury, Cambridge.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable, and may be paid by instalments, if desired.

Prospectus from the Director of Studies, Department P17.

Three-Quarters Peace

THE right economic policy for Britain in 1951 turns on how quickly public opinion can be brought to see that a cold war is not simply a total war writ small, but requires policies of a sharply different kind. The last war is close in memory; the war economy of 1939-45 was successful—at least in the sense that its mistakes did not make military victory impossible. In these circumstances no one can avoid thinking of present issues in terms of, very largely, the extent to which it is necessary to go back. Such an approach is implicit in almost all current discussion. Mentally, the whole horrible apparatus of the war economy is reassembled and the politicians and economists look for the bits and pieces that ought to be picked out and used again. Superficially, this is reasonable as well as natural. The economic nature of rearmament is, after all, essentially the same as that of a fighting war. In both cases the economic problem is to shift resources of men and machines and materials away from work for civilian buyers to the production of war supplies.

There are, however, also two fundamental differences between the economics of war and the present economics of defence. They are differences in size and in timing. For war the required effort is sharp and relatively short. For defence in the cold war it is smaller but more prolonged. So much emphasis has rightly to be put on the need to make willing sacrifices for defence that it is easy to forget how big is the difference in size between what is being attempted now and what was done ten years ago. In quiet times, in the twenties and early thirties, the British people devoted to defence about 3 per cent of the national income. Rearmament and war raised that proportion to a peak, in 1943-44, of 51 per cent of net national income. What is now proposed in the Government's defence programme is to bring it back to about 15 per cent by 1953. If 3 per cent is taken as a standard for normal, if imperfect, peace, then the shift of resources from civilian to military purposes was equivalent to 48 per cent of the national income in the fight against Hitler and will be 12 per cent this time. What we are now engaged in is one quarter of the effort of total war. Cold war is, in economics, three-quarters peace.

This is a difference of degree, but it is large. The other difference is, indisputably, one of kind: defence demands less effort than war, and the distribution of that effort over time is reversed. In war, the economic problem is to go on piling up more and more resources for military use until the moment when either victory or defeat is certain. There can never be any question of subordinating immediate needs to considerations of long-run prosperity and economic efficiency: the issue is whether there will be any long run, and in so far as the current war effort can be strengthened by mortgaging the future—by running into debt abroad and by forgoing capital investment and even renewals at home—then mortgages there have to be. The present needs of defence are quite different. The policy of trying to maintain peace by strength is nothing but an invitation

to disaster unless the initial climb to a position of strength is as fast as possible. But once that position has been reached—say, in three years' time—an appreciably smaller effort will be needed to maintain it. On the other hand, it is realistic to assume that this effort—absorbing, perhaps, 10 or 12 per cent of the national income—will remain the necessary price of security for a generation or more. War demands a heave of mounting force but short duration; cold war demands an initial heave followed by a lesser but steady pull of indefinite duration.

*

If these distinctions of size and of timing are clearly seen, the economics of defence plainly have no more than a family likeness to those of war. There is no reason whatever to assume that the methods used in war will serve well enough if they are watered down for defence. The essence of the war economy of 1939-45 was that a moderate inflation was used to lubricate the initial shift of resources to military purposes but was prevented from getting out of hand, and then pulling resources back to the satisfaction of inflated private incomes, by a variety of physical and moral compulsions on the consumer (rationing), on the worker (direction of labour) and on the business man (price and direct production controls). A certain degree of inflation can be accepted in wartime, provided it is limited both in scope and in duration. But simply to transfer the policy to conditions of three-quarters peace might be disastrous. For one thing, the duration would not then be limited, and a persistent fall in the value of money, continuing over a decade or more, would have disastrous consequences on the structure of society, on the balance of payments and on the flexibility and efficiency of the economy.

Secondly, it is very doubtful whether controls can do in three-quarters peace the job they did in time of war. Controls can always, of course, be made to work at some cost with some measure of success. But the costs—in bureaucratic interference with the ordinary man as well as in money and manpower—may be high; the inefficiency and waste apparent in the results may be glaring. If controls work really badly they will bring quite as much political discredit on the Government as would any alternative policy—either a policy of letting the inflation go unsuppressed or one of undertaking the measures of retrenchment, supposedly for so long "politically impossible," that would cut inflation at the source. And it is difficult to see any realistic basis for believing that in the present situation controls can work otherwise than very badly indeed. There are no criteria by which to measure precise degrees of success or failure. In the war, there were certain obvious conditions that enabled the controls to work not intolerably badly, and that are absent now. The first was the simple fact that the Government was itself the main consumer: in the vital economic sector—engineering—four-fifths of the labour force was at the peak engaged on Government orders. In these circumstances controls played only a minor part in determining what was produced. The main determinant was the placing of Government contracts. When the Ministry of Supply knew so much about what was happening in the engineering industry, the control of production and allocation of materials for the one-fifth that was still working on private account was a comparatively simple task. Control would be an entirely different proposition with the proportions

reversed, as they will be under the present defence programme—one-fifth of the engineering industry working for defence and four-fifths continuing to meet the demands of a peacetime economy.

For this reason the tasks falling on the controllers in three-quarters peace would be bigger and more complicated, not smaller and simpler, than in war. And the standards they would have to apply would be much less clear-cut. In war there is a single, if vague, criterion—whether it is indispensable to the successful prosecution of the war—that Government officials can apply to every application for a licence, for an allocation of raw materials, and so on. In a rearmament programme of the present kind, there cannot, as Ministers have recognised, be a simple overriding priority for defence orders: the individual firm has to make up its mind what orders to put first, and if asked for advice the Government departments will give it according to the merits of the particular case. This is all right if the price mechanism is working fairly well—if what is most profitable to the firm generally reflects what is most urgent for the country—and the departments have to be consulted only in a relatively few marginal cases. But if the civil servants have to try to pass judgment on thousands of individual cases, they simply cannot know enough of the facts to make rational decisions. They cannot, that is to say, operate an elaborate system of controls with any approach even to wartime efficiency.

*

These are the ways in which the smaller size of the defence effort makes the methods of the war economy unsuitable to present tasks. The difference in timing points to the same conclusion. Even when controllers could work by the simple criterion of a war economy they did not in fact attempt the impossible task of discriminating according to the merits of each case. Most controls worked on the quota principle of basing everything—with exceptions only in the most special cases—on an equal percentage of the prewar "normal" level. This is an acceptable principle, of economic inefficiency but rough justice, when it can be assumed that war will last at most for a few years and nothing else matters much until afterwards: it is acceptable in the short run for a siege economy. It is quite unacceptable for a state of one-quarter or one-fifth war that may last ten times as long. Quota controls become more inefficient, more restrictive and less fair in geometric progression as the base year from which the quotas are derived gets more remote. They are quite intolerable devices for a country trying to combine a heavy defence effort with the economic efficiency required for a large export trade and a high standard of living. That would be true even if the start was being made with a clean slate, with an economy whose resources were being used freely according to the pulls of the price mechanism. In fact the existing distortions are severe enough for any prolonged addition to them to be little less than an invitation to eventual breakdown.

It is difficult, and probably impossible, to see any way round these obstacles to the use of physical controls. And it is quite certain that the basis of popular consent, which made wartime controls workable, does not exist now. There are two aspects of this difference. First, there cannot in preparation against war be the positive, patriotic willingness and even anxiety to make sacrifices

and accept restrictions that existed when men were being killed in battle. The continuance of party warfare reduces this moral self-discipline still further. But, secondly, and probably not less important, the economic calculus affecting the individual is different. The essential effect of wartime controls was in one way and another to dam up purchasing power that would otherwise have been used for consumption or investment. From 1939 to 1945, private people and firms accepted these restrictions and were content to save because they looked forward to a time not far ahead when not only would the restrictions be gone but their money would probably be worth more than in wartime. No one can have any such expectations now; goods will get scarcer and money will be worth less. Any elaborate measures of physical control will, therefore, run entirely against economic incentives instead of in part with them, as was possible in wartime. It is completely unrealistic to suppose that in this situation they can, without intolerable waste and delay, turn the necessary proportion of the national resources to defence.

This argument has been concerned with the sustained use of controls for a protracted defence effort. It does not necessarily rule out their use in the initial heave that

Fate of the Schuman Plan

IN the shadow of the meeting of deputy Foreign Ministers in Paris there is drawing to a climax what may prove to be the final crisis of the Schuman Plan. For several weeks now the negotiators have been confronted with the basic issues on which sacrifices are required—chiefly of the Germans. In the face of bluster and outraged protests from industrialists in all the six countries concerned, M. Monnet has persisted in cutting down to bedrock through their pretence that they could maintain old ways of doing business under a new guise. The process has been painful, at times dangerous; but there are signs that it is producing compromises and that signature may be in sight. To have come thus far since last June in breaking down the central problem of Franco-German rivalry is by any measure a great achievement; and it is not for those who have stood aside from the toil of negotiation to scoff if there is now a final faltering.

Two problems are holding up progress; each is of crucial economic importance now, and each will have great political and military importance in the future. First, the Germans do not wish to give up the closely interlocked and highly cartelised organisation of their coal and steel industry. Outstanding among these economic groups is the central coal selling agency (DKV) which—once the powers of the Ruhr Authority and the High Commissioners had been removed—would control all sales of Ruhr coal and thereby exercise a powerful influence on the steel-making and steel-using industries of Western Europe. The DKV, working freely, could almost dictate by its decisions production and prices in the major industries of Germany's neighbours. To allow this to happen would be to make nonsense of the main purpose of M. Monnet and his colleagues, which is to create a single market for European heavy industry giving everyone free access to raw materials and allowing production in the course of time to be concentrated in those enterprises which have proved themselves most efficient. The same objection applies to the vertical trusts of the

is required this year and next. Few people, indeed, would seriously argue that the price mechanism alone could shift men and resources to defence as quickly as could be done with the help of some physical controls. There must certainly be restrictions on the civilian use of some scarce materials. But the case here is for the prompt use of a limited number of controls. It is quite different from the gradual establishment of more and more controls for long periods, in an attempt to cope with the consequences of making the initial shift chiefly by inflationary finance. As a rough empirical test, it is probably fair to say that those controls will be effective that are put into operation within the next six months and become unnecessary within two years. Anything more than that cannot be expected to work: the methods of a war economy are not those of a quarter-war. There are no precedents for the situation with which Britain and the other nations of the Atlantic alliance now have to deal. The right policies will certainly not be seen, at any rate as a whole, immediately. But they will be seen less slowly the more thoroughly it is realised that the questions are new and the stock answers will not serve. A one-quarter war will not be run by one-quarter controls.

Ruhr, whose dissolution is being resisted by the Germans. By their ownership of many mines the great steel companies controlled in the past 56 per cent of the Ruhr coal output, and this allowed them in times of shortage to restrict supplies to their competitors, and in times of surplus to undercut prices and discriminate.

In short, the question at issue is whether an International Authority or a group of German industrialists and technicians shall in future decide how much coking coal Western Europe may receive and at what price. It can be regarded primarily as an issue of principle or as a conflict of self-interest. If the heavy industries of the west are to be rationalised and the restrictive practices and manipulations of decades gradually discarded; if a power group which has been closely associated with two ventures of German imperialism is to be broken up; if there is to be a genuine step forward towards integrating Western Europe for its future defence and prosperity—then M. Monnet is right in his persistent challenge to the German industrialists. That is the issue of principle. When, however, the French argue that, to complete their national recovery, they cannot tolerate the risk that their steel industry will be forced into decline through lack of the Ruhr's coal, then the Germans have some reason to look carefully at the arguments put to them. That is the issue of self-interest. The Germans can argue—and their case has its points—that the operation of a free market would merely serve to prove that heavy industry should be centred in Germany; but that is quite a different thing from admitting this conclusion in advance just because the Germans have a predominant share in supplies of coking coal. The history of the Ruhr Authority has already shown with what pertinacity they have fought against the sharing of this coal with their neighbours.

It may be said that these are old arguments; their substance was known before M. Schuman ever launched his project. That is true; and it is also true that a year ago the Germans could have been brought a long way

towards accepting the French and European position. But Korea has had its effect on this as on every political and economic question. Before Korea, the German industrialists saw in the Plan a way of getting new markets at a time when surpluses of coal and steel seemed likely. The German politicians saw in it a way of shaking off the control of the Ruhr Authority set up by the occupying powers and taking an equal place in Europe's counsels. The western decision to rearm has removed at a stroke both these incentives. It now looks as if there will be in the predictable future no surpluses of coal and steel, and Western Germany sees itself winning equal status in Europe as the price of helping to defend it against the Russians. The Ruhr—trade unions as well as industrialists—is in fact now determined to go on judging the plan on its economic merits until acceptance of all or part of it can be bartered against concessions from the occupying powers.

The last few months have therefore seen the Germans getting more and more difficult. When they asked in December that negotiation on the plan's provisions for breaking up the great concentrations of industry should be postponed, while they discussed their implications with the Allied High Commission and industrial experts, the other delegations agreed. They hoped that the men of the Ruhr would accept the spirit of the plan and subscribe sincerely to the principle of competition within a free market. After Christmas, German delaying tactics took a new form. Suspect statistics made their appearance; national federations of industry in all six of the Schuman Plan nations were mobilised to protest; a former American Secretary of War, Mr Patterson, was briefed to fight deconcentration in the Ruhr against the policy of his own Government. Resistance among French industrialists has also grown. They believe that they could best get the coal they need by international bargaining of the prewar type between cartels, and they protest against encroachments of a European authority on their jealously guarded preserves. M. Monnet, who is the life and soul of the Plan, is therefore facing a solid front of industrial interests and German political parties.

*

Clearly the stage has now been reached where three things should happen: statesmen should intervene to prevent the technicians and the businessmen from turning differences into reasons for despair; both sides should be reminded, especially the Germans, of the political purpose that originally inspired the Plan, which was to draw France and Germany together by bonds of self-interest into the nucleus of a new European association; and the Germans should be reminded of the powerful cards that are held by the West if they insist on turning the negotiations into a protracted poker game. Something like this appears to have begun. The American High Commissioner, Mr McCloy, has been discussing with the Germans a compromise which would leave the central coal selling agency to be liquidated over a period of time, provide the Germans with a written pledge to dissolve the Ruhr Authority by September 30th, and allow the individual steel companies to own up to 75 per cent. of the coal they need to operate at their present capacity. But these proposals do not go to the root of the difficulties. There is no doubt of the basic good will towards the Schuman Plan of Dr Adenauer and his principal representative, Dr Hallstein, both deeply influenced by the friendly

spirit created among the negotiators. The fact remains that Dr Adenauer cannot yet guarantee that the Bundestag would ratify the Plan. Both Right and Left in Germany will persist in their criticisms of the economic aspects of the Plan so long as they see no wider concessions forthcoming to counterbalance German sacrifices in the eyes of the electorate. And such concessions to the German demand for equality of rights in Europe are still held up by that uncertainty of aim which has dogged the German policy of the western governments.

The matter is urgent. The western governments want the Schuman Plan initialled and its ratification in Bonn assured before the full meeting of Foreign Ministers—possibly in May. The Germans see every advantage in stalling so that they can exact the greatest possible benefit from the competition of the west and the Russians for their favours. The time has come to make vigorous use of both carrot and stick. The Americans can and should use the Germans' dependence on the grain and raw materials to press for signature; just as the Germans are using, and will continue to use, their possible contributions to western defence as a means of pressure on the Americans. And the western governments should now explain firmly to the Germans that acceptance or rejection of international control of heavy industry will be treated as evidence of their reliability as equal partners in Europe. Compromises on economic matters are all very well; but who can tell whether when the time comes a German Government will want, or be able, to honour the pledge to dissolve the coal-selling agency? The answer is—no one. Some guarantee that the interests of Germany's neighbours will be protected from domination and some evidence that the German parties will in fact co-operate in Europe are required.

Such a guarantee the Schuman Plan could offer. On the other hand, let it be recognised that the Germans are being asked to give up a great deal: the fruits of their natural advantage in raw materials, a form of industrial organisation whose efficacy has been proved, and a monopoly selling agency which, they claim, enabled uneconomic mines to be worked and employment to be maintained. These are advantages that no German politician can surrender without misgivings. They, too, want their guarantees.

This is the psychological moment for fitting the signature of the plan into the general scheme of policy towards the Germans. It is evident that the revision of the Occupation Statute announced this week is only a further step towards its complete abolition. Its political effects on public opinion have long been discounted in advance by German public opinion. It is, in fact, a damp squib. If the nature and timing of Western Germany's final step towards equal status in Europe could be decided and declared without further delay, the western governments would have a very strong case for insisting that the Schuman Plan should be part of the final settlement. Enthusiasm has to be kindled for the politics of the plan, for its manifestation of a new spirit in Europe, and that can be done only by a political gesture and a campaign of popular persuasion. Now that the economic issues have been thrashed out *ad nauseam* it is time for the statesmen to take a hand. Above all, it is time for this country, as an ally of France and a co-trustee for Germany, to show the sympathy and statesmanship that were withheld last June.

Morale Off the Rails

(By a Railway Correspondent)

THE basic problem of British Railways is one of morale, and it has in no way been solved by the recent wage increase. Railwaymen are worried by the prospect of their industry taking the place of coalmining as the Cinderella of the industrial world. It is, in fact, only the wide dispersal of the staff in small units that is delaying the development of the sort of unrest that used to exist in the coalfields—and which is already appearing in the larger railway centres. On the other hand, it is precisely because of this wide dispersal of the staff that morale on the railways is so important. There are few industries in which the effect of delays or inefficiency in quite small matters is so cumulative, and in which, consequently, prosperity depends to such a degree on the devotion to duty of the individual.

Such devotion can thrive only if the staff has confidence in the management. How to maintain this confidence, in a contracting industry, is one of the unsolved problems of industrial relations. The railways today show every symptom of contraction. Improvements and even replacements are curtailed by the shortage of materials and the need for economy. Although many of the staff continue to work in conditions that would not be tolerated in other industries, a full programme of improvement must await better days. Branch lines are closed, or have their passenger services withdrawn; lightly loaded trains are cancelled.

In this situation the Railway Executive has done no more to take its employees into its confidence than to explain itself to the public. On the one hand, the British Transport Commission's declared policy for integration implies that the future position of the railways will only gradually be worked out in practice; on the other hand, the actions of the Railway Executive are already quite plainly committing the railways to a position of reduced importance in the national economy. On the one hand, the staff and the public are asked to suspend judgment until the new charges schemes are published; on the other, the withdrawal of trains accelerates the insolvency of branch lines and makes their closing inevitable whatever the charges schemes may do.

The staff are naturally bewildered; just as naturally they state their uncertainty in terms of their own personal prospects. In this frame of mind, they cannot be expected to respond to exhortations from the management to redouble their efforts and make the best of the equipment they have. Confidence in the Executive is impaired, and will only begin to be restored when the Executive can convince its employees that it knows where it is going and what it wants. On these questions of high policy, railwaymen merely share the uncertainty of the public at large. But they would be less apprehensive if they had any more confidence in the internal administration of the Executive.

It is an unfortunate result of past railway history that staff administration is associated in the minds of railwaymen with negotiations on wages and conditions of service, principally because staff officers have always represented the management on the local departmental

committees and sectional councils which form the negotiation machinery. The Executive consequently has the services only of specialists whose conception of staff relations is inextricably confused with that of negotiation. For that reason its commercial department was able recently to get away with the "targets scheme," which no business with a proper conception of internal relations would have tried to suggest to its employees at such a time, and which by its ineptness has still further reduced the staff's confidence in the management.

Even in its conscious efforts to improve internal relations the Executive has succeeded only in losing confidence. The consultation procedure instituted over a year ago failed to satisfy trade union demands, and it made the mistake of using, as the nucleus of the employees' participating, representatives elected for the very different purpose of negotiation, with all its associations of bargaining and pressure. How unsuccessful the procedure has been is shown by the policy, which some Chief Regional Officers have been forced as a makeshift to adopt, of holding large meetings of employees and talking to them over the heads of their more immediate superiors.

*

These are important points affecting the morale of railway workers as a whole. There are others whose primary effect is more limited, but whose secondary effects may be nearly as widespread. On paper the powers of many local officials have been increased since nationalisation, but none feels that this is so in fact. The Executive has allowed the intended scope of its functional organisation to be exceeded. Its purpose was to promote rapid standardisation, but the Executive headquarters is going further and interfering in day-to-day administration. Instructions from the Executive are accompanied by requests for detailed reports and statistics to a degree that is seriously interfering with practical work and inflating local staffs. The blame is commonly put on the subordinate officials at headquarters, whose mediocre quality is attributed to the Executive's unwillingness to pay salaries sufficient to attract the right men from the provinces. Whatever the reason, all the symptoms of bureaucracy are rapidly developing. Local officials inevitably feel that they are not being trusted.

When the Railway Executive organisation was first published, it was generally thought that the chief regional officers would have a difficult task when their regional departmental officers were to report direct to the functional members of the Executive. This system is bad enough in all departments, but disastrous in the case of the staff department, which inevitably has a finger in all the others. The regional staff officer, responsible directly to London, has more real power than the chief officer.

Centralisation and specialisation have not eased the tasks of the chief regional officers, and it is probably, therefore, no coincidence that the most efficient and progressive region is the one which has its headquarters farthest from London and the strongest character at its

head. To compare the way railwaymen talk about their chief regional officers with the way they used to talk about their general managers is to realise how much has been lost.

The old railways had their head offices in London, but London was never more than the terminus of the line. Now the feeling is that the whole railway system revolves round London, and the presence there of four regional headquarters in constant daily contact with the Executive itself only adds to the general centripetal effect. There is a good deal that is irrational in this sort of feeling, but since it exists, it is necessary to do something either to satisfy it or to remove it. There is already enough

"we" and "they" feeling on the railways without extending it on a geographical basis.

It would be foolish to suggest that anything the Railway Executive could have done would by now have made morale on the railways entirely satisfactory. Many managements before have failed to maintain or restore good industrial relations in a contracting trade. The problems of contraction at a time of full employment are new even if they are on balance easier than those of general depression. The Executive has in some respects a pioneering task in which success could not be expected quickly. It is the more pity that so many mistakes are apparently being made.

The Record on Korea

THE war in Korea has now been going on for more than eight months. It would be idle to deny that, in spite of the almost universal approval which was given in this country at the end of last June to the United Nations action on behalf of South Korea, there is now a widespread apathy about the cause in which British troops are fighting in Korea and an increasing activity of those political circles which argue that the first aim of British policy in the Far East should be peace at any price. This trend of opinion over the first real enterprise of collective security in the history of the world has been at least partly due to the obscurity of the issue at stake since the United Nations decision (which was sponsored by the British Government) to cross the 38th parallel and the subsequent intervention of Communist China. Last June the issue was clear enough; it was to repel and drive back the North Korean invaders and restore the state which had been the victim of aggression. But since the crossing of the 38th parallel and the advance to the Yalu, the original clarity of purpose has been replaced by confusion about the objective for which the war is being fought, and, in consequence, a general demand for terminating the war by negotiation with China without any idea of minimum terms on which the United Nations must insist if it is not to be utterly discredited as a collective security organisation.

This state of mind has unfortunately provided fertile ground for a propaganda which has grossly misrepresented the course of events in Korea and has persuaded many people who are far from being Communists that China has been more sinned against than sinning in the whole affair. It is therefore worth while at this stage to review the record and point out what exactly did happen in the preliminaries of the present situation.

The decision to cross the 38th parallel politically, and not merely for tactical military purposes, was taken by the Political Committee of the United Nations Assembly on October 4th and formally adopted by the Assembly itself on October 7th. The voting in the Political Committee was 47 nations (including Britain, the United States and France) for the resolution, five (the Soviet bloc) against, and seven abstentions (including India, Egypt and Yugoslavia). The Assembly took its stand not on the Security Council's decision to extend aid to South Korea against North Korean aggression, but on the earlier decisions of the United Nations which established the Republic of Korea. The resolution recalled the Assembly's declaration of December 12,

1948, that the Government of the Republic of Korea "is based on elections which were a valid expression of the free will of the electorate of that part of Korea (i.e. South Korea) and which were observed by the Temporary Commission, and that this is the only such Government in Korea." On the ground that the "essential objective" of the earlier resolutions of the Assembly had been "the establishment of a unified, independent and democratic government of Korea," it was therefore decided that "all appropriate steps be taken to ensure conditions of stability throughout Korea," and that "all constituent acts be taken, including the holding of elections, under the auspices of the United Nations" for the creation of a unified, independent and democratic Korea.

This resolution meant that the Commander-in-Chief of the United Nations' forces in Korea was authorised to advance into North Korea in order to eliminate all armed forces and civil authorities of the Communist regime and "ensure conditions of stability throughout Korea." The United Nations forces, as distinct from South Korean troops, did not cross the 38th parallel until they were authorised to do so by this resolution. They had reached it already on October 1st, but General MacArthur halted them for eight days until the Assembly had taken its decision. The only crossing in pursuit of the defeated North Korean forces was made by the South Korean troops, and this reflected the independent attitude of the South Korean Government which, although willing to subordinate its forces strategically to the supreme United Nations command, denied that it was politically subject to such authority in Korean territory.

After the advance into North Korea had led to a military disaster and the Korean conflict had developed into a struggle with Communist China, the British Government became anxious to minimise its responsibility for sponsoring the decisive resolution of the United Nations, and its defenders resorted to the argument that General MacArthur had not needed the authorisation of the United Nations to cross the parallel. This argument was valid in so far as General MacArthur's commission to carry on war against the North Korean forces certainly empowered him to conduct operations beyond the 38th parallel for purely military reasons as part of the task of repelling the invasion of South Korea. It is absurd, however, to maintain that it made no difference to strategy whether the political aim was to restore the *status quo ante bellum* or to occupy and unify the whole

of Korea. General MacArthur could not have justified an advance to the Yalu without the authority of the United Nations decision of October 7th, and in fact he held his forces back until that decision had been taken; however embarrassing may have been the Supreme Commander's verbal excesses, he neither forced the hand of the United Nations by acting in advance of its decision, nor did he subsequently exceed the directive given to him.

The United Nations decision in the first week of October was, of course, taken under the influence of the successful Allied counter-offensive in the second half of September which had resulted in the recapture of Seoul on the 25th. On September 30th, indeed, the Chinese Foreign Minister, Chou En-lai, had declared that the Chinese people would not "supinely tolerate seeing their neighbours being savagely invaded by imperialists," and the Indian Ambassador in Peking had conveyed a warning that Communist China would intervene if the parallel were crossed. At that time, however, there was a general unwillingness, alike in military and diplomatic circles, to take the threat of Chinese intervention seriously. Russia, though giving political support to North Korea, had made no threats, and it was generally believed that Russia would not risk a world war on the Korean issue; without Russia it seemed incredible that the Chinese Communists would dare to challenge the whole power of the United Nations after this power had been so strikingly demonstrated by the recapture of Seoul. Even after Chinese forces had actually crossed the Yalu, the move was regarded as a bluff for bargaining purposes rather than as a real order of battle, and it was the persistence of this belief at General MacArthur's headquarters which led to the fatal strategic miscalculation of the offensive in the fourth week of November.

The fact that the political and military authorities concerned gravely underestimated the bellicosity and competence of the new regime in China does not, however, affect the quality of the Chinese action in relation to the United Nations and the powers, including both Britain and America, which were enforcing its decisions in Korea. The United Nations has indeed, after prolonged obstruction, finally condemned the Chinese action as an aggression. There has been, nevertheless, a strong tendency in this country, since the defeat at the end of November, to condemn the advance into North Korea as not merely unwise strategically, but as an act of provocation to China which virtually justified the Chinese intervention.

It is true that Chinese regular military units did not cross the Yalu until after the United Nations forces crossing of the 38th parallel. It does not follow, however, that the Chinese intervention was prompted merely by alarm at the prospect of the arrival of United Nations forces on the Manchurian border. It is necessary to take into account the actions of Communist China before that date. The Peking Government and its controlled press and radio had from the outset given the most explicit approval and moral support both to the initial North Korean aggression against South Korea and to the subsequent North Korean defiance of the United Nations. On August 17th Mao Tse-tung and Chou En-lai sent Korean independence anniversary greetings to Kim Il-sung declaring that "the Chinese people warmly support the Korean people in their just war against

American imperialism and aggression, to bring about national independence and unification."

Nor was this backing of North Korean aggression merely verbal; it had taken a most concrete and practical form. Shortly before the North Korean attack last year Korean divisions of the Chinese army, drawn from the million or more Korean settlers in Manchuria and other parts of China, were sent to Korea, and it was not until after the incorporation of these troops, battle-trained in the Chinese civil war, that the North Korean Government felt ready to launch its assault. In international law such a transfer of organised troops from one state to another as part of the preparation of aggressive war involves a grave complicity on the part of the transferring state. The Foreign Ministry of the Chinese People's Republic, however, took up a most truculent attitude on the subject, when publicity was given to the fact in one of General MacArthur's reports; admitting that Koreans who had fought in the Chinese civil war had been sent to Korea, a spokesman declared that, now that victory had been achieved in China, it was the "sacred duty" of "Korean people residing in China" to return to their motherland and take part in its defence.

*

Since they were so deeply implicated in the attempt to destroy the Korean Republic, it was only logical that the Chinese Communists should take over the task when the North Koreans had failed by themselves to accomplish it. It is highly probable that they did not venture to engage in war against the United Nations without some definite assurance of Russian aid if they were subjected to retaliation within their own territory. But whatever may have been their calculation of the risk they took, their aim was always the same as that of the North Koreans—to wipe out the South Korean regime and to drive the United Nations army out of Korea. If it had been merely to safeguard their own frontier and their interest in the hydro-electric installations of the Yalu, they could have taken advantage of the repeated American declarations of intention to respect Chinese territory (such as Mr Acheson's statement of August 30th) and the proposal for a joint commission to regulate power supplies from the Yalu dam. But the Peking Government never attempted to negotiate on this basis. They were not interested in mere frontier security; their aim was, and is, total victory for Communism on the East Asian mainland. If, as the many apologists for the Chinese Communists in this country maintain, the Peking Government had been moved only by fear for its own safety, it would have been content with the American abandonment of Chiang Kai-shek and refusal to supply tanks to the South Koreans, instead of first promoting, and then taking part in, a war of aggression.

It does not follow, of course, that there must now be war against Communist China or even an attempt to impose sanctions. The United Nations is a political organisation that must always consider the consequences of the actions it takes, not a blind arbitrator handing down judgments *ruat coelum*. But at least there should be no obscurity about the moral and legal position. The Communists—whether North Korean, Chinese or Russian—have put themselves in the wrong; there have been no breaches of trust by the Americans or by anybody else on the United Nations side. Those who dispute these statements are wilfully refusing to face the facts of a very clear record.

NOTES OF THE WEEK

Crisis in Teheran

The outlook in Persia is black. There is no fitting successor to General Razmara who was assassinated by a small group of fanatics on Wednesday morning. It is feared that the Shah, who though charming has a weak and obstinate character, will recall to office the avaricious and corrupt politicians who have misruled Persia roughly from the end of the war until General Razmara took office nine months ago. It is due to these former rulers, who are important landowners as well as politicians, that the ordinary Persian has been reduced to such a depth of misery that Communist propaganda, coming from the northern frontier, has fallen on fertile ground. The Shah called General Razmara to power when he had become seriously alarmed by the revival of the outlawed Tudeh (Communist) Party last summer; but, unfortunately, the palace failed to give General Razmara the full support the Shah had promised to him. The big landowners, who wield enormous power in the Majlis (Parliament), were alarmed by the General's excellent plans for social reform. These were to be financed by the large sums of money the Government would have received in royalties from the Anglo-Iranian Oil Company had the Majlis ratified the supplemental agreement with that company. The agreement would not only have produced an immediate payment of £45 million, but would have guaranteed a yearly income of over £22 million to finance long-term draining, irrigation and other large works projects which formed the basis of General Razmara's plans for social reform.

The Majlis failed to ratify the agreement which General Razmara had supported largely because the late Prime Minister was inept in dealing with his opponents in the chamber and lacked political technique outside it. Thus the ignorant townspeople were easily convinced by the Teheran press, which had been lavishly bribed by the big landowners, that Razmara had fallen entirely under the influence of the west and was "working against Persian interests." This accusation was patently untrue. In some respects the General appeared more influenced by Moscow. He had recently signed a new commercial treaty with the USSR and he allowed the Russians to send commercial travellers all over Persia; at the same time he banned the Persian broadcasts of the Voice of America.

It is not yet clear whether the religious enthusiasts who murdered the Premier were inspired or paid (or both) by the extreme right—Nationalists—or extreme left—Tudeh. What is somewhat alarming is that the Persian delegate to the World Peace Council at Berlin, Mr Eskandary, reminded his audience a fortnight ago of "the fact that the Soviet-Persian Treaty of 1921 empowered the USSR to dispatch troops to counter any imperialist plan aiming at Persia's occupation." This interpretation of the treaty is not without foundation.

Deputies in the Toils

It is no credit to the diplomacy of London, Paris and Washington that the deputies of the Foreign Ministers were caught within three days in the toils of argument about a point which means nothing to the European man in the street. Maybe the west scored a point by getting Mr Gromyko to talk about the possibility of putting the Austrian Peace Treaty on the agenda of the Foreign Ministers; and if the Soviet delegate really wanted a conference, and was not working within the limits of a strictly defined brief, he could quite easily have left the question of Trieste to be

raised as one of "the causes of international tensions in Europe"—first item on the agenda proposed by the west. But the course that the talks have taken could have been foreseen and the western agenda should have been drawn up in such a way as to seize and hold the initiative from the moment the talks in the Palais Rose began.

The western deputies were ill-advised to contest the Russian wish to put Germany at the head of the list of topics to be discussed; for it is clear to everyone that this is the central problem. While insisting that the talks should not be confined to Germany, as the Russians seemed to wish, they should have made the unity of Germany their first item and made it clear that they had ready a plan for attaining it. This would have stolen Mr Gromyko's thunder about demilitarisation and put the Russians into the untenable position of opposing German unity. With that question first on the agenda, the western representatives could then have argued that the "prevention of remilitarisation of Germany" and its demilitarisation according to Potsdam—the first item on the Soviet agenda—would present no difficulties at all once causes of tension in Europe—which is in both lists—had been discussed.

Such a tactic would have had two advantages: the debate would have made sense to the man in the street as he reads his newspaper or listens to the wireless, and Russian policy for Germany would have been challenged at its crucial point with the question about free and fair elections all over the country. It may be objected that this would have led the deputies into discussing not the procedure of drawing up the agenda but matters of substance. In fact they have already strayed into matters of substance, and the talks are taking on the too familiar form of polemical wrangling about two lists of agenda which look to the layman almost identical save in their order. It is, incidentally, a great pity that someone of greater experience than Mr Ernest Davies could not have been found to lead the British delegation.

* * *

The Foreign Secretaryship

Mr Bevin's return to work last week after his latest bout of illness created a further burst of speculation about his future, which, in turn, evoked from Downing Street an official denial that the Foreign Secretary had already decided to resign. The influence that Mr Bevin has exercised both in the Labour Party and in the Cabinet since 1945 has been so great that any change of his role is bound to assume the dimensions of a minor political earthquake.

Such an upheaval appears to be likely in the near future. The chief obstacle to the change has been the difficulty of finding a successor for Mr Bevin at the Foreign Office. Mr Attlee, in his search, has been up against much the same problem that he faced when Sir Stafford Cripps resigned from the Chancery of the Exchequer last autumn—the lack of Ministers in the second rank with a real capacity for leadership and with political experience wide enough to enable them to take over from any one of the small group that has dominated Labour affairs since 1945. To replace Sir Stafford Cripps Mr Attlee decided to turn from the pure politicians to the dons and other experts who form such an important section of his following. It was from them that Mr Gaitskill was promoted. But considerable as Mr Gaitskill's abilities may be, he has yet to prove that leadership of public opinion is his forte.

At the Foreign Office such leadership, particularly in the present situation, is an absolute essential, and in the Prime

Minister's calculations this makes the choice of Mr Herbert Morrison as Mr Bevin's successor almost inevitable. The other names that have been under consideration—Sir Hartley Shawcross, Mr Gordon Walker, Mr McNeil—are those of able administrators whose capacity for influencing opinion inside or outside the Labour movement remains unproved. Of the older guard of politicians, Mr James Griffiths was at one time considered for the post and seems to have had Mr Bevin's support, but the Prime Minister has not favoured the idea. Mr Bevin has had his backers, some of them people who dislike his views on domestic policy, but it seems that he will have to demonstrate at the Ministry of Labour that he has checked his natural rashness before further promotion comes his way. In the end, therefore, the choice swings back inevitably to Mr Morrison, whose appointment is not likely to be delayed. Mr Bevin, in that case, would become Lord Privy Seal and Mr Chuter Ede would take over the leadership of the House of Commons.

* * *

Figures in the Air

Mr Arthur Henderson, the Secretary of State for Air, is not a compelling parliamentary figure, and his introduction of the Air Estimates on Tuesday was rightly described by Mr Eden as an "amiable gallop through a pretty voluminous brief." In describing the expansion of the RAF, he was reduced by the dictates of security to the method of Russian trade statistics, giving figures as a proportion of an unknown base-line. Thus "the present strength of the Royal Air Force is more than half as great again what it was . . . in March, 1948"—a statement that sounds impressive to those who do not know how small the front line strength was three years ago; that it consisted of a tiny handful of squadrons. But Mr Henderson did give a few encouraging facts. One was the great improvement in the number of night fighters and the introduction of the Canberra into squadron service. (The technical aspects of the debate are dealt with in a note on page 563.)

But neither these facts nor the soothing tones of Mr Henderson and his under-secretary could conceal the fact that Britain's air defences are by no means adequate at the moment and are unlikely to be for some time to come. The aircraft construction programme cannot be accelerated very much. There is a great deal of leeway to be made up in the training and provision of aircrews; Transport Command and Coastal Command present as urgent cases for expansion as do Bomber and Fighter Commands. The problem of submarine detection and destruction is still, as Mr Henderson admitted, "a formidable one." In addition, the British lead in fighter design, which for a period after the war was unchallenged, has been overhauled by the successful development of delta wing types in America and in Russia. Of the three services, it will undoubtedly take the RAF longest to achieve full preparedness.

In so far as there was any party division in the debate, it seemed to show itself, curiously enough, on the question whether Britain should possess a long-distance bombing force. Mr Eden and other Tory members emphasised the importance of being able to strike enemy bases and argued that Bomber Command should possess heavy bombers, while Mr Paget and other Labour members regarded it as a task to be left to the Americans. It seems unlikely that the RAF could achieve its urgent task of expanding its fighter and tactical strength and organise a heavy bomber force as well, and since this seems to be the Government's view, it is hard to understand why four-engined and larger machines are under development. It may be that British design teams can make a genuine contribution to heavy bomber construction, or it may simply be that the *amour-propre* of the industry needs soothing. It is impossible to tell from the generalities expressed by Mr Henderson.

Private Members' Time

Mr Eden indulged in some justifiable banter against Mr Morrison this week for the failure of the Government's supporters, including Mr Morrison himself, to rally last Friday for the vote against a private member's motion criticising the Government for bungling the purchase of raw materials. This is the second successive vote carried against the Government on a private members' day and though no question of confidence is at stake, the issue of prestige certainly arises. It will be a great pity if the whips are, officially or unofficially, to be put on private members' business, for the result would be to destroy the essential nature of such occasions, which give members the chance to vote on individual rather than party lines. Both sides of the House are at fault in this matter. The Tories, by using private members' time for such measures as the present Transport Bill, tried to force decisions on major issues of policy. Mr Morrison for his part has little defence. He has for so long been contemptuous of private members' activities that he cannot complain if his opponents use these occasions for party purposes.

Stalin's Budget

At the session of the Supreme Soviet, attended on Wednesday by Stalin and all the Soviet leaders, the Finance Minister, A. G. Zverev, reviewed the Soviet budget for 1950 and presented the estimates for 1951. Perhaps because of the preliminary talks now being held in Paris, he dealt with the international situation at greater length than is customary for a Finance Minister. He contrasted the "peaceful development" of Soviet economy with the "war economy" of the western powers. Later he stated that 21.3 per cent of the 1951 budget has been earmarked for defence. Although this figure is 2.7 per cent higher than last year's defence estimates (18.6 per cent) it does not yet show a new line in Soviet policy, but seems rather to strengthen the impression that Stalin is still wavering and awaiting new developments before committing the Soviet Union to a definite line of international, and hence of economic, policy in face of western rearmament. The rise in the expenditure on defence, is not as steep as it appears, since the actual expenditure on defence in 1950 in fact exceeded 20 per cent of the total budget. Stalin's indecision may best be seen by comparing these percentages with two other sets of figures: between 1933 and 1937 expenditure on defence accounted for less than 13 per

SOVIET BUDGETS
(In billions of roubles)

	1950 (estimates)	1950 (actual)	1951 (estimates)
Revenue:—			
Turnover tax.....	239.0	235.0	244.6
Profit tax.....	40.0	40.4	47.1
Direct taxes.....	35.4	35.8	43.1
State loans.....	31.8	31.0	33.3
Other revenue.....	85.8	78.9	89.9
TOTAL.....	435.1	422.1	458.0
Expenditure:—			
Grants to National economy.....	164.4	157.3	178.5
Social and cultural.....	120.7	115.8	120.8
Defence.....	79.4	82.9	95.4
Administration.....	13.9	13.9	14.2
Unspecified.....	49.5	41.8	51.6
TOTAL.....	427.9	412.7	461.5

cent of total budget expenditure; between 1938 and 1940 for over 26 per cent (in 1940 it reached 32 per cent). For the moment the proportion spent on defence is still somewhere half way between the two.

Broadly speaking, neither the actual figures for 1950 nor the estimates for 1951 reveal any strikingly novel departures from the pattern of the previous budgets. Both revenue and expenditure were in 1950 lower than had been estimated. On the revenue side this is explained by the fall in the turnover tax due to a reduction in the price of consumer goods;

on the expenditure side, grants to industry and social and cultural services have been the main victims of saving.

The new cut in the prices of consumer goods, it is claimed, should enable consumers to "save" 27 billion roubles in the present budget year. Despite this Mr Zverev forecast an increased revenue from the turnover tax. Hence he must rely on a substantial rise in consumption and therefore on the ability to supply a sufficient flow of goods.

Mr Zverev stressed the great achievements of the Soviet economy during the last five years. Yet he did not attempt to draw a balance of the last Five Year Plan, nor did he make any reference to a new plan. Soviet reluctance to proclaim its economic targets is certainly not unconnected with the international situation and with Stalin's perplexity as to whether or not he faces a 1938 situation.

Morocco and the Moslems

General Juin's request to the Sultan of Morocco that the Istiqlal-National Party—be disbanded has caused serious demonstrations, disturbances and strikes throughout the Moslem world from the north coast of Africa, through the Arab Middle East, as far afield as Indonesia.

The General's intentions were good. He wished to rid the country of organised Communism, which was supporting the Istiqlal, before American soldiers arrived to begin construction work on new air bases. The Pleven government, which fully supported the General's actions, failed to realise the effect their actions would have in the Moslem world. Volatile Arab crowds have joyfully screamed "Down with French imperialists." The Egyptian Prime Minister, Nahas Pasha, has stated that his government regards the issue as similar to that which arose in the Levant states in 1945, when the French attempted to retain the Mandate over Syria and the Lebanon and render powerless the governments of those countries. Egypt and the Arab countries gave as strong verbal support to Syria and the Lebanon as they are now giving Morocco. A special meeting of the Arab League has been called to discuss the Moroccan situation, and the Arab states are loudly proclaiming their intention to break off diplomatic relations with France and uttering other threats which they are most unlikely to carry out.

In Morocco, where some Istiqlal leaders have been arrested, all is quiet, and although there is considerable surprise at the repercussions caused in Cairo, there is keen disappointment that the Americans, who were believed to support Moroccan independence, have remained so neutral. However the present crisis may end, the fundamental issue of Moroccan independence remains. The Moroccans are far more politically educated, and certainly on these grounds have a greater claim to independence, than their neighbours the Libyans, who will be granted staterdom next year. Until the Moroccan question is settled the Arab world will demonstrate against imperialism, whether of the British, American or French variety, every time a tarbush is dropped. It is useless to point out that France has sent some of its best colonial administrators to Morocco, or to mention the benefits the inhabitants derive from the capital brought into Morocco from Paris by over 300,000 colonists. These colonists, who have built homes and intend to remain with their families permanently in Morocco, stand in the way of a Moroccan state, as the French would never willingly agree to be ruled by Moslems.

Third Force in Search of a Leader

After M. Guy Mollet's convincing failure last Tuesday to gain from the National Assembly the absolute majority for his investiture, the President of the Republic has again asked the Radical, M. Henri Queuille, to try to form an

administration. M. Queuille, the former country doctor, who led the most stable of postwar governments, from September, 1948, to October, 1949, is the most generally popular of the politicians of the Third Force, and at the time of writing seems likely to succeed in negotiating a compromise on electoral reform between his own party and the MRP. The signs are that the parliament, less the Communists, recognises the need for elections in the early summer and will agree upon how and when to go to the country. Nothing more serious than a forty-hour strike of Parisian bakers is happening at present.

In the economic field the *gouvernement de liquidation* will have to take a decision on wages in the nationalised industries and subsidies for coal, electricity and steel; in so doing it will carefully measure the relative political advantages of granting increases and subsidies now (if such measures can be financed) or waiting until the summer, when present stocks are exhausted and the incidence of the higher cost of raw materials and retail prices will have become plainer. In spite of the economic hardships the political temperature is low; if only inflation can be avoided it is likely to remain so.

In world affairs French confidence is waxing day by day; the Egyptian allegations about French brutality toward the Moroccan population have provoked a wave of healthy indignation. Much credit for this heightening of national conscience should go to Jean-Paul David, the Radical deputy, who is running a powerful and subtle campaign of propaganda against the Soviet Fifth Column.

Divorce After Seven Years

The major private member's Bill for discussion in the House of Commons on Friday was the Matrimonial Causes Bill presented by Mrs Eirene White. It proposed to extend still further the grounds for divorce.

The Bill provides that a petition for divorce may be presented where the parties have lived separately for a period of not less than seven years and where there is no reasonable prospect that cohabitation will be resumed. It adds one further qualification: the court may refuse a divorce, or defer granting a divorce, to a husband who has not fully met all his existing financial liabilities to the wife and to any children of the marriage. Where no formal obligation has been imposed on or accepted by the husband, the court, again as a condition to the grant of the divorce, may require him to make proper provision for his family.

Hitherto, in England and Wales, divorces have only been granted (save in the case of insanity) on the supposition that one party has committed a matrimonial "offence" and the court, accordingly, regarded the other spouse as entitled to a divorce because of that offence. True, the supposition had worn thin enough, but under Mrs White's Bill it would be possible for a man or a woman to be given a divorce because his or her spouse had committed no more "offence" than a determination to abide by a mutual decision to separate. For that reason many people will condemn the Bill on principle. But it is extremely doubtful if, today, a majority of people do hold to the rigid view. Marriage in English law (as distinct from English society) has never been a sacrament, which means that the benefits and burdens of that state must be subject to the normal tests applied to any social and economic custom. Certainly no lawyer could claim that Parliament would be wrong if it gave the claims of social justice greater weight than the claims of religious doctrine. Mrs White's Bill is designed to meet the cases, roughly estimated at 100,000, in which the reality of the marriage has been ended by a separation, brought about by consent or by court order. It is not a matrimonial offence to be separated by agreement or court order. It may be an offence, that of desertion, to be separated without any

order or agreement at all, with the result that a woman deserted by a husband and offered a separation agreement may have to decline the protection it gives in order to keep alive her chance of getting a divorce. When a man and wife have separated for seven years, when the obvious and inescapable fact is that their marriage is dead in everything but status, it cannot be right to condemn them to a choice between perpetual celibacy, casual encounters or an irregular union. Nor can it be right to punish in that way any individual who will take on the risks of an irregular union with devotion, nor the children of such a union who, as the law stands, can never be legitimated. If social justice is the proper test, the arguments in favour of the Bill are overwhelming.

Overtime Tactics

The present disputes in parts of the engineering industry emphasise what to the outside observer are somewhat conflicting elements in the trade unionist's attitude to overtime. On the one hand, the opportunity to work regular overtime appears as a privilege, whose distribution among the labour force is in many undertakings a subject of jealous scrutiny and whose withdrawal is regarded as legitimate ground for a strike; on the other hand, refusal to work overtime has been in recent months the chief weapon used in disputes in the printing trade, and now the engineering industry. It is quite wrong to conclude that overtime is refused, just as the shorter basic working week has been demanded, because of a preference for leisure as compared with additional income. The shorter working week is in fact a device for ensuring that more of the hours actually spent at work shall be called overtime and paid for accordingly; it is a disguised wage increase whose advantage in giving the worker a more flexible choice between work and leisure is only secondary. Hence the importance attached to a "fair" distribution of overtime opportunities—and hence, also, a proportion of the midweek absenteeism which can be profitably made up at weekends.

A situation in which plenty of overtime must be worked in order to keep overheads within bounds and get jobs done to schedule suits the wage-earner, in fact, far better than it suits the employer. But, given that situation, it is important to the employer that the necessary overtime shall in fact be put in, and refusal to work the extra hours can be used exactly as the strike weapon is used. It constitutes, indeed, a semi-strike, with the advantages that it carries no such opprobrious and significant name; that it involves only a partial, instead of a complete, sacrifice of earnings; and that it puts the employer unable to face the losses involved in the position, should he close down his works, of having originated a lock-out. In the current engineering dispute refusal to work overtime or on piecework is related to dissatisfaction with piece-rate earnings, but the relation is fortuitous. Any grievance or ambition could give rise to similar tactics. The shorter basic working week has added a powerful new weapon to the workers' armoury.

White and Black Rhodesia

Officials from the two Rhodesias and Nyasaland and members of the Colonial Office have this week been discussing the possibilities of closer union between the three territories. The question has been debated so often, both by a dispassionate Royal Commission and by heated and prejudiced adherents of both sides, that it is difficult to believe that any concrete proposals can now be put forward with any hope of success. African opinion was so stampeded by the handling of the Victoria Falls conference, from which Africans were excluded, that it will regard any proposals for closer union with intense suspicion, while European

opinion in Southern Rhodesia is unlikely to accept anything less than full amalgamation.

The present conference, therefore, might well consider a proposal first put forward many years ago, and now being revived, that Northern Rhodesia should be partitioned. The copperbelt and European farming areas along the railway line would be amalgamated with Southern Rhodesia to form a self-governing colony; the north-eastern part of the territory would be amalgamated with Nyasaland as a protectorate under the Colonial Office; and another protectorate would be formed by the amalgamation of the rest of Northern Rhodesia with Barotseland and possibly Bechuanaland. The point of making the new territories protectorates rather than colonies is that the possibility of all the areas being eventually amalgamated into a central African dominion should be

kept in mind; it should be made clear that this is not a policy of *apartheid*, but of preparing the way for, eventually, a successful federation or even union of white and black areas. The chief purpose of the partition would be, that it is to say, to lessen the present friction between Europeans and Africans so that the extreme views which each holds of the other might in time become more moderate or even disappear. There would probably have to be a subvention, though not necessarily a large one, from Rhodesia to the protectorates, but this would be a cheap price to pay for racial harmony.

Persecution of *La Prensa*

If there were any lingering doubts about the character of the government that President Perón has given the Argentine people, these must be dispelled by the mixture of chicanery and violence he has used to suppress the leading independent newspaper of Latin America—*La Prensa*. Over the past two years the President and his henchmen have harried the publishers of *La Prensa* and have attempted to drive them either into bankruptcy or subservience. Supplies of newsprint have been cut off, bombs have appeared in the premises, advertisers have been intimidated and the paper has been accused of being a tool of alien exploiters. Through all these tribulations *La Prensa* has stuck to its job of reporting impartially the news, including the speeches of both government and opposition.

Recently Perón's attack has sharpened and it is now almost six weeks since the paper has been allowed to publish. The immediate offence committed by *La Prensa* was to

report objectively the railwaymen's strike, which occurred at the turn of the year and ended when the independent union was broken and replaced by government-appointed spokesmen of the workers. The sequel followed on January 25th. The Newsvendors' Union—a member of the Government-controlled CGT—declared a boycott after the management of *La Prensa* had refused to meet their demands for sole distribution rights and for a 20 per cent share in the paper's revenue from classified advertising; this cut was to be used for the union's welfare funds. Other associated unions struck in sympathy, making it impossible for *La Prensa* to appear on the streets.

After a month's stalemate a new chapter opened last week. The printing staff of *La Prensa* called on the police and, upon being assured of their protection, decided to resume work at the picketed plant. On their arrival they were met by gangs of armed hoodlums who shot one printer and wounded fourteen other employees. The police appeared on the scene only after the shooting, and then only to close the premises and to round up the staff for interrogation. Two foreign correspondents, one British and one American, who witnessed the shooting, were also imprisoned and released only after protests from their respective governments.

Since the incident, members of the government-sponsored trade unions have met to pass resolutions condemning *La Prensa* as "an enemy of the workers" and demanding its expropriation in order that it become "an organ of service to the country." Presumably the first step toward satisfying this "spontaneous popular" demand has been taken; legal proceedings were instituted this week against the principal owner, Dr Gainza Paz. According to the local Peronista press, the charges against him include promoting "a disorder that caused one death and several wounded" and "disseminating disruptive propaganda." This is the technique of Hitler.

The Explosive Soles of Luebeck

Stories that Communists and Fascists have from time to time used explosive soles and heels to remove some of their more obnoxious opponents have hitherto sounded like one of the wilder nightmares of Hollywood and Senator McCarthy. Now the police of Schleswig-Holstein have discovered an arms dump in the neighbourhood of the Soviet-German frontier which contained, among a quantity of ammunition, dynamite charges and fuses, and five soles and heels made of a highly explosive material called (appropriately enough) "Ekrahit." It must be assumed by the most sober observer that this type of soling and heeling was intended for somebody—perhaps somebody who intended to take a trip by air.

Traces of other similar dumps, which had been removed in time, have been found by the Luebeck police. This find seems to confirm the reports which were issued by responsible officials, including the head of the railwaymen's union, that the Communists had been ordered to prepare for widespread sabotage in Western Germany. Dr Lehr himself, from the Ministry of the Interior, recently declared that police uniforms had been smuggled across the frontier from the Soviet zone.

Bonn still has no police force with which to meet subversive activities, though there has been progress latterly towards agreement in principle on the establishment of Western *Bereitschaften* and frontier guards. It is deplorable that the weakly German democracy should be exposed to the dangers that arise when plots have to be countered by armed police and a secret intelligence corps. In comparison, the evil effects of setting up a regular German armed force inside the framework of Atlantic defence would be negligible. But the explosive soles of Luebeck tell a tale that cannot be ignored. Nobody can imagine that the latest British action in tightening interzonal passes will be an adequate answer to "Ekrahit."

The Heresy of Slingism

Heresies seem to be multiplying in the Stalinist empire. It is an affliction that can command some sympathy from Europe, which was so long riven and weakened by the heresies of men who had visions or thought for themselves. A curious feature of the Communist phenomenon is that the charges against the heretics are always cast in very much the same forms, whereas the heresies get different names. "Slingism" is the latest variation on a theme originally announced three years ago by Marshal Tito; yet the alleged crimes of Otto Sling, secretary of the Czechoslovak Communist Party in Brno, are boringly similar to those charged against Laszlo Rajk in Hungary and Traicho Kostov in Bulgaria—both now "liquidated." Like them he took money from foreign intelligence services, plotted to overthrow the government and conspired against a leader's life—or so it is said.

There is one interesting difference between "Slingism" and its predecessors. Whereas Rajk and Kostov were accused of plotting with Tito, Sling seems to have been a lone wolf, guided solely by his wicked instincts; although he was aided and abetted by such people as Mme Smervova, once acting secretary-general of the Czech Communist Party but now revealed as "her real unbolshhevik petty bourgeois self." It looks as if the Party has decided that nothing is to be gained by implicating Tito in such incidents, because it merely shows how heresy breeds heresy and how Yugoslavia's defiance has been so far successful. Indeed, Titoism is now surrounded with an aura of success and is best forgotten.

In any case, the backslidings within the Czechoslovak Communist party are clearly sufficiently grave to justify a grand show trial. Periodic and frequent purges of the party have proved inadequate; so now it is to be subject to a "continuous and never-ending purge." According to Kopecky, the Minister of Information, only those will remain who

consider it as their most sacred duty unconditionally to love the Soviet Union, the glorious All-Union Party of the Bolsheviks and Comrade Stalin.

To fail in this duty is the error which all these heresies—Titoism, Kostovism and Slingism—have in common. Now that Togliatti has returned to Italy from his treatment in Moscow, it is presumably the turn of Cucchism.

Teachers' Training

It is a bold step by the Minister of Education to abolish the four-year teacher training grants when graduates in the schools are so scarce. In principle he is perfectly right. In practice he is taking a grave risk. For decades graduate teachers have been lured into the schools by the bait of a four-year university course at state expense. At the outset they signed a "declaration" of intention to teach. This declaration has been much reviled and is now to be abolished. Henceforth no one need commit himself to teaching until the end of his third year, when he starts the final post-graduate year of training. Up to that time no one will bear the label of "intending teacher." Those who hope to train will compete on equal terms for open state and local scholarships.

This decision of the Minister raises two important issues. First, will the new arrangements affect the flow of graduate teachers to the schools? In the short run, it is difficult to feel optimistic about this. Good graduate teachers, particularly of science, are already critically short in the grammar schools: in a number of girls' and a few boys' schools science departments are being closed. The abolition of the declaration may increase the shortages. In the longer run, the difficulty of finding good arts teachers is likely to diminish as alternative occupations become well filled, but for most sciences the openings in industry are still easy to find and attractive.

The second issue affects the universities. To fill in the gap caused by the abolition of the teacher training grants the Ministry of Education now proposes to increase the number of state scholarships by another 950, up to a total of 2,000, and hopes to persuade local education authorities to increase their grants as well. In 1949-50 new teacher training grants were running at 1,580 a year, so that local education authorities would have to increase the number of local awards by about 650 to bridge the whole gap. This would mean an increase of some 16 per cent over the number of major awards (4,026) given in 1948-49. At a time when local authorities are being pressed from every side to economise such an expansion will be difficult. Yet without it the universities may have difficulty in filling their places. The chances of finding good fee-paying students decrease as taxation and the cost of living rise.

* * *

New Towns and Rates

Hertfordshire County Council is alarmed by a steady rise in rates. In contrast to a favourable prewar position, its rates last year reached a level exceeded by only two other counties in England. This year a further steep increase has been prevented only by the possibility of taking the equivalent of a 1s. 5d. rate out of balances. The special factor in Hertfordshire's case, which causes gloomy financial prognostications, is that the county contains four new towns and two LCC satellites. The initial cost of providing these new areas with county services is considerable. The provision of education (which anyhow absorbs well over half the county's rate) is particularly expensive, since the number of children in the developing areas is far above the average. In fact it is claimed that the present rate income from the LCC's Oxhey estate does not even cover its education bill.

Hertfordshire is, of course, a special case among counties, since it bears the brunt of public schemes of dispersal from London. Moreover, its distant future is perhaps brighter. In the long run, the new towns, if they turn out to be the "balanced communities" which are intended, may accumulate enough rateable value to pay their way locally—although LCC estates will certainly not do so. The county's problems underline the haphazard way in which the costs of physical reconstruction will fall on local authorities in the London region.

The redevelopment of central London and the dispersal of population—if it actually comes to pass—will be costly and will affect local authorities, in unequal measure, over a wide region. "Exporting" authorities, of which the LCC is the chief, must face not only high redevelopment costs but a heavier burden of debt charges in consequence of their reduced population. "Importing" authorities also face a serious deficit where they are saddled with large housing estates of low rateable value. The only contented local authorities will be those which, like Hertfordshire itself before the war, can attract a big influx of middle-class residents. It seems from their planning proposals that some counties near London are hoping to make their contribution to the dispersal policy in this painless manner.

The present method of financing major schemes of reconstruction in the London region is neither fair as between the numerous local authorities affected, nor does it encourage development to take place on the right lines and in the right places. The same point applies to other big industrial regions which have similar problems. It is surely time that the Government instituted an inquiry into the whole tangled subject.

Old People's Homes

The National Corporation for the Care of Old People has its feet firmly planted on the ground. Its annual reports,

PRECISION

To one of the TI Companies precision can mean making a tube which will fit inside another tube rather finer than a hair. A useful kind of accomplishment in an organisation which, in Britain, operates factories mostly concerned with light engineering. Bicycles and cycle components — electrical appliances — pressure vessels — precision steel tubes — metal sections — aluminium sheet, strip, extrusions — all call for a high degree of accuracy, and TI makes them all.

T.I.'s FORTY-NINE FACTORIES SERVE THE WORLD

TUBE INVESTMENTS LIMITED • The Adelphi, London, W.C.2 • Trafalgar 5633 

of which the latest has just appeared, show that it continually bears in mind the increasing burden that old people are throwing on other sections of the community and the consequent need to ensure that what help is given is given economically and where it is most wanted. It insists, therefore, that the accommodation provided by local authorities and volunteer bodies should be restricted to old people really in need of "care and attention"; it should not be provided for those who, however lonely, can live independently in their own homes or who have relatives able to give help and care. Similarly, it deplures unnecessarily high standards in the homes provided, which must limit their numbers. "Few old people in their own homes are able to maintain the standards which some local authorities are setting." Probably this criticism should be directed at the Ministry of Health, which imposes the standards, rather than at the local authorities themselves. For instance, the Ministry has laid down that the floor space of a cubicle in a converted dormitory should be quite unnecessarily large, which would at once reduce the number of cubicles that could be provided. As the corporation says, there have to be standards, but they must be reasonable and must not be lavish.

The other main topic dealt with in the report is the old one of the borderline between sickness and health in old age. The report points out that some homes, originally intended for the able-bodied and staffed accordingly, are probably now facing the increasing infirmity of their residents. The danger is that they will either have to take on more staff, and therefore possibly become too expensive, or will degenerate into small, inadequately staffed, homes for the chronic sick.

To avoid this danger the corporation has agreed to provide the capital for experimental homes whose maintenance costs would be shared between the hospital and the welfare authority according to the number of residents for whom each was prepared to accept responsibility. Money given by the people of South Africa is being devoted to this purpose. Unfortunately, the suggested division of maintenance costs has so far not proved possible. One reason is that old people classed as hospital patients receive their old age pension either in full or in part and free maintenance, whereas old people classed as in need of care and attention are charged a minimum of 21s. a week. Such is the result of the attempt to co-ordinate the social services, which was one of the main purposes of the Beveridge Report.

* * *

Revolutionising the Tay Valley

The plan for the future development of the counties of Angus and Perthshire has now been published for the East Central Scotland Regional Planning Committee. It calls for the elaborate reorganisation of industry and redistribution of population, without regard to the economic problems involved, which is characteristic of too many of the postwar regional planning schemes. The Tay Valley district has an area of some 2,000,000 acres and a population of under 400,000, nearly half of which is concentrated in Dundee. Apart from Perth with 40,000, Arbroath with 20,000, and two other towns with about 10,000, the populations of the remaining ten burghs range from 700 to 7,000. During the nineteenth century, the rate of growth of population in the area was less than that of Scotland as a whole, and there has been a five per cent decline since 1901. Rural population has fallen steadily since the middle of the nineteenth century and there have been similar decreases in most of the small burghs during this century; Dundee continues to grow, but at a diminishing rate.

The purpose of the plan is to reverse this population trend. One is asked to take it as axiomatic that 150,000 is the ideal population of a town and that, therefore, 30,000 people from Dundee should be partly rehoused in two satellite towns and partly distributed over the region. "If

people left the rural areas because they could not make a living then the means must be provided to make that living." The necessary housing services and social facilities to encourage people to repopulate the foothills of the Grampians and Central Highlands must be provided. To provide employment, people establishing new businesses or extending old ones will be encouraged to site their works at places that in many cases must be miles from the nearest railway and subject to isolation by snow in winter. Furthermore, on the theory that diversification of industry is a remedy against unemployment, no village must be dependent on a single firm, and a limit of twenty or thirty employees per firm must be set. The problem is seen entirely in terms of control over the location of new building and the transplantation of seedling businesses from some unidentified nursery garden. For this purpose the successful development scheme in Dundee, where general services seem capable of further loading, must be halted. It is blandly assumed that what has been possible in a large town with seaport and main-line railway services, suffering from unemployment through the depression of an industry which once occupied nearly half its working population, is equally possible on a diminished scale in a highland village with a few hundred souls.

Nowhere is the cost of the proposals considered. The provision of buildings is regarded solely as the choice of one site rather than another. The effect of location on production costs is ignored. The same nonchalant attitude to costs is shown in the endorsement of the local demand for a Tay road bridge. Such a bridge would undoubtedly benefit about 250,000 people living north of the Tay by improving communications with the growing coalfield in Fife; it would

Fiscal Probity

It is essential to our future safety and good government that all leaders of public opinion, whether in Parliament or in the press . . . should take a deliberate view of the solemn responsibilities attached to their position, and . . . should resolve to abstain in future—whatever be the temporary triumph they may thereby have to forego—from arousing that "ignorant impatience of taxation" which, if carried much further and persevered in much longer, will end in rendering the wise and safe administration of this great empire a thing almost impossible. Already it is difficult to modify or to exchange a tax without raising a storm which no cautious Chancellor of the Exchequer will readily encounter. Already it is difficult to maintain inviolate sources of revenue which every man with the slightest insight into public business knows to be perfectly indispensable. Already, on more than one occasion, legislators, in whom class sympathies overpowered their sense of the imperial necessities, or whose thirst for popularity was stimulated by an approaching dissolution, have voted the repeal of taxes which it was impossible to spare; . . . All this is fraught with menace and with mischief: . . . it should be met face to face, and vigorously argued down. We shall scarcely be accused by any who have accompanied us from the beginning, of being the advocates either of lavish expenditure or of needless or mischievous taxation: we have fought in the ranks of retrenchment and reform too energetically and too long not to have earned the right to speak our thoughts now, and to be listened to with patience and candour, when we say that England can well bear, and ought not to grudge, any expenditure demanded for the maintenance of the national credit, for the completion and consolidation of the national interests, for the collection of that full and close statistical information without which rulers must often be working in the dark, or for the remuneration of those public services which—where really rendered—it is not easy to overpay.

The Economist

March 8, 1951

WORLD IDEAL

ONE fact should be remembered by everyone who talks about the American public reaction over Korea, if we wish to avoid glib reactions of our own.

We shall comprehend the feelings of ordinary Americans with sympathy if we do not forget that Korea has cost them casualties on a scale more than fifty times the British toll. The total is equal to the population of a fair-sized town. It is 49,000. More than 8,000 homes in the United States mourn men who will not return.

We should honour the memory of these American young men, and our own. Whatever history finally records of Korea, however much more we may learn, it will be right to remember that belief in a great ideal sent them to that country—the ideal of responsibility to enforce world law and order, fully accepted by a world organisation of nations for the first time.

We honour these men who died for a world ideal. We should think generously of the United States for her sacrifice in defence of it.

Reprinted from the editorial column of the Daily Mirror of 22nd February. The Daily Mirror's net sale—over four and a half million—exceeds that of any other daily newspaper in the world.

HOTELS

personally and independently recommended by
Ashley Courtenay

"His cogitative faculties immersed in cogitation of cogitation."

My daily past gives me much cause for cogitation, but I find much pleasure in helping others to solve their holiday plans. My "Shop Window" below may be of help to you in holiday planning, but for other districts, write to me, enclosing a stamped-addressed envelope to: 65, St. James's Street, London, S.W.1.

REMBRIDGE, I.O.W. for your holiday. **ROYAL SPITHEAD HOTEL** offers comfort and good food. Direct access to beach. Sports. Family parties welcomed. Fully licensed. Brochure on application. S. C. Selwyn, resident Managing Director.

BROADWAY, Wores. THE LYON ARMS. Always in season, though there are many who feel its mellowness is enhanced when the curtains are drawn, for it is then they appreciate the log fires, cooking in the best English tradition, and a pleasantly warmed bedroom complete in its comfort. Tel.: 5.

HAWKHURST, Kent. COLLINGWOOD HOUSE HOTEL. In this historic and lovely Georgian house, the art of gracious living is still practised. Warmth, unusual comfort and a high standard of catering will be your lot. For Brochure write: N. Allan-Smith. Tel.: 3340.

HYTHE, Kent. HOTEL IMPERIAL. Holiday this year on the Kentish Coast, at this magnificently equipped hotel facing the sea. 50 acres garden, private Golf Course. A large number of rooms with private bath; some private suites. Fine Ballroom and Cocktail Lounge. A.A., R.A.C. Tel.: 67441.

JERSEY, C.I. ST. BRELADE'S BAY HOTEL. (1st Register). 11 hrs. flight from London. Flowers, sunshine and an equable climate. Completely sheltered, facing the sea and the south. Now looking for Spring. Details with pleasure from R. H. Colley. Tel.: St. Aubin 1.

MINEHEAD, Somerset. NORTHFIELD. Situated in 3 acres of grounds, aims at high standards of catering and comfort AT ANY TIME OF THE YEAR. Convalescence? A honeymoon? Or just in holiday mood? Exmoor, the sea, and Northfield make a happy combination. Tel.: 864.

NEWQUAY, Cornwall. HEADLAND HOTEL. Reopens April 28th. Billiards, Bridge, Dancing, Tennis, Snooker, magnificent sands. 18-hole Golf Course adjoining. Good food, well-stocked cellar, attractive Cocktail Bar and Sun Lounge. Every room with a sea view. (Private bathrooms available). Early booking advisable. Write, W. Pulgaze. Tel.: 2211.

NR. NEWQUAY, Cornwall. GLENDORRAL. Nigel Tange offers you the perfect holiday by the sea. Private steps to Atlantic surf-bathing and golden sands. 10 acres of private coaching grounds. Own farm produce; cream, milk, Children's paradise; comfort and rest for adults. Tel.: Newquay 2949.

NINFIELD, Sussex. MOOR HALL HOTEL. (Cooley Beach 4 miles), has the Country House atmosphere you may be seeking. Riding Stables; Saturday Dances; Hard Tennis Court; Golf; Cocktail Bar, and always someone genial to meet. Tel.: Ninfield 320.

SALCOMBE, S. Devon. TIDES BEACH HOTEL. What a lovely address for a seaside holiday! Here, on the edge of a sandy beach, with boats, fishing, safe bathing and fine walks, are added the finishing touches of comfortable accommodation, good rate and ample garage space. Tel.: 235.

RAVENSCAR, Scarborough.
RAVEN HALL HOTEL

A completely self-contained, fully licensed holiday hotel. Heated sea-water Bathing Pool, 9-hole Golf Course, Putting, Hard Tennis, Bowls, Billiards, Dancing (Orchestra)—all free to residents. Riding available. Fully inclusive terms 35/- to 47/6d. per day. Tel.: Cloughton 253.

SCARBOROUGH, ROYAL HOTEL

Planning a sunny, bracing holiday this year? Write Tom Lanchton, Resident Director of this superbly situated hotel, providing excellent food, delightful surroundings, light music, dancing and comprehensive holiday amenities. Early application is essential. Terms 28/- to 39/- per day. Tel.: 1016.

EASTER IS EARLY
this year, but not too early to enjoy the Spring sunshine and flowers at

TORQUAY'S GRAND HOTEL

Now booking for Easter. For tariff write E. Paul, General Manager. Tel.: 2234.

A statement about the NEWS CHRONICLE

Below are extracts from a recent book 'The British General Election of 1950' by H. G. Nicholas, Fellow of Exeter College, Oxford, and Faculty Fellow of Nuffield College, Oxford.

"It (*News Chronicle*) certainly conceived of itself as serving a popular but intelligent readership which did not wish to be led in the blinkers of any party.

It was in keeping with this attitude that the paper's most distinctive election features were its Gallup Polls and its 'Great Debate'.

For the first time in British election history, a whole-hearted attempt was made to bring before the readers of a single newspaper the whole range of party viewpoints presented by party leaders themselves.

Straight news was not affected by the political leanings of the newspaper.

The *News Chronicle* seemed commendably free of special attitudes towards most issues and individuals."

WHAT IS THE BEST WAY TO GO TO
AUSTRALIA OR NEW ZEALAND ?

FLY BY PAN AMERICAN—
THEIR COMMONWEALTH
PLAN OFFERS LOW
ALL-INCLUSIVE FARES!

Now! From London and Glasgow. Your ticket covers your entire flight from London or Glasgow to Australia or New Zealand on the Sunshine Route via the U.S.A. Includes hotel expenses in New York and San Francisco . . . all meals and transit expenses. Trip takes only five days.

Giant new double-decked Clippers* and Sleeperette*-equipped Clippers across the Atlantic and Pacific. Luxurious oversize berths available on double-decked Clippers at small extra charge. Sleeperette-equipped Clippers offer special reclining bed-length seats (no extra charge). Facilities for babies.

Special arrangements made for inexpensive and speedy forwarding of heavy luggage.

No delay—you can go now! Call your Travel Agent, or:

Pan American at 193/4 Piccadilly, W.1. (REGent 7292);
also at Prestwick Airport (Glasgow Central 9780).

Make certain of History TODAY

The success of the first two numbers of HISTORY TODAY means that you should make sure of your copy by placing a firm order with your newsagent or by taking out an annual subscription.

HISTORY TODAY, the half-crown monthly historical magazine, is concerned with every branch of our past experience. Its articles, written by experts, have a very wide and general appeal. The illustrations, from prints and photographs, are profuse.

Contributors to the March issue—on sale now—include Sir Henry Bashford, Geoffrey Grigson, D. W. Brogan, G. H. D. Cole and others.

HISTORY TODAY costs 2/6d. and is obtainable from your usual newsagent or bookseller, or by annual subscription of 30/- from: HISTORY TODAY, 72 Coleman Street, London, E.C.2.

have little advantage for longer-distance communications, and an expenditure of upwards of £3,000,000 must be judged entirely in terms of local advantage. The Tay Valley has its problems, but the plan not only fails to offer a solution; it fails to state the problems.

Dutch Trade is Shattered

At midnight on February 26th, a goods train loaded with Dutch vegetables was stopped at the frontier by German customs officials. By the following morning, Holland realised that overnight it had, at least for the time being, lost its chief markets for fruit and vegetables, and dairy produce for the duration of the German economic crisis. The Germans had been importing these under quota until they decided temporarily to suspend imports from all countries in the European Payments Union.

At that point, their debt to Holland under EPU was rather more than \$100 million. Earlier, on February 21st, the frontier had also been closed to imports on the liberalised list, which included Dutch eggs and electrical products.

In the short term the German action means that Dutch exporters have enormous perishable surpluses on their hands which must either be counted a total loss or put in expensive cold storage. Dutch exports of eggs to Germany were running at the rate of approximately £1,500,000 a month, fruit and vegetables at about £700,000. On the longer term, the Dutch

can expect that the Germans will relax their ban. What they cannot expect is that trade can return to the high levels of 1950. For Holland this is a serious blow. Under the auspices of liberalisation, their total exports to Germany in the first eleven months of 1950 rose to roughly £92 million including nearly £7,000,000 of butter, £13 million of eggs and over £7,000,000 of vegetables, for which there are no obvious alternative markets.

The movement to liberalise European trade and payments has been based, to some degree inevitably, on a highly artificial structure, too inflexible to absorb the natural stresses that are bound to arise. When one strut snaps, others have to bear an intolerable strain. It is artificial primarily in its geographical scope; eighteen countries which are not entirely complementary trading partners have agreed to free a fixed level of their trade with each other and to regard this free element as a permanent factor in their trade balances and their internal production. It is artificial, secondly, because all those eighteen countries are at different stages in their economic recovery. It was undoubtedly worth trying; but, if only to protect the vulnerable members, it should have been tried on a far broader basis. Holland might not have suffered if Germany had been able to earn a sufficient surplus with other members of the EPU to finance the deficit in its trade with the Dutch. But within the limited field which the Payments Union actually covers, there was little chance of this being possible.

Letters to the Editor

FBI and the Budget

Sir,—In *The Economist* of March 3rd it is stated that "The FBI, having reckoned that £300 million a year could be secured in this way (that is, by economies in civil expenditure), then lends support to the spreading fallacy that an equal further 'saving' could be got merely by switching the capital financing of local authorities from the central government to the private capital market."

May I suggest that this statement does not represent the intentions of the FBI memorandum? The authors of the memorandum did not for one moment suppose that by switching the amount of £300 million from the central government budget (where it appears in the "below the line" expenditure) and putting it more directly on to the shoulders of local authorities, £300 million of physical resources would automatically be made available for financing rearmament. Obviously if the same expenditure is incurred as before, and there are no additional savings, the change would make no contribution whatever to the problem of financing rearmament without inflation.

The main purpose of the transfer would be to throw the financial responsibility more directly on to the shoulders of those who are responsible for initiating the expenditure, and it is believed that such a change would lead to greater economy than the present system of financing this expenditure by ultra cheap loans through the central government. The field of economy in local government expenditure is, of course, wider than that covered by these loans.

The Chancellor of the Exchequer has, however, two closely related tasks: one is to keep the "domestic" accounts of the central government in good order by balancing the budget (or budgeting for a defined surplus or deficit), and the other is to endeavour by his own policy to keep the nation's finances as a whole healthy, i.e., to encourage savings to match capital expenditure or discourage capital expenditure to match savings.

The saving of £300 million referred to in the FBI memorandum is the gain to the central government budget.

It is obviously proper when considering the more domestic problems of the Chancellor in raising taxation for the central budget to take this saving into account. If there is not a corresponding reduction of expenditure by the community as a whole, then to this extent this balancing of his own budget will not succeed in reducing the inflationary pressure.

May I point out that the Chancellor is faced with precisely the same problem when he raises extra taxation? If he raises £300 million of extra taxation, but this is offset by a corresponding reduction in savings, or an increase in capital expenditure, his action in trying to avoid inflation is, to this extent, rendered nugatory.

It is to be regretted that the brevity of the FBI memorandum should have caused misunderstanding, and to have led anybody to suppose that its authors fell into the very elementary error of which they are accused.—Yours faithfully,

S. P. CHAMBERS

Chairman, Taxation Committee,
Federation of British Industries
London, S.W.1

Middle East Oil

Sir,—An author should take criticism in good part, but I feel that the review of "Wells of Power" in your issue of February 17th is perhaps unfair in general and misleading in particular. The gravamen of the general charge lies in the reviewer's objection that I failed to go into detail in the matter of the 1950 negotiations for a revised Middle Eastern oil concession. The omission was deliberate and actuated by two considerations, the first that a book timed for publication near the crucial moment likely to decide failure or success in these negotiations might embarrass the negotiations if it dealt in detail with this subject, the second that on a long-term view I thought, and still think, these arguments may prove ephemeral.

From several instances of misrepresentation or misstatement may I select two?

(i) Your reviewer writes:

Many other facts given are plainly wrong. For instance, Sir Olaf dubi Turkey a dictatorship, which is to ignore the elections of May, 1950.

I wrote (pp. 14-15):

At least she (Turkey) has been able to take on the social and political forms of Europe in a grave and measured manner, all her own. . . . It is true that the revolution in Turkey led her through a stage in which her people submerged all loyalties to a single leader. But that resignation, even as Islam itself, had in it some quality of independent will, something human and not mechanical, which, search as one may, is not discoverable in Russia or the satellite States. Turkey has had her Cromwell and revered him. Now she moves on to wider fields.

(ii) Your reviewer writes:

He states that Russia, when Israel won the Palestine war, dropped the Arabs and took up with the Israelis, whereas the fact is the other way about.

I did indeed write more or less that (pp. 153-4). In support one might quote two recent books, Mr George Kirk's "Short History of the Middle East," and Sir Reader Bullard's "Britain and the Middle East." On page 287 of his book Mr Kirk describes the Russian solicitude for the embryonic Jewish State, which, he points out, lost them their support in Arab left-wing circles. He added that this policy would change with expediency. On pp. 152-3 of his book Sir Reader observes that Russia and her satellites recognised Israel immediately, and that Israel began her career with expressions of gratitude to America and Russia. So wrote I.—Yours faithfully,
Steyning OLAF CAROE

Eight Pennyworth of Planning

Sir,—Your objection to Mr Webb's defining as "inflationary" the increase in the price of Argentine meat calls for some comment:

(a) The present British economy is surely one of "controlled inflation," that is, an economy in which the excess of demand over supply is only partly checked at source, and otherwise is controlled in its symptoms—rising prices—by various means.

(b) The controlled price of meat is an essential component of the cost of living, and any increase in the former has a direct effect on the latter, which contributes to cause a general rise of the salaries and wages.

Therefore, while it is evident, as you say in your reply to Mrs Hall, that more purchasing power would be absorbed by a higher meat price, it is hardly likely that this would occur without a corresponding increase in the total purchasing power of the country.—Yours faithfully,
M. BARENDSON

Milan, Italy

A Decimal Currency

Sir,—£ s. d. can be converted into decimals more easily even than Mr Gardiner suggests. We need only mint 20 pence to the florin. 10 florins make a pound. Mr Gardiner gets his 10 pence to a shilling and we keep the

shilling and the pound. Both, being monies of long standing, are well worth preserving and the disturbance to tradition is lost. The suggestion is not original. I heard it first from the late Professor Sir Norman Howarth many years ago.—Yours faithfully,
DENARIUS

The Billion Again

Sir,—May I take the liberty of protesting against the apparent use (in the article on "Electric Power in France" in your issue of February 24th) of "billion" in the American sense of one thousand million (10⁹) and not 10¹², as is customary in England and France. Considerable confusion may result in readers' minds if the American "billion" continues to appear on this side of the Atlantic; and, while it is to be appreciated that you have an American circulation, I would suggest that the adoption of the American usage is a part of a process of depreciation of standards.

I believe that there are many Americans who deplore the continuing tendency to use long words in place of short, grand titles for simple institutions; the use of "university" comes readily to mind. This inflationary tendency is most evident on the average pin-table, where even the smallest score is labelled 10,000. (Compare "transportation" for "transport!") No doubt the word billion makes an impressive sound; but I must deplore the misunderstandings arising from its American sense. After all, as the Lancashire man said in the trenches, its à la language. Why should we not write 2,000 m.?—Yours faithfully,
GORDON MANLEY

Department of Geography,
Bedford College,
University of London

[We gave notice some years ago that, in all American contexts, and permissibly in others, we proposed to fall in with the long-established practice of the large majority of users of the English language and use "billion" to mean one thousand million. In a French context, "milliard" has the same meaning, and might have been used in the article to which Professor Manley refers, but it has never been an English word.

We do not understand Professor Manley's argument about the American addition to cumbersome phrases instead of short ones. "Billion" is shorter than any of the alternatives. His suggestion of "2,000 m." strikes

us as an abomination. If he is prepared to write "m." for million, why not "th." for thousand and "h." for hundred?—
EDITOR.]

The Middle East

Sir,—I do not wish to belittle the importance of the Turkish army, but I feel that many of your readers will think, like me, that your correspondent in your issue of March 3rd ignores well-known facts when he predicts that, of Greece, Turkey and Persia, "Turkey only is likely to stand firm in an emergency."

Not long ago the military correspondent of *The Times* ended an enlightened article on the Greek army thus: "It is probable that no small nation today can put into the field a better army."—Yours faithfully,
ARISTIDE EATYCHIDES
London, N.W.8

A Stone in the Wind

Sir,—Your account of the report of the Committee of Inquiry into the law of succession in Scotland is distinguished for its introduction of a Senator of the College of Justice unknown in Scotland. There was a Lord Morison on the bench some twenty years ago, but he resigned in May, 1937.

Moreover, a surviving spouse in Scotland has for many years, as is indeed clear from the committee's report, enjoyed legal rights in the estate of the predeceasing spouse, rights which cannot be defeated by will. May I refer you to page 7 of the report where the committee note that in England it is only since 1938 that a modified system of legal rights has existed.

The recommendation which you note of a cash payment free of duty to a surviving spouse where there is no will is an extension of the present rule giving the surviving spouse the first £500 of the estate on intestacy when there are no lawful issue of the marriage. The statutory provisions at present in force are in the Intestate Husband's Estate (Scotland) Acts, 1911 and 1919, as amended by the Conveyancing Amendment (Scotland) Act, 1938, and the Law Reform (Miscellaneous Provisions) (Scotland) Act, 1940.—Yours faithfully,
JOAN SMITH

Books and Publications

Good Governance

The Economic Role of the State. By William A. Orton. Hodge. 188 pages. 12s. 6d.

The borderland between economic and political theory is perilous ground for explorers and mapmakers. Professor Orton's unexceptionable aim is to survey it in the light of fundamental principles—the fundamental principles of ethics and political theory. Of the fundamental principles of economics he remains remarkably careless; deliberately so, indeed, since he is concerned with man, not economic man, with the concrete not with the abstract, but mistakenly so since his neglect leads him to turn a blind eye to entire fields of state activity which any comprehensive survey and criticism should include. There is nothing in his pages about monetary policy, next to nothing about foreign trade, nothing about full employment and the necessity (or non-necessity) of state action to maintain it, there is little awareness of modern welfare theory and hardly more of the analysis of imperfect competition—both highly relevant to his theme.

To say this, however, is in some measure merely to criticise the title Professor Orton has chosen for his book, a title which claims at once too much and too little. Too much, for the reasons just given; too little, since it gives no indication of the scope of his more general discussion of the nature and limitations of the state. In a free society the state must have a monopoly of coercion but must be denied a monopoly of valuation. It is "the social structure through which our sense of right becomes articulate and effective"—but only when that "sense of right" is a genuine consensus, a "sense of the meeting," a joint discovery of the "natural order." When those in control of the state machinery go beyond the implementing of the broadly agreed, claiming a "monopoly of valuations," society ceases to be free. The same danger arises when the state supersedes the social functions of other, voluntary forms of association—family, church, union, corporation—to become either the universal arbiter or the universal provider. On the other hand the state cannot abdicate its function as the interpreter, in economic matters or otherwise, of the moral consensus. (Here Professor Orton takes the argument up to the very edge of the *justum pretium* controversy, but shies away before it is too late.) The competitive economy will only work given certain restraints, decencies, recognition of the "fair" and acceptable thing, not reducible to terms of individual self-interest; it is the state's business to embody these in law, not merely to hold the ring, punish fraud, and slap down monopolies.

This is the economics neither of the neo-classics nor of Socialism but, in essence, of the Papal Encyclicals from which Professor Orton quotes freely; and it leads him to some very odd con-

clusions in particular cases. Altogether his book is best regarded as a challenge, a stimulus to soul-searching, rather than as a guide; it should be judged as an attempt to set the idea of the state in perspective rather than as a prescription for the proper behaviour of actual administrations.

The Koreans

The Truth about Korea. By Robert T. Oliver. Putnam. 178 pages. 10s. 6d.

This is a book on Korean affairs up to and including the outbreak of war last June, written by an American who was personally involved as an adviser to the South Korean Government and an old friend of Dr Syngman Rhee. It is written with passion and sometimes with an excess of sentimentality about the virtues of the Koreans—to whom the author is greatly attached. It is nevertheless worthy of note as a presentation of the case for the South Korean regime, which has been so overwhelmed with obloquy by publicists of the Pritt-Pratt school that a great part of British public opinion now appears convinced that, whatever the legal issue in the Korean conflict, it is a matter for shame that we are involved in defence of so reactionary and unpopular a government. The record in fact shows a remarkable achievement of economic and political progress in a new state which started on its career with every conceivable handicap.

After thirty-five years of Japanese direct rule the Koreans were left without constitutional political experience or qualified administrators; to this disadvantage, which it needed time and settled conditions to overcome, was added the partition of the country, which cut off South Korea from coal and electric power resources essential to its industry. The Americans originally had no plans for building up a Korean state single-handed, and in the early days gave hardly any economic assistance. For two years they clung with fatuous trust to Russian pledges, and far from promoting Syngman Rhee as an American puppet leader, they regarded him with deep disfavour; as one American official put it, "he has made himself so objectionable to Russia that he can never have a part in any American-sponsored government of southern Korea." Even after Washington had been compelled by Russian stonewalling to give political and economic support to the Korean Republic as the only alternative to Communist rule over all Korea, heavy armaments were denied to it in order to refute the Russian charge that "American imperialism is preventing the unification of Korea in order to maintain a military base there." The only result was to leave South Korea helpless to

defend itself against an attack with armoured forces.

Mr Oliver provides some important statistics about the use which was being made of ECA assistance before the North Korean invasion, and quotes an ECA adviser as saying "I have never seen a lazy Korean." Despite many shortcomings, the Korean Republic last June was a going concern and industrial production was steadily rising. It was not a bankrupt or collapsing regime which the Communists set out eight months ago to destroy by force.

Toujours la Clarté

How to Write Technical Books. By John Gloag. Allen and Unwin. 159 pages. 12s. 6d.

Authorship nowadays is thrust upon many who have information to impart but who possess neither a strong desire to write, nor that creative urge which should make communication a tolerably easy task. This book is meant for that increasing army of scribes. It is a sound and practical guide to the writing of technical books by a writer of considerable authority. He is a professional publicist who has written many books on technical subjects and who has had to read many more.

Since the technician is becoming an increasingly significant figure in society it is as well that he should be an intelligent technician. That is the burden of Mr Gloag's primer. If the technician cannot write movingly he should at least be able to write clearly; if he cannot inspire enthusiasm he can, implies Mr Gloag, at least keep his readers' friendly interest—but only if he follows certain rules.

Mr Gloag takes his general method from that advocated by Belloc for addressing an audience: tell your audience you are going to tell them something; then tell them; then tell them you have told them. This book—its first-rate example of how to write a technical book—follows that plan. In the first chapter the author announces his intention. He follows this with a

SPRING BOOKS
1951

MODERN BANKING

By R. S. SAYERS

THIRD EDITION, 1951

17s. 6d. net

When the first edition of this book was written in 1937 it was essentially a snapshot, through a theorist's eyes, of banking (mainly English banking) in the middle nineteen-thirties. The present edition is similarly a snapshot of banking at the beginning of the nineteen-fifties. The material has changed substantially in the meanwhile: radical changes were already in progress in the nineteen-thirties and the Second Edition, prepared in 1946, came too soon after the war to allow for the crystallization of the innovations. To allow adequately for these changes and to make room for other improvements almost complete rewriting of the book has been necessary, although much of the original structure remains.

The only substantial change in the scope of the book is that it is now just a book about banking, to the exclusion of any attempt to outline the theory of international prices.

OXFORD UNIVERSITY PRESS

MOTOR-COACH TOURS

AT HOME OR ABROAD THIS YEAR!

★ If unable to call write for the appropriate Motor Coach Programme:
1. Tours in G.B. and Ireland or,
2. Tours on the Continent
to Dean & Dawson Ltd., Dept. 49/M.B./M.C., 81 Piccadilly, London, W.1.

Once again a wonderful selection of Motor-Coach Tours is available to you through Dean & Dawson—a choice based on experience to ensure that you get those which give you the best itinerary, good accommodation—and sound value for money... whether in Great Britain, Ireland or Abroad. Any branch will show you these attractive tours and give that personal attention to your plans for which Dean & Dawson have been known for so many years.

DEAN & DAWSON

BRANCHES IN PRINCIPAL TOWNS

description of the planning of a technical book, illustrated from three of his own books. In his third chapter he stresses the need for simplicity. Say what you mean, avoid jargon, clichés and verbiage—and when in doubt, cut. The succeeding chapters should help not only technicians but almost anybody who has to write, or who wants to write, a book. These chapters include useful information about the relationship of publisher and author, an analysis of a typical agreement, advice on the preparation of the typescript, on correcting proofs, on preparing an index and on book production generally. The last chapter is a refreshing criticism of the obscurity of official forms, with suggestions for improving them. The book is well illustrated and easy to read. Mr Gloag instructs both practically and painlessly.

The Devolution of Bureaucracy

The Civil Service Today. By T. A. Critchley. Victor Gollancz. 150 pages. 12s. 6d.

Mr Critchley writes as a working civil servant having personal experience in a number of departments and has been in each of the three main grades, clerical, executive and administrative. He is well qualified to describe the service from the inside and this he has done, department by department, illustrating his survey with analyses of functions undertaken and descriptions of the life of the men who fill the offices. Considering the extent and complexity of this subject the result is impressive, but it does not make easy reading. The organisation of government offices is meant to be purely functional, is certainly fluid, and the set-up at any particular time is unlikely to arouse either a lively or an abiding impression among those who do not already have a special interest.

Mr Critchley permits himself only occasional glances at current criticisms of civil service practice and his answer generally is that the service is what parliaments and governments have made it. Successive ministries have equipped themselves with new powers and Parliament retains its right of detailed inquisition at question time. These two factors have made the civil service large and ensure that its machinery will be cumbersome. Minor improvements can be made by Organisation and Methods tests and by intelligent establishment work, but the main outline is fixed by circumstances properly beyond the control of the civil service itself. Having established who is responsible for the present state of affairs Mr Critchley goes on to ask in an interesting last chapter whether or not this is satisfactory. The main and obvious difficulty is sheer size. Numbers are so great that individuals cannot recognise their own work as forming part of a whole which has evident meaning, and Mr Critchley thinks there has been some lowering of morale as a result. He might have fortified this opinion with a fuller description of the Whitley Councils at work. The procedure whereby civil servants divide themselves into two parties, one representing the employer, the State, and the other the employees

themselves, inevitably suffers from unreality. The official side must stick rigorously to their Ministers' instructions. The staff side inevitably respond by grasping as a precedent every concession that is offered to them. The cumulative effect is a set of rules defining conditions of employment which become Byzantine in complexity. With such a background to staff relations it is easy to understand why Mr Critchley unhappily observes that the spirit of public service is no more than a name.

If the defects of today's civil service are due to its size the obvious remedy is to split it into smaller and more manageable units. Unfortunately the multiplication of departments has already gone so far that they can scarcely maintain a sensible liaison. It might, however, be possible to relieve the congestion at the centre of the government machine by raising the status of the executive class and handing over to them suitable blocks of work to be handled in new subordinate departments. The administrative class might then be distinguished as "thinkers" rather than doers and should abrogate their present claim to be above the executive even in the executive field. Mr Critchley reports that the distinction between executive and administrative is becoming blurred. One may reasonably hope that this process will lead not to a completely amorphous structure but to a redefinition of the roles of the classes.

East-West Trade

Soviet Trade With Eastern Europe. By Margaret Dewar. The Royal Institute of International Affairs. 123 pages. 8s. 6d.

Miss Dewar describes the purpose of her study as "simply to collect such data as are available on the nature and extent of the exchange of goods between Eastern Europe and the USSR (not including the Eastern Zone of Germany, Finland)." In effect she has prepared for general consumption the contents of the many Chatham House press cuttings on the subject, added a seasoning of sifted rumours and made certain general observations. Of the officially published news, it is sufficient to say that the book is exhaustive, and of the rumours that all have been wisely selected. Only two "unofficial reports" appear to be suspect, viz., that 86 per cent of Rumania's national income was taken by the USSR between December, 1944 and February, 1946 and that the balance of Hungarian reparations remitted in 1948 had to be used for domestic rearmament. The author has, however, sagaciously refrained from including any of the many reports circulating about the influence of the Council for Mutual Economic Assistance since its foundation.

Of the observations she makes, the most interesting is on the extent to which the USSR has replaced Germany as the market for and the source of supply of Eastern Europe. The reopening of transport routes and trade relations with the West in 1946-47 diminished the relatively large postwar share of the Soviet Union in East European trade. The conclusion of larger trade agreements with

the USSR, in compensation for deprivation of Marshall Aid and the boycott of Yugoslavia, reversed this trend in 1948-49. By 1949 the USSR had become a larger trading partner in East Europe than Germany had been, albeit with a different content and distribution. Miss Dewar rightly holds this to be due, not to a deliberate preference for Soviet goods (since in any case the USSR cannot supply all that is required for their expanding economies) nor to any aim of economic self-sufficiency, but to the limited range of exports offered to the West.

The imposition of security export controls by the West not only commits East European trade still further to the USSR (and, to a lesser extent, China), but marks the end of a clearly defined period in their trade relations. To Miss Dewar's narrative, this is in fact today's envoi.

Famed Invention

Studies in Accounting. Edited by W. T. Baxter. Sweet and Maxwell. 455 pages. 23s. 6d.

If economics is the dismal science, accountancy might with equally rude inaccuracy be called the contemptible art. Those who take this view of "mere bookkeeping" and accept accountants as necessary nuisances for clearing up their surtax should read this admirable symposium. They will discover that the art of accounting displays every sign of intellectual curiosity, a bustle of ideas perhaps more vigorous than at any time since Paciolo first laid down the principles of double entry more than five hundred and fifty years ago.

Professor Baxter has had the excellent idea of gathering into one volume a collection of essays, mainly of an academic or meditative character, on the history, law, practice and theory of accounting. He laments the tradition that writing on accounting must be dull if it is to be sound—and proves how absurd it is by bringing together a collection of lively, well-written, controversial and sceptical pieces of which any professional could be proud. There is a profile from the *New Yorker* about the American accountant of the late thirties who was finally detected in the vast virtuosity of creating nearly two million dollars of non-existent assets—a *tour de force* that brought the creator much toil and no profit. It includes two chairmen's speeches of the late Arthur Chamberlain of the middle thirties of truly admirable quality. Professor Ronald Edwards's series on the nature and measurement of income, that appeared in *The Accountant* in 1938, is almost a book in itself; and there is a final symposium on depreciation and changing prices.

Throughout, the collection is full of liveliness and intellectual richness. It is in itself a claim that accountancy, far from being dull, can be a progressive, even turbulent, art.

This was the fam'd and quick invention, which Made Venice, Genoa and Florence rich.

Today it is doing more even than that; it is making its practitioners think.

AMERICAN SURVEY

Wrestling with Conscription

Washington, D.C.

FOR many weeks members of Congress and officials of the Defence Department from General Marshall down have wrestled with what must be counted as one of the most distasteful issues the United States, its government and its people, have ever had to face. It is the question of conscription in time of half-peace. The Americans have been told by their best-informed leaders that they must now prepare for a decade, two decades, or perhaps "a lifetime" during which their security will be so threatened that they must do a thing which is alien to their temperament and against all historical precedent. They must provide and maintain a big standing army backed by a big trained reserve; they must submit their youth to universal military service.

It is of no comfort to the Americans to be told that the French have had compulsory military service since 1798, or that Britain's youth has been conscripted for the last ten years. The Americans a long time ago set out to do better than that, and they have done better, by the aid of heaven and their geographical position. They have mobilised when they had to, as quickly as possible—nearly 400,000 men for the Revolutionary War, 500,000 in the War of 1812, about 3,000,000 in the Civil War, 4,000,000 in the first world war, 14 million in the second—and then, with the restoration of peace, they have swiftly dismantled their fighting forces and joyfully returned to their peaceful pursuits.

The pattern was established at the beginning of the Republic. As soon as the Colonies had won their independence, Congress established a standing army which consisted of just 80 men—the minimum necessary to guard military supplies. Many an American general has since wrung his hands over what General Marshall calls "our policy of feast and famine." Spokesmen of the Defence Department bitterly recall that when, only a little over 20 years ago, General Douglas MacArthur (then Chief of Staff) publicly expressed the view that some money should be spent in peacetime on the development of tanks and other weapons, he was picketed by angry citizens of Pittsburgh with signs reading: Butter—Not Guns. General Marshall told a Women's Patriotic Conference in Washington a few weeks ago:

My own feeling is that our failure to provide for Universal Military Training in 1920, and the tragic repetition of that error in 1945 and 1946, are largely responsible for the call we must make on our young men today. I am convinced that it would not now be necessary to interrupt the normal course of their lives if we had taken the conservative, wise action—an effort that was defeated largely by emotional rather than logical reactions.

It is true; it is all true. But there may be grave doubts whether an American nation which was willing to accept the logic of a military role in peacetime could have been

expected, at the same time, to preserve intact the reckless and generous instincts that have made it what it is. The truth is that an emotional revulsion to the disruption and waste of conscription for war in time of peace is a characteristic of decent, free Christian peoples. Such peoples may recognise, but they cannot reasonably be asked to embrace with any fondness, a new need for turning their sons into soldiers.

★

Nowhere is the capacity of the Russians to cut their own throats illustrated better than in the short postwar history of conscription in America. By taking over Czechoslovakia in 1948 the Russians created the majority in Congress necessary to revive the Selective Service Act—though it was only by writing into the Act a provision which exempted ex-servicemen and limited to about 2,000,000 the number who could be drafted that the Congress could bring itself to take this abhorrent step.

In June, 1950, the Russians set the North Korean Communists off on their predatory adventure and thereby procured in the Congress the majority necessary to remove the limit on the numbers of young Americans who could be drafted into the armed forces. In November, 1950, the Russians approved the Chinese entry into Korea; and it is that action which is making possible the projected new legislation designed to equip the United States with standing forces of 3,462,000 and to establish for an unpredictable future the first system of universal military training the United States has ever contemplated.

Something like 100 witnesses, contributing 1,241 pages of testimony, appeared before the sub-committee of the Armed Services Committee (Senator Johnson of Texas presiding) which produced the Senate Bill. In the lower House a comparable committee is struggling with what promises to be a rather different Bill with the same objectives. Witnesses of all shades of opinion have had their say from the great Generals in the Pentagon down to the tight-lipped mothers from the women's clubs. Heartfelt misgivings have been stirred by the programme the Defence Department is recommending, and the greatest controversy of all has surrounded the proposal that the draft should reach out to take men of 18—which is often to say boys who have just finished high school, have not yet been to college and have never held a full-time job. The sharp differentiation between boys of 19 and boys of 18, the immensely involved arguments designed to show that, by various expedients, it should be possible to make 18½ the minimum draft age, might astonish those in Europe who have long ago resigned themselves to the heartaches of conscription. But the desire to temper the wind to the shorn lamb, even a little, is well enough understood in America.

★

Under the Selective Service Act of 1948 single men between the ages of 19 and 26, except ex-servicemen, have been called up in numbers determined from month to month by the Defence Department, for 21 months' service. Under

the Bill devised by the Senate sub-committee single men of 18 to 26 (ex-servicemen again excepted) would have been called up for 26 months' service. The President in future, as in the past, could order the call-up of married men of these ages, too.

The sub-committee has sought to soften the blow for 18-year-olds by proposing that none shall be inducted until all the available 19-to-26 manpower has been absorbed. The effect would be to defer the 18-year-olds' draft for over a year. Another provision of the Bill would allow 75,000 selected students due for scientific and technical training to return to their colleges after a short basic military training. And the President would be authorised to appoint a civilian National Security Training Commission to arrange a universal four-to-six months' military training programme when the need for rapid mobilisation has passed.

This is rather less than the Defence Department asked, but it is more than Senator Morse, of Oregon, considered the ablest critic of the Bill, has been ready to concede. He has challenged the Defence Department's figures, accused it of wasting manpower and denounced the system by which the more glamorous Air Force and Navy skim off the cream and get all the men they want by voluntary enlistment, so that the conscripted men go to the Army. But his amendments, which would have raised the minimum age to 18½ and deferred 150,000 science students, were voted down this week; and in place of his 3,500,000 limit on the strength of the armed services, which military leaders said would be a "gamble with the national security," a 4,000,000 ceiling has been adopted. The Senate agreed to set the period of service at 24 instead of 26 months, but in other respects it backed up its committee.

Without doubt, the armed forces have been caught in the

past wasting and bumbling and asking for a lot more than they need. They are not above suspicion. Yet there is much evidence that General Marshall, with the vivacious help of the new Assistant Secretary for Defence, Mrs Anna Rosenberg, has prepared and presented a strong case for a law to set the keystone into the edifice of strength American policy is building. To the House committee last week General Marshall pointed out, with faint bitterness, that two months ago, when the Korean picture was dark, he was being criticised because he had not immediately gone to Congress to ask for 5,000,000 or 6,000,000 men. And already, now that the Korean picture is brighter, he is being told that 3,462,000 may be too many. The Bill he gets may well fall short of the Bill he wants. Even so, it will be a manifestation of an American decision to do under the spur of events what has always been and still is a congenitally hateful thing.

Portrait of Taft

[FROM A CORRESPONDENT IN OHIO]

THE debate between Senator Taft and Governor Dewey over troops for Europe dramatises a regional conflict within the Republican party as well as a personal rivalry for leadership. As Policy Chairman of the party, the Ohio Senator speaks with more authority for the middle west than does the New York Governor for the eastern seaboard. But Mr Taft labours under the handicap of having his every word and act examined in the light of his Presidential hopes and prospects.

What manner of man has Ohio, "Mother of Presidents," launched again upon the national scene, with the prestige of

The London Office in the City—
117 Old Broad St., E.C.2

Wide horizons

THE FINANCIAL PROBLEMS of businessmen with world-wide interests are best solved by a bank that thinks and operates globally.

Those who deal with the London headquarters of The National City Bank of New York enjoy the advantage of being served by a staff not only equipped to handle business in this country, but trained and experienced in the field of international banking.

Moreover, the London offices can call upon the skill and support of over fifty branches circling the globe, in addition to many hundreds of banking correspondents in every commercially important city of the world.

With its headquarters in New York, plus 850 banking correspondents throughout the United States, the Bank is very favourably placed to advise on the development of the vital two-way trade between this country and the dollar world.

Today, no less than 4,500 of The National City Bank's 11,000 employees are stationed overseas. Every 3 seconds, they serve a client—handling his financial problems with the understanding and proficiency born of over a hundred years of banking experience.

THE NATIONAL CITY BANK OF NEW YORK

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

a brilliant Congressional victory four months ago and bright prospects for a Presidential nomination 15 months hence? One might gather from his last-ditch stand on the troops issue that mulishness is the Taft hallmark. Characteristically, he has seized upon what he takes to be a vital principle and holds on tenaciously. But obstinacy is not Mr Taft's dominant trait. No opposition leader could command the Congressional coalition between Republican and conservative Democrats without great intelligence and great energy. The energy was displayed during his recent campaign, when the Senator toured every one of Ohio's 88 counties, made 1,000 speeches and exhausted his party workers. His keen legalistic mind is unmatched on Capitol Hill in debate on the fine points of legislation or in sifting piles of data in search of a policy.

The key to Senator Taft's success, and to many of his failures, is a painfully blunt integrity. The leader of the conservative wing of the Republican Party has shocked "Big Business" by advocating more social security, public housing at public expense and Federal aid to public education. As chief author of the Taft-Hartley Act he is more cordially hated by the labour leaders—though not, as the Ohio election proved, by labour's rank and file—than any other man in American history. Yet he was the sole member of Congress to oppose, and block, President Truman's order drafting the railway strikers into the Army in 1946. Though born to wealth, he insists that the prodigious defence programme be financed out of current taxes. One Taft position can be safely predicted: he will fight any extension of Federal power until he is personally convinced it is essential and unavoidable. Temperamentally and as the leader of a party 18 years in the opposition, he is not easy to convince.

*

This man of principle is also a man of strong prejudices. When he confuses his prejudices with his principles, as he often does in foreign affairs, he can be dismally wrong. It has been said that "Bob Taft has the best mind in America—until he makes it up." The quip is clever but incorrect. When he makes up his mind after dispassionate study of the facts, he is generally right. Also, he has proved that he can change his thinking radically on the basis of experience. An early and bitter critic of New Deal reforms, he became in time a constructive force in economic and social legislation, as even Mr Truman once admitted. Since 1945, despite much evidence to the contrary, he has been gradually changing his mind about America's responsibility in world affairs. The Taft of 1951 who calls himself "a show-me internationalist" is far removed from the pre-Pearl Harbour isolationist. After his re-election in November he publicly remarked, "only a fool would be an isolationist today." He voted against the North Atlantic Treaty because it was "not specific"—the legal mind at work. He opposes sending American troops overseas in peacetime without prior Congressional approval because that is not according to the bond. Yet he accepts the pact as law and favours all-out American aid to any ally under attack.

The Senator is less isolationist today than most of his Ohio constituents. A frequently heard question throughout the state these days is, "Why are we in Korea, anyway?" The "letters to the editor" in Ohio newspapers are predominantly isolationist. So is the Senator's mail—so heavy that five clerks sometimes cannot handle it. Ohioans will admit, under questioning, that physical isolation is no longer possible, but they believe the nation's commitments now exceed its powers. Even General Eisenhower's report left grave doubts about the capacity or the will of "some of our

allies"—usually meaning France—to defend themselves. More than any other midwestern member of Congress these days, Senator Taft is the centre of conflicting forces. In Washington the constant presence of the emergency, which he is too intelligent to deny, urges him toward bipartisanship; but he is pulled back by emotional and political cords from the Corn Belt. No longer isolationist in theory, Mr Taft retains his old isolationist temper. He questions instinctively any new proposal for enlarging America's responsibilities abroad. This has made him the favourite target of Eastern sharpshooters of the press and radio, but leaves him unscathed in Ohio.

*

Some Republicans voted for Mr Taft in November reluctantly and in spite of his foreign policy. Others who value him as a Senator would not want him as President. But the great majority of Ohio Republicans today would undoubtedly like to see him installed in the White House as Ohio's eighth successful "favourite son." And voters in both parties who like to "back a winner," as so many do, were impressed by his almost unprecedented 430,000 majority in November. The Senator's recent speaking tour of the Middle West was almost a triumphal procession. The Lincoln Day Republican box supper in Washington last month was turned into a Taft-for-President rally. The absence of overt symptoms of a boom in Ohio is due to the Senator's own reluctance to give a go-ahead signal to his state lieutenants.

Yet in December a national poll showed him running second to General Eisenhower and likely to defeat Mr Truman easily in an election held at that time. It is more significant, since party workers and not the rank and file control the nominating conventions, that the Republican National Committee which met in Washington on January 26th strongly favoured Senator Taft. Of the 65 members of the 105-man committee who expressed themselves, 28 backed him, while only 12 were for General Eisenhower.

Senator Taft has said repeatedly he will not campaign for the nomination, but would take it if offered. Translated into practical politics, this means that he will toss his hat into the ring if, during the remainder of 1951, Republicans have made clear that they want him. He must decide by next February, since under Ohio's law would-be delegates to the conventions must file in that month, and if pledged to vote for a certain candidate must have his written permission at the time of filing. Some observers think the Senator is assuming a reluctance he does not feel. Others, including the manager of his Ohio campaign, flatly assert that he will not run. One factor often ignored is the serious illness of Mrs Taft, who was his mainstay in past campaigns. A formidable obstacle is that Senator Taft would enter a nominating convention of fewer than 1,100 voting delegates with at least 250, controlled by Governor Dewey of New York, Pennsylvania's Senator Duff and California's Governor Warren, arrayed against him. And it should be remembered that Republicans have not picked their Presidential nominee from Congress in 30 years.

Mr Taft's Achilles heel, in a national campaign, is still his foreign policy position. With the Republican Party now split in that field and with the intentions—and even the party affiliations—of General Eisenhower still in question, any prediction would be rash. But his dozen years in Congress, and especially his recent conduct, suggest that Ohio's senior Senator would rather be right—according to his lights—than President.

American Notes

The FRB Scores Points

The Federal Reserve Board has not scored a knock-out in its struggle with the Treasury over interest rates, but it has certainly got well ahead on points. It will probably be some time before the exact implications of the "full accord" suddenly announced last week-end are clear. The issues involved are discussed more fully in a business note on page 560. What is quite plain is that the Treasury, which had been having all its own way against the Board's protests, has given up some ground. The compromise appears, in fact, to be if anything nearer to the Board's than to the Treasury's view.

The reasons for the Treasury's partial surrender are obscure. It was certainly unexpected to President Truman, who only five days before had appointed a special group of advisers to devise ways of curbing bank credit without interfering with the Treasury's cheap-money policy. The membership of the committee seemed to be weighted in favour of the Treasury view that debt policy has little to do with inflation, and the President's intervention in the conflict a month earlier had amounted to an attempt to force the Board (which is not constitutionally responsible to him) to give way. Last week the President hastened to give his blessing to the accord, but neither he nor Mr Snyder, the Secretary of the Treasury, attempted to explain why the Administration had at last stopped regarding borrowing at 2½ per cent as an inviolable right of modern government.

The new issue of 2½ per cent long-term bonds is intended to reduce the supply of bonds that can provide a basis for credit expansion by being sold to the Federal Reserve Banks. The new bonds will not be marketable though they will be exchangeable—on terms to be announced on Monday week—for Treasury notes that can be sold. Whether in these circumstances the extra ¼ per cent will be an adequate inducement to conversion by many holders of 2½ per cent bonds it is at present too early to guess. It would be rash to assume that the Treasury has given way so thoroughly that a definite halt to credit expansion has been called. But it seems probable that the expansion will be slowed down, and it is no small thing that any central bank can still force a Treasury to compromise.

* * *

Crime Without Punishment

The Senate Crime Investigating Committee, created to discover whether crime was a business which, in crossing state boundaries, called for federal control, has submitted its interim report before moving on to a rousing finale in New York. This leaves no doubt that there is an extensive and lucrative inter-state commerce in crime, nourished by a \$20 billion a year blood-stream of illegal gambling and

controlled by two major crime syndicates, one operating between Miami and Chicago, the other between Miami and New York.

The most shocking and damaging part of the report is that dealing with official connivance and laxity on the Federal, state and local levels. The Federal culprit is the Bureau of Internal Revenue, which, the committee charges, accepts from known gamblers and criminals income tax returns no law-abiding citizen would dare to sign. In the states, it reports substantial contributions from gambling elements to the campaign funds of two Democratic Governors, Mr Forrest Smith of Missouri and Mr Warren of Florida—but notes that gamblers regularly contribute to both parties when this seems likely to show a return. In California the Attorney General's office was involved in a brazen attempt to organise a state-wide system of protection for rackets of every kind. In virtually every city the committee visited there were alliances between criminals and the police.

The creation of a new federal unit, either a Congressional body or a Crime Commission, to keep watch on the battle against organised crime is expected to be one of the committee's recommendations, which it must submit by March 31st. Others include control of the interstate transmission of gambling information and money for bets, special treatment for the tax returns of known criminals, and strengthening of Federal law enforcement agencies. All these are rather gentlemanly, long-term approaches to the underworld, though it must be remembered that Al Capone was only brought to justice on an income tax charge. But the reader is left wondering why, if these criminals and their activities are so well known, they are not simply jailed. Frank Costello, the alleged head of one crime syndicate, has spent just ten months behind bars—for illegal possession of a pistol at the age of 24.

What is certain is that Senator Kefauver, the Democrat who heads the committee, has done his country a signal service—and what is equally certain is that the gratitude of his party will be tempered by fear of the political consequences. Crime flourishes in big cities, and, as it happens, most of these are under Democratic control. Combined with the dirt thrown up in the investigation of the Reconstruction Finance Corporation, the Democrats run the risk of being associated firmly in the public mind with crime and corruption, as the Republicans have always charged they were.

* * *

Thaw for Prices

The stabilisers last week began a piecemeal and temporary thawing out of the prices frozen so hastily late in January. Shops selling clothing, footwear, furniture, furnishings—some 70 per cent of all non-food sales—will from March 29th be able to raise their prices, to reflect increases in the cost of the goods they buy, so long as their percentage mark-ups remain what they were on February 24th. According to Mr DiSalle, the Price Administrator, the thaw

... requires a well planned and executed sales program. Irving Trust Company will put you in touch with competent organizations in the United States to help you develop or expand your sales there.

IRVING TRUST COMPANY
 ONE WALL STREET • NEW YORK 15, N. Y.
MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

will be short-lived; and later "prices will be put back into the deep-freeze for the duration." Some relaxation was urgent, because at the time of the freeze wholesale prices had risen by 15 per cent since the Korean outbreak, while retail prices had risen by only 6 per cent.

Further orders, expected shortly, will extend this fixed-margin type of price control—used during and after the last war—to food stores (though here Mr DiSalle proposes to furnish the proper percentage mark-up himself), to other retail shops, and perhaps to manufacturers. But these are all temporary expedients; the final goal still remains the fixing of dollars and cents ceiling prices for most goods. These will be infinitely easier to police than ceiling prices which vary, widely and quite legitimately, from one shop to another.

What worries retailers in the present order is the threat of a "roll-back" to pre-Korean margins and the degree to which they may be required to absorb increases in overhead costs and permitted increases in manufacturers' prices. The first such relief has gone, as was expected, to the automobile manufacturers, who were caught in a preliminary freeze in December. They will be allowed to increase their prices by 3½ per cent to compensate them, though only in part, for increases in labour and materials costs in 1950, which they were prevented from passing on. Dealers will only be able to raise their prices by the actual dollars and cents increase to them. The disgruntled labour unions, noting the record profit of the General Motors Corporation in 1950, will take this as additional proof that the stabilisation machinery is being run in the interests of business, rather than that of the plain people. But still further price increases probably became inevitable when, a few days after established cost-of-living clauses in wage contracts were recognised as sacred, the General Motors Corporation, the Ford Company, and the Chrysler Corporation agreed to a five-cent an hour increase to offset the rise in living costs to January.

* * *

Water by Commission

The bulky report of the special presidential commission on "A Water Policy for the American People" shows that America's water, the most plentiful of its natural resources, is, like the country's other natural resources, unable to keep up with the phenomenal growth in population and prosperity. In order to safeguard this vital asset from wastage, the commission proposes that the conglomeration of laws dealing with the subject be rewritten and that a whole new network of organisations be set up to co-ordinate the development of each major river basin separately and to be itself co-ordinated by a Federal Board of Review. The recent shortage of water in New York City, on the wet east coast, and the regular and devastating floods in California, on the dry west coast prove not only that co-ordination is needed, but also how involved it will be.

Flood control and the provision of adequate water for a growing population are probably the two most important aspects of the problem. But the commission discusses many others; the growing population has a growing appetite and farm land must be irrigated and reclaimed. New industries, such as synthetic rubber and atomic energy, use more water than old, and pollute rivers and underground water supplies even more dangerously. An expanding economy needs more hydro-electric power and better waterways; with a rising standard of living, more water is needed for air-conditioning, swimming baths and so on. Los Angeles is the outstanding example of a city that is outgrowing its available water supply, but there are others in serious difficulties, even though New York's troubles arose from delay in developing the local watershed rather than from any inadequacy of potential supplies.

The commission thinks that Los Angeles' idea of distilling sea-water is unnecessarily extravagant at present, but should be studied. It also feels that further attention should be given to the rain-making and cloud-seeding experiments that have apparently been so successful in the arid south-west, and which led to the formation of a National Weather

Improvement Association Inc. in Colorado recently. Senator Clinton Anderson, of New Mexico, has introduced a Bill, providing for a Federal Commission, on the lines of the Atomic Energy Commission, to control these undertakings and to protect rainmakers from damage suits brought by those who would rather have been left high and dry or who suspect that their showers have been stolen. Clouds certainly engage in inter-state commerce and would therefore seem to be a subject for federal regulation. But many state legislators think differently and so do the rainmakers, who believe that federal supervision would restrict, if not prevent, their experiments.

Local and business interests are even less enthusiastic about the attrition of their powers that would result from the presidential commission's proposed water policy. The main opposition to such river development projects will presumably come, as it always does, from the private electric power companies. But, although the President has promised to consider what action is needed, in view of the commission's report, a great deal of water is likely to have passed under the bridge before much is done.

Shorter Notes

The bulk of the Connally-Russell resolution, approving the dispatch of American troops to Europe, has now been accepted by the Senate Foreign Relations and Armed Services Committees. They have rejected the Republican proposal to require the assent of the House, as well as the Senate, and have turned down that part of Senator Lodge's alternative version which would have insisted that the major contribution of the United States should be in the form of air and naval strength. All that remains to be decided, before the resolution is ready for consideration by the Senate, is whether a joint Congressional committee should be created to supervise the programme.

*

President Truman has asked a special commission, headed by Mr William Paley of the Columbia Broadcasting System, to study the long-term, as distinct from the immediate defence, aspects of the country's requirements and supplies of industrial materials. The group is to report within nine months on the likelihood of shortages and on the adequacy of government policy and industrial practice. It is to recommend ways of balancing supply and demand so that no shortage of raw materials endangers either the national security or future economic expansion.

THE WORLD OVERSEAS

China's Economic Strength—I

Manchuria—Key to the Five Year Plan

(By a Correspondent)

THE Peking Government recently attempted to draw up a balance of the economic achievements of the first year of its rule over the whole of China. Most of this material has now sifted into the Soviet economic journals, which are devoting much space to the situation in China. Unfortunately the same system of presentation is used as for Soviet statistics: absolute figures are often avoided and replaced by percentage increases related to some unrevealed plan, or to an unknown figure in the base year. *Faute de mieux*, however, recent Soviet comments allow at least a glimpse of the present trend in the Chinese economy.

In 1950 China seems to have had the first budget for years that was not doomed from the start to succumb under inflationary pressure, though the subsequent influence of the Korean war on the original estimates is not known. To enforce its financial policy the government needed efficient administration; therefore, as a preliminary step to balanced budgeting, it carried out an administrative reform. Briefly, the thirty or so provinces have been grouped in six administrative and one autonomous (Inner Mongolia) regions. Each regional government has been given sufficient independence and scope to adapt itself to the varying local circumstances. But, in exchange for this partial decentralisation, it must be an obedient and efficient tool of the executive policy of the central authority.

This policy seems to have paid dividends. In the original budgetary estimates for 1950 expenditure was to exceed revenue by 18 per cent (to be made up partly by a loan and partly by note issue), which for China seemed very little. Subsequently the government considered that even this deficit was too large, and it decided to balance the budget through cuts in the expenditure on administration, though not on defence.

OVERALL CHINESE BUDGET ESTIMATES FOR 1950 (Per Cent of the Total)

Expenditure		Revenue	
Defence	38.8	Agricultural Tax	41.4
Administration	21.4	Other Taxes	38.9
Grants for Public Enterprise	23.9	Revenue of Public Industry	17.1
Education and Health	4.1	Revenue of Public Trade	2.4
Subsidies for Local Govt.	2.3	Other Revenue	0.2
Interest on N.E. Chinese Loan	0.1		
Reserves	9.4		

In making defence by far the biggest single item on the expenditure side this budget does not differ much from its Kuomintang predecessors. Likewise, expenditure on administration is still five times that on health and education, in a country where some 80 per cent of the inhabitants are illiterate. A notable change, on the other hand, is the almost total cancelling of the National Debt services and the considerable percentage devoted to investment in state industry.

Besides the cut in administrative expenditure another measure aimed at curbing inflation was the decree compelling public enterprises to deposit in the National Bank all their funds, except those needed for current expenditure. Thus, between March and September of last year the deposits in

the National Bank of China rose sixteenfold. Dealings in foreign currencies have been forbidden.

All these measures must have had their effect, since the value of the new currency was stabilised. The rate of interest fell from its astronomic height, though it still is far from low. In February, 1950, the monthly rate of interest on loans in private banks was: 42 per cent in Shanghai, 63 per cent in Tientsin and 45 per cent in Hankow. This exorbitant rate was obviously a sign of the rapid depreciation of currency. By May the rate had fallen to 3, 4½, and 4½ per cent, respectively. The rate in the National Bank was still 2 to 3 per cent per month.

Taxes are often paid in kind (e.g. foodstuffs) and their disposal is controlled by the National Bank. The government thus exercises a great influence on food prices. This, combined with the control of currency and the banking policy, has led—according to Peking—to a fall in prices. The National Bank price index for 80 commodities, with February 1950 as 100, fell by May to approximately 80 in Canton, 76 in Peking, 75 in Tientsin, 74 in Shanghai, 66 in Hankow—and on an average throughout the country to 71.2. If it is true that this fall in prices has resulted in a substantial rise of real wages, the government will have strengthened the support of the workers for its policy of nationalisation.

Legacy Of The Japanese

This policy in industry was facilitated by the fact that the government inherited from the Japanese a large proportion of big factories, particularly the heavy industry, the centre of which the Japanese shifted to Manchuria. Thus heavy industry is now nationalised and the larger private industrial and trade establishments are controlled by the state to the extent of 70 per cent of the output of coal, 90 per cent of steel, 50 per cent of pig iron, 70 per cent of machine output, and 78 per cent of electric power. Part of the light industry, the whole of the foodstuffs industry and two-thirds of shipping are still privately owned. But, as during the NEP period in Russia, the government controls private industry through its hold on the supply of raw materials, through state contracts and through its credit and taxation policies.

Workers' control in nationalised industries is more reminiscent of Russia immediately after nationalisation than of the present Soviet system. In Russia, at present, the director exercises exclusive control of the firm and is responsible only to the appropriate ministry. In China, too, each factory is headed by a director; but he must share command with an administrative committee, elected by the workers once or twice a year. The committee has a say in the establishment of the production plan, in the matter of wages, wage-scales, taking on and dismissing workers. In bigger factories there are fortnightly meetings of workers' delegates, at which the administrative committee reports on its activity.

The plans of production are established in the various industries under the guidance of the Ministry of Heavy Industry. At the end of 1950 the government's financial-

economic committee made it known that it is preparing a plan for 1951 and also a five-year plan. Up to the end of last year 22,320 kilometres of railway line, out of a prewar total of 24,794, had been restored to use. Progressively the government is getting the situation in the textile industry under control. Already in 1947 with some three million spindles restored China claimed to be the biggest textile nation in Asia. Now, with 5,200,000 spindles, China seems to have regained its prewar capacity, but this requires at least 550,000 tons of cotton. In 1949 the total crop was only 415,000 tons, of which only 150,000 went into factories. In 1950 the crop was already 650,000 tons. This year the government plans to double the output of cotton mills.

Though national targets are set for industry the main role in reconstruction is played by Manchuria. All the Chinese economic plans seem to depend on the return of this region to full productive power. In 1936 Manchuria produced over 12 million tons of coal and nearly 2,000,000 tons of pig iron; by 1941 the Japanese planned to produce 28 million tons of coal, 5,000,000 tons of pig iron and as much steel. It is estimated that their peak output reached 30 million tons of coal and, together with North China, 3,000,000 tons of steel. Obviously the war and Russian dismantlement crippled for a time the Manchurian economy. But it must be remembered that by 1948 in China proper the output of pig iron was only just over 10,000 tons and of steel below 50,000 tons. When it is realised that Manchuria has three times as much industrial labour, particularly skilled labour, as China proper, then its vital importance is clearly seen.

Outwardly Manchurian industry is working at full steam. According to Chinese data 90 per cent of factories are working again, but a further analysis shows that they are working with much reduced machinery. Thus, for example, in 1949 the metallurgical industry had only 25 per cent of its wartime machinery, though it produced 42 per cent of its peak wartime output. The same ruthless exploitation of machinery is noticeable in all industries.

The targets for industrial development in 1950 were very high. Pig iron output was to rise fivefold, coal output by 55 per cent, textile production by 132 per cent. Both the low level of available plant and the very high targets for industrial development indicate that an estimate of Russian dismantlement and removals at some 70 per cent need not be exaggerated. On the other hand, it would also indicate that the Chinese Government is relying on the speedy return of these plants by the Russians. Manchuria is the key to Sino-Soviet relations as China needs, to accomplish its industrial revolution, not only the return of machinery, but also the assistance of Soviet technical experts. Manchurian output is the basis on which the forthcoming five-year plan must stand or fall; for, at least in the near future, it is destined to play the same role in China as the Donbas played in the beginning of the industrial drive in the Soviet Union.

(To be continued)

Storms Around De Gasperi

[FROM OUR ROME CORRESPONDENT]

ON the eve of his well-timed visit to London, which has brought forth some positively cordial interpretations of the British position in the Italian press, Signor De Gasperi has had to meet one of the more serious of the revolts which from time to time remind the public that the premiership is a competitive post, not a life appointment. The last disturbance of comparable gravity was a little over a year ago. It originated with the withdrawal of Signor Saragat from the vice-premiership in consequence of one of the periodic campaigns for the formation of a grand united Social Democratic Front; it gained momentum from the pleasure in that development shown by a Christian Democrat fraction which is at one and the same time much to the Left in social policy and somewhat militantly clericalist, and would gladly be quit of the alliance with the anti-clerical Social Democrats; and it ended, somewhat oddly, after a prodigious overhauling of everyone's general social and economic formulas, with the reconstruction of the Government leaving out the Liberals (that is to say the non-clericalist and non-Fascist Conservatives). Signor De Gasperi's national leadership was supposed to have been considerably shaken by the difficulty of the negotiations, the defection of the Liberals, and the evaporation—during the crisis—of part of the Saragattians who departed to join the new PSU (Romita-Silone United Socialist Party). It must be said that the weakening has not been apparent to the public. The Communists' interpretation of the crisis as a trumpet of doom defeated its own ends by its exaggeration. And other questions, particularly rearmament economics and the threat of inflation, have come uppermost, relegating to a secondary place the subjects of dispute of a year ago (agrarian reform and public investment for peaceful purposes). Thus a year passed without a serious challenge.

This February's disturbance which will last on at least well into March, springs altogether from inside the Christian Democrat party. Its first serious manifestation was at a meeting of its group of deputies to consider the Government's Emergency Powers Bill (giving faculties for controlling markets, supplies and prices over a period of two years). There were 189 favourable votes, 30 contrary, and 55 abstentions. After the meeting assurances were given by some of the "opposition" that when it came to voting in parliament the party would be compact. This was far from being the case. On a technical issue the Government was put in a minority of 5, and on a more important but secondary measure, relating to methods of collecting data on raw material stocks, the majority was only 16. Voting is by secret ballot whenever requested by ten deputies (a request which the Communists in these circumstances are

not slow to advance) so there can be no specific remonstrances by whips, or expulsions. Actually about 30 Christian Democrat deputies seem to have voted against the Government while about seventy stayed away from the house.

Revolt of the "Wasps"

The challenge to De Gasperi from inside the party comes from two quarters, but is essentially and chaotically variegated. The smaller group of rebels is headed by the restless President of the Chamber, Giovanni Gronchi, whose main though shifting platform at present is the advocacy of a sort of armed neutrality for Italy in world politics. The chief weight of the rebellion in the party has, however, been provided by a larger and looser group of rebels known as the "Wasps," from the name of the premises where they meet. They are a right-wing group, and to some extent have grown out of a movement initiated by Deputy De Martino a year ago to shelve the agrarian reform, as accepted by the Cabinet, and to replace it by something much more bland and gradual. No fewer than 160 Deputies or about half the Christian Democrat representation, were said then to favour that scheme. It was withdrawn, however, after De Gasperi had designated the agrarian reform programme as a question of confidence. De Martinism has, however, played its part in delaying the arrival of the basic reform law on the Statute book. What have so far been voted, and are going into piecemeal application amid distressful comments and headshaking from landed quarters, are the "Sample Law" concerned primarily with selected land-starved communities, and the Southern Fund Law, which provides for expenditure of 100 milliards annually for ten years on investments connected mainly with the reform.

The new revolt of the "Wasps" ostensibly concerns not the agrarian reform—though many of them hold that the Sample Law is quite enough for a long time—but the Government's demand for emergency powers for two years for the regulation of trade, supplies and prices, in view of the rearmament emergency. The powers sought have been considered excessive by many constitutionalists and economists outside the Christian Democrat Party. It appears, however, that inside the Christian Democrat Party the contrary votes and abstentions are due to a great variety of motives; the "Wasps," who are on the whole opposed to all economic planning, being incongruously assorted with all sorts of Leftists who want a great deal more than is promised. What all probably join in desiring is a shake-up of the Ministry and portfolios for new men.

It is not impossible that Signor De Gasperi may be forced to something of the sort, if not by the goadings of his own impatient followers then by a resurgence of the idea of a united (anti-Communist) Socialist Opposition towards which Saragat would feel a compulsory attraction. Saragat himself is already outside the Government, so as to be able to give full attention to the development of inter-Socialist politics. But three Cabinet posts and some under-secretaryships remain in his party's hands. Their resignation would probably involve that of the Government. The Cucchi-Magnani defection from the Communist Party, and the simultaneous defection of Carlo Matteotti from the wholly Sovietised Nenni party, have roused some hopes that these disillusioned elements of the extreme Left may shortly fall into a line of common action with the PSU (mostly ex-Saragattians), and be joined by Saragat himself. That would undoubtedly signify a big change in the parliamentary situation and De Gasperi might feel that his specific mandate as head of the 1948 election coalition had come to an end. As yet, however, the PSU (Romita and Silone) cannot manage to bring both the ex-Communists and the Saragattians under a single roof. De Gasperi therefore remains, though once again somewhat storm-shaken, at the head of affairs.

Soviet Economic Progress—III

Lag in Agriculture

[BY A CORRESPONDENT]

DURING the last five years progress in agriculture was not comparable with the achievements in industry. Here the Plan has not been fulfilled, except in cotton and sugar-beet, where it has even been exceeded. The grain crop of 1950 fell short of the targets; in livestock, although the position was even worse, the Government raised somewhat the targets in a special new Plan published in 1949.

The ravages of war, shortages of machinery and the calamitous drought of 1946 offer part of the explanation. Since 1946, however, climatic conditions have improved and there has been a steady flow of machinery to the collective farms. At the close of 1948 the number of tractors in the countryside was already roughly the same as before the war. In 1950, 90 per cent of ploughing and sowing was done with tractors, and more than half the crop was gathered by harvester-combines. Yet, as the table below shows, the dramatic recovery of agriculture in 1947-48 was followed by relative stagnation in subsequent years, when the equipment of the farms was much better:—

GRAIN PRODUCTION
(000,000 Metric Tons)

	1948	1949	1950	1951*
1940	119	118		
1945	80	124		
1946	70	124		
1947	110	127		

* Planned.

The yield per acre has not risen very substantially and seems to be somewhat less than the 4.85 quintals, which is

claimed to be the average. The total area under cultivation is still less than before the war. In 1950 the total cultivated area was nearly 15 million acres greater than the year before, yet the crop was exactly the same in both years. The lower average yield in 1950 may be partly explained by the drought which hit the Caucasus.

The Government does not seem to be unduly alarmed by this situation. The grain crop was still approximately 5 million tons higher than in the prewar record harvests (1937, 1940), which had enabled the Soviet authorities to build up reserves for the war. The rise since 1940 has been proportionately greater than the growth of population. The supplies to the state of the so-called commercial grain may be estimated at nearly 40 per cent of the total crop, i.e., roughly some 50 million tons. This should be sufficient to feed the more than 70 million urban dwellers, to supply bread to the farms which do not produce grain, and to leave a big surplus for stocks. But the non-fulfilment of the Plan may have prevented the Soviet Union from increasing the

export of grain, which might have served as a political trump card, particularly in Asia.

Rising Urban Population

But the problem of agricultural expansion is fairly acute. The urban population of the Soviet Union is growing fast. Between 1926 and 1939 it rose by nearly 30 million. The process was slowed down by the war, though even then 67 new towns were built, 53 of these behind the Urals. Further urbanisation is planned; but it may be hampered by the inadequate growth of agriculture, especially in Asiatic Russia.

The gap between the original plans and the actual achievements is even wider in livestock. Shortage of cattle has been a chronic illness of Russian agriculture since the October Revolution. The Civil War, the famine of 1921, the mass slaughter of cattle and horses by the peasants during collectivisation greatly depleted stock. To restore it the Government organised before the war special cattle-rearing farms, and even encouraged private rearing. A cow in every rural household was Stalin's slogan. Then came the losses of the war. Hitherto these have not been made good, and the Plan has not been fulfilled:—

	LIVESTOCK (In Millions)			
	Horses	Horned Cattle	Sheep and Goats	Pigs
1915	35.8	60.6	121.2	20.9
1940	20.6	71.0	108.5	35.1
1945	10.5	47.0	69.4	10.4
1950	13.7	57.2	99.0	24.1
1950 (targets)	15.3	65.3	121.5	31.2

These figures cast some doubt on Marshal Bulganin's recent statement that the supply of meat, sausage and butter was in 1950 more than 30 per cent higher than before the war.

The quantities of meat and milk supplied to the towns may have increased, but this could not outweigh the actual drop in livestock.

Sugar beets and cotton are the only agricultural products in which both the prewar level and the targets have been exceeded:—

	(In Million Tons)		
	1940	1950	1950 Target
Sugar beets	21.8	27.25	26.0
Cotton	2.7	3.65	3.1

Large scale cultivation of cotton started in the Soviet Union only in 1928. Now Uzbekistan is the main cotton producer, accounting for more than half of the total crop. The collective farms of that region are amongst the richest in the Soviet Union. Generally, there is much scope for further development of cotton cultivation in Soviet Central Asia.

The most publicised features of new agricultural development are those designed to protect Soviet farming from the periodical natural calamities and to reclaim desert land. A 15-year plan of afforestation was proclaimed in 1948. It received the imposing title of "Stalin's Plan for Changing Nature." Forests were to be planted as a protection against sand drifts; snow reservoirs and ponds were to be built to preserve moisture. Soviet propaganda was mobilised to bolster this venture; the composer Shostakovich was even commissioned to produce a symphony on this topic. But it soon became clear that the "Stalin Plan" was inadequate. New plans to combat drought and increase the area under cultivation have now been launched. These are to be combined with a huge programme for the development of power stations. In addition, 65 million acres of desert or other land perpetually threatened with drought in the Volga region, in Central Asia, in the northern Crimea and Southern Ukraine are to be irrigated by canals.

Development Of Central Asia

The greatest works are to be carried out in the region of the Caspian Sea between the rivers Volga and Ural (some 30 million acres are to be irrigated here) and on the river Amu Darya in Turkmen S.S.R., where the desert, covering 87 per cent of the land, is to be prepared for cotton cultivation. The scope of plans for this region may be gauged from the project to build a canal nearly 700 miles long through the Kara Kum desert. The irrigation plan covers also the European provinces—e.g., it provides for the linking of the Volga and the Don near Stalingrad, which is not quite a new project—yet the main stress is on the development of Central Asia. Similar projects were already being considered before the war. Some attempts at fighting drought in Central Asia were made, particularly in the Fergana Valley. But the methods were still primitive. Now the job is to be carried out with the aid of modern machinery, which is to be supplied through the new Five Year Plans. Local manpower, from state and collective farms, is to be used for these gigantic works.

These agricultural plans, coupled with the scheme for "agrotowns," are not less ambitious or less difficult of attainment than are Stalin's objectives for industry for 1965 or even 1960: 60 million tons of steel, 60 million tons of oil, and 500 million tons of coal. The fulfilment of these targets, it is proclaimed, should mark the beginning of a new era, "the transition from socialism to communism."

★

Correction.—In the table on page 494 of *The Economist* of last week some of the figures for the Soviet 1950 plan targets were incorrectly given. The correct figures should read: artificial fertilisers, 5,100,000 tons; cotton fabrics,

Opportunity

EVERY YOUNG MAN employed by John Laing and Son Limited knows what opportunity means. He knows that directors and executives have worked their way up and that the same road is open to him.

His ambitions will be encouraged. Then he will be given a chance to prove any latent ability and, once proved, to develop it both by study and by practical experience.

This policy of selection, training and promotion, initiated 30 years ago, is fundamental; for the firm's capacity to-day consists, first and foremost, of the knowledge, the skill and the will of men—men who have worked, and are working in a climate of opportunity. This fact is one more guarantee of a good job for those who entrust their construction to John Laing and Son Limited.

Aspects of enterprise

No. 10.

Under the auspices of the Medical Research Council practical research was undertaken in the Simon engineering works on a new type of dressing for minor injuries. Investigations by the sister-in-charge of the Simon health centre and a member of Manchester University, supervised by the Simon Engineering Group's medical officer, gave positive results which may be useful to industry at large. The new dressing brought about an average saving of twenty hours in the treatment of every hundred minor wounds, with benefit to the patients, the first-aid staff and the works output.

Inflation Threatens New Zealand

[FROM OUR WELLINGTON CORRESPONDENT]

THERE is every indication that New Zealand's National Party Government, elected in 1949, after 14 years of Labour rule, faces a very difficult period in this, the second year of its three-year term. In the untrammelled freedom of opposition the National Party found it easy to promise that it would make the New Zealand pound buy more. It has now been in office for 14 months and is finding, like most governments, that promises cheerfully made in opposition can prove exceedingly inconvenient when in power. In the event, prices in New Zealand have continued to rise steadily and wages, as their habit is, have pursued them, until today the cost of living is unquestionably the most awkward domestic issue the Government has to face.

Meanwhile, with job vacancies running at a weekly figure of about 30,000 and industry apparently irrevocably tied to a 40-hour, five-day week, the country has been experiencing the inevitable effects of over-employment, and the costs of this have been added to the costs crowding in from every direction. The pages of any daily newspaper in New Zealand today contain columns of display advertisements seeking people for even such inconsequential positions as office boys and junior typists. Practically every factory building in the country is placarded with hoardings shouting for labour, and employers everywhere have been forced to bid against each other until actual wages bear very little relationship indeed to the award rates fixed by the arbitration Court. In this contest, the basic primary industries upon which New Zealand's economy is founded, have inevitably had the worst of the bidding and the dangerous drift from the country to the towns, already very apparent before the war, has been accelerated.

Labour Calls the Tune

In this situation, neither the individual employer nor the Government can afford to quarrel with organised labour. The last thing either can do is to suggest, however indirectly, that labour should work harder and work longer hours. That is why, when the Arbitration Court on January 31st ordered a 15 per cent general increase in award wages (incorporating an earlier interim rise granted last year) the Government almost bent over backwards in its efforts not to upset the workers by emphasising the inevitable effects. It was, therefore, disappointing that the workers appeared to be upset anyway, not by the effects, but by the fact that they did not consider the increase large enough. The Government immediately gave assurances that it would pass on the increase—as it was in fact bound to do—to its own employees and to superannuitants and pensioners, and the majority of employers are preparing to follow this lead.

When the court's order was issued the Government, in accordance with its election promises, was busily removing price controls and had already reduced subsidies by over £11 million. In an effort to prevent the wage increase from being passed on it has now discontinued the removal of controls, has promised that subsidies on certain staple food-stuffs will be maintained and has issued regulations preventing more than 75 per cent of the wage increase from being written into the prices of a number of items still

remaining under price control. In addition it warned employers that if restraint was not exercised in passing on the higher wages costs, that celebrated official movement, "further steps," would take place.

Apparently the Government hoped that employers would be willing to carry some of the increase out of profits or, if not out of profits, that they would compute it upon award rates and not upon the actual wages they were paying. It seems already evident that these hopes were stillborn. Employers, compelled by conditions to keep their labour satisfied, seem likely to pay for temporary peace and conditional quietness. The wage increase may well inject £40 million or more this year into New Zealand's money circulation without any increase in production. This is an obvious inflationary fact and it seems unlikely that the present patchwork of controls and subsidies, backed by exhortation, can do anything very effective to alter it.

Plutocrats of Wool

Mr Holland, the Prime Minister, is now confronted with another national waterfront strike and mutterings of discontent all over the industrial field. There are also the problems of New Zealand's primary industries. The dairy farmers, who were refused an increase in the prices paid for their butter and cheese by Britain this season, contend that, now their wages bill has been raised, the Government must either increase the guaranteed price it pays them for their produce or else they must cut into their stabilisation reserves. The meat industry, though it was granted a delayed 5½ per cent increase in British prices last month, finds that killings have dropped off by 25 per cent, partly because of a late fattening season but also because farmers are finding it more profitable to hold back their lambs, ewes and wethers, for wool. The wool growers are the plutocrats of the moment, but even they, through sheer excess of prosperity, present the Government with very difficult problems. One-third of their total cheque this year will be compulsorily "frozen." This may well amount to £40 million for the full season, a liability backed and guaranteed by the Government, even if it is paid into the individual banking accounts of the growers and held in suspense. If wool prices remain high, and the Government continues to freeze a third of the New Zealand wool cheque, its mounting indebtedness to the woolgrowers could become like an old man of the sea on the nation's shoulders.

Rising world prices, increasing shortages and the evident necessity for heavier expenditure upon defence all add to the Government's difficulties. This last has already largely wiped out the savings Mr Holland made earlier by reducing subsidies. Now he (or his Government) seems inclined to expand subsidies again and may have no option but to spend still more on defence. The President of the New Zealand Federated Farmers, the most influential of New Zealand's organised groups of primary producers, has already bluntly warned the Government that as one necessary check to inflation it must severely retrench its own expenditure. Any such retrenchment would have to include some curtailment of New Zealand's heavy programme of public works. While Auckland, where the National Party had its most important election gains, is clamouring for a harbour bridge and the electrification of its suburban railways, and other districts are urging their own development schemes with equal urgency, Mr Holland will find this a very difficult situation to face.

Indeed it seems inevitable that if the National Government is to tackle New Zealand's chronic labour shortage and its rising living costs, it cannot help losing votes. It had a margin of some 50,000 at the general election, but there are signs that this reserve has dwindled since. It will require political foresight and courage of a high order to deal with this situation on national rather than party lines.

THE MAN WHO SHOCKED THE WORLD

The Wonderful Story of H. G. WELLS

Here is the most controversial book of the year. Already it is hotly attacked by some, praised by others.

As the prophet and guide of man into the infinities of space and time, Wells foresaw the war of the air and the atomic bomb.

And in his rich, romantic novels he became the apostle of the "new freedom" in our social life, and shocked the world.

Yet few know that his own personal life matched even the dramatic stories from his pen.

"H. G. Wells was born into a depressing, impoverished household..." so the story begins.

Poor? Yes—until he decides to educate himself. Wells discovers he has a strange and dominating attraction for women.

He marries—and lives to regret.

He has a passing love affair.

He runs away with one of his pupils—and eventually marries her. They set up an extraordinary household.

He grows rich. As he flits from one affair to another the gossips attack his private life. And powerful forces try to ban his books.

Here is the wonderful story of The Man Who Shocked The World.

It begins on Sunday in the

SUNDAY EXPRESS

Unless it is stopped, corrosive water eats insidiously into the iron and steel pipes of many industrial water systems. This corrosion is a trouble-maker which brings dislocation of work and high maintenance costs in its train. But Calgon (Albright & Wilson's Sodium Metaphosphate) introduced into the system by what is known as Threshold Treatment will halt corrosion and banish the troubles that arise from it. A few parts of Calgon in a million parts of water effect a cure—a cure which our technical department will be pleased to discuss with you.

THE BUSINESS WORLD

Should Britain Waive the Waiver?

THE comptometers ticking up the service on the two dollar loans raised by the British Government on the morrow of victory, began to click at the beginning of this year. The initial period of grace on the United States and Canadian lines of credit is over. The first annuity payable by the British Government on each of them is due on December 31st next and will relate to the year 1951. In framing estimates of the balance of payments of the United Kingdom for the current year, this is a factor for which allowance must be made.

What are the sums involved? The amount due on the United States line of credit relates not only to the \$3,750 million of new money that was put at Britain's disposal as a result of the financial agreement of December 6, 1945, but also to an amount of \$600 million (never collected in cash) representing the value of lend-lease goods that were in the "pipe-line" when lend-lease came to an end, less certain counter-claims by Britain. The whole of the line of credit was drawn; hence the capital indebtedness to the United States amounts to around \$4,350 million. Under the agreement this sum is to be repaid in 50 annual instalments of which all but the last are to be calculated at the rate of \$31,823,000 for each \$1,000 million of credit drawn by December 31, 1951. The total annuity due at the end of this year to the United States will thus be US \$138,500,000. Of this, the sum due for interest (at 2 per cent on \$4,350 million) will be \$87 million; the balance of \$51,500,000 will represent capital.

*

The amount outstanding on the Canadian line of credit will be the original amount granted, i.e., \$1,250 million, less the unused balance of \$65 million, which the British Government recently announced would not be touched. The terms on which the outstanding and utilised \$1,185 million will be repaid are identical with those laid down in the agreement with the United States Government. It follows that the amount due to the Canadian Government at the end of this year will be Can. \$37,700,000 of which \$23,700,000 will be for interest and \$14 million for capital repayment.

The agreements with the United States and Canada both embody waiver clauses entitling the debtor, in certain circumstances, to absolve himself from the need to pay interest. The text of these clauses is almost identical in each agreement, that with Canada having copied the relevant sections that had been hammered out with no little difficulty in the earlier Anglo-American negotiations in Washington. The waiver applies to the payment of interest only, but in the earlier years of the repayment period this represents the larger part of the annuities. The waiver, if successfully invoked, involves the complete cancellation of the amount due for interest for the particular period. No liability is carried over to another year.

The waiver has to be invoked by the British Government—the initiative lies with the debtor. If it is invoked, the creditor must grant it, provided that two conditions are satisfied. The first is that

The Government of the United Kingdom finds that a waiver is necessary in view of the present and prospective conditions of international exchange and the level of its gold and foreign exchange reserves.

The second condition requires that

The International Monetary Fund certifies that the income of the United Kingdom from home produced exports, plus its net income from invisible current transactions in its balance of payments, was on the average over the five preceding calendar years less than the average annual amount of United Kingdom imports during 1936-38 fixed at £866 million, as such may be adjusted for changes in the price level of these imports. . . . If waiver is requested for an interest payment prior to that due in 1955, the average income shall be computed for the calendar years from 1950 through the year preceding that in which the request is made.

If the British Government is to invoke the waiver on these two loans, it must, therefore, find that this is necessary in view of the present and prospective state of the gold and foreign exchange reserves—a matter in which the British Government is to be the sole judge. In addition, the IMF must find that exports of UK produce plus net invisible income in 1950 were inadequate to pay for a volume of imports equal to that of £866 million recorded in the base period 1936-38. The adequacy of the gold and dollar reserves is an issue on which recent ministerial pronouncements leave room for no doubt whatsoever. The inflow of gold has been at a rate much greater than would be needed to meet the debt annuities—in the first half of 1950 it was \$734 million (including \$514 million from the Canadian credit and from ERP receipts) and in the second half it was \$878 million (including \$293 million of ERP receipts). But the total of the reserves, after allowance for price changes, is still much lower than before the war. They are certainly not such as to allow the whole sterling area, whose needs they have to serve, to launch itself into the open seas of full convertibility and non-discriminatory trade.

As for the second criterion, exports of UK produce in 1950 amounted to £2,170 million, while the total for net invisibles is likely to be £350 million. These net invisibles totalled £160 million in the first half of the year and undoubtedly increased in the second half under the influence of the rise in commodity prices and in income from dividends and profits earned overseas. The current earnings of the United Kingdom in 1950 will thus have been sufficient to pay for imports valued at around £2,520 million. This is considerably less, allowing for changes in import prices, than the basic figure of £866 million included in the waiver clause. The import price index for 1950, based on the figure for 1947, was 135, while the 1947 average based on 1938 was 258, so that

the rise between 1938 and 1950 was 100:348. This ratio would reduce the 1950 export proceeds to only £725 million in terms of 1938 values—well below the basic figure.

On both grounds, therefore, the British Government would have the right to claim the interest waiver on the two credits. A possible complication is introduced by a further clause, which appears in both agreements. This clause (in the American version) provides that

Waiver of interest will not be requested in any year unless the aggregate of the releases or payments in that year of the sterling balances accumulated before the effective date of this agreement is reduced proportionately.

In the Washington discussions, this qualification of the waiver clause was propounded by the American negotiators, and accepted by the British, on the understanding that the problem of the sterling area balances would be settled on the neat and tidy pattern contemplated in section 10 of the Financial Agreement—under which part was to be cancelled, part funded, and part released and made convertible immediately. There has been no such global solution of the problem. To interpret and apply this part of the waiver to the loose and extremely variable arrangements made by the British Government with its sterling creditors would defy the ingenuity of any lawyer, British or American. This particular complication can, therefore, be ignored; the issue has to be judged by reference to the two basic conditions.

*

The letter of the agreement would unquestionably justify the invocation of the waiver. If this were invoked and successfully approved by the International Monetary Fund, the annuities payable at the end of this year would be reduced from US \$138,500,000 and Can. \$37,700,000 to US \$51,500,000 and Can. \$14,000,000 respectively. Are there considerations of higher policy that counsel Britain to the more heroic course—the waiving of the waiver and the proud payment of a debt that Britain is not bound to honour in full? It will probably be argued that to invoke the waiver after a period during which the gold reserve has been rising would arouse vehement criticism in certain quarters in the United States. These, however, are the quarters that would criticise anyhow; doubtless they would murmur even if, by some miracle, Britain found it possible to repay the whole loan lock, stock and barrel at the end of this year.

Much more to the point is the fact that the waiver clause was intended to meet precisely the condition that obtains today—one in which Britain is still importing

less in volume than before the war, and is incidentally assuming a large share of the common Western burden of defence outlay. It could surely be demonstrated to the United States that to pay the whole of the annuity would require Britain to impose restrictions on imports from the United States and Canada on a much more severe scale than would otherwise have to be done. That is an argument that, apart from its inherent validity, would tend to stifle much of the criticism that the invocation of the waiver would arouse in US Congressional quarters. To pay the first instalment on the US and Canadian credits in full, irrespective of what the waiver clause says, might be to commit the British Government to go on paying even though the balance of payments seriously deteriorated. The first payment would create a precedent from which it may be difficult to withdraw, because it would relinquish the right given in the agreement, and make it difficult to invoke this right in future.

The choice before the British Government is one of some difficulty, a difficulty that will reaffirm the conviction that must have been present in the minds of many of the loan negotiators that waiver clauses are unsatisfactory devices, with a high potential for friction and mischief-making during the course of the agreement in which they are incorporated. This waiver was introduced by the United States and Canada to allow them to give a "commercial aspect" to all the other features of the credits they were making available to Britain. It was accepted by Britain, but against the better judgment of most of its representatives, who felt they were acting under something like duress; they took it as the third best of what had been hoped for, the first hope having been for an outright grant and the second for an interest-free loan. But, granted that the credits had to be given the trappings of commercial operations, the waiver clause was an acknowledgement by the lending governments that the facilities they were making available were not, in fact, normal commercial loans but were an integral part or extension of the wartime arrangements for mutual aid between the members of the grand alliance. This fact has since been tacitly and generously recognised by the subsequent offer of Marshall Aid. This being so, it would be the height of constructive statesmanship by the two lending countries if they were now to indicate to the borrower that he should exercise his rights under the waiver clause—in the interests of all concerned. Such initiative, tactfully and discreetly conveyed, would probably put an end to a good deal of anxious heart-searching in London—quite apart from conducing to a more realistic approach to the problem of external debts left as a relic of the war and postwar settlement.

Upward Bound Shipping

THE remarkable boom in the international shipping industry in the past few months provokes an inevitable question: is it merely a temporary response to international tension or is the world's merchant fleet becoming insufficient to meet the requirements of post-war international trade? To make long-term forecasts about an international market so dependent upon world forces would be rash; but the influences that have brought about such a dearth of tonnage in so short a time certainly need close examination. The exceptional strains of recent months were bound to create an acute pressure upon tonnage; it would be much more significant if the present inadequacy of the merchant fleets (in which, ton for ton, war losses have to a large extent been replaced) were also partly attributable to fundamental changes in the pattern of world trade—in particular in the movement of raw materials in bulk.

The booming state of the freight market is indicated by the change in the index number of tramp shipping rates published by the Chamber of Shipping of the United Kingdom. This index, dramatic though its evidence is, does not tell the full story of what is happening in world shipping, for it is confined to dry-cargo shipping and is computed only from tramp fixtures made on a sterling basis. In December last the index reached 115.7 (1948=100); this figure was itself higher than that of any individual month since the index began to be compiled in January, 1948, but in January the index showed a sensational leap of 36 points to 151.9. Nor is this the peak, for during February freight rates generally increased further. This, to repeat, is not a complete measure of the state of the shipping market. Liner conference rates in practically every part of the world have been, or are about to be, increased, and tanker freights have also surged upwards.

This startling advance in freight rates is only nine months old. The quantum of world trade during the first quarter of 1950 was nearly 10 per cent higher than the prewar volume but, during that period, employment for tramp shipping was at a low level. By May, 1950, the Chamber of Shipping index had dropped to 71.4, and some owners talked of laying up ships, although there were fewer tramp ships in service than before the war. The composition of the world merchant fleet has, in fact, experienced a marked change since 1939. Statistics compiled by Lloyd's Register of Shipping for the end of June, 1950, show that the world fleet then totalled 84.6 million tons gross, compared with 68.5 million tons before the war. Towards this increase, the tanker fleet contributed a large part, with its expansion from 11.4 million tons in 1939 to 16.9 million tons in 1950, and it must be remembered that 14 million tons of dry-cargo tonnage were laid up last June in the United States reserve fleet. The total of active dry-cargo tonnage, therefore, was considerably smaller in 1950 than in 1939; yet freight rates were falling and the demand for tonnage was declining.

This downward trend was arrested in June, when war broke out in Korea. Rates rose only slowly, for the immediate demand for military transport was satisfied mainly by the release of American ships from the laid-up reserve fleet. But the Korean outbreak had the

immediate consequence of a rapid expansion of stockpiling in the United States, and elsewhere; rearmament added further strains on the tonnage available for the international transport of raw materials. Meanwhile, the British export drive was in full swing and a considerable amount of extra tonnage was required to carry exports of manufactured goods from the United Kingdom. The liner companies, unable to meet the increased demand for outward cargo space, went into the market to charter tramp ships to supplement their fleets. The combined result of these factors is seen in the rise of the tramp freight index to 95.8 by October.

At that stage charterers would normally have been taking steps to cover their requirements for winter shipments of grain, and charterers on behalf of the British Government did begin to look for tonnage to ship last year's bulk purchase of grain from the Black Sea. They did not find much tonnage on offer at the rates suggested, nor did they rush to accept vessels—much to their later discomfiture, for their calculations were completely upset when the British Government suddenly announced its decision to import more than a million tons of coal from the United States. Other Western European countries, deprived of expected coal from Britain and other producers, turned to the United States for emergency supplies, and rushed into the market to cover their own freight requirements; freight rates consequently soared. To add to the confusion, tonnage was urgently sought for timber from the Pacific coast and for large importations of grain from North America.

In this situation, the Minister of Transport was compelled to approach the British shipping industry for assistance in securing the imports the Government urgently needed. The industry responded by voluntarily restricting its activities in the international market. But in order to meet the most pressing needs of the import programme, ships had to be sent on long voyages in ballast, and this had the immediate effect of curtailing export shipments and interfering with normal shipments of other commodities, including in particular imports of iron ore. The Scandinavian countries had to adopt similar measures to ensure the fulfilment of their own import requirements, and charterers were soon forced to pay rates as high as 100s. per ton to secure foreign ships to bring coal across the Atlantic.

The winter months are normally the high season for shipping demand, and the sudden concentration of special demand on an industry already more than normally busy dislocated the freight market. There was, in fact, no reserve of active shipping to meet the urgent demands of India for wheat from North America; to prevent famine, the United States has now agreed to the exceptional measure of releasing more vessels from its laid-up fleet to relieve the abnormal pressure on tonnage. This, however, can only provide temporary relief, and even so laid-up ships take some time to get into service. Whether this tonnage will be capable of providing more lasting assistance depends on whether cargo ships can be operated commercially under the American flag at anything less than peak freight levels.

Much of this exceptional demand for tonnage is a

direct consequence of the international situation, and of the famine in India, but it is difficult to believe that its worst consequences could not have been avoided if the Government's trading methods had been less cumbersome and its demands for American coal had not been left to the last exigent moment. These decisions wholly failed to sense the intricate reactions upon the international shipping market. The current pressure is also increased by the serious loss of carrying capacity of the world's tonnage, and by the delays which are now common in ports all over the world. But there is perhaps an even more fundamental cause of the shortage of shipping which has become rapidly apparent—the rising level of output and the advancing standard of living in so many countries; industrial expansion increases the demand for imported raw materials and the return traffic of manufactured exports rises to match. In the Western world the production of finished manufactures is pressing severely upon the world's resources of raw materials. The indications are that, apart from the question of rearmament, world consumption of primary foodstuffs and raw materials including oil, will make far larger demands on ocean transport than ever before in peacetime.

Against this background, the maintenance in good order of the world's merchant tonnage for the increased work it will have to do is of first rate importance. Apart from the American war-built reserve fleet, one-quarter of the world's effective merchant tonnage is now more than 25 years old; this is an age at which most ships become uneconomical to run, owing to comparative inefficiency and cost of maintenance. The boom in freight rates has produced a spate of orders for new cargo ships; the shipping industry is still prepared to accept the risk of changes in long-term demand, and to assume the heavy financial burden of present-day shipbuilding costs. Merchant ships have a vital strategic importance in time of war and the American Government, despite

the huge reserve of laid-up tonnage, has decided to spend over £70 million on building 25 new cargo vessels. British and other shipowners have no such golden crock to provide the funds for replacing old tonnage with new and efficient ships; the most they can hope for is some official response to the argument put so strongly at the recent annual meeting of the Chamber of Shipping for the alleviation of taxation on profits set aside for replacing obsolete ships.

The fact that freight rates are so high at present may seem to weaken the force of this argument about replacement; but these enhanced rates reflect not only the exceptional demand for tonnage but also the increased costs of operating ships. Operating costs have been rising since 1948, and the rise has increased steeply quite recently. In the last two weeks, for example, there has been an all-round increase of 10 per cent in marine insurance premiums on hulls, owing to increased cost of repairing and maintenance, and the new National Maritime Board wage agreement has come into force, under which the seaman's basic wage has increased by 10 per cent. The dockers have received increased wages, which the shipowners will be called upon to pay, other port charges have increased, shipbuilding costs are rising, and fuel bills have mounted considerably in the last few months. These factors have received less prominence than the rise in freight rates but they are a source of constant concern to the shipping industry. For while it is true that under certain conditions the boom in freight rates could be reversed, it is less certain that operating costs could be reduced to match. Indeed, the present appearance of prosperity in shipping should not be allowed to obscure the fact that the industry's "break even" point is probably higher today than it has ever been before. In these circumstances, a relatively modest reversal of the recent trend in the freight markets might have a disproportionate effect upon the industry's fortunes.

Business Notes

Change of Front on Commodities?

There are evident signs that the United States Government may be reconsidering its policy about stockpiling. The decision to purchase no more tin until the price has fallen to "a more reasonable level" may have implications stretching far beyond the tin market, particularly after the recent decisions to slow down the purchasing of copper, zinc and rubber. But some clarification of this week's apparent change of front will be needed before it can be seen for certain whether the consequences for commodity markets are as far reaching as they appear. It is not known, for example, whether the total quantity of materials to be accumulated is to be reduced or whether the time limit by which the reserve should be completed is to be extended. The immediate effect of either of these decisions, however, would be to ease the pressure of demand on the markets, and conceivably to cause some descent from the peak of prices.

Stockpiling is of vital concern to certain of the commodity committees of the international materials conference now meeting in Washington, and until clear intentions are announced by the United States, the work of these new bodies is likely to be hampered. There would be no need for any international allocation of copper and zinc, for example, if the United States purchased none for its stockpile during the next year or so. For rubber and tin the problem is not so much to free supplies for defence purposes as to redirect

exports at present going to Russia, China and other countries in the Soviet sphere of influence. Chinese imports of rubber in the first quarter of this year are likely to amount to 45,000 tons, making a total of no less than 110,000 tons in the nine months since the invasion of Korea. Again, present shortages of sulphur, cotton and wool do not proceed directly from stockpiling, though defence demands have certainly caused wool prices to rise sharply. The scarcity of cotton may be only temporary, if the United States has a large crop this summer. But the scarcity of sulphur, wool and certain alloy metals such as tungsten is likely to be more persistent.

For wool and tungsten, the market itself might provide an effective method of allocating supplies—provided that defence requirements were kept to modest proportions. The United States, however, has preferred export control to the price mechanism in eking out its dwindling reserves of sulphur and here the case for international allocation would seem to be strong. But the United States might well demand in return like treatment for commodities that it has to import.

Gouging and Stockpiling

The announcement that the United States is to stop stockpiling tin caused a very sharp fall in the London price this week. Spot tin had been hovering around £1,500 a ton for the past fortnight, though last week it fell to

£1,422½ at one time, only to rally again to £1,480. This week the trend has been unmistakably reversed; the price fell to £1,430 by Tuesday morning but recovered in the afternoon and reached £1,470. On Wednesday it fell by £120 to £1,337½ and it closed on Thursday at £1,217½, making a total fall of £240 since the announcement of the American ban. Backwardation has widened considerably and is now about £120 a ton compared with £65 a fortnight ago. The question at the moment is not whether the market will fall still further but rather at what level will it stop.

The feeling in the United States about tin producers holding the American Government up to ransom was expressed very strongly in a report of a subcommittee of the US Senate committee on the armed services. It stated that:

The American taxpayer is weary of being gouged for the privilege of obtaining from some of its allies the raw materials with which she is expected to supply the food and armament needs of the non-Communist nations in the event of another all-out war.

Whatever may be felt on this side of the Atlantic about such a form of words, they have apparently struck home. Stockpiling has been abruptly suspended, and preliminary governmental talks on the formation of a tin committee in the international materials conference are to open in Washington next week.

World production of tin is well in excess of world consumption, and the strength of the market in recent months has been due almost entirely to the demand for stockpiling. World output of tin metal last year reached 172,400 tons compared with a world consumption of 154,000 tons; most of this excess supply went into the American stockpile. But

a large part of it was purchased under long-term contracts from Belgium and the Netherlands, and presumably these supplies will not be affected by the suspension of stockpile purchases. If the American ban means that only some 5,000 tons a year less will go into stock, there will be only slight relief for other countries, including Britain, that are now anxious to build up their stocks.

But this is not the whole story. The American ceiling price for tin is £1,464 a ton and even when the price was below this level American merchants were not buying on the open market; their requirements have been met almost entirely by supplies from the Reconstruction Finance Corporation which operates the Texas smelter. The withdrawal of a substantial part of total American demand for tin might well cause quite a severe slump on the tin market. One American report has suggested that the price of tin should be pegged at around 125 cents a lb. (£1,000 a ton). Such a price would no doubt be reasonable for Malayan and Indonesian producers, but it would hardly encourage an expansion in marginal output in the Belgian Congo and Bolivia.

Dollar Exports and Defence

The need to maintain dollar exports has not been lessened by the rearmament programme; indeed the President of the Board of Trade has put forward the proposition that dollar exports "are a necessary part of rearmament itself." This was the theme of the convention organised by the Dollar Exports Board that met at Eastbourne last week. An impressive array of speakers included the Chancellor of the Exchequer, the President of the Board of Trade, the Minister of Supply, the Canadian Ambassador and the head of the ECA Mission in Britain. Perhaps some of the British industrialists assembled at Eastbourne may have felt a closer concern about the relative priorities of defence and dollar exports they no doubt profited much from the frank and detailed discussion of the problems involved in selling goods in North America.

Dollar exports have so far achieved great success. In the fourth quarter of 1950, the value of British exports to North America was 80 per cent higher than in the fourth quarter of 1949. The engineering and the motor industries have established their product in Canada, and wool textiles have enjoyed an expanding market in both Canada and the United States. But the problem this year will be to maintain the current rate of exports and at the same time to meet the even more urgent demands of the rearmament programme. Raw materials, chemicals, metals and their semi-manufactures accounted for a quarter of Britain's total exports to North America in the second half of 1950 and all these are already short—and in some cases desperately short—for the total tasks to which British industry is now committed. Again, the engineering and vehicle industries supplied together a fifth of total exports to dollar countries last year and they will have to bear heavy responsibilities for defence.

At a rough guess, and on the assumption that the pattern of exports to dollar markets could not be changed, rearmament could cut into their volume by perhaps a third; the only way of making this good would be a corresponding increase in the export of other goods, notably consumer goods, to North America. Such a change would be no easy task. Shortages abound in these industries too, notably in textile materials, Mr W. L. Batt, the head of the ECA Mission in Britain, told the delegates at Eastbourne that many American consumers deprived of domestically produced goods would welcome imports of similar goods from abroad. But he also added that American manufacturers no longer permitted to make products of this kind would offer no such welcome. It should be possible to broaden the basis of British dollar exports by sending more of the goods that already have a ready sale and by developing markets for new types of goods. But that involves a further process of education and persuasion at a time when the home market is likely to be bare of supplies and a clamant customer.

* * *

Pattern of Priorities

Mr Gaitskell made some sensible remarks at the convention about the application of priorities in handling defence, export home orders. The practical problems of industry, he recognised, cannot be answered solely by general statements from the Government, laying down a crude sequence in which defence and dollar exports come first, exports to the Commonwealth second, and supplies to the home market and other foreign countries last. No hard and fast rule can be applied except at the cost of over-elaboration (as the production Ministries' recent experience in prohibiting even a modest range of relatively unimportant metal goods has once more demonstrated). Any company, the Chancellor said, that is uncertain whether it should accept an order for one purpose which might mean the less rapid fulfilment of another, should seek guidance from the Ministry concerned; simple, and largely regional, administrative machinery was being set up to handle these cases.

In certain sectors of industry, this machinery will certainly be kept busy. Defence orders may seem at first blush to fall upon a narrow front of industry; but it is one where the ramifications are very complex. When the sub-contracting stage of defence production is reached on any scale, the tracing of priorities between different types of engineering components, for example, may require more time than manufacturers should be obliged to give. Restraint in the march towards more elaborate controls (of the kind that Mr Wilson appeared to contemplate in the debate at the end of last week) would be a welcome attitude upon the part of the Government—provided always that the authorities were prepared to use the means of fiscal, monetary and credit policy to do this same work more effectively and more equitably. But there is a tendency in certain sectors of industry—usually those where the conflict of claims will be particularly acute—to urge that fuller controls should be set up; this reflects the manufacturers' human desire to shift squarely upon the shoulders of higher authority the unpleasant responsibility of selecting the customers who are to be disappointed. These industrialists might soon find more bitter cause for complaint if the Government hand were to grip the engineering industry more tightly; and there are other manufacturers, not engaged on defence work, who already face worse embarrassments than overfull order books. In certain sections of industry, and perhaps more generally at a later stage, there may develop a case for stricter priorities, when the framework of estimates is translated into industrial activity. At this stage, however, the first priority is information, not regulation. The Government departments, and some organisations within industry, are satisfied that all concerned are being kept fully informed; but comments from some of the companies which will ultimately have a big part to play in the programme suggest that this essential liaison still needs to be strengthened.

* * *

Raw Materials for Export

Now that the United States has decided to slacken its stockpiling purchases of copper, zinc, rubber and to cease buying tin, Britain should be able to acquire larger supplies, though by no means sufficient to meet all its requirements. Cotton and sulphur, however, would remain critical. This country's allocation of only 265,000 bales of American-grown cotton is little more than a third of its imports from the United States last year, while the quota of elemental sulphur for the first quarter of 1951 was 81,465 tons against requirements, on the present restricted level, of about 112,000 tons. Supplies of cotton and sulphur from other sources are simply not available to make good these deficiencies. Home supplies of sulphur for steel production, oil refining, tin plate, processing of vegetable oils, metal extraction and refining and essential food and health services will be maintained at

present levels, but supplies to the chemical industry generally will be seriously reduced and supplies to the rayon and other industries even more seriously cut. Output of rayon has already suffered a 20 per cent reduction and a cut of 40 per cent is immediately in prospect. The United States may provide a further allocation of cotton after April and there are hopes that its export of sulphur to Britain for the second quarter will be raised to 100,000 tons. If this quantity is forthcoming these further damaging cuts in the use of sulphur may be averted.

But shortage of raw materials would still persist and with it the need for some method of apportionment of supplies to the various uses—defence, exports and essential home needs. It is indeed clear both from Mr Gaitskell's speech at Eastbourne, and from that of the Minister of Supply, that the Government does not intend to introduce any formal system of priorities for materials. The Ministry of Supply will base its allocation of copper and zinc and their alloys for incorporation in export goods on three principles: the conversion value of the raw material into the end-product, the type of currency to be earned and whether the market for the goods is likely to be a permanent one. These principles are not to be applied rigidly—indeed, that would scarcely be possible—but are merely regarded as a rule of thumb. Their purpose is to prevent the export of raw materials and semi-manufactures even to dollar countries. Such exports have expanded quite rapidly in recent months because of shortages and rising prices in the United States; there is little chance that they would become a permanent feature of British trade. Moreover, if large exports of raw materials and semi-manufactures were permitted now, unemployment in the later stages of production in this country would be almost inevitable.

Interest Rates in America

In recent months a lurking doubt about the permanence of the present structure of interest rates has been noticeable in the City, and has become in some minds just sufficiently insistent to be a little disquieting. It is no more than that; but that is enough to give City bankers a keen interest in the moves and countermoves in the controversy that has been raging in Washington. It is hard to decide, however, where the honours lie in the formula for truce announced jointly by Mr Snyder and Mr McCabe early this week. The US Treasury and the Federal Reserve now declare their "full accord" in the policies to be followed for their "common purpose" of assuring both the successful financing of the Government's requirements and the minimum monetisation of the public debt. After this display of solidarity (which ought at least to mean that any future differences will be kept behind closed doors), the contestants join hands to attempt a conjuring trick that is apparently intended to allow the Treasury to keep its 2½ per cent basis sacrosanct

'BARCLAY'S NEW CLERK, 1786'

After a watercolour now in the Institute of Bankers

History records that even in 1786 this "new clerk" appeared a little overdressed in his "embroidered waistcoat reaching nearly down to his knees." It is pleasant to be able to add, however, that he "remained in the house many years, and died at a very advanced age, much respected by his employers."

Much has changed since 1786, but it is still the aim of our staff to provide the same high standard of personal service which the old private bankers offered in the days of "Barclay's New Clerk."

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C.

I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Ask the man from the **PRUDENTIAL**

for long-term securities quoted in the market while relieving the Federal Reserve from the need to make supporting purchases that monetise debt. On Monday week details are to be announced, and the lists will open a week later, for a conversion offer to holders of 2½ per cent bonds, 1967-72. The new security will carry 2½ per cent, will be optionally redeemable in and after 1975 and finally redeemable on April 1, 1980, and will not be marketable or transferable (though it may be tendered for death duties). It will, however, carry an option to convert into marketable 5-year 1½ per cent notes.

The general intention seems pretty clear, though many vital details are lacking. The effect of rigid pegging of prices such as has been practised in the United States is to convert even long-term securities into demand securities or "near-cash." What is now hoped is that the offer of an extra ¼ per cent (if this does in fact prove to be the net outcome of the terms) will induce investors to forgo this chance to take cash—or at least to postpone their exercise of it. In this sense, the readmission of the interest rate into the calculus of liquidity preferences is a clear moral victory for the "Fed." But whether the gain in practice is likely to be large or enduring will probably depend upon whether the rate of interest is to be readmitted to the market as such. If the option to turn the non-marketable debt back into marketable notes is tightly drawn, or is subject to any large penalties (even if these arise from no more than the fear that the authorities would support the long-term market but not the short), the offer of an extra ¼ per cent may look unattractive. In that case, the gain to the authorities from the lock-up would be small—and will in any case be non-recurring. On the other hand, if the option is attractive, and readily exercisable, investors will collect an extra ¼ per cent, but will still be free to press upon the market. And when they do press, will the authorities make it still easier for them by continuing to peg the market or by keeping its movement within narrow limits? If so, the monetisation of debt will go on, subject only to a moderate brake. In short, it seems clear that this sleight of hand cannot succeed by itself. Its success will be proportionate to the readiness of the authorities to allow rates to rise in the market. Only time (and the detailed terms) will show whether the American Treasury has really yielded much ground.

* * *

Germany's External Debts

As part of the arrangements for modifying the German occupation statute and granting Germany a far wider measure of autonomy, the Bonn government has at long last accepted responsibility for Germany's postwar and prewar external debts. The acknowledgment has been made in very general terms and does not by any means amount to a commitment to pay in full. It is merely a pledge of the West German Government's "desire to resume payments on the German external debt." The post-war debts, which cover aid to Western Germany by the United States, the United Kingdom and France, amount to about \$3,500 million. The capital amount of the pre-war bonded debt is about \$1,000 million. In addition there is the standstill debt, now outstanding to the amount of about \$100 million, which is not part of the Reich debt but which will certainly rank high in the coming negotiations.

For some time past, representatives of the three occupying powers have been working on the problem of these external debts, attempting to arrive at some more precise estimate of their total, and considering in very general terms the question of priorities. These talks are expected to broaden in the near future. Arrangements will be made for the participation of the foreign creditors, of the German debtors and of the various interested governments, in the hope that it will be possible to agree upon an orderly settlement that will not place excessive weight on Germany's balance of

payments; at the moment, unfortunately, this balance of payments could hardly bear any additional burdens at all.

According to the letter of existing agreements, the Allied powers could claim unquestioned priority for repayment of their postwar relief expenditures in Western Germany. If these priorities are insisted upon, nothing will be left for the prewar creditors, but it can hardly be the intention of the Allied authorities to press their legal rights to this extreme. The most immediate object of the coming negotiations should be to re-establish German creditworthiness in foreign markets and to recreate the links between German commerce and the credit facilities of which Germany is in such dire need. For this purpose, a reasonable settlement of the commercial debts embraced in the standstill agreements should have high priority. In this connection it may be noted that steps were recently taken in Germany to allow the transfer of blocked mark balances between non-resident holders and that German standstill debtors have been given the right to repay their debts in Deutsche marks. These two provisions taken in conjunction should provide a channel through which standstill creditors can, if they wish, take repayment of their claims in marks and find buyers for them in their own currencies. Unfortunately, however, it is laid down in the relevant regulations of the High Commission that before the German debtor is allowed to repay any standstill debt in his own currency, he must notify all his creditors by registered letter of his intention and must give 60 days' notice of any such repayment. The difficulty of complying with this procedure in a dismembered country such as Germany has so far provided an insurmountable barrier to any repayment.

* * *

New Aircraft for Defence

The statement of the Secretary of State for Air on the air estimates last Tuesday gave little new information about the defence programme. The £81 million allowed for aircraft and spares are to pay for aircraft that will be delivered this year; that is, largely for Meteors, Venoms, Vampires, Canberras and other aircraft ordered twelve months or more ago. At present prices this sum can hardly provide a large number of machines. Allowing for the time required for placing orders and for tooling-up, it seems likely that only a few of the aircraft specifically ordered as part of the accelerated rearmament programme will be delivered within the 1951-52 financial year and provision for them will doubtless appear in the supplementary estimates.

If Mr Henderson gave away no new facts about the size of the programme, he did reveal an important change in the purchasing policy of the Air Ministry and of the Ministry of Supply. He confirmed the Prime Minister's statement that orders had been given for a four-engined jet bomber and he mentioned a number of other new orders for "advanced fighters," and "jet night fighters" as well as for an "all-weather two-seater jet fighter." In particular, the orders for advanced fighters were described as "substantial." Under present security regulations, the fact that none of these aircraft was identified means that none has yet flown; this implies that the aircraft have been ordered off the drawing board. This is a departure from previous practice, at least for military aircraft, for it has hitherto been the rule that a prototype was ordered only after intensive flight testing and development. One of the principal complaints voiced in recent years has been that the decision to call a halt on the development of a new type and to give an order for production was too long deferred.

What the programme will mean in terms of labour, new capacity, machine tools and materials is still in the field of guesswork. For the three-year programme, a rise in the labour force employed directly or indirectly on military aircraft construction from rather less than 100,000 to perhaps 300,000

may be a plausible shot. Shortage of engine making capacity will have to be made good, with an appreciable amount of new building and the procurement of special machine tools. The Government departments concerned with these matters have not shown, in the industry's view, the necessary drive and urgency that this side of the programme requires. The leisurely interdepartmental gather-round on permits should not be allowed to delay the engine programme; and without the assurance of special American tools the provision of rotor blades for jet machines may be seriously affected.

Mr Henderson mentioned the possibility of buying two types of American aircraft, the Sabre fighter and the Neptune for Coastal Command reconnaissance; he also confirmed that the Canberra bomber will be built in America for the United States Air Force. An initial order for 500 of these machines is said to have been placed with the Glenn L. Martin Company. Since the Rolls-Royce Avon engine which powers the Canberra has not been licensed abroad it may be that the Armstrong-Siddeley Sapphire engine, which has been licensed to the Wright Aeronautical Corporation, may power the American built Canberras.

Rocket Developments

A short reference to rocket developments was made during the debate by the Under-Secretary of State for Air. He said that the speed of development was increasing "so we may find ourselves up against these possibilities rather sooner than many think." Air Chief Marshal Sir Alec Coryton, who is in charge of the Ministry of Supply's rocket research programme, recently disclosed that parts of a new rocket, which he described as larger and more accurate than those previously tested, are ready for assembly at the testing site at Woomera in Australia. He also said that British work was concentrating on the rocket as a weapon of defence—it is now possible to build missiles that will "home" on an incoming target with a fair degree of accuracy, and this accuracy will improve as designers gain experience. These targets include incoming guided missiles as well as aircraft.

Such developments are bound to have repercussions on the aircraft programme. Now that the way seems clear to build rockets that can be directed to their flying target, there may be less need to undertake extraordinarily complicated design projects for ultra-high speed aircraft and the same may apply to bomber development. Much depends on the way in which the electronic apparatus that would form the "brain" of certain designs of rocket can be developed. All such equipment uses large numbers of valves and it has yet to be shown that the requirements for valves in a guided missile programme of this kind could be met by the valve-making industry.

The aircraft industry has shown little interest in the cruder types of rocket motors for piloted aircraft; these have high fuel consumption and cannot maintain the aircraft in the air for more than a few minutes. Small rocket motors to give a supplementary boost to jet-engined aircraft are being developed, but a similar thrust can be imparted by injecting fuel into the exhaust of a jet engine and re-lighting it; much experiment will be needed to decide between the two methods. Crude rockets of this kind can readily be built by aircraft firms, but much of the mechanism of big guided missiles would have to be provided by radio and electronic engineers. Some engine designers, including the Bristol Aeroplane Company, are experimenting in this new field, but rocket development will still make heavy demands on the technical reserves of the radio industry, already heavily committed on the aircraft instrument and radar programmes.

Rocket fuels present another set of problems. Their basic fuels are not oil products, but hydrogen peroxide, industrial alcohol and liquid oxygen; some motors also need gases such

as helium. The Distillers Company, the principal supplier of industrial alcohol in Britain, already faces a steadily growing industrial demand that will be difficult to meet even with the new plant at Grangemouth for synthesising alcohol from petroleum. Laporte Chemicals has recently built a new factory for producing hydrogen peroxide, but production of guided missiles on any scale might call for a special fuel development programme.

Cinema Earnings Improve

British cinemas took nearly £27 million at the box office in the third quarter of 1950, or 6.6 per cent more than in the three months from March to June; though later figures of Entertainments Tax receipts from cinemas suggest that the industry's takings may have declined again towards the end of last year. Not more than one-sixth of this quarterly increase, according to Board of Trade estimates published last week, would have been attributable to the general increase in admission charges in mid-September. The increase in takings occurred generally throughout the country, a major proportion of the extra receipts being taken in cinemas in holiday resorts, which always show a seasonal increase in

business during the English summer holidays. Of the gross takings that resulted from 5 per cent more admissions, some £9.5 million went in tax, and £6 million for film hire; the exhibitors were left with £11.3 million, 7 per cent more than in the previous quarter.

* * *

Quota and Levy

Increased total earnings need not, however, imply larger returns for British film producers, to judge from the Board of Trade's film quota returns this week. In the year ended September 30th last year the statutory quota of British films to be shown in the country's cinemas was set at 40 per cent for first features and 25 per cent for supporting programmes; in fact, the percentages achieved were 30.4 per cent and 22.5 per cent respectively. A majority of cinemas reporting (2,335 out of 4,632) defaulted upon their quota obligations: since these included the three major circuits, Odeon, Gaumont-British, and Associated British Cinemas, they represented a much greater majority of the industry's seating capacity. The exhibitors explained simply that there were not enough British films to show: a state of affairs that seems likely to be recognised in limiting the quota for the coming year to 30 per cent.

Exhibitors' representatives met Sir Wilfrid Eady at the Treasury last week to submit a plan for increasing admission prices by an average of a penny a seat, to be shared equally between exhibitors and producers. The existing "Eady levy" on exhibitors' proceeds, financed by higher prices and tax adjustments which cost the Treasury £300,000 a year, does not appear from the first few months' experience to be raising as much for the production side of the industry as the intended £1,500,000 a year. Similar proposals to increase

seat prices and the levy have been put forward by more than one section of the industry in the last few weeks, though these differ about the sharing of the additional proceeds. Some exhibitors have been concerned, however, that any proposals should be made which might suggest to the Treasury that the industry can afford to put up prices without adversely affecting cinema attendance; the Chancellor's regard for the future of British film production may be less strong than his desire for larger proceeds from Entertainments Tax to help solve his Budget problem.

* * *

Falling Bank Deposits

The seasonal flow of funds to the tax collectors is, as usual, producing a sharp contraction in the volume of bank deposits, as the Treasury uses its cash surplus to repay its floating indebtedness to the banking system. The latest statement from the clearing banks shows that in the five weeks to February 21st, net deposits fell by £208 million to £5,835 million—though they were still £189 million above their corresponding 1950 level. The month's contraction was nearly £38 million smaller than the record decline that occurred in February, 1950; but it is clear that this difference was not attributable to any diminution in the rate at which the Government was repaying debt. On the contrary, it is more than explained by a substantial increase in the credit requirements of the private sector of the economy. The pause in the upward trend of bank advances—caused last summer and early autumn by the spate of new issues—ended in October; the rise was then resumed, and last month actually outstripped the corresponding movement of the previous year; February's rise amounted to £62 million, in contrast with £39 million. (About £11 million of this expansion, it should be noted, arose from a special influence—the effects of the Irish bank strike upon the published advances total of the National Bank.) In the past few months, moreover, several of the banks have resumed net buying of investments; the aggregate portfolio rose only slightly in January, but last month increased by £14 million—owing mainly to the operations of the Midland Bank—whereas in February, 1950, it fell by £9,000,000.

Over the month, therefore, advances and investments combined rose by over £76 million, compared with a rise of £29 million twelve months earlier—a difference that more than accounts for the somewhat slower decline in the level of deposits. It may be deduced, therefore, that Governmental repayments have been on a somewhat larger scale than they were in 1950, evidently because the recent running-down of Britain's surplus on its external balance of payments is reducing the strain that this surplus puts on the cash position of the Exchequer. The counterpart of the decline in deposits is naturally to be found chiefly in the banks' holdings of floating debt—notably in their bills and call

money, which have together fallen by nearly £155 million. But there has also been another sharp contraction in the holding of Treasury deposit receipts, which are down by £92½ million on the month, at only £290 million, or 4.8 per cent of gross deposits.

* * *

Last Thoughts on Prohibitions?

There is at last some approach to finality in the prohibitions of the use of copper, zinc and their alloys in a range of inessential end-uses, though the regulations concerned have undergone considerable amendment since they were first announced in December. A joint statement by the Ministry of Supply and the Board of Trade last week gave details of the permitted exemptions; they relate mainly to export goods.

Upon the principle of "conversion factor" laid down by the Chancellor last week as the best criterion of assessing comparative uses of materials, the new arrangements require that any goods on the prohibited list must show an export value (f.o.b.) at least fifteen times their raw material costs if they are destined for dollar markets, and at least 50 times for other markets. Makers must establish, by past trade, definite inquiries, or orders, that the goods can be sold abroad, that import licences can be obtained, and that "the opportunities in the market are not purely temporary due to scarcity of metal in the importing country." (They may also subsequently be required to show that the goods have been exported.)

A few special cases, moreover, are admitted in the prohibition of goods for sale on the home market. Government orders are exempted; so are articles where anti-corrosive material is a necessity (which the Ministry of Health might argue includes galvanised dustbins for the housing programme?) and those in which very tiny amounts of the metals are needed for essential parts (such as gear wheels). The Government may issue licences, also, for the finishing of stocks of semi-fabricated or partly processed metal in stock on March 1st; or for metal "for work in progress which is not quite finished."

* * *

Progress in Cotton

The cotton industry last year produced 1,052 million pounds of yarn and 2,830 million yards of cloth, 6.3 per cent more yarn and 9.2 per cent more cloth than in 1949. The weekly average output of single yarn was 20.2 million pounds compared with 19.0 million in 1949 and 13.4 million in 1945. The average weekly output of cloth was 54.4 million yards, 4.6 million more than the year before and 18.9 million more than in 1945. An analysis of these figures in the

current issue of the *Cotton Board Trade Letter* shows that the largest increase in output was in rayon yarns and cloths and mixtures of rayon and cotton. In the fourth quarter of the year rayon and rayon mixtures accounted for 10.5 per cent of the yarn produced and 25 per cent of the total cloth output. Production of rayon and mixture cloths rose by 20 per cent last year compared with a 6 per cent increase in the output of cotton cloth. This increasing dependence on rayon will be halted this year, and probably reversed by the fall in rayon production; this may cause some difficulty to those cotton firms that have installed special machinery for processing rayon.

The chairman of the Cotton Board recently declared that the progress made by the industry towards higher efficiency was still too slow and last year's figures lend point to his comment. The Cotton Board attributes most of the increase in output since the war to the expansion of the labour force—there were nearly 313,000 workers by the end of the year compared with an average of 118,300 during 1945—and only a small part to increased productivity per head. An independent estimate shows that by the end of the year barely a quarter of all the firms in the Master Cotton Spinners' Associations had started or were planning redeployment schemes, fourteen concerns put new schemes into operation during the year, making a total number of 104 with another fifteen projects in preparation. About 300,000 ring spindles were installed during the year, bringing the total up to 10.4 million compared with 18.1 mule spindles (three-quarters of a million fewer than in 1949). There are more than 300,000 Lancashire looms in the cotton industry alone. The output of automatics has recently reached 900 a month as factory extensions have come into production, of which nearly three-quarters are sold on the home market; about 5,000 new automatic looms were probably installed last year.

* * *

Building Societies' Active Year

The Building Societies movement had another active year in 1950. The March issue of the *Building Societies Gazette* contains its usual careful annual estimate of the movement's composite balance sheet and accounts, based on results for 1950 issued by 831 representative societies. These estimates, which are summarised in the accompanying table, show that the total advanced on mortgages in 1950 was some £273 million, only £3,000,000 less than the record 1949 figure. The movement continued to be an important source of thrift. Mortgage repayments amounted to £164 million in 1950 (£3,000,000 higher than in 1949) and balances due to shareholders rose by £110 million (or by £22 million more than in 1949). Total saving through the movement, including saving for mortgage repayments, amounted to £276 million in the year. The

total number of shareholders and depositors in the movement is now over 2,900,000—very nearly as many as in 1938; the average holding of these investors is just under £400, compared with £238 in 1938.

Despite the increase in advances shown by the movement as a whole, the *Gazette* points out that some societies were following a policy of retrenchment in 1950. This was due

neither to lack of potential business nor to a shortage of funds, as the increases in holdings of shares and deposits show, but to a feeling that caution was necessary at a time when current market prices of second-hand houses, whose purchase the movement now largely finances, are so far above replacement costs (Sir Harold Bellman drew special attention to this point in his speech at the annual meeting of the Abbey National Building Society last week). In general, however, while some of the smaller societies that expanded their loans particularly rapidly in the early postwar years may now be drawing in their horns, the larger societies seem likely to continue their expansion. The Halifax Building Society, the largest in the movement, has recently announced that its assets increased by nearly £11 million, to £165½ million, last year; new advances on mortgages amounted to £30½ million (against £29 million in the previous year) and mortgage assets rose by £12 million net, to £126 million.

Second Thoughts on Europe's Steel

The "Rollman report" on European steel trends, which was published at the end of 1949, was an ambitious attempt to forecast the pattern of European steel output, consumption and exports in 1953; its conclusions were impressively

gloomy. The steel section of the Economic Commission for Europe, which prepared the estimates, has now revised some of its figures; it has not, however, found any reason to abandon its gloom.

The original estimate, which was prepared by assuming that all projected steel production targets throughout the continent would be fulfilled completely, and by estimating secular trends of consumption in Europe and its export markets, held that by 1953 Europe would be producing more than 70 million metric tons of steel, consuming within its boundaries not more than 58 million metric tons, and exporting no more than 4,100,000 metric tons. In short, some 8,000,000 tons of its available annual output would not find a market. The partial revision just published adjusts these figures in the light of experience since the original was drafted—though it specifically ignores future effects of rearmament and possible raw material shortages upon the steel industry. On present plans, Europe (not counting the USSR) could be expected by 1953 to have the capacity to produce nearly 75 million tons of crude steel (against a production of 60.7 million tons last year). Its home consumption might be 60 million tons in terms of crude steel (which represents an increase of 9,000,000 on 1949). World imports, the framers of the report now consider, might absorb a total of 7,200,000 tons, of which Europe might secure 80 per cent, giving 6,100,000 tons for exports. As will be seen, this does not materially alter the unbalance that ECE expected; it still suggests a possible excess of capacity over consumption in 1953 of 8,000,000 to 9,000,000 tons of steel. Detailed calculations within the general estimate suggest, as would be expected, that this problem would exist almost entirely in Western Europe; any surplus production in Eastern Europe could almost certainly be disposed of in exports without difficulty.

The Commission's revisions are interesting and go some way towards meeting the criticisms that the original report aroused from expert critics; but it is difficult to estimate their validity in view of the two questions they have deliberately left aside: defence and raw materials. Armament programmes cannot be regarded as a permanent outlet for additional steel capacity, but their effect will presumably not have subsided, in terms of steel demand, by 1953, when Britain's rearmament, for example, will be at its peak. The report's recommendations concerning reduction of steel producing costs, promotion of steel consumption, and restraint in prices remain valid whatever the reliability of their figures. But in the present circumstances, and with such heavy qualifications, the Commission's estimate, which sixteen months ago represented so useful a venture in a field where other experts feared to tread, would seem for the present a rather less profitable statistical exercise.

More Reports on Productivity

The first team from the food industry to be sent to the United States by the Anglo-American Council on Productivity has published its report. It covers the handling and packing of meat and meat products and its general conclusions follow those made familiar by earlier reports. There is the same emphasis on the concentration of men and machines on single operations, with a resulting high rate of output. Most of the teams, including the meat packers, hesitate to censure British industry for failing to develop specialisation to this high degree, on the ground that the British market is not large enough to justify the long production runs that are needed to yield the economies. A different version of this argument appears in another report on boxes and cartons. Here it is suggested that the size of the average American order (about five million cartons) justifies investment in high-speed machines at great capital cost, and that such machines would be uneconomic in this country. These points are presented as axioms, but future teams might usefully examine the question how specialisation

developed in the United States, instead of concentrating principally on the way in which it is applied. It might be that the markets followed, and did not precede, such a high development of specialisation.

Emphasis on the superior quality of American raw materials is another common feature of these productivity reports. The box-making team found several American techniques that would be impossible in this country because of lack of suitable materials. But perhaps it is not unfair to recall that comparatively few British industries paid close attention to feeding their machines with materials of uniform standard in the days when they could have insisted upon getting them; it was more common to adjust the machine to the material. The productivity reports rightly emphasise the fact that high machine speeds and high rates of output involve careful preparation of materials and production schedules.

One of the most marked differences in British and American practice is that the British retailer still carries out many of the packing operations now performed in America by the processor. This is as true of sausages and canned meat as it is of pre-packed joints. The team from the meat industry is convinced that British meat concerns will at some time have to start pre-packing, and this will entail heavy investment in machines and factory space. Who is to pay for this investment? The team holds that it must be borne largely by the retailer, on the grounds that the packer is already working on a narrow margin and that the additional cost should not "in fairness" be passed on to the consumer. But would retailers accept smaller margins on pre-packed meat products on the argument that their distribution costs had been reduced in other directions?

Shorter Notes

The International Monetary Fund has instructed its staff to consult with member countries to devise more effective methods to implement its policy on gold sales; it considers, not very surprisingly, that this policy is being undermined by the fact that "some at least" of the large quantity of newly mined gold now being sold at premium prices on the industrial market is finding its way into private hoards. The Fund's staff will not be envied for its task of "consulting" Mr Havenga on this matter.

*

Only 71,000 tons of coal had to be taken from Britain's distributed stocks in the week ended February 24th; the total in hand, 9,786,000 tons, was a million and a quarter tons below that in the same week of 1950. Between the end of February and early May, stocks may be expected to decline by roughly a million tons; so that at the end of the coal year 1950-51 these may be down to what for practical purposes is almost "zero stocks." This situation, however, is considerably better than seemed possible a few weeks ago. Manpower in the pits continues to increase remarkably, with the recent wage award—and possibly the call-up of reserves—as a possible incentive; it is a little disturbing, however, that the increase in total manpower should be accompanied by a rather slower rise in numbers of miners at the coalface.

Company Notes

Associated Electrical Industries.—The reaction of Associated Electrical £1 ordinary shares to 86s. 9d. seems a thankless response to an impressive rise in trading profits and to the raising of the ordinary dividend from 15 per cent to 20 per cent. But this response, which were marked up to 40s. nominal, reflected the capital reorganisation proposals rather than the impressive results of the year. Group trading profits have increased from £7,602,000 to £8,440,000. In his review a year earlier, Mr Oliver Lyttelton pointed out that the return to holders of the equity in the full sense of revenue and capital reserves and ordinary capital—a total of £25,340,000—was little more than 3½ per cent. Such a return, the chairman added, was "unduly low, taking into account the risks which have to be undertaken and the long period during which conservative management and restraint in the distribution of dividends have built up the financial strength of the company." The decision to raise the dividend to 20 per cent meets the best expectations that these words held out. "Net profits available for distribution" have fallen from £2,688,000 to £2,496,000, but this movement largely results from a substantial increase in the amount set aside for increased replacement costs of fixed assets from £500,000 to £950,000; this sum is in addition to the normal depreciation provision of £810,000, against £913,000. Of the increase in total profits from £7,762,000 to £8,605,000, taxation has absorbed more than half, with a rise in the total provision to £3,960,000, against £3,519,000.

The proposed capital reorganisation scheme with its cut in the preference dividend—at a price—and the proposals for an ordinary share issue of nearly 700,000 shares at 40s. to employees may have caused some doubt in the minds of equity shareholders, though there is little in them to disturb the calm of preference shareholders. The company's trading record and its future prospects are undimmed. There are orders in plenty to sustain the recent high levels of output and sales.

De Havilland Aircraft.—The preliminary statement of De Havilland Aircraft shows the results of a very satisfactory year, in which group net profits before taxation have risen from £824,664 to £1,071,101. The statement appeared on the same day as the debate on the air estimates. Mr Henderson's statement that the fighter-interceptor force will be "very substantially" increased and that fighter-bomber squadrons will be re-equipped with Venoms augurs well for De Havilland, and should provide a proper return for the company's work in the development of new aircraft. It is possible that the development costs of the Comet, which were met as far as the airframe was concerned from the company's own resources, may have imposed some strain on financial resources in 1950; if this is the case, the rise in profits will be the more welcome as a source of replenishment. In view of the company's commitments both for the production of the Comet and of military aircraft, it is hardly surprising that De Havilland should have preferred to have put the whole of the increase into reserves rather than to raise the distribution to shareholders. The ordinary dividend, which has been paid since 1941, a rate covered by earnings of 36 per cent, is amply 29 per cent in the previous year. The dividend, despite the impressive rise in

earnings, was that the £1 ordinary shares fell by 2s. to 43s. 6d., at which they yield £4 12s. per cent.

The possibility that the company may eventually need additional finance of a permanent nature is a matter on which the full report may well throw light. In his speech last year the chairman suggested that new finance should wait until it became "more certain that the present satisfactory level of work is likely to continue in the future" and when it was clear that aircraft productive capacity was not "in excess of the economic requirements for the industry." The company will certainly be one of the principal supports of the expansion of the air arm, and on this score continuity of orders seems assured for some considerable time ahead.

Store Profits.—For a year of expanding turnover and rising prices, the latest trading results of departmental stores (summarised in the inset table) are not impressive. It may be that William Whiteley provides a pointer to future prospects. Total sales of this company were higher than in the previous year and turnover in some departments, particularly clothing, was described as encouraging; but increased costs and lower profit margins destroyed the benefits that might have been expected. The trading results of all these companies also show some partial reflection of the recent scramble (which still continues) to buy goods before prices rise further. The satisfactory rise in profits of Lewis's Investment Trust may suggest that this factor was of considerable importance in the high wage areas of the North and Midlands.

One of the most serious, and most controversial, problems of the retail trade is the effect of the Board of Trade's control of certain profit margins and the probability of further cuts in the current year. Mr Wilson,

Store Profits for year to end	1950	1951
January, before tax	£	£
A. W. Gamage :—

(a) Includes 1950-51 revenue for subsidiaries not consolidated £445,697 (£425,552) and profit on investments £22,342 (nil). (b) Includes £32,045 surplus on realisation of a trade investment.

in a statement this week to the Drapers' Chamber of Trade, said that he did not "accept the view that distributive percentage margins should remain unchanged at a time when manufacturers' prices are increasing, thus giving an automatic and continuing windfall in the shape of increased cash margins." But he was fair enough to add that the Board of Trade would take into account the changes in the volume of turnover and increases in real distributive costs to ensure "the legitimate standard of living of the distributor and the cost of living to the consumer." In a spirited attack on this policy, which he described as "dishonest window dressing," Mr Eric Gamage pointed out that it will mean that "retailers' net surpluses will shrink alarmingly" and that "it is a direct encouragement to many a harassed retailer to pay higher rather than lower prices in order to secure quite legally a living profit." Unless economies can be made in other directions, such as in the costs of display and advertising, it is likely that profit margins will in any case be squeezed.

EXCHEQUER RETURNS

For the week ended March 3, 1951, total ordinary revenue was £119,501,000, against ordinary expenditure of £96,381,000 and issues to sinking funds £3,251,000. Thus, including sinking fund allocations of £18,354,000, the surplus accrued since April 1st is £769,546,000 compared with £649,450,000 for the corresponding period a year ago.

BANK OF LONDON & SOUTH AMERICA LIMITED

SATISFACTORY PROFIT

MR. FRANCIS M. G. GLYN ON EXCHANGE RATES

The eighty-ninth annual general meeting of the Bank of London & South America Limited will be held on April 3rd in London.

The following is an extract from the statement of the chairman, Mr Francis M. G. Glyn, circulated with the report and balance sheet for three months ended December 31, 1950:—

Members were informed last November that in order to alter the bank's balancing date from September 30th to December 31st of each year, it had been decided to introduce an accounting period covering the three months between the date of our last accounts at September 30, 1950, and December 31, 1950. In these circumstances variations in the balance sheet figures are unlikely to be the same as when the interval is a full year, while the profit and loss account and the dividend are based on the earnings of three months only.

BALANCE SHEET

The balance sheet totals at December 31st last at £165,885,093 exceed the corresponding figures at September 30, 1950, by £8,898,609. Account should, however, be taken of the omission from the totals at both dates of bills for collection on account of customers, previously included. Bills in course of collection at December 31, 1950, are now shown in Note (6) on page 8 of the accounts, and you will see that there is a substantial increase over last September's figure of £34,832,163. Most of the increase represents increased business, though a part is due to delayed liquidations.

The effect of variations in exchange rates on this occasion is small. Thus the increase from £105,100,753 to £111,804,733 in current, deposit and other accounts, etc., reflects a true expansion, attained despite seasonal withdrawals. The total of engagements on account of customers shows an increase of approximately £2,250,000.

Although the figure of £43,780,018 for cash in hand, at bankers and at call is £1,003,544 lower than on September 30th last, this is to a large extent a seasonal reduction; as the percentage of cash, etc., to current liabilities (excluding those to the Argentine Central Bank, which are secured by other assets) still exceeds 38 per cent., I think you will agree that the liquid position of the Bank is above question. Increases of approximately £2,050,000 and £5,183,000 in bills receivable less rebate, and advances and other accounts respectively, show that the increased deposits are being profitably employed.

PROFIT AND LOSS ACCOUNT

The net profit on the trading for the period of three months ended on December 31st last, after providing for taxation, amounted to £82,749, which compares favourably with the average rate of earning for the preceding period of twelve months. While the net earnings themselves were higher, credit has also been taken for a conservative estimate of unilateral double tax relief in respect of the proportion of taxation falling on the earnings of the period under review. Owing to inevitable delays in agreeing the tax liabilities in some of the countries where the Bank is established, the possibility of ascertaining the precise figure of relief with promptitude appears at present to be remote.

It has again been considered advisable to refer to the proportion of the period's profit still awaiting remittance. Some countries are, of course, handicapped by shortages of ster-

ling—Brazil for the moment being noteworthy in this group—while Argentina has not, at any rate so far as this country is concerned, as yet granted any permits for the remittance of financial services.

SIMPLIFICATION OF EXCHANGE CONTROL

The countries of Latin America, physically remote from any likely area of world conflict, yet able to supply many materials essential for war, inevitably strengthen their economic position as a result of the feverish rearmament and stockpiling activities which arise from the present international tension. It is greatly to be hoped that prosperity will bring in its train a simplification of the complicated structure of controls which impede the flow of trade with many of these countries. There are signs even now of movement in that direction. Peru's efforts to cut herself free from the tangle have met with success, and Chile's recent action to establish a legal free market in exchange has resulted in an immediate improvement in the Chilean peso on the open market.

REMITTANCES

In my address of 1949 I drew attention to the undesirable effects of multiple exchange rates. They tax the efficient producer and subsidise the inefficient; they penalise the consumer by forcing him to pay high prices for his goods; briefly they are the antithesis of liberality in economic policy, too often used primarily as a means of raising revenue. Let us hope that advantage will be taken of the present turn of events to eliminate some of the inconsistencies created by these systems.

Let us hope, too, that the near future will see the resumption everywhere of financial remittances, payments which are withheld in some countries as though they represent debts not of the same standing as those incurred by the current purchases of goods. Yet the British and other foreign resources which were transferred to such countries have played a great part in their development and the creation of the riches which their inhabitants now enjoy. The desirability of attracting new capital is repeatedly acknowledged by their leaders, and equitable treatment and a fair return for any such investment promised. But still in many cases allocations from available resources to meet these long overdue remittances are not made.

TAXATION ON UNREMITTABLE PROFITS

This brings me to my final point—that we must still pay British taxation on these unremittable profits. Our liability to pay tax in sterling on earnings which cannot be converted into sterling is in itself hardly equitable; a worse aspect, however, is that to meet this taxation we and institutions in similar circumstances must find sterling from resources other than the profits which are taxed, and in doing so we make inroads into funds legitimately accumulated for other purposes. Would it not be only reasonable to defer the tax charge until these profits are received or remittable in sterling?

Though some relief has been afforded by the double taxation provisions of the Finance Act, 1950, this anomaly remains, and injures those very institutions which, because of their contributions to British exports, both visible and invisible, should surely receive every encouragement.

MERCANTILE BANK OF INDIA

EFFECT OF HIGHER COMMODITY PRICES

SIR CHARLES A. INNES' REVIEW

The fifty-eighth annual general meeting of The Mercantile Bank of India, Limited, will be held on March 29th in London.

The following are extracts from the statement of the chairman (Sir Charles A. Innes, K.C.S.I., C.I.E.):—

Deposits have increased by £12,000,000, and the balance sheet total stands at £67,000,000, compared with £54,000,000 in 1949. On the assets side, the outstanding features are an increase of nearly £7,000,000 in bills and £4,500,000 in loans and advances. These increases are the direct result of the very much higher commodity prices which prevailed especially in the second half of the year. Our profit is up on the previous year's figure, and we are again paying a dividend of 12 per cent., less tax, for the year.

INCREASED PRESSURE FOR FINANCE

Since I addressed you last year there has been a serious worsening of the international situation. But while the political scene darkened, the immediate effect of the international tension and of the war in Korea was to create a somewhat hectic prosperity in many of the countries in which we have branches. Trade boomed in Hongkong and Japan. There was a scramble for rubber and tin, largely for strategic stockpiling, in the United States and many other countries, and prices rose to heights which a year ago would have seemed quite fantastic. Malaya and Thailand and in a less degree Ceylon profited greatly, and moreover, since rubber and tin are important earners of dollars, the rise in the price of the two commodities materially helped to alleviate the world dollar shortage and to improve the position of sterling. Pakistan, too, benefited by the demand for its jute, cotton and wool, all of which fetched high prices. As was only to be expected, the higher level of commodity prices increased the pressure on banks for finance, and this trend is reflected in our accounts in the higher proportion of our resources which is invested in loans, advances and bills. These very high prices obviously cannot last indefinitely, and the possibility of a sudden break in prices, though at the moment it does not seem to be likely, has always to be borne in mind.

INDIA AND PAKISTAN

On January 26th last India completed the first year of her existence as an independent republic. It was a year of economic strain. There are some bright spots in the picture. In the 12 months following the devaluation of the rupee in September, 1949, there was a favourable balance of trade of more than nine crores of rupees compared with an adverse balance of nearly 221 crores in the previous twelve months.

One of the most important events of the year was the award made in August last by the All-India Industrial Tribunal dealing with Bank disputes. The award has increased our local establishment charges in India by nearly 15 per cent. It also decrees that any Bank which pays a dividend of 4 per cent or more to its shareholders must also pay a bonus to its employees, the amount of the bonus varying with the amount of the dividend. The award is the subject of an appeal to the Supreme Court, and I will merely say now that it looks as if the effect of the award should it be implemented in

full may well be to restrict banking facilities in India and to increase the cost of banking services to the public.

On the economic side, Pakistan has been more fortunate than India. The war and its developments have created a strong world demand for Pakistan's principal exports, jute, cotton, wool and hides and skins. Prices have rocketed up and in spite of the 2s. 2d. rupee and heavy export duties on wool and cotton, Pakistan is enjoying an export boom.

BURMA, CEYLON AND MAURITIUS

Conditions are still confused in Burma, and it is not easy to obtain a clear picture of the state of the country. There seems to have been some improvement and the Government have made some progress in re-establishing their authority. There has been a welcome improvement in the import trade, much needed supplies of piecegoods having arrived from Japan and India.

The prosperity of Ceylon depends on its three great export crops, tea, rubber and coconut products, and the island had a very good year. There was also a favourable balance of trade in 1950 amounting to nearly Rs. 400 million, and Ceylon has at present a favourable balance of payments. Ceylon therefore is very prosperous, but it has to be remembered that when world trading is resumed on a competitive basis, it will almost certainly be necessary to remove or materially to reduce the export duties.

Mauritius was again fortunate enough to escape a cyclone and for the fourth year in succession it harvested, at 456,600 metric tons, a record sugar crop.

Hongkong has experienced another year of remarkable prosperity. The rehabilitation of Japanese industry goes on apace in spite of the difficulty experienced in obtaining adequate supplies of raw materials.

GOVERNMENTS STOCK AND OTHER SECURITIES INVESTMENT

NEW ISSUE FORESHADOWED

The ordinary general meeting of The Governments Stock and Other Securities Investment Company, Limited, was held on March 5th in London.

Mr H. C. Drayton, the chairman, in the course of his speech, said: In the year under review our gross revenue was £151,800 as against £137,000 in the previous year, an increase of £14,800. Our income from dividends is up from £133,900 to £146,200.

Deducting interest on debentures and income tax from our revenue, we are left with a figure of £53,100 as against £45,500 and, if the shareholders approve the directors' recommendation of a dividend of 8 per cent. on the deferred stock, there will remain £12,800 to be added to the undivided profits account. That figure is equal to another 3.98 per cent. on the deferred stock.

We intend as soon as possible to make a new issue of deferred stock, which will be offered to the deferred ordinary stockholders, at par by way of rights in the proportion of £1 of new stock for every £12 already held. Special forms will be issued to the stockholders to enable them to apply for any excess shares. We believe that this is in the stockholders' interests and we hope that it will show them an appreciation when the shares are fully paid and come to be quoted on the Stock Exchange.

Our results this year will depend upon the taxation imposed upon us in April. However, I shall be very sorry indeed if we cannot come before you next year and present as good a revenue account as we have this year.

The report was adopted.

TATE AND LYLE LIMITED

"MR CUBE" WINS FIRST ROUND

LORD LYLE ON SUGAR RATIONING

The forty-eighth annual ordinary general meeting of Tate and Lyle, Limited, was held on March 7th in London.

The Rt. Hon. Lord Lyle of Westbourne, the president, in the course of his speech, said:—

Since our last meeting the most important event affecting our company has been the inclusion of the following words in the King's Speech at the opening of Parliament on October 31, 1950:—

"A measure will be laid before you to place on a permanent basis the legislation relating to the beet sugar industry and to transfer to public ownership the shares in the British Sugar Corporation which are not held by the Exchequer."

One could infer from this that sugar refining has been dropped from the nationalisers' list. But don't let us be deluded into thinking that the comrades have turned their covetous eyes elsewhere, though I think that it is fair to claim that we have, with the help of Mr. Cube, won the first round.

As I warned you at our last meeting, the cost of our campaign was considerable. However, in my view the publicity given to our affairs during the past two years has helped materially to maintain the prestige of the company. I hope that you will agree with me that the expenditure of this money in protecting the property of our company was well spent.

It will not be necessary, of course, to continue spending at such a high rate, but I feel that it would be wrong to allow the volume of prestige advertising to sink back to the pre-war level. Even at that level the cost would amount to about £50,000 a year at present-day prices. I am sure that we must continue to keep our customers and the public informed about our affairs. Unless we do so we shall find unscrupulous people once again misleading the public with their muddle-headed misrepresentations and distorted theories.

We propose to continue to use the services of the C.I.M.S. of Industry to assist us in this task. This non-profit-making organisation is doing a splendid job in telling the story of free enterprise. It did me the honour of electing me its president and I am proud to be able to serve in that position.

IMPORTANCE OF FAIR COMPETITION

The proposed nationalisation of the British Sugar Corporation, already controlled by the Treasury, is presumably a sop to the nationalisers. I cannot see what good this step is going to do anybody. But if it comes about, we shall not fear competition with a State-owned section of our industry so long as the competition is fair and above-board.

We have prepared a paper setting out our views on how fair competition can be assured and have stressed the importance we attach to the removal of all restrictions such as quotas, zoning and the discouragement of new entrants to the industry. This paper has been sent to those who will be responsible for the Bill which no doubt will soon be placed before Parliament. I hope that our views will not again be ignored, but I am bound to tell you that so far no approach has been made to us with a view to discussing the various problems involved.

Whether the beet industry is nationalised or not, it is important that it should be put on a proper basis, in such a way that fair competition is ensured. Without competition it is impossible to guarantee efficiency. We would naturally prefer trade in competition with free enterprise, but if a section of our industry is taken over by the nationalisers, it is only by competition that there is any hope of avoiding the sickening spectacle of another State undertaking sinking rapidly into lethargy and decay.

RECORD EXPORT SALES

The gross profit at £3,400,000 is some £370,000 higher than last year. This followed an increase of £8,000,000 in turnover from £76,000,000 to £84,000,000. We must thank our export trade for the improved results, for there was a decrease in our home trade both in sugar and syrup due to cuts imposed by the Minister. Export sales were once again a record for the company, and I believe for any sugar-refining company in the world. They amounted to 670,000 tons, an average of 13,000 tons per week, as compared with 470,000 tons last year. The total value of the exports amounted to £29,000,000 and involved trade with fifty-five separate countries.

When the prosperity sharing scheme was introduced, it seemed to us an appropriate moment for announcing an increased dividend to shareholders. This modest increase will bring the total dividends on ordinary stock to 3s. per unit as compared with 2s. 8.4d., if the final dividend now proposed is approved by this meeting. We hope that the increased distribution can be maintained.

STATE BUYING

Ladies and Gentlemen, before I finish I must comment on the present controls under which we are obliged to work. The most far-reaching of these are State buying and rationing. Our raw sugar supplies continue to be bought by the Minister of Food. What is so disturbing is that the responsibility for sugar is borne by a government which has shown itself totally unfitted for such a task. This is only too clearly illustrated by its efforts in the field of meat, ground nuts, eggs and poultry. It has bulk purchased and planned us into unprecedented scarcity.

It is high time that buying was returned to private traders. A mistake made by one trader only affects his own pocket. A mistake by a Minister is magnified a hundred times and affects the pockets of all of us. Private traders are not encumbered with diplomatic problems. Given the opportunity they could get on with the job and I don't for a moment doubt that they would supply us with more and better food at a cheaper price.

Is rationing necessary at all? Thanks to the Empire and our own farmers, there is available for this country, according to my latest information, a total of 2½ million tons of sugar for which no dollars are needed. Edith Summerskill has said that unrationed requirements are 2,325,000 tons a year. Why does the Minister hesitate? Not because sugar is unavailable. Not because it is going to cost us dollars. What, then, is the reason? I strongly suspect that it is largely due to the absurd and clumsy financial manoeuvres with which the planners attempt to hide the rising cost of living.

The report was adopted.

ABBEY NATIONAL BUILDING SOCIETY

TOTAL ASSETS NOW £122,000,000

EXTENSIVE SUPPORT FROM INVESTING PUBLIC

VALUABLE SAFEGUARD IN A PERIOD OF INFLATION

SIR HAROLD BELLMAN'S REVIEW OF YEAR'S ACTIVITIES

The annual meeting of the Abbey National Building Society was held on March 2 at the Wigmore Hall, Wigmore Street, London.

Mr Stanley C. Ramsey, F.R.I.B.A., deputy chairman, presided in the absence through indisposition of Sir Harold Bellman, D.L., J.P., LL.D., chairman.

Sir Harold Bellman's speech, which was read by Mr R. Bruce Wycherley, M.C., F.C.I.S., managing director, was in part as follows:—It is our pleasure to meet you today in our 101st annual meeting. We thus inaugurate the society's second century and I am happy to say that the report and accounts which we are now privileged to lay before you are worthy of the occasion.

Turning to the accounts for the past year, two points stand out. First, the society has once more shown a strongly progressive tendency, while secondly, it has to be observed that this has been achieved on the prudent basis established by our century-old experience. We submit our accounts, therefore, in the confidence that they will pass the most stringent tests.

RECORD AMOUNT OF MORTGAGE ADVANCES

The society's expansion in 1950 is most directly reflected in the growth of its total assets, which increased by £18 million to £122 million. The amount advanced on mortgage last year, at £29 million, compared with £28 million in 1949, and established a new record in this sphere of our activities. It should be emphasised, however, that the great bulk of these advances were in respect of individual advances which did not exceed £2,000.

This is very noteworthy, having regard to the present level of property values, and is a pointer to the fact that we have continued our mortgage business on cautious lines during the past year. In its lending policy the board has been truly selective, since by no means all the mortgage securities offered have been accepted. Nevertheless, we have done our utmost to provide a service which is as helpful as possible to the borrower, while observing those canons of prudence which are no less in his than in our interests.

The houses which form the security for our advances consist largely of the best type of those built between the wars. There is still a strong demand for houses of this character. In addition, sitting tenants continue to purchase houses of which, in many cases, they have been tenants for a long period of years. It is the policy of the society to encourage this class of business, which we feel is by no means yet exhausted.

Meanwhile, the valuation of second-hand houses is far from an easy matter. Current market prices are still very appreciably above replacement costs, although present-day building costs continue to rise. Nevertheless, the scarcity element in the prevailing prices of second-hand houses is a factor which we should like to see minimised as far as practicable. The most ready solution to this problem would be a revision of the Government's allocation of the proportion of current house building which it permits for individual home ownership. This ratio is still no more than one in five, notwithstanding the fact that some one and a quarter million families have been rehoused since the end

of the war. A more liberal policy in this matter would accord with social justice and the needs of the economic situation.

Those who bought their homes before the war must today realise how they profited thereby, in view of the value of the capital asset which they possess. Moreover, the possession of one's own home tends to be a valuable safeguard in a period of inflation, since houses are broadly responsive to the price level and help to preserve the purchasing power of the savings invested in them.

The magnitude of our mortgage advances in 1950 has been possible only because of the support which we have received from the investing public throughout the year. As a result, new share subscriptions and additions to deposits amounted to £28 million, which is a remarkable figure and an impressive demonstration of the confidence with which the society is regarded by the nation's savers.

AN EMBODIMENT OF STRENGTH

Turning to the balance-sheet as a whole, it stands forth as the embodiment of strength. Our liquid securities, which consisted of trustee investments and cash at bank and in hand, amounted to no less than £16,700,000, thus representing an increase in the degree of liquidity as compared with last year. On the other hand, our reserves and carry-forward totalled over £6,600,000, and altogether we have a balance sheet which, bearing in mind the prudence which underlies our policy, signifies the great financial strength of the society.

Returning to the society's affairs for a moment, a year of such activity has made very heavy demands upon all who serve the society, in which connection I would like to mention especially the outstanding contributions of the deputy chairman, Mr Stanley C. Ramsey, and the managing director, Mr R. Bruce Wycherley. As the society's chief executive officer, Mr. Wycherley has had a year of exacting responsibility. The services of the general managers and secretary during this period have likewise been most valuable. Our staff, both at head office and at our many branches spread throughout the country, have accepted their additional burdens cheerfully and given willing service.

The society faces 1951 with confidence. We shall bring to all our problems a deep sense of stewardship, realising that we are accountable to our investors and depositors for the safety of their savings and to would-be borrowers for the best service we can offer. We shall pursue every course of action which seems best in the interests of prudence, and here let me emphasise that at no time and in no circumstances do we aim at expansion simply for expansion's sake.

The managing director concluded by moving the adoption of the report and accounts.

MR STANLEY C. RAMSEY'S REMARKS

Mr Stanley C. Ramsey, F.R.I.B.A., in seconding the adoption of the report and accounts, said: The figures in the present balance sheet, so lucidly dealt with by our chairman, do not disclose any dramatic changes over those of the preceding year. They do, however, represent the considered and cautious policy of your board: a policy

of caution determined to a great extent by the uncertainties of the country's economic position, which have, unfortunately, persisted so long.

The year's work, set out in so abstract a form, is one of which the board, the management, the staff, and the members of the society have every reason to be proud. All have contributed to the success recorded in these revealing figures.

The present Government has made a strenuous attempt to provide homes for those who require to rent, and if their efforts had not stopped there they would have merited a higher degree of praise. The meagre allocation of licences for the building of houses for those who prefer ownership has imposed on this section of the community a great deal of unnecessary hardship. The failure of the Government in this respect has meant that the activities of building societies have been narrowed, with the result that they are much more concerned in the changing ownership of existing houses instead of helping, as they would prefer, large numbers towards the ownership of new houses.

HOUSING COSTS: OFFICIAL DON'TS ATTITUDE

Had the policy which directs our housing efforts been more widely based there would, in my opinion, have been a substantial decline in building costs. One of the official excuses is that the prices of houses built by the private builder show no worthwhile saving over those built by the local authorities under Government direction.

But in order to effect large-scale economies there must be large-scale enterprise. The narrow scope allowed the private house-builder has not been sufficient for him to plan effective operations. Surely a wise programme would have allowed for some experiments of a sufficient magnitude to test the results. If, as I confidently believe, such permitted enterprise had shown a substantial saving in cost, then the prices of local authority houses would have fallen in sympathy.

The report and accounts were adopted.

The society's auditors, Mr Harold Lake-man, F.C.A., Lieutenant-Colonel W. C. Smith, D.S.O., M.C., F.C.A., and Mr R. T. Walters, T.D., M.A., F.C.A., were re-elected. Mr William Cash, M.A., F.C.A., Mr Arthur Collins, F.S.A.A., and the Right Hon. Sir Geoffrey Shakespeare, Bt., M.A., LL.B., were duly re-elected to the board.

MR BRUCE WYCHERLEY'S REMARKS

Mr R. Bruce Wycherley, M.C., F.C.I.S., managing director of the society, said:—It is my special privilege to emphasise the debt which we owe to our staff for the excellent results that have been laid before you today. They have loyally supported me throughout the year. The society is extremely fortunate to be served by a team with such an outstanding record. I believe public appreciation is sufficiently reflected in the figures embodied in the accounts.

In our new situation with the emphasis on the defence programme, the business of meeting the nation's housing needs will no doubt suffer. We cannot but deplore this fact while recognising the necessity for the measures which bring it about.

As and when our defence requirements have been substantially met, I hope we shall give the highest possible priority to housing. There are few things more fundamental to civilised living. We must then enter upon a real crusade that will provide new homes for those who prefer to own, with additional accommodation for letting for those who require to rent. We must above all things seek a balanced housing supply and I have no doubt that the building societies, not least among them the Abbey National, will then be ready to help in every way possible.

MANCHESTER OIL REFINERY LIMITED

ANOTHER YEAR OF PROGRESS

RISE DEMANDS SHOULD ASSURE CONTINUOUS MARKET

MR H. STUART EBBEN ON THE EXPANSION PROGRAMME

The third annual ordinary general meeting of Manchester Oil Refinery Limited will be held on March 30th at the registered office of the company, 170 Piccadilly, London, W.

The following is the statement by Mr H. Stuart Ebben, O.B.E., the chairman, which was circulated with the report and accounts:

Members who have studied the financial statements in the report will, I think, agree that the year 1950 was a not unsuccessful one for the company: this is apparent from the comparative figures inserted in the accounts which for the first time are strictly comparable. The period under review is the second full year of independent operation after the termination of the rental agreement with the Petroleum Board.

In view of the increase in the number of ordinary stockholders during 1950, members will be tolerant if they find repetition in some of the following remarks, but I feel they may be helpful to the new stockholders.

We have again made considerable progress at the refinery and further consolidated our position. The tonnage of crude treated during 1949 increased by some 46 per cent. over the figure for 1948, and during 1950 rose by a further 23 per cent. over 1949. This development is due to the modifications effected and additional tankage installed during the year, and also reflects the state of efficiency in which the plant has been maintained.

PROPOSED NEW ORDINARY ISSUE

In order to enable us to carry out a programme which we have formulated to increase still further the throughput of the plant and the range of our products, it is proposed to issue part of the new ordinary capital of £175,000 created by a resolution passed at a recent extraordinary general meeting. The remainder will be available for the general purposes of the company in the future. I hope that arrangements will be sufficiently far advanced for me to be able to tell you the amount to be issued, and the terms, at the forthcoming annual general meeting.

Turning to the accounts, the profits on trading have risen from £265,319 in 1949 to £514,453 during the past year.

It will be noted from the consolidated profit and loss accounts for both 1949 and 1950 that certain non-recurring profits which cannot be ascertained are included. It is our practice where possible to cover our future foreign exchange commitments and, at the time of devaluation, dollars had therefore been purchased in respect of future contracts for feed-stock to the extent that we were permitted by the authorities. The resulting profits fell partly into 1949 and partly into the early months of 1950. As close an approximation as can be made indicates that the figure included in this year's profits is of the order of £35,000.

The consolidated profit and loss account shows an amount of £147,201 available to the parent company for reserves, appropriations and distribution after providing for taxation in respect of the year's profits. Of this amount it is proposed to apply £4,668 towards reducing the goodwill item to £160,000 and £20,000 in eliminating the item "other intangible assets." The preference stock dividend for the year required a net amount of £9,831. An interim dividend of 10 per cent., less tax, was paid last September and a final dividend of 10 per cent. is recommended by your board, making a total distribution for the year of 20 per cent., less tax. It is further proposed to increase the reserve for future taxation by a sum of

£65,000. If these appropriations are approved, there will remain to be carried forward in the parent company's balance sheet £26,059.

SUBSTANTIAL TAXATION PROVISIONS

Members may be surprised at the very substantial provisions for taxation. In respect of the year's profits a net amount of £197,637 has been provided, and, in addition, there is the proposed transfer of £65,000 to reserve for future taxation. This is the third annual report of this company, which, you will recall, was formed to take over the assets and liabilities of its predecessor. In view of the basis of assessment of income tax on company profits it is now the generally adopted practice to make reserves for future taxation so as to have at all times sufficient to cover the eventuality of a sharp fall in earnings. This means that in the first years of a company's activities the provisions for tax make an unduly large inroad into its profits. On this occasion we have, out of 12 months' net revenue, provided for more than a year's tax, and have brought the reserve for future taxation up to the full amount of the estimated 1951-52 income tax liability.

The consolidated balance sheet shows that after providing £98,133 for depreciation (as compared with £72,325 for the previous year) fixed assets increased by a net amount of £15,173. The actual capital expenditure during the year totalled more than £110,000. Current assets at £1,494,326 show an increase of £400,202 and reflect the higher price structure and the increased turnover. Part of the increase in the volume of our oil stocks as at the date of the accounts is due to the arrival of a cargo of crude oil just before the end of the financial year; the carrying of larger stocks has been made possible by the installation of additional tankage referred to previously. This is essential in order to give the best possible service to consumers, and to have a reserve against delays in shipments of crude.

The liabilities side of the balance sheet calls for no particular comment. It will, however, be observed that the loan of £250,000 which we have from one of our bankers is more than covered by the total amount of balances at bankers and cash in hand. Interest is only payable on the day-to-day net debit balance at the bank concerned, and you will note that the amount paid in bank interest during the year was £954 as compared with £2,952 in the previous year.

Considerable progress has been made in overtaking deferred maintenance, £18,495 having been spent on this item during the year.

The devaluation of sterling and the commencement of hostilities in the Far East have resulted in certain increases in selling prices during the year, but these circumstances have not materially affected refinery margins or selling conditions. Prices of most products remained based upon American quotations adjusted to include freight differentials; prices, therefore, kept substantially in line with the sharp rise in freights.

CONSISTENTLY STRONG MARKET

The market for all grades of oils has been consistently strong. The rising demand is illustrated by the fact that European countries consumed in 1949-50 about 17 per cent. more than in 1948-49. The increased consumption of fuels and industrial lubricating oils is a direct consequence of the drive for greater mechanisation in all branches of

industry and agriculture. More particularly, the expansion of electrical installations to meet rising power requirements demands a constantly increasing supply of transformer oil, one of the main products of the refinery.

In the latter half of 1950 the requirements of the defence programme have aggravated the short supply situation already created by the rapid development of normal industrial demand. To meet this it has been necessary to curtail export business from the United Kingdom.

During the past year considerable progress has been made in the manufacture and sale of special oils. Our company has played a leading part in the development of cutting oils used in the machining of alloys for jet engines, gas turbines and other aircraft engines, and also in the production of textile oils. Progress has also been made in the chemical products division.

The export and merchant business conducted by our wholly owned subsidiary, Raven Oil Company, Limited, has continued to expand throughout the year and its activities are now widespread.

A successful ancillary operation has been the advancement of the business of Flexibox Limited. This company manufactures and markets mechanical seals used mainly in pumps and compressors. Developed in wartime owing to a lack of suitable equipment, it has now fully established itself on a peacetime basis, and Flexibox seals are being used by a number of leading oil refining and refrigeration companies in this country and overseas.

MAINTENANCE OF PRODUCTION LEVEL

We believe that the rising demand for all types of fuels and lubricating oils assures a continuous market for the company's total capacity. It is our aim to maintain the highest level of production consistent with plant efficiency, to develop the market for special products now included in the company's programme, and to continue our research and development work so as to keep pace with the changing needs of mechanised industry.

It is early in the year to make any comments on current trading, but I am glad to say that results to date are satisfactory. It is my hope that this progress will be maintained, but in a period of inflation and uncertainty I have to remind you that every industrial enterprise is faced with many additional problems.

At this stage of the company's development, I should like, on behalf of the board, to place on record our sincere appreciation of the work and foresight of our two managing directors, as a result of which the present position has been attained and also of the efforts of the general manager and the other employees, all of whom have given devoted service to the group.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

NEW BUSINESS EXPANSION

In presenting the report and accounts to the 113th annual general meeting, held in Edinburgh on March 6, 1951, the chairman, Mr R. Y. Weir, O.B.E., drew attention to the considerable expansion in the new business. The net new ordinary sums assured were more than three-quarters of a million greater than those for 1949, which was itself a record year. The corresponding new premium income showed an even larger proportionate increase. The interest income, too, had risen and represented an improved yield of £4 9s. 10d. per cent. gross, or £3 8s. 5d. per cent. net after deduction of income tax, calculated upon the total funds, including the general reserve fund.

A slight increase in claims was only natural owing to the steady growth of the business. It was gratifying to note, however, that the amount paid on surrenders of policies had fallen, indicating that the worth of the Institution's policies was well appreciated and that every effort was being made by members to maintain them in force, even where rising prices caused a general financial stringency.

WELL DISTRIBUTED ASSETS

As a result of the year's operations, the total funds had increased by over £800,000 to £28,604,456. A sound investment policy had resulted in the assets being well distributed, and the margin between the book value and market value of all investments was in the aggregate greater than the figure a year ago.

It was important, especially at the present time, that every effort should be made to encourage all forms of saving, and life assurance was of increasing importance to this end. The continuous development of life assurance to meet popular demand had resulted in emphasis being laid today on the provision of income rather than capital. The advantages of a policy which was basically an endowment assurance with the sum assured payable by instalments, should not be overlooked. By adding to this basic contract various supplementary benefits, the Institution produced some most attractive contracts. The emphasis on income was also evident in the amount of pension scheme business which had been transacted. The Institution had specialised in this class of contract, and much of the new business had come from this source.

The report and accounts were adopted.

ALDERS (TAMWORTH) LIMITED

OUTPUT SUBSTANTIALLY INCREASED

The fifteenth annual general meeting of Alders (Tamworth) Limited, was held on March 2nd in London.

Mr E. B. Montesole, J.P., the chairman, who presided, said, *inter alia*: Since last April the wood-pulp market has been in a chaotic state, and apart from its high cost, in common with all other raw materials today, wood-pulp is in short supply. So far as waste paper and home-produced materials are concerned, we are still getting reasonable quantities, though here again prices have risen, and are still rising, and shortages in some directions are frequent. In this connection I would like to stress the importance of the new salvage drive now being instituted by the Waste Paper Recovery Association. More waste means more paper and more exports.

As you are aware, the company has always specialised in papers made largely from home-produced ingredients, including straw, and this latter material has proved of great benefit in maintaining output of certain qualities intimately associated with rearmament and export packing.

The accounts show trading profits of £85,110, which, after making provision for all expenses and taxation, leaves a net profit of £34,380, compared with £19,354 a year ago.

Your directors propose appropriations as set out in the report, including the maintenance of the ordinary share dividend at 30 per cent. for the year by a final distribution of 20 per cent., the placing to general reserve the sum of £10,000 and leaving to be carried forward the somewhat increased sum of £9,733.

The dividend paid after taxation on the actual capital employed in the business, as shown in the balance sheet, is equivalent to 4½ per cent., and if the real value of the assets on a replacement basis is taken, the return would be appreciably less.

The report and accounts were adopted.

BRITISH TYRE AND RUBBER COMPANY, LIMITED

SALES EXPANSION

The twenty-seventh annual general meeting of the British Tyre and Rubber Company, Limited, will be held on March 28th in London.

The following is an extract from the circulated statement by the chairman, Sir Walrond Sinclair, K.B.E.:—

Following devaluation of sterling, there has been a steady expansion in the volume of the group's domestic and export sales, and on the other hand, there have been constant—and in some cases phenomenal—increases in the costs of all raw materials. The latter applies most forcibly, of course, to rubber and cotton, our principal raw commodities. In consequence we have been compelled, in common with the rubber industry generally, to raise the selling prices of our products, and this, coupled with the increased volume, has resulted in a substantial increase in our sales in terms of money.

INCREASED GROUP PROFIT

The group profit of the year, after expenses but before taxation, has increased from £883,239 to £1,251,887. This is still some £200,000 short of the corresponding figure for 1948, but your directors regard it as very satisfactory in the circumstances prevailing during the period concerned.

It is proposed to pay a final dividend of 20 per cent., making 25 per cent. for the year. Your directors consider that in view of the increased level of wages and salaries, and in the light of present day conditions, this is only a fair and reasonable return to the shareholders having regard to the capital actually invested in their business and the scale of our trading operations.

Despite the apparent strength of the group's resources, however, it is clearly my duty to warn you that our industry is now, through the still steeper increases that have arisen since the close of the accounts, facing raw material costs drastically above those known for very many years, and there is at present no indication that the peak has been reached. In addition, the prices of all kinds of plant and machinery are at a very high level and are still rising. Labour costs are also moving upwards, a substantial wage increase having, in fact, come into effect last November. Accordingly, there is every indication that the group's liquid resources are by no means in excess of the requirements of its business in the immediate future, and, indeed, additional working capital will be essential if progress is to be unhampered.

THE CURRENT YEAR

There is little need for me to comment on the future outlook, although the first four months of the new trading year show a steady increase in the volume and value of our sales by comparison with the previous year. All these factors, however, are overshadowed by the present international situation and its eventual development and effects. The immediate future of our industry and business will be influenced primarily by the Government's defence and re-armament programme, and the incidence of this on the availability of labour and raw materials, some of which vital to our industry, are already in short supply. On the other hand, your group's reputation for quality and service stands high, and its products are of essential importance to the national economy and to industry in general. I am confident, accordingly, that whatever the future may hold, your company and its subsidiaries will be able to give a good account of themselves.

MILLS AND ROCKLEYS LIMITED

The twenty-second annual general meeting of Mills and Rockleys Limited, was held on March 8th at Nottingham, Mr George T. Mills, chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts:

The trading profit for the year ended October 31, 1950, amounts to £134,054, an increase of £10,552 before provision for tax. After deduction of tax the net profit is £55,857, an increase of £2,520. The directors recommend a dividend of 10 per cent. (one shilling per share), less income tax, the rate that was paid last year, and a transfer of £20,000 to general reserve, raising this to £165,000, and £5,000 to tax equalisation reserve.

They have decided to take powers to increase the authorised capital by £250,000 in 6½ per cent. cumulative preference shares of £1 each and to issue 42,409 of these as a bonus issue at once to existing shareholders in the proportion of one such share to 25 ordinary shares of 10s. each.

ADVERTISEMENT REGULATIONS

A year ago, when I referred to the Advertisement Regulations under the Town and Country Planning Act, I told you that we had not been dissatisfied with the way in which they had worked over the eighteen months preceding our meeting. Unfortunately a complete change has since occurred and the present position is disquieting.

Under the Regulations the Local Town Planning Authority has a discretion to accept or reject applications for consent to use new advertising sites. In the event of rejection, the applicant has a right of appeal to the Minister, on whose behalf an inquiry is then conducted.

During the first eighteen months of operation under the new regulations the decisions given on appeal appeared to be impartial and consistent. As a consequence it was becoming possible to foresee with some certainty the type of advertising which the Minister was prepared to permit and distinguish it from that which he proposed to stop. We were able, therefore, to review the decisions of the local authorities with reasonable certainty that their decisions in certain cases would be supported by the Minister and in certain other cases would be reversed on appeal.

MINISTERIAL INCONSISTENCY

The position during last year, however, has been radically altered, because the decisions on appeals to the Minister have ceased to have the consistency which they displayed during the first eighteen months. I defy anyone when examining appeal decisions recently given to find in them any thread of consistent policy or any trace of adherence to the principles upon which the Minister was understood—even declared—to be working.

The result is that instead of appeals diminishing as practice became established and the number of precedents grew, their number must now increase out of all reason, for nobody can foretell with any confidence the outcome of any particular appeal, whether it be a borderline case or whether it be at one extreme or the other of the range between the permissible and the prohibited. It would appear therefore that the administration of appeal procedure must be taxed to breaking-point. We are very concerned about this matter since the greater the number of appeals the more likely it is that their conduct must be delegated to levels where impartiality of decision and consistency of policy must be more difficult to secure.

The report was adopted.

SUN LIFE ASSURANCE SOCIETY

SUBSTANTIAL NEW BUSINESS

MR W. M. PRYOR'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63, Threadneedle Street, London, E.C.2, on Tuesday, April 3, 1951.

Mr W. M. Pryor, D.S.O., D.L., chairman of the Society, has issued a statement to shareholders, which in outline is as follows:

FUNDS, INCOME AND OUTGO

The total funds at the close of the year under review amounted to £78,202,000, having increased during the year by £4,396,000. The Life Assurance Fund increased by £4,061,000 to £70,109,000, while the life premium income of £9,528,000 is the highest recorded by the Society.

The gross interest income of the Life Account amounted to £2,560,000 and represents a gross rate of £3 16s. 8d. per cent. This is 1s. 4d. higher than that shown in 1949, which is very satisfactory bearing in mind the strain on the yield occasioned by the loss of higher yielding investments as the result of nationalisation of certain industries and of normal repayments.

The claims by death show an increase, but I am pleased to say that the number of such claims was again less than the number expected.

NEW BUSINESS

The life assurance new business for the year consisted of 27,849 policies assuring £35,300,000. It is pleasing to report that this represents the very substantial increase of £4,212,000 in sums assured, and I would take this opportunity to express the thanks of the Directors to insurance brokers and other connections for the confidence they have demonstrated in the Society by their valued support.

NOTICES

THE EASTERN BANK LIMITED

The Transfer Books and Register of Members will be CLOSED from March 27th to April 10, 1951, both days inclusive. By Order of the Board.

2 & 3, Crosby Square, London, E.C.3. March 7, 1951. C. L. MANNING, Secretary.

VACATION COURSE ON WOOL

International Wool Secretariat

Tuesday, March 27th, to mid-day, Saturday, March 31st, 1951, at the L.C.C. Technical College for the Distributive Trades, London, W.C.2.

A non-residential day course arranged by the Department of Education of the International Wool Secretariat mainly for men and women teachers of history, geography, economics, commerce, arts and crafts, science and domestic science in Primary and Secondary Schools, Technical Schools, Schools of Arts and Crafts, Teachers' Training Colleges, etc. A limited number of places will be reserved for other interested persons.

Lectures, supported by films and filmstrips, will be given on:

Wool Growing
Wool Marketing
Woolen and Worsted Cloth Manufacture
History and Geography of Wool
Cloth Construction and Judgment
Science of the Wool Fibre—including recent technical developments
Development of Fashions in Wool

There will also be simple laboratory work and demonstrations of hand-spinning, hand-loom weaving, etc.

A certificate will be awarded to students who complete the course satisfactorily.

Fee 10s. 6d.

For further details and forms of application apply to: P. A. Wells, M.A., F.Inst.P., Director of Education, International Wool Secretariat, Dorland House, 18-20, Regent Street, London, S.W.1.

THE Economists' Bookshop, 11-12, Clements Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (periodicals excluded).

YOUNG Woman Graduate (Economics) required as assistant to Economist in market research and statistical sales department of large manufacturing company in North London. Applicants should give details of age, education and experience.—Box 599.

INFORMATION Bulletins, Journals of Societies or Institutions: editing, design, layout and finalisation of text for printer. Moderate fees. Inquiries from embassies, literary, social and industrial bodies.—Box 589.

Our experience in the transaction of life assurance without medical examination has been highly satisfactory, and we are prepared to grant assurances for amounts up to £30,000 at the same rates of premium and with the same privileges as those effected with medical examination provided, of course, that the proposer has a satisfactory health record and is under 50 years of age or, if over 50, that the assurance is to terminate before the 65th birthday. In the opinion of your Directors the valuable benefits of life assurance should, so far as practicable, be made available to all who require them, and as a result of the knowledge gained from a long experience the Society is able to grant favourable terms to those who are medically under average.

PENSION SCHEMES

Employers everywhere are appreciating that one of the best means of promoting harmonious relations in industry is the inauguration of a scheme of life assurance to assist employees in making provision for their old age and for their dependants in the event of earlier death. Employers who have been confronted with appeals for assistance on compassionate grounds from relations of deceased employees will appreciate the advantages of a recognised scheme that makes provision on a definite basis, thereby avoiding the necessity for such appeals. The Society's experience in this specialised class of business extends over a period of 25 years, and our officials are qualified to advise upon the many complex problems which arise. Whether provision is to be made for a staff of many hundreds or half a dozen or even a single valued employee, interested employers are assured that their needs will receive expert attention.

INVESTMENTS

The funds are mainly invested in stock exchange securities, but a considerable sum is

represented by loans under our house purchase scheme, the amount advanced during the year being the record sum of £3,600,000. The liberal scale of advances available to persons desirous of buying houses for their own occupation, combined with provision for immediate release of the property free from mortgage in the event of the death of the borrower, no matter how soon after the granting of the loan, makes this the ideal system of house purchase.

The activity in new capital issues during the year enabled the Society to invest substantial sums in well-secured debentures on relatively favourable terms. Every opportunity is taken to improve the yield on our assets by making exchanges of investments when suitable alternative securities are available, which accounts for the reduction of our holdings of British Government securities by £650,000 to £23,800,000.

The market values of fixed interest securities as at December 31st last were generally higher than at the close of the previous year, resulting in an increase in the margin of the market values of our assets over the figures at which they stand in the balance sheet.

FORTHCOMING VALUATION

This is the last year of the quinquennium, and a valuation with a view to a declaration of bonuses on profit-sharing policies is due to be made as at the end of December next. The present time is therefore particularly opportune for effecting new assurances under our popular "with profit" tables.

TRIBUTE TO THE STAFF

My statement would not be complete without expressing to the staff the directors' appreciation of the highly satisfactory results. The substantial increase in new business is a testimony to the skill and energy of our outdoor representatives and to the efficient support which they receive from their indoor colleagues.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF ECONOMICS AND COMMERCE

Applications are invited for appointment as Research Assistant at a salary of £450 a year. Candidates should have had training in both Economics and Statistics and will be required to undertake research upon the Wool Trade.

Applications should reach the Registrar, The University, Leeds 2 (from whom further particulars may be obtained), not later than April 16, 1951.

NATIONAL COAL BOARD

Applications are invited for the post of Head of the Intelligence Section of Production Department at London Headquarters.

The Section is responsible for the interpretation of statistical material for advising the Department on statistical requirements, for the examination of trends and for the preparation of periodic reports on output, productivity, etc.

Experience in the analysis, interpretation and presentation of statistics (preferably of production, productivity and manpower) is essential.

Commencing salary will be either on the scale £850 to £1,200 (male) per annum, or £750 to £950 (male) per annum, according to the qualifications and experience of the selected candidate. London Location Allowance is payable in addition.

Apply, in writing, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates) to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/298. Original testimonials should NOT be forwarded. Closing date March 27, 1951.

HOW often have you wished you had a simple means of keeping all your domestic papers, letters, documents, receipts, etc., in orderly form out of sight, yet always instantly available for immediate reference? The new Automatic Secretary for the Home is the ideal device—simple, compact, durable, inexpensive, it is also an automatic reminder. Send P.C. for descriptive leaflet AS.28, to Shaw Publishing Co. Ltd., 180, Fleet Street, London, E.C.4.

BALLIOL COLLEGE, Oxford, proposes to elect a Junior Research Fellow in History or Politics or Psychology as from September 29, 1951, and invites applications, to be received not later than April 30, 1951. The choice of the College will not necessarily be confined to those who apply. Details may be obtained from the College Secretary.

WANTED.—Secretary with University education, bi-lingual, able to translate English into French and vice versa; also typing and shorthand. Most interesting work for suitable candidate. Salary £500 per annum.—Apply Box 594.

FOR SALE.—Economist, Dec. 7, 1946, to Jan. 28, 1950. Supplement from Jan. 4, 1947, to May 28, 1949. Offers.—Box 595.

FOR SALE.—Economists, 1946 (two missing), 1947 (three missing), 1948 and 1949 complete, 1950 (two missing).—Offers to Box 588.

THE REFUGE
WILL SAFEGUARD THE FUTURE

THE NATIONAL BANK OF INDIA LIMITED

NOTICE IS HEREBY GIVEN that the Annual General Meeting of the Shareholders will be held in the Bank's premises at 24, Bishopsgate, London, E.C.2, on Tuesday, April 3rd, at twelve o'clock noon precisely, to receive the Accounts to December 31st last with the relative reports by the Directors and the Auditors; to elect Directors; to fix the remuneration of the Auditors; and to transact all such other business as can be transacted at an Annual General Meeting of the Company.

In connection with the election of Directors special notice has been received by the Company pursuant to the provisions of Sections 142 and 185(5) of the Companies Act, 1948, of the intention to move at the above Meeting a Resolution for the re-election as a Director of the Company of Mr. R. L. Hird, who attained the age of 70 years on January 30, 1947. Mr. Hird retires by rotation and offers himself for re-election.

By Order of the Board,
W. KERR, London Manager.

The National Bank of India Limited,
26, Bishopsgate, London, E.C.2. March 6, 1951.

INCORPORATED ACCOUNTANTS

THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS' EXAMINATIONS

Examinations, May, 1951

The Society's May, 1951, Examinations will be held on the following dates:

Final: May 1, 2 and 3, 1951
Intermediate: May 2 and 3, 1951
Preliminary: May 1 and 2, 1951

The centres will be Belfast, Birmingham, Cardiff, Dublin, Glasgow, Leeds, Liverpool, London, Manchester and Newcastle-upon-Tyne. Applications, on the appropriate forms, which can be obtained from local Hon. Secretaries of District Societies, must be lodged with the Secretary, Incorporated Accountants' Hall, Temple Place, Victoria Embankment, W.C.2, not later than Monday, March 19, 1951.

NO Capital Depreciation and a return of 2½ per cent. (income tax paid by the Society) are the terms offered for Share Investments by the 73-year-old Chelsea and Fulham Green Building Society. Write for Leaflet F to 110-112, Kings Road, Chelsea, S.W.3.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

Biggest Land and Cattle Sale in South African History

On 29th March, 25th & 26th April and during May, 1951, the following will be sold by public auction in Vryburg, South Africa. On 29th March, 26 farms totalling 267,647 acres and on 25th & 26th April and during May, 12,000 head of cattle consisting of Hereford X Afrikaner and Aberdeen Angus X Afrikaner and including 180 pedigree bulls.

Please write to GRANT ADVERTISING LTD.,

UNIVERSITY OF GLASGOW

DEPARTMENT OF POLITICAL ECONOMY

Lectureship in Money, Banking and Economic Fluctuations.

Applications are invited for a Lectureship in Money, Banking and Economic Fluctuations tenable from October 1, 1951. Salary £500 to £1,100 according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (5 copies) should be lodged not later than March 31, 1951, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON, Secretary of University Court.

THE UNIVERSITY OF MANCHESTER

AMENDED NOTICE

Applications are invited for the post of LECTURER IN ECONOMICS. Salary scale £500 to £1,100 per annum with membership of the F.S.S.U. and Children's Allowance Scheme. Initial salary according to qualifications and experience. Applications should be sent not later than March 31, 1951, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

URWICK, ORR & PARTNERS seek additional staff for the Accountancy and Administrative Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:—

1. Professional qualification in Accountancy.
2. Some years' responsible executive experience in senior industrial appointments.
3. Knowledge and experience of modern techniques of Cost Control.
4. Sound general education and wide interest in contemporary affairs.

Successful candidates will be trained as Management Consultants at the Company's own Training Centre.—Applications should be addressed in writing to the Company's Offices, at 7, Park Lane, London, W.1, quoting Reference: C/1047.

BOOKS Bought: Please send lists of any standard or rare books, runs of learned journals, for disposal.—W. Heffer & Sons, Ltd., Petty Curry, Cambridge.

The Virtue of Obstinacy

THE substitution of Mr Morrison for Mr Bevin at the Foreign Office is much more than a passing event. It is the end of a chapter, and perhaps very nearly the end of the book for the Labour Government. Mr Bevin's tenure of the Foreign Office has been long and notable; and it has also been very fully suffused with his own strong personality. It is impossible that his replacement by such a very different man as Mr Morrison should make no difference, if not to British foreign policy, at least to its conduct. And at the same time the removal of Mr Morrison from the Leadership of the House of Commons and the daily supervision of the party machine must inevitably weaken the Labour Party on its most precarious front, the parliamentary and electoral. The opinion of this journal was expressed some weeks ago that Mr Morrison was making a mistake—in his own interests, in his party's and in the country's—in going to the Foreign Office. That opinion is not changed; but it did not arise out of any lack of appreciation of his qualities—we repeat that Mr Morrison has been the best member of this Government—and still less does it mean that Mr Morrison should not be wished well in his heavy new responsibilities. It is still the sound tradition of this country that the Foreign Secretary should be supported as much as possible and exempted from captious or purely partisan criticism; Mr Morrison deserves the protection of this tradition.

It is far too soon to assess the merits of Mr Bevin as Foreign Secretary. He has certainly had his failures in recent years, and some of them have been directly due to his own personal limitations. The collapse of his Palestine policy was the fruit of his obstinacy, and the part he has played in the development of policy towards Germany has suffered from the same defect. He greatly raised the hopes of the Continent by his speech of three years ago in favour of Western Union—and then gradually allowed the Western Europeans to be persuaded that British policy was cynically obstructing this same high object. His fight against ill-health in the last year or more has won for him high admiration on personal grounds; but the same vein of stubbornness has prevented him from seeing (or at least acknowledging) that his own silence and immobility have driven British policy into a state of stagnation that has sometimes looked like deliberate isolationism. And yet, when the final account comes to be reckoned up, it may be that these defects of his firm character will count for much less than the great service that the same obstinacy rendered to the country and the world in his first two years. A Labour Foreign Secretary, coming into office on the morrow of the war, in an atmosphere of rosy illusion, backed—and sometimes confronted—by a party blinded by its own ideology, might have led the country to disaster. It is to Mr Bevin's everlasting credit that he saw clearly on the main issue and refused to be budged from the policy he first took up. He was the first—long before the Americans—to stand firm against Russian intransigence and encroachments, and he has had the

satisfaction of seeing the free world, by a large majority, come round to his view. On balance, Mr Bevin's obstinacy has been a great national asset.

That is precisely what gives one pause about Mr Morrison. He is not an obstinate man. That has, indeed, been his great merit, and his title to statesmanship. There is no doubt that his advent to the Foreign Office will have very great advantages. Where Mr Bevin has been at his worst, Mr Morrison, generally speaking, will be at his best. Where Mr Bevin has been inarticulate, Mr Morrison will expound and explain. Where Mr Bevin has been immobile, Mr Morrison will explore. Where Mr Bevin has allowed British policy to appear worse than it is, Mr Morrison will make it appear at least as good as it really is. These are great advantages. But the supreme need for British foreign policy is still for firmness.

Diplomacy is the art of skilful negotiation; but the danger of successful and experienced negotiators is that they come to think that there is nothing that cannot be arranged by negotiation. There is, for example, the recurrent belief that if only someone really persuasive and authoritative could have an hour or two alone in the Kremlin with Stalin, all would be well. But the truth is that, in present circumstances, nothing could be more dangerous than a "new initiative"—at least so long as it comes from the side of the west. What is so often called a "general settlement" with Stalin is highly improbable. The only general settlement that would really relieve tension is one that would demand from Moscow more concessions than there is the slightest reason to expect to be forthcoming. Over a period of years some relief of tension may come about by local and regional bargains negotiated from strength and prepared with great patience. But if Soviet expansionism has to accept these local checks, it will be none the less stubborn and suspicious. The basic cause of world tension does not lie in any one situation or even in the present level of Soviet armaments. It lies rather in the nature of the Soviet state. The free world, with its eyes wide open, has entered upon the only possible policy for maintaining peace in the face of a deliberately world-revolutionary great power. But it is a policy that cannot succeed quickly and that cannot

succeed at all without firmness and endurance in firmness. Let it by all means proceed *suaviter in modo*; but the essential is that it should be *fortiter in re*.

In principle, and in the abstract, of course, everyone will accept this. Everyone means to stand firm. But one cannot help having a serious doubt whether the Labour Party can be relied upon to stand firm in a pinch, and to go on standing firm in all the pinches that a long series of years will bring. Its character and its record support the doubts. There is a strong pacifist or near-pacifist element in the Labour Party; will it have the nerve to stand firm in one of those great crises—provoked, it may be, by Russian encroachments on Yugoslavia or Persia—when the best hope of peace is, for a few weeks, to court war? There is a strong ideological element in the Labour Party which still harbours the strange illusion that there is such a thing as socialist foreign policy; will it not seize on every opportunity to make mischief with capitalist America with the same glee as in recent months? The strongest of all elements in the Labour Party is the belief in more pay for less work; will the adherents of this doctrine go on bearing the burdens of armed strength in the years when the need for it is less apparent than it is today? And if one has these doubts about the Labour Party, can Mr Morrison—who is so much flesh of its flesh and blood of its blood—be exempt from them?

The answer, no doubt, is to point to the record. Has not the Labour Party shown that it can face facts and cultivate a sense of realism? But is that what the record really shows? Certainly not the prewar record, which was one of wilful blindness and folly (Labour was still voting against conscription in the spring of 1939). And as for the record of the last five years, one has to ask oneself how much realism there would have been in foreign affairs without the accident of Mr Bevin? Or, in another element, would there have been any realism at all in economic affairs without the accident of Sir Stafford Cripps? Perhaps the real importance of last Friday's announcement is that it removes from departmental office the second of the two men who have had a policy to give to the Labour Party. What remains is manoeuvre and no more. Mr Bevin's obstinacy will be missed.

Inflation's Gallop

THE rapid progress of world-wide inflation provoked last week-end a cry of alarm from the council of the Organisation for European Economic Co-operation. It is useful to have the finance ministers of Western Europe recognising their problems collectively even if their proposals for doing something about it are no more than jejune generalisations. That had to be expected: the regret must be that the cry was no louder and commanded no more attention. Among the experts as well as the general public there seems as yet to be little understanding of either the probable size or the implications of an inflation that is now running strongly and cannot be quickly halted. In this country, especially, people still seem to regard present price increases as a once-for-all reaction to the Korean war, as just another turn of a screw that in the past ten years has grown familiar—a large turn, no doubt, and particularly unfortunate, but no more decisively damaging than many turns before.

This is to misread the signs. Prices are now rising faster than at almost any time in the forties. To find a parallel, it is necessary to go back to the beginning of the last war. In the first eight months, from September, 1939, to May, 1940, the Board of Trade's index of British wholesale prices rose by 27 per cent. This was in the period of rapid mobilisation: a British army was sent to the continent and defeated. By comparison, nothing has happened to men or industry in the eight months, from June, 1950 to February, 1951, since the Korean war began. But wholesale prices have risen nearly as sharply—by 19 compared with 27 per cent. Moreover, this time the increase has occurred in spite of the fact that food prices have been kept almost constant (largely by refusing to import things which were getting dearer). All that has really happened so far is that the wholesale prices of basic industrial materials have risen by 83 per cent in eight months and are now more than twice what

they were a year ago. What has so far seeped through to the price of manufactures is, even at the wholesale stage, an increase of only 8 per cent in eight months. The rises in shop prices still reflect, for the most part, the growth of import costs after devaluation and the American restocking boom; they do not yet reflect what has happened since the Korean war began and wage restraint broke down at home.

It is certain that, even if the prices of raw materials are shortly stabilised or even if they fall considerably, both the wholesale and the retail prices of consumer goods will rise fast throughout 1951. Even those exceptional things that have stood steady through ten years of inflation and have helped to maintain some sense of the old value of money—the penny newspaper, the twopenny public telephone call—can no longer be taken for granted. Inflation seems to be spreading to every corner of the economy, a mood is developing in which heavy spending is bound to add to the pressure of rising costs, and in this atmosphere it is inevitable that wages should rise further and start a new round of cost inflation. There is, in short, a very real danger that in the next twelve months the British people will experience a fall in the value of their money such as they have rarely if ever known before.

★

This country faces the entirely new circumstances of undertaking a great peacetime rearmament before it has digested the financial problems of the welfare economy and when Keynesian conceptions of public finance and monetary policy are still capable of being misapplied. It would be very foolish to rely on past experience for the complacent belief that runaway inflation cannot happen here. The perils of an open inflation such as has now clearly begun surely need no stressing. In any circumstances, and even in small measure, it is socially unjust; in any great measure it would be quite intolerable when it comes after ten years of consistently, if slowly, rising prices and redistributive taxation. Those two things together have already depressed the living standards of people with relatively fixed incomes to an extent that was hardly imaginable, as a permanent state of affairs, not ten but as little as five years ago. Even if, as is perhaps conceivable, the trade unions are now powerful enough to push up wages almost as fast as prices, no one can want to penalise still further the small salariat and the pensioners for the benefit of, primarily, the Treasury, and, secondly, profits—which is what such an inflation would mean. Whatever is the right way to pay for defence, it is certainly not to try to put most of the

burden on the bank clerk, the school teacher and the middle-class aged. These are just the people who, by most standards of fairness, ought now to be spared as much as possible.

The natural and instinctive reaction of governments and legislatures to a situation of this kind is to clap on all manner of controls and rationing schemes and to shovel out subsidies in an effort to keep prices down. These attempts to avoid the social injustices of rising prices are praiseworthy in their intention; but they can be disastrous in their effects, as this country has had ample opportunity of learning in the past decade. To keep prices down when incomes have risen is to invite people to consume more. In fact, however, they will have to consume less, since the demands of rearmament are rising. So there has to be still higher taxation to take away by the back door the purchasing power that it would be anti-social to allow prices to limit—and then even higher taxes still to make up for the saving that the public refuses to do. The economy is distorted; everything is scarce, whether it needs to be or not; and necessary production, such as for rearmament, can be pushed through the overcrowded channels of the economy only by the sheer brute force of an overtaxed administration. Suppressed inflation, like a suppressed fever, can be infinitely more dangerous than if it is let out.

If it sounds paradoxical first to bemoan the damage done by inflation and then to oppose any attempt to keep prices down by government action, that is only because the nature and the definition of inflation are thoroughly muddled in the public mind. Inflation and rising prices are not synonyms for each other (however much one is forced in ordinary conversation to use them as if they were). Inflation is a state in which the flow of money trying to spend itself on goods and services is larger than the flow of goods and services available (at the prevailing price level) to be bought. Inflation, in a state of nature, causes rising prices, just as a fever causes perspiration. But the rising prices, so far from being identical with inflation, are (like the perspiration) nature's attempt to restore the balance.

It is no longer possible for the British people to choose whether or not they shall have inflation or not in 1951. The germ is already in the bloodstream; it is gradually incubating; and the period of development will not be over for many months yet. There are, however, two choices still open. The first is what form the inevitable inflation of 1951 shall take. The second is whether the seeds are to be sown for a continuing, and probably

Head Office,

ROYAL EXCHANGE
ASSURANCE: INCORPORATED IN 1720

stronger, inflation in 1952. It is most important that these alternatives should be understood and the right one in each case chosen.

Once inflation is in the bloodstream, the choice of the form it shall take—suppressed or open—is a cruelly difficult one. To choose suppression now means shortages and queues; it means that there will be more rationing, production controls and allocations; that the incentives to work hard and to change jobs in response to changing demands will be weakened; that stocks will be run down and productivity fall as workers wait for materials to turn up; that yet more rigidities and inefficiencies will be built into the British economic system; that the rearmament effort will probably, in spite of the controls, be weakened, and exports of consumer goods will almost certainly fail to make up the gap left by the inevitable reduction in engineering exports.

These are not imaginings; they are what happened in 1946 and 1947. There are still two more arguments against suppression. One is that there is no end to it. A policy of suppression can never kill the forces of inflation. It leaves the excess of purchasing power latent, to become effective if supplies improve or if the controls break down and prices are allowed to rise. The other argument is that, in present circumstances, it would almost certainly not work. Such success as suppression has had in the past has been due to the trade unions' restraint about wages and that has clearly broken down. To attempt suppression, to tie the economy up in red tape, and then to have rocketing prices after all—this would surely be the worst of both worlds.

Yet if these are the evils of suppressing inflation, the evils of letting it run its course are no less. If the first are economically debilitating, the second are socially corrosive. For over a decade, British economic policy has, in substance, refused to choose between these unlovely alternatives. The result is that we have had a bit of each. There has been enough congestion to make the economy dangerously rigid and inefficient—but not enough (save at intervals) to bring about open

The Commonwealth and Malan

DR MALAN, the Prime Minister of South Africa, has recently made two statements which have raised a buzz of comment throughout the Commonwealth. In the first, on February 9th, he complained about the delay in transferring the control of the native protectorates of Bechuanaland, Basutoland and Swaziland from Britain to South Africa. In the second, on February 23rd, he flatly declared, among other things, that British colonial policy is undermining the foundations of the Commonwealth. The first occasion—a surprising speech, since it was delivered at a dinner in Capetown at which the Secretary of State for Commonwealth Relations, Mr Gordon Walker, was present—has naturally been overshadowed by Dr Malan's more recent, more outspoken and more fundamental observations. But the two taken together raise issues which the members of the Commonwealth, and most particularly the United Kingdom, cannot afford to ignore.

The South African Nationalist Party, of which Dr Malan is the head, has never in the past been distinguished for any intimate concern about the fate of the

economic disaster. There has been a fall in the value of money, rapid enough when looked at in retrospect, but not sufficient at any time to produce social revolt. With inflationary pressure no more than it has been in the last five years, or with the special disciplines of wartime, such an ignoble compromise will work. It is very doubtful whether it will work with the much greater inflationary pressure that is now in prospect.

★

What, then, is the choice that policy should make? The politician will want to feel his way, but the economist's answer ought to be quite clear. The right policy is to let the inflation that is already in the bloodstream work its way out in rising prices (with all the hardships and difficulties that that involves) but to resolve that there shall be no fresh crop in 1952, so that prices will before too long reach a plateau and level off. In practice, neither half of this prescription can be filled completely. No government could afford to remove all controls on prices. And so long as the outside world is inflating and rearmament is a categorical imperative, it is virtually impossible to prevent all further inflation. But these are the objectives to which public policy should be directed. There should be a real attempt to get rid of all the artificialities and distortions that a decade of suppressing inflation has produced; in principle, prices should be allowed to find their own level. And there should be a determined effort, by using all the old-fashioned remedies—by monetary policy, by restriction of credit and by public retrenchment—to cure inflation in the only way it can be cured—that is, by pulling the total of demand down until it is no greater than the available supply.

This combined policy may not seem to politicians to be one that they can sell to the electorate. That is their business; but it is the economist's business to warn them that the alternative may well be an economic and social disaster to which past history in these islands provides no parallel.

Commonwealth. The Prime Minister's remarks have therefore fallen with more of an impact than they otherwise might. They are, of course, partly to be explained by internal South African politics. Indeed, both by speaking up for the Commonwealth and by voicing fears about the growth of negro power in Africa—which the Nationalists are not alone in fearing—Dr Malan has adroitly and successfully split his political opponents, the United Party, from top to bottom. On the other hand, this does nothing to detract from the intrinsic force of Dr Malan's views. It only emphasises them.

The essence of Dr Malan's statements has been this. First, in conceding self-government to the Gold Coast, the United Kingdom is going beyond its legitimate powers. The native population of Africa is already more or less in a state of ferment as a result of the world situation and Communist propaganda. By encouraging this unsettled state of mind, without reference to the views of the rest of the Commonwealth, Britain is playing fast and loose with the safety of white South Africa.

Secondly, since the Commonwealth is "a closed group, all free and equal," Britain has no right on its own to promise membership of the Commonwealth to a series of new states. West Africa will be only the first of several more to come, like the British West Indies and territories such as "Indian-dominated East Africa," Uganda and Nyasaland. The Commonwealth is based on only two things, "specific common interest and sufficient homogeneity of cultural and political outlook." What greater solidarity can seriously be expected to exist, for example, "between Australia and the negro state of West Africa than between Australia and the United States?" It is the right of all members to decide who shall and who shall not join the Commonwealth. Thirdly, Dr Malan in both his recent statements deplored the policy which makes it possible for one Commonwealth member to interfere in the internal affairs of another through the United Nations.

Dr Malan has in effect raised two main questions of principle—whether Britain should now be bound to act jointly with the other members of the Commonwealth when deciding matters of colonial policy, and whether Britain should still be regarded as the presiding architect of the Commonwealth. To the former the answer must be No—with qualifications. On the latter, Dr Malan undeniably has a good case.

The final aim of modern British colonial policy—just as in the distant days before the present Dominions were created—is to build each colony into a state that can stand on its own feet. That has been the declared intention for nearly a generation, and there is plenty of evidence that it is being carried out. Whether the policy is a wise one or whether it is being pursued too rapidly does not affect the principle. As Dr Malan admits, the colonial territories "belong to Britain alone"; so long as they remain colonies, at any rate, they are not Commonwealth responsibilities. The final British aim—of granting full self-government—is therefore, and must remain, a matter for Britain alone to decide, whatever the future form of the Commonwealth or the new rules, if any, governing the admission and conduct of its members.

That being said, it is only realistic to admit that it would be very foolish of the United Kingdom to conduct its colonial policy in Africa without any regard at all for the views of the large number of white communities now domiciled in that continent. What in fact should be Britain's function, as the years roll on and more and more of black Africa reaches the boiling point of political emancipation? It is possible to foresee a period, not long hence, when the ferment of native opinion and the pressure of world events will have produced several new self-governing negro states, each in varying degrees of association with the Commonwealth. Even if the United Kingdom were to change its mind about the policy of emancipation and try, at this late date, to reverse it, or even to put the brakes on, it is very doubtful whether it would be possible to do so without the expenditure of very much more repressive effort than the people of Britain would have any stomach for. But, having built up these new states on the basis of a colonial policy devoted—unlike the French or Belgian—to the granting of an untrammelled freedom of choice at an early stage, will Britain be acting in the best interests either of the Commonwealth or of itself or even of the new states, if it unhesitatingly takes their side against the white communities, led by South Africa?

Almost certainly not. The British role ought to be that of a mediator and conciliator, seeing both sides of the case and trying to create—however difficult the task—a united Africa.

If this is so, what effect should it have on British colonial policy now? While there can be no question of climbing down and abandoning any long range objectives, there is certainly much to be said in Africa for making more of an effort to associate the white communities more closely with the year-to-year work of native development. It is unfortunate that the most important of these communities, South Africa, should at present be pursuing in its idea of *apartheid* a line of action which is unacceptable to British public opinion—as well as to many other Europeans in Africa. But the fact remains that the results of British policy are going to have profound effects on the lives of all white men in Africa. It is only fair that, before final decisions are taken, their views should be taken fully into account, wherever they are expressed with good will and without prejudice.

★

On his second point of principle—about the rights of Commonwealth members—Dr Malan has moved in where angels fear to tread. If his words had come from the mouth of an acknowledged elder statesman like General Smuts, they would have been taken differently. As it is, Dr Malan has played the part of an *enfant terrible*, and however well justified his views they have been heard with mixed feelings. It is certainly right and proper that the Commonwealth should guard its membership jealously, and that members should have a say in the election of new colleagues. But Dr Malan spoke as if this principle were being ignored. It is not. The claims of the new Asian members, India, Pakistan and Ceylon, were all in effect considered by the Commonwealth over a considerable period of years, after the old Government of India had risen to a special status in the first world war. Then, when the new India raised the question of becoming a republic, the whole subject was specifically and fully discussed at the Commonwealth Prime Ministers' Conference of April, 1949.

Dr Malan is in practice arguing two things. Since it is wrong, he claims, that the chairman of the club—Britain—should continue to have such excessive ideas of his own importance as to believe that he can promise membership to anyone he pleases, it is time the committee asserted itself. But that is really an argument for the kind of stricter and stronger central Commonwealth organisation which the Australians—with excellent logic—customarily put forward and which the Canadians and others—for various equally good reasons—consistently reject. Secondly, Dr Malan is heading for a state of affairs in which there are virtually two kinds of members in a two-tiered Commonwealth, the fully elected member and the associate who hopes to assume full membership later. Here again there is a good deal to be said for his point of view—so long as the line is drawn on some logical basis of suitability, maturity and perhaps size. Southern Rhodesia, for instance, has long been waiting for complete dominion status—being partly held up, incidentally, by British reservations about the handing over of full control of native policy. What would be fatal to future relations

between the white and other races in the Commonwealth would be for the line to be drawn on grounds of colour alone. Yet that, of course, is precisely what Dr Malan indicated was in his mind when he raised the question of Commonwealth membership at all in connection with the self-government of the Gold Coast.

The fact of the matter is that no one can put the clock back. In the Commonwealth, Britain no longer has the right to dictate a policy, even as regards membership. At the same time, there is an increasingly strong case for making the rules of the club more precise if they are to fit the rapidly shifting pattern of the modern world. And that is up to the Commonwealth as a whole—to discuss again, perhaps at the next Commonwealth Conference. In the field of colonial policy, the trend

of the times is toward a speeding up in the journey to national independence and freedom of choice. Not to acknowledge that is to make it impossible to fight Communism in Africa or indeed to ensure the proper development of British colonial territories without bloodshed and the disruption of normal life. The South Africans—and others—must face these facts. They possibly exaggerate the dangers, and in any case Britain must take account of their fears. But, just as South Africa's internal *apartheid* in its present crude form looks a little like running round a problem that will some day have to be met face to face, so Dr Malan in his attempt to stop what is now on foot through the length and breadth of Africa looks suspiciously like Canute trying to hold back the waves of the sea.

How Strong are the Communists?

THE strength of Communism in Britain tends to be measured by the number of spectacular strikes the Communists succeed in instigating and by the propaganda points they succeed in scoring. A dock strike in Birkenhead, a campaign to ban the atom bomb, a broadsheet on Korea, a rowdy meeting in Trafalgar Square, a skilful misrepresentation of Anglo-American relations—all these give rise to the belief, not so much that it needs only a signal from Moscow for the Red Dawn to break, but that a shockingly large number of Communists are lurking in dark corners and influencing events.

The secret or avowed Communists in high places, however, are not a very serious threat to internal security. A Dr Fuchs may, as a spy, do some damage to the national interest, but it does not really matter tuppence if a gaggle of scientists or a flock of red deans openly proclaim their allegiance to Communism—so long as industrial workers remain unmoved. "The dictatorship of the proletariat" is not a meaningless phrase. The best measure of the strength of Communism in any western country, therefore, is the extent of workers' support for Communist policies, not the much-publicised soul searchings of intellectuals. It is for this obvious reason that, while every propaganda advantage is taken of such intellectuals, the real work of Communists is done in the factory canteen and the dockside public house.

Enough is now known of Communist methods to need no more than a brief outline here. Any doubts about previous reports of Communist tactics have been dispelled by Mr Hyde, the former news editor of the *Daily Worker*, in his book "I Believed," and by a former secretary-treasurer of the Canadian Seamen's Union, in an article published in several trade union journals. Both men make it quite clear that the main effort of the Communists is directed towards securing control of the trade unions. By pressure-group tactics, and particularly by taking advantage of the apathy of union members in times of full employment and high wages, they seek to dominate first the local branches and then, as opportunity provides, the national executives of unions. Artificial strikes are engendered by Communist shop-stewards in order to discredit the union concerned, and all Communists seize every opening for putting forward political views to their workmates or for exploiting grievances. In those unions which employ some Com-

munist as officials but which are not properly under Communist control, the Communist officials will publicly put forward the union policy, but privately recommend the Communist "line." On the national front, the *Daily Worker* pours out a continuous stream of skilful propaganda, taking its lead from monitored Moscow broadcasts circulated daily by the Soviet embassy and from the Cominform journal—*For a Lasting Peace, For a People's Democracy*—which is published fortnightly in Bucharest, and also exploiting any local incident which will serve Communist interests.

It is extremely difficult to measure the effect of this activity on industrial workers. Figures give only a general guide. The card-membership of the Communist Party is said to number about 40,000 people. In the last general election, the Communists lost the two seats they previously held and they polled a bare 92,000 votes—2 per cent—out of about 4,600,000 votes cast in the 100 constituencies where Communist candidates stood. In 1950, only one per cent of a total working population of 22 million were involved in strikes or stoppages—and by no means all disputes were inspired or even influenced by the Communists. On the other hand, it has to be remembered that many of the constituencies contested by Communists last year seemed to be chosen because they were marginal seats, where the drawing-off of some Left-wing votes would do most harm to Labour, rather than because they were the places where the Communists would make the best showing at the polls. Again, although a purely Communist resolution regretting the split of the TUC from the Communist-led World Federation of Trade Unions was rejected at the Bridlington congress in 1949, it nevertheless received more than 1,000,000 votes out of a possible 7,000,000. There is also little doubt that the Communist-sponsored "Peace Pledge" was signed by several million people, but it is impossible to say what proportion knew the nature of, and fully supported, the document they signed.

Even if the statistics were not conflicting it would be rash to draw any firm conclusion from them alone. Support for Communism is not always overt. It is comforting, therefore, to find the balance of the statistical evidence confirmed in other ways. Mr Deakin and his colleagues in the Transport and General Workers' Union, for instance, have shown that as soon as they countered the Communists with equally energetic methods in the local branches of the union, very few

indeed of its 1,250,000 members continued to support the Communists. It is also worth recalling that the recent railway dispute began as far back as last August, and, in spite of several breakdowns in negotiations, there was little hint of strike action until the report of the Court of Inquiry was published in February. In fact, with the principal exception of the miners, who last year accounted for one-third of the total time lost in disputes, few workers are as prone to strike as is generally supposed.

★

There is also a traditional dislike among trade unionists for mixing politics and business—business being wages and working conditions. That is not to say that they do not take part in political activities, but that they refuse to use the strike weapon in political matters. It is extremely unlikely, for example, that even if the Communists were much more influential than they appear to be, they could stir up any widespread strikes with the conscious purpose of stopping defence preparations or of securing the repeal of the Conditions of Employment and National Arbitration Order (No. 1305), unhappy as most trade unionists are about the first and much as they would like to see the second cancelled. The Communist, therefore, has an uphill task in stirring up militant political activity; he is obliged to produce a genuine, or near-genuine, grievance over wages or working conditions before he can persuade any substantial majority of workers to support him. Even then, he runs the risk of finding his grievance taken over by the official union and settled by the normal conciliation machinery.

There is still, however, a profound ignorance among most workers of the nature of a Communist dictatorship. There is also a sinister line of thought, expressed from time to time in letters to the editors of trade union journals, that even if the Communists—or Russians—ruled this country, the workers at least would have nothing to fear; their possessions and their wages would remain intact and it would be the *rentiers*, the bourgeois middle classes, who would suffer—and a good thing, too! Why then, the arguments run, should the workers tolerate rearmament which is increasing the cost of living?

It is on the questions of peace and the rising cost of living that Communist policies are receiving most support from non-Communists. Many workers steadfastly refuse to believe Ministers' statements about Russian activities. A few trade union delegations which have been on conducted tours of Russia during the past eighteen months have returned with stories denying military activity on the other side of the iron curtain and praising to the skies the efforts of Soviet workers in civilian occupations. It is regrettable but true that many British workers put more faith in these stories than in any accounts issued from Whitehall or in the national press.

There are other strings to the Communist bow. As a matter of official policy, most trade unions have modified the old claims for a share in the management of industry to demands for joint consultation, but the drive towards joint control still persists, particularly in the nationalised industries. It is a short step from joint control to complete workers' control, and the Com-

munist have energetically promoted this movement. They have also strongly supported every attempt to establish a closed shop, which again has found favour with a large number of non-Communist workers who feel that a closed shop policy immeasurably strengthens their hands in wage negotiations—as indeed it does. Finally, the Communists have made the most of the widespread feeling that dividends are wicked and that shareholders are little better than usurers; they strongly support demands for the abolition of interest payments to holders of compensation stocks for the nationalised industries, which are thought to be losing money chiefly because of these payments. Few union leaders support this view—much of the incomes of unions and of the co-operative movement is derived from successful investments—but it is proving difficult to convince the rank and file of the fallacy of such arguments.

It may be that the real strength of Communism in Britain can easily be underestimated. But undoubtedly its active influence is confined to a small minority of workers, and in the past eighteen months it has decreased and is decreasing. It should, however, be realised that this is so in part just because non-Communist unions are taking over policies and principles originally sponsored by the Communists. Some of these policies are reasonable enough and fit in with the traditions of the trade union movement, but others could be almost as disastrous for the country as Communist control of the unions. In their energetic and so far successful battle against the Communists, union leaders should make sure that the loaded guns they have captured are not still aimed at their fellows.

The English Table

Modern Domestic Cookery. By a Lady. With Illustrative Woodcuts. *John Murray, Albemarle St.*

What people write a great deal about, they perhaps understand but little. English cookery is avowedly far behind that of most of the nations of Europe, though a great number of books have been written on the subject. The utility of such works, if well done, and the great success of one or two, have called a multitude into existence, many of them worthless. None of them has surpassed, either for goodness or sale, the much-renowned "Domestic Cookery" of Mrs. Rundell. Time, however, has effected some fissures in that, as in the institutions of Europe. The progress of society requires changes to be made in sauces as well as laws and constitutions, and requires new receipts and new editions of cookery books as well as new enactments and further reforms. Mr Murray is at least quite as ready as any legislature to comply with the demand, and has taken all possible pains to satisfy the public. Many new and original receipts are added; economy is studied; every part of the book has been thoroughly revised, and adapted to the present condition of cookery. We are happy to see the article "Soups" especially attended to, and the means pointed out by which much wholesome nourishment may be obtained at a cheap rate from matters that are often thrown away. Other things in which improvement was required are not neglected; and, as a complete collection of useful directions, clothed in perspicuous language, for the practice of an art that more than any other serves to keep the body in health and the family in harmony, the "Modern Cookery" can scarcely be surpassed.

NOTES OF THE WEEK

Talking in Paris

There is a mood of cautious optimism in Paris about the progress being made at the meeting of the Four Power deputies. Mr Gromyko's acceptance on Wednesday of two secondary amendments to the western draft for the agenda of the Council of Foreign Ministers and his own submission of two changes in the Soviet draft, at least show that the Russians are prepared to yield ground in their manœuvres to get their way on the one item to which they attach cardinal importance—the discussion of German "demilitarisation." Under this heading they count on blocking any German participation in the Atlantic Pact and on forcing the Western Powers on to the defensive in the propaganda battle for Germany.

This continued wrangling in Paris, however, has now gone on long enough to warn the western capitals that they must not lose sight of their basic objectives. A point may be scored here or lost there, perhaps even with singularly unfortunate results in the field of propaganda, where the Russians have again shown themselves superior to the Western Powers. But what really matters is the future of civilisation, the supreme issue of peace or war. It is no use conceding points at the deputies' table which could only get the Western Powers into a Council of Foreign Ministers on the wrong foot. Perhaps the most essential of these is to refuse to admit German disarmament to the agenda as an item by itself, without any mention of German unity or of the disarmament of the ex-enemy satellites. It would be better to have no agreement at all between the deputies than a bad agreement.

On the other hand, there is great value in keeping on talking, as the Russians also well know. So long as the talking goes on, the channel of direct contact is at least being kept open, and there is at least the satisfaction of knowing that nothing is being left undone in the attempt to reach a settlement by negotiation rather than by open war. Nothing is being held up in the progress of western rearmament by the deputies' meeting. It would be folly to give up the deputies' talks through sheer impatience. Indeed, one important result of negotiating at all is that, having done so at exhaustive length, neither side can have much excuse for miscalculating the resolution of the other. There is no harm, from the western point of view, in accepting this challenge to a talking marathon—always provided two vital points are kept in mind. First, the unity of the three western powers must at all costs be preserved—some wavering is already apparent in the Quai d'Orsay. And second, means must be found to secure that the Russians do not get all the propaganda advantages out of the turns and twists of the negotiations.

* * *

Trouble Brewing in Persia

All of a sudden, the long simmering pot in Persia has come to the boil. After the assassination of the Prime Minister, first a Committee of the Majlis and then the whole Majlis itself, by a unanimous vote, has demanded that the Anglo-Iranian Oil Company should be nationalised and, although the word expropriation has not been used, there is no doubt that this is what is intended. In fact, the Petroleum Committee has requested the Majlis to extend its life for two months in order that it may be able to study various methods for taking over the company. It has requested its representatives in Washington and London to obtain details of the methods used in Mexico and Venezuela.

The new Prime Minister, Hussein Ala, is known to support the Western Powers and to have a thorough understanding of the situation which has now developed between the Com-

pany and the Persian Government. He doubtless hopes that nationalist sentiments will be less violent after the nation has exhausted itself by four or five days of celebration on the occasion of the Moslem New Year on March 21st. But this may be a vain hope; both parliament and public opinion (in the towns) are already too deeply stirred by the unholy alliance of extreme right nationalist and religious groups working, it would seem, in co-operation with the illegal Tudeh (Communist) Party.

The Majlis could be dissolved and Hussein Ala could rule, for a short period, by decree were it not absolutely essential for Parliament to pass the Government's new Finance Bill. Persia faces an acute currency crisis brought on by excessive Government spending and a recent flight of notes into provincial stockings. This situation must be faced because the National Bank, if the new Bill were not passed, might be unable to meet its obligations at the end of this month when New Year bonuses fall due.

*

Thus the Prime Minister, who was in any case most reluctant to take office, must retain the Majlis and attempt to keep its members in good humour. Hussein Ala is therefore in no position to consider any new proposition which the Anglo-Iranian Oil Company might wish to make—although a "fifty-fifty agreement" on the lines of the one recently signed by Arabian-American Oil Company with King Ibn Saud could only be beneficial to the Persian Government, who, if they attempted to operate on their own, would have to face not only the highly technical problems of oil production but the even more difficult ones of marketing and transport. The Persians have neither road nor rail facilities in their mountainous country to be able to transport their petroleum for sale in Russia or Pakistan, nor do they possess tankers in which they could move the oil to the west.

But Persians are capable of cutting off their noses to spite their faces in a way westerners, who naturally cannot understand this trait, would consider to be sheer madness. They might well make an anti-British gesture which would cause the loss of their enormous revenue from the oil company and would leave a painful vacuum in the petroleum industry. This would be bad enough, in view of the large part that Persian oil plays in the vital supplies of the free world. But any successful offensive of expropriation in Persia would infallibly and immediately be imitated in the adjoining countries of the Persian Gulf, whose rapidly developing resources are the chief hope of the world oil industry. In short, the problem of dealing with Persia is one of the utmost gravity and difficulty and there should be no room for the rather silly Anglo-American divergences of policy that have been exhibited in recent years. There is some talk of calling a conference of American and British economic advisers in the immediate future to discuss the situation in Persia and, more important, to advise upon a joint policy. Strong and united action now by the Western Powers is their only hope of preventing the petroleum resources of Persia from falling into reckless and irresponsible hands.

* * *

Plotting in Pakistan

The arrest at the end of last week of the ringleaders in a plot to seize power in Pakistan has undoubtedly strengthened the hand of Mr Liaquat Ali Khan, the Prime Minister, on the eve of the important provincial elections in the Punjab. These are the first elections ever to take place in Pakistan. They, therefore, constitute the first public

trial of strength for the Muslim League—which was responsible for creating Pakistan and has since run the government, pending the drawing up of a constitution and the holding of elections on a national scale. The Punjab contains well over half the population of western Pakistan and is the centre of its economic life. It is here at Lahore and in the rest of the Punjab that Mr Liaquat Ali Khan has spent most of his time since returning from the Commonwealth conference, that the plot was being hatched, that contact is closest with Kashmir—the problem which dominates Pakistani life—and that the nation's relatively few Communists are at their most active.

Those who have so far been arrested for plotting against the government in Karachi include Major-General Akbar Khan, the army chief of staff; Brigadier Latif Khan, in command at Quetta; Mr Ahmed Faiz, editor of the *Pakistan Times*, and Air Commodore M. K. Janjua, the senior Pakistani air force officer. Their precise motives are not clear. But it is plain that a *coup d'état* of the kind that was threatening—and Mr Liaquat Ali Khan is not the man to have struck against it unless the evidence was certain—was just what Karachi has feared for some time if it gave way to India on the Kashmir issue. In the army, in fact, many of whose senior officers have served in Kashmir, there has been a mounting sense of irritation at Karachi's inability to wring a satisfactory settlement out of Delhi. In addition, as the quality of the army has gradually been built up, and now as Pakistanis have replaced British officers in the higher posts, there has been a growing and dangerous tendency for the military to look down on the civil power.

Here, then, were the obvious makings of trouble. Communist agents and fellow-travellers unquestionably did what they could to foment it. The *Pakistan Times* has frequently adopted an extreme left-wing approach, sometimes even pushing the Communist party line. The presence of the paper's editor among the ringleaders and the favourable comment which the world's Communist press has now made about this attempted coup are a warning that the Communists will use anyone who may serve, however unintentionally, as a tool in their hands. Britain's role, and indeed that of the Western Powers, must certainly be to continue close relations and friendly sympathy with Mr Liaquat Ali Khan's government in Karachi. Nothing could serve Pakistan worse at the moment than that its government should be overthrown by force.

* * *

Party Manners

The Speaker of the House of Commons has had a highly unenviable task during the past ten days. Not only has he had to intervene repeatedly in scenes of uproar that recalled some of the violent days when the Irish members were still at Westminster, but he has been forced to pronounce a ruling on three separate cases of privilege. In one of these, dealing with comments made during a broadcast last week, he ruled that a *prima facie* case of privilege exists, and the matter has accordingly been referred to the Committee of Privileges. In another, in which complaint was made of remarks by Mr Robert Boothby that the Tories would "harry the life out of the Government," the Speaker ruled that no *prima facie* case was established, and the House let the matter drop.

The third case was more complex. It arose from the action of Mr Rodgers, the Conservative member for Sevenoaks, who sent on a letter from one of his constituents, a vicar, to the Bishop of Rochester without telling the constituent. The vicar's letter attacked rearmament and criticised the attitude of church leaders in vehement terms. Most members of Parliament would disagree strongly both with the sentiments expressed by the vicar and his manner of putting them forward. But a great many members undoubtedly felt that by sending the letter to the bishop Mr Rodgers had broken the confidential relationship which should exist between members and constituents. The Speaker decided that this could not be

regarded as a *prima facie* breach of privilege, but Mr Sydney Silverman, the Labour Member who raised the issue, has pressed for a vote of the House, and tabled a motion calling for the matter to be referred to the Committee of Privileges.

These delicate questions have had to be dealt with in an atmosphere of weariness and irritation resulting from the Tory tactics expounded by Mr Boothby, of trying to wear out the Government by making them "sit up day and night and grind away until they get absolutely hysterical." This intensification of the already intense Tory pressure against the Government reflects the hopes raised by recent public opinion polls. The Conservatives are, of course, fully entitled to use every Parliamentary dodge and method open to them to get the Government out of office and precipitate an election. But there is a line to be drawn somewhere, and to try to wear out Ministers by keeping them up until one or two in the morning must surely fall on the wrong side of the line if (as has happened) the prayer they are required to answer is then withdrawn at the last minute.

The new Leader of the House, Mr Chuter Ede, who has taken over in the midst of this storm, has appealed to his followers not to be rattled by the Tory attack. It is, indeed, to be hoped that the Easter recess will bring some lowering—at least until the inevitable Budget storm breaks—of the temperature of the House. There is a limit to the amount of political wrangling which any country, even this country, can stand in so critical a year as 1951.

* * *

The Liberals' Strategy

The Council of the Liberal party passed last Saturday a resolution on electoral strategy, defining the proper attitude of Liberals towards local constituency agreements with other parties. Its importance lies not in its positive recommendations—which are vague—but in its negative implication. The fact that such a definition has been attempted at this stage must be taken to mean that most, if not all, of the Liberal leaders have ruled out the possibility of an agreement with the Conservatives. What some had hoped for was, of course, an informal but general understanding that would secure straight fights, on terms that would not compromise the party's independence, for a dozen or a score of Liberal candidates.

The effect of the resolution is to emphasise the Liberals' innocence of any agreement or understanding with any other party. No candidate should place himself under any obligation, express or implicit, to vote if elected otherwise than on Liberal principles, and the party must remain entirely free to advocate its distinctive policy and programme. Views on what are Liberal principles and policy are varied enough for this clause to be interpreted according to taste. The definite restriction laid down by the council is that where a straight fight is arranged "there should not be any joint manifestoes or arrangements whereby Liberals appear on the platforms of other parties."

This is to demand of the prospective partner a self-effacement that few Conservative associations are likely to undertake. The Liberals' firmness does not mean that they now scorn constituency pacts. But if any such pacts must be made, in fact as well as in form, purely at the local level, some of them may easily be of a kind acutely embarrassing to the party nationally. In spite of Mr Churchill's friendly interest, considerable difficulties have surrounded the attempt to give Lady Violet Bonham-Carter a straight fight against Labour in Colne Valley, and there are lesser cases where the practical effect of local negotiations could at most be to give a little more respectability to the label "Liberal-Conservative"—and to give the Liberal party nothing at all in return. The truth is that, whatever might have been possible six or nine months ago if the leaders of the Liberal party had been of one mind, the Conservatives are now

confident enough of their ability to win an election unaided to have no interest in helping more than an isolated Liberal or two into Parliament on his or her own terms. Mr Attlee might be able to change that attitude by staying in power long enough for the Gallup Poll figures to move back in Labour's favour; the possibility, if remote, seems much more likely than that the Liberals will—by agreeing on an immediate policy firm enough to command some public attention—save themselves.

* * *

Land and Water

There is no doubt that the quality of the defence debates is beginning to improve, for the obvious reason that the rearmament programme provides something concrete and important to talk about. In the debates on the Army Estimates last Thursday and the Navy Estimates on Tuesday, the sense of anxiety and frustration so noticeable in the debate on the Air Estimates earlier last week was less evident in the House of Commons. The situation in the Army and in the Royal Navy is far less disquieting than the situation in the RAF. The technical development of ships and ground weapons has not proceeded at such a fast pace as to render useless all the stock of equipment produced during or after the war, and both services could face an emergency during the next two years with greater equanimity than could the RAF.

Mr Strachey had very little that was new to announce. On the manpower side, a sensible—and long overdue—decision has been taken to increase the permitted length of service for other ranks to fifty-five. He also made public the fact that a new tank—the successor to the Centurion—is in course of development, and a reduction of 20 per cent in the vehicles of a division is being carried through. The policies are probably irreconcilable since the use of new and heavier armoured vehicles with heavier guns inescapably increases the amount of transport that has to be used to carry petrol and ammunition. Mr Eden urged with considerable force the necessity to create a cadre of commanders whereby the Home Guard could be quickly mobilised, a step about which the Government seem unnecessarily hesitant.

Since it is impossible to conceal the existence of new ships from the enemy, the Navy is always less perturbed by questions of security and Mr Callaghan was able to give much more information than either of his colleagues. Under the new three-year programme, six new aircraft carriers, eight new destroyers, twenty-four new frigates, and about 200 mine-sweepers and small craft will be laid down. They will not of course be completed in this time, nor have all of them been ordered. The ability of the Navy to deal with an emergency—particularly of submarine warfare—must for the next two or three years be governed by the existing construction programme which is on nothing like the same scale.

One point has emerged very clearly from the recent defence debates—the extent to which all three service ministers and even Mr Shinwell, the Minister of Defence, are in the hands of their military advisers. Defence policy is quite clearly decided by the services themselves and handed to the politician to present to the public. The rôle which the ministers are playing is not to evolve policy but to trim it—as on the duration of the Class Z training period—where it is politically unacceptable. The danger of this was very clearly exposed in a most able speech by Mr Paget, the Labour member for Northampton, who pointed out how easy it is for a service minister to be lulled into believing that any criticism or policy which is not devised by his own staff must be wrong. It is peculiarly difficult for a civilian politician to impose his views upon a service department, but the great advances in military organisation have always stemmed from the energy and self-confidence of a Haldane or a Churchill; they have rarely come from the general staffs.

The German Parliament Asserts Itself

An impressive move was made by the Federal German Parliament last week to assert its right to take a full part in decisions on the future of the country. All parties, except the Communists and the irresponsible Reconstruction Union, approved a note to the four occupying powers which, in addition to laying down terms for German unity, demanded that they should take no relevant decision without German consultation and agreement.

By addressing itself directly to the occupying powers, the Federal Parliament has effectively snubbed the leaders of the "People's Chamber" in the Soviet Zone, who had appealed over Dr Adenauer's head for all-German talks on the establishment of a nominated Constituent Assembly. The appeal of national unity is, indeed, recognised—the resolution pledges the parliament to work with all the powers it commands for the reunion of the whole country. But it is made clear that the Federal Parliament reserves the initiative to itself. And the four essential conditions laid down for uniting the Soviet Zone and the Western Republic are those that Moscow cannot accept: free, equal, secret and direct elections; effective protection for all parties and persons, involving the effective introduction of democratic freedoms into the Soviet Zone for a period before the elections; establishment of the parliament as the sole authority for forming a constitution and an independent government; and safeguards against arbitrary interference with the government's powers. In his speech, Dr Adenauer made it quite clear what the Soviet occupation authorities would have to do before their overtures would be trusted by Western Germany. They would have to release all German political prisoners, return those deported to Russia, annul the so-called "Law for the protection of peace" and dissolve the *Bereitschaften*.

That the parliament of Western Germany should be standing up to Soviet propaganda so clearly and boldly (for there are personal risks involved) is very satisfactory to the Americans, the British and the French. But any temptation to regard it as a vote of confidence in themselves should be removed by the speech of Dr Schumacher, the leader of the Socialists. He accused the western powers of having a confused, vacillating policy towards Germans, of treating them as mere material to be shaped at will, and of leaving the east to adopt the slogan first of "unity" and now of "peace." The latest act of the western powers—the revision of the Occupation Statute—was just another pettifoggery, belated step which failed to rouse the moral forces of Germany. Every word which Dr Schumacher said was true; but there is regrettably little to indicate that any of them will be heeded in the near future.

De Gasperi in London

Signor De Gasperi, the Italian Prime Minister, and Count Sforza, his Foreign Minister, have been welcome visitors in London this week. Their trip has passed off, as Signor De Gasperi put it, in "the best possible atmosphere." The main feature of the visit has been that it should have taken place at all. This is the first time that the head of an Italian government has paid a formal visit to the British Government for over a quarter of a century, and the occasion certainly marks a new high-water mark in Anglo-Italian cordiality—which has sometimes been at a rather low ebb during the last three years—as well as the gratifying re-emergence of Italy as a leading democratic power of Western Europe. Following his personal meeting with the French Prime Minister at Santa Margherita a month ago, Signor De Gasperi's present conversations with Mr Attlee and the new Foreign Secretary have now given him a very complete picture of the point of view of Paris and London on all the leading international issues. This is valuable, among other

that's all you need
to operate this machine

Dictaphone TIME-MASTER is the simplest dictating machine

Dictating machines were introduced to simplify office dictation. But if they are to help you crystallize that sudden idea or write that difficult letter, they must be *simple* to operate themselves.

Easy to operate. The Time-Master is essentially simple. It is by far the best-looking machine and gives the clearest dictation... Yes, and it is the easiest to work with. You just pop in a Memobelt, flick a switch, and you're all set for 15 minutes perfect recording! The same control automatically backspaces and plays back your last few words so that you can instantly find your place or pick up the sense after an interruption.

The marvel of the Memobelt. Time-Master records on Memobelts, small plastic belts that give perfect recording quality. They retain the advantages of Dictaphone cylindrical recording—uniform speed and measured backspacing. Pliable and expendable, Memobelts may be filed flat or posted in a standard envelope.

Write for TIME-MASTER literature to Dictaphone Co., Ltd.

reasons, in that it will enable the present Italian Government to feel and act as a full partner in the Atlantic Pact—a matter about which there have hitherto been some grounds for disappointment in Italy.

Topics discussed in London have included the general Communist threat to Europe, the present talks in Paris between the deputies of the Four Powers, the progress being made with the North Atlantic Treaty Organisation, and—raised by Italy—the position of Italians in the former colonies, together with the future of Trieste. This latter question once more became a burning international issue after the Anglo-Italian talks were arranged—Signor De Gasperi was the object of a hostile demonstration in connection with Trieste just before he left Rome. The important thing, however, is not on any account to allow the problem of Trieste to hold up the rapprochement between Yugoslavia and Italy on the one hand and the rest of the western powers on the other, just because the Russians have chosen to raise it for that very purpose at the meetings of the deputies. Moscow wants above all to retain its position in Austria by stalling on an Austrian peace treaty, so that its juridical excuses for keeping Soviet forces in Hungary and Rumania can be maintained. If this object can be promoted even indirectly by switching western attention to Trieste and bargaining over the inability to agree on a final settlement for that territory, then the anti-Cominform powers will simply be playing into Russian hands. It is at present essential that any practical change in the position of Trieste be made only as a result of bilateral agreement between Italy and Yugoslavia. And if they cannot agree, then the present regime should continue.

* * *

The Yugoslav White Book

The Yugoslav Communists have carried over from their old Comintern and Cominform days into their new “Titoist” era an unflinching sense of the supreme importance of good publicity under the political conditions of the modern world. Admiration is certainly due for the consummate skill with which they have taken a leaf out of the Russian book, directing their case both to the world of the comrades and to the western democracies. Ideologically, the Yugoslavs have not been content to defend themselves against the bombardment of Cominform accusations of betrayal of the Communist cause; they have boldly tried to wrest the propaganda initiative from Soviet hands and have proclaimed themselves the only true exponents of Marxism-Leninism, in contrast to the “degeneration” of the Russian Revolution under the leadership of Stalin. These offensive tactics have certainly done more to disturb international Communist loyalties than any other form of Communist opposition to Stalin since 1936. But western democrats do not greatly care who is entitled to inherit the mantle of Lenin. They are much more interested in the question of defence and aggression in Europe. For their information the Yugoslav Government has now published a White Book of 481 pages, giving up-to-date details of all the Soviet bloc's modes of pressure and menace against Yugoslavia, including organised border incidents and mounting military preparations in the neighbouring satellite countries. Yugoslavia evidently believes in the wisdom of putting everything into the record well in advance of the anticipated crisis instead of afterwards, and has not been deterred from this challenging publicity by any fear of adding extra provocation to the wrath of the enemy. Copies of the White Book have been given to all newspaper correspondents in Belgrade, and are to be transmitted to the diplomatic missions of non-Cominform states, as well as (unofficially) to the Secretariat of the United Nations.

The Yugoslavs allege that the number of frontier clashes is continually increasing and that they constitute a “permanent little war.” It is claimed that Hungary, Rumania

and Bulgaria “are undertaking far-reaching and serious military measures which are not customary on the borders of countries in peacetime”: that their armies “surpass by far today the numbers set by the peace treaties” and are equipped with armaments prohibited by the peace treaties: that their troops are indoctrinated with intensive anti-Yugoslav propaganda: and that they have Soviet officers as “advisers on all levels of command.” In view of the fact that these military preparations by Hungary, Rumania and Bulgaria are not merely threatening the peace of Europe, but are definite violations of treaties not yet five years old, it seems incomprehensible that the western powers in the conflict over the agenda for the Foreign Ministers' conference (which is essentially a struggle for propaganda position) should not at the outset have matched Russia's specific item on German rearmament with another on the rearmament of the former German satellites. British and American diplomats ought to take some time off to study Yugoslav technique in order to learn how to co-ordinate publicity with diplomacy.

Durham's Closed Shop

The debate in the House of Commons last Tuesday on the decision of the Durham County Council to enforce a closed-shop policy for its employees was inconclusive. The Conservative motion was defeated by fifteen votes, but the Labour amendment was an equivocal statement which neither denied nor affirmed the right of the council to insist on such a policy. The issue now seems to be confined to an almost private quarrel between the local branch of the National Union of Teachers and the council. The local issue was well argued, but the principle at stake was of sufficient importance to have merited a much wider discussion in the House.

The arguments which are put forward by supporters of a closed-shop policy are thoroughly unsound. That all those who benefit from a union's activities should subscribe to the funds of that union is an absurd doctrine. One might as well say that all seamen should pay a levy to the Royal National Lifeboat Institution, or that all engineering and chemical workers should contribute towards the Royal Society. Both institutions have benefited non-members quite as much as the unions. The other main argument put forward is that a union cannot be fully effective unless it has the support of—and control over—all the workers for whom it is negotiating. This is the crux of the controversy. No one denies that a closed shop increases the power of the union: the case against it is that absolute power corrupts absolutely. If an employer could not employ a non-union worker, the power of a union over its members would indeed be absolute. Any worker could be deprived permanently of his livelihood by a union official who simply withdrew his union card. It might be very hard for any trade unionist to hold, and act upon, a minority opinion. The possibilities of dictatorship by an *imperium in imperio* would be intolerable. Far from supporting the closed shop, the Government should pass legislation enabling any person who is deprived of employment on account of non-membership—or membership—of a trade union to obtain legal redress against the union or employer concerned.

Their Master's Voice

The most doughty supporter of nationalisation could hardly claim that the elaborate apparatus for consumers' comment on what the boards do and leave undone has been much of a success. Many would call it a safety valve to let out hot air rather than a point at which pressure can be applied on the public boards. Most of the consumers' consultative councils have quickly learned to behave properly

—that is, to act as apologists and amateur public relations appendages for the boards, more at home in explaining why consumers cannot have what they want than in representing the consumer as master and regarding the boards as servants.

These animals would indeed be troublesome if they were to defend themselves. Is the Central Transport Consultative Committee of that mind? Its report for 1950 suggests a certain independence of spirit by putting on record at the outset the observations of Mr Barnes, the Minister of Transport, about its work.

You observed that the Central Committee, and in fact all the Consultative Committees, were free and independent bodies whose duty was to consider any matters they thought fit affecting the services and facilities provided by the Commission; and that they had not been set up to rubber-stamp actions and decisions of the Commission but to consider problems affecting the users of transport. Sometimes, therefore, the Committee would be critical of the Commission's actions and this was desirable.

These are brave words and they come distinctly close to suggesting that the customer may sometimes be right. At any rate, customers seem to be trying the experiment, for they made seventy-eight representations to the committee last year, including complaints that fares were too high, that trains were dirty, that food and service in refreshment rooms were often bad, and that damage and delay occurred to goods in transit.

Those whose memories stretch back into the vistas of time before 1947 may think that these complaints have a familiar sound. It would not be surprising if among the older railway servants some could be found who remembered criticisms of this kind getting through the well-protected ramparts into the inner keep of railway management, without the compulsive push that only a Consultative Committee can impart. The Committee is determined not to become a yes man, for the Commission or the Minister, but equally should it not avoid the danger of becoming a universal aunt?

Kashmir at the Security Council

The Security Council is still vainly struggling to make some progress in the Kashmir dispute. On February 21st, Britain and America jointly made a fresh proposal. Its provisions were that a new mediator should be appointed in succession to Sir Owen Dixon to try to get both India and Pakistan to agree on a programme of withdrawal of troops—on the basis of Sir Owen's proposals—as a first step to holding a plebiscite: that the two countries should accept arbitration on any points of difference which the mediator could not settle: and that the mediator should report back to the Security Council within three months with such findings and recommendations as he might think fit. This proposal was rejected as “wholly unacceptable” by India on March 1st. In Pakistan, while there has been no outright rejection, the reaction has been that the proposal does not settle anything. Sir Zafrullah Khan, Pakistan's Foreign Minister, has somewhat ambiguously demanded of the Security Council that it appoint “an outstanding personality of high repute” with “full powers” to enforce the present agreement and hold a plebiscite.

The fact of the matter is that India has every interest in doing nothing, while Pakistan must at all costs keep the issue alive if it is to get its way. This imposes an obligation of constant agitation on the part of Pakistani spokesmen, with the perpetual threat that if they do not cause enough international stir they will be subject to violent condemnation at home—with results such as the recently attempted *coup d'état*. This is an explosive situation which the Security Council should try to eliminate, even if it cannot enforce a settlement of the dispute.

There is a possibility that if Sir Benegal Rau, the Indian representative, continues with his present attitude on the

Security Council, the Anglo-American resolution—or something very like it—will be forced through against him. That would at least have the benefit of bringing arbitration a stage nearer and presumably, since India has always opposed this perfectly possible and legitimate way of ending the dispute, it might eventually lead to a general condemnation of Delhi's attitude by the United Nations. It is a tragedy that India, a country which has so recently established not only an international reputation as a conciliator but has helped add to the prestige and lustre of Uno too, should now be placing itself in this dilemma. The free world cannot any longer afford the Kashmir dispute and the Security Council would be shirking its duty not to carry the present debate to its logical conclusion.

Australia's Communists

Mr Menzies, the Australian Prime Minister, has asked the Governor-General for a double dissolution of Parliament, involving both the Senate and the House of Representatives in a general election. The issue on which Mr Menzies has taken the opportunity of appealing to the country—the rejection by the Senate of the Government's Banking Bill—is not the real trouble. In fact, the Labour opposition has done what the government wanted in providing these grounds for holding a general election, which will be fought on the fundamental question of Australia's policy towards its virulent and dangerous Communist Party. Among the critical events leading up to the present political impasse was the High Court's invalidation on March 11th by 6 votes to 1—the Chief Justice—of the recent Communist Party Dissolution Act. This is what has precipitated the immediate crisis—which on Tuesday inspired Mr Menzies to declare his intention of asking the people “where they stand on the crucial issues of Communist conspiracy, of law and order in industry, of public safety, of the preparation of this country to meet as heavy a cloud of danger as free men have looked at for many long months.”

Four questions are in fact wrapped up in the rejection of the Bill to ban the Communists. There is the issue of political liberty itself—the Labour opposition is bitterly opposed to the policy of trying to control people's thoughts in a democracy, whatever the motive in doing so. There is the weakness of the federal power in relation to that of the states under the present constitution; a case can certainly be made out for saying that the constitution is out of step with Australia's modern needs. There is the sense of political frustration which the government feels—not without reason—in its desire to take a more active hand in directing national life at this juncture in the world crisis. And there is the constitutional question of the government's power to decide when Australia is virtually at war and when it is not. The High Court's ruling showed that, while banning the Communists might be legitimate in wartime, it was not in peace. For want of evidence—which the government declined to give on security grounds—the members of the High Court felt bound to conclude that Australia is not technically in a state of war emergency.

Mr Menzies speaks as the statesman who, conscious of his great responsibilities, has to face the world as it is to-day. The High Court is the voice of the law. Under the impact of the world-wide Communist offensive these two often no longer tally. It is deeply regrettable that any Commonwealth country should feel bound to restrict the political liberties of its subjects even in the genuine name of national freedom and survival. But the threat to normal life is now too great to take risks, and, if the Australian Government sincerely feels that it must impose a political ban on one section of its citizens, by far the best course is to seek the country's verdict. The vital thing now is to give the Australian electorate as full an account as possible of all the facts and all the dangers.

Casualties of the Mines

The Medical Research Council's Memorandum on the social effects of pneumoconiosis in South Wales is a sharp reminder that the casualties of coal-mining are far more numerous than the victims of sudden catastrophe; the undramatic development of the disease popularly known as "miner's asthma" is just as serious an occupational risk. In South Wales, between 1931 and 1947, 18,000 cases were certified, more than six times as many as in all the other coalfields of Great Britain. Within the area's general unemployment problem, the pneumoconiotic ex-miner still presents a special difficulty. He most commonly has to leave the mines at about 50 years of age, when he is unlikely to learn a new skilled trade; while the typical breathlessness on exertion prevents him from undertaking a "pick and shovel" job. In the field of light unskilled work, his most suitable employment, he must compete with the cheaper labour of women and juveniles.

Although measures to suppress dust in the mines should, in future, greatly reduce the number of cases of dust diseases of all kinds, the legacy of the high incidence of the past is still a problem of some magnitude. In June, 1950, nearly 4,000 of the pneumoconiotics in Wales registered as disabled were unemployed. This figure—about 11 per cent of the total unemployed—excludes the large number of sufferers not registered as disabled as well as those recognised as needing employment under special conditions. The situation has been somewhat eased by the Act of 1948, which allows miners, under certain conditions, to remain in the industry while receiving disability benefit; the rate of benefit no longer depends on the difference between earnings before and after certification, so that employers need not be afraid of taking on men with no incentive to increase their earnings by working overtime or by high output on piecework. The experience of some new factories in South Wales seems, however, to show that more than reduced rent is necessary to induce employers to accept both a disadvantageous site and a rigid requirement about the proportion of disabled men they must employ; success in absorbing these victims of the mines remains dependent on the good will of the employer and on the victims' willingness to move to areas where suitable jobs exist.

* * *

New Lease of Life for OEEC

Far from withering away when Marshall aid for Europe formally ends next June, the Organisation for European Economic Co-operation (OEEC) is apparently being fitted for a wider role in the defence effort of the non-Communist world. This evolution was foreshadowed by several recent events and was reflected again in the two reports on raw materials and financial stability considered by the Ministerial Council of OEEC when it met last week-end.

Among the recommendations made in the finance report was one calling on all member countries to "take forthwith . . . such fiscal, credit and other measures as may be necessary to keep [civilian] demand within the limits set by available resources." Looking beyond their own frontiers, the authors requested that the United States and Canada also review their internal financial position and, along with the Marshall countries, provide full details to OEEC.

This may seem presumptuous in an organisation which was due for burial in three months' time and can only mean that there is increasing acceptance of the idea that OEEC should continue in some form as a co-ordinating and advisory body for the whole of the Atlantic community. Already a 12-man group made up of OEEC staff (excluding the neutrals and Germany) is at work advising the North Atlantic Treaty Organisation (NATO) how the rearmament burden

can be shared among the West European nations. It is intended that this group shall be amalgamated with the present finance committee of NATO to form a new body called the Finance and Economic Board (FEB), which will act as the economic twin of the Defence Production Board, and have the power to advise on the allocation of military aid.

Where the question of raw materials is concerned, the part to be played by OEEC is not yet entirely clear. Simultaneously with the appearance of the OEEC report, it was announced that the organisation would be represented on the central steering committee of the International Raw Materials Conference in Washington; hitherto this has been a tripartite (Anglo-French-American) body. However, the announcement gave no indication about the precise responsibilities of the OEEC representative. Will he speak for all the Marshall countries, including France and Britain? Will he hold one or 18 votes? Through what channels will he receive his instructions? Will the West European countries also be represented on the various commodity committees by a single delegate, speaking for all of them?

If the European countries are collectively represented on these committees, it is plain from the conclusions of the OEEC report that their voice will swell the chorus of those advocating guaranteed prices and markets for producers who expand their output in the interests of rearmament.

European Coal Shares Agreed

The Coal Committee of the Economic Commission for Europe in Geneva has just agreed on a scheme for distributing 9,500,000 tons of coal and 3,000,000 tons of coke among European consuming countries over the second quarter of this year. Inevitably it is a scheme which pleases nobody, arrived at, as it has been, by reducing what countries already consider their rock-bottom requirements and "reviewing" existing trade agreements. Even allowing for the arrival from the United States of about 5,000,000 tons of coal (for which neither dollars nor shipping are certain) there is still a gap of about a quarter of a million tons (actually 120,000 tons of coke and 100,000 tons of coal) which must somehow be extracted from European sources if some industrial dislocation is to be avoided. This deficit is very small (it is equal to about one-third of a day's production in the United Kingdom) and the committee addressed an appeal to producing countries with better hopes that it might be heeded than the makers of such appeals usually have.

The OEEC in Paris is now working on financial arrangements to cover American imports and investigating how much coal can really be shipped from the United States. To date the American authorities have not released Marshall funds for the purchase of American coal, and the European countries have therefore been compelled to use their own earned dollars. Once it is known whether Europe has managed to close the quarter-million gap from its own resources, and acceptable financial arrangements have been worked out, the OEEC will move on to the allocation of American availabilities.

Provided that the quarter of a million tons can be found, no unmanageable situation is likely to arise this summer. But if the 5,000,000 tons from the United States cannot be moved to replenish stocks (now at a record low level) in time for next winter, then a major fuel crisis can hardly be avoided.

*

Correction.—In the table of Soviet budgets on page 529 of *The Economist* of last week the unspecified expenditure in the 1951 estimates was incorrectly given as 51.6 billion roubles. This should have read 41.6 billion, making the total estimated expenditure 451.6 billion roubles.

WHAT IS YOUR CAPACITY FOR BRAIN-FATIGUE?

The quick cure is
'Burroughs'

A BUSINESS is a complex mechanism—its efficiency suffers immediately if any of its parts is overstrained. It means nothing that production is up, and sales are good, if the nerves of the business—the accounting routine—are frayed by overwork.

Is your office operating smoothly? Or do mounting delays and bottlenecks—due to antiquated figuring methods—result in inflated overheads?

There's one short answer to your calculating problem—'Burroughs.'

For a start, enquire about models 51435 and 51455—the British-made, key-driven, non-listing adding-calculating machines.

ACCUMULATES GROUP TOTALS AND GRAND TOTAL

Where a grand total of individual results is required, the Duplex Adding-Calculator gives maximum speed, simplicity, and accuracy. Special features: positive registration of full key values, a column lock that prevents operating errors, direct subtraction without use of complements.

ADDS, SUBTRACTS, MULTIPLIES, DIVIDES, ACCUMULATES. THIRTEEN COLUMNS OF KEYS.

CRITICAL TIME FOR ADVERTISERS

During a period of rising prices and wages, the pattern of consumer demand changes very rapidly indeed. Purchasing power fluctuates among all sections of the community: every family's budget is re-examined: no single buying habit is left unquestioned. For the advertiser, this period is a very critical one. If he is both to retain old customers and win new ones, he wants large spaces as frequently as possible. At all costs, he must advertise in a medium which has a direct selling impact. That is why Picture Post has a special value for advertisers today. It is read by one out of every four people in Britain. And its policy is to offer advertisers large spaces wherever possible: to provide colour when wanted: to guarantee continuity: and to promote merchandising. Despite the shortage of space and the great demands made on it, Picture Post is doing its best to accommodate all-comers. It will not reverse its policy of co-operating with advertisers—just because there is a sellers' market for space.

For all enquiries please get in touch with F. A. Gray, 43/44 Shoe Lane, E.C.4. (Tel: CEN 7400)

EVERY AMBITIOUS ADVERTISER IN BRITAIN USES PICTURE POST

Letters to the Editor

Figures in the Air

Sir,—Let me plead with you not to countenance the drawing of a party line over the development of Bomber Command, as suggested in your issue of March 10th. If the suppression of Bomber Command is to become a party line of the Labour Party, I hope there will be some doughty deviationists including, I imagine, the Air and War Secretaries of State.

The main war function of the Royal Air Force is to fight for air superiority. With air superiority its power to defend these islands against hostile air forces, to attack centres from which rockets may be launched against us, to demolish the sources of the enemy's military power, to paralyse his communications, to co-operate effectively with the Royal Navy in defeating the submarine, to help the Army to destroy the enemy's Army and even (if this should be required of it in future) to launch air-borne forces, is limited only (but strictly) by its size, equipment (including, in particular, availability of airfields—a requirement to be remembered before generalising about the lessons of Korea) and by the degree of superiority obtained. At best it cannot do all these things at once. Priorities must be laid down for it. Without air superiority it can do none of them.

Air superiority must be fought for—not in one decisive battle but unceasingly and unrelentingly. The protagonist in this drama is Bomber Command, with Fighter Command maintaining local mastery in the air over this country. Without Bomber Command the Royal Air Force would be emasculated and incapable of discharging its main function in war—to obtain air superiority.

By winning the Battle of Britain, Fighter Command stopped the invasion of this country, obtained mastery in the air over these islands, conferred upon us immunity from large scale day bombing, and turned the tide of war. Moreover, they kept this local air mastery and extended its area into France as a result of constant hard fighting. It was, however, the achievement of Bomber Command in carrying the war into Germany in 1941 and 1942, before our valiant American allies joined us in the fight, which compelled the Germans to switch rapidly and increasingly from the construction of bombers to that of fighters and to build up a great system of air defence which absorbed more than a million fighting men. Bomber Command thus threw the Germans on the defensive in the air and our air superiority steadily increased until D-day, when not a bomb was dropped on the great Allied Armada or on our troops as they struggled ashore on to the Normandy beaches.

So Mr Henderson deserves support in giving priority to Bomber and Fighter Commands. Coastal Command and Transport Command are certainly im-

portant too and must not be neglected, but surely it is hardly just to say that they "present as urgent cases for expansion as do Bomber Command and Fighter Command." At least as strong a case could be made out for the Commands responsible for training the air crews and ground staff of the Royal Air Force and for maintaining their supplies and equipment; yet, they cannot all have priority and unless Mr Henderson and his advisers preserve their sense of proportion, they will make a poor job of the architecture of the new Royal Air Force. A substantial degree of air superiority is the condition without which neither Coastal Command nor Transport Command can fulfil their functions. Bomber Command and Fighter Command must secure it for them. Therefore, let Bomber Command and Fighter Command have priority.—Yours faithfully,

ARCHIBALD SINCLAIR
Altnabreac, Caithness

Groundnuts and Gambia

Sir,—Your readers have no doubt noted, from time to time, judicial pronouncements upon the duty of candour and honest statement of relevant facts imposed by statute on directors of public companies. Furthermore, the Board of Trade has power to impose public judicial investigation where there seems some doubt whether directors have performed their duties or where losses have been excessive. Had the groundnut scheme been a public company, there is no doubt that, on the ground of the loss of £36 million alone, a public judicial inquiry would have been ordered.

Mr Attlee's persistent refusal to grant such an inquiry suggests that lower standards are to be set for state concerns than for public companies—with increased nationalisation a truly alarming prospect! The failure of the Gambia chicken scheme will make rumours grow in intensity until an impartial inquiry is held.—Yours faithfully,

W. A. C.
London, S.W.1

Can Transport Pay?

Sir,—You imply in your issue of March 3rd that the profits of the railways are at a maximum when their charges are yielding the maximum revenue. You say "the demand for railway transport is not so highly elastic that to increase charges and fares would produce less revenue." This is probably not true; but if it were, it would require a very great increase in charges to fill the gap of 10 per cent which you seem to expect in 1951. Suppose you are only just right—that is, that the elasticity of demand is unity, so that any change in rates and fares would not affect the total revenue. Then I suggest the railways would have to raise their charges by as much as fifty per cent. Given unit elasticity, such a rise would reduce traffic by one-third, and this would enable

the railways to cut train-mileage by some 25-30 per cent without much risk of losing more traffic. The resulting fall in variable running and maintenance costs—which are probably less than 25 per cent of the total—together with a few other consequential cost reductions, might give you a saving of about 10 per cent of total expenditure on revenue account—just about enough to fill the gap.

However, growing competition tends to raise demand elasticities, and there is reason for supposing that the elasticity of demand for railway services as a whole is rather greater than unity. For passenger services before the war, it was about 1.17 (see *Economic Journal*, September, 1937), and today it is likely to be higher rather than lower. For shed-class traffic—the cream of railway goods traffic—it probably exceeds 1.2; but for coal and other minerals consigned in large quantities it may be less than unity. On the whole, therefore, a general rise in rail charges would result in lower revenues; but the consequential fall in operating costs might exceed the loss of revenue, in which case it would pay to raise charges. You would have to reduce charges to obtain an increase in gross revenue.

The formula for calculating the rate per ton-mile or the fare per passenger-mile that produces the maximum profit or minimum loss is simple enough; but it contains two constants—the marginal cost and the elasticity of demand—which, for the multiplicity of traffic the railways convey at a multiplicity of rates and fares, almost defy evaluation. Yet unless the Railway Executive or the Transport Commission have some idea of these values for each of the different kinds of traffics under the new conditions, they cannot know where and to what extent their rates and fares should be increased or decreased in order to convert the annual loss into an annual profit. If rates and fares were at the optimum before January, then as the increase in wage rates has raised marginal costs, the new optimum rates and fares will be proportionately higher, and profits will be smaller. But who knows whether they were at the optimum or not? And for that matter, whether they were above the optimum or below it? All this is fundamental in railway financial policy, more today than ever before.—Yours faithfully,

E. J. BROSTER
Bushey Heath

Railway Charges

Sir,—The British Transport Commission is faced with the task of increasing its revenue by something over £20 million per annum and this comes within a year of the increase in freight charges by 16½ per cent and of the acknowledgement both by the Commission and the Railway Executive that railway fares were already on the point of diminishing returns.

The present standard passenger rate of 2.44d. per mile for single journey is double that of the London Transport (notwithstanding the integration arrangements of October, 1950) and more than double the average provincial road fare. Even the monthly return rate of approximately 1.65d. per mile is not competitive and traffic is still falling steadily despite full employment and unparalleled economic activity. Many professional and black-coated workers who formerly spent more on travel are finding it increasingly difficult to take a holiday away from home or to visit relatives. The change in the distribution of income and in habits of spending is such that even a small increase in fares would tilt the scales against the Transport Commission.

There would seem at first sight to be a case for making some increase in workman's fares and season ticket rates as these, at about a quarter the standard rate, represent (apart from excursion fares) the only types of traffic competitive with road transport. Furthermore, the real cost of carrying this traffic during peak hours must be relatively high. But these classes together only account for about 15 per cent of total railway passenger takings, or about 5 per cent of total railway revenue. One cannot escape the conclusion that the only possible way to find the additional revenue (if it is to be found at all) is by a further increase in the various goods categories which together provide over two-thirds of railway revenue.

It is imperative to achieve a better loading factor for passenger as well as goods traffic. To this end the first step would be to get rid of the anomaly of the standard rate of 2.44d. per mile single fare. To reduce this to the monthly return rate of 1.65d. would cost about £4,000,000 per annum, allowing for some increase in traffic at the lower rate. In addition, it would be necessary to offer day return rates at about 1.25d. per mile to all destinations within a radius of about 60 miles, with facilities for return by alternative routes. Excursion arrangements would then have to be modified both to reduce costs and to make better use of train capacity. To meet these concessions, it would be necessary to increase London Transport 1½d. fares to 2d., workman's and early

morning fares by about 10 per cent and season ticket rates by about 5 per cent.

Nothing short of this will stop the drift; it is unlikely that any integrated passenger scheme can come in time to give fresh heart to those who earn their livelihood in the railway service and to enable the Railway Executive to decide objectively the fate of the many declining branch and cross-country lines.—Yours faithfully,
A. R. MORDAUNT.
Chipstead.

Price of the Peak

Sir,—I would like to comment on the business notes headed "BEA's Vain Chase" and "Price of the Peak" in your issue of January 27th.

When new plant is installed to meet peak loads, this plant, being cheaper to operate, is run for longer periods; older, more costly plant is run for shorter periods. The economy in fuel resulting from this I estimate would be approximately equivalent to 55 per cent of the capital cost of the new plant based on your figure of £60 per k.W.

Further, I fail to see how dual circuit installations are to be avoided; voluntary load shedding seems to me to be wishful thinking even if the contract to supply electricity is based on such action. Your own statement of dual charges for different classes of load implies dual circuits as does your suggestion that if voluntary load shedding does not take place partial compulsory load shedding will be made.—Yours faithfully,
Ewell

W. CROSSLEY
[Some technical readers seem to have confused themselves about the two notes. These described a system by which centrally-controlled load limiting switches would be installed on the premises of commercial and large domestic consumers. The system is intended to limit the domestic and commercial demand during peak periods only. If the consumer took more electricity than the "essential demand" set by agreement in his supply contract, he would be warned by a signal causing his lights to flicker or his electric fires to drop to half heat. If he persisted in exceeding his agreed load, the equipment would switch off his power supply, but he could restore the current by restricting his load within the agreed maximum. This system, it is important to emphasise once again, would come into operation only at times of peak demand and would be set in motion by centrally-controlled signals.—EDITOR.]

The Measure of the Burden

Sir,—The interesting articles in your issue of February 24th on the burden of the defence programme repeatedly contrast reduction in consumption and increase in output as sources for meeting the real cost. The distinction is, of course, essential, but it is not always as clear cut as is sometimes implied. The estimate of the real cost of the recent war puts the contribution of increased output at double that found from reduced consumption. But a significant part of the increase in output was a reduction in consumption under a different name, as it represented the substitution of paid work for unpaid activity in the home. This implied a substantial reduction in the quantity and quality of certain services which are an important component of the standard of living. The suggestion that a 40 per cent increase in output was achieved without a resulting reduction in consumption gives an exaggerated idea of the slack available in the British economy in 1938.

This is only another way of saying that the national income (or output) is not the aggregate of the flow of goods and services over a given period, but only a conventionally defined part of this total flow. For familiar reasons a large proportion of the total has to be excluded from the definition and computation of the national income; and over a period of years substantial quantities of resources may shift from one class into the others.

Yours faithfully,
P. T. BAUER
Cambridge

The Billion Again

Sir,—You did give notice, it is true, that you would be using the word billion to denote 10⁹. But is it not now time to realise that this was a mistake? Your readers are not all so accustomed to large figures that the distinction between an extra nought or two at the end is easily comprehended. This additional ambiguity is most irritating and unnecessary. "Milliard" has in fact quite often been an English word and is only one letter longer than billion.—Yours faithfully,

G. MATHIESON
Woodford Green

No More Roosevelts

Washington, D.C.

IN January, 1947, the Republicans who had just won a majority in the Eightieth Congress assembled in Washington in the frame of mind of men who, at long last, had brought under control a fire which had been raging since 1932. The Democratic Party, given a leader like Franklin D. Roosevelt and a series of fortuitous events which the Republicans were powerless to control, had demonstrated that it could prevail upon the American electorate to maintain it in office for sixteen consecutive years. But now the people seemed to have come to their senses; and now was the time to make sure that it could not happen again.

With many signs of dedication, the Republicans passed in both the Senate and the House a resolution which had some of the elements of an insurance policy signed on a salvaged table on the front lawn even before the departing fire brigade was out of sight. The resolution projected an Amendment to the Constitution of the United States—the twenty-second in American history and the first since prohibition had been discarded sixteen years earlier—prohibiting any third and fourth terms for all future Presidents. A vice-President who succeeded to the chief office at precisely the right moment might spend ten years in the White House. For others the limit would be eight years. Nor could a President who had served two terms return after an interval for another, as Theodore Roosevelt tried to do.

The thirty-six state legislatures which would have to ratify the proposed Amendment before it could be written into the Constitution would, however, require proof that this was not merely an effort to stop the Democrats in their tracks, but was a solemn affirmation of the nation's best interests. So Mr Truman was specifically exempted; he was made the only American legally able to remain in the White House for as long as he could win enough votes to be re-elected. The states had seven years in which to ratify or reject the projected Amendment. It went forth; and in due time, a number of other things having meanwhile happened, it dropped out of sight.

★

Although no other Congress had brought itself to the point of submitting the issue to the states, the question of whether a rationing system should be applied to the Presidency was as old as the Constitution itself. Statistics which a student of the Presidency, Mr Sydney Hyman, has assembled recently show that more than a hundred attempts were made in Congress between 1787 and 1949 to limit the period during which a man could be President. More than sixty efforts to confine Presidents to a single term of six years came to nothing.

The view of George Washington (who declined a third term for himself) was that there could be "no propriety in precluding ourselves from the services of any man who, in some emergency, shall be deemed most capable of serving the public." But Jefferson at one time entertained fears that an ambitious man might find ways of capturing and holding the Presidency for his lifetime and even perhaps

of handing it on to his son, like a crown; and Jackson, another two-term President, recommended a Constitutional Amendment that would have abolished the already vulnerable electoral college and limited each President to one elected term only. His arguments were cogent enough to be used against Lincoln when he was seeking his second term. Only Franklin D. Roosevelt had been strong enough to beat the no-third-term tradition; he even went on to a fourth term. There had been nobody like him before. And the Republicans in the Eightieth Congress, assembling less than two years after his death in the belief that the Democratic thrust was spent, set out to see that there should be no more like him ever again.

The Democratic thrust was not spent, as Mr Truman was able to show late in the following year; but the Republicans had nevertheless raised a popular issue. As early as 1943 and 1944 the Gallup Poll indicated that a clear majority of the electorate—the same electorate that, a few months later, voted Roosevelt back into the White House for a fourth term—favoured a Constitutional Amendment limiting the Presidency to two terms.

The American democracy was displaying even then not only its old, deep, instinctive suspicion of a too-strong man, but also its equally old, deep and instinctive uncertainty about its own capacity to resist a strong man when he appeared. Given such a man, and so long as the times seemed to require it, they might follow him. But on the morning after, when he was gone and the times seemed safer, they were ready to admit to themselves that too-strong men, like too-strong drink, might be bad for them; they were ready to sign the pledge.

There seems to be little reason to doubt that some very similar instinct was astir in the British democracy when it turned away from Mr Churchill on the morning after. In America the Republicans were able to repeat their hitherto unheeded warnings that the New Deal, with its enlargement of patronage and its alliances with dubious political machines, might, in time, have been able to perpetuate itself in office. Nobody was surprised when the two-term resolution was passed by the first Congress in which the Republicans had a majority since the launching of the New Deal in 1933.

What was a surprise was the sudden spurt of activity on the resolution by the state legislatures in the first weeks of 1951. Indiana, Montana, Idaho, New Mexico, Wyoming, Arkansas, Georgia, Tennessee, Texas and North Carolina signed up in a rush. On the afternoon of February 26th Utah ratified, and a few hours later Nevada put the amendment over the top, beating by a short head Minnesota, which had been intent on casting the thirty-sixth vote.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

HEINEMANN

Now that the deed has been done, there are some evident misgivings about its wisdom. Why should mid-twentieth-century Americans reveal less confidence in their fitness to choose their Presidents than did eighteenth-century Americans? In reply the contention is advanced that the world is now a much less secure place, and that the Presidential powers are wider and more pregnant with dangerous possibilities. But the argument is now academic. The new Amendment is law, and it is a watertight law. Only Mr Truman is provided with the legal means, as Americans say, of beating this rap. But can he: will he?

If he is renominated by the Democratic Party next year it may be held that, whatever legal exemption he enjoys, he will be running in the face of the expressed will of the people, since he will have served more than two years of Roosevelt's fourth term as well as four years in his own right. A widely held view at this moment is that Mr Truman will not run again. In the first place, he is believed to have had about enough of the cares and strains of executive office. In the second place, it is argued that the new Amendment will make it so much more difficult for him to win that he may not be subjected to the party pressure normally applied to a reluctant incumbent.

If Mr Truman is unlikely to run and win, who is? The prevailing theory is that it will be General Eisenhower—a successful Eisenhower, back from a magnificent job in Europe and unbeatable at the polls. But if so, is General Eisenhower to win as a Republican or as a Democrat? He comes from a Republican family. But he voted for Roosevelt in 1944, and it was powerful Democratic delegations from New York, New Jersey, Illinois and California which tried to draft him in Mr Truman's place before the convention in 1948.

The General himself has plainly, feelingly and repeatedly declared that he does not want to go into politics; he wants to return to his useful and congenial job as President of Columbia University. But some feel that this genuine reluctance might be overcome if General Eisenhower could be convinced that only by entering the race himself could Senator Taft—and the policies he is now espousing—be prevented from capturing the White House.

American Notes

Troops with Reservations

The great—and interminable—debate in committee on the control Congress should exercise over the dispatch of ground troops to Europe has finally come to a somewhat confused end. The Administration and General Eisenhower can justly claim a victory, if a long-heralded one, over the retreatists in that the resolutions approved—for there are two, one inviting the concurrence of the House—specifically repudiate the Hoover policy of abandoning Europe, record the belief of the Senate that it is necessary for the United States to station enough troops abroad to contribute a "fair"—though not "major"—share of European ground strength, and approve the sending of the four divisions now contemplated. No rigid ceilings are imposed, and no ratio of European to American troops required.

The price which the Republicans and some Democrats are trying to exact is that, if further troops are to be sent the approval of Congress (not merely of the Senate), must be secured. Such a provision, if accepted by the full Senate, lacks the force of law, but exerts a heavy moral pressure. Oddly enough, although the amendment was sponsored by Senator Smith, a liberal Republican, the use of the word "approval," instead of the vaguer "collaboration," was inserted to win the crucial votes of two Southern Democrats—Senators Byrd and George. This amendment might mean

a Congressional debate and vote every time routine troop movements to Europe are needed. The events of the past two months show what delays may be caused by party and intra-party politics. Such a provision, as the *Washington Post* points out, is not only contrary to Senator Smith's original intention, it is also a complete reversal of the role Congress ought to play in military matters. Mr Truman may have won the battle, but he seems to be in danger of a defeat in the ancient constitutional war with Congress over the Presidential powers to deploy troops.

A related unwillingness to give the Administration too much rope prompted the Senate, debating military manpower, suddenly to reimpose a limit on the strength of the forces. This had been removed, for a four-year period, last August. Senator Morse's proposal, which would have frozen military strength at present goals, was rejected, but a limit of 4,000,000 was adopted, over the protests of military spokesmen from General Marshall down. Strong sentiment for it is expected in the House, where it may prove the price of agreement to a universal training scheme.

New Life for Point Four

Just four months ago, Mr Gordon Gray startled the world with an imaginative approach to American foreign aid. Until last Sunday, nothing more had been heard about it, except for the appointment of Mr Nelson Rockefeller as chairman of an International Development Advisory Board which was to work out the next steps. Mr Rockefeller has now submitted a detailed plan to revolutionise American foreign lending policy.

The first barrier which the revolutionaries would attack is one that survived, undamaged, the first impact of Point Four: the belief, or rather hope, that private capital can do practically all the investment needed in underdeveloped countries. The Gray Report was the first inkling of an authoritative American confession that this was not true. Mr Rockefeller has gone on to propose three channels through which substantial government funds should flow, primarily into public works. A new American agency would be created to handle all foreign assistance, other than military, with an appropriation of about \$500 million for use exclusively in the underdeveloped areas on specific projects with specific time limits. The International Bank would raise funds not exceeding \$500 million by further subscriptions from member governments to form the capital of an International Development Authority which, under management contract with the Bank, would finance public works (other than projects of strategic value) in underdeveloped countries by grants as well as loans. Finally, a proposed International Finance Corporation—a further affiliate of the International Bank—with a total capital of about \$400 million would make loans and equity investments—if appropriate in local currency—to private companies without the backing of government guarantees. By entering the commercial field themselves, governments might hope to prime the private investors' pump.

*

Thus, two more barricades would be cleared in one leap. Some United States government money would be free, untied to purchases in the dollar area. American aid to underdeveloped countries—a new unprecedented scale would be entrusted largely to international, not governmental, hands. This does not mean that Mr Rockefeller despairs of private investment. Far from it; he and his board have still sought to place "prime reliance on private enterprise" in all but public works, to avoid dangerous inflationary pressures at home. But for the first time someone has dared to probe the depths of the pit which private investors have to fill. Mr Rockefeller comes up with the encouraging view that the pit is by no means bottomless; the

face of the underdeveloped areas could be transformed if investment from the western world were maintained at a steady level of \$3 billion a year, or less than 1 per cent of total national income in the United States and Western Europe. The immediate target for the United States should be to double its present outflow of \$1 billion, and Mr Rockefeller has proposed some amplifications of the original Point Four incentives.

This is a formidable programme which would take the most enlightened Congress some time to digest, and Congress today is determined to cut expenditures, if possible, rather than add to them. The most hopeful omen for its future is that Mr Rockefeller has rested it fairly and squarely on the Atlas of American self-interest. This is the only way, he claims, to increase the supplies of strategic raw materials; if it is followed it should mean a 50 per cent expansion in those available for purchase by United States. This also is the only way to keep the free world free—and this, after all, is the objective of all American aid.

* * *

Cotton Controversy

With cotton prices five times what they were in 1939 and the government pleading for a 60 per cent increase over last year's scanty crop, something like a cotton rush is developing in the west. California, scene of the original gold rush, has land which can produce three times as much cotton an acre as the national average. A measure of the boom is that planting this year is expected to be more than twice as great as it was last, when curbs, which required particularly severe reductions in western plantings, were in effect. Vegetable and fruit lands, vineyards and feed crop fields are being diverted to cotton. Texas also expects to more than double last year's cotton acreage and to exceed that of 1949, the previous peak. But the south-east, the traditional home of cotton, has too vivid a recollection of price collapses in the past, and has invested too much in diversified farming, to join in the rush. It is still doubtful, therefore, whether the Secretary of Agriculture will achieve the 16 million bale crop needed to satisfy both military and civilian demands at home, and export requirements, and leave a safe margin for emergencies.

The prospect of a sharp rise in the price of raw cotton between now and June—and consequent increases in textile prices—persuaded the President to support the Price Administrator in his challenge to the Congressional cotton bloc, which had been fighting to free the raw fibre from all controls. Uniform prices have now been set at the farm, varying according to grade, above or below a basic rate of 45.76 cents a pound. These replace the individual ceilings for each trader imposed in January, which were so numerous that they made trading impossible—and with the setting of a uniform ceiling price for futures, the exchanges have been able to reopen for the first time in six weeks.

Cotton's ceiling, based on an average of recent high prices, is more than 40 per cent above prices prevailing before the Korean war, and more than 125 per cent of parity, the level at which the farmer theoretically receives a fair return. But Senators from the cotton states still do not think it allows enough incentive to expand production; during the last war, they argue, cotton was left free and controls began at the textile stage. But then there was a surplus, and the price was below parity; today the opposite is true. Even so, Mr Bowles, then Price Administrator, tried, although he was soundly defeated, to secure Congressional permission to fix prices at the farm.

Bills have already been introduced to exempt raw cotton from control, and Senator Maybank of South Carolina, chairman of the Banking Committee which handles price control legislation, has threatened that when the control Act expires in June steps may be taken to prevent "bureaucratic" interference with the prices of other raw farm products.

These are now controlled only at the processing level, but it is only a matter of time before livestock prices, like those of cotton, must be limited. Processors are already having to pay more for meat animals than they are allowed to charge. Mr DiSalle's first serious battle with Congress will evidently not be over the extension of his authority to the majority of farm commodities selling below parity, but over the authority he already possesses to control those selling above it.

* * *

Short Changing the Schools

This year American schools, like the old woman who lived in the shoe, have so many children they hardly know what to do, and new efforts are being made to persuade Congress to authorise federal aid to education—if only on the grounds that illiteracy still requires the forces to reject substantial numbers of men. The rock on which past Bills have foundered has been the determination to permit no aid to non-state—in effect, Catholic—schools. The two first Bills in the new five-point programme would provide funds for the poorer states for construction and to pay teachers' salaries in tax-supported schools only. It is not certain that Congressional shipwreck can be avoided this way, but the school authorities are convinced that mounting enrolments, high costs and competition for men and materials from the defence effort make federal aid more urgent than ever.

The full impact of the high post-war birth-rate upon the elementary schools is producing more crowded classes and part-time schooling and requiring the use of antiquated and unsafe buildings. Moreover, as the chart shows, the prospect is for continued increases until 1958; before then the secondary schools, now enjoying a temporary lull, will begin to be swamped. The two great needs are for more buildings and more teachers, to make up for the famine which accompanied and followed the war, and to cope with the bumper crop of children. Neither will be easy to

satisfy, though teachers point out bitterly that the proportion of a much larger national income spent on the state schools is only 1.8 per cent compared with 3.09 per cent in 1930. Both money and materials for building will be shorter than ever, and unless steps are taken to make teaching more attractive, the schools may not only fail to find the million or so new teachers they need in the next decade, but may actually lose teachers, as they did from 1940-1945.

According to a study* published by the National Bureau of Economic Research, salary increases between 1945 and 1949 have virtually restored teachers' income to the pre-war level. The great gains in the economic status of teachers took place, however, between 1900 and 1930; after that they fell behind other groups. Today every state complains of a shortage of teachers for its elementary schools. In part

this is due to a general disinclination to enter teaching; the number of teachers trained is beginning to fall off again, and only three-quarters of these actually enter the schools. But there is also a reluctance to accept the lower salaries, lower prestige, and harder work usually involved in elementary teaching. The shortage is most acute—often tragically so—in rural schools, which must make do with unsuitable and unqualified people.

The most hopeful sign is the formation of citizens' groups to defend and improve the schools. The Fact-finding Commission on Education created by Connecticut two years ago has been assisted by such bodies in nearly 100 cities. Many of these will continue on a permanent basis, to make sure that the Commission's recommendations for modernising the schools and extending their usefulness do not go disregarded.

Contract Renegotiation Again

Businessmen are once more crowding into Washington, in spite of the government's attempts to decentralise procurement by giving regional offices more independence. And President Truman has just turned the clock further back by using his emergency powers to authorise the placing of government contracts by negotiation, instead of by the competitive bidding that is required in peacetime for all but the most secret and technical work. Negotiated contracts will apparently be on a fixed cost, or cost plus fixed fee, basis; cost plus a percentage of cost is not authorised. Congress is now in the process of making nearly all government contracts subject to renegotiation, after the work is under way or even completed; this system was established in the last war and

* George W. Stigler: *Prices, Wages and Compensation in Education*, 1950.

has again been applied gradually to aircraft and other military contracts during the past two years.

Excess profits taxes deprive manufacturers of a large part of any profits made in excess of a supposedly normal base period. Renegotiation is intended to deprive them of excessive profits, before taxation, resulting from faulty estimates, improved techniques, increased output and so on while a contract is actually under way. It is often impossible to assess costs accurately in advance, especially when a product new to the manufacturer, or entirely new in itself, is to be made and when large-scale output is needed quickly. Nearly \$11 billion was regained in this way on contracts, valued at \$200 billion, let in the last war; almost \$8 billion would have been recaptured in any case, at a later stage, by excess profits taxes. In practically all cases the necessary agreement was arrived at after friendly bargaining between procurement officers and manufacturers, few of whom have any wish to line their pockets unduly at their country's expense.

The new Renegotiation Bill is very similar to the old, the Senate having refused, in most cases, to accept the severer provisions sought by the Administration and accepted by the House without a dissenting vote. It sets up an independent five-member board with authority to renegotiate practically all government contracts. Certain principles must be borne in mind, such as the efficiency of the contractor and his contribution to the defence programme. No one is liable to renegotiation if his government business amounts to less than \$250,000 worth in the year, and contracts for agricultural products and minerals are exempt at the primary marketing level. The Bill incidentally gives a backhanded recognition to the notorious "five percenters," the commission agents who help inexperienced businessmen to find government contracts, by providing that such contract brokers will be subject to renegotiation if their receipts amount to more than \$25,000 in a single year.

Shorter Notes

The most controversial and important political trial in recent American history came to an end this week when the Supreme Court refused to re-examine the evidence in the Hiss perjury case. It is two and a half years since Mr Whittaker Chambers, admitting his own earlier espionage activities, accused Mr Hiss, formerly a high official of the State Department, of being a member of a Communist underground and supplying it with secret information. Three members of the court did not take part in the decision; two had been character witnesses for Mr Hiss at his first trial and the other was Attorney General when the case began. Mr Hiss, preparing for five years' imprisonment, still protests his innocence. The charges against Mr Hiss—the first solid evidence of past laxity and disloyalty in the Administration—paved the way for Senator McCarthy's continuing accusations against the State Department; Mr Acheson has continued to suffer, politically, for his public refusal, at an early stage, to "turn his back" on his former friend.

* * *

Rockford College in Illinois, a small independent women's college, has devised a new scheme for students who need to work their way. Instead of paying for alternate terms of study and work, as in some of the other colleges, students may work three days a week and study the other three. Local businessmen who find it difficult to obtain staff, have agreed to engage two girls for the same job, and to pay them prevailing wages—about \$1 an hour. Each girl, it is estimated, should earn about \$1,000 of the \$1,400 required for each college year, and, by going to summer school as well as the regular sessions, should complete the normal four-year course in four and a half years.

This view of part of the South Bank Exhibition—centre piece of the Festival—shows the underside of the giant Dome of Discovery—365 feet across, the largest dome in the world—together with the Skylon which, suspended in mid-air, will glow brightly across the night sky to sign-post this exhibition of Britain's industrial and scientific prowess.

CHLORINE

A hundred years ago in Great Britain typhoid fever and cholera were common water-borne diseases. To-day cholera is unknown and an outbreak of typhoid makes front page news. This improvement in public health reflects the unremitting care of all concerned with water purification. Of the major defence measures employed against pollution and disease, sterilisation by chlorine is one of the most important. Chlorine is a very active chemical which in nature is found only in combination with other substances, from which it must be isolated. The best known of these is common salt in which chlorine is combined with sodium. The passing of an electric current through salt splits it into its constituent elements and releases chlorine in the form of a greenish-yellow gas, which is dried and liquefied and so made available for ready transport all over the world. I.C.I. are large manufacturers of chlorine as well as producers of the salt from which it is obtained. In addition to having many uses as a sterilising agent, chlorine is an important raw material. Textiles, petrol, dyestuffs, paper, medicines, insecticides, anaesthetics and dry-cleaning fluids all need chlorine at some stage in their manufacture.

SARDINE OR WHALE?

It's a matter of taste, of course. From the culinary point of view both have their advocates. For us, in the more specialised field of refrigeration, the big and the small are equally welcome. For 70 years now, we have been producing refrigeration units for every conceivable purpose for trade and industry... for big projects such as ice rinks, marine storage, and meeting the more modest requirements of shops and business by way of store cabinets and show-cases. We also make it our special concern to ensure that each of our customers, big, medium and small, receives a first-class service in the maintenance of his equipment. Our experience, in other words, is as broad as it is long, and therefore, whether yours is a sardine or a whale of a problem we will be only too glad to help you. Why not write to us today?

THE WORLD OVERSEAS

Votes and Veils in the Middle East

THE President of the Egyptian Chamber of Deputies, Abdul Fahmy Gomaa Pasha, is believed to be sympathetic to the Egyptian feminist movement whose cause has recently been advanced by the tabling of a private Bill in the Chamber by a Wafdist deputy. This Bill proposes that all women over the age of 21 should vote in Chamber elections and those over 25 in elections for members of the Senate. Although the chances that this Bill will pass are slender, there now seems little doubt that Egyptian women will be enfranchised within the next few years.

During the past six months the feminist movements of Egypt have become increasingly active. In Cairo fifteen hundred women recently dared to march through the main street, force their way into the courtyard of the Chamber of Deputies and there demand the abolition of polygamy and a vote. Although two women were injured by pushing their way through the courtyard gate, the police made no effort to break up the demonstration. In Damascus women want representation in the Syrian Parliament; even in Amman a delegation of veiled Jordan women has called on the Government to "demand their rights," and they were courteously received. No feminist demonstrations have yet taken place in Baghdad, but they can be expected as a suffrage organisation has been established there for some years. In Iraq, as elsewhere in the Middle East, the emancipation of women has been retarded by violent twentieth-century Arab nationalism which is strongly Moslem and frequently anti-western.

The Inconvenience of Illiteracy

Feminist movements in the Arab Middle East can indeed no longer be dismissed by Moslem politicians as ridiculous. The ruling Pashas now realise that organisations demanding votes for women must be taken seriously albeit with apprehension and caution. Those few educated women who travelled to Europe and dropped the veil before the first World War were the pioneers of the movement for women's rights without being aware of their role. The anti-veil movement which was inspired by M. Worth rather than by Mrs Pankhurst, spread from the smart set of Cairo to the reactionary middle classes not only of Egypt but of Damascus and Baghdad.

Later women who begun to accompany their husbands to a few social functions found illiteracy inconvenient and demanded that their daughters should be educated, whilst braver spirits—frequently alas those unable to attract a suitable husband through lack of wealth or beauty—learnt to type and obtained jobs with foreign firms and even forced their way up the back stairs of government offices.

Husbands and fathers had, however, been given so much power by Koranic Law that women were unable to engage in public activities which did not receive the full approval of the male members of the household. Thus they were unable to form any effective feminist organisation to bring their newly felt demands and views to the notice of the Government. Perhaps because they had no active suffrage organisation to absorb their energies, women educated in the west and female university students developed a serious bitterness. They found themselves continually thwarted both politically and economically when they attempted a suitable career. They argued that because it was quite

hopeless to change the attitude of Moslem politicians, the only possible solution was a major revolution which would overthrow the Pashas of all parties and afterwards establish a state in which women would have an opportunity to work and play on equal terms with men. Moslem women whose views on all other political issues could be described as mildly radical or conservative joined fellow travelling organisations.

Unconsciously Arab women were influenced and encouraged by the thousands of allied service women they saw driving lorries around the Middle East during the war. But the Palestine War which followed really shook the reactionary Pashas. Stories of Jewish women fighting in the front line circulated freely in Arab capitals, whilst Moslem Generals publicly wailed that the Jews had doubled their manpower by using women as soldiers. For these reasons Egyptian women were reluctantly allowed to become army nurses and an ATS type of organisation was formed attached to the Moslem Egyptian army.

Syria Gives a Lead

Egyptians, who believe themselves to be the natural leaders of the Middle East, were profoundly shocked when Colonel Zaim, dictator of Syria, announced that all women over eighteen with primary school certificates might vote in the next Parliamentary elections. The small Egyptian feminist organisations were furious that the "backward" Syrian women should be the first to vote in the Arab world. The Lebanese, who have a Christian majority and have always considered themselves to be the most advanced of the Arab States, were equally angry. After Zaim's assassination when the law was not rescinded feminist organisers in these countries began serious work. In Egypt they renewed the demand for abolition of polygamy and a vote. They quote the Koran to support their views on marriage and divorce*. The feminists adopted a policy of "quiet agitation to gain support for their programme amongst politicians." No large public demonstrations were attempted until last month when women carrying banners marched through the streets shouting "Down with the Parliament without women," and "The cause of women is the cause of the nations"—slogans which are more effective in their original Arabic. A deputation was received by the Chamber of Deputies and after this the demonstrators marched to the senate where leaflets were distributed in the galleries. In connection with these, Mme. Doria Shafik, president of the largest feminist organisation—the *Bent el Nil*—will be charged before the Abdin correctional court on April 10th for fomenting public disorders. It is most significant that several of Egypt's leading lawyers have expressed a wish to defend her, *Al Ahram*, Egypt's oldest and most responsible daily paper, made a sensible comment by attacking the feminists "for not proving their title to a parliamentary vote by more active social work."

These sensational events have made a considerable impression in Beirut, Damascus, Aleppo, Baghdad and even Amman—in fact in all places where the Egyptian daily papers are widely read. Women in Syria, where they have achieved a vote, have been moved to further action and agitation to increase their political responsibilities. In Amman there is

* Koran Sura IV verse III: "If ye still fear that ye shall not act equitably (to your four wives) then (take) only one."

deep resentment against King Abdullah's reactionary policy, in particular, the law which insists that women must be veiled is irksome to young Moslem women from Palestine who have never previously worn veils.

But in the harems of Saudi Arabia and the Yemen between four and five million women have yet to learn that a world exists beyond the one they see from peepholes in their latticed windows. Unable to read, forbidden to listen to the radio, their lives are lived in the manner of the Middle Ages. But even here there is an air of unrest, a feeling that something is wrong.

Post-Mortem on Wheat Agreement

[FROM OUR OTTAWA CORRESPONDENT]

THE four-year wheat contract between Britain and Canada, which formally ended last July, has become the cause of one of the most acute political disputes Canada has had since the end of the war. It would be well if the dispute were confined to Canada, but it is not. The British Government is being made the scapegoat for some of the unpopular things that the Government is doing.

The trouble arises from the contention of the western farmers on the prairies that they have lost hundreds of millions of dollars by selling their wheat to Britain under the contract instead of selling it at "a free world price." To establish the contention it is, of course, necessary to determine what the "free world price" was, if indeed there was one. In the early years of the contract—that is in the second half of 1946 and 1947—the opponents of the contract were wont to refer to the prices paid on the Chicago grain exchange as the "world price." It has since been demonstrated that the Chicago price was determined almost entirely by the price support policies of the US Government and by its purchases of wheat to give away as Marshall Aid under the Economic Co-operation Act. The opponents of the contract have, therefore, latterly concentrated their attention on the Canadian "Class II" price. The Class II price set by the Canadian Wheat Board is the price it receives for export sales outside the Canada-UK Agreement, or now, outside the International Wheat Agreement. If this is accepted as a fair standard for the "world price" it can easily be shown that Canadian wheat growers have lost a great deal of money by accepting the prices paid under the four-year contract with Britain.

All wheat from the Canadian prairie provinces is sold by the Government Wheat Board on a pooling basis, and the last pool was for five years, covering the crop years 1945-49. All of these five years of the "pool" except the first, were, therefore, covered by the contract with Britain.

COMPARATIVE PRICE FOR CANADIAN WHEAT, 1945-50

(All Prices in dollars for No. 1 Northern Basis
Fort William—Port Arthur, Carrying Charges Extra)

Crop Year	Price Under UK Contract	Class II Price (Average)	Domestic Price	Price Under International Wheat Agreement
1945	...	1.55	1.25	...
1946	1.55	2.43	1.25*	...
1947	1.55	2.88	1.55	...
1948	2.00	2.23	2.00	...
1949	2.00	2.16	2.00	1.80†

Notes.—Each crop year is from August 1st to July 31st of following year. * The domestic price was raised from February 17, 1947, to accord with the Government's general policy of de-control of prices. † 1.80 was the figure fixed by the International Agreement in US dollars. 15 million bushels of wheat were sold at this price before the devaluation of the Canadian dollar in September, 1949, brought the Canadian price up to \$1.98 (Canadian).

The fallacy in accepting the Class II price as the world price is best seen by relation to the quantities sold. In the whole five-year period from August 1, 1945, to July 31, 1950, Canadian exports were distributed as follows:—

1. To UK and all other countries for crop year 1945 (that is, before the UK contract); 208 million bushels, at an even price of \$1.55.
2. To the UK during the four years of the UK contract: 631.5 million bushels.
3. To other countries during the years of the UK contract (that is, sales bringing the Class II price): 196.2 million bushels.
4. To countries other than the UK under the International Wheat Agreement (crop year 1949 only): 55.6 million bushels.
5. Domestic: (over the five-year period) 251.5 million bushels.

This shows how relatively small were the sales under the so-called Class II price, which some people are now proclaiming to represent the world price. It is perfectly clear that any attempt to have disposed of the whole of the Canadian surplus at the prices fetched by this more or less marginal quantity would have had profound effects on the whole world wheat situation. To go no further, it would have vitally altered the relationship between Canada and the United States as suppliers of the British market; and in these years of ECA it is not inconceivable that Canada might have lost most of the British wheat market to the United States.

Mistaken Fear of Slump in Prices

The other determining factor throughout the whole course of the Canada-UK wheat contract was the expectation of both sides that the world price of wheat was about to fall to a ruinous level. In 1945 and 1946 it was common talk among grain men on both sides of the Atlantic that wheat would soon be back to the depression price of 30 cents or less. This was the psychological atmosphere in which Canada entered into the contract, believing it to provide a quite invaluable assurance of reasonable stability. A sign of this feeling was the contract provision that the third year price should not be less than \$1.25 and the fourth year price not less than \$1. A clause, however, was also included providing that the price to be paid in the third and fourth years should be fixed having regard to the gap which might have appeared in the first two years between the price paid by Britain and the "world price." This meant that the \$2.00 price for the final years was not settled without hard bargaining, and it was accepted—so far as one can learn—in the continued belief that a prospective fall in prices was probable. Indeed the price of \$2.00 that Britain agreed to pay in the last year was 20 cents a bushel more than the maximum which had been fixed under the International Wheat Agreement.

The feeling nevertheless persisted among the wheat growers that the contract had given them bad returns. Last May, Mr. C. D. Howe, the Minister responsible for wheat marketing, was under some pressure to get a final "compensatory" payment when he was in London on trade talks. Instead he was perhaps more concerned to get an assurance that Britain would continue to get from Canada its quota of wheat under the International Agreement in the present year. He got that assurance. He certainly agreed with the British Government that it had fully discharged its obligations under the four-year contract. There might well have been an end of the matter if last year's crop had turned out better. But early frost spoiled a large part of the 1950 crop, and the atmosphere on the prairies was ripe for discontent, which was constantly fostered by the people who had always opposed the four-year contract.

By February of this year it had got to the point where Mr J. G. Gardiner, the Minister of Agriculture, who comes

from Saskatchewan, felt bound to do something for the wheat farmers if he was to have any hope of holding their votes. Hence followed his abortive journey to London. Having settled the contract with one responsible Minister of the Canadian Government it was hardly to be expected that the British Government would reopen it with another Minister of the same Government. To make very clear that the thing had been settled once and for all the British Government solemnly renounced the \$65 million which remained in the Canadian credit of 1946, and which had not been drawn since last July. They renounced it before Mr Gardiner could get to London and propose, as he meant to, that they should draw the rest of the credit and use it to make a final "compensatory" payment on the wheat contract.

Failing to get the farmers any money from Britain, Mr Gardiner was more successful with the Canadian Cabinet. He persuaded it to make a "contribution" of \$65 million to the five-year wheat pool. This announcement has enraged nearly everybody. It has enraged the wheat-growers who demand at least twice as much: and indeed if their thesis about the gap between the British price and the Class II price is to be accepted at all, they deserve twice as much. It has enraged the growers of every other commodity sold to Britain under government contracts since the war: they say why should not they have more too. And it has enraged the taxpayers who are required to find the money. The result of all this anger is that Liberals have to find a scapegoat, and the only possible candidate is the British Government. The Government itself cannot openly join in the accusation of default, because its own Minister agreed last summer that there had been none. But by implication and innuendo some Government spokesmen are spreading the same impression.

China's Economic Strength—II

The Agrarian Revolution

[BY A CORRESPONDENT]

CHINESE Communists often emphasise the agrarian character of their revolution. It may therefore seem strange that the rhythm of change is now much quicker in the towns than in the countryside. It may at first seem puzzling that land reform has as yet been carried out in only one-third of China and for the remainder the Government has decided in 1950 to put into practice a milder land reform spread over three years. In the Soviet Union the burning castles and manors of the landlords lit the path of the October revolution and the agrarian upheaval was a matter of a few weeks or months at the most; the bolshevik government sanctioned only the *fait accompli*, the seizure of the land by the peasants. Why was there no such elemental peasant rebellion in China? Why, even if the Government were reluctant, did the Chinese peasants not force its hand like the Russian moujiks had done?

The key to all these problems, as well as an important clue to the character of the whole Chinese revolution, is to be found in the structure of the rural population of China. The very statistics supplied by the Soviet Encyclopædia in its chapter on Chinese agriculture (and based on the research work of the Chinese economist Tao Tshi Fu) explodes the official Communist myth of a feudal Chinese economy propped on a class of large feudal landowners. By the size of his property, the Chinese "landlord" is nothing more than a glorified kulak.

STRUCTURE OF CHINESE RURAL POPULATION

Group	Number of Families	% of Total	Land in Acres	% of Total	Average in Holding Acres
Landlords	2,400,000	4	108,106,250	50	45
Kulaks	3,600,000	6	58,918,250	18	10.8
"Middle" peasants	12,000,000	20	52,431,875	15	2.7
Poor peasants and labourers	42,000,000	70	36,756,000	17	0.83

The above figures (quoted from the Soviet Encyclopædia in a slightly modified form) must, of course, be taken with a grain of salt. At best Chinese statistics are not very reliable. Besides, the over-population of the countryside imposes a very intensive, garden-like form of cultivation. Rice, the main staple food of China proper, which accounts for roughly over one-third of the total grain harvested, is suitable for intensive culture and in certain regions there are two and even three crops per year. Moreover, the figures in the table quoted are based on prewar China proper. On the other hand, during the war years Chinese agriculture has been stagnant and no radical changes can have taken place. Furthermore, though cultivation is intensive, it is primitive and only the roughest sort of tools are to be found. Hence for wheat the yield per acre is estimated to be roughly three times smaller than in this country, while for rice it was only 75 per cent of the Japanese yield.

Broadly speaking, an acre of land in China means more than in Europe. But however one interprets the difference, the figures still speak for themselves. In the Soviet Union, before the revolution, some 30,000 landlords owned about 190 million acres, with an average holding of over 6,000 acres. In China proper, on the eve of the reform, some 2,400,000 "landlords" owned just over 100 million acres, with an average plot of 45 acres. Thus the average Russian landowner had some 130 times more land than the Chinese "feudal lord." The difference between the two revolutions may be largely explained by this fact.

The Chinese landowner, however, let his land to tenants and lived on the rent. Since rents averaged 50 per cent of the crop, he could live quite well even on his 50 acres, educate his children and thus, until the advent of the bourgeoisie, monopolise the rule of the country. But the mass of these semi-kulaks, semi-landlords was too great, their holdings too small, for their expropriation to be even a partial solution of the rural problem.

WELCOMBE

HOTEL
STRATFORD-UPON-AVON

Shakespeare's genius immortalised not only his memory but the Countryside he knew so well. In lovely Warwickshire, especially at the Welcombe Hotel, the beautiful grounds of which were once part of his estate.

— ESTABLISHED 1835 —

48, GRACECHURCH STREET, LONDON, E.C.3.

The first land reform law was passed in 1947, during the Civil War. It seemed to fulfil the centuries old aspirations of the Diggers, the Babouvists or some of the Russian Norodniks. By this decree not only were the lands of big owners and the churches divided equally among the poorer peasants, but the richer peasants also gave away part of their land. Thus, under the supervision of the local peasants' committees, the land and other property was divided in equal shares—due account being taken of the fertility of the soil—among all the inhabitants, male or female, including the former landlords and even the families of Kuomintang employees, with the sole exception of "traitors." All debts were also cancelled. This equalitarian reform was applied in one-third of the Chinese territory, with an agricultural population of 145 million, covering Manchuria, taken over by the Soviet Union in 1945, and those parts of North China which had been conquered early by the Chinese Communists. The idealistic, equalitarian character of the reform seems well in keeping with the mood of a peasantry which cannot see in the expropriation of the landlords alone a solution to its own land problems. The redistribution was facilitated, particularly in Manchuria, by the existence of large areas formerly belonging to Japanese settlements or to Chinese collaborators.

Few Huge Estates

Once, however, in control of the whole of China the Peking Government was still faced with the task of carrying out an agricultural reform in the remaining two-thirds of China, with a rural population of 264 million. The peasants did not clamour for land, since there were not many huge estates to be broken up. An equal distribution on the Manchurian model over the whole of China could not give an average holding of more than 3.5 acres. This was shown by the results of the first reform. Even in Manchuria, where the reform was radical, the population comparatively sparse, and the estates to be shared comparatively large, the final share per family varied from 3.5 to 7.5 acres. In other regions it was even less. Thus around Peking and in Shantung it averaged just over three acres, while in Singkiang it was only roughly one acre per family.

The Government thought that it could gain more favour among the peasants by cutting rents and interest rates than by a hasty reform. The sharecropping, paid in grain, used to average some 50 per cent of the rentpayer's yield. Now they are to be lowered to 25 to 35 per cent. The Peking authorities also claim that interest rates, also payable in grain, which had varied from 20 to 40 per cent, have been cut substantially.

Partly relieved from rents, taxation, heavy indebtedness and the road *corvée* the Chinese peasant did not immediately press for land reform. Therefore for the remaining two-thirds of China proper the Government felt able to spread it over three years. The new Act, passed in 1950, does not affect the kulak who, in most cases, is but a "middle" peasant. Since the distribution of his land would not affect greatly the final share, it is not to be touched, at least for the time being. This time only the "big estates" are to be broken up.

Peking's Dilemma

In general the new act shows in many ways the dilemma of the Peking Government, which must somehow reconcile the Stalinist dogma of a feudal Chinese economy with large estate owners with the real state of affairs. It therefore sends to the local peasants' councils, which are to carry out the reform, an orthodox Marxian instruction defining the landlord as a person living on the rent of the land without working on it, and a kulak, as himself working on the land, but also hiring labour. At the same time the Government instructs the peasants' councils not to stick literally to these definitions but to consider the standard of life of each

person. A landlord living like a kulak, it is said, should be considered as such; and, in the same way, the kulak living like a "middle" peasant. This standard of life test is passed at a local public meeting. Thus to keep at least the appearance of a feudal Chinese economy it is necessary to supplement and even replace the Marxian definition of a person's class by his "place in production" by a more subjective and ethical test of his mode of life.

The new and softened land reform is to be progressively applied throughout the country. In 1950-51 it is to be introduced in regions with a total population of 100 million. In the meantime the Government tries to satisfy the peasants with cuts in the rate of interest and in rents. It also wants to avoid internal strife in the countryside while attempting to rebuild China's agriculture. Irrigational canals and dams had to be repaired and tools replaced before even the low prewar level could be reached. By 1949 the harvest of all grains was 112 million tons, by 1950 it was to reach 125 million tons, i.e., 90 per cent of a normal prewar level.

But even when both reconstruction and reform are completed the agrarian problem of China will remain acute. There are not enough large estates to satisfy the land hunger. For the moment it seems that the peasant is more grateful to the Government for the cut in rents and interest rates than for the land. Land reform cannot solve the peasants' problem, and the future of China's agriculture will be intimately connected with possibilities of land reclamation, developments of technique and particularly with the development of industry.

(Concluded.)

The End of Hungarian Socialism

[BY A CORRESPONDENT]

THE other week there was held in Budapest the second congress of the United Workers' Party, formed in 1948 by the "fusion" between the Hungarian Communist and Social Democratic parties. The proceedings of the congress, the personalities of the main speakers, the tone and reception of the speeches, and the election of the party's officials, all make perfectly clear what was in fact already obvious three years ago: that "fusion" was merely a pious understatement for the forcible conquest of an old and honourable labour movement by a Muscovite clique. Accounts by speakers of industrial progress and shortcomings referred to the problems described in *The Economist* of February 17th. The analysis of the agricultural situation, and of the prospects of collectivisation, was similar to that recently made by the leaders of the neighbouring "popdemocracies." Discussions of foreign affairs included the usual self-abasement before the great Stalin and the usual denunciation of American imperialism. The Minister of War, Farkas, blandly declared that Hungary's armed forces were being brought up to the limits set by the peace treaties, and asserted that the western powers were already training a German armed force of 600,000 men.

In the political committee of the party the only remaining former Social Democrat is "resident of the Republic, Ronai. During 1950 the 4... Social Democrats were removed from their posts in the government. Now they are excluded from even nominal prominence in the party. Hungary, since 1944, provides in fact, the perfect example of what happens to Socialists in Communist-ruled countries. Immediately after "liberation" the right wing of the Social Democrat Party, including its veteran leader Peyer, was purged. In early 1948 came the turn of the party's left and left centre, including such persons as Antal Bán and Miss Ann Kéthly, whose opinions might perhaps be com-

ANNOUNCEMENT BY ALMIN LIMITED

TWO OUTSTANDING STRUCTURES in Aluminium

by S.M.D. OF SLOUGH

This year has seen the completion of the two most outstanding structures ever attempted in aluminium alloy. We are pleased that our construction company STRUCTURAL & MECHANICAL DEVELOPMENT ENGINEERS LTD. of SLOUGH has played a leading part in the construction of each project; for the Ocean Terminal—the entire construction of the Telescopic Gangways; for the Dome of Discovery—the manufacture of the Main Arch Ribs which support the Roof, the Canopy and the Apron.

THE ASSOCIATED LIGHT METAL INDUSTRIES GROUP

Head Office:

pared with those of Mr Aneurin Bevan. After this the party was left in the hands of its Platts-Millses; the most important of them was the servile Marosan, who led it enthusiastically into "fusion." But only two years later Marosan was removed from the government, and even the complaisant President of the Republic, the former party leader Szakasits, had to give way to the still more subservient Ronai. Whether the disgraced leaders are still at liberty is not known. There have, however, been a number of arrests among lesser ex-Socialist collaborationists in the bureaucracy and the propaganda machine.

The lesson of Hungary should not be entirely lost in Western Europe. It is a warning to those in Western Germany who may still believe that co-operation with Communists is possible—a warning which seems likely to be reinforced by the purge of ex-Socialists now proceeding in the SED in the Soviet zone. It is a warning, too, to those elements in the British Labour Party who persist in believing that Communists are a kind of Socialist, that the Soviet Union is a friend, and that the United States is the capitalist enemy.

French Price Policy for Rearmament

[FROM OUR PARIS CORRESPONDENT]

WHILE the National Assembly has been debating electoral reform, the ministries have been examining the problem of subsidies for France's key industries—coal, electricity and steel. The *Charbonnages de France* are suffering from their wage-increase last November and the prospect of another one soon, from a rise in the freight charges of American coke, which they are importing at the rate of some 4½ million tons a year, and from the urgent need to plough back revenue for investment. *Electricité de France* must also build up capacity and in its case too wages will probably rise. The steel industry is likely to experience union demands and, even if it escapes them, will certainly feel the effect of the increased costs in the coal mines. In addition there is to be an increase in the authorised price of scrap which, because of its relatively low price, has been snapped up by foreigners. Another factor making for increased steel prices is the industry's desire to enter the Schuman single market with as much modern equipment as possible; the profits from higher prices, it is hoped, would make possible larger immediate investment. All these elements present a *prima facie* case for subsidies which is argued by the interested parties with all their habitual acumen.

The weight of official opinion is, however, against any substantial coal, electricity and steel subsidies. MM. Petsche and Faure who, with the Governor of the Bank of France, are chiefly responsible for the country's finances, point out that the value of money is depreciating the world over. France will therefore suffer no relative disadvantage in allowing prices to rise. Since rearmament inevitably means dearer raw materials everywhere and, unless the Washington commodity groups show a surprising turn of speed, there is little hope of a reverse trend soon; so it is as well—this school argues—to accept higher costs in France. Moreover, the fiscal problem of raising another 50 to 60 billions of taxes above the onerous increment voted last December would be well nigh insoluble. Apart from political opposition, the tax administration is incapable of surmounting the fraud that a further large increase in direct taxation would provoke. If, therefore, the budget is to be balanced, only indirect taxes could provide the revenue. But their further increase would be a calamity for the working class.

The case for subsidies is again weakened by the fact that a rise in the price of coal and steel would have nothing like a proportionate effect on the selling price of manufactured

consumer articles. In the small measure that these materials impinge on the family budget (electricity is indeed the only "popular" item among the subsidy candidates) it is probable that a rise in their price could be largely absorbed in the chain of production.

Argument Over Subsidies

But if the working class does not stand to suffer crucially from a rise in coal and steel costs, the entrepreneurs, public and private, do. For, while their own costs will have risen inescapably they will have no guarantee of being able to pass on this rise in an increased selling price. Hence their desire for subsidies which would enable them to peg their selling price and maintain their high rate of profit per unit of turnover (the fundamental vice of the French economy). Thus in the pursuit of subsidies there is an unholy agreement between the steel industry and the Socialists who, having introduced nationalised industry, would like it kept afloat. The latter, gaily advocating a dream-regime in which *dirigisme* reigns and the rich are soaked, skate lightly over the reality which is that subsidies can only be paid by the poor. In general, therefore, French officials are most unwilling to burden the taxpayer with heavy subsidies, such a charge being in their view unsound in principle, socially unjust and unfinanceable. Moreover, a subsidy to be useful must, in their view, be temporary and self-eliminating. With one exception neither of these conditions prevails. The exception is the case of imported American coking-coal which, it is anticipated, will soon be removed from European consumption. Here a subsidy of 7 or 8 billion francs should tide over the emergency.

One of the more telling arguments put forward by some officials is that France is not yet in a state in which too much money is chasing too few goods. Admittedly retail prices over the past six months have begun to rise: between June and December, 1950, for example, there was a 10 per cent increase in the Paris cost-of-living index. But there is little resemblance to the post-liberation years when stocks were desperately short and, above all, the population was plagued by the black market in food. Food is now abundant and prices of fruit, fresh vegetables and some other foods have remained stable, a source of sorrow to no one but the farmers. The lower income groups, far from bursting with purchasing power, are at present holding off the market because they lack the money to buy clothes, shoes and manufactured goods at the high price-level which a protectionist import policy encourages.

If there is little inflation yet, there is a strong likelihood of it when rearmament expenditure proper begins. For if the money demand resulting from higher wages is not met with a corresponding increase in the supply of consumption goods, prices will soar. Only two measures will counteract this tendency: a really bold import policy, which France with her excellent balance payments position may well withstand, and an increased national production of consumers' goods.

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

We've solved some problems in our time!

In 1942, peak period of Hitler's submarine campaign, came a request for batteries to operate wireless transmitters in the ships' boats of the Merchant Navy. Batteries that could be relied upon to give immediate service when needed, even if they had been standing by unused for as long as two years.

That was a problem. No such battery existed. Normally a filled battery progressively loses its power when idle and needs periodic recharging; an unfilled battery needs a lengthy first charge before it can be used.

Our answer was to produce the Exide self-priming battery. Its plates were dry charged, and sealed in a compartment separated by a thin diaphragm from another compartment containing acid. When the diaphragm was pierced with a punch attached to the battery, the acid ran on to the plates, and within a few minutes the battery was working at full strength—even after 2 years or more of inactivity.

Thousands of these batteries were supplied; and many a seaman owed his life to them.

We have been solving battery problems for over 50 years. Wherever batteries are used today you will find Chloride, Exide and Exide-Ironclad batteries giving good service in jobs for which they were specifically designed at a user's request. Our battery research and development organisation, the largest and best equipped in this country is now, as ever, at industry's service—ready at any time to tackle another problem.

The Basis of Agreement

Economic Literature Since the War

TO COMPARE, however roughly, the trend and colouring of books written since the war on social and economic subjects with the corresponding literature of the 1930s is to risk a judgment which may well be discredited by the passage of another decade. What looks like a marked change of direction may prove to be a deviation up a blind alley; an apparently significant concentration of opinion may be no more than a momentary convergence of interest and vocabularies. But from the vantage point of 1951, this change of direction and concentration of opinion appear unmistakable.

During the 1930s, writers in the social and economic field concentrated on two main themes: Poverty in the midst of Plenty, and the diagnosis and prevention of Fascism. While the labelling of Fascism as a disease and the desirability of stopping its spread were, with very few exceptions, common ground in Britain, on the question of poverty-in-plenty the moral and intellectual cleavage was apparently irreconcilable. In the field of theory the neo-classics, uneasily allied to a political Right most of whose measures they heartily disapproved, agreed in laying the chief blame for depression on departures from the ideal competitive economic order, on internal rigidities of prices and wages, on obstacles to trade, on monopolistic elements. The Socialists, in flat contradiction, hailed it as justification for Marx's prophecies or, at the least, for the analysis of J. A. Hobson. At less rarefied levels, the "Condition-of-the-People question" was ventilated by inquiries, whether detached or crusading, into the distribution of incomes, into nutrition, housing and the general standards of the unemployed and the underpaid—most attention coming from the Left and the distressing findings being used most frequently as a stick with which to beat the existing political regime. Those were the great days of the Left Book Club, of a Russia-worship only slightly flawed by the early purges, of a clear-cut conviction—on both sides of the intellectual and political dividing line—that the other side were utterly and rather contemptibly mistaken. They were also days, however, of agreement, transcending such division, on one general proposition: that the governing factors in a human situation, which all agreed to be unsatisfactory, were economic or, at most, political. In both these respects there has been a change.

In the past few years there has been a considerable blurring of the theoretical line between Left and Right. The orthodox have been chastened by the Keynesian explosion; having been forced to concede that even an ideally free enterprise economy cannot be counted on for stability, they have *ipso facto* conceded half the Socialist case. The Socialists, who were already in the later thirties inclined to treat with new respect that principle of consumers' freedom which they used to deride, have been forced by factual demonstration to jettison most of the other half; the claim to hold, in Socialism, the key to an enormous potential of productive power; the claim to be able to remove the root causes of international conflict; the claim that all-in planning is not merely rationally but practically a possible means of achieving the best use of available resources; above all the claim that public ownership can be equated with a new moral order. In such works as Professor J. E. Meade's "Planning and the Price Mechanism," or Professor Arthur Lewis's "Principles of Economic Planning" on the one hand, and Professor Lionel Robbins's "Economic Problem in War and Peace," or Sir Oliver Franks's "Central Planning and Control in War and Peace" on the other, there emerges a remarkable measure of agreement, which amounts almost to a new synthesis.

This common measure of agreement embraces the need for central control in the interests of stability, although how detailed a control, exercised through what organs, judging stability according to what quantitative criteria, remain debatable questions. It also covers the need for central action towards the reduction of inequality; again to what extent, by what specific measures, at what acceptable cost in terms of other desirable ends, being matters of disagreement. It accepts the individual consumer's freedom as a basic principle, and the circumscription of that freedom where needful (to an extent to be empirically, not dogmatically, settled) in the interests of the general public benefit, of equity, or of rapid adjustment to emergency. It accepts a division of ownership and authority between public and private agencies according to criteria on which agreement is no less substantial because of practically important differences of interpretation. This basic agreement does not mean perfect harmony and mutual trust. Those whose

Economic Fluctuations in
New Zealand: 1840-1914

by C. G. F. SIMKIN 18s. net

This book describes and explains the economic fluctuations that occurred in New Zealand from the beginning of systematic European settlement up to the outbreak of the First World War. It is based primarily upon an analysis of available statistics; in particular, those relating to external trade, banking and public finance. But the provisional conclusions which emerge from the statistical analysis are revised and considerably extended by using a wider range of historical material. In this way a connected account is provided of the course of fluctuation in a depended, and rapidly developing, economy.

intellectual pedigree is Conservative suspect their Socialist counterparts of a certain tepidness towards individual freedom; while the Socialists suspect their academic adversaries of an equal tepidness towards social justice and of undue readiness to demand of others a degree of versatility and responsiveness to economic stimuli which their avocations do not entail for themselves. In the works of Mr Thomas Balogh, one encounters demonstrations of righteous wrath and contempt recalling the best days of the twenties and thirties; while in Professor J. Jewkes's "Ordeal by Planning"—not to mention Professor Hayek's "The Road to Serfdom"—the Right has given quite as good as it gets.

There is no doubt that a common ground exists, in the field of economic thought, such as has not existed in this century; a framework of basic assumptions within which special studies fall into place as explorations of the essential data for an agreed policy. Among such special studies the most important on the theoretical side will probably, in the perspective of the next decade, be judged to be those on the causes of instability by Mr J. R. Hicks, "A Contribution to the Theory of the Trade Cycle," and Mr R. F. Harrod, "Towards a Dynamic Economics," both representing an advance from the static analysis of Keynes's "General Theory" to a dynamic consideration not only of monetary but also of "real" disturbing influences in a progressive economy. Professor D. H. Robertson, perhaps the most effective of Keynes's critics in the thirties, emphasises this return to the "real" in the postwar edition of his "Banking Policy and the Trade Cycle." Among studies of institutional structures three of special interest are Professor Sargent Florence's "Investment, Location and Size of Plant," Mr J. B. Jefferys's "The Distribution of Consumer Goods" and the late Professor Hermann Levy's "The Shops of Britain"—representing a type of work whose expansion would go far to meet the criticism that economic theory lives in an abstract world.

*

To describe postwar economic and social literature entirely in terms of a Left-Right rapprochement would, of course, be gross oversimplification. In the academic stratosphere controversies on the nature and assessment of economic welfare, as exemplified in Mr M. W. Reder's "Studies in the Theory of Welfare Economics" and Mr I. M. D. Little's pathbreaking "Critique of Welfare Economics" are on the contrary uncovering and making explicit a fundamental divergence of view on the criteria of economic success. This divergence, very broadly, is between the notion of economic welfare as an objective total capable, if not of absolute measurement, at least of ordinal comparison, and that of economic welfare as a function of distribution, entirely meaningless except in relation to the pattern of incomes in the society concerned. The political implications of this divergence are obvious, and obviously divisive rather than uniting. It is one thing to weigh

against one another "wealth" and "social justice," and reconcile their conflicting claims by rational compromise; it is another to confront the view that apart from "social justice," however defined, there is no such thing as "wealth" at all.

In some more specialised fields old controversies also continue or take on new forms. One—that between neo-Malthusians and optimists—has been conducted mainly in America and been echoed here only in ephemeral debate. Another, harder to define, is concerned in a variety of contexts with the issue of stability, its attainment and the value to be set upon it. In the international field Mr Thomas Balogh's "Dollar Crisis" states the extreme case for stability at all costs against a background of assumptions about distribution which, though unanalysed and violently partisan, have something in common with the meticulously objective conclusions of Mr I. M. D. Little and well demonstrate their explosive potentialities; Mr R. F. Harrod's similarly (though more politely) polemic book "Are These Hardships Necessary?" though keyed to the circumstances of the crisis year 1947, embodies the contrary thesis of the "dash for freedom."

*

In a sense the whole postwar literature of full employment, the Keynesian and anti-Keynesian controversy, is concerned in one of its aspects with this debate. It is apparent in such Socialist statements as Prof. G. D. H. Cole's "Economics of Socialism," as well as in the less partisan essay on "Overhead Costs" by Professor Arthur Lewis, where one main issue is the proper treatment of resources embodied in forms inappropriate to present demands. It merges here and elsewhere, indeed, with the main problem of the rationale of planning, and constitutes a major cleavage between points of view otherwise well on the way to reconciliation. Its immediate practical importance is illustrated by the lack of guidance in principle afforded to the Monopolies Commission, who are in effect asked to judge *in vacuo* which private stabilising devices are, and which are not, in the public interest. Here is a theme likely to be further discussed, possibly in more popular terms, in the next few years.

If there has been, on balance, a certain concentration and harmonising of opinion on economic questions since the thirties, there are signs of breakdown in the tacit agreement to seek for social explanations and remedies in economic terms. Today an increasing emphasis can be noted on sociology, on the relations within and between groups. This is explained partly by the shift in class relationships under the impact of war and postwar stresses and of equalitarianism, and partly by the growing urgency of the industrial human relations problems in conditions where simple carrot-and-stick economic incentives have been blunted and the scale and structure of industry simultaneously enlarged and complicated. "The English Middle Classes," by Mr

Roy Lewis and Mr Angus Maude, and perhaps Mr R. C. Churchill's "Disagreements: A Polemic on Culture" may stand as examples of the work inspired by the first type of change; much of the impetus for that concerned with the second comes from America. One may cite Professor Elton Mayo's "Social Problems of an Industrial Civilisation," whose influence can be detected in Mr Tredgold's "Human Relations in Modern Industry" and Mr Rattray Taylor's "Are Workers Human?"—this last exhibiting a significantly violent reaction against economic interpretations and even economic criteria. At the same time the typical "Condition-of-the-People" literature of the thirties finds its postwar counterpart in studies concerned less with standards of living than with ways of life; in such inquiries as "Eighty Thousand Adolescents" (Westhill Training College, Birmingham), Miss Pearl Jephcott's "Girls Growing Up" and "Rising Twenty," or Professor Zweig's "Men in the Pits," a study of the mining community and its *mores*. This trend has not gone nearly as far in Britain as in America, but it is unmistakable and, if periodical literature is any guide, likely to persist and increase.

**The Peasant and the
Townsmen**

Two Frenchmen: Pierre Laval and
Charles de Gaulle. By David Thomson.
Cresset Press. 256 pages. 12s. 6d.

At a time when a just estimate of France's motives and possibilities is so important Dr Thomson has done well to bring together into one study the figures of Laval and de Gaulle, those two poles of French philosophy and behaviour. Of the two figures portrayed by Dr Thomson, de Gaulle stands out more clearly in the imagination than Laval, a man so much more devious than either the General, his opponent abroad, or the Marshal, his master at home. De Gaulle's heroic faith in the allied cause in 1940; his fanatically tenacious grip on every French interest during the war; his aloofness from the starved and dejected French population after it—these are well known. Yet few realise the magnitude of Charles de Gaulle's personal decision in June, 1940. As Dr. Thomson shows, almost overnight de Gaulle, the soldier technician fretting obediently at the blind incompetence of his seniors, became the soldier-politician in open revolt not only against the military hierarchy but also an executive power, which he proclaimed illegal.

Laval is shown as a shifty *combinard* who nevertheless believed, or at least half believed, that in peace and in war he was serving his country. Laval's manoeuvres were neither the dodges of a place-hunter nor the intellectually defined tactics of an ideologist. They were the manoeuvres of a man whose only political principle was to place himself at the head of the main popular trend of the times and, by an almost oriental technique of assiduous lobbying, to seek the support of enough of the floating or the hostile to win the day. This utter renunciation of moral leadership won Laval all the chief ministerial posts of the Third Republic, including three premierships. In 1940 Laval, believing in a German victory and sensing the bankruptcy of the parliamentary forms, accepted the transference of power to Pétain as the one practical means of saving the bulk of French interests in a peace treaty. As German fortunes declined, Laval, never liked by Pétain and never liking him, still clung to the reins of power even, finally, at the cost of serving alongside out and out collaborationists such as Henriot and Déat. This mistake cost him the remains of his reputation and finally his life. Laval, a democrat in the literal and worst sense of the word, had certainly no taste for the *Etat Français* and the religiosity of Vichy. His aim was to tide over the German occupation and then restore the Third Republic, a regime to which he himself owed everything.

Laval was the incarnation of French peasant realism. He is dead and de Gaulle very much alive. It would be rash, however, to conclude either that France has seen the last of Lavalism. De Gaulle, "the man of the French towns," as Dr. Thomson rightly calls him, will continue to meet the resistance of much of that other France which is "the peasants' republic."

The World's Debate

A History of the Crusades. Vol. I: The First Crusade and the Foundation of the Kingdom of Jerusalem. By Steven Runciman. Cambridge University Press. 377 pages. 25s.

Writing in her old age, Anna Comnena summed up the First Crusade which she had witnessed by the side of her father, the harassed Eastern Emperor Alexius: "Europe was loosed from her foundations and hurled against Asia." Six hundred years later Gibbon ended his account of the Crusades with a lovely and penetrating phrase: "a mournful and solitary silence prevailed along the coast which had so long resounded with the world's debate." Both these authors realised the crucial importance in history of this impact on one another of the western world, half barbarian, half Roman in ancestry, and the eastern world, part Hellenistic, part Byzantine, part Arabic, part Persian. To this theme later historians have added another: how, in the crusading states of Syria and Palestine, feudal society can be seen as under a magnifying glass, trying to reach a solution to the problems of feudal organisation and at the same time to absorb an alien proletariat.

In spite of the importance of the topic, however, the writing of the history of the Crusades has been left largely to Continental scholars, especially to the French, who have a patriotic interest in the matter. Now Mr Runciman has brought his detachment and his magnificent equipment to the task—an equipment which includes intimate acquaintance with the sources in seven ancient tongues and the secondary authorities in as many modern languages. This volume, the first of three, paints the Middle Eastern background from the christianisation of the Roman Empire; the bulk of the book is a narrative of events from the Council of Clermont to the day when the able, unscrupulous Baldwin rode down from Edessa to Jerusalem to become the first king of the new state. On the way we have a vivid account of the early, abortive popular movements and their horrible end; the anti-Jewish pogroms which disfigured the European beginnings of the Crusade; the difficulties of the Emperor Alexius with the "nobles," Crusade; then we accompany the latter on each stage of their long, difficult fight to reach Jerusalem. The account of events is masterly: the innumerable contradictions and difficulties of the sources are resolved in a manner far surpassing that of Mr. Runciman's predecessors. His sympathies (as might be guessed from his earlier works) are throughout with the Byzantines and especially with that extraordinary man Alexius Comnenus. Nevertheless, the portraits of the western leaders are full, convincing and on the whole just.

This does, however, raise one issue of first importance: Mr Runciman's reluctance to answer the question "Why?" in any terms other than those of personal motives. To take one quite small example, the reader is left with the impression that Godfrey de Bouillon's assumption in 1099 of the title *Advocatus Sancti Sepulchri* was a personal choice, with no other cause than Godfrey's personal piety and humility; and the subsequent struggle over the control of Jerusalem is represented as a clash between the personalities of Godfrey and Daimbert, the papal legate. But the title *advocatus* is an important technical term which western feudalism used in defining certain relationships between secular and ecclesiastical authority, and by assuming it Godfrey and the laity were staking out a definite claim in the new organisation. The subsequent struggle with Daimbert resulted from this, and was not only a clash of personalities: it was a clash of ideas, a continuation of the unresolved debate on authority, its varying origins, forms and scope, which had been going on in Western Europe for over half a century. Again, in a wider sphere, Mr Runciman's answers to the questions concerning the deeper causes of the Crusade are somewhat disappointing. He does deal with such problems as land-hunger, or the idea of a Holy War, but sketchily: he leaves the impression that he is not so interested in western society, and is anxious to hurry his Crusaders off to the east he knows and loves. This lack of depth inevitably falsifies the narrative to some extent. For all that, Mr Runciman's is certainly the best history of the first Crusade and his succeeding volumes will be eagerly awaited.

To Arrest the Course of History

Mirabeau—A Study of a Democratic Monarchist. By Oliver J. G. Welch. Jonathan Cape. 356 pages. 18s.

A statesman's public and private life can often be neatly dissociated. Not so for Mirabeau. Unfortunately for him, as soon as the fascinating thunder of his voice died down the revolutionary Assembly could not bring itself to trust a man with such a reputation for venality and debauchery. Yet his disorderly past had certainly helped to put Count Riquetti de Mirabeau in the ranks of the bourgeois Third Estate. A bankrupt, an adulterer, and divorcé, disdained by the aristocracy, ignored by the Court, there was no outlet for his energy except to lead to attack on the existing regime.

His life before the Revolution reads like a romantic thriller. The pock-marked hero was ugly, but he was so irresistible that love affairs figure in his tale as prominently as prison sentences, exiles or debts. Mr Welch, however, shows, in this interesting biography, that all this time Mirabeau thirsted for political activity. He offered his services to England and Prussia, without success; from the French Government he only got an unofficial mission to Berlin; there seemed to be no scope for his abilities. Then came the Revolution. Acclaimed by the Commons of Aix, Mirabeau immediately imposed himself in the States General and leapt straight into history with his famous rejoinder: "... for we shall not quit our places except at the point of the bayonet."

In this revolutionary prologue, while the conflict of Commons versus Nobility was undecided, Mirabeau, Tribune of the People, was even ready to oppose the royal will. However, when the Commons won, and the States General became a National Assembly, Mirabeau began fearing for the monarchy. When others did not even contemplate a republic, he dreaded its advent, since for him republic spelt anarchy. The popular idol was a staunch monarchist and he showed it in September, 1789, by defending the King's absolute veto. Soon he was to receive money from the Court.

He hoped for an alliance between the King and the Assembly, now dominated by the middle classes, with himself as prime-minister. Hence he desired a governmental system on the English model with the ministers chosen from the Assembly. But the protagonists were not ready for an understanding and neither side wanted him as matchmaker.

Henceforth Mirabeau was fighting a losing battle. The Court listened only because it was in desperate straits and did not obey his tactically brilliant notes. Yet even if it had followed them it is very doubtful whether the projects would have succeeded. To defeat revolutionary Paris, Mirabeau advised the King to leave the town openly and appeal to the provinces (but not to foreigners) even at the risk of civil war. The Court dallied. Time was playing against Mirabeau. His plans became more devious: he now proposed to halt the revolution by Florentine methods of corruption. At the end of February, 1791, the Jacobins started an open attack on Mirabeau. The battle was never concluded. Sapped by excesses and worries Mirabeau died in April, still in his early forties, but at the right moment for his reputation. Barely two months after, the flight to Varennes marked the final divorce between the King and the Revolution.

Mr Welch contends that Mirabeau's attempt to introduce constitutional monarchy on the English model could have been successful in France in 1789. Yet the conflict between Nobility and Commons came much later in France and was incomparably more deadly. Monarchy had been a part of the feudal system and the Court was unwilling to adapt itself to a new situation. Louis XVI was beheaded, Charles X driven away before Louis-Philippe became a Bourgeois King. Mr Welch himself thus resumes Mirabeau's advice:—

"Instead of being trailed ignominiously behind the revolutionary car, Louis should be seen sitting within it, benign and stately and as much at ease as in the state coach of the old regime."

The Court could accept the temporary erasure of the feudal coat of arms; it could not resign itself definitely to a new coach. Mr Welch has written a very interesting and well documented life of Mirabeau as a man. To prove his wider point Mr Welch would have needed to abandon for a moment his hero, to analyse the social conditions of France, the temper of Paris and to show how, at this late hour, a conflict between the old and the new forces could have been avoided. This would be a far harder task.

Facts and Fluctuations

Business Cycles and National Income. By Alvin H. Hansen. W. W. Norton, New York. 639 pages. \$6.75.

The appearance of this book is a reminder of the way in which the study of business cycles is acquiring, in American universities, the dignity of a separate branch of economics—a status which it is hardly likely to attain in Britain, but which is natural enough in the American setting. What Professor Hansen is here offering is a comprehensive text-book for use in such courses; and there is certainly no one who is better able to produce what is wanted for that purpose. But it must be confessed that this particular orientation is a little daunting to the English reader, since it makes for great length, and for the combination in the same volume of much elementary platitudes with other material of an advanced and specialist character.

The book is divided into four parts. Part I contains an excellent summary of the facts about the fluctuations in American business from the end of the Civil War to the present day. There is no doubt that this summary will be useful to English readers, though one may regret, from the point of view of the American public, that the emphasis is so exclusively American; more attention to the experience of other countries, and to the international aspects of the cycle, would have been an improvement, both here and in other parts of the book. Part II is a straightforward account of the Keynesian theory of income and employment, with accelerator added, in the manner of Professor Hansen's earlier books. Part IV, on policy, contains nothing particularly new. These three parts form a sound, but not at this time of day particularly exciting, elementary text.

Nearly half of the whole volume is, however, occupied by Part III, which is a history of cycle theories, or rather of the ideas which have gone to make the modern theory of the cycle. Nothing quite like this has been done before, and it deserves attention from many people who will not have much to learn from the remainder of the book. What Professor Hansen has done here is to provide the modern theory with its pedigree—a much more respectable, and much more believable, pedigree than that of the "brave army of heretics" and mercantilists whom alone Keynes was willing to recognise as forerunners. Instead of standing out in the splendid isolation that Keynes gave him, Malthus steps back into the shadow of a clearer thinker, Lauderdale, while the influence exercised by both upon J. S. Mill is not denied. It is, however, admitted that this first group of effective demand theorists left no successors; the continuous development begins much later in the century. The real originators are Tugan-Baranovsky (1894), with his insistence on the part played by investment in fixed capital in the causation of fluctuations, and Wicksell (1898), with his workable model of an economic

system which was not inherently stable. From these beginnings development was really (now that we can look at it with a little perspective) remarkably steady. Minerva did not spring ready armed from the head of Jupiter; she was, after all, born and brought up the natural human way.

Professor Hansen has given us an excellent survey of all this literature; but he has not inquired very far into the fascinating historical problems raised by his story. During the last century the character of the cyclical fluctuations experienced has undoubtedly undergone changes. How far are the changes in the theories a reflection of real changes in the phenomena which economists have been trying to explain? How far, also, are they a reflection of changes in economists' knowledge of the phenomena? The importance of this last must surely be very great indeed. Is it surprising that nineteenth century economists paid so little attention to unemployment when they knew so little about the facts of employment percentages? How much does the multiplier theory owe to the labours of national income statisticians—Keynes to Bowley and Colin Clark?

It All Depends

Relativity—A Richer Truth. By Philipp

Frank. Jonathan Cape. 124 pages. 7s. 6d.

Science, Sense and Nonsense. By J. L. Synge. Jonathan Cape. 156 pages. 8s. 6d.

In the great days of the BBC Brains Trust many listeners were infuriated by the famous formula "It all depends what you mean by..." This seeming inability to give a straight answer to a straight question was widely regarded as a rank depravity; whereas it was possibly the most consistent piece of good sense exhibited in these broadcast discussions. The habits of detached inquiry and qualified statement were, and are, widely held responsible for the demoralisation of Western civilisation and its weakness in the face of aggression, through their undermining of faith in "absolute values"; the allegedly exaggerated role which science has played in modern thinking was denounced as the cause of this deterioration of morale.

Professor Frank champions the opposite view, that "absolute values" are a delusion, leading only to contradictions and irreconcilable quarrels. At best they have to be so qualified and interpreted as to lose all absolute quality; and at worst they degenerate to slogans or battle-cries, divorced from any real meaning, in whose name all kinds of evil are perpetrated. He holds firmly to the doctrine of logical empiricism, based on the pragmatism of C. S. Peirce and William James, that the whole meaning of beliefs and statements is contained in their concrete consequences; a so-called "absolute" truth is meaningless except in relation to particular sets of circumstances. This is the "relativity" he defends, and whose application in philo-

sophy, ethics and politics he very persuasively urges.

The methods of science are, essentially, agreement on methods of verification, and then agreement on a body of known facts. No arguments about absolute principles, nor attempts to justify them by reason or revelation, need deter this start. General principles, at first limited in scope, are framed to embrace the known facts, and are tested by their ability to predict hitherto unverified facts. If they fail to embrace newly revealed facts, they need amending until they do; and so acquire a correspondingly wider validity. It is putting the cart before the horse to lay down the basic principles before elucidating the facts, yet this is the common rule in ethics and politics. "Absolute" systems must in the end either retire behind a screen of ambiguous words; or else reinforce their prestige by discouraging the investigation of facts and the detached examination of their basic principles. History, both past and present, has examples enough to show that science is the enemy of totalitarian systems.

Scientific investigation is based on a belief in the "rationality of nature." This is, in fact, not a belief about nature, but about ourselves—that the patterns which are revealed in the phenomena of the world will continue to seem rational to us. This correlation between nature and the human mind is what Einstein calls "cosmic religion"; and Professor Frank ends his book with a discussion of its relation to the orthodox religious faiths, and to the scientific empiricism he has outlined. Einstein himself best sums up the argument: "Ethical axioms are found and tested not very differently from the axioms of science. Truth is what stands the test of experience."

The cynicism and slapstick of Professor Synge come as light relief after Professor Frank's earnestness. His aim seems to be to show how many pitfalls there are in the business of passing ideas from one person to another, and how rickety the whole structure of modern scientific knowledge is, regarded on a logical basis. To which the reader can cheerfully reply, with the author's blessing, "Who cares?" He begins with a good smack at words, which are derided as mere links for the construction of meaningless vicious circles. Mathematics, in its present highly purified state, is conceded to make fairly good sense. But mathematics and reality are in no way connected; and Professor Synge is shocked at the callous indifference to the rules exhibited by mathematical physics in its attempt to explain reality.

Some entertaining interludes of Shavian buffoonery are provided; in particular, the browbeating of Euclid by the street urchin of Alexandria, is delightful. Unfortunately, they do not all seem to fit successfully into the argument, and the author rather ruefully predicts some puzzlement in the reader. Again, "Who cares?" The sense and the nonsense can be portioned out to suit each individual reader; the book has plenty of both.

The Little King

The Man of Independence. By Jonathan Daniels. Gollancz. 384 pages. 18s.

This is a lively and affectionate biography of the President of the United States. It tells the latest American success story: how a penniless, bespectacled little fellow from Missouri, who at sixteen could not decide whether to be a pianist or a soldier, made his way up to the White House. The author is himself a militant Democrat from a militantly Democratic southern family, and his book was written with Mr Truman's help and approval.

The greater part of the book is about Mr Truman's relationship with the allegedly corrupt Democratic "machine"—the administration which governed Kansas City and its surroundings when Tom Prendergast was boss. Mr Daniels makes no effort to conceal the fact that the "machine" brought Mr Truman into politics. He argues, however, that the Prendergast leaders depended ultimately on a popular vote and that Mr Truman, an ex-farmer, a veteran of World War I and an active member of a Masonic lodge, was always more help to them than they were to him. He shows how Mr Truman applied his principle that "honest administration is good politics," and how he served eleven years in a corrupt local government and worked forty months as chairman of the widely publicised Senate Committee on wartime expenditure, emerging with an immaculate record which even his worst enemies have never dared to challenge. When he arrived in Washington in 1933 Mr Truman is believed to have been the poorest senator in Congress. Mr Daniels takes 1936, the year of Tom Prendergast's arrest, as the dividing line in Mr Truman's career: until then his association with the "machine" was an asset, afterwards it became a liability.

Only a small section of the book treats of Mr Truman as President. The author gives a warmly sympathetic account of the origins and principles of the domestic "Fair Deal," but says little about what happened to it. On international affairs he admits that President Truman knew nothing whatever when he was suddenly called to succeed President Roosevelt in 1945. He describes how the new President worked on the assumption that foreigners must be fundamentally rather like the people back in his home county, and he quotes Mr Truman's view after the Potsdam Conference that Joe Stalin was more like Tom Prendergast than any man he had ever known. He also recalls the President's famous comparison between Stalin's supposed troubles with the Politburo and his own difficulties with the conservative Eightieth Congress. Later, when things went wrong, he was angry as well as surprised.

For the British reader, unfamiliar with American institutions and personalities, parts of the book may be muddling. Mr Daniels assumed more background knowledge than non-Americans would normally command. The British edition might have been still more readable if it had been either abridged or annotated.

UNITED NATIONS

NEW UNITED NATIONS' BOOKS:

**Yearbook of the
United Nations 1948-49**

The third volume in a distinguished series, the Yearbook presents a full and authoritative record of the work and accomplishments of the United Nations from September, 1948, to December, 1949. A full section is devoted to the achievements of the specialised Agencies during this period.

Palestine, Indonesia, Kashmir, Berlin, Human Rights, and Technical Assistance to Under-Developed Areas are among the important U.N. activities covered by the current Yearbook.

The Yearbook reprints key documents and resolutions and contains a full index.

A reference volume of permanent value to public officials, scholars, librarians, diplomats, editors, teachers, students, etc.
1,171 pp. Cloth Bound.
£4.10.0. (1/6d. postage.)

United Nations' Publications may be obtained from:—

H.M. Stationery Office (P.O. Box 569, London, S.E.1)

or through any bookseller.

Everyman's United Nations

A new and revised edition of a popular reference guide to the structure, functions and work of the United Nations and its related agencies.

In the economic, social and legal as well as political fields, the U.N. has made headline news. Everyman's United Nations summarises the achievements in each of these fields from 1946 to 1950 and in addition contains important chapters on the origin, structure and administrative machinery of the various United Nations bodies.

Everyman's United Nations has been designed as a compact and conveniently arranged source book of essential information about the United Nations and the Specialised Agencies.

313 pp. Paper Bound. 9s. (4d. postage.)

The Sunday Times TRAVEL AND HOLIDAY GUIDES 1951

**THE
BRITISH ISLES EDITION**

Holiday suggestions of every kind everywhere in England, Scotland, Wales, Ireland and the Channel Islands. Where to stay—details of more than 3,000 Hotels. Comprehensive Guide to the Festival of Britain with many maps, plans, etc. 600 pages. Full cloth bound, with numerous maps and drawings.

**THE
CONTINENT OF EUROPE
EDITION**

A complete and up-to-the-minute survey of travel and holidays on the Continent. Resorts, hotels, restaurants, motoring, information, maps, road signs, useful language phrases, food and drink. Every section newly composed. 600 pages. Full cloth bound, freely illustrated. Many useful maps.

**10/- EACH VOLUME
FROM NEWSAGENTS AND
BOOKSELLERS**

In case of difficulty copies may be obtained direct by post—10/6 each volume, post free—from the Publisher, The Sunday Times, Kemsley House, London, W.C.1.

HAMISH HAMILTON LTD

Books by the Million

[BY A CORRESPONDENT IN NEW YORK]

There are about three hundred publishers in America. They are mostly in New York and Boston, but the growing number of university presses is tending to scatter the industry. Big houses are the exception, and the trade is full of able men who prefer to work with their own small list of authors and who manage to do it without falling too far into debt to printers and paper companies. The most drastic change this year is in that the old and famous house of Macmillan has cut loose from its British connections and become an American public company.

Given the industry's aversion to statistical inquiry, the Department of Commerce figures on editions published annually, and money spent for them by the consumer, provide the best rough measure of the dimensions of American publishing. In 1949 the country spent \$636 million for books and maps, a slump from 1946 when the figure was \$739 million, but a rise from 1942 when it was only \$317 million. For this money, the publishers issued a total of 10,892 editions including new books and reprints. In 1950 the figure was 11,022, crossing the 11,000 mark for the first time since 1940. (This figure compares with the British figure of 17,034 editions for a population only a third as large, but it can be argued that the American market for periodicals is far larger than the British, and that popular readership moves in that channel.)

Within those figures of total sale no official details are available. An informed guess by Mr J. K. Lasser, accountant to the trade, is that textbooks make up the single biggest fraction, with about \$179 million spent for them in 1949, mostly by states which distribute them free in elementary and secondary schools (\$65 million of it was spent by students themselves for college textbooks). The next big fraction, \$160 million, went for the general run of trade books, and \$100 million was spent for paper covered volumes and "juveniles" selling at under a dollar. The other great categories—book club sales, religious books, technical and scientific books, the output of subscription houses and university presses—account for the rest.

The spectacular forces in the industry are the book clubs (an advertising euphemism for a highly efficient distributing system) and the cheap mass-produced volumes bound in brilliant paper. Both of them represent a revolt against the musty air, bad manners and slow service of the traditional bookshop. Both aim to move more books into the hands of more people faster. Both claim cultural ideals and influence. Both arouse envy or dismay in the traditional publisher.

Actually, the difference between them is far greater than these similarities would indicate. The book clubs came first and secured a public in the millions by making the buying of books an almost painless process. The "book of the

month," chosen by a jury of impeccable qualifications from among the offerings of all publishers, comes to a member automatically unless stopped in advance, with the purchase price slightly less than he would pay his regular bookseller. Moreover, membership in such a "club" has been loudly proclaimed to indicate social status, and this, in a fluid society, attracted members who could afterwards be held by the convenience of the plan. The influence of book clubs on publishing in general is much debated. Since 1947, when the largest of them sold \$18 million worth of books, their influence has seemed to wane. However, the clubs still do a thriving business.

The paper-bound reprints, old as Tauchnitz in Europe or dime novels in America, entered their new and very different phase about 1937, when Penguin Books came from England and Pocket Books were launched. In 1949 the market absorbed 184 million copies, and the sale in 1950 is said to have reached 200 million. They sell for 25, 35, or 50 cents a copy, the price depending on bulk. They too have, in some instances, pretensions to cultural value, but these are ideals in their publishers' breasts, and not primary elements in their popularity. The success of the business depends on the economies of mass manufacture, and of a mass distribution scheme very different from that of the book clubs. They are distributed by the same firms and the same methods that distribute weekly and monthly magazines across the land.

This operation bears little resemblance to English cheap edition business. Competition for desirable items is keen, and the profit to the original publisher as well as to the reprinter may be large. The successful reprinters have now reached the point where they can "plant" a desirable manuscript with a house of first issue, paying part of the cost of first publication in order to assure themselves the reprint rights after a reasonable interval.

The stand-bys are mysteries and Westerns, but the trade is experimenting with an increasing number of "good" books. Bantam Books, Pocket Books and the successor to Penguins, the New American Library, all report considerable success. Sales of "The Naked and Dead" passed half a million, Homer's "Odyssey" and a well known treatise on anthropology sold 300,000 or more. But Mr Walter Lippmann's "Public Opinion" only sold 50,000—and any volume selling less than 100,000 is a failure in this trade. Twelve titles by famous American novelists piled up a joint sale of 32 million. The revolution represented by such figures is too new to have been adequately analysed for causes and effects. Meanwhile, however, it shakes the peace of the individualists in publishing at the same time as it falsifies the arguments of pessimists that radio and television have robbed the public of the power to read.

Catholicism in America

Freedom and Catholic Power. By Paul Blanshard. Secker and Warburg. 318 pages. 16s.

There are some books which are more important for the treatment they are accorded than for what they contain. It is no depreciation of Mr Blanshard's book to put it in this class. Portions of it published as articles in the American weekly, *The Nation*, provoked the banning of that magazine from the libraries of New York high schools and the subsequent verbal duel between Mrs Roosevelt and Cardinal Spellman. The book itself, despite its large sales, was passed over in a curious silence by most American journals. The furor is indicative of the hair-trigger sensitiveness of the American hierarchy; the silence testifies to the reluctance of even a predominantly Protestant America to air the social and political implications of Catholicism.

Yet there is as little in Mr Blanshard's book to surprise as there is to offend. The moderation of his language is matched by the essential familiarity of his facts. Very few of his pages should startle anyone acquainted with the principal tenets of the Catholic faith. Any element of shock or urgency which his argument has acquired comes from the accumulation of factual evidence and from his demonstration of the process by which American Catholicism is moving from the position of a minority sect to that of an aggressive pressure group. In the course of that transition the latent social and political implications of Catholicism are coming to the surface—and that is all. The behaviour which Mr Blanshard outlines in the fields of education, medicine, sex, the arts, learning and international relations follows naturally from the two assumptions of having a monopoly of truth and denying the right of private judgment.

"The growth of Catholic power in America," he says, "is part of the Irish success story." He might have gone further and said it was one aspect of the American success story itself from its humble beginnings in an obligatorily tolerant Maryland to its triumph in an aggressively intolerant Massachusetts, from being a socially despised sect of a few thousand immigrants to becoming a national church with 26 million members, exercising a veto power over a large area of public affairs. And of this growth the most sensational period has been crowded into the last half century, which has seen the American Roman Catholic Church pass from being a mere missionary outpost of Rome into being by far the wealthiest and all but the most powerful national component of world Roman Catholicism.

Mr Blanshard sees the spearhead of the Catholic attack in the assault on the public school system. Historically he is certainly right. Take away the public school system and the melting pot becomes a powder barrel. But it is indicative of a certain *naïveté* in his philosophy that he does not realise that the logic of the public school system—that all should be obliged to attend—is as totalitarian as the logic of the parochial school and that its totali-

tarianism is not modified a whit by the "democratic" principle that the parents may sack the school masters.

The same holds true for a good deal of what he has to say about Catholic teaching and practice in respect of marriage and birth control. Once the right of the Church to lay down rules for its own members in these fields is admitted—and it can hardly be denied—then its consequences for private individuals, however extraordinary they may appear to an outsider, must also be accepted as permissible. For this reason it would have been better had Mr Blanshard confined himself to the way in which the Church has extended its policy in these fields to encroach on the public areas of the law and the press. It is where he comes to deal with the effects of Catholicism as an instrument of censorship and boycott that he is most impressive and disturbing. Although the Church at present concentrates upon the instruments merely of mass persuasion like the cinema and the radio, the techniques and the pressure here depicted are capable of equal application to other levels of expression and communication.

The Mysterious Sign

English Inn Signs. By Jacob Larwood and John Camden Hotten. With a Chapter on the Modern Inn Sign by Gerald Miller. Chatto and Windus. 336 pages. 42s.

Larwood and Hotten's "History of Signboards" first appeared in 1866. There were successive editions down to 1907. Now Messrs Chatto and Windus (who descend from Hotten's publishing firm) have produced in this very handsome volume a completely revised and modernised version of the standard work.

It is difficult to believe that there can be anything more to be said about inn signs. And yet the impression left upon the reader's mind is likely to be how little is really known about the origins of many of the most familiar signs. For example, it is easy to say that the White Hart was the badge of Richard II. But why was that weak king, whose reign was short and turbulent, commemorated by so many more taverns than any other monarch? Why was the Marquis of Granby so often preferred above other sporting peers? Even some of the more abstruse explanations, of which everyone knows a few (for example, that the Goat and Compasses is really "God Encompasseth Us") seem improbable when examined. The Cat and Fiddle has been interpreted as *le chat fidèle* or *Caton le fidèle* (he was Governor of Calais) or even *Catherine la fidèle* (of Aragon). But the explanations end with "probably merely from the nursery rhyme." Probably, indeed—but there are others for which no probable explanation suggests itself. The Shoulder of Mutton and Cucumbers at Yapton in Sussex is attributed simply to "an epicurean publican" and his "gastronomic combination." Larwood and Hotten know all there was to be known about inn signs; but they were clearly not authorities on gastronomy.

The Smile of the Absent Cat

Essay in Physics. By Viscount Samuel. Blackwell. 154 pages. 7s. 6d.

Exactly a hundred years ago Lotze started his protest against scientific dogmatism. His training in the exact sciences made him their critic when he sought to reconcile his aesthetic judgments with the demand to limit man's knowledge to what he can measure. With Kant as his prophet, Lotze countered both the intellectual arrogance of Hegel and the materialism of science. Today Lord Samuel repeats to modern science the challenging thoughts which have remained unattended for a century. He has provided the challenge for which the twentieth century has subconsciously been waiting. How can mathematics claim to be more than a mental treatment of symbolic measurements of what science calls "the observables"? How impossible it is to conclude with science that "unobservables" have no significance for human understanding. "It is to the realm beyond the range of scientific observation that we may now be well-advised to devote our special attention."

Newton said "*hypotheses non fingo*," yet himself went on to advance theories which postulated an "ether" throughout space. From this, Lord Samuel traces the scientific need for an "ether" and points out that the space-time continuum of Relativity is really an alternative name for an ether.

The fact is that the old fixed notion of ether collapsed because it had materialistic connotations whereas the new belief in the need for an ether does not require any such materialistic implications. There is, for example, the need to explain, first, the nature of electromagnetic radiation and the medium for its transmission, second, the nature of gravitation and its propagation and, third, the nature of motion and momentum.

Such problems necessitate a new notion of an ether which will reconcile the basic problems of modern physics; these hinge on the notion that electrons have both a corpuscular aspect and an undulatory aspect. That is to say that energy changes or transmissions are manifested either as waves or as particles. The two concepts appear contradictory but "yet physics has to stumble along and work with them both."

Lord Samuel breaks through with a new proposition which he clearly offers only as a tentative approach. For him there must be an "ether" which may well be a continuum of energy—and energy can change from a state of quiescence to a state of activity or *vice versa*. "Quiescent energy is conceived as a continuum, and as the sole physical constituent of the universe. All material events are to be accounted as cases of the activation of quiescent energy." There is postulated a "two-state ether" which is basically in the quiescent state but is subject to activation manifested either as waves propagated spherically or

as particles in linear projection. "Matter is clotted ether."

The system has to be accepted as an existing fact. It is impracticable to pursue the infinite regress and explain how this two-state ether came into existence; we can but observe its activation as the vehicle of the processes of the physical universe. This is in line with Lotze's conception of the physical universe as a whole which moves through its processes with variations corresponding to the theme of its "melody"; within this setting, Reality holds its mental and physical counterparts in reciprocal interaction.

For Lord Samuel, the conception remains of an all-embracing universe which we picture as "an ocean of energy in a state generally of quiescence, but with waves of radiation constantly flickering in it; and numberless particles forming and either enduring or dissolving." His treatment of space and time is in line with Kantian phenomenalism but now the emphasis is not on space and time as individual aspects, but on the space-time continuum itself as a mental interpretation of the two-state ether. He concedes the basic fact of causation but yet asserts, with Lotze, that freedom of will can be maintained in control of it.

There has been a growing revolt over the last fifty years against the failure of science to explain the basic notions it so readily employs. And yet the wheel must go full circle again; Lord Samuel's essay into physics is brave but can only claim serious consideration if it survives critical examination by the mathematicians. They are the custodians of the mental "drawing board" where the pioneering speculations of the philosopher-physicist must be validated.

Whatever the outcome, it cannot destroy the fundamental value of Lord Samuel's philosophic onslaught on the bastions of scientific credulity which masks ignorance by the use of terms having no real significance. It is, indeed, an encouraging sign that a note could be enclosed in this book written by Einstein and commenting on the impression attributed to Lord Samuel "that contemporary physics are based on concepts somewhat analogous to the smile of the absent cat."

Art and Allegory

Chaucer the Maker. By John Speirs. Faber. 222 pages. 12s. 6d.

This book was written with the purpose of revaluating the work of Chaucer for the modern reader. The author holds that a taste attuned to the complexities of Shakespearean metaphor may be disconcerted by the very immediacy and simplicity of Chaucer's similes. He believes that the art and vision of his poetry cannot be understood without an appreciation of the expanded metaphor of

Shakespeare and the expanded simile of mediaeval allegory—for even those poems which present the human comedy as directly observed, as *Troilus and Criseyde*, still have their origin in allegory and personification which "provided Chaucer's observation with an initial guiding method and his judgment with an initial scale of values."

Mr Speirs warns his readers against mistaking the deliberate discipline of a profound and civilised sympathy for a "primitive unsophisticated naïveté, however charming" and distinguishes between early Elizabethan rhetoric, which was an embellishment, and mediaeval rhetoric, which was a particular conception of the art of literary expression carefully formulated by the schools, which Chaucer either used as a basic form or parodied at will. He also stresses the advance made on the French and Italian originals, which were enriched with a distinctive English sensibility by Chaucer, who was both the fine flower of his own age and the pioneer of the new realism which was the foundation of our modern drama, novels and poetry. He stands at the parting of the ways, taking leave with the "Boke of the Duchesse" and the "Parlement of Foules," and looking forward with "*Troilus and Criseyde*" and the "*Canterbury Tales*." All this is stimulating and provocative—although the approach is less revolutionary than one is led to expect—and the many and appropriate quotations are given in their originals, so that one may rely on common sense and a feeling for rhythm without being fobbed off with distressing translations.

It is a pity that confidence in the reader's discernment was not further extended. It is of the essence of enjoyment of Chaucer wholeheartedly to enter his world of courtly gesture and countering yeoman robustness, and to follow him without preoccupation through tapestried gardens of dalliance, into cloudlands of fantasy and back to the highroad of reality, so that we become of the company of the "yonge fresshe folkes." But just as we achieve this enchanting metamorphosis we are nudged back by an intrusive comment. When we are savouring the hidden wink in:—

"O Crist," thoughte I, "that art in blisse,
Fro fantom and illusioun
Me save!" and with devocioun
Myn yēn to the heven-I caste.

we are brought up short by a *sotto voce* gloss that "Chaucer's rational intelligence and his religious feeling are in no way antagonistic." And it is maddening to be jerked from contemplation of Emily, singing like an angel as she gathers flowers at sunrise, by the observation that "the freshness and naturalness of the clear visualisation of the young girl springs from the comparison with the flowers." Surely Chaucer enthusiasts may be credited with some gumption?

Such persevering commentary would be excessive even in a text-book. Chaucer wrote for a leisurely, gossiping society of considerable erudition and sophistication, and his conversation pieces were for reading aloud.

The Nature of States

An Introduction to Politics. By R. H. Soltau. Longmans. 328 pages. 16s.

The first excellence of this book lies in the fact that it fulfils the promise of its title. It poses the principal problems which occupy the minds of political scientists and which beset practitioners and observers of the art of government; it examines the varying answers which have been given to these questions in different times and different places, in theory and in practice. The book's second excellence lies in the skill and clarity with which these problems and answers are presented. It is an easy book to read. This is not to say that Professor Soltau has represented as simple things which are far from simple. He has, however, succeeded in making readily intelligible things which are clearly shown to be always serious, often complex, but not essentially abstruse.

The first third of the book is expository. Professor Soltau's first question is: what is politics? Thence he turns to the size, shape and climate of states, to the quantity and quality of their population and to distinctions between the state and society; he sketches the history of the state from its earliest discernible origins; he treats of law, justice and sovereignty; and he explains how a state actually functions. Therewith he concludes his "survey of the essential characteristics of any political organisation or state, irrespective of its particular form," and turns to the differences between states. These differences are, in his view, ultimately only aspects of a single question:

"how much of the common life shall be organised and directed by or through the state... how much of a man's life and activities shall be legally controlled and guided, how much shall legally be left to his own initiative?"

This leads to a discussion of Freedom and Rights as a prelude to the core of the book, which consists of six chapters on the Free Democratic State. The first of these deals with the bases of democracy. It is followed by a well proportioned account in three chapters on democracy at work—the expression of the will of the people (elections and representation), the organisation of the will of the people (political parties), and the implementation of the will of the people (organs of government). The theoretical and ideal picture inevitably drawn in these chapters is supplemented by a discussion of the principal problems and duties of the Free Democratic State. Among these problems are the slowness and dullness of democratic processes, the increasing size of the modern state, problems of leadership and of pressure groups, the possibilities of abuse of power. The duties fall into three categories: essential duties such as the maintenance of order, inessential but practically universal duties such as public education, and controversial duties such as the extension of the state from the domain of control into that of action. Professor Soltau concludes that democratic practices are difficult to learn but can be learnt; for him democracy is at present only in an experimental stage.

A famous 'family'

For the industrialist and banker, student and writer, the HARRAP STANDARD FRENCH AND ENGLISH DICTIONARY is indispensable for complete and perfect exchange in the French and English languages. In two vols. (French - English 45/- net; English-French 66/- net). The latest edition, just printed, contains a supplement (also available separately at 7/6 net).

From the *Standard* are descended the *Shorter*, *Concise* and now *Pocket* versions. The *Pocket* is a handy one-volume work for day-to-day reference by all who use French in correspondence or conversation, and costs 6/- net.

GEORGE G. HARRAP & CO. LTD

The Great Globe Itself

The Origin of the Earth. By W. M. Smart. Cambridge University Press. 239 pages. 12s. 6d.

The only doubt about this book is whether the title adequately conveys to the reader the scope and variety of the subjects which it covers. A discussion of the "whence, when and how" of the origin of the earth is indeed the recurring theme, but it is impossible to consider the origin of the earth without considering also the origin of the solar system and the other planets with their satellites. This discussion must in turn involve some consideration of the other stellar systems, or at least of such features as the "time-keeping" Cepheid variables and the theory of the expanding universe. And in the other direction it is not possible to study the origin of the sun and its planets without embarking on an investigation of the nature of matter. As a result Professor Smart is led insensibly to cover almost the whole ground of astronomical and physical science, as well as some part of geology, and he does so in a masterly and most attractive manner. The volume invites comparisons with the brilliant works of Jeans and Eddington in the thirties, but every generation needs its Jeans and Eddingtons, and Professor Smart covers not only the same fields as they did but includes many researches and hypotheses which have been put forward since their time.

His provisional answer to his first question, "Whence came the earth and the other planets?" is that they must have come into existence as the product of some single cosmic process. The piecemeal growth of the solar system by fortuitous capture from the world of space cannot be seriously entertained in the light of the uniformities of orbital and rotational motions. It is not unlikely that the origin of the planets is to be sought in the sun, though it is possible that the planets may have been torn out of, or by, some star now roaming in the depths of space during a passage near to the sun. The answer to the second question, "When?" can be almost as definite as Archbishop Ussher's, though with far more reason: the earth and the rest of the solar system came into being about 3,000 million years ago. Geology demands an age of at least 2,000 million years for the age of the earth. Professor Smart treats with great respect Kelvin's famous arguments showing that, on all the physical facts known in his day, the earth could not be more than 100 million years old. It is radioactivity that has reconciled the arguments of the two sciences, and there is a nice account of a lecture given by Rutherford on the subject and attended by the aged Kelvin.

The answer to the last question, "How?" cannot be anything like as definite in the present state of knowledge. In 1796, Laplace put forward his theory that the sun threw off rings, like those of Saturn, which coalesced into the present planets, but there are now insuperable objections to this theory. Other theories examined are that a passing star formed great tides in the sun, allied to which is the Chamberlin-Moulton theory that the planets were

drawn out from solar protuberances; Jeffreys' suggestion that the planets were ejected in a grazing collision; Ross Gunn's notion of an encounter with a rapidly rotating sun already at the point of instability; von Weizsäcker's recent hypothesis of the passage of the sun into a comparatively dense interstellar cloud of gas and dust particles; Alfvén's explanation of how matter would accumulate in the sun's equatorial plane if the sun is assumed to be immersed in a cloud of ionized atoms; and Mr. Hoyle's hypothesis that the planetary system is a by-product of the explosion of a super-nova. Professor Smart shows himself to be in the true succession of Jeans and Eddington when he affirms the saying of Francis Bacon (whom he strangely calls Lord Bacon), "I had rather believe all the Fables in the Legend and the Talmud and the Alcoran than that this Universall Frame is without a Minde."

The Charm of Birds

Birds and Men. By E. M. Nicholson. Collins. 256 pages. 21s.

"Birds and Men" is the first book in the *New Naturalist* series to deal exclusively with British bird life. It is concerned with the effect of man's work on the birds of these islands and considers how "in shaping the landscape of Britain we also shape the bird life." The effects are amply illustrated in the life-histories of more than thirty birds whose habitats are coincident with the main centres of human activity—towns, buildings, farms and gardens. The changes that result from the march of towns and industry are far-reaching but they are by no means always harmful.

In the short run there has often been some impoverishment in the number of species, but it would be rash to conclude that built-up areas with enough mature gardens cannot compare favourably in character and variety of bird life with many of the habitats from which the land was taken over.

Mr Nicholson is not prepared to accept the axioms of gossip. He considers the crimes of the crop-stealers and the claims of the gardener's friend and comes to the conclusion that

it would be wise to assume until much more contrary evidence can be brought forward that wild birds do us very little harm and also very little good.

While that reservation may be justified economically, the study of birds in our towns and countryside has given a great deal of silent happiness to many people, which is attested by Mr Nicholson's own balance between the weekday life of a distinguished civil servant and a spare time ornithologist.

Twenty-five years ago Lord Grey of Falldon wrote in the preface to his "Charm of Birds" that there were three categories of British bird books. There were those with coloured plates for identification; those which summed our total knowledge of the various species

for reference purposes; and those which were the result of personal observation of particular bird types. The last category were to be read right through and were "a most valuable contribution to our knowledge." As an instance of this type of work he mentioned some articles which had recently been published by Mr E. M. Nicholson.

Since then Mr Nicholson has studied the behaviour of many birds in many lands. He has seen the Arctic tern in Greenland and the blackbird in the Azores; he has watched yellow wagtails at Bablockhythe and listened to the cry of young wrynecks at Potsdam; he has counted great blackbacks on the Thames and seen the bird life of the Camargue. His latest book is the fruit of many years' close study in the field and is a most valuable contribution to British ornithological writing. It is full of personal observation and is very readable, but it has also the value of a work of reference even though the author disdains any attempt to make it so.

Science and the Farmer

The New Farming. By D. H. Robinson. Faber. 234 pages. 16s.

The last war accelerated the technical changes in British farming to the pace of revolution. Since 1938, the number of tractors on British farms has increased seven-fold; the increase in the variety and efficiency of the machine is perhaps even more striking than the rise in their numbers. Wartime needs and the stimulus of an assured market and guaranteed prices for most of the produce have made the farmer much more ready to listen to the scientist and to try out new methods. The great reduction in the volume of imported feedingstuffs and the consequent necessity for livestock to be fed from the grass and crops of our own farms have left a mark on the pattern of farm production and on the attitude of farmers to their job, to methods of increasing crop yields, to improving qualities of livestock, and sometimes to reducing costs of production.

The story of the scientist's work told by Dr Robinson is an impressive one, and there can be no doubt about his wide knowledge of the subjects he has dealt with in this book. This book is a new edition, greatly rewritten and enlarged, of one published in 1938 in which he first brought the influence of science on farming to the attention of the public. But one wonders whether every chapter will really interest those who are not already equipped with a fair knowledge of farming techniques; the "intelligent layman," whose interest in the scientific side of farming the author hopes to stimulate, may find himself sometimes having to try to absorb more scientific formulae and technical terms than he likes or needs to know. In this respect the book is rather uneven. The author does not quite seem to have made up his mind about just who he is writing for, the specialist or the general reader. Nevertheless, this is a valuable survey for those who know something of farming, and the suggestions for additional reading which follow each chapter will be welcomed by the student.

From Love and Ignorance

The Life of Mahatma Gandhi. By Louis Fischer. Jonathan Cape. 593 pages. 25s.

Mr Fischer has written a book of many faults. His style runs the gamut from melodramatic to flat. The first few chapters are, inevitably, a rehash of Gandhi's own autobiography and suffer severely by the comparison. Above all, Mr Fischer seems to have no understanding of the motives, the consciences and the achievements of anybody except Gandhi. In the Congress itself he hardly mentions the part played by Patel's organisation or Nehru's oratory. He dismisses Muslim separatism as the result of the Muslim middle class's fear of Hindu competition. He grants the British only their railways. His hero is belittled in consequence because he is never allowed opponents worthy of his mettle. Politics is a struggle of ideals, however ugly the ideals may sometimes be. Mr Fischer's weakness is that he endows no one except his hero with any positive viewpoint at all, so that his Gandhi is always functioning in a moral vacuum.

Mr Fischer, indeed, gives throughout the impression that he speaks of India always as an outsider. He has never felt the emotions which move her people and the Englishmen who have had the privilege to serve her, so, naturally, he can convey neither.

Yet it is still a very fascinating book. He knew the Mahatma, though not well, and he has for him the understanding which comes from sympathy. It was Gandhi's misfortune that most people knew him only at the end of his life, when he was already India's greatest leader, and therefore half deified him or saw in him every vice from hypocrisy to lust. Neither view, as Mr Fischer shows, had any foundation. Gandhi never had any mystic experience, his "inner voice" was only his own conscience. He never made any claim to be more than a man following his beliefs to their conclusion, differing in method rather than intention from Mr Gladstone.

Gandhi's mind developed by experience rather than by logic. He took from life what his thought needed, but he could not have explained how. The Bhagavad Gita was his favourite scripture, so he used the Gita, Hinduism's greatest defence of the duty to use force in a good cause, to support his own non-violence. He was not a clever man. He had none of Jinnah's academic brilliance. He was a man of action, a Karma Yogi. He saw his duty and did it. For him the duty was always clear and simple, the action immediate. He never counted cost. At seventy-seven he walked from village to village in remote Noakhali to bring back love between Hindu and Muslim. For the same reason as in his South African youth, he had started, overnight, a co-operative farm; because it seemed to him right. In the remorseless refusal to take into account any other consideration lay his strength and his hold; and it is because he brings this out so clearly that Mr Fischer deserves to be read.

Analysis and Observation

The Role of Measurement in Economics. By Richard Stone. *Cambridge University Press.* 85 pages. 12s. 6d.

This is the third in the series of monographs published under the auspices of the Department of Applied Economics, Cambridge, and in a sense it might be said to set out the basic philosophy or strategy which underlies the work of that Institution, as conceived by its Director. Put very briefly, the central objective is to try to bring together the work of analytical economists with that of observers and recorders of what goes on in the real world. Mr Stone firmly, and rightly, rejects the idea that one group can proceed without the other. Whilst stressing the need to combine the collection of accurate and economically meaningful information with the propounding of good theories, Mr Stone is under no delusions about the difficulty of either task. The process of linking the two together might perhaps be said to present the most formidable difficulties of all, for the well-known reason that the social scientist cannot conduct controlled experiments.

A considerable part of the book consists of a discussion of the underlying logical problems involved in bringing facts and theory together, and of the difficulties of actually working with economic information which comes to the investigator largely in the form of time series. This is a very large subject to handle in so small a space, and to understand parts of it properly familiarity with mathematical ways of thinking is necessary. Mr Stone strikes a rather uneasy compromise between trying to make the outline of the argument clear to the less mathematical readers and trying to treat the points rigorously enough to convince sceptical experts. His main device for squaring this circle is to include many references to other books and articles where particular aspects are dealt with at greater length; this is particularly useful because the literature on the subject is mostly quite recent and is scattered over the globe.

With these references and certain technical sections of the book provided for the expert, the less mathematical reader may well feel that more concessions to his needs should have been made elsewhere. The difficulty is the usual one: the arguments may not require any "advanced" mathematics, but the reader who is not accustomed to thinking mathematically needs a lot of help, and above all the analysis must not move so fast that he misses the significance of key points. Mr Stone is not as helpful as he might be in these respects. Vital assumptions about several points are often made in one continuous sentence in the text, instead of being set individually on separate lines; the arguments are put in ways which make them admirably clear and succinct for the mathematician, but which others may have to translate. But there is no doubt that the logic appears in the text, and the reader who is not used to it will find it at length before he can appreciate the analysis of the whole. The analysis is perfectly simple, and the general reader will

an excellent illustration for Mr Stone's general discussion; but he is likely to be frightened off by the unfamiliar "operator" notation, and (as a smaller example) he would understand the logic of equation 19 more easily if he did not have to work out for himself that the coefficient of the second term was bound to be negative.

These criticisms should not, however, be allowed to obscure the merits of the book. It will undoubtedly be of value to people who are already interested in econometrics, and should impress on them the need for due modesty about their achievements, whilst reminding them of their need to collaborate both with theorists and with collectors of primary data. The "general" economist should make the necessary effort to read it, even if parts are skipped, because it shows him what econometrists are trying to do, and by what methods. His conclusion may well be similar to that of Lord Keynes, quoted at the beginning, which may be inelegantly summed up as "It still seems to me like an attempt to achieve the impossible by means of statistical black magic; but Mr Stone seems to be honest about his results, so good luck to him."

A Banker's Feast

Money in a Maelstrom. By J. W. Beyen. *Macmillan.* 212 pages. 15s.

Keynes was once heard to remark about central bankers in general and British central bankers in particular, "When they begin a sentence with 'I think' don't pay any attention; but when they say 'I feel' then keep your ears open." This remark might apply to this book by Dr J. W. Beyen on the subject of international financial co-operation during the last three decades. It has nothing fresh to add to knowledge on economic theory but it is full of illuminating anecdotes and comments in which the inherited wisdom and the "feel" of the good banker are enshrined. Dr. Beyen is well placed to tell this tale. Apart from his experience in commercial banking in the Netherlands and as a high executive of the Unilever combine he spent some years in the Bank for International Settlements and is now an executive director of the International Monetary Fund and the International Bank.

Of international institutions as a whole he deplores the fact that they never get a chance of starting small and growing gradually.

They are conceived as full grown giants and have to fight their attacks of measles and whooping cough in the merciless light of full publicity. The statesmen who create them think of them in terms of foundations not realising that they should think in terms of roots which have to be grown by the plant itself.

Of the orgy of international lending in the 1920s Dr Beyen says "The United States had just entered the field of

foreign lending with all the vigour of a newcomer and some United States banks ran their foreign departments as if they were sales departments selling a new article." On the German standstill agreement he gives the following apt parable: "The creditor says to his debtor 'Let us pretend that you are a good debtor so that I can go on pretending that I am worthy of credit myself.'" There is a good story dating from that barren World Economic Conference of 1933, of a French resolution advocating the subsidisation of propaganda for the consumption of wine. The British delegate protested saying that His Majesty's Government could never concur in subsidising consumption of "intoxicants," provoking the French retort: "Intoxicants! Mais, monsieur, c'est du soleil en bouteille."

There is a telling attack on bilateralism and on one of its earliest children, the Clearing Agreements, which, says Dr Beyen, tend to petrify the monetary and economic relations between the two signatories.

Clearing Agreements produce a special psychology in those who run them. They generate at the same time a balance of payments phobia and a sense of power over the economic development of the country. And nothing is more dangerous than a combination of fear and power.

These few comments picked at random in Dr Beyen's book indicate what a feast will be found in it by the discriminating reader.

A Living Portrait

Robert Blatchford: Portrait of an Englishman. By Laurence Thompson. *Gollancz.* 242 pages. 16s.

It is a mark of the great writers of fiction that they create characters who become types, so that, afterwards, one describes someone as a "Henry James character," or a "Dickens character." Robert Blatchford is, unmistakably, a Dickens character. "The little dark Nonconformist person from Northwich" who "could bite," who adored William Morris as his master, and who, over the world famous pen name of Nunquam, became one of the most potent journalists of his day, the man who wrote, in simple, nervous English, one of the great propaganda books of our time, came straight out of the world of Dickens, both in background and in character and career.

He was, as are so many of the most English of the English, a mongrel, his mother being an Italian. He was brought up in the *coulisses* of provincial theatres and lodgings. He served for seven years in the regular army, was an excellent, if "careless," sergeant, and there learned that faith in his fellow men out of which his Socialism sprang. He taught himself to write through reading; he copied out passages from Webster's Dictionary in shorthand, correcting it against a shorthand dictionary. This gave him a vocabulary, later most rigorously pruned, since he spent hours reading chapters from the Bible, which he then re-wrote from memory, noting in particular where he had used a weak word instead of a strong one. His first writings took the form of short stories based on his army experiences, undertaken simply in

order to make a little more money than the thirty shillings a week he was earning as time-keeper, for the benefit of his wife and small daughter. Writing brought him into contact with a young journalist named Alexander Thompson, of the *Sunday Chronicle*, who got him on to the paper at the superb salary of £4 a week, and became a life-long friend. By the time he left the *Chronicle* to found *The Clarion*, he was earning the unprecedented sum of £1,000 a year; he left in obedience to an entirely disinterested conviction—the idealism the English like to hide from themselves. An unsleeping fury against the horrors perpetrated by the industrial system, and a deep belief in the underlying goodness of his fellow men, brought him into the infant Labour movement; personality made him a leader in it.

In *The Clarion*, Blatchford did more than establish a paper; he created a fellowship. There are still in the British Labour movement many who learned their Socialism as *Clarion* scouts, and grew up with his *Mervie England* as their Bible; many who still share Blatchford's passionate early belief in man and his disbelief in the God of the Churches. They like to talk of the days when the infant party was torn by controversies and rich in the clash of diverse personalities—Blatchford himself, H. M. Hyndman, John Burns, Tom Mann, Bernard Shaw, Sidney Webb, Keir Hardie, Ramsay MacDonald, Philip Snowden. Controversy was, indeed, the mark of fellowship. The day came when Blatchford himself was slung out as a heretic, when his individualism prevailed over his Socialism, when it was possible for Northcliffe to say of him "He's more like a stubborn old Tory square than a live journalist."

Robert Blatchford, a "character" if ever there was one, deserved to have a real biography, and he has now got it. Laurence Thompson, the son of "Dangle" of *The Clarion*, Blatchford's oldest and closest friend, has drawn the likeness of a man, and has given us not the facts only but the *feel* of a remarkable and distinct individual. Here is Blatchford the fighter, the writer, the reader, the human being, and an immensely, continuously, interesting human being. The tender happiness of his home life, the warm quality of his personal friendships, the wide range of his intellectual interests are here set down, without malice and without prejudice. The result is a portrait which lives and will have a lasting interest: it will be a book to keep.

Owing to limitations of space in this week's issue of *The Economist*, reviews of the following Spring Books will appear next week.

Warrior without Weapons. By Marcel Junod. Jonathan Cape.
Winter in London. By Ivor Brown. Collins.
London, the City. By Claud Golding. Robert Hale.

THE BUSINESS WORLD

The Budget and the Gap

THE Budget is now little more than three weeks distant, and public apprehension about it does not diminish as the day approaches. Although much is already known about its principal new component—the defence programme—the patterns that will determine its shape are more than usually elusive. The biggest difficulty among many is to fit the Budget into its proper place in the framework of the nation's whole economy. To do this is the very essence of the Chancellor's task, for the chief function of the Budget this year will be to ensure that the diversion of productive resources to defence takes place with the minimum of inflationary stress. Guesses about Government revenues and expenditures are in themselves almost meaningless, because the extent of the surplus that the Chancellor ought to provide depends upon the size of the inflationary gap that is opening out—the gap between the capital outlays that the nation is likely to make, and the total flow of savings likely to be generated without the aid of any undue degree of inflation. Unless Mr Gaitskell decides that a bigger inflation is, in fact, the least of several evils that confront him, his duty is to make the "public" savings, through the Budget surplus, big enough to fill this gap. The first broad problem in budget-making is, therefore, to guess the size of the gap. The second is to decide what combination of many different possibilities will provide the best means of filling it. This article is devoted entirely to the first question.

The pattern of the budgetary accounts themselves is still obscure. Its clearest portion is the expected expenditure. The bill for defence in 1951-52 is tentatively estimated at £1,443 million, including £11 million for civil defence and £143 million for stock-piling; this compares with original estimates for 1950-51 of £801 million and revised estimates of £844 million. The official estimates for civil and revenue departments, totalling £2,420 million, contain £236 million of traceable double-reckoning of defence items, so that the true estimate for civil expenditure is £2,184 million, compared with original 1950-51 estimates of £2,117 million, and revised estimates of £2,141 million. The biggest element in this increased civil spending is an extra £37 million for civil expenditure of the Ministry of Supply, which doubtless arises indirectly from defence needs; but a further £25 million is absorbed by national health, insurance, assistance and education. In addition to these "supply" expenditures, there are the Consolidated Fund Services—chiefly national debt servicing—the charge for which will not be disclosed until budget day. If it is the same as that for 1950-51, the grand total of estimated above-line spending (including the defence supplementaries to provide for the recent increase in the programme) will be about £4,165 million—an increase of £710 million on

original estimates for 1950-51, and a bigger increase still on the probable actual spending in that year.

What revenues can the Chancellor expect, from existing sources and tax-rates, towards meeting this hugely increased bill? The first guide to this is the experience of the current year. Sir Stafford Cripps budgeted for an above-line surplus of £443 million, after provision for sinking fund. That target will be far exceeded; unless some unexpectedly large charges are brought into the accounts in the closing weeks, the excess may be several hundred million. Most of this gain, however, will be due to a shortfall of expenditure below original estimates—partly, it seems, because of modest economies but chiefly because Government stocks of food and raw materials have been run down. Inflationary influences, and especially the effects of rising import prices upon the yield of customs, have kept the revenue buoyant; but even the most optimistic guess would not put the gain on estimate beyond £100 million. It is more likely to be £80 million, which would mean a total yield for the year of £3,980 million.

Fortunately, the buoyancy will be much more pronounced in the coming year, and this will be true both of the taxes that are assessed in arrear and those paid currently. The former will benefit from last year's increment of productivity and from the post-devaluation gains in exports, especially invisibles. The currently-paid taxes will be swollen by the big addition to the wage-bill resulting from the increases granted in recent months, by the effects of rising prices on the yield of *ad valorem* indirect taxation, and by consumers' forestalling purchases of taxable goods. The principal gains will be in income tax, profits tax and customs and excise. The buoyancy element in income tax this year appears to have been nearly £50 million (twice the Budget estimate), and this is after making good the loss caused by the first impact of the increased initial allowances for depreciation; this loss, officially estimated at £40 million, has been shared between income tax and profits tax. With this in mind, it seems reasonable to guess the 1951-52 gain in income tax at not less than £150 million (minus the further loss to be expected from the initial allowances, the increased total cost of which will this year be £35 million). The yield from profits tax will not in 1951-52 reflect more than a part of the sharp increases in profits now becoming apparent in company reports for years ended after the third quarter of 1950; but the accounts made up in the preceding twelve months showed appreciable increases. Profits tax has been stable in 1950-51 at about £260 million; it may rise by £30-50 million gross in 1951-52. Customs and excise seem likely this year to beat the target by at least £50 million; they may yield a similar increment in the coming year.

Surtax and the minor taxes may perhaps yield the few million needed to offset the further shrinkage in the now almost exhausted excess profits tax, but there will be more serious losses elsewhere. The £35 million loss from the full effect of the revised initial allowances has already been mentioned; another £2,500,000 will be lost net from last year's tax changes. The yield from surplus war stores, now presumably nearing their end, has been more than halved this year, at under £40 million; the prospective loss here may be £30 million or more. The return from trading services is more difficult to guess. Their large contribution of £81 million this year was, specifically stated to be due to the receipt of £37½ million of special credits; these will not recur, but there may be other windfalls from post-devaluation profits.

Altogether, the major tax sources may yield some £250 million more, before allowing for the effects of earlier tax changes; but these changes, and losses elsewhere, may absorb between £50-£100 million. On this basis, the total prospective revenue, at present tax rates, could well be more than £4,100 million but would not be likely to exceed £4,200 million—unless swollen by a much sharper dose of inflation. Since the above-line expenditure, as already shown, will be about £4,165 million, this means that the above-line surplus will have virtually disappeared. From this it follows that the Chancellor will face a large overall deficit. Below-line expenditure this year seems likely to be below estimate at rather more than £400 million net. Unless war damage payments run down very sharply or unless there are more substantial postponements of housing outlays than the Chancellor has implied, the 1951-2 net expenditure is not likely to be less than £350 million or so. That would indicate an overall deficit of between £300 and £400 million.

★

Last year the Chancellor budgeted for an approximate overall balance, and it is widely supposed that this must be the minimum target for disinflationary budgeting. This, however, misconceives the basic principle. The significant quantity is not the overall result, but the true surplus on current account; this more nearly resembles, but is not identical with, the outcome of the above-line account. Any capital expenditures in the whole account can be omitted from the reckoning of budgetary expenditure, either because they represent moneys that are saved by the recipients (such as EPT refunds) or because they are reckoned separately as part of the nation's whole investment outlay that has to be financed from total savings. Nearly all the below-line expenditure is of this kind, and so, indeed, is part of the above-line expenditure—notably, in 1951-52, the £143 million for stockpiling. If the above estimates for 1951-52 could be reconstructed on this basis (which is the one adopted in the National Income White Papers and the Economic Survey), they would probably imply a true "current" surplus of at least £150 to £200 million. This would compare with an original estimate of £400 million for the calendar year 1950, a figure that was substantially exceeded in fact.

This prospective "true" surplus now needs to be fitted into the savings-investment account for the whole national economy. This is a precarious exercise and only

the broadest guesses can be attempted here. Allowing for a number of cross-factors (including the running-down of stocks in 1950, the increase in prices that has already occurred, the further effects of the rise in import costs, and the "dislocation" delays to be expected this year), the estimate for investment outlay in 1951, may not differ much from the sum originally estimated for 1950 (£2,435 million). This ignores the stockpiling programme, on the ground that the Chancellor is prepared to finance it by drawing on gold reserves. In addition, however, some £50-£100 million may have to be provided for special defence investment in private industry. If, apart from stock-piling, the surplus on the external balance of payments (£200-£250 million in 1950) is extinguished by the deterioration in the terms of trade, the investment account will not this year be burdened by any net investment abroad.

On the savings side, there will be the steep decline in the true Exchequer surplus, but against this there will be gains in company savings. The full effects of the steepening rise in profits that began a few months ago will buttress the savings account; the gain might be not less than £150 to £200 million gross. If personal savings are put at £400 million—or appreciably less than the Chancellor impliedly forecast for 1950—these various and tenuous assumptions would point to a substantial shortfall of prospective total savings below prospective investment. On the most optimistic reckoning, the gap might be less than £100 million, but it seems more likely to be between £150 and £200 million.

These final guesses, it will be seen, are themselves the resultant of many other guesses. Indeed, this whole analysis is better regarded rather as a demonstration of how the Budget figuring ought to be approached than as a serious estimation of the significant quantities. Among many uncertainties, one in particular deserves to be noted—the extent of the saving produced by the decline in the export surplus. Ordinarily, the relief that this affords would occur through the release, for use at home, of goods that would otherwise have been exported. But this year roughly the same physical volume of goods will have to be exported merely to keep the account in balance; the 1950 surplus will be depleted by the higher prices to be paid for an unchanged volume of imports. The domestic "saving" caused by this depletion will occur because the domestic purchasers of imported goods, having paid the higher prices, will have less to spend on other things. A large part of the burden of defence in this first year or so will in fact be thrust upon the public by this means—which explains why the prospective inflationary gap that remains to be closed by budgetary action is so much smaller than many people have supposed. The "smallness" of these figures does not imply an optimistic view of the weight of the whole new burden. It merely assumes that it will be imposed in the most likely way. The only optimistic assumption, in principle, is that the prospective saving will not be largely frustrated by a steep rise in wages in response to the higher prices. Some further rise in the wage-bill is assumed in this figuring; but if the rise steepens, the gap remaining to be covered through the budget would be correspondingly larger. Apart from this, it will be seen that the extra taxation (or retrenchment) that is needed to close the gap would still leave the Exchequer account in "overall" deficit. If the Chancellor budgets for such a deficit, that will not mean, of itself, that he has abandoned the task of disinflationary budgeting.

Tools for the Job

FOR the second time in fifteen years, rearmament is making an abrupt demand for more machine tools than British makers can supply unaided. The present demand—which is for nearly three times the current annual value of output, to be delivered within two years—bears some resemblance to the task imposed upon the industry in the late 'thirties. In 1936, defence orders for machine tools which would have necessitated a considerable increase in annual output could not readily be fulfilled. Output was, in fact, built up in the ensuing years by expanding the machine tool industry and by sub-contracting until it was able to turn out nearly 96,000 tools, valued at £33.5 million, in 1942. But very large quantities of American tools were still needed to complete the equipment of Britain's armament industries; up to the middle of 1941, machine tools were very short and certain specialised tools remained scarce for some time afterwards.

Expenditure upon machine tools for the defence programme of £4,700 million was originally put by Mr Gaitskell at "£50 million for re-tooling and £65 million for new capacity" in the first two years of the three-year programme. It now appears that the final expenditure may turn out to be somewhat lower. Mr Strauss has revealed that the number of tools required is about 27,000. An average of perhaps £3,500 a tool would be extremely high for British-made tools; this emphasises the considerable dependence that the Government is placing upon machine tools from overseas; Mr Strauss announced this week that orders worth £40 million had been placed abroad (presumably including advance payments of £5,500,000 in respect of some 9,000 tools), and he confirmed that further large orders were about to be placed with American manufacturers. Roughly three-quarters of the £40 million worth of contracts already placed are believed to be with American suppliers; without this "absolutely vital supply," Mr Strauss said, "we could not hope to complete the defence programme."

Until now, any thought of interrupting the British machine tool industry's present commercial business to meet the needs of the defence programme has been kept in the background. In the first stages of rearmament

before the last war, the mobilisation of economic resources was circumscribed by what has been called "the doctrine of normal trade"; it is perhaps possible to detect a similar reluctance today. This reluctance must not be dismissed as discreditable, but it is certainly open to question. The British machine tool industry today is considerably larger than it was in 1936—and very much busier; and it is an industry that has responded with success to the Government's pleas for increased exports. Its recent development is magnified and also blurred by the published statistics of its output; these figures are shown by value and are not easy to adjust for price, owing to changes in the proportions of the various types of tools produced and to the design of the types themselves; the accompanying table offers a comparison of output last year with that of 1938. Reckoned by numbers of tools produced, it may be that the industry's output today shows a modest increase on 1938 (when perhaps 25 per cent of production may have been devoted to rearmament); but a crude comparison of this kind would ignore such facts that most machine tools today incorporate individual electric motors, and that the range of manufacture has been widened to include more of the complex, specialised types of tools. Exports in 1950 were roughly 36 per cent of output of major machine tools; a comparable figure for 1938 would probably be well below one-third of output. Moreover, total exports of major and small machine tools, including second-hand tools, amounted to £16.8 million last year, while imports cost only £5,800,000; in 1938, total exports were £4,500,000 and imports £5,000,000. Machine tool exports have a high "conversion factor," and since devaluation the price advantage has given British manufacturers added strength to withstand competition in world markets; even before Korea set off world rearmament, the British tool industry had probably a longer order book in relation to its output than any of its competitors.

Official statements concerning machine tools, since the increased defence programme was decided upon, have referred in general terms to the need to maintain the industry's exports. Regard for this hard-earned but still vulnerable export success was, no doubt,

partly responsible for what some machine tool manufacturers regard as an unexpectedly slow placing of orders in this country; the official explanations that the full demand to be made upon the British industry cannot be drawn up until the supplies that can be obtained abroad are clearly known are merely another way of saying the same thing. Recent impressions in certain parts of the industry of a hesitant official approach have been followed by two specific criticisms. The first suggests that the defence programme might need fewer machine tools than the Government supposes. The "machine tool population" of this country, its proponents argue, is today probably 800,000 to 900,000 major tools, which is not much less than the number with which British industry achieved its peak armament production in 1943-44; they argue that more effective utilisation of tools at present distributed throughout industry for arms production might reduce the number

of new tools required. The second criticism, which may be more generally held, within the industry and outside, is whether the policy of partial reliance upon imported tools for defence, coupled with a high level of British tool exports, may not be carried too far.

Both criticisms may have taken insufficient account of two central factors in the present defence programme for machine tools: types and time. The considerable differences between the types and proportions of machine tools required for current rearmament, and those existing in general engineering today (which is emphasised by the high average price noted above), or those used in armaments production in the 1939-45 war, are not generally realised. Of the "strategic reserve" of special tools from the last war which the Ministry of Supply held back, fewer than a thousand—"quite a small proportion," according to Mr Strauss—have proved suitable for the present defence programme. Requirements fall into three categories: single-purpose, entirely specialised tools, such as shell-making machines, which cannot be turned to any other use; special-purpose tools of various types for quantity production; and general-purpose tools. The indications are that it is upon the second category that the greatest pressure may fall; these tools are produced for civilian purposes, but in quantities insufficient to satisfy the urgent needs for defence. The tooling problems of gas turbine production in quantity, for example, are entirely different from those of piston engine manufacture. They have, in fact, barely been solved; the trend towards the use of axial-flow compressor turbines for the newer aircraft increases their difficulty. No thoroughly satisfactory method of quantity production of turbine blades seems yet to have been evolved; and the special-purpose "profiling" tools required depend upon the preliminary processes which are adopted. It is no criticism of the British machine tool industry to

say that it is not producing such special-purpose tools in quantities sufficient for rearmament needs; it is probable that no machine tool industry is doing so. The prospect that defence production may need a high proportion of tools not available in general industry may make resort to defence sub-contracting extremely difficult, particularly in view of the urgency of the programme; it may well prove impossible to spread the industrial burden of defence so widely as might be hoped. Moreover, such special requirements will mean uneven demands upon the British machine tool industry, with a particular concentration upon certain manufacturers for tools which they have never been called upon to produce on a large scale.

*

The policy of purchasing in time such special-purpose tools wherever they are to be had is therefore inevitable; but it involves certain risks that are not easy to calculate. Britain has so far profited by the slowness with which the multiplicity of "procurement agencies" responsible for American rearmament have moved from words to action; British defence orders in the United States appear to have been placed well ahead of American orders. But the delivery dates secured—generally within 18 months—would be liable to rapid alteration if the American Government established overriding priorities for its own military needs; and this, according to recent reports, it is beginning to do. Mr Gaitskell was able to announce that the Americans have promised "priorities" for the delivery of British-ordered tools, at least for types not available here; to ensure that these are high priorities, and that delivery of remaining orders is not relegated to a much lower category, will prove an important task for the new Director-General of Machine Tools, Mr S. W. Rawson of John Brown's.

Developments in Government policy announced this week, following upon Mr Rawson's appointment, go a long way to help and inform the industry. The order books of 30 of the industry's most important manufacturers are to be examined to see how many tools of the types required can be diverted from inessential purposes; and the fact that it may be necessary to divert certain exports as well has reluctantly been accepted. British firms are today fulfilling orders for general-purpose exports, while at least some machines of the same type—costing considerably more—are being imported for defence purposes. In part this is a consequence of the general fact that British export prices are too low; but except in cases such as Canada, where recently-won markets need consolidating, it seems a remarkable involution of trade policy. Following the new decisions Mr Rawson can proceed with his dual task of ensuring that export deliveries are fulfilled and mobilising the British industry to produce such tools as are not best obtained overseas. It will not be an easy one. The Ministry of Labour is to assist in recruiting the skilled engineers whom the manufacturers need; but such men are hard to find, and the industry has recently been losing them to less exacting work in other engineering. Sufficient extra labour to work double shifts would reduce the need for sub-contracting and plant expansion, which might be hard to carry through within the time limit set (though more practicable if defence expenditure at the present rate is to continue after the three-year programme). The size of the problem, however, now seems fully to be appreciated; and in the new measures to meet it there is a welcome note of urgency.

Business Notes

Uneasiness Returns

Even those who had been disposed to argue that long-term factors presaged some tendency towards easier conditions in the gilt-edged market would certainly agree that this week's reverse would represent a distinctly abrupt "return to normal." Falls of up to half a point in the long-dated issues, such as occurred on Wednesday, look disturbing enough in the cold print of the price lists, but they are the inevitable result of a small volume of selling in a market that has suddenly become friendless. That markets generally should be suddenly deserted is hardly surprising; there is the long account with the Budget at its end, anxiety about Persia, the setback on Wall Street, disappointment with the February trade figures with their challenge to certain of the assumptions on which the defence programme has been based, the difficult progress of the four deputies in Paris, and doubts in some quarters about the future trend of commodity prices. And it happens this week that a spate of capital issues has been competing with existing securities; when the public and the institutions are invited to put up £12 million in cash for securities free of stamp, the result can sometimes be distinctly chastening for thin markets bare of support.

Of the week's issues, the Northern Rhodesia loan is at once the most important and the most interesting in its implications about the thinking of the authorities on trustee loan terms. On this occasion, there was no attempt at forcing the pace—which was as well in view of the subsequent setback in gilt-edged—even though the authorities were not disposed to give much away. The issue is of 3½ per cent stock, with a narrow bracket of dates (1970-72) offered at a price of 99. This represents a notable drawing in of horns since the Southern Rhodesia issue, with its 30 to 35 year span, was made two months ago at par; the fact that this scrip stood at an equivalent price of 3 discount when the Northern Rhodesia terms were announced tells its own story. Even so, the setback in gilt-edged prices was obviously bound to challenge the success of the public offer of £5½ million of the new stock, for redemption yields on several of the guaranteed stocks provide a shilling or two more than 3½ per cent at the cost of only a modest increase in life. In the result, 94 per cent of the issue was left with underwriters.

The news that the Majlis has voted for the nationalisation of the Anglo-Iranian properties caused a further fall in the shares on Thursday to 103s. 1½d. It is difficult indeed to judge the outcome of Anglo-Iranian's present difficulties, and it could be fatally easy to pre-judge it, for reasons that are discussed in a note on page 584. The shares have been a vulnerable market for some time past. Recent events in Persia have had a depressing influence extending well beyond the confines of the oil share market, but provocative though they are, the arguments for not accepting them too tragically may still have much to commend them.

EPU in Danger

The February settlement of the European Payments Union reveals a disturbing intensification of the creditor position of the United Kingdom on the one hand, and of the debtor position of Germany on the other. The United Kingdom built up a further surplus equivalent to \$73,800,000 with other EPU countries last month, following the surplus of \$32,400,000 for January. Given the present relation of Britain's accumulated surplus to its quota, one half of each monthly addition to that surplus is being taken in gold.

For February, therefore, Britain acquired a further \$36,900,000 in gold from EPU. The total amount of gold acquired by Britain from EPU since it came into operation on July 1st last has risen to \$88,700,000. In addition to working off the initial debit position Britain has accumulated a credit of \$300,700,000 with EPU. In the face of that impressive performance many EPU countries find it a little difficult to understand the reticence with which the British Government is importing from Europe, notably in that large sector of trade that has not been liberalised because it is subject to government trading.

The German position goes from bad to worse. The deficit of Western Germany for February amounted to \$58,300,000. Of this, two-thirds was covered out of the special credit of \$120 million put at Germany's disposal after the initial EPU quota had been exhausted. The other third was met by a further gold payment. Germany's cumulative deficit since EPU came into being has now reached \$457,100,000. The unused margin of the special credit of \$120,000,000 has been reduced to \$28,600,000, and this should be exhausted in the course of the current month. The drastic measures required to meet this situation are now under consideration in Bonn and Paris. One inescapable fact that is beginning to emerge from the evidence of the German balance of payments crisis is that German exporters are "salting away" abroad a substantial part of the proceeds of their sales. Membership of EPU should require some readiness to abide by common standards of exchange control. As things are, Britain is in effect financing a substantial export of capital from Germany. That was not one of the objectives for which EPU was founded.

The German difficulties are beginning to spread their contagion to neighbouring countries, especially to the Netherlands. The Dutch deficit in February amounted to \$25 million, of which \$5,000,000 was paid in gold and the balance added to the Dutch overdraft with EPU. If Germany now goes back completely on the previous trade liberalisation measures and does so on a non-discriminatory basis it will cut imports of Dutch agricultural produce and will plunge the Netherlands further into debt with EPU. One consequence of that will be to defer still further the few remaining hopes of completing the Benelux union. Not for the first time, balance of payments disequilibrium is proving itself a virulent source of economic infection.

* * *

Agreement with Egypt

The long-protracted financial negotiations with Egypt have at last reached a successful conclusion. The main point at issue between the Egyptian and British Governments was the treatment of Egypt's sterling balances. These amount to about £290 million, of which £230 million are in the immobilised No. 2 account and £60 million in the free No. 1 account. An arrangement has been reached for an immediate transfer to Egypt of \$40 million from the sterling area dollar pool; these dollars will be paid for from the No. 1 account. The amount in the No. 2 account is to be repaid over a long term of years. Britain has agreed to transfer in each of the next ten years a minimum of £10 million a year and a maximum of £15 million from the No. 2 to No. 1 account. Assuming that the maximum will be transferred—and there is no reason for making any other assumption—a total of £150 million will thus have been liberated. The remaining balance of £80 million will be subject to negotiation in ten years' time. Egypt meanwhile is to remain in the transferable account group of countries.

These arrangements envisage a gradual break with past practice under which the major part of Egypt's external foreign exchange reserve was kept in sterling.

That break has been formalised during the past week by the approval of a new law that transforms the National Bank of Egypt into a purely Egyptian central bank. The bank will remain privately owned, but its higher policy is to be settled in agreement with the Egyptian Government. The main lines of currency and credit policy will be laid down by a supreme council consisting of the Minister of Finance as chairman, three representatives of the Government and three of the bank. All members of the board of the bank will henceforth have to be Egyptian-born nationals. The term of office of the present Governor, Sir Frederick Leith-Ross, expires next May. From then onwards the National Bank will be administered by an exclusively Egyptian personnel. The new law has been hailed in Egypt as severing the link between the National Bank and sterling. What it cannot abolish is the fact that the bulk of Egypt's foreign trade is likely for some time to come to be transacted with sterling countries and in terms of sterling.

Work of the Stock Exchange

The general public is still so ill-informed about the activities of the Stock Exchange that any discussion by its leading figures deserves a warm welcome. It is to be hoped, therefore, that the address given last week by its chairman, Mr J. B. Braithwaite, to the Institute of Bankers will reach a wider audience. Most of his talk was devoted to the work and growth of the Exchange, but he also gave some interesting figures not previously published. In the past four years £1,562 million of new capital has been raised through the medium of the Stock Exchange; the peak year in this period, perhaps rather surprisingly, was 1949, when £488 million was raised. These figures do not include British Government, nationalisation, Dominion and Colonial issues. Mr Braithwaite emphasised that the need for the Stock Exchange, which must now provide a market for between two and three million investors in British trade and industry, has been in no way diminished by the recent tendency of industrial concerns to borrow, at short-term, direct from institutional investors. Despite the obstacles that the 2 per cent stamp duty puts in the way of dealings in short-term stock, new issue business outside the market has amounted to only about £80 million in the last three years—and these issues themselves could not have been as finely priced as they have been without the service of the Stock Exchange barometer.

In his account of the gradual growth of the Stock Exchange mechanism during the past 250 years, Mr Braithwaite could point to a youthful London market that is growing up to meet a new need in much the same way as the Stock Exchange did from the days of Jonathan's Coffee House onwards. This new market is the Air Charter Market on the Baltic Exchange. Mr Braithwaite instanced this development as an illustration of the spirit of City enterprise and of the resilience and adaptability of its institutions. There may well be a moral here for the Stock Exchange itself. The structure of the nation's capital market, in its widest sense, is changing radically; and the Stock Exchange, still an indispensable mechanism, will need to show these qualities of resilience and adaptability in a high degree if it is to perform its traditional functions as effectively in the changing circumstances as it has done in the past.

* * *

The Piecework Muddle

The dispute over piecework rates in the engineering industry continues unabated. While some concerns notably Craven Brothers at Stockport, have settled their local dis-

putes satisfactorily, others in their turn have had to close down parts of their works. Similarly, although the ban on overtime and piecework has been lifted in some districts, it has been newly imposed in others. The result is a continuance of the muddled and confused atmosphere which has surrounded the dispute about piecework from the start.

One thing at least is becoming clear: neither employers nor employees are happy about the wages agreement from which the dispute arises. Both suffer from it, for it puts a premium on time rates and time rates have never been a satisfactory method of payment in the industry. From the point of view of the employees, they are unattractive as they provide little opportunity for the extra earnings which the energetic worker has always been able to make in the past. There is a case for a thorough overhaul of this wages agreement in order to bring it back into line with traditional practice in the industry. Neither side, however, seems able or willing to withdraw from the position it has taken up, and this fact holds out little hope of agreement in the near future.

It remains for individual employers, therefore, to settle the matter with their own workers. Craven Brothers have led the way towards a settlement—as they led the way in retaliation for the original action of the workers—and it is expected that other companies will follow suit. The loss to the small companies affected and to their industrial customers which has resulted from the dispute is beginning to reach very serious proportions; the stage has been reached for more sense and less emotion.

* * *

Bulk Buying Crosses the Atlantic

At the very moment when even the ardent British champions of bulk purchase are having slight doubts whether they are right, encouragement comes to aid their flagging spirits. They look westward, and see that the land is bright. The United States Government has decided to extend its experiments in bulk purchase by becoming the sole purchaser of tin, just as it became the sole importer of rubber at the beginning of the year. The United States authorities have convinced themselves that primary producers have been exploiting defence needs by holding back supplies and that bulk purchase will teach them a lesson. They can hardly blame tin and rubber producers for holding more old-fashioned ideas about what happens to markets and prices when the world's largest consumer tries to accumulate a large strategic reserve and at the same time to maintain a high level of civilian consumption.

It is an open question whether American bulk buying will bring more stable prices. It did not prevent rubber from rising to 72d a lb last month. If the United States refrains from buying either rubber or tin for any period of time, the prices of these commodities will undoubtedly fall and other countries will benefit by being able to obtain their requirements more cheaply. But if American buying is resumed, prices are likely to rise again; just as the British Government has found it impossible to buy secretly on the market or by private deals, so the actions of the United States authorities are likely to be easily interpreted. Indeed, if the operations of the US Munition Board are any guide to the discretion with which American official buying is pursued, prices may even fluctuate more widely than in the past.

The important question is not whether the United States Government pursues bulk buying, but whether it continues to buy for stock. Raw material prices are already too high for comfort and safety, but until the total demand for raw materials falls, the prospect of any appreciable fall in prices can only be slight. Whether such a fall will result from the international materials conference now meeting in Washington depends on the quantities of rubber and tin that are bought, not on how they are bought. If American stockpiling

purchases were to be suspended, there would be more for Britain and Western Europe—and also for Russia and China unless some system of control over exports was adopted.

Reaction on Prices

Fears that the stockpiling boom may be over have already caused commodity prices to fall. Tin last week fell by £260 to £1,220 a ton, though this week it has been surprisingly steady and recovered to £1,325 a ton by Wednesday. The "free" market prices for copper, lead and zinc have all dropped noticeably during the past ten days, while tungsten, which had experienced the most spectacular rise in price, fell for the first time in thirteen months and was quoted this week 57s. 6d. lower at 612s. 6d. a unit. The decline in metal prices during the past week is shown in the accompanying table. The rubber market has also weakened, but fibres, especially wool, have remained firm.

This reaction in prices has naturally prompted the question whether a new phase lies ahead for commodity markets. The United States authorities seem determined to prevent a continued rise in prices—if they can. But it is not known whether they are equally determined to prevent supplies of

TRENDS IN METAL PRICES

Tin (£ per ton)	600	1,227	1,550	1,422	1,337	1,325
Tungsten (s. per unit)	126-9	480-0	585-0	670-0	670-0	612-5

key commodities reaching unfriendly countries. Unless international allocation at fixed prices is adopted and can be enforced, these two policies are contradictory. Both the Ministry of Food and the Ministry of Supply have shown the world that any attempt to buy cheaply must mean that little or no supplies are obtained. The United States can hardly succeed in teaching the so-called "gougers" a lesson and at the same time prevent Soviet satellites from building up larger reserves of strategic materials.

Turn-down in Trade?

Total exports last month fell sharply to £183 million, the lowest level since September when the delayed effect of the holidays affected the figures. February was a short month, but the daily rate of export was itself 8 per cent lower than in January and in the fourth quarter of 1950. Imports fell by £50 million to £248 million, but they were still £30 million higher than the monthly average for last year. The excess of imports (valued cif) over total exports (valued fob) for the month amounted to £65 million making a total of £140 million for the first two months of the year; the corresponding figure for the whole of the second half of 1950 was £128 million.

British Exports (Adjusted to a standard month of 26 working days.)			
1950:	1st quarter (monthly average)	2nd	£m.
		3rd	174
		4th	178
1951:	January	February	181
			206½
			206½
			190

Statistics for two months hardly provide a sufficient wide base from which to judge the trend. In particular, dock

troubles may have played an important part in the decline in exports last month. Again, January imports were partially inflated by imports of coal, and no doubt the February figures have also been affected. One of the most disquieting features of the trade figures so far this year is the decline in exports to the United States and Canada. Shipments to North America in February earned US \$50 million compared with \$57 million in January and the average of \$70 million a month in the fourth quarter of 1950; the main explanation for this is the fall in exports in Canada. Total American imports in January reached a new record level owing to heavier imports of primary products such as sugar, coffee, rubber, wool and jute. So long as American purchases of raw materials continue at recent levels, the sterling area is likely to make good any loss in dollar income suffered by Britain, and this impression also seems to be confirmed from the latest monthly figures of the European Payments Union.

Britain is committed to a high level of imports this year to keep up industrial output, and the question is whether exports can be maintained at a sufficient level to balance the overseas payments account, as the Chancellor intends. A major contribution to last year's surplus came from invisible items and these may prove equally buoyant during the present year. But it would be assuming too much to suppose that the running down of Britain's payments surplus can necessarily be controlled by government policy. What follows if the rate of decline should be too swift for normal corrective action?

Boom Time in Latin America

The economic barometer in Latin America has always oscillated between storm and set-fair in response to marginal changes in commodity prices in the United States. Since the war, however, these oscillations have been unusually violent. In 1949 the 20 Latin American republics ran a trade deficit with the United States of over \$400 million; in 1950 this was replaced by a surplus of about \$300 million, and the trend at the end of the year was clearly sharply upwards. In the circumstances, the latest of Mr Francis Glyn's annual reviews of Latin American conditions to stockholders of the Bank of London and South America strikes a more cheerful note than last year's. The upward trend of prosperity in the countries in which the bank carries on business is strikingly reflected in the bank's balance sheet. Its deposits increased by some 6 per cent in the last three months of 1950, despite seasonal withdrawals.

There are, of course, some disappointing clouds in the Latin American scene. Quite apart from the sorry deadlock in Anglo-Argentine trade, British exports to the area have not expanded as rapidly as might have been expected after devaluation—and certainly not as rapidly as German and Japanese exports have done. In part, this is due to the long delivery dates quoted by British suppliers and to the paucity of direct shipping facilities, but in part, too, it arises from a continuing sterling shortage (and hence to continuing import restrictions) in some countries. Countries that have now a dollar surplus, such as Brazil, are not inclined to use their new-found dollars to settle sterling debts, and their arrears of sterling remittances are piling up. Mr Glyn seemed reasonably confident, however, that Brazil would be able to resume remittances after its present bumper cotton crop begins to come to the market in a few weeks' time. It is to be hoped that other Latin American countries now returning to solvency in their external accounts will take note of the marked improvement in the economic situation in Chile and Peru since those countries made their bold attempts at lightening the burden of exchange regulations just over a year ago. Meanwhile, however, the Bank of London and South America—and other British companies trading in the area—still have to pay British taxation on those of their profits that are frozen abroad by exchange regulations; Mr

THE CONSOLIDATED MINES SELECTION COMPANY, LIMITED

ABRIDGED REPORT OF THE DIRECTORS FOR THE YEAR ENDED 31st DECEMBER, 1950.

CAPITAL

The authorised capital remained unchanged at £900,000. The issued capital was increased during the year to that amount by the issue of the 400,000 reserve shares at 27s. 6d. per share. Stockholders being offered 350,000 of these shares. Underwriters subscribed for the balance of 50,000 shares at the issue price of 27s. 6d., and as a result of this issue, the Company has received £550,000 of new capital.

It is proposed to submit, as special business, at the Annual General Meeting a resolution to increase the authorised capital of the Company to £1,200,000 by creating 600,000 new Ordinary shares of 10s. each and empowering the Directors to issue these shares on such terms and conditions as they may think fit. Your Directors have these shares on such terms and conditions as they may think fit. Your Directors have the no present intention of issuing additional capital, but feel that it is desirable in the interests of the Company that there be some reserve shares available for issue at short notice without the delay involved in calling Extraordinary General Meetings either to increase the authorised capital or to obtain authority for a new issue.

NEW ARTICLES OF ASSOCIATION

A Special Resolution will be submitted at the Annual General Meeting for the adoption of new Articles of Association. The existing Articles were adopted in 1910 and apart from the need to make certain specific alterations to the Articles on such matters as borrowing powers and Directors' remuneration it is considered desirable to recast the Articles so that they will be in conformity with the requirements of the Companies Act, 1948 and modern practice generally.

A print of the new Articles may be inspected at the office of the Company during usual business hours prior to the Meeting.

ACCOUNTS

	1950 £	1949 £
Profit after charging all expenses but before providing for taxation was	305,795	220,207
Add: Unappropriated Profit brought forward	41,032	41,284

	223,831	160,720
Deduct: Amount transferred to General Reserve	50,000	30,000
	173,831	130,720
Deduct: Proposed Dividend of 15% and Bonus of 10% (less Income Tax) and Directors' Additional Remuneration (Dividend of 21% (less Income Tax) and Directors' additional remuneration)	137,250	—
	—	89,688
Unappropriated Profits carried forward	£36,581	£41,032

The profit shows a satisfactory increase and your Board feels justified in recommending a small increase in distribution. At the same time they propose to divide the total of 2s. 6d. per stock unit into a dividend of 1s. 6d. and a bonus of 1s. Profits of a business such as that of your Company are liable to vary substantially from year to year, being dependent on dividends from mining companies, sharedealing and underwriting. Revenue from dividends and interest can be looked on as reasonably dependable and so far as the Directors can see should be sufficient to maintain a

distribution of 1s. 6d. per stock unit. The balance represented by the 1s. bonus can be regarded as accruing from other sources of profit.

In the year under review the figure of £284,855 representing Dividends and Interest received is abnormally high due to certain non-recurring receipts. The Anglo American Corporation of South Africa, Limited, in which your Company maintains a large holding, has for the first time adopted the practice of paying an interim dividend; thus during our financial year 1950, the Anglo American Corporation dividend of 6s. in respect of 1949 and an interim of 2s. for 1950 were both received. Certain other exceptional receipts from other companies are also included. For 1951 your Directors do not expect to receive more than about £180,000 from dividends on our present shareholdings but this estimate must be subject to the usual uncertainties inseparable from mining enterprises. Your Company now has a substantial cash surplus available for investment as and when favourable opportunities occur and to the extent that this is invested in revenue producing shares income will, of course, be augmented.

The year under review was not favourable for sharedealing and revenue from that source is considerably lower. Income from underwriting has shown a tendency to rise and every effort is being made to develop this branch of our business.

The Balance Sheet reflects the improved cash position of the Company resulting from the receipt of £550,000 from the issue of 400,000 shares at 27s. 6d. each. There were, however, contingent liabilities amounting to £465,969, but of this amount £150,000 has since given rise to an actual liability of approximately £18,000. The bulk of the remainder, namely, £200,000, is an underwriting commitment in respect of 5 per cent. Registered Convertible Notes of President Steyn Gold Mining Company, Limited, which are under option until April, 1952.

An amount of £73,152 has been written off certain shareholdings, reducing the balance of the Investments Reserve from £89,404 to £16,252. This particular reserve was originally created by writing up certain investments either to cost or to their then market value in accordance with the provisions of the Companies Act, 1948. In the circumstances your Board does not propose to make any special provision to maintain the balance on this reserve. We have, however, appropriated £50,000 to General Reserve, bringing it up to £250,000 and resulting in a small reduction in the balance of unappropriated profit carried forward.

INVESTMENTS

These remain substantially unchanged. The holding in De Beers has been disposed of and replaced by an increased holding in Anglo American Investment Trust, Limited. A substantial holding has been acquired in Orange Free State Land and Estate Company (Proprietary) Limited, a company with extensive properties in and around the Orange Free State goldfield. The holding in Beart Products, South Africa, Limited, was previously felt to be too small to be specifically mentioned. This company has now expanded its operations and has begun to pay satisfactory dividends.

Although time must still elapse before our investments in the Orange Free State begin to yield income, we are satisfied that our participation in the finance of this important new goldfield will prove to be highly profitable.

The fifty-fifth annual general meeting of members will be held at The Chartered Insurance Institute, 20, Aldermanbury, London, E.C.2, on the 3rd April, 1951, at 12.30 p.m. Copies of the full Report and Accounts may be obtained on application to the Company's Office, 11, Old Jewry, London, E.C.2.

Glyn voiced what will widely be regarded as a legitimate complaint at the obligation that is thereby imposed on them to draw upon funds legitimately accumulated for other purposes.

* * *

Banking and the China Trade

A great deal has happened in the Far East since the chairmen of the big British banks operating there issued their reports to stockholders for 1949. In view of the inflation of commodity prices it is not surprising that each of these banks recorded an increase in total assets of between 15 and 40 per cent in 1950. It is perhaps more surprising, and more satisfactory, that each of them has maintained or expanded its profits; indeed, one bank, the Chartered Bank of India, Australia and China, has even felt able to raise its dividend. As usual, the chairmen's statements range over a wide array of financial developments in the many countries in which their banks operate. It is plain, however, that there are three main topics that are now uppermost in the minds of all

bankers in the East. The first is the great question-mark hanging over the future of western trade relations with Communist China; the second is the danger as well as the immediate gain attached to the present high level of commodity prices; and the third is the vital importance of renewed and expanded trade between India and Pakistan.

On the first of these points the views of Sir Arthur Morse, the chairman of the Hongkong and Shanghai Bank, will naturally attract wide attention. Sir Arthur was unable to give much new information about conditions in China itself, although he did record that the cost of living in China ports generally has kept fairly steady in the past year; the five offices that the bank still maintains in China are now a liability, however, rather than an asset, and are tightly controlled by the local authorities. The most prominent increase in the bank's business last year was in Hongkong, where exports rose by 60 per cent, imports by 38 per cent and clearing house figures by 30 per cent over the levels for 1949. These increases are largely due to the initial closure of Shanghai, which has resulted in the diversion of an exceptional amount of trade, to and from both China and Japan,

through Hongkong. Sir Arthur Morse dealt at some length with the difficult position that has arisen in Hongkong as a result of the decision made by the American authorities last December to extend to the colony the drastic economic measures already applied to direct trade with China. This decision not only led to the disruption of contracts already made; with startling suddenness, it also cut off the colony's growing indigenous industries from nearly all the raw materials that they normally import from the United States. The Hongkong and Shanghai Bank is endeavouring to comply strictly with the American regulations about blocked funds and so on, and Sir Arthur expressed understanding of the urgent motives behind the American action; he could not, however, see eye to eye with the American authorities on the desirability of the rigid form of embargo imposed: "To plunge the sword into the delicate texture of international trade and finance," he argued, "may cause irreparable injury and shatter faith in the sanctity of contract."

* * *

Expansion of Eastern Banking

Elsewhere in the East, the expansion of banking business in the past year reflects an increase in the volume of trade financed as well as in prices, as Mr V. A. Grantham pointed out in his address to stockholders of the Chartered Bank. It is clear, however, that the possibility of a sudden break in prices, which may not seem very likely at the moment, is a cloud hanging over many bank boardrooms. Sir Charles Innes, of the Merchantile Bank, pointed out that these very high prices, which "obviously cannot last indefinitely," are driving up the cost of living and wage levels as well; in this respect, banking costs in India have been significantly raised since last August, when the award of All-India Industrial Tribunal increased the salaries of the staffs in no fewer than 205 banks.

The recent agreement between India and Pakistan to resume trade relations at the cross-rate of Pakistan rupees 69½ to Indian rupees 100 was welcomed by all the chairmen; Mr J. E. Jenkins, of the Eastern Bank, suggested that the Pakistan decision not to devalue in September, 1949, has been justified by results—especially in view of the extraordinary world demand for cotton and jute in recent months. Political differences (especially over Kashmir) still remain, but the decision to resume trade, if it is loyally carried out, should bring immeasurable benefit to both countries, each of which is now showing a substantial surplus on its external balance of payments. The major source of economic disequilibrium in this area is India's desperate shortage of foodstuffs, to which Mr J. K. Michie, of the National Bank of India, drew particular attention. But this may be eased by the new trading agreement almost as much as by the generous American gift of grain. In other eastern countries, the bank chairmen could report satisfactory expansion. Burma and Indonesia are returning to normal life and moderate prosperity (though Indonesia is troubled by malcontent extremists in its labour unions). In Japan, industrial activity has recently been more than 20 per cent above the 1932-36 average; textile production, though still backward in its recovery compared with that in other industries, is now about double the 1949 average. In Malaya, Thailand and even Indo-China, business has been satisfactorily prosperous in spite of great political difficulties.

* * *

More Freedom for Timber

Timber is one of the few raw materials of which the supply this year should be more or less secure. Consumption of softwood is still severely rationed at last year's level of 1,030,000 standards. But imports are expected to reach at least 1,500,000 standards, of which the Timber Control will be responsible for 1,000,000 standards and the private

trade for the remainder. It is possible that the figure might even be as high as 1,750,000 standards. Last year imports amounted to only 796,000 standards. The main problem so far has been the shortage of shipping space. The Timber Control bought heavily in North America last autumn, but the sudden decision to import coal led to a scarcity of shipping for other purposes, including the movement of timber. The President of the Board of Trade has recently stated, however, that all the purchases so far made from the Pacific Coast will have been shipped by the end of June. The first call on these larger imports will undoubtedly be to build up stocks. By the end of 1951, stocks are expected to total over 600,000 standards, the highest level for many years. But it is certainly arguable that consumption should also be allowed a modest expansion.

A fortnight ago restrictions on the price of softwood were removed. Prices were fixed by the Timber Control last April and had not been altered despite the general rise in commodity prices. In future timber traders will be able to sell privately imported softwood and softwood purchased from the Timber Control at prices based on their purchase prices. They have assured the Board of Trade that the new prices will allow only a reasonable margin of profit and they have set up a committee on which consumers will be represented to deal with problems of price and distribution. Although timber users have been faced with a price rise of some 50-60 per cent, timber is not, in relative terms, a dear commodity and if restrictions on its use were relaxed, demand would almost certainly outstrip supply.

Two stages of decontrol have been successfully negotiated. First the partial reversion to private import last October; secondly the abolition of controlled selling prices. The third stage—full reversion to private import—should follow as a matter of course quite quickly. In other commodities problems of exchange control have been solved quite successfully. The Timber Control has a poor record of securing supplies at satisfactory prices, and it is difficult to believe that private trade could not improve on its performance in delivering timber in the right types and specifications to the right ports.

* * *

Allocation for Steel?

Steel production last month reached a new record, with an annual rate of 16,952,000 tons. Such an output, according to the best estimates that the industry can make, should still be sufficient to meet the current physical consumption of steel. But this does not alter the fact that some consumers are undoubtedly suffering from production difficulties through lack of steel. Actual use of steel, in short, now bears only a limited relation to paper demand: each customer, understandably fearing a developing shortage and higher prices, is busily putting into stock all the steel he can acquire, and in the rush the hindmost may be getting less than their current needs.

Inevitably, this has encouraged suggestions that steel allocation may again be extended to types of steel other than sheet and tinplate. The Ministry of Supply's Iron and Steel Division is stated to be considering the re-introduction of allocation; and it would probably be supported by disappointed customers and by those for whom the disciplining of a free market demand into an orderly queue for paper permits has an intrinsic attraction. Steel allocation might indeed become more desirable later this year, when the demands of rearmament begin to become important; but it is doubtful whether it could be justified at present. The steel industry is experiencing difficulties in the supply of ore and scrap, partly through the shortage of shipping; and in recent weeks its inability to secure as much coke as it could use has been aggravated. For the moment, however, it seems that informal arrangements between steel

(The liability of members is limited to the extent and in manner prescribed by Ordinance No. 6 of 1920 of the Colony.)

REPORT OF THE DIRECTORS

SUBMITTED to the Members at the Ordinary Yearly General Meeting held at the Head Office, Hong Kong, on 10th March, 1951.

The Directors have pleasure in submitting the Balance Sheet at 31st December, 1950, together with the Profit and Loss Account for the year ended at that date.	
The Profit for the year, after providing for taxation on profits earned to date and after making transfers to the credit of Reserves for Contingencies, out of which Reserves provision has been made for any diminution in value of current assets, amounts to	
To this must be added the undistributed profit brought forward from the previous year	HK\$17,947,794
An Interim Dividend of £2 per share, free of Hong Kong Corporation Profits Tax, was paid on the 11th August, 1950, amounting to £220,000 @ 1/2 7/8	
leaving a balance available for distribution of	
This balance the Directors recommend be appropriated as follows—	HK\$17,947,794
Amount to be written off Bank Premises	6,000,000
A Final Dividend of £3 per share, free of Hong Kong Corporation Profits Tax, £450,000 @ 1/2 7/8	10,744,538
leaving a balance to be carried forward to next year of	
The above appropriations have been incorporated in the Accounts.	HK\$22,686,787
DIRECTORS —The Hon. Sir Arthur Morse, G.B.E., has been elected Chairman for the year 1951.	
The Hon. D. F. Lamdale, Mr. H. J. Collier, C.B.E., and Mr. J. D. Alexander retire by rotation, but, being eligible, offer themselves for re-election.	
AUDITORS —The Accounts have been audited by Messrs. Peat, Marwick, Mitchell & Co. and Messrs. Lowe, Bingham & Matthews, who offer themselves for re-appointment.	
HONG KONG, 27th February, 1951.	

A. MORSE, Chairman.

BALANCE SHEET at 31st December, 1950	
Share Capital—	
Authorized and Issued:	
100,000 Shares of HK\$125 each, fully paid	HK\$12,500,000
Reserve Liability of Members	4,125,000
HK\$125 per Share on 100,000 Shares	HK\$12,500,000
Reserve Fund	96,000,000
Profit and Loss Account	6,000,000

PROFIT AND LOSS ACCOUNT for the Year ended 31st December, 1950

Interim Dividend of £2 per Share, free of Hong Kong Corporation Profits Tax, paid	
14th August, 1950, £220,000 @ 1/2 7/8	HK\$4,400,000
Appropriations recommended by the Directors—	
Amount to be written off Bank Premises	HK\$6,000,000
Final Dividend of £3 per Share, free of Hong Kong Corporation	
Profits Tax, £450,000 @ 1/2 7/8	HK\$9,000,000
Balance carried forward to next year	10,744,538
	6,000,000
	HK\$22,686,787

STATEMENT IN CONNECTION WITH SUBSIDIARY COMPANIES.

(1) The Investments in Subsidiary Companies appearing in the annexed Balance Sheet represent the Issued Share Capital of three Trustee Companies and three Non-trustee Companies wholly owned by the Bank. No Group Accounts have been submitted as the Directors are of the opinion that such Accounts would be of no real value to the members of the Bank.

REPORT OF THE AUDITORS TO THE MEMBERS OF THE HONGKONG AND SHANGHAI BANKING CORPORATION.

We have examined the above Balance Sheet with the books of the Corporation kept in Hong Kong, with the audited accounts of the London Office and with the returns received from the other offices which have been signed by the Branch Managers. We have obtained all the information and explanations we have required and in our opinion such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Corporation's affairs at 31st December, 1950, according to the best of our information and the explanations given to us and as shown by the books kept in Hong Kong and by the returns received from other offices.

suppliers and their customers should be sufficient to relieve particular cases of industrial dislocation. Steel allocation, however, is also being considered in Whitehall once again in the light of its importance as a so-called instrument of planning. If and when the Government decides that it needs to apply a stricter supervision to the industries contributing to rearmament, or to shift the balance of the economy towards those industries, steel allocation may present itself as perhaps the least ineffective lever to hand.

Pressure on Prices

Wholesale prices increased further by 2 per cent in February, a more modest increase than in most of the months since June. Once more the main advances occurred in raw materials, prices of which rose by 6 per cent. Raw wool, silk and sisal showed the greatest increases but tin, groundnut and palm kernel oils, esparto, hides and skins, and rubber were also dearer. Prices of intermediate products rose by 3 per cent and those of manufactured articles by 2 per cent.

But it is not only imported goods that are imposing strain on prices. The general increase in coal prices, which came into operation on February 5th, raised the coal index by 6 per cent. Dearer coal and coke caused iron and steel prices to be

raised on February 21st; this sub-index rose by barely 1 per cent in February and the full effect will be felt in the March figures. The index for non-ferrous metals actually fell last month despite a rise of 17 per cent in the price of tin; brass ingots were cheaper and these carry a larger weight in the index than tin. The cotton index rose by 3 per cent, wool by 11 per cent and "other textiles" by 6 per cent.

The sharp rises in raw material prices of recent months are beginning to show their effect upon intermediate products and finished manufactures, though the price increases so far recorded in these groups are not very marked. Higher prices for utility shirts and underwear will come into operation next Monday; cotton garments will be increased by about 15 per cent and wool garments by 25 per cent. Certain hollowware articles such as buckets and tinned saucepans will also become dearer next week.

Problem for the Jute Industry

The new India-Pakistan trade agreement will have important consequences for the British jute industry. Demand for jute cloth and bags has increased considerably owing to the shortage of other packaging materials. These coarser cloths were made in India, but as a result of the trade deadlock between the two dominions, supplies of them from India have for many months been small. British manufacturers have made good the deficiency by switching their

production to the types that the Indian industry has been unable to supply. Discussing the implications of this change at the annual general meeting of Jute Industries Limited, Mr. W. G. N. Walker, the chairman, stated that the British jute industry "was being steered away from its traditional markets and forced to make the very types of cloth that it had lost to India through lack of protection during the interwar years." The industry has no guarantee that these markets will be open to it in future. If coarse jute cloths are exported in large quantities by India in future, Dundee will have to meet competition in a product that it cannot produce as cheaply as India, and it will also have a hard fight to regain its traditional markets both at home and abroad.

This prospect may seem bleak, but circumstances offer a short respite to allow important decisions to be taken. Despite the new trade agreement, the Indian jute mills have had to close down for ten days owing to shortage of raw material. Moreover, Pakistan has developed Chittagong as a sizeable port and new anchorage facilities have been provided at Chalna. These two ports alone can handle almost the whole of Pakistan's seasonal exports of jute. It seems doubtful whether Pakistan will forsake this important export trade that it has built up during the past eighteen months. The reappearance of India as a major supplier of jute manufactures may therefore not be seen for some time. But Dundee and the Government must decide quickly. The longer the traditional markets of the British jute industry are left unsupplied, the more difficult will it be to recapture them.

Safer Industry

Industrial accidents, after declining from a wartime peak and showing signs of stability in 1948, again showed a welcome fall in 1949. Some 192,982 accidents were notified, a decrease of 4 per cent from the 1948 figure of 201,086; and the 10 per cent fall in fatal accidents, from 861 to 772, was particularly encouraging. In his annual report for 1949 the Chief Inspector of Factories shows that of 78 industrial groups for which separate figures are available, 21 showed increases in the numbers of accidents while 57 showed decreases. Accidents in metal foundries, where the inspectorate has been carrying out a special survey, fell during the year by 12 per cent. Building accidents increased by 20 per cent, but part of this increase is believed to be due to fuller notification of accidents; fatal accidents (statistics of which are more dependable) declined in this industry by 11 per cent.

The rate of accident frequency (based upon an international formula taking into account hours worked) was highest in the tinplate industry (where it rose in 1949), followed by iron and steel founding, other iron and steel process industries, non-ferrous metals, shipbuilding and repairing, and bricks. At the other end of the scale, the lowest rate

ACCIDENTS IN BRITISH FACTORIES, 1944 TO 1949

Year	Number of Notifiable Accidents	Index (1944=100)	Accident Rate per 1,000 Employees	Index (1944=100)
1944	266,766	100	40	100
1945	226,461	85	37	92
1946	207,587	78	34	85
1947	185,747	70	29	72
1948	182,838	69	28	70
1949	172,026	65	25	65

was recorded for printing, followed by tobacco, light engineering and radio, aircraft and aero engines, and electrical engineering. The general trend of accident frequency was downward, though there were increases in several of the heavier industries. The analysis of accidents by cause showed reductions in the number of accidents caused by shafting, milling machines and power presses (which are small in number, but generally cause serious injury); a

REPORT BY THE COURT OF DIRECTORS OF The ROYAL BANK of SCOTLAND

TO THE ANNUAL GENERAL COURT OF PROPRIETORS, ON WEDNESDAY, 14th MARCH, 1951

The Court of Directors now submit to the Proprietors Group Accounts comprising the Balance Sheet and Profit and Loss Account of the Royal Bank of Scotland as at 14th October, 1950, and the Balance Sheets and Profit and Loss Accounts of its Subsidiary Companies, Glyn, Mills & Co. and Williams Deacon's Bank Limited as at 31st December, 1950. The Net Profit of THE ROYAL BANK OF SCOTLAND for the year to 14th October, 1950, after providing for Taxation and making transfers to Reserves for Contingencies, out of which Accounts provisions have been made for all bad and doubtful debts and fluctuations in the value of Investments, amounted to		£361,250 0 0	£618,622 7 10
Interim dividend at rate of 8½ per cent. actual paid at Midsummer, 1950, required	£162,562 10 0	0	
Less Income Tax	£361,250 0 0	£162,562 10 0	
Interim dividend at rate of 8½ per cent. actual paid at Christmas, 1950, required	£361,250 0 0	£162,562 10 0	
Less Income Tax	£361,250 0 0	£162,562 10 0	
There have been transferred to Property Maintenance Reserve Account	30,000 0 0		
Contributed to Staff Pension Fund	75,000 0 0		
Contributed to Staff Widows' Fund	15,000 0 0		
Carried to Reserve Fund	101,247 7 10		
The Reserve Fund now amounts to	£4,773,800		£618,622 7 10

A dividend of 17 per cent. per annum having already been paid, the Court of Directors do not recommend any further dividend for the year. A valuation of the Bank's quoted investments at 14th October, 1950, is in excess of the sums at which they appear in the annexed Balance Sheet. The Directors record with deep regret the death of The Right Hon. Lord Bradbury of Winsford, G.C.B., LL.D., who had been an Ordinary Director since November, 1930. During the year the Directors, in virtue of the powers conferred upon them by the Royal Bank of Scotland Act, 1873, elected The Right Hon. Sir Ronald Ian Campbell, G.C.M.G., C.B., and Mr. Kenneth Graham Holden, Ordinary Directors of the Bank; they hold office until this Annual General Court only, but are eligible for re-election. In exercise of the powers already mentioned, the Directors have elected Sir William Crawford Currie, G.B.E., Deputy Chairman of Williams Deacon's Bank Ltd. an Extraordinary Director of the Royal Bank of Scotland. The Governor, the Deputy-Governor, the Extraordinary Directors and the Senior Ordinary Director (The Right Hon. The Earl of Elgin and Kincardine, K.T., C.M.G., LL.D.), retire at this time and are eligible for re-election. Mr. George James Gregor, C.A., and Mr. S. W. Murphy, C.A., Auditors for the past year, are willing to continue in office as Auditors and will be re-appointed pursuant to Section 159 of the Companies Act, 1948. Edinburgh, 20th February, 1951

STATEMENT OF ACCOUNTS, 14th OCTOBER, 1950

CAPITAL STOCK, Authorised and Issued	£4,250,000
RESERVE FUND	4,773,800
NOTES in circulation	£9,023,800
DEPOSITS and other Accounts, including Reserves and Provisions for Contingencies and Taxation	131,293,730
AMOUNTS due to Subsidiary Companies	4,852,832
DIVIDEND—Christmas, 1950, less Income Tax	198,687
LIABILITIES for Acceptances, Confirmed Credits and other Obligations	6,959,935

Notes:—The profits of Williams Deacon's Bank Ltd. and Glyn, Mills & Co. have been taken into the Royal Bank of Scotland profit only to the extent of the Dividends declared. The Nominee Companies are non-trading and have made neither a profit nor a loss for the year ended 14th October, 1950. Foreign Currency Balances have been converted into Sterling at the rates current on 14th October, 1950. United Kingdom Income Tax has been provided on the profits to date.

Statement required by the Eighth Schedule of the Companies Act, 1948. The Directors of the Bank have, in terms of Section 153 (1) of the Companies Act, 1948, investigated the possibility of making the financial year of each of the Subsidiaries coincide with its own. The practice of the Subsidiaries has been to make up their Accounts as at 31st December in each year, and it is considered impracticable to alter this arrangement. The Royal Bank of Scotland has, since 1879, made up its Accounts annually on the second Saturday of October, and any alteration in this long-established and convenient procedure would involve administrative difficulties in the conduct of the Bank's affairs. The Directors are satisfied that the foregoing considerations constitute good reasons for not making any alteration in the financial years of the Bank or of the Subsidiaries.

KENNETH MURRAY, ELGIN, C. AUGUSTUS CARLOW, Directors.
J. M. THOMSON, Cashier and General Manager.

Of these amounts, there are included in the Accounts of the Subsidiary Companies sums amounting, in all, to £26,206 (1949, £27,696).	

AUDITORS' REPORT

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our Audit. In our opinion proper books of account have been kept by the Bank so far as appears from our examination of those books, and proper returns adequate for the purposes of our audit have been received from Branches not visited by us.

We have examined the above Balance Sheet and Profit and Loss Account which are in agreement with the books of account and returns of the Bank. In our opinion and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1948, in the manner so required, and on the basis authorised by the Act for a banking company give a true and fair view in the case of the Balance Sheet of the state of the Bank's affairs at 14th October, 1950, and in the case of the Profit and Loss Account of the profit for the year ended on that date.

We have examined the Group Accounts (comprising the above Balance Sheet of the Royal Bank of Scotland as at 14th October, 1950, and the annexed Balance Sheets of its Subsidiaries, Glyn, Mills & Co. and Williams Deacon's Bank Ltd., both as at 31st December, 1950) with the audited accounts of the Banks dealt with thereby, which accounts, with the exception of the Royal Bank of Scotland, have not been audited by us. Subject to the foregoing, in our opinion, the said Group Accounts have been properly prepared in accordance with the provisions of the Companies Act, 1948, and, on the basis authorised therein, give a true and fair view of the state of affairs and of the profit of the Royal Bank of Scotland and its Subsidiaries.

GEO. JAMES GREGOR, C.A., Auditor.
S. W. MURPHY, C.A., Auditor.

ESTABLISHED IN CALCUTTA, 29th SEPTEMBER, 1863.

HEAD OFFICE . 26, BISHOPSGATE, LONDON, E.C.2

NOTES.

1. Bills receivable rediscounted £6,462,626, of which up to 6th March, 1951 £1,523,930 have run off.
2. Forward contracts outstanding for the purchase and sale of Bills and Telegraphic Transfers £94,316,147.
3. Liabilities have been incurred in respect of building contracts for new premises amounting to approximately £158,446.
4. There are contingent liabilities in respect of guaranteed credits outstanding amounting to £23,322,872.
5. There are contingent liabilities in respect of guarantees entered into in the ordinary course of business.
6. Overseas Current Assets and Liabilities have been converted at the rate of 1/6d. per Indian Rupee, 2/2d. per Pakistan Rupee and £1 per 20 East African Shillings, and other currencies at the rates of exchange ruling on 31st December, 1950.

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion, proper books of account have been kept by the Bank so far as appears from our examination of those books and proper Returns adequate for the purposes of our audit have been received from Branches visited by us. We have examined the above Balance Sheet which is in agreement with the books of account and Returns. In our opinion and to the best of our information and according to the explanations given to us the said Balance Sheet gives the information required by the Companies Act, 1948, in the manner thereby authorised for Banking Companies and on such basis the Balance Sheet gives a true and fair view of the state of the Bank's affairs as at 31st December, 1950.

We have also examined the annexed Consolidated Balance Sheet and Consolidated Profit and Loss Account of the Bank and its Subsidiaries dealt with thereby with the audited accounts of those Companies. In our opinion such Consolidated Balance Sheet and Consolidated Profit and Loss Account have been properly prepared from such accounts in accordance with the provisions of the Companies Act, 1943, in the manner thereby authorised for Banking Companies and, on this basis, give a true and fair view of the state of affairs of the Bank and its Subsidiaries dealt with thereby so far as concerns members of The National Bank of India Limited.

LONDON, 7th March, 1951.

COOPER BROTHERS & CO. }

Chartered Accountants.

The Ministry of Food has decided to increase the retail price of tea by 4d. a lb. to an average price of 3s. 8d. a lb., commencing May 21st. The subsidy will be correspondingly reduced from 1s. to 8d. a lb. In an article "Food Stock-taking" on page 448 of *The Economist* dated February 24th the imports of tea in 1950 given in Table I should have read 164,000 tons, making the decline in stocks during the year 28,000 tons. The stock figure for tea in Table II remains unchanged.

During January industries in the "metals, engineering and vehicles" classification of the Ministry of Labour increased

Rugby Portland Cement.—Record production, deliveries and exports last year are reflected in the rise in group trading profits from £380,270 to £448,517. Rugby Portland Cement has dealt more liberally by its equity shareholders during the dividend freeze than many companies; for 1950, apart from the third successive special tax-free distribution of 5 per cent from capital sources, the Ordinary dividend has again been raised, from 17½ to 20 per cent; this dividend absorbs 42 per cent of available profit, compared with 43 per cent in 1949. The net dividend represents a return on the real equity capital (ordinary shares and reserves) of 2.9 per cent, and the earnings return is 7 per cent. The balance sheet shows a high proportion of fixed capital equipment; group fixed assets, after depreciation, stand at £2,014,623, against £2,025,001, but net current assets have also risen from £543,768 to £687,791.

The margin of profits on home deliveries is small, and only 28 per cent of group net profits of £153,264, against £133,630, come from home sales. Costs of production are nearly doubled and costs of new plant trebled compared with 1939. Exports are the principal source of the industry's profits. It may be that British cement exports are near their peak; cement output expanded from 9,287,000 tons in 1949 to 9,672,000 tons in 1950, but there was only a slight increase in exports of 4,000 tons to 1,864,000 tons. The corresponding figures for 1939 were total production of 8,252,000 tons, of which 665,000 tons were exported. The industry has had to meet the strain of substitution for timber in building; the consequence is that a council house now consumes three times the amount of cement used before the war. This was one of the factors contributing to "a slight shortage" of cement in 1950, and to the need for imports. In his freely hitting speech, Mr Halford Reddish does not spare "the planners"; their estimate of home consumption in 1950 was too low; in his view, their estimate for 1951 is "wildly high."

Rugby Portland Cement, with new kilns at Rochester now complete, have contributed towards the expansion of the capacity of the industry. Demand should absorb

their labour force by 23,000 to 4,109,000, compared with an increase of 16,000 in January, 1950. This increase, coupled with the facts that manufacturing industry as a whole gained only 39,000 more employees during the month, and that unemployment fell by ten per cent, instead of showing its usual seasonal rise, suggests that the first effects of defence contracts are beginning to be felt. The shift in the pattern of employment, however, is very slight ; and it is within the engineering industries that the most important movements, those of skilled labour, will have to be looked for.

In an effort to stem the tide of internal inflation, the Ceylon Government has increased export duties on a number of commodities. The duty on tea has been raised by 7 cents (1½d.) to 60 cents (11d.) a lb, rubber by 15 cents (2½d.) to 50 cents (9d.) a lb., copra by Rs.25 (37s. 6d.) to Rs.100 (150s.) per candy, coconut oil by Rs.81.25 (121s. 8d.) to Rs.325 (487s. 6d.) a ton, coconut poonac (a cattle feed) by Rs.100 (150s.) to Rs.200 (300s.) a ton, and pepper by 50 cents (9d.) to Rs.2.50 (3s. 9d.) a lb. A new duty of 25 cents (4½d.) a lb. has been imposed on cocoa and of Rs. 2 (3s.) a lb. on cardamoms (a spice) and citronella oil (used in pharmaceutical preparations). The new duties on rubber, cocoa and pepper are unlikely to affect world prices since Ceylon is a relatively small producer of these products ; but part of the increased duties on the other items might well be passed on to the consumer.

this output, and exports may well be stabilised at current levels. Rearmament may create new demands for cement directly for military construction and indirectly as a substitute for steel and timber. The increase in the price of cement by 4s. a ton, Mr Reddish emphasises, is an equalising charge to meet the cost of imports at higher prices. Although costs can be expected to rise further and a shortage of paper sacks will add to difficulties in 1951, the immediate prospects of the company seem satisfactory.

Associated Electrical Industries.—It was unfortunate that a year of impressive achievement by Associated Electrical Industries was overshadowed, as far as the market was concerned, by the proposed capital reorganisation scheme. Whatever the conclusion may be about the scheme, the rise in group trading profits from £7,601,904 to £8,439,937 and in the ordinary dividend from 15 to 20 per cent (which represents a return on the real equity capital of some £28 million of little more than 4½ per cent) can only evoke praise. The value and volume of production rose further last year and the group expanded its exports, particularly to hard currency areas.

The strength of the balance sheet reinforces the good impression made by the year's profits. In his review of 1949, Mr Oliver Lyttelton commented that stocks appeared "to be above what is desirable in relation to annual output." In the past year, although stocks reflect rising prices, their total has been reduced from £23,996,425 to £23,464,714. During the last four years, working capital and liquid resources have been progressively strengthened; net current assets stood at nearly £24 million at the year-end, against £18.2 million at the end of 1947, cash at £2,104,806 against £949,578, while £1,000,000 was held in tax reserve certificates, against £395,425. Total reserves have been built up from £19,344,103 to £22,060,063 in the past year, and it is a sign of the times that fixed asset replacement reserves have risen from £500,000 to £1,450,000. Some measure of the recent rate of expansion is given by the rise in the group's fixed assets.

at cost, from £14,681,283 at the beginning of 1947 to £21,592,405 at the end of last year. On the company's trading record alone, equity shareholders are entitled to look to the future with confidence.

Hoover.—The sustained expansion in production and sale of Hoover household appliances and of the recently developed fractional horse-power motors branch is mirrored in the jump in group trading profits from £1,962,393 to the record figure of £2,984,238, of which some £927,000 was earned by overseas subsidiaries. Total turnover was more than seven times that of 1938 and profits have increased in the same proportion. The company has more than played its part in capturing and holding foreign markets by exporting more than 40 per cent of total production; in the first two months of this year this figure has risen to 53 per cent. Some of the reasons for success are quite clear. First, efficiency in production has meant that, in the competitive market for electric cleaners, the retail price, apart from purchase tax, has risen by less than 10 per cent compared with prewar levels. Secondly, the company has continued to pursue an expansionist policy: the doubling of factory space at Merthyr Tydfil, where washing machines are manufactured, is nearly complete, and further extensions have been approved; while the Cambuslang works, which produce motors, are being increased in size by nearly 75 per cent.

<i>(a) Includes a special non-recurring credit of 665,888</i>		

The company's new ventures have proved successful and the directors consider that shareholders are entitled to share in the success in the form of increased dividends and should receive a return compatible with the risks that are undertaken with their money. A total dividend of 45 per cent was paid in 1949 on £935,000 capital; in 1950, an interim dividend of 15 per cent was declared on this capital and a final dividend of 22½ per cent on £1,870,000. The issued equity capital was doubled in December last by the capitalisation of reserves to reduce the disparity between issued capital and the capital employed in the business. A computation of percentage earnings, after these capital changes, might be misleading, but the dividend is covered more than twice. Sir Charles Colston, the chairman, points out that, after allowing for the changes in the price level and the incidence of tax, ordinary shareholders are worse off than in prewar years and that the net dividend represents only 12½ per cent of profits after depreciation, against 42½ per cent in 1938.

In view of the company's rapid expansion, the strength of the balance sheet is indeed impressive. Stocks at £2,200,000, against £1,300,000, and debtors (of which a fair part may represent hire purchase contracts) at £2,500,000, against £1,700,000, reflect the expansion of turnover and sales. Equity shareholders are likely willingly to accept the chairman's statement that "provided there is no general war, I think we may look forward to the future with sober confidence."

Bradford Dyers.—The excellent trading results of Bradford Dyers—group trading profits have risen from £1,773,243 to £2,836,523—owe much to an expansion of business overseas. Trading profits at home have risen by some 46 per cent to over £1,500,000, but this is overshadowed by the remarkable expansion of overseas trading profits by some 85 per cent to £1,300,000. To the extent that the group works on a commission basis, as it largely does, these sums represent "pure" profits in the sense that inventory windfalls will have had little part in them. After the bleak years of the thirties, ordinary shareholders have progressively shared in the steady improvement in profits, and for the latest year the dividend has been raised from 7½ per cent, which includes a 2½ per cent jubilee bonus, to 10 per cent. The dividend is well covered, even on a stringent calculation, by earnings of 45 per cent, against 23 per cent. This expansion of earnings has been retained, to the extent of no less than £407,575, by subsidiaries; in 1949 the latter passed on all their profits apart from £2,322.

	Years to December 31, 1949	1950
Consolidated earnings:—		
Trading profit in Britain	1,070,635	1,534,737
Overseas subs. trading profit	702,608	1,301,785
Total income	1,845,383	2,934,353
Taxation	544,948	752,440
Depreciation	652,293	791,999
Group earnings for ord. stock	255,313	770,301
Ord. dividends	93,175	124,233
To general res. and c/f.	2,258,794	159,816

	1949	1950
Cons. balance sheet analysis:—		
Fixed assets, less depreciation	3,562,325	3,208,085
Net current assets	4,745,171	6,161,957
Stocks	2,035,694	2,094,149
"Quick" assets	4,257,707	4,988,871
Revenue reserves	1,454,953	1,862,257
Ord. capital	2,258,794	2,258,794
£1 ordinary stock at 30s. 9d. yields 10s. per cent.		

Bradford Dyers has evidently done very well in its overseas ventures, and the erection of a factory in Australia for the dyeing, finishing and printing of rayon fabrics is planned. Perhaps the most impressive feature of the balance sheet is the size of liquid resources; cash has risen from £1,850,000 to £2,540,000 and quoted investments total

nearly £1,700,000 against £1,440,000. Working capital has risen from £4,700,000 to nearly £6,200,000, and as stocks must largely represent work in progress, there should be no difficulty in meeting any capital commitments in the current year.

The outlook for Bradford Dyers largely depends on the prospects of the textile industry as a whole. In a year of record prices for wool and serious cuts in rayon production, it would be optimistic to expect the physical volume of textile production to expand very much further. This prospect, coupled with the possibility of buyers' resistance to higher prices, introduces a question mark about the possible outcome for the current year.

International Nickel.—The highlights of the financial reports of International Nickel for the years ended December 31, 1949 and 1950, are indicated in the following table:—

	1949	1950
Earnings:—		
Net earnings	32,252,314	48,765,849
Income taxes	17,975,014	27,597,615
Common and pref. divs.	31,090,237	31,090,237
Additions to mines and plant	18,553,551	18,683,606
Earnings per common share	2.08	3.21
Paid per common share	2.00	2.00

	1949	1950
Dividends:—		
Nickel (lbs.)	209,292,257	256,410,543
Copper (lbs.)	221,075,080	212,947,394
Platinum metals (ozs.)	214,735	267,316

De Beers.—The traditional buying of diamonds as a hedge against inflation clearly furnishes much of the explanation of the remarkable jump in De Beers' net profits last year from £7,216,568 before tax to £10,380,000. Sales of rough diamonds by the central selling organisation were £50.9 million, against £28.4 million in 1949 and £38.1 million in 1948. Moreover, increased rearmament activity was responsible for a jump in sales of industrial diamonds to £5,500,000 in the last quarter of 1950, against £2,500,000 in the two previous quarters.

The dividend policy of the company has in the past been conservative, particularly in view of the comparatively light burden of South African taxation; this absorbed £2,500,000 last year, against £1,525,000. Since 1947, the dividend had been maintained at 90 per cent, but the raising of the dividend for 1950 to 110 per cent is clearly justified by the year's results, and shareholders may feel that conditions would have to alter radically if the dividend were not at least maintained for the current year. The recent increase in diamond prices is evidently a favourable pointer. The 5s. deferred shares at the current price of 58s. yield nearly 9½ per cent.

Canadian Pacific Railway.—The income accounts of Canadian Pacific Railway for the years ended December 31, 1949 and 1950, are summarised below:—

	1949	1950
Gross earnings	363,252,094	378,576,688
Less working expenses	342,620,125	340,556,331
Net earnings	20,631,969	38,020,357
Other income	23,636,653	23,236,264
Total income	44,268,622	61,256,621
Less fixed charges	14,543,817	13,389,610
Net income	29,724,805	47,867,011
Less pref. divs.	5,872,768	3,368,648
Less ord. divs.	16,750,000	20,100,000
Balance carried to P.L. account	9,102,037	24,378,363

The substantial improvement in net railway earnings from \$20,631,969 to \$38,020,357, and with only a slight fall of some \$400,000 in income from other sources, has enabled the company to raise the Ordinary dividend from 5 to 6 per cent.

EXCHEQUER RETURNS

For the week ended March 10, 1951, total ordinary revenue was £82,393,000, against ordinary expenditure of £71,246,000 and issues to sinking funds £993,000. Thus, including sinking fund allocations of £19,747,000, the surplus accrued since April 1st is £779,700,000, compared with £653,911,000 for the corresponding period a year ago.

[illegible]

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper books of account have been kept by the bank so far as appears from our examination of those books, and proper returns adequate for the purposes of our audit have been received from the branches, which have not been visited by us. We have examined the annexed balance sheet and profit and loss account of The Chartered Bank of India, Australia & China, which are in agreement with the books of account and returns so stored at. In our opinion and to the best of our information and according to the explanations given to us the said accounts give the information required by the Companies Act, 1945, in the manner so required for the purposes of the Companies Act, 1945. The said balance sheet gives a true and fair view of the state of the bank's affairs as at 31st December, 1950, and the profit and loss account gives a true and fair view of the profit for the year ended on that date.

We have also examined the annexed accounts of the subsidiaries, Altabad Bank Limited and The Chartered Bank (Malaya) Trustee Limited, which have not been audited by us. Subject thereto in our opinion such accounts have been properly prepared in accordance with the provisions of the Companies Act, 1945, so as, in conjunction with the accounts of the bank as audited by us (which include particulars regarding the same) to give the full and correct view of the bank's affairs as at 31st December, 1950, and of the profit for the year ended on that date of the bank and its subsidiaries so far as concerns stockholders of The Chartered Bank of India, Australia and China.

**THE INSTITUTE OF CHARTERED ACCOUNTANTS
IN ENGLAND AND WALES**

APPOINTMENT OF ASSISTANT TO THE TAXATION AND
RESEARCH COMMITTEE

Newly-qualified members of the Institute who are anxious to obtain interesting experience are invited to apply for a temporary appointment, limited to a period of three years, on the staff of the Institute to undertake reference work and drafting for the Taxation and Research Committee and its sub-committees. The commencing salary will be £600 per annum, being subject to a 10% increase in pension rights. The successful applicant will be required to attend all meetings of the committee and its sub-committees. Applications, in writing, giving full particulars of education, qualifications, and experience, should be sent to the Secretary of the Institute, Moorgate Place, London, E.C.4. Envelopes should be marked "T. & R. Assistant-confidential."

RESEARCH DEPARTMENT OF THE LABOUR PARTY. Education Officer. Knowledge economics, general political questions and Labour Movement essential. Experience in organisation of adult education most desirable. Salary £550-£650. Application forms, which should be returned by March 31, 1951, from Secretary, Labour Party, Transport House, Smith Square, London, S.W.1. The successful candidate will be required to join the superannuation scheme.

ANYONE can write a letter; to write advertising that sells is a job for men with special experience and flair. • For persuasive publicity that produces worthwhile results, consult **Museum Clark and Co., Ltd., 57/61, Mortimer Street, London, W.1. MUSEUM 5659.**

**THE INSTITUTE OF CHARTERED ACCOUNTANTS
IN ENGLAND AND WALES**

APPOINTMENT OF SECRETARIAL ASSISTANT

Applications, preferably from barristers-at-law, are invited for an appointment as Secretarial Assistant to undertake duties in connection with Institute committees and administration. The appointment is intended for a person between the ages of 25 and 30. The commencing salary will be £300 per annum and there will be contributory pension rights. Applications, in writing, giving full particulars of qualifications, education and experience, should be sent to the Secretary of the Institute, Moorgate Place, London, E.C.2. Envelopes should be marked "Secretarial Assistant-confidential."

YOUNG WRITER required, London, W.1. Interesting subjects on business and economics. Good conditions; good future for resourceful work. Write, age, experience, salary required (hand-writing please).—Box 593.

ECONOMISTS for sale covering the last five years.—Offers to Box 602.

JANUARY 1, 1914, to June, 1913, Bound Volumes Economist, and July, 1918, to December, 1950, Unbound, complete with Indices. What offers?—Box 597.

NO Capital Depreciation and a return of 2½ per cent. (income tax paid by the Society) are the terms offered for Share Investments by the 73-year-old Chelsea and Walham Green Building Society. Write for Leaflet F to 110-112, Kings Road, Chelsea, S.W.3.

MR V. A. GRANTHAM ON THE OUTLOOK

The ninety-seventh ordinary general meeting of The Chartered Bank of India, Australia and China will be held on the Bank's premises, 38, Bishopsgate, London, E.C., on April 4th.

The following is the statement by the chairman, Mr V. A. Grantham, which has been circulated with the report and accounts for the year ended December 31, 1950:

The proceedings at our forthcoming annual general meeting will be again of a formal nature as I am continuing the practice of sending to the stockholders, with the report and accounts, a statement on the affairs of the Bank during the past year. As usual I shall deal first with domestic matters and thereafter devote some attention to a brief survey of conditions in the areas in which the Bank's branches are set and which it is the aim of the Bank to serve.

At a meeting of the Court of Directors on April 5, 1950, Mr James Leslie Milne, who has been a director of the Bank since 1942, was unanimously appointed deputy chairman of the Bank. Stockholders will realise that the work of the Bank has increased enormously and I have been very glad to have the assistance which Mr Milne always so readily gives.

MANAGEMENT AND STAFFS

Our growing business and the greatly increased volume of work devolving upon the head office of the Bank have rendered it necessary during the year under review to introduce changes in the administration of our London office, and to enlarge our executive staff. Following upon the retirement on pension of Mr A. C. Gordon and Mr H. G. F. Kirk, joint accountants in the London office, the directors decided to appoint Mr N. T. Williams, hitherto manager of the executor and trustee department, to be manager of the London city office, with Mr R. D. Butterfield as accountant under him. Mr W. H. Carrick, until recently one of the accountants in head office, was then appointed to the executive post of chief accountant of the Bank. In order to avoid confusion, and in the belief that the titles of the chief executives of the Bank as now given in this report are more in keeping with the duties devolving upon them, the directors re-designated them as shown, and appointed Mr W. G. Pullen, until recently the secretary of the Bank, to be assistant general manager, while, to succeed Mr Pullen as secretary, the directors appointed Mr H. E. Faulkner, who for many years past had served with great distinction as manager of the Bank's Manchester branch.

A year ago I referred to the difficult living conditions encountered by our managers and

their staffs at many points in the East in consequence of political instability and inflation. The housing position has shown little improvement and the Bank has therefore continued its policy of providing accommodation for officers wherever necessary and desirable.

As my subsequent survey of economic affairs in the Asian territories served by the Bank will show, the complications and hazards which are inherent in a business like ours have in no way diminished in the year under review.

BURDENS INCREASINGLY ARDUOUS

Although the Bank remains, and must remain, a purely commercial undertaking, its activities are regulated and affected more and more by political developments in the economic field, and under these circumstances the responsibilities and administrative burdens borne by our managers in the East are becoming increasingly arduous. Seeing that the organisation of the Bank serves no less than seventeen territories, apart from the United Kingdom, each of them enjoying either sovereign independence or a large measure of political autonomy, it will be realised that the business in which we are engaged demands of those who conduct it, exceptional qualities of probity, prudence and skill. Throughout the East the branch managers and their British and Asian colleagues continue to serve the Bank with conspicuous ability, diligence and loyalty. The environment in which our officers live and work in Eastern countries has, in most places, changed out of all recognition during the past few years; but the success of their work, which is reflected in the accompanying report, demonstrates very clearly that constructive British endeavour in Asia is nowhere at an end but everywhere in progress.

The business we conduct in the East, in Europe and in North America, serves a creative purpose throughout, and full comprehension of the constructive functions of the Bank in the modern world, sustain the management and the staffs everywhere in their exertions and in the sacrifices of leisure they have constantly to face in coping with the demands made upon them. In London, equally with many places in the East, and in New York and Hamburg, the operations of the Bank have enormously increased in size, number and complexity, and in consequence the staffs everywhere have been called upon to undertake long hours of gruelling work which have been shouldered uncomplainingly and with full understanding of the needs of the situation, and in the knowledge that their efforts were furthering the objectives of the Bank and the countries it serves in fostering and financing foreign trade on a vast scale.

The accounts indicate the continued expansion of the Bank's business, and this year *we* have again to deal with record figures. The total of the balance sheet at £193,602,640, the largest we have ever been able to show in the entire life of the Bank, is £42,082,196 greater than last year, and reflects not only a large expansion in the volume of the Bank's business, but also the inflated prices of many of the commodities we are constantly called upon to finance in the daily conduct of our affairs.

On the left-hand or liabilities side of the balance sheet, all the main items, with the single exception of notes in circulation (decrease £11,243), show increases, the large expansion in the figures of current and other accounts, fixed deposits and acceptances of £33,820,824, £2,943,033 and £2,337,033 respectively, being specially notable. The slight decrease in notes in circulation in Hongkong, where alone the Bank now has note issuing powers is without significance. The increases in current and other accounts, and in deposit receipts reflect, in the main, higher figures in areas served by the Bank further east than India. In India, finance provided by the Exchange Banks, of which this Bank is one of the leaders, has a tendency to find its way into other sections of the banking system, so that, in spite of the greatly increased business the bank is handling there, our current accounts and deposit receipt figures in that country, if anything, show a slight contraction.

On the right-hand or assets side, the increases are again widely spread and, as on the liabilities side, extend to all the main items, with the exception of the securities held against the note issue, the decrease in which, in view of the remarks already made regarding notes in circulation, requires no explanation. Increases of £10,228,241 in bills of exchange and of £14,304,371 in advances to customers and other accounts, reflect the greater extent to which the Bank has assisted industry and trade in the year under review, while the increases of £5,436,401 and £6,171,069 in cash in hand, at call and at bankers and in Government and other securities respectively, reveal that, in spite of the added calls made upon the Bank's resources for the finance of trade, it has still been possible to preserve and maintain a liquid and strong position. The increase of £3,737,500 in balance of remittances, drafts, etc., merely reflects the higher prices of commodities and the greater volume of entries passing through the Bank's books, but is otherwise without significance, while the increase of £2,337,033 in liability of customers for acceptances, offsets the equal increase on the other side in acceptances and, as was the case last year, is mainly due to an expansion in the business being handled by and on account of our branches in Japan.

PROFIT AND LOSS ACCOUNT

The net profits for the year are £632,807, an increase of £117,215 over those of last year. In my speech last year I referred to a general deterioration in working conditions in almost every eastern country in which the Bank operates. These conditions have persisted and there has also been a further rise in working costs. But, as our balance sheet figures show, our business has substantially increased and this increase is naturally reflected in the larger net returns. We must be prepared, I think, from now on, for diminishing net returns.

We paid an interim dividend in September last of 6 per cent, less income tax, absorbing £99,000. We now feel that we can reasonably return to an annual rate of distribution of 14 per cent, which was the level of dividend paid by this Bank before the war for a great many years. With the exception of China, our branches are now all working again and several new branches have been opened. We

have completely recovered from the serious losses suffered during the war when more than three-fourths of the Bank's offices were overrun by the enemy, and our business fully justifies a return to the old rate of dividend.

It is therefore proposed that, out of the balance available for distribution this year, a final dividend of 8 per cent., less income tax, be paid, costing £132,000, making the total distribution for 1950 14 per cent.

ALLOCATIONS

As regards allocations to the various funds, your directors recommend allocations to the pension fund and widows' and orphans' fund of £125,000 and £20,000 respectively. The calls upon both these funds continue to be heavy and I am sure the stockholders will approve of the increased allocations.

We propose to repeat last year's allocation to premises account of £200,000. Expenditure under this heading still goes on and it will continue to be necessary during the next few years, to take every opportunity of keeping the balance sheet figure under this heading at a reasonable level. But we hope that our programme of building, both of office premises and of accommodation for our officers, will from now on gradually lighten.

Finally I would refer to the Bank's reserve fund. During the last ten years our balance sheet total has increased out of all proportion to the issued capital stock and reserve fund. In 1931 we had to make an allocation of £1,000,000 from the reserve fund to provide for exceptional losses in exchange due to this country going off the gold standard. We have this year restored this fund to its original figure of £4,000,000 by a transfer from contingencies.

It is proposed to transfer £100,000 from profit and loss account to contingencies, thus reducing the amount to be carried forward to £365,836. During the last few years the amount carried forward has been kept at rather a higher figure than was strictly necessary because of various developments to which I have referred from time to time, but it is felt that the time has now come to return to a more normal carry forward. I trust the stockholders will approve of our proposals.

INTRODUCTORY

In spite of the acknowledged difficulty of expressing detached views regarding conditions in areas with which we are so closely concerned, I feel that you will expect me to continue my practice of attempting to do so.

Much that has to be deplored has happened in the Far East in the year 1950, but much good may yet come out of events still in progress, and I should be lacking in a sense of balance were I to paint in the background entirely in black without any relief. Unquestionably the whole position has been dominated by the Communist victory in China. The new régime and their armies have thrown their shadow over all the surrounding countries and even influenced events in far off Malaya, where the bandits drew encouragement for a time from events in China and Korea.

The engagement of a picked Communist Chinese army in Korea by the troops of the United Nations has deflected the attention of the Communist hosts from the lands to the South of China, and, although it is too early yet to attempt to forecast the future outcome of events now in progress in Korea, it is clear that recently the United Nations' armies have been more than holding their own in spite of the great numbers arrayed against them, and if this state of affairs can be continued, it is not too much to hope that the result will be momentous and salutary in improving the chances of a return to more stable conditions in many countries in the Far East, hitherto apparently under

threat from the Chinese. At any rate recent events in the Korean war would seem to presage for many of the countries of South-East Asia a greater chance to develop their new constitutions and economies undisturbed from outside than appeared possible even a few months ago.

With this background I shall now endeavour to survey the conditions which face the Bank in the areas in which it operates. As you are aware, and as I stated last year, the Bank is a trading concern pure and simple, operating to further the economic well-being of all the countries it serves, and having no direct concern with politics of any kind. Unfortunately, however, the economic position in all countries is nowadays so greatly influenced by their Governments and by policies deriving from political rivalries, that it is well-nigh impossible to comment upon the economic aspects in any country without appearing to adopt some standpoint in the political field. Nevertheless, my endeavour will be to view the position objectively.

INDIA

It is with deep regret that I record the death, on December 15th, of one of India's great statesmen, Sardar Vallabhai Patel, Minister for Home Affairs and Deputy Prime Minister. In the interval between August 15, 1947, when the Dominion of India came into being, and January 26, 1950, when the new Union of India was inaugurated, it was mainly due to the energies and forceful direction of Sardar Vallabhai Patel that the rulers of the Indian States, over 500 in number, were persuaded to accept the integration of their territories into the Indian Union, which now has a population of around 350 million souls. It is thus a somewhat disturbing feature that this great statesman, who, above all things, was a realist, should be removed by death just when his great qualities of wisdom and firmness would have been more invaluable than ever to the nation in its conduct of affairs.

In the first year of its existence as an independent sovereign republic, India has encountered many vicissitudes, but while the economic health of the nation has suffered severe set-backs, it is encouraging to note that the main problems in the economic field are being tackled with energy and understanding. The many difficulties inherent in the economy of a nation of some 350 million people have been increased by a series of natural calamities, for earthquakes, floods and drought have, in turn, seriously interfered with agricultural production in the home field, and for food—the provision of which in adequate quantities is, of course, a problem of the first magnitude—India has been thrown on the mercy of foreign growers, to an extent greater than ever before, perhaps, to obtain her ever-increasing requirements.

HELP FROM UNITED KINGDOM AND AMERICA

You are no doubt aware that, so great was the emergency facing India recently in respect of food supplies, the United Kingdom, itself vitally dependent upon imported foodstuffs, diverted to India some hundreds of thousands of tons of grain en route from Australia to England. But so great are the needs of India for food, that this quantity represented no more than a gesture of goodwill, and only the arrival of shipments of literally millions of tons of grain during the next six to twelve months will prevent famine developing in India over a wide area, with all that means in the dislocation of industry and employment.

Fortunately, Mr Truman, the President of the United States, realising the needs of the position, has offered, in the first instance, one million tons of wheat as a gift, and Mr Dean Acheson, the United States Secretary

of State, has indicated that a further million tons may be made available at a later date, and this is reassuring; but much more is likely to be required, and the mere physical difficulty of moving such quantities of grain as will be required by India within the year, from distant countries, even if the grain exists and can be made available, is a problem which is no more than possible of solution, and then only at a sacrifice of shipping space which normally would be otherwise employed. It is scarcely to be wondered at, therefore, that much serious thought is being given in Governmental and banking circles to the questions surrounding the importation of food on a gigantic scale, and the means of payment therefor, and on the related questions of industrial production, capital investment, control of prices, and the appeasement of labour, to enumerate just a few of the outstanding problems in the economic life of India today.

RELATIONS WITH OTHER BANKS

In such an environment, the work handled by the exchange banks in India and by the banks in general has been both extensive and complicated, and our staffs have been taxed to their uttermost to cope with the ebb and flow of trade in and with India. It is gratifying to be able to say that our relations with the Indian Joint Stock Banks continue to be excellent and that we find the Reserve Bank of India ever helpful and efficient in the great task which it performs at the centre of the Indian economy.

In August last, after many months of deliberation, the All-India Industrial Tribunal (Bank Disputes) findings were made public. The award affects about 200 banks and is concerned mainly with a number of questions relating to pay scales, dearness allowances and bonus, etc. While the award is not subject to appeal, banks have been able to obtain a stay of execution in regard to certain points of some importance; but, in spite of this, the repercussions of the award—which, without question, imposes heavy additional burdens upon the profit-earning capacity of all banks and especially banks with many branches in India—will be widespread and will eventually be felt by all sections of the community.

LABOUR CONDITIONS

Labour conditions and productive capacity in industry have been far from satisfactory. The cotton mills in Bombay have had to contend with a protracted strike on the part of their operatives, while, in both the jute and cotton industries, a shortage of raw materials prevented their operating on a full and efficient basis. In respect of both these commodities the lack of adequate supplies from Pakistan is a serious feature, and it is with great pleasure, therefore, that we have all learned recently of the signing of an Indo-Pakistan trade agreement.

In spite of the many unfavourable conditions noted above, there has been an improvement in India's overall trade balance recently. This has been achieved to some extent at least through a rigorous control over imports, rather than by increased exports, although rising prices of the latter have assisted this favourable development. Translated into figures, it would appear that, while at the end of June, 1950, the trade balance for the previous twelve months was adverse to the extent of about Rs. 49 Crores, the trade figures in the twelve months to September, 1950, became favourable by some Rs. 9.5 Crores which, however achieved, must be regarded as a hopeful sign.

PAKISTAN

In reporting upon the position in Pakistan last year, I indicated that prosperous conditions had prevailed until the closing months

of the year when a recession in exports had set in and conditions generally assumed an unfavourable appearance. This course of development was attributed to the fact that, when sterling was devalued in September, 1949, Pakistan, alone among all the countries in the Commonwealth, decided to maintain its currency on the old level, with the immediate effect of rendering the products of Pakistan expensive in terms of the almost universally depreciated currencies of former buying countries.

In the year now under review the position has been reversed in that the outlook in the first few months of the year continued to be black; but as the months passed, and chiefly as a result of the world boom in the prices of basic commodities, and specifically of jute and cotton, Pakistan's trade position improved, and the continued buoyant world demand for these two commodities, and for all the tea, wheat, and any other grain Pakistan can produce has swung Pakistan's trade position greatly in her favour, and has removed, for the immediate future at least, any need to contemplate depreciation in the value of the Pakistan rupee, although, from the point of view of convenience alone, some adjustment to a more workable level would appear to be indicated, and might ultimately be possible of arrangement, now that a trade agreement with India has been signed.

TRADE FIGURES

For years past I have drawn attention to the desirability of Pakistan and India having the closest possible trading relationship. I am well aware of the political differences which separate the two Dominions; but, in trade, they were and should continue to be complementary. Admittedly and surprisingly, Pakistan has demonstrated that the country can operate successfully quite independently of India, as the following trade figures with the outside world will show:—

	Imports Crores	Exports Crores	+ or — Crores
Jan (Nov., 1949)	Rs. 98	Rs. 71	— Rs. 27
Jan (Nov., 1950)	Rs. 83	Rs. 116	+ Rs. 33

and although it is confidently expected that the jute crop will be disposed of in good time without an undue carry over, present conditions will not last indefinitely. Up to the time of signing the trade agreement the bulk of Pakistan's products were being marketed overseas, and there was a question whether, with the present world shortage of shipping and a limited tonnage of her own, her exporters would be able to continue to keep up an even flow of supplies to markets where they are at present most sought. This position will now be eased.

Pakistan became on July 5th a fully fledged member of the International Monetary Fund and of the World Bank. Its economic and financial position is fundamentally sound in spite of the high level of expenditure on defence. Some progress has also been made in the import of machinery and in setting up both cotton and jute industries. With the signing of the trade agreement and assuming that the wise control on financial and economic policy as exercised by the State Bank will continue, the future can be looked forward to with some confidence.

BURMA

In a country which so recently was almost completely disorganised through civil strife, it is a considerable achievement that rice exports have recovered since the war to the extent which they have done. Internal strife and insurrections continue to cause grave losses of revenue and foreign exchange; but the policy of extending paddy cultivation has been pursued diligently and, although not yet regarded as completely satisfactory, the crop forecast for 1950-51 places the sown area at about 74 per cent. of the average for

the prewar five years ending 1940-41. No official figures are available for the export of rice and rice products for 1950, but it is estimated that the State Marketing Board's forecast of 800,000 tons has been exceeded by roughly 400,000 tons, with an old crop carry forward of about 250,000 tons. On the other hand, it seems absurd that Burma, with all her natural wealth of oil, should find it necessary to import the greater proportion of her requirements of oils and petrol.

From the commencement of 1951 the Union Bank of Burma have been prepared to buy from and sell to banks sterling at 1/6 and 1/5½ respectively up to six months forward. This was a wise move and has been a material factor in enabling the banks to finance the movement of the rice crop. This move also augurs a sound position in relation to the currency and has created confidence among the banks, which has been further confirmed by the Currency Board having continued to operate from London, no announcement having yet been made of any impending transfer of its functions to Burma.

SEMBLANCE OF ECONOMIC STABILITY

It is significant that, in spite of internal unsettled conditions, Burma has been able to maintain some semblance of economic stability. Extensive rice exports at handsome, though in no sense excessive, prices under present world conditions, have enabled the country to import and pay for considerable quantities of "procurement goods," and in July last, the importation of certain categories of textiles was placed under open general licence with the effect that imports of textiles between August and December amounted to some Rs. 12½ Crores. At present, stocks of piece goods are undoubtedly heavy but they have been laid down at under present replacement cost, and under normal conditions they should move into consumption during the next three or four months.

Last year I felt that the future of Burma depended upon the ability of the Government to preserve law and order. This year this factor is no less important, but progress in this direction has been made and the Government's attention on the economic side should be directed to broadening the base of the country's economy, which, at the moment, and naturally perhaps, depends too largely upon the production and export of rice. Not that any let-up is suggested in this direction; but if, happily, the rest of the world should become more nearly self-sufficient in regard to food than at present, however unlikely not to say impossible this may appear under present conditions, it would be well for Burma to have other means of procuring the foreign exchange necessary to provide the people with the products they need, if the greatly hoped for betterment in their living standards is to be achieved. Burma is, fortunately, a fundamentally wealthy country, possessing great potentialities, and all that would appear to be required—a good deal, perhaps, under present conditions in the East—is law and order and stable government within the country so that Burma's other great industries, namely, timber, oil, mines and plantations, may make their contribution to the economy of the country.

CEYLON

Ceylon has again enjoyed a fair measure of prosperity and, as there has been a continuance and enhancement of the good world markets prevailing last year for all its main products, viz., tea, rubber, copra and spices, it would have been surprising had this not been so. On the other hand, however, the island in common with some of its neighbours has had to utilise a large proportion of the proceeds of exports in the import of food-

stuffs and other essentials to maintain the well-being of the people, and this process has placed a heavy strain on the island's economy and throughout the year much attention has had to be directed toward curbing inflation and keeping living costs within bounds. It is clear that the Government—and Ceylon is fortunate in possessing a stable government and governmental institutions—has been giving much serious thought to devising means of curbing inflation, and it is no doubt fully realised that inflation cannot be cured merely by framing a fresh set of monetary laws.

The crux of the position is, of course, increased production and a drawing-off of current spending power in the shape of savings, if possible, accompanied by a drastic curtailment of expenditure, particularly in the cost of excess public and social services. All these items appear to be receiving attention, and the Central Bank of Ceylon, the formation of which I reported last year, has recently increased the ratio of reserves which the banks must place with the central institution, although so liquid are some of the larger banks in Ceylon that their funds with the Central Bank already exceeded the increased marginal requirements imposed. Be that as it may, the step was doubtless justified in relation to the position of some of the other banks which may have been granting credit too freely. Although in an economy so dependent upon the export of primary commodities at soaring prices, the prevention of inflation is no easy matter, it is to be hoped that some solution will be found that will enable the economy of the island to be preserved on its present sound basis.

NOTE CIRCULATION

Between the period January to November, the note circulation in Ceylon has undergone considerable change, doubtless due to the advent of the Central Bank of Ceylon, which opened for business on August 27th. The gross circulation on the one hand fell by Rs. 123.6 million from Rs. 449.9 million to Rs. 326.3 million, while, on the other hand, the "active" circulation increased by Rs. 93 million from Rs. 227.6 million to Rs. 320.6 million. The "active" circulation is, of course, the real measure of the note circulation, and therefore the increase of Rs. 93 million must be regarded as a considerable indication of inflation, although not without qualification, for all prices are higher, and this increase is matched by an increase, since January, of some Rs. 64 million in banks' deposits, which, according to the latest figures available, now stand at Rs. 870 million.

Like the position in Burma and Pakistan of the countries I have already reviewed, and like many other countries in the East, the permanent economic well-being of Ceylon can only be established by diversification of the country's industries and pursuits to an extent which would render the country less dependent upon factors entirely outside of its control, such as the prices of primary commodities, and as this is largely the aim of the Colombo plan, and as, apart from its name, the Colombo plan aims at aiding India, Pakistan and Ceylon among the Commonwealth countries, and the British Far Eastern Colonies, Malaya, Singapore, Borneo, Sarawak and Brunei, which I shall soon be reviewing, this seems an appropriate place to interject a few remarks regarding the plan and its aims.

THE COLOMBO PLAN

A new and notable feature of postwar development in the world has been the voluntary assumption by economically advanced nations of responsibility for the development of technologically backward areas, or of areas which have been gravely damaged by the

war. The Marshall plan, the greatest voluntary burden of this nature ever shouldered by any nation, was planned by the United States in an endeavour to assist the war-torn nations of Europe toward recovery of their economic health. The British Government in its turn has evolved similar types of plans on a smaller but still considerable scale to create and encourage productivity in British Colonies, for instance:—

(1) The Colonial Development Welfare Acts of 1940 and 1945 cover a joint enterprise with the colony concerned to create new industries and services within the colony;

(2) The Overseas Resources Development Act, financed by the United Kingdom to expand production in colonial areas; and

(3) The Overseas Food Corporation and the Colonial Development Corporation, both of which aim at encouraging and supplementing private enterprise in the colonial areas.

The Colombo plan differs from all the foregoing, however, in that it is a co-operative effort, jointly planned and jointly financed by the self-governing members of the Commonwealth in a concerted effort to assist in overcoming the poverty of Asian countries and in an endeavour to raise the general standards of living.

This is a notable undertaking in the history of the world, and at a conference of Commonwealth Foreign Ministers, held at Colombo, Ceylon, from January 9 to 15, 1950, the members agreed to contribute within the limits of their resources, sterling credits for machinery, agricultural tools and consumer goods. A Commonwealth Consultative Committee was created to study the needs of the area and to work out co-ordinated plans. Following meetings of the Consultative Committee in Australia, it was announced that each beneficiary country would prepare by September 1, 1950, a six-year plan to meet its development needs, and it was further laid down that a programme for technical assistance would be set up, that non-Commonwealth nations in South and South-East Asia would be informed of the project and invited to participate, that the economic needs of the area should be kept under constant scrutiny and a programme adopted if necessary to meet changing conditions. It was further agreed that ultimately consultation should draw in other nations, including the United States especially, in view of President Truman's point IV programme, and of expressions of interest and sympathy by State Department spokesmen.

SIX-YEAR PLAN

Between May and September six-year plans were drawn up by India, Pakistan, Ceylon, Malaya, Singapore, North Borneo and Sarawak, and when the Consultative Committee met again in London recently, delegations from Laos, Vietnam, Cambodia and Thailand attended, while Burma and Indonesia appointed their ambassadors to London as observers, although none of these nations have yet submitted plans.

A draft report was submitted and adopted, and on November 28, 1950, it was published in a White Paper, entitled "The Colombo Plan for Co-operative Economic Development in South and South-East Asia," and presented to the parliaments of all the participating nations.

While the programme so far outlined affects only British Commonwealth or Empire countries, the door is wide open to Burma, Indonesia, and all other countries in South and South-East Asia. The programme aims at economic expansion, coupled with direct social gains in regard to housing, health and education, and as such should prove an inspiration to all participating countries.

The plan is a large one and is expected to cost £1,868,000,000 over the six-year period and will affect no less than 450,000,000 people. India is to receive about two-thirds of the total investment, Pakistan about one-seventh, and the remainder is to be divided about equally between Ceylon and the Malaya-Borneo area. Among the varied aims is a plan to bring great new areas under cultivation and to increase the production of food grains by some 6,000,000 tons.

This is not the place to go into details of the various six-years' plans, but the emphasis everywhere is on increasing food grain production and other products of the soil by flood control and irrigation schemes and in the case of Ceylon to diversify its economy, especially in food production in order to offset the dangerous fluctuations in the prices of tea, rubber and copra, to which I have already drawn attention above.

PROVISION OF FUNDS

Of the total funds required to implement the scheme it is estimated that £1,030,000,000 can be supplied by the beneficiary countries from domestic funds, of which some £246,000,000 required externally will be obtained from outstanding sterling balances. The balance of £838,000,000 will have to come from other sources, presumably mainly from the United Kingdom, Canada, Australia and New Zealand, although it is significant that, on January 24, 1951, the United States Secretary of State, Mr. Dean Acheson, announced that the United States would participate in a conference of the seven-nation Commonwealth Consultative Committee. He called the plan "a basis for genuine economic progress" and stated that the United States intends, so far as possible, to co-ordinate its own economic aid programme with those of the Commonwealth and of the United Nations. Since then, however, it would appear that the United States may have decided to work through their own point IV programme.

With such backing and with the goodwill of all the participating nations, it is hoped and expected that the Colombo Plan will move from strength to strength and that through it will be solved the intractable problems of food supplies in the area of South and South-East Asia, which are of such magnitude as to produce feelings of apprehension in the hearts of all thinking people.

MALAYA

It can be categorically stated that Malaya (a term which in this report is used to cover the Federation of Malaya and the Colony of Singapore) has had the most prosperous year in her history from the point of view of trade. Nevertheless, trading conditions have not been free from difficulties and uncertainty, due to the mounting political tension in the Far East, the continuance of banditry on a wide scale in Malaya, the sharp rise in the price of tin, and the phenomenal advances and fluctuations in the price of rubber. The lack of confidence in the future is exemplified by the low prices of tin and rubber shares despite boom conditions in the industries, although in so far as prices of shares quoted in this country are concerned, the position is influenced by the penal taxation suffered by investors which, to some extent, nullifies the advantages of expected high dividends.

As one contemplates the troubled conditions which have ruled throughout almost the whole of the Far East, culminating in the outbreak of hostilities in Korea, it is perhaps not surprising that the widespread banditry in Malaya has shown, until recently, little sign of abatement, notwithstanding the positive measures taken by the Government following the appointment of Lt.-General Sir

Harold Briggs to the special post of Director of Operations. If the bandits are not controlled indirectly by those who seek to disturb the peace of so many Eastern countries, it is evident that they gain inspiration from that source. In the result a heavy price is being paid, especially by planters and miners, to maintain a constant flow of tin and rubber which contributes so high a proportion of United States dollars to the Empire pool. To them also, Malaya owes thanks for having been able to close the year with an overall surplus in visible trade, the first since the war, of no less than Straits \$1,066,000,000 (£124,370,000) against a deficit for 1949 of some Straits \$162,500,000 (£18,960,000).

REMARKABLE ACHIEVEMENTS

The actual figures for 1949 and 1950 were:—

	1949	1950
Exports	\$1,677,500,000 (\$195,710,000)	\$3,957,000,000 (\$461,650,000)
Imports	\$1,840,000,000 (\$214,670,000)	\$2,891,000,000 (\$337,280,000)
Total trade	\$3,517,500,000 (\$410,410,000)	\$6,848,000,000 (\$798,930,000)
Deficit	\$162,500,000 (\$18,960,000)	...
Surplus	...	\$1,066,000,000 (\$124,370,000)

Exports in 1950 to the United States of America aggregated about Straits \$1,048,000,000 (\$430,000,000 in 1949), producing about U.S.\$425/475,000,000 (U.S.\$175/200,000,000 in 1949) for the Empire dollar pool, while imports from the United States reached only Straits \$89,000,000 (against Straits \$113,000,000 in 1949).

These are remarkable achievements, especially when one remembers the conditions under which the planting and mining industries have worked in Malaya, and when our authorities in the United Kingdom add up the quarterly accessions of United States dollars, which have been a feature of our economy over the past year or so, they should spare a thought of gratitude for Malaya and for the planters and miners there whose devoted efforts have made such figures possible.

RUBBER

Rubber produced in Malaya during 1950 reached the highest tonnage ever recorded at 703,891 tons, compared with 679,066 tons in 1949, and it is interesting to note that, of the 1950 figures, approximately 328,000 tons came from small holdings. Total exports including imported rubber and latex, were 1,106,483 tons, against 899,212 tons in 1949, and of the 1950 figure, the United States of America took 375,724 tons, the United Kingdom 197,777 tons, Russia 68,058 tons and France 60,540 tons. The increase in exports was in the main due to the import of a very much larger tonnage from Indonesia; but all the surrounding areas contributed, and it is a notable fact that the increased price obtaining for rubber has greatly increased the importance of Singapore's entrepôt trade, a natural development under the circumstances.

The excess of world production over world consumption of rubber during 1950 was greater than in 1949; but stockpiling for rearmament purposes may bring the position into equilibrium in a short space of time. The position of the synthetic product and industry looms large in the minds of those concerned with natural rubber, and while the United States Government remain committed to continued expansion of the synthetic rubber industry, only exceptional requirements for stockpiling can be expected to keep prices and production of natural rubber at present levels, and as the United States Government have already acquired considerable supplies, it will be realised that the position is vulnerable, although doubtless

there are other buyers who, while unwilling to make the running and bid against the United States in world markets, would willingly take supplies at reasonable prices were such available.

On November 4th the Government announcement regarding increased rates of export duty on rubber caused a furore. It was strongly felt that Government were singling out the industry for added taxation and were thus breaking the principle of an even distribution of the tax burden. Moreover, the industry had long suffered from unduly low prices and strongly resented the drastic nature of the taxation applied, and criticised above everything the proposed method of application and collection. However representations from all sections of the industry caused the Government to modify their proposals, and in the event the export duty effective from January 1, 1951, ranges from 2½ cents at 50 cents a lb. to 31 cents at \$2 a lb., which includes access for replanting and new planting, the rate to be fixed at weekly intervals based on the average daily price in Singapore during the preceding fortnight.

TIN

Turning to tin, Malaya's other main product, production in 1950 was 57,500 tons, constituting a post-war record and representing an increase of about 2,600 tons over the 1949 figure. Exports, which include re-exports, amounted to some 81,800 tons, and exceeded the figure for 1949 by about 27,000 tons. Shipments to the United States of about 44,590 tons were slightly in excess of the preceding year's shipments. The chief factors affecting the market were the stockpiling operations of various countries, especially the United States, and resort had to be made to stocks in this country to supplement supplies from the production areas. The Ministry of Supply disposed of about 30,000 tons from stock which was thus exhausted. It seems probable therefore that stockpiling demands are likely to have first call on production during 1951 and ordinary consumers are likely to find some difficulty in filling their needs, so that a firm market would appear to be assured for some time to come.

It is perhaps of interest to record the price changes in rubber and tin during the year, which were as follows:—

	Lowest	1950 Highest	Closing
Spot rubber	15d. 4.1.50	72d. 9.11.50	56d.
Cash tin	£578 5s. 3.1.50	£1,300 7.11.50	£1,150

Iron ore production in the Federation rose from 8,390 tons in 1949 to 498,903 tons in 1950, while Malaya's only coal mine at Batu Arang, Selangor, produced 415,777 tons, some 29,000 tons above the figure for 1949.

BUDGETARY POSITION

The budgetary position, which a year ago looked difficult, has been eased very considerably by the revenue accruing from the large increases in export duties due to the higher prices of rubber and tin, and it has been stated that the special contribution of £3,000,000 by H.M. Government for use under the headings of Emergency and Defence should now prove adequate for the year. Revised estimates of revenue for 1950 are now set at \$416,000,000 with expenditure at \$369,000,000, giving an estimated surplus of \$47,000,000, while estimates for 1951 set revenue at \$474,000,000—which includes \$64,000,000 in respect of anticipated increased revenue from the new rubber export duty—and expenditure at \$440,000,000. The estimated surplus of \$34,000,000 should be further augmented as the result of the increase from 20 per cent. to 30 per cent. in company tax effective in 1951. The whole budgetary position has thus improved to an

extent which may render it unnecessary for the Government to float the loans which last year I anticipated would be required. Undoubtedly there is much surplus currency available in Singapore and Malaya, and much good would result to the economy of the country if the public could be induced to subscribe to a loan of considerable dimensions and the money diverted to constructive undertakings.

Inflation in Malaya tends to get out of hand, and although the note issue is only expanded when absolutely necessary to finance the growing requirements of Malaya's main industries (for the banks, and especially the principal banks, adopt a public-spirited attitude in this respect), there can be no doubt that the high prices of rubber and tin and the wide dissemination of the proceeds are creating demands for consumer goods which it is impossible to satisfy adequately or wisely. As a consequence prices of consumer goods are rising, and have risen to levels which can no longer be regarded as healthy, while the danger always exists that any marked fall in the prices of rubber and tin will bring heavy losses to importers, who, in attempting to satisfy estimated requirements which may prove evanescent, have to order goods months in advance and pay the current high prices.

NOTES IN CIRCULATION

Notes in circulation at January 1, 1951, amounted to \$633,487,211, an increase during the year of \$230,543,371, or over 57 per cent. The steepest rise took place in the last months of the year. It was of course inevitable that a large expansion of currency would be needed to finance rubber and tin at the very high prices obtaining for these commodities, but wise handling of the position will be required if evil effects are not to ensue following any marked or sudden fall in the prices of the two commodities on which Malaya's economy so largely depends. Here again, as in the case of Ceylon and other countries in the East, only diversification of the country's industries can offer any final or adequate solution; but realising the dangers inherent in the present position, it should be possible for the Government, if only by the flotation of an attractive loan, or by encouraging savings on the part of the public, to do something to reduce the pressure of money. So rapid has been the expansion of the currency (the rise in December alone was over \$43,000,000) that some shortage of actual notes was caused, but commendably prompt action by the currency commissioners prevented grave inconvenience to the banks.

The Malayan War Damage Commission commenced its assessment of claims during the year and under the Federal War Damage Scheme, 1950, an initial payment of not exceeding \$350 was authorised to each claimant. The board of management of the war risks goods insurance fund have also been examining claims and some payments have already been made. Though the many advantages which would have accrued from a speedy settlement—which I have on several occasions advocated—have been lost, and though any addition to money in circulation today in Malaya can now but add to the embarrassment of the position, it is still to be hoped that the awards in respect of all claims will be paid in full during 1951.

NORTH BORNEO

It is pleasing to record a year of considerable progress in all spheres in this Colony. The greatly enhanced price of rubber brought conditions bordering upon prosperity and in its train a marked freedom from discontent, except in regard to the means of meeting the rising cost of living, for which upward adjustments in salaries and wages have had to be conceded by most employers.

The three major needs in North Borneo, namely, an increased labour force, improved

communications, and materialisation of building plans, are perhaps not being fulfilled as rapidly as might be desired, but in all these matters, forward steps have been taken, though in the two last mentioned, within the limitations imposed by shortage of skilled staff and labour, delays in obtaining materials and lack of adequate finance.

Trade figures for 1950 were very satisfactory, total trade (imports and exports) being set at \$138,000,000 (£16,100,000), an increase of \$66,500,000 (£7,758,333) or 93 per cent. over last year's figure. The favourable balance of trade amounted to over \$45,000,000 (£5,300,000), as compared with about \$2,000,000 (£233,000) in 1949. These figures speak for themselves.

RECONSTRUCTION AND DEVELOPMENT

The Government are bending their energies toward the completion of the reconstruction and development plans, but the cost of the former is likely to be some £1½ million more than originally estimated, and of the latter some £1 million more. This means that by the end of 1951 there will be little left of the grant of £1,600,000 made by H.M. Government. It is fully appreciated by the Colony's Government that further external help cannot be expected unless North Borneo itself takes active measures to meet its increasing expenditure. Therefore company tax is to be raised from 20 per cent. to 30 per cent. in 1951, the rubber tax increased to 10 per cent. *ad valorem* and, because the Colony is not yet in a position to undertake the collection of income tax, a residents' tax is to be imposed as an interim measure to be calculated on a sliding scale on each adult resident's annual income. This added taxation should not prove unduly burdensome in a country where the level of taxation is yet modest and will act to some extent as a check on inflation, which here as elsewhere is assuming threatening proportions.

The Budget position last year improved, ordinary revenue being approximately \$16,100,000, against \$11,000,000 last year, while ordinary expenditure was \$9,200,000, against \$9,700,000 last year. Expenditure on reconstruction and development was \$5,300,000, against \$7,200,000 the year before, and there was consequently a surplus of revenue of about \$1,600,000, against a deficit last year of around \$6,000,000.

Steps are being taken to improve the wharf facilities at Jesselton, Sandakan and Labuan at a cost of about £850,000. Efforts to form a Customs Union between North Borneo, Sarawak and Brunei have not yet been successfully concluded, but tariffs in all three countries have been made more uniform and goods already subjected to duty in one territory will not be reassessed in either of the others.

GREATER EXPORTS

High prices for rubber and copra have resulted in greater exports. The timber industry is also progressing satisfactorily, in part due to improved methods introduced into the industry, and shippers have been unable to meet the full demand. Exports of cutch and firewood have been well maintained. The Colony is still a deficient area in rice, but the Government's experimental rice station in the Bandau area is in full swing, so that good hopes are entertained that eventually the country may become self-sufficient in this staple item of food. All in all, therefore, the year has been one of steady if quiet progress and if much still remains to be done much is being done by a Government with the best interests of the Colony at heart.

In the Bank's domestic field, representation in the Colony was increased during the year by the appointment of the North Borneo Trading Company, Limited, as our agents at Labuan where the entrepôt trade is expected to develop.

SARAWAK

Sarawak has had a peaceful year and has received its full share of high rubber prices and of a good demand for its timber and other produce, though at the expense of the vital needs of local paddy cultivation. In these conditions the Government were able to increase their revenue by raising import duties and the export taxes on rubber and produce.

Trade figures, though not available to me at the time of writing, may be expected to be much higher than for 1949 when, according to statistics published in mid-1950, exports were valued at \$187,628,000 (£21,900,000), inclusive of \$74,500,000 (£8,700,000) in respect of oil, and imports (excluding about \$60,000,000 (£7,000,000) represented oil imports from Brunei). In Sarawak as in North Borneo, the year has been one of quiet and steady progress.

THAILAND

In Thailand, possibly more than in any other country of South-east Asia, could the year be termed uneventful. Not that local opinion was insensitive to the major issues being contested in the world, and the outbreak of hostilities in Korea resulted, as might be expected, in a flight into commodities which caused piecegoods prices to soar and had repercussions on the Bangkok money market.

Generally speaking, however, a stable government and the absence of serious domestic troubles enabled Thailand to take full advantage of the increased world prices of its primary products. Shipments of rubber from South Thailand and tin ore from the West Coast and Haad-yai increased both in volume and value, whilst the total exports of rice for the year, at 1,483,248 metric tons, were more than 250,000 tons in excess of 1949 shipments. These valuable exports enabled Thailand to increase its holding of foreign currencies and ensure the tical retaining without strain its value against sterling currencies and the U.S. dollar. Furthermore, it enabled a substantial reduction to be made in the country's external debt although internal borrowings, in the form of Treasury Bills, more than offset this.

The Japan-Siam trade agreement worked for the most part against Thailand and import permits for Japanese goods were restricted for corrective purposes. The prosperity that has come to the country shows no signs of abating under present conditions. The prospects for next season's rice crop are good and, if officialdom restrains rather than increases its activities in the commercial world, Thailand should move forward to even greater financial and economic stability.

REPUBLIC OF INDONESIA

The young Republic of Indonesia entered the year 1950 in a state of internal inflation and with an external deficiency but with the hope that those intangible factors, independence and self-government, would effect that increase in production of primary products necessary for the economic survival of the then Federation.

That hope for more exportable goods and for increased crops to reduce food imports might have been fully justified had it not been for the deliberately obstructive tactics employed by labour, but in spite of a number of costly and unwarranted strikes, a remarkable change for the better took place in the Republic's financial and economic position during the year.

The financial recovery started with the introduction in March of two measures—a forced loan which converted roughly half the money in circulation into a long-term State loan and the other a complicated form of devaluation designed to promote exports

at the expense of imports. The net result of the second measure is that the value of the rupiah has been reduced either to one-half or to one-third of its former value according to one's interests.

We shall never know how effective these measures would in themselves have been, for their introduction coincided with an upward trend in world prices, particularly of rubber, which, accentuating the value of Indonesia's increased exports, turned a foreign exchange deficit into a substantial credit balance. The pity is that the machinations of labour, to which I have already referred, which included burnings, lootings and communist-tinged strikes in ports and other communication centres, as well as on estates, prevented the Republic from taking full advantage of the unique opportunity given for the consolidation of its external trade position and incidentally the improvement of the living standard of its people. Disappointing, too, was the continued banditry which left whole districts without law and order and prevented rubber and coffee estates and tea gardens returning to production.

GOVERNMENT'S TASK

The efforts of the young and untrained ministers of what, in September, became the Unitary Republic of Indonesia, have, for the most part, been commendable, but internal expenditure is outrunning revenue, although taxation is higher than perhaps anywhere else among Far Eastern countries, and while the external foreign exchange position has recently become favourable, there is, doubtless due in some degree to the discrimination against imports already noted in respect to exchange rates, a dearth of consumer and reconstruction goods, which is augmenting the inflationary tendencies fostered by prodigal internal spending. These matters require attention, but the overriding task of the Government is to establish sound relations with labour, for on its future relations with labour the fate of the Government will depend. Unless the Home Minister and the holder of the labour portfolio are prepared to take a firm but just line and unless the Cabinet is prepared to give them whole-hearted backing no genuine progress can be made and reversion to almost complete anarchy may result. All friends of Indonesia in this country wish the Government success in its difficult task and hope that good and fair administration will prevail.

The review would, I think, not be complete without reference to the benefit Indonesia has derived during the year from an E.C.A. loan of U.S. \$40,000,000 and quite recently the Export Import Bank have agreed to release over U.S. \$50,000,000 to assist the development and reconstruction programme.

Irian continues to be an insurmountable issue between the Netherlands and the Indonesia Governments. The Cabinet in The Hague has resigned over this vexed question and the President of Indonesia has found it difficult to explain to his peoples the continued *de facto* possession of the territory by the Dutch in view of earlier promises.

The Chartered Bank has given fully in effort and all the resources of its organisation to help promote the trade of Java, Sumatra and the Outer Islands, and I am pleased to say that our relations with officials and the business community are on a sound and friendly basis.

INDO-CHINA

The military position in Indo-China deteriorated considerably during the greater part of 1950, and toward the end of the year following victories over isolated forts in the North by the Vietminh insurgents, the outlook appeared bleak with a Chinese army apparently available for action if called in by the rebel leader Ho Chi-minh. Recent de-

velopments in Korea have tended to minimise this risk while following the advent of General de Lattre de Tassigny, the military outlook has improved.

Although somewhat short of up-to-date figures relating to Indo-China, it is not difficult to draw fairly accurate conclusions from those which are available. The course of trade has followed its customary pattern, or rather the pattern which has become customary during the past few years. Rice exports, already insignificant, compared with prewar days, have been placed under an interdict since August, while the export of other commodities such as maize, rubber, coal, and cement have been at a level much below that required to maintain a normal economy. During the first half of the year 1950, imports reached a total value of Piastres 1,726,500,000 (at 20.5—U.S. \$84,253,000) while exports amounted to no more than Piastres 614,900,000 (U.S. \$30,007,120) and while the increased price of rubber would enhance the value of that item in the second half of the year, this would be offset by the cessation of rice exports from August onwards, and therefore it can be fairly accurately surmised that the total adverse balance of trade for the year would exceed the equivalent of U.S. \$100,000,000. Indeed were it not for France's military contribution—estimated at £600,000,000 since the outbreak of the Vietminh rebellion—the country would be in a difficult financial position, and it is this item alone which maintains the external balance of payments of the country.

When the urgent needs of the countries of south and South-east Asia for rice and yet more rice are remembered and on which I have had to comment frequently in these reviews, it is sad in the extreme to realise that here in Indo-China is a granary, second only to Burma at its best, going to waste, and it is therefore sincerely to be hoped that the forces of law and order will soon gain the ascendancy.

THE PHILIPPINE REPUBLIC

I think that those of you who noted my remarks last year on the Philippines will not have been unprepared for the conclusions of the Economic Survey Mission appointed by President Truman to study the economic and financial problems of the Philippine Republic. The mission's report, known as the Bell Report, stresses the pervading unbalance between production and needs in the Philippines and states that the measures that could halt the deterioration have not been put into effect.

Various contributing causes are cited for the present critical situation and amongst recommendations made for remedying the position are increased taxation on high incomes, a two-year emergency tax of 25 per cent. on imports and the granting of a "strictly conditioned" loan of U.S. \$250,000,000 by the United States of America.

As the situation now exposed has been known to many officials in the Philippine Government for some time it is interesting to see the result of efforts made during 1950 to combat in particular the financial crisis which successive large budgetary deficits and excessive creation of credit made inevitable.

By strict control imports were reduced to nearly 50 per cent. of the 1949 figures. As the many restrictions fell mainly on luxury and non-essential goods this was a decided step in the right direction. At the same time a strict exchange control, administered with integrity by the Central Bank, ensured that the proceeds of exports accrued to the Republic. Fortunately the year under review saw substantial increases in the exportable crops of sugar, hemp and copra whilst the unsettled international situation was responsible for a rise in the world market prices of these primary products of the Philippines.

THE ECONOMIST, March 17, 1951

So serious, however, was the adverse balance of payments created by the excessive imports and large non-trade payments of 1948 and 1949, aggravated by the tapering off of United States disbursements, that the advantageous swing in trade figures during 1950 did little to restore confidence in the peso.

PROPOSED TAX ON REMITTANCES

Officials have many times reiterated the Government's determination not to devalue and this policy receives support from the deflationary recommendations of the Bell Report, but the bill now before Congress to impose a tax of 20 per cent. on remittances during 1951 and 15 per cent. during 1952 is the first sign of a break in the external value of the unit of currency.

That this tax is to be imposed as an alternative to a tax on imports, is doubtless due to the fact that an import tax would be ineffective as, under the Treaty with the United States, the Philippines are not allowed to tax imports from that quarter, and as everyone is aware, most of the imports derive from the United States of America. The tax on remittances, however, will fall mainly on foreign interests, and therefore is likely to discourage the entry of foreign capital into the Philippines, and in any case it is doubtful whether a tax of such limited scope can be effective.

There is no doubt that the Philippines have reached their economic cross-roads and, unless the Government and the people are prepared by sacrifices all round to take the hard way that leads to increased output and fair wages and to eschew many luxuries, recovery will be long delayed and an intervening period of serious inflation, political trouble and danger to law and order may ensue. An interesting aspect of the trade of the Philippines during 1950 was a trend, although slight, from United States to European markets.

HONGKONG

According to figures published by the Department of Commerce and Industry, total overseas trade handled by Hongkong in 1950 was valued at £472 million as against £336 million in 1949. Of these figures, trade with China represented about 30 per cent. in 1950 and 24 per cent. in 1949. But while exports to China in 1949 were roughly equal to imports from that country, in 1950 exports to China exceeded imports by some £37 million. The People's Government banks in Hongkong made large purchases of sterling during the year, while in Singapore they were good sellers on London, indicating that purchases of rubber and possibly tin for China were partly financed through Hongkong and taking into account China's adverse balance of trade with Hongkong in 1950 as noted above, presumably from accumulated funds. Malaya, on the other hand, has been selling sterling in Hongkong to cover family remittances to China; but also, it is reported, to purchase gold, which is, of course, illicit business.

The desire of the Singapore and Hongkong Governments to conserve their entrepôt trade is to be commended. The published figures of Hongkong's trade with China—namely: 30 per cent. of the total as mentioned above—may well be greater as even the casual observer would probably place the figure much higher, and this may partly explain the discrepancy between exports and imports of £37 million already noted, which otherwise seems an unduly high figure. But in the absence of actual figures these can be only surmises.

In December, the United States of America froze all funds in America belonging to residents of the Chinese mainland and restricted

all shipments of goods to China likely to prove of any strategic value. Shipments to Hongkong were included in the ban. This policy was naturally not particularly welcome, especially among the business community which is not entirely British, being indeed very cosmopolitan, but it was undoubtedly a correct one in all the circumstances, and certainly not open to criticism.

The delicate position in which Hongkong finds itself, and which I mentioned last year, has not been changed in any sense by the events in the North over the past year, and it behoves us all to walk warily in these uncertain days.

CHINA

Last year I decided to confine my remarks on China to a few statements setting out our aims and modest hopes. These modest hopes have not been realised, for the business we have been able to transact in China can best be described as nominal. In Shanghai in particular we have a staff of Chinese personnel considerably in excess of our present requirements; but we are powerless to reduce the number of our clerks. Our costs and, therefore, our losses, for we have little earning power, have, however, been reduced to a minimum. Our liabilities in China are limited to our responsibility for the well-being of our staffs, both European and Chinese. Our assets consist of modest advances generally made against collateral outside of China and, of course, our office buildings and houses.

Various methods have been used by the People's Government to revive external trade. The latest schemes amount to pure barter, imports into China having to arrive before the corresponding exports, completing the deal, are allowed to be shipped. This development followed the freezing of funds in the United States belonging to Chinese residents, and may have its origin in the fear that other nations will adopt the same policy.

EXTERNAL TRADE

As we have already seen, when considering the position in Hongkong, China's external trade through Hongkong increased in 1950, in spite of all surrounding difficulties. Direct trade, too, with the United Kingdom, revived somewhat from the lows of 1949, in that imports from China to the United Kingdom amounted to £6,911,195 in 1950, as against only £3,197,407 in the previous year, while

needs of the country without the aid of imports from outside. These are solid achievements and might augur well for the future if the People's Government decided to confine their activities to internal affairs, which we have read it is their dearest wish to improve. May it so come to pass.

JAPAN

Last year I reported various steps which were taken in Japan during 1949 which had the effect of placing the Japanese economy and facilities for importing and exporting on a more normal basis. During the year under review further similar steps have been taken and recently the Supreme Commander Allied Powers (SCAP), whilst still retaining responsibility, has handed over the management of overseas trade to the various Japanese official organisations in anticipation of the signing of a Peace Treaty.

It, of course, remains to be seen to what extent the outside world will consider Japan as credit-worthy when the country stands on its own. This is important, because at the moment, to finance the necessary importation of food and raw materials, the foreign banks operating in Japan are called upon to grant large lines of credit facilities on the responsibility of SCAP, owing to the impossibility of balancing sterling imports with sterling exports day by day, especially in the early part of each year.

This situation is likely to continue, and until Japan can build up an adequate foreign currency reserve, in dollars and sterling, foreign assistance will be required. Given that American aid is soon to be considerably reduced, it will be appreciated that Japan has an enormous task ahead. The fact that in the latter part of 1950 overseas trade turned in favour of Japan gives room for a certain optimism; but as the improvement was largely due to the outbreak of fighting in Korea as a consequence of which the United States Government made large purchases of war materials in Japan and used the Japanese coastal fleet to ease the transport situation, it is necessary to temper this optimism with realism.

TRADE FIGURES

The figures relating to external trade, expressed in terms of U.S. Dollars in 1948, 1949 and 1950, were:—

Year	Exports	Imports	U.S. Govt. Aid
1948.....	\$258 million.	\$222 million.	\$461 million.
1949.....	\$509 "	\$370 "	\$534 "
1950.....	\$1,008 "	\$677 "	\$400 "

while the details of the figures for 1950 were:—

1950	Exports	Imports	Balance of Trade
Visible Trade.....	\$773 million.	\$645 million.	+\$128 million.
Invisible trade.....	\$235 "	\$32 "	+\$203 "
	\$1,008 "	\$677 "	+\$431 "

and it may be of interest to quote the direction of the trade in 1950 which was approximately:—

1950	United States	Open Accounts	Sterling Area	Total
Exports.....	\$364 million.	\$183 million.	\$226 million.	\$773 million.
Imports.....	\$284 "	\$160 "	\$201 "	\$645 "
Plus or minus.....	+\$80 "	+\$23 "	+\$25 "	+\$128 "

exports to China from the United Kingdom were £3,536,248, against £2,146,456 in 1949. The figures for 1950 are, however, considerably less, both for imports and exports, than 1948, and this was probably to be expected.

Apart from foreign trade, undoubted progress has been made by the People's Government in stabilising the currency, and in improving communications within the country while, still more important, it would appear that the supplies of foodgrains produced have been increased to an extent which in a normally productive year should suffice for the

As already stated the enormous increase in receipts for 1950, was accounted for largely by the special procurement demands for the Korean campaign; even so, from a study of the above figures it will be clear that had Japan paid for imports provided with U.S. Government aid, the overall trade balance for 1950 would have been adverse by some \$69 million, not a formidable sum in itself, but in the circumstances outlined enough to reveal the immensity of the task which lies before the Japanese Government before the country can become self-supporting from

current trade. Be that as it may, through the bounty of United States aid and as a result of their own steady efforts, Japan has amassed considerable reserves of foreign currency which, while yet far from adequate for all purposes, will probably prove of considerable help in securing for them the credit facilities required especially during the importing season. It will be realised that as Japan exports mostly manufactured goods it is essential for her first to secure and pay for the requisite raw materials.

STERLING AREA AGREEMENT

The sterling area trade agreement for the period July 1, 1950-June 30, 1951, was signed late in November, envisaging a balanced trade of £185 million (as against £110 million for the previous year), and our four offices in Japan have been fully extended in coping with such part of the finance of this trade as is directed through this Bank.

Before closing this report on the position as we find it in Japan, I quote the comparative figures of the Note Issue as at:—

	Millions
Dec. 31, 1948.....	Yen 368,000
Dec. 31, 1949.....	Yen 355,000
Dec. 31, 1950.....	Yen 422,000

In spite of the increase which took place in 1950, money in Japan is in short supply. The Bank of Japan charge 6.935 per cent. per annum for internal (domestic) finance and 5.84 per cent. per annum for foreign trade finance (to banks), whilst Japanese banks charge anything up to 12 per cent. per annum to merchants. Practically all foreign trade transactions have to be financed by promissory notes discounted by Japanese banks with the Bank of Japan, owing to the absence of resources held by Japanese traders, and it is not difficult to visualise the loss of competitive power in world markets imposed by such stringent monetary conditions. A new Government-sponsored bank with a capital equivalent to £15 million and called the Japan Export Bank, has recently been founded to grant long-term loans to exporters and the need for a similar institution to assist importers, may soon become apparent if it is not so already.

OTHER CENTRES

New York.—There has not been so much evidence in the Far East during the past year of the desire to purchase dollar goods as against those from the sterling area. Trade figures reported in the American press confirm this, exports from the U.S.A. being some 18 per cent. lower than in 1949.

Our New York office continues to handle a large volume of business, however, and it remains a vital link in our business, besides keeping us in close touch with our many American and Canadian friends and correspondents, from whom we have continued to receive valuable business and support.

Hamburg.—I have again to report an increase in trade between Germany and the Far East, in which we are participating satisfactorily within our normal scope.

Manchester and Liverpool.—Our two branches in the north of England have kept us in touch with both importers from and exporters to India and the Far East and have fulfilled a valuable function.

West End.—This branch, much utilised by clients on furlough from the East, continues to enlarge its usefulness.

GREAT BRITAIN'S POSITION

In closing this review I cannot do better than say which converted roughly half the money in circulation into a long-term loan and the other a complicated form of my practice or devotion m. wide chain of branches. As was the case last year, in practically all these countries inflation is still present in serious degree and, if

exports from the United Kingdom are to be hindered through strikes and lockouts at the docks and on the railways as well as through inability to meet all demand, due only in part to concentration upon defence preparations, then a splendid opportunity will be lost, of improving not only the positions in the would-be importing countries but also the United Kingdom balance of trade position on which so much depends. But it is not only the trade position in the countries of the east which would be improved by providing the goods they want. On the contrary it must be realised that behind the trade position in these countries are the great mass of the people who, perhaps for the first time within recent memory, are producing with their labour, products greatly sought after by the nations of the west, and for which the nations of the west are willing to pay high prices in terms of currency.

It was well realised immediately after the war, when the return to eastern lands became possible, that the returning merchant must have available large supplies of goods if he desired to secure the products of the east. The position today is not so very different and in some of the more backward lands it has changed very little. It is therefore to be hoped that production in the United Kingdom will continue to rise in spite of the interference of defence preparations for in the conditions which I have reported in many of the countries of the Far East, it is essential that we keep the goodwill of the people and this can only be done by maintaining a stable value for money and providing the goods they require and, for which, for the first time in their lives, perhaps, they can pay.

HELP FROM THE WEST

Last year I thought that greater assistance would be required from the west if some of the countries in the Far East were to be saved from disintegration. Since then this has been realised, not alone by that great and generous nation the United States of America, but by all the Commonwealth nations who, in the Colombo Plan to which I have devoted some attention above, have taken an enlightened co-operative step toward self-help which is unique in the history of nations. All in all, therefore, in spite of the serious developments in the Far East and the parlous position in several of the countries in which this bank operates, progress has not been lacking, and as for the working of the bank, my belief last year that, in spite of uncertainties on every hand, the bank would continue to play a notable part in the furtherance of trade in the areas it serves, has been fulfilled.

In common with the great shipping and insurance interests, but more intimately than either of these, banks such as the Chartered Bank operate as a link between the countries of the eastern world and the United Kingdom, and while performing this invaluable function, assist to increase the earning power of every trading institution in the United Kingdom dealing with eastern countries, and at the same time augment by its own earnings the invisible earning power of the nation, besides bearing perhaps more than a full share of taxation burdens both at home and abroad.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

THE EASTERN BANK LIMITED

INCREASED RESOURCES

The forty-first annual general meeting of the Eastern Bank Limited will be held on April 4th at 2 and 3, Crosby Square, London, E.C.

The following is an extract from the statement by the chairman, Sir Evan M. Jenkins, G.C.I.E., K.C.S.I., circulated with the report and accounts for the year to December 31, 1950:—

The balance sheet total at £27,659,393 is higher by £3,551,347 than that of 1949. The main contributory increases are on the one side £3,379,081 under current, deposit and other accounts and on the other £2,431,847 under cash and bills receivable and £986,252 under advances. Notwithstanding the decline in acceptances shown in the balance-sheet, there was a fourfold increase in outstanding credits confirmed by the bank. Net profit stands at £123,928 against £118,244 for 1949.

A BUSY YEAR

The bank has had a busy year, with increased resources and ample scope for their employment; but the figures reflect the present world-wide instability. During the second half of the year the war in Korea, and fears of its extension, caused a further rise in commodity prices which were already high. There was no diminution in the demand for manufactured goods, and in present conditions it is indeed essential throughout the East that consumer demand should be adequately provided for. No immediate change in business conditions seems likely; but at some time a change will come, and profits generally will fall much faster than the costs of earning them.

The appropriations made from net profits are £30,000 to premises and £60,000 to reserve for contingencies and a final dividend of 3s. 6d. per share, less tax, being the same as the final dividend for 1949 is now recommended. This year's outlay mainly for the Bahrain premises, other existing commitments, and possible future outlay for premises at Baghdad and Karachi and for residential accommodation elsewhere, make the transfer to premises desirable although our present assets of this nature stand at a low valuation in our balance sheet. No appropriation to reserve fund having been made last year, the board have decided to transfer to reserve fund this year £200,000 from contingencies as augmented by the appropriation of £60,000 from net profit. This is made possible by the release of some special past provisions which are no longer required. The reserve fund will now stand at £1,200,000.

RIISING COST OF LIVING

In the countries in which the bank is established, generally it must be understood that the cost of living is everywhere high with a strong tendency to rise; that building costs are three times those of the nineteen thirties, and in some places more; and that the expenses of maintaining and expanding our business are increasing accordingly. In all the countries concerned except the Persian Gulf and Malaya, Central Banks are operating, and we are required by law to maintain compulsory deposits with those banks, and to comply with other requirements which vary with the conditions in each country.

Towards the end of the year the board decided to establish a branch office at Aden. It is expected that it will be open for business by the end of this month.

Our thanks are due to Mr N. S. Golder, the general manager, and to the staff, both at home and abroad, for the results achieved by a strenuous year's work.

HONGKONG AND SHANGHAI BANKING CORPORATION

INCREASED NET PROFIT

UNSETTLED WORLD CONDITIONS

SIR ARTHUR MORSE'S REVIEW

The ordinary general meeting of shareholders of the Hongkong and Shanghai Banking Corporation was held on March 10th in Hongkong.

The Hon. Sir Arthur Morse, C.B.E., in the course of his speech, said: The net profit for the year, after making transfers to reserves for contingencies, amounts to HK\$17,247,704, which exceeds the corresponding figure for the previous year by just over HK\$205,000. Including the balance of profit brought forward from last year, the sum available for distribution amounts to HK\$22,606,787. It is recommended that an amount of HK\$3,000,000 again be written off bank premises and after allowing for this amount, for the interim dividend of £2 per share and for the final dividend of £3 per share which is now proposed, there remains a balance of HK\$6,699,224 to be carried forward to next year, an increase of HK\$1,340,000 on the amount brought forward from 1949.

In view of the world political situation and the unsettled conditions prevailing in many of the territories where your bank operates, your directors consider it prudent to pursue a conservative policy and to continue to build up our inner reserves.

GENERAL POLITICAL DEVELOPMENTS

Many of you will remember how in past years your chairman of the day has at this meeting frequently commented on adverse political factors, which were sometimes local and internal, sometimes widespread and external. On each such occasion our report showed that the bank stood firm and had steered its way successfully through the political breakers. From 1941 to 1945 the bank was, however, forced by the outcome of events to take refuge, as it were, from the passing typhoon and to rest on its oars. But not all of that time was wasted; preparations for recovery were made and in 1945 we were able to re-emerge and indeed to start making up lost ground in spite of a still dismal and uncertain political outlook in many parts of the east. Since then the progress made in some of the British territories in the east has been remarkable and in Hongkong it has been spectacular beyond all expectation.

Now, once again the barometer has fallen but I have no hesitation in asserting—and this is after all a mere commonplace which has been repeated again and again in recent years—that the great mass of the eastern peoples do not want to be disturbed, regimented, mobilised and driven into extravagant and ambitious campaigns against other peoples.

What I feel sure the Asian peoples as a whole want most of all—just like other people—is freedom from want, which means in the case of 70 to 80 per cent. of the population, freedom to grow their crops, to sell them and to buy the essentials of life in exchange. They understand little about Democracy, Socialism, Communism and Marxism, but they will naturally respond at once to any measures which promise a rapid improvement of their standard of living and freedom from the spectres of hunger and poverty.

PROPOSED CONSTRUCTIVE STEPS

In South-east Asia as a whole all countries are "anxious to grow strong and

healthy on democratic lines." So said that great statesman, Mr Senanayake, the Prime Minister of Ceylon, in a BBC broadcast in January. Some of the new postwar systems of government have so far been unable to improve the lot of the people. The problems vary from country to country, but I want to stress the constructive steps which are proposed and in some cases have been set under way, whereby the democratic nations, and particularly the British Commonwealth and the United States are tackling these problems which if not faced will lead to increasing discontent and misery in extensive areas throughout Asia. The steps under way may not be spectacular but without endangering political, economic and personal freedom they will give more value in a practical, evolutionary and methodical way than can be obtained by the professedly revolutionary ways of proceeding to this end which are being adopted by the other camp.

I refer especially to the report by the Commonwealth Consultative Committee known as the Colombo Plan for Co-operative Economic Development in South and South-east Asia, which was presented to Parliament last November. Combined with this is the very important Council for Technical Co-operation. Setbacks and difficulties are bound to come but if the Commonwealth and its friends will really press forward this thing as a matter of urgency, in spite of the pre-occupation of rearmament, then it will indeed prove to the world that it has established "a genuine bridge of understanding between east and west." At the same time the United States Government has been proceeding with its own aid to Asia; recently it has taken a very welcome first step towards joining in the Colombo Plan. The required external financial support amounting to some £1,100 million in the six year period is, as the report of the Commonwealth's Consultative Committee says, manifestly not a task which can be tackled by the Commonwealth alone. Perhaps some co-ordination will be possible with the various ways in which American aid for Asia is being provided.

I have spoken so far of plans and hopes which might come to fruition under political and economic conditions in a normal world, by which I mean a world which is not involved in a full-blown war. Such a catastrophe one does not like to think about. If political blunders and misunderstandings bring things to such a pass, then naturally all hopes of betterment for the peoples of Asia and the world as a whole will be set back, if indeed they are not completely destroyed for ever. On January 12th the Commonwealth Prime Ministers in their joint communique issued in London stated: "We would welcome any feasible arrangement for a frank exchange of views with Stalin or Mao Tse-tung." The outlook is dark and we can only hope that perhaps this year we may yet see the fulfilment of this idea and the liberation of the unfortunate Koreans from their appalling suffering.

The chairman then reviewed in detail the day-to-day problems which had faced the bank during the past year in the countries where they had interests and concluded: Shareholders can be fully assured that their directors are taking every reasonable care to protect the bank's interests in these perplexing and uncertain days.

The report and accounts were adopted.

NATIONAL BANK OF INDIA

YEAR OF EXPANDING BUSINESS

The annual general meeting of The National Bank of India, Limited, will be held in London on April 3rd.

The following is an extract from the statement by the chairman, Mr J. K. Michie, circulated with the report and accounts for the year 1950:

I have the pleasure to report on another year of expanding business, and in so far as that has been the consequence of our own policy it is a matter for satisfaction. The total of our balance sheet reaches a new peak at £109,970,762, the comparable figure for last year being £92,972,507. Deposits have risen by £17,311,149, and advances by £3,604,982. Our consolidated balance sheet total shows an equally satisfactory increase, the figure being £133,404,121, as against £114,559,065 last year.

A SATISFACTORY RESULT

After making full provision for taxation, bad and doubtful debts and other necessary reservations, including an appropriation to the staff pension fund, which previously has been shown as a separate item in the profit and loss account, our net profits are £361,957, against the comparable figure for 1949 of £354,500. Considering that working expenses continue to go up the result is satisfactory.

We propose to allot the sum of £100,000 to premises account, increasing last year's provision by £50,000. We have in progress and ahead of us a heavy programme of building new and rebuilding old banking premises and of building and buying housing for our overseas staffs. Your board therefore consider it wise to provide against this expenditure as we go along as far as this is possible.

Out of the year's profits we have been able to allocate £60,000 to the reserve fund and, to supplement this, we have transferred £40,000 from inner reserves no longer required. Our published reserve funds will now stand at £3,600,000. The amount to be carried forward to next year is increased by a small amount.

Grindlays Bank Limited have brought their accounting year into line with our own, and their results for the period of fourteen months covered by the accounts were satisfactory. Our finance corporation has continued to meet the needs of the limited market for which it was created. As you know, corporations of this kind are not intended to overlap or compete in normal banking business.

During the past year we have opened five new branches and sub-branches, and under the authority of the respective central banks we shall shortly open branches at Bangalore in Southern India and at Khulna, which will serve the new port of Chalna in East Pakistan. We have also arranged to open a branch at Fort Portal in Uganda. Our further programme of extensions overseas is held back only by the difficulty of recruiting trained staff in step with our needs.

We have another and more local development in train. Provisional arrangements have been made to lease a very suitable building in St. James's Square at one time known as Windham's Club, and we hope to open a West End branch there sometime this year. Not only will this additional office enable us to offer our constituents better service in London, but it will relieve the increasing pressure on space in our head office. As soon as this can be done our customers will be advised of the opening date and of the services that will be available.

EFFECTS OF DEVALUATION

Last year was one in which many adjustments had to be made, for the major effects

of the devaluations of certain currencies carried out in September, 1949, did not begin to emerge until 1950 while more recently the world-wide programmes of rearmament have added further impetus to the inflationary trend which devaluation had already accentuated. Industrialists and merchants, and not least bankers, have had to face the problem of financing stocks and shipments of goods at consistently rising prices until today the whole financial machinery is under strain. Taxation of commercial profits is so high that an altogether disproportionate share of the burden of financing highly priced goods is being placed on the shoulders of banking.

The expansion of capital in the hands of commerce, industry and banking has not kept pace with this inflation, so we must warn ourselves against the ever increasing danger of advancing money to speculative borrowers. It is our duty to assist sound commerce; it is also our obligation to our borrowers and to our shareholders to keep this help within the limits of safety.

In a period of world shortages and advancing markets buyers will overlook late shipments and even faulty documents but an altogether different attitude will be shown should prices recede from these—in some cases—fantastic levels. Divergent views are held about the immediacy of this danger but if the value of money is to be preserved a serious attempt must be made to control the rising trend of the prices of what it buys. Restrictions of certain kinds of credit is one potent method but unless adopted as a general policy it would be ineffective.

Provided nothing cataclysmic happens in world affairs or in commodity markets—and the two are not necessarily synonymous—our prospects for 1951 are quite favourable but, I repeat, the higher prices go the greater the danger and the greater the anxieties of responsible bankers.

SECOND BRITISH ASSETS TRUST, LIMITED

The seventy-second annual general meeting of the Company was held at Edinburgh on March 15th, Mr W. H. Fraser, chairman, presiding.

In moving the adoption of the report and accounts, the chairman said:—

I am glad to welcome Lord Polwarth as a member of the board, and you will be asked to confirm his appointment.

Our revenue has exceeded the expectations of a year ago. This is due partly to the more liberal dividend policy that many companies at home are now adopting and partly to our increasing interests in North America, where yields generally are more generous than here and where we have had the benefit of a full year's effect of devaluation. In paying 17½ per cent. on a somewhat larger capital we are still only dividing some 76½ per cent. of our total gross revenue, so that our total income would have to fall by nearly a quarter before the present dividend is in danger.

The percentage of the company's investments in the U.S.A. and Canada has increased to 26.6 per cent. of our total valuation—as in previous years we have ignored in our valuation the premium ruling in London.

At a later date this year you will be asked to approve of new Articles of Association. These have not been revised since July, 1929. Since then there have been such material changes in company law and in the requirements of the Stock Exchanges that our present articles are in many respects out of date.

Present indications are that the current year's revenue should not be less than that of the year under review, but the uncertainty of the present outlook renders it impossible to forecast far ahead.

The report and accounts were unanimously adopted.

ROYAL BANK OF SCOTLAND

HIGHLY LIQUID POSITION: RECORD DEPOSITS

UNCERTAINTIES IN INTERNATIONAL OUTLOOK

PROGRESS OF SCOTTISH INDUSTRIES

THE DUKE OF BUCCLEUCH'S REVIEW

The annual general court of proprietors of the Royal Bank of Scotland was held in Edinburgh on Wednesday, March 14, 1951. In the absence abroad of His Grace the Duke of Buccleuch and Queensberry, K.T., P.C., G.C.V.O., governor of the bank, his speech was read by Mr Kenneth Murray, chairman of the court of directors. It was as follows:—

Before dealing with the ordinary business of the meeting, I have to refer to the loss sustained by the bank through the death of the Rt. Hon. Lord Bradbury of Winsford, G.C.B., LL.D. Lord Bradbury, who had been a director of Williams Deacon's Bank since 1925, joined our board when we acquired the capital of that bank in 1930, and his expert knowledge in matters of business and finance was freely placed at the disposal of both institutions. His loss is greatly regretted by his colleagues on the board. On the other hand, I have pleasure in referring to the appointment of the Rt. Hon. Sir Ronald Ian Campbell, G.C.M.G., C.B., and Mr Kenneth Graham Holden, as ordinary directors, and of Sir William Crawford Currie, G.B.E., a deputy chairman of Williams Deacon's Bank, as an extraordinary director. The wide knowledge of business and public affairs possessed by these new directors will, we are sure, prove of great value to the bank.

I assume it will be your pleasure that the annual report of the bank and our balance sheet and profit and loss account, and those of Glyn, Mills and Company, and Williams Deacon's Bank, which have been circulated, shall be taken as read, but in compliance with statutory requirements the auditors' report falls to be read at this meeting, and I now call upon the secretary to do so, after which it is open to inspection by any proprietor.

The secretary (Mr Thomas Brown) then read the auditors' report.

DEPOSITS AND OTHER LIABILITIES

The governor's speech continued:—Referring first to the balance sheet, our deposits and other accounts at £131,000,000 are a record in the history of the bank. They show an increase on last year's figures of fully £4,000,000, an increase which is in accord with the general experience of other banking institutions. The decrease in amounts due to subsidiary companies is a matter of internal administration and does not call for any special comment on my part. The amount of notes in circulation is not greatly altered, but it is pleasing to record a further increase of nearly £1,000,000 in acceptances, confirmed credits and other obligations.

Our capital remains unchanged at £4,250,000, but the reserve fund, by the addition of £101,248 from the year's profits now stands at £4,773,800.

LIQUID ASSETS AND INVESTMENTS

Turning now to the other side of the balance sheet, the total assets amount to £161,000,000. You will observe that our customary highly liquid position is being more than maintained with cash, balances with the Bank of England and other banks and money at call and short notice, amount-

ing to over £34,000,000, representing more than 24 per cent. of our liability for deposits and notes issued.

Our bill portfolio shows a marked increase on last year's figure; the increase on the year is accounted for as to £500,000 by a larger holding of Treasury Bills and, what we are specially pleased to note, as to £800,000 in commercial bills. On the other hand, Treasury deposit receipts show a further contraction due to the continuance of the Treasury's borrowing policy.

The total of our investments shows little change on the year and, as usual, those quoted are valued in the balance sheet at or under market prices ruling on the date of our balance. Our British Government securities are well distributed, and are mainly in the short and medium dated stocks.

Following on the substantial increase in advances during the preceding year, the total on this occasion shows little change, although I need hardly remind you of the very many variations which take place throughout the year in the individual items which go to make up the aggregate. The other items on the assets side do not call for any special comment this year.

PROFITS AND APPROPRIATIONS

I come now to the profit and loss account, in which we show an increase of £3,400 over last year's profit, and, keeping in mind the growing burden of charges, the directors consider this a satisfactory result. Following our usual practice, full provision has been made for contingencies and all bad and doubtful debts.

Two interim dividends having been paid at Midsummer and Christmas respectively, amounting together to 17 per cent. per annum, the directors do not recommend any further dividend for the year. The allocations proposed for property maintenance and staff pension fund are similar to those of the last five years, but there is an additional allocation of £15,000 to the staff widows fund, which will continue as a yearly payment in fulfilment of an agreement made between the directors and the staff association and embodied in an Act of Parliament setting up the revised widows' fund. I am glad to say that the improved conditions of this fund have been a source of considerable satisfaction to our staff. A balance of £101,248, as I have already mentioned, has been added to our published reserve fund, raising it to £4,773,800.

THE THREE BANKS

The accounts of our associated banks, Glyn, Mills and Company, and Williams Deacon's Bank, have already been submitted to their general meetings. These accounts are also in every sense satisfactory, and show a further record of steady progress in both institutions. Last year I referred to the successful inauguration of *The Three Banks Review*. It continues to have an ever-widening circulation, and I would take this opportunity of congratulating the editorial committee, which includes representatives from all three members of the group, on the notable success of their efforts.

NATIONAL AFFAIRS

In the wider sphere of national affairs, it is obvious that the position today is dominated by the uncertainties of the international situation. It is indeed a calamity that, at a time when our resources should be directed towards repairing the ravages of war, we should once again be compelled to incur vast outlays on rearmament. Nevertheless, it is important that every effort should be made to lessen the strain of this heavy expenditure on the country's resources, a strain which is all the greater by reason of the fact that it is being imposed upon us during a period when a policy of full employment is the national objective. Despite the renewed confidence in sterling and the closing of the dollar gap, it is as essential as ever to maintain our exports, and, faced as we are with the necessity of diverting to rearmament labour and materials which could be usefully employed in the pursuits of peace, the present circumstances constitute a challenge to those in authority to tackle the situation in a manner which, in the end, will best serve the interests of the nation. Pre-eminent in this connection is the need to do everything possible to prevent further inflation, and one can but hope that, coupled with increased productivity, the additional burden which confronts us will be offset to some extent at any rate, by a bold and statesmanlike effort to cut down unproductive expenditure in other directions.

Additional taxation—in so far as this may be possible in our present over-taxed condition—offers no solution, and may well prove harmful in the end. As things are, industry is being called upon to bear a staggering load of taxation and, while under present conditions any lightening of this burden can hardly be expected, it is to be hoped that, whenever circumstances permit, serious effort will be made to lessen the drain on those resources which properly, and with advantage to the nation as a whole, should be ploughed back into business. The phenomenal rises in the costs of capital re-equipment and of raw materials are creating problems of finance which, in turn, are intensified by the fact that profits, required for the maintenance of business efficiency, are being so drastically reduced by taxation.

SCOTTISH INDUSTRY AND COMMERCE

I record with pleasure that, in the industrial and commercial life of Scotland, there exists today an eagerness to develop the skill and resources of the country greater than at any time in her history. To some extent the heavy industries have been faced with new problems as a result of recent legislation, but one cannot doubt that the fame of Clydeside will continue to assert itself; and it is indeed fitting that, in connection with the Festival of Britain, the Exhibition of Industrial Power is to be held in Glasgow. In Scotland today the Scottish Council (Development and Industry) has established itself as a live force in the commercial and industrial affairs of the country, and much good, which it is hoped will be lasting, has already accrued from its efforts. In the struggle to achieve equilibrium in the balance of payments Scotland has good cause to be proud of the contribution made by her old-established industries.

In the export drive many of them have helped to lessen the problems of the Dollar Export Board, and notably outstanding in this connection is the contribution which has been made, and continues to be made, by the Scotch whisky industry. In the past, Scotland has left herself open to the risk of serious industrial depression by reason of the fact that her main activities have been concentrated on a few large industries, and the studied trend towards establishing her economic life on a broader basis has everything to recommend it. Light industries, to an extent and variety hitherto unknown in

Scotland, have now been established within her borders and, on a grander scale, are the oil distillation plants being set up at Grangemouth. All of these will, in time, by adding to our exports and lessening the demand for certain imports, help to preserve the balance of payments between Great Britain and abroad, and thereby contribute to a material extent in maintaining the exchange value of the pound.

POSITION GENERALLY GOOD

Generally, the present industrial situation in Scotland is good, but one cannot overlook the grave anxiety being felt in many industries at the alarming increase in the prices of raw materials. In Scotland, as elsewhere, there are businesses of undoubted standing, but possessed of moderate resources, which have been enabled by a combination of caution and skill over the years to attain their present sound position. The proprietors of many of these businesses, often handed down from father to son, now see, in the current high level of prices, a danger of possible unfortunate consequences not only to themselves but to the pioneering enterprise of their predecessors as well. Within our experience of late there have been in this category customers of the bank, with a record and resources which warranted further accommodation, who have displayed an understandable reluctance to assume the risks of additional borrowings in order to meet the exigencies of the present situation. In previous years I have referred in detail to the importance of the agricultural industry in Scotland, and I need not on this occasion make further detailed comment. All I need say is that, in any defence programme in Great Britain, the agricultural industry is obviously in the front line.

TRIBUTE TO OFFICIALS AND STAFF

During the year the staff have continued to give their usual loyal and efficient attention to the affairs of the bank, and the directors desire once again to place on record their sincere appreciation of the valued services rendered by Mr Thomson, the general manager, the assistant general manager, and the officials and staff at head office, London City and West End offices, Glasgow, Dundee, Aberdeen, and all the other branches.

I now beg to propose that the report, containing a statement of the accounts and balance sheets, be approved.

The report was approved, and the governor, deputy-governor, extraordinary directors and the retiring ordinary directors were re-elected.

STERLING TRUST, LIMITED

LARGER INCOME AND DIVIDEND

The thirty-fourth annual general meeting of The Sterling Trust, Limited, was held in London on March 13th, Mr Maurice Hely-Hutchinson, M.C., the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts for the year 1950:

The improvement of £17,365 in the normal gross income chiefly arose from our holdings in Ordinary stocks and was partly due to increased dividends and partly to the investment, in recent years, of a greater proportion of our funds in equities, which contributed about 51 per cent. of the total gross income.

In considering the dividend on the Ordinary stock the board have borne in mind the many uncertainties in the political and economic outlook, but in view of the strength of the company's position as disclosed by the

accounts, they have decided to recommend an increased final dividend of 5½ per cent., making, with the interim dividend, 7½ per cent. for the year, against 6½ per cent. for each of the three previous years.

The capital position has also improved. The valuation of the investments at December 31, 1950, amounted to £5,233,786, showing an appreciation of £842,955 over the book value or 19.2 per cent., compared with 12½ per cent. at the end of 1949.

The issued Ordinary stock (£875,000) had the substantial additional backing of £1,313,608, comprising revenue reserves £470,653 and capital appreciation £842,955. Each £100 of Ordinary stock therefore was represented by £250 worth of assets. An estimate of the income for the current year shows little changes in the normal income. The report was adopted.

BEAUMONT PROPERTY TRUST LIMITED

GOOD DEMAND FOR PROPERTIES

The seventeenth annual general meeting of The Beaumont Property Trust Limited was held on March 13th in London, Mr C. W. Black, J.P., M.P., C.C., F.R.I.C.S., F.A.I. (the chairman), presiding.

The following is an extract from his circulated statement:—

The net profit for the year ended September 30, 1950, including dividends received from the three subsidiary companies, amounted to £61,532, after providing £59,407 for income tax and profits tax. Compared with the previous year, the net profit shows a decline of about £5,000, and the amount payable in respect of income tax and profits tax an increase of about £5,000. To the profit for the year there must be added the sum of £32,657 brought in from the previous year, making a total sum of £94,189 available for appropriation.

The three subsidiary companies have made satisfactory progress during the year, and have declared dividends on their preference and ordinary capital amounting to a total of £77,313 gross, leaving, after deduction of income tax, a net amount of £42,522.

RESTORATION OF PREWAR DIVIDEND

During the year dividends on our preference capital were paid on the due dates, and an interim dividend of 2½ per cent., less income tax, was paid on August 15, 1950, on the ordinary capital. After careful consideration, your directors reached a decision to recommend that a final dividend should be paid of 5 per cent., less income tax, making a total of 7½ per cent., less income tax, for the year. This recommendation restores the rate of ordinary dividend to the rate which was paid on the ordinary capital in the years before the war.

The demand for our properties continues to be good, and, owing to the slow rate of completion of new properties, the demand still much exceeds the supply. For a long time to come there is likely to be little difficulty in promptly reletting any properties which come into possession.

Owing to the innumerable restrictions to which the building development business is still subjected, our subsidiary development companies have been unable to resume their prewar business of erecting new residential and business premises; this is to be much regretted, as we could, if allowed to do so, have made an appreciable contribution to the solution of the housing problem, and the community would have been saved the heavy subsidies which are payable in respect of Government-sponsored housing.

Your directors continue to be satisfied with the soundness of your companies, and will continue to watch over the interests of the shareholders to the best of their ability.

The report was adopted.

HOOVER, LIMITED

RECORD EXPANSION OF BUSINESS AND TURNOVER

REMARKABLE EXPORT ACHIEVEMENTS

RISK CAPITAL THE LIFE BLOOD OF EXPANDING BUSINESSES

INADEQUATE INCENTIVES STEM THE FLOW

SIR CHARLES COLSTON ON DIVIDEND LIMITATION

The annual general meeting of Hoover, Limited, will be held on April 2, 1951, at Perivale, Greenford, Middlesex.

The following is the annual review of the chairman and managing director, Sir Charles Colston, C.B.E., M.C., D.C.M., which has been circulated with the report and accounts for the year ended December 31, 1950:

It is with very real gratification that I am able to review the operations of the company during the past year. We have made important advances in every section of our activities both at home and abroad. During 1950 we succeeded in surpassing the remarkable results of 1949, easily the record year in the history of the company up to that time.

The expansion of our business during the year was larger than ever. In 1950 our turnover was seven times as large as in 1938, our record year before the war.

It is a striking fact that during the last three years the average expansion of our business each year has been substantially greater than our total annual business in 1938. In effect, during these three years we have been adding a business larger than pre-war Hoover, Limited, to our business each year.

ADVANCE IN ELECTRIC CLEANER SALES

I propose first to review our operations here at home. Our sales in Great Britain of electric cleaners, manufactured at our main Perivale factory (works No. 1), have continued to forge ahead. The peak turnover of cleaner sales in the home market which we attained in 1949 was exceeded by more than 20 per cent. in 1950. Our home sales alone of electric cleaners during the year were more than double our total sales in 1938.

In spite of the steep rises in wages, materials and services, the prices of Hoover electric cleaners have been kept down and, apart from purchase tax, are still less than 10 per cent. above prewar prices. Unlike the position in many other industries where increased turnover simply represents increased prices, the increased turnover in our case

represents a doubling in the physical volume of our electric cleaner business in Britain.

During the year we introduced our new model 119, and this was immediately an outstanding success. This splendid electric cleaner, the result of brilliant research work, contains many improvements and innovations. It has been most warmly welcomed by the public both here and overseas.

We have continued our policy of giving priority to export orders. As a result we have to our regret been compelled to disappoint our dealers at home in regard to deliveries. The quality and attractive price of the Hoover electric cleaners have created a strong and insistent demand which we are doing our best to meet. Our dealers and the general public will bear with us, knowing how important it is to increase exports to the maximum.

COMPARISON WITH PREWAR PERIOD

The remarkable progress which we have made is based on a sure foundation because we constantly give better and bigger value to our customers. We have brought down the retail price of the Hoover electric cleaner from £25 in 1920 to an average of about £14 5s. in 1950; and even our lowest-priced cleaner today is of much better quality and durability than the cleaners which we were marketing in the twenties.

LOWER RELATIVE PRICES IN SPITE OF HIGHER COSTS

It may be of more immediate interest if we make similar comparisons between 1938 and 1950. The average retail price of Hoover electric cleaners in 1938 was about £13 2s. As already mentioned the average retail price in 1950 was about £14 5s. a rise of less than 10 per cent. The general price level during this period of 12 years rose by approximately 110 per cent. In relation to the general price level, the average retail price of Hoover electric cleaners in 1950 (even after including the heavy purchase tax now imposed), has fallen by about 35 per cent. compared with the price in 1938. If we exclude purchase tax the relative fall is no less than 48 per cent.

We can make the comparison in another way by expressing the fall in the relative price of the Hoover electric cleaner in terms of the hours of work necessary to purchase it. For this purpose we may select four important categories of workers. We find that in order to purchase the average price Hoover cleaner (apart from purchase tax) it was necessary for them to work less than one-half the number of hours in 1950 that they would have had to work in 1938.

No. of hours work to purchase Hoover cleaner (excluding purchase tax)

	1938	1950
Miner	212	104
Engineer	207	99
Agricultural worker	385	143
Clerical worker	274	136

The electric cleaner industry is severely competitive. Hoover, Limited, has set a pattern for the industry as a whole in keeping down prices to a level not very much above the prewar level. We have certainly made a contribution towards maintaining the value of the £.

We are proud of our success in Hoover, Limited, in improving the quality of our electric cleaners and at the same time reducing the price relative to the level of wages, materials and services. We have succeeded in doing this because of the striking technological advances we have made, and the important economies, both in production and distribution, flowing from the increasingly large scale of our operations.

IMPORTANCE OF HOME MARKET

This has helped us to expand our home market and, as I shall show later, has enabled us to make striking advances in the export field. It is the home market taken together with the export market which gives us the large-scale volume of business which yields the maximum economies in production and distribution.

Since 1938 there has been a marked rise in the standard of living of our lower income groups. This, together with the lower price of the Hoover cleaner relative to the general price level, has brought it within the reach of millions of additional homes. The electric cleaner is no longer a luxury or a semi-luxury. It has become a necessity for a large part of the population.

NEED FOR LABOUR-SAVING APPLIANCES IN THE HOME

It is common ground that every effort should be made to raise the general standard of living where possible. This may be measured not only in terms of increased incomes, but, not less important, in terms of reduced drudgery for our housewives. We constantly stress the vital necessity of introducing labour-saving appliances in factory and office. But for the sake of the health and happiness of the over-worked housewives of the nation, it is vital also to introduce modern labour-saving appliances in the home on an ever-increasing scale.

In this field, the United States is far in advance of Great Britain. It is estimated that, with about 7 per cent. of the world's population, the United States sells each year in its own home market about 70 per cent. of the total world production of household appliances so essential for the modern housewife. Every effort is made there to save her unnecessary work. We here should do likewise.

Our rearmament programme makes this problem in some respects more urgent. There seems little doubt that rearmament will create acute shortages of labour in certain sections of industry. Our womenfolk are being increasingly urged to help production, on either a whole-time or a part-time basis. It is, therefore, all the more necessary that the burden of housework should be lightened as much as possible to encourage and help women to go into industry.

HOOVER SERVICE DEPARTMENT

Our Service Department, with headquarters at our Park Royal factory (works No. 5), has continued to render fine and prompt service to the owners of Hoover electric cleaners in Britain, who now number more than two million. The department is expanding its facilities in order to service the rapidly increasing number of Hoover washing machines in British homes. The smooth, efficient organisation of our service department is one of the corner-stones of the success of our business.

HOOVER WASHING MACHINE—A WORLD WINNER

The expansion in the production and sale of Hoover electric washing machines continued very vigorously during the past year. Our turnover of washing machines at home and overseas is now more than double the total turnover of our business in our peak prewar year. This is indeed a remarkable achievement as we only began manufacturing the washing machine in 1948.

In 1950 we increased our sales in Great Britain by one third over the previous year. But our exports in 1950 were two and a half times as large as our exports the previous year, which had already reached substantial proportions.

The importance we attach to building up strong export markets and the priority we give to export orders have compelled us to keep the home market very short of supplies. We give our dealers an allocation which is disappointingly small, and very many people are kept waiting for a Hoover washing machine which they so urgently need.

The Hoover washing machine is suitable for almost every home in the country. It is small in dimensions but does a big wash, and does it quickly and with the highest efficiency. It is a necessity in working-class homes as much as it is in more well-to-do households. It appears to me unjust that heavy purchase tax should continue to be levied on a necessity of this kind.

The Hoover washing machine relieves the harassed housewife of an immense amount of unnecessary and exhausting manual labour. Hundreds of thousands of housewives who now have the machine wonder how they ever managed to do without it. Another and perhaps more important aspect in these days is the great opportunity it gives to housewives, in shortening their housework, to help in production.

FACTORY EXTENSIONS IN SOUTH WALES

In order to cope with the demand both at home and overseas for the Hoover washing machine it is imperative to expand our production facilities. I mentioned in my last annual review that we were negotiating with the Board of Trade for the doubling of our factory space at Merthyr Tydfil (works No. 4). I am glad to say that these negotiations were satisfactorily completed and this extension is now almost finished.

But this doubling of space will not be sufficient, and official approval has been given for a further extension of our Merthyr Tydfil factory which will make it about three times its original size. This work is already in hand. The enlarged Merthyr Tydfil factory, together with our factory at Cyfarthfa (works No. 6) and our factory at Aberdare (works No. 8), should enable us substantially to increase our washing machine production.

We have been greatly honoured by the visit of H.R.H. Princess Margaret to our Merthyr Tydfil factory. We have also been visited by Mr G. R. Strauss, the Minister of Supply, and he has paid tribute to our help in bringing valuable employment to South Wales, and also to the striking contribution which we are making to the export drive.

We have taken substantial risks in sinking very large sums of our shareholders' money in expenditure over a number of years on research work in connection with the Hoover washing machine, in equipping large-scale factories for its production, and in creating sales organisations all over the world. Taking these risks has proved in the event to be justified. It is right in our view that our shareholders should receive reasonable reward for the risks they have taken.

F.H.P. MOTOR DEVELOPMENTS

As you know we are manufacturing fractional horse-power motors at our Cambuslang factory (works No. 2) in the Scottish Development Area.

I am glad to be able to report satisfactory progress in this section of our business. We have developed and during the year put on the market our latest type of F.H.P. motor. This has been very well received both at home and abroad. We are also manufacturing at Cambuslang the F.H.P. motors required for the Hoover washing machine. This also will involve growing demands on our manufacturing capacity. We have, therefore, found it necessary to carry out a considerable factory extension at Cambuslang, which will increase its size by nearly 75 per cent. This extension is well in hand.

NEW INDUSTRIES IN DEVELOPMENT AREAS

The Hoover Washing Machine Company in South Wales and the Hoover Electric Motor Company in Scotland constitute important enterprises which we have built up in these Development Areas. We have thereby provided valuable sources of employment where they are much needed. These undertakings are on a solid and permanent basis, be the times good or bad.

They are not branch factories from which work could be transferred in time of depression to our main factory. They are separate companies and the South Wales and Scottish Development Areas are their homes. They are equipped and tooled up specially for their own separate products, and there is no question at any time of transferring production to our main factory at Perivale where we manufacture the Hoover electric cleaner.

In the long-term interests of the Development Areas it is desirable to build up undertakings there which can, so to speak, stand on their own legs and this is preferable to setting up branch factories for the manufacture of products which are also produced at main factories elsewhere.

I may also record very satisfactory progress at our High Wycombe factory (works No. 3) where we are manufacturing Dustettes and various industrial products such as plastic commutators and switches. This factory is also being extended and rather more than 50 per cent. is being added to its floor area.

THE NEW HOOVER FLOOR POLISHER

I am happy to inform you of the proposed launching of the new Hoover electric floor polisher. For a number of years we have been intensively engaged on the development of this new product. I am confident that its standard of performance will fully maintain the Hoover reputation for quality.

We are releasing the Hoover floor polisher in Belgium this May, but it may be some time before we release it for the home market. I think the Hoover floor polisher should represent a valuable addition to our business. This further widening of the range of our products will bring additional strength and stability to our great undertaking.

STRIKING EXPORT EXPANSION

I shall deal next with the remarkable expansion of our exports during the past year.

The need to increase British exports is more vital than ever. Marshall Aid has ceased. The burden of rearmament is becoming heavier. Many of the essential raw materials we import have risen steeply in price. If in spite of these adverse factors we are to maintain our standard of living, we must export more, and this is largely dependent on higher efficiency and greater productivity.

I think the company may take pride in its export achievements. We have laid down the policy that exports must have priority over home orders. Our first duty is to build up strong stable markets abroad for our products. During 1950 we succeeded in increasing our exports of electric cleaners by about 65 per cent. over the previous year. Even more striking was the expansion of our washing machine exports, which were two and a half times as much in 1950 as in 1949.

About 57 per cent. of our total production of washing machines was exported during 1950, a substantially higher proportion of a much larger production than the previous year. Exports of our F.H.P. motors and our other industrial products are being satisfactorily developed and, at present, more than half are being exported. In addition, large numbers of the motors which we sell in the home market are incorporated in other manufacturers' products which are being exported. Adding these indirect exports to our direct exports, it is estimated that about three-quarters of our F.H.P. motors are sent abroad. Taking all our products together, we exported in 1950 more than 40 per cent. of our total production, a considerable achievement. The percentage, however, is still rising and for the first two months of 1951 the figure is no less than 53 per cent.

INCREASED TRADE WITH EUROPE

Particularly noteworthy is the increase of our exports to the Continent of Europe. The closer economic links between Britain and her European neighbours are most welcome. Some of the vexatious restrictions which so seriously hampered international trade have been removed and we are on the way to creating a real European market.

Freer trade has been one of the potent factors in the economic revival on the Continent. The continued strengthening of the economies of the European countries in the North Atlantic Treaty Organisation is essential to enable them to bear their share of the burden in men and armaments for defence against aggression.

This freer European market has given a real opportunity to efficient British manufacturers to expand exports just as it has given a corresponding opportunity to Continental manufacturers. Hoover, Limited, has made

the most vigorous efforts to expand its European business, and I am glad to say that our total exports to the Continent in 1950 increased by about 100 per cent. over the previous year. We are doing increasing business with practically every European country outside the Iron Curtain.

PROGRESS OF HOOVER SUBSIDIARIES IN EUROPE

Hoover subsidiary companies in Europe have made splendid progress. Our Belgian subsidiary has substantially increased its turnover as compared with 1949. Our Dutch subsidiary has made a most striking advance and has multiplied its turnover more than tenfold, which illustrates what can be achieved if trade barriers are removed. We have now built up major businesses in Belgium and Holland; taken together they are comparable to our total business before the war.

Our French subsidiary is making valuable progress. Turnover has been more than trebled. Our factory at St. Ouen, near Paris (works No. 7), has operated very satisfactorily. Our Swiss subsidiary has further strengthened its position, and the prospects for the future are very promising. Our subsidiary in Germany has made little progress so far owing to the continued abnormal conditions in that country.

In Italy, we increased our sales to such an extent that we decided to form a subsidiary company there, and this was set up in October last. I think it will make a useful contribution to the strength of our organisation.

TRADE WITH THE DOMINIONS

Increased exports to the Dominions are more important than ever in order to pay for the essential raw materials we import from them, the prices of which in some cases have risen to fantastic heights. It is with satisfaction, therefore, that I can record that our Australian subsidiary has increased its turnover by about 75 per cent. during 1950. I personally visited Australia at the beginning of 1949 and initiated a policy of expansion, which I am glad to say is proving abundantly justified. Our Australian subsidiary has built a major business in this important market. In view of this expansion we recently increased the capital of our Australian subsidiary from £A100,000 to £A250,000 and a further increase will probably be necessary.

By way of contrast, in South Africa we are faced with severe import restrictions, although there has been a slight improvement recently, and our South African subsidiary has little possibility of developing this potentially valuable market under present conditions. In New Zealand the position is worse still. I very much regret that our products, with the exception of F.H.P. motors, are completely excluded from this Dominion as a result of import restrictions. I earnestly hope that, in the interests of closer economic ties within the Commonwealth, some of these barriers in the way of British exports will be removed without undue delay by the Governments of South Africa and New Zealand. These continued restrictions are in regrettable contrast to the policy of freer trade with Europe, which is bringing such benefits both to Britain and her Continental neighbours.

We are making efforts to develop the Canadian market. We are at present exporting our electric cleaners and washing machines in parts for assembly in the Dominion.

SIZE OF THE WORLD MARKET

As is well known, the United States is not an easy field for British exports, but we are making persistent efforts to develop a market there for our products. We are exporting large numbers of our Dustette electric cleaners as well as a number of our industrial pro-

ducts, and we wish to acknowledge the co-operation given to us in this regard by the Hoover Company of America.

So far as the rest of the world is concerned, we are for all practical purposes barred from the countries behind the Iron Curtain. In many of the populous countries in the East there is little, if any, market for our products owing to the low economic standards in these areas as well as the small proportion of homes wired for electricity. The States within the Soviet sphere and these Eastern countries account for about two-thirds of the world's population. Apart from this there are still many countries in which import restrictions, quotas and shortage of foreign exchange seriously hamper our exports. For manufacturers of electrical appliances like Hoover, Limited, the immediate potential world market is in reality much smaller than might at first sight appear.

Nevertheless, we are doing business with 59 countries. Our exports have been rapidly increased during the last few years. The expansion of our subsidiaries abroad has been impressive. Their sales in 1950 were nearly double our total sales including exports before the war.

CAPITALISATION OF RESERVES

To enable the company to meet the ever-increasing world demand for its products, profits have been consistently ploughed back to a considerable extent. The amount of capital employed in the business had become disproportionately large compared to the issued share capital. With a view to reducing this disparity, in December last we capitalised with Treasury consent, £975,000 of the company's reserves. Of this sum £772,646 consisted of the share premium reserve, part of the amounts subscribed by our ordinary stockholders. The sum capitalised was applied in paying up 3,740,000 ordinary shares of 5s. each and 800,000 "A" ordinary shares of 1s. each, and these were issued to the holders of the company's ordinary stock and "A" ordinary shares respectively in the proportion of one new fully paid ordinary share for each 5s. unit of ordinary stock and one new fully paid "A" Ordinary share for each "A" ordinary share held. The new ordinary shares have been converted into ordinary stock. The new ordinary stock and the new "A" ordinary shares rank equally for dividend with the ordinary stock and "A" ordinary shares previously issued. After carrying out this capitalisation the board is satisfied that the company still has adequate reserves.

PROFIT FOR THE YEAR

As the result of the continued expansion of our business, our consolidated profit has increased from the record total for 1949 of £1,719,000 to a new record of £2,475,000. Of this profit no less a sum than £927,000 was earned by our overseas companies, itself two-and-a-half times our total prewar profit. Our total turnover, as I have mentioned, was more than seven times as much as in 1938, and our profit has increased in about the same proportion. In 1938 our business was confined to Hoover electric cleaners. Now we have firmly established undertakings for the manufacture of Hoover washing machines and fractional horse-power motors and we have developed also a number of major businesses abroad. The company's activities are more widely based. The larger scale of our operations has enabled us to secure important economies which have been passed on to our customers in the form of still better value.

SHAREHOLDERS AND POLICY OF EXPANSION

These achievements are the result of our policy of extending the range of our pro-

ducts and developing numerous export markets. This policy has involved large capital expenditure over a period of years and very real risks of loss. Our new ventures have proved successful, and the board consider that our shareholders are entitled to a share in this success in the form of increased dividends. I do not think it would be right for any responsible board of directors to embark upon a policy of expansion, risking the loss of their shareholders' money if things go badly, but giving them no benefit if things go well. Our shareholders should receive some reasonable reward to encourage them to support the board's policy of expansion. Such a policy involves risks for any company. But if the mass of British companies were to adopt the alternative of a safety-first policy, a policy of negotiation and a refusal to venture into new fields, it would be fatal to Britain's hopes of retaining her position as one of the leading industrial nations of the world. Our rulers should encourage the spirit of industrial adventure, not subdue it with threats of compulsory dividend limitation and high rates of profits tax.

DIVIDEND DISTRIBUTION

After very careful consideration the board have decided to recommend a final dividend of 1s. 1½d. less tax on each ordinary stock unit. Together with the interim dividend, this amounts to the equivalent of 1s. 6d., less tax on each ordinary stock unit, after the capitalisation of reserves already referred to. On the basis of the above distribution to the ordinary stockholders, the "A" ordinary shareholders are entitled under the articles of association to receive a dividend of 2s. 1.0065d. less tax per "A" ordinary share. The additional reward to our senior executives which this distribution represents, is more than justified having regard to their strenuous and successful exertions on behalf of the company. There is no doubt that the incentive provided by the "A" ordinary shares to our executives has contributed more than any other single factor to the remarkable progress of the company.

AMERICAN INVESTMENT IN BRITAIN

I should like to refer to our American stockholders, the Hoover Company of America, who have a considerable investment in our company. Last year they pointed out that sterling devaluation had seriously cut their dividend in terms of dollars, and they urged that our dividend should be increased sufficiently at least to maintain the dividend in terms of dollars which they were receiving prior to devaluation. We met their request last year to a very moderate extent only. This year our profit is nearly three times what it was in 1948 and seven times what it was in 1938. We have increased our dividend as mentioned above, but even now our American stockholders will only receive in terms of dollars a minute amount more than they did for 1938, although the profit of the company is seven times what it was in 1938.

The issue raised by our American stockholders is of general importance. Industry as a whole in Britain is experiencing a growing shortage of capital. Additional capital is urgently needed by many companies to enable them to install more modern plant and equipment, the cost of which has risen sharply, and to finance expansion. Unfortunately, onerous taxation has seriously reduced the fund of savings available for investment, and there is a need of American investment in British industry to make good the deficiency. Americans believe in incentives for those who risk their capital. Rigid limitation of dividends would be fatal to our hopes of attracting increased American investment.

Dividends from our overseas subsidiaries for 1950 were substantially larger than our total profit in our peak prewar year. It is gratifying that the countries in which our subsidiaries abroad operate encourage free enterprise and are willing to pay a just return on risk capital. This encourages us to invest and expand our activities there. It would be rather strange if we were prepared to receive increased dividends from abroad but withheld the benefit from our own shareholders. It is upon dividends received from abroad as well as on exports that the standard of living in this country depends.

Before the war we had no subsidiary companies either at home or abroad. For the year 1950 the net dividends we have received from our overseas subsidiary companies alone amounted to 95 per cent. of the total distribution which the directors are now recommending.

STOCKHOLDERS WORSE OFF THAN PRE-WAR

The board consider that it could be forcibly argued that the ordinary stockholders are entitled to a larger share in the success of the company. It may be useful to compare the gross dividends and net dividends (after deduction of tax) on the ordinary stock for 1938 and 1950, in relation to the profit for those years:—

Profit	1938
Gross dividend	£338,515
Net dividend	£200,000
	(59.1% of profit)
Profit	1950
Gross dividend	£145,000
Net dividend	£145,000
	(42.8% of profit)
Profit	1950
Gross dividend	£2,475,000
Net dividend	£561,000
	(22.7% of profit)
Profit	1950
Gross dividend	£308,550
Net dividend	£308,550
	(12.5% of profit)

It is estimated that the present-day value of the net assets of the company is between four and five times as high as in 1938. But the net dividends which the ordinary stockholders will receive for 1950 are only just over double their net dividends for 1938 in spite of the seven-fold increase in profit.

We may test in another way whether the dividend which the ordinary stockholders are receiving is adequate or not. The price level since 1938 has risen by about 110 per cent. In terms of 1938 prices, the net dividend on the ordinary stock for 1950 is only 1 per cent. more than for 1938. Yet during these 12 years we have ploughed back some millions of pounds into the business and in addition the ordinary stockholders have subscribed nearly a million pounds additional capital.

It is of interest also to compare the burden of taxation which we carry with the net dividends which our ordinary stockholders receive. These net dividends represent less than 1½ per cent. of the price which the public in this country and abroad pay for our products. Taxation (including purchase tax) in this country actually accounts for 24 per cent. of the retail price. The removal of purchase tax would immediately reduce the price of our principal products very substantially, but the elimination of the ordinary dividend in its entirety would make only a negligible difference.

In my view the incentives to those who provide industry with risk capital are not too large, but too small. Without adequate incentives we shall fail to attract new savings in sufficient measure, and the existing shortage of risk capital in industry is likely to grow steadily more acute. It must be borne in mind that new and expanding businesses can only flourish if risk capital is available. Risk capital will not be available unless the reward is commensurate with the risk. Rigid limitation of dividends or any increase in the

existing rate of profits tax would further stem the flow of risk capital—the life blood of new and expanding businesses.

IMPORTANCE OF INCENTIVES

I have often stressed the importance of incentives for all those engaged in industry. The company is constantly endeavouring to develop various payment-by-result and incentive schemes as widely as possible. I am glad to say that every person on the staff of the company is included, in one form or another, in our incentive schemes. The cost involved has been fully justified by the greater efforts and the better results obtained.

We have always attached great importance to sound superannuation provision for our employees. As you know, in addition to our long-standing superannuation scheme, we introduced some years ago an additional free employees' superannuation scheme, to which our employees do not make any monetary contribution. The company has already provided the sum of £260,000 for this free superannuation scheme, and the board have now decided to appropriate a further sum of £125,000. I am glad to say that the free superannuation scheme is being extended to include both our Scottish and South Wales factories, in addition to our Perivale group of factories and our sales force, and pension benefits are being increased by 10 per cent. I have always made it clear that the continuance of our contributions to this free superannuation scheme depends upon the continued prosperity of the company. Undoubtedly this provides an added incentive to our employees to make the maximum effort on behalf of our undertaking.

SPLendid TEAM WORK

The striking progress which the company is continuing to make is due to fine team work on the part of all our departments and the splendid team spirit which we have succeeded in creating. There is the same urge and drive in our engineering and design, production and administrative departments as there is in our sales and service departments. It is only because each department gives of its best that the overall results are so gratifying.

The remark is frequently made about Hoover products: "Of course they go well; they are made and sold by Hoover, Limited." Many people seem to take the success of Hoover products as a matter of course. But I should like to say this. Industrial efficiency is not a natural phenomenon; it does not grow on trees. It is the result of far-sighted planning, intense application, and sheer hard work. We cannot afford to rest on our laurels. Without sustained effort at the maximum tempo, success would rapidly wither away.

TRIBUTE TO OUR STAFF

The board and our stockholders would wish to join with me in most warmly congratulating all our employees on their fine work during the year. I should like to express to my colleagues on the board how much I appreciate their very valuable co-operation.

THE FUTURE

Provided there is no general war, I think we may look forward to the future with sober confidence. To the extent that we are required to join in the rearmament programme we will welcome the opportunity to do our part. Our wartime record is still fresh in the minds of senior Government officials and our resources are greater than ever. Even if we participate on a substantial scale in the rearmament effort, the expansion of our peacetime activities will only be temporarily delayed. We are a powerful, virile and growing undertaking. In spirit we are a youthful

organisation. Very many of our senior executives are youthful in years as well as in spirit. More than half of our sales managers, for example, are under 40. At our recent Harrogate Sales Conference the average age of our group chairmen was 30.2 years, the oldest being 33.

What is it that keeps this company in the forefront? We have grand products, but primarily our success is due to the men who constitute the company. I believe that investment in men is better than investment in bricks and mortar.

We have a united and enthusiastic team. We are determined to preserve our youthfulness of spirit and the insistent urge always to do better. This is the spirit which I have endeavoured to instil in every part of our great organisation. It is the spirit which is needed in every section of British industry at the present time.

RUGBY PORTLAND CEMENT

RECORD PRODUCTION AND EXPORTS

The speech of the chairman and managing director, Mr Halford W. L. Reddish, to the forthcoming annual general meeting of The Rugby Portland Cement Company, Limited, has been circulated with the accounts. The following is an extract:—

All our works exceeded in 1950 their previous best figures for production, and our total deliveries and our exports were again records. During 1950 our cement went to more than 60 different countries, including the U.S.A. and Canada.

This is the fifth successive year in which we have been able to put before you record results.

The trading profit of the group for 1950, including income from investments, was £464,990, which compares with £396,393 for 1949, an increase of 17 per cent. We propose that the dividend on the ordinary shares of the parent company should be raised to 20 per cent., which automatically increases the profit-sharing bonus of every full-time employee of the Company. It is interesting to note that the gross amount payable to every man in the works with over 27 years' service exceeds the average gross dividend payable to the ordinary shareholders.

We also recommend continuance of the usual payment of 5 per cent. from capital reserves, which of course by its nature is outside the field of income tax.

Of the group net profit, only 28 per cent. was derived from the manufacture and sale of cement in the home market. The balance came from other trading activities and from the export trade.

THE BURDEN OF TAXATION

It was not until September that the new kiln at our Rochester Works was completed, so that we had the benefit of the additional production for the last four months of the year only. A further kiln is now being added at the same works, and it is hoped that it may be in production before the end of 1951.

During the year we invited Mr David Gammans, M.P., to join the board. Mr Gammans will be known to many of you as a fearless fighter in the cause of free enterprise and a staunch upholder of the British Empire, of many parts of which he has an intimate knowledge. I am sure that he will be a very useful addition to our board.

I must refer again to the heavy burden of taxation. The so-called profits tax is objectionable from many points of view. It is inequitable in that it falls entirely on the ordinary shareholders who provide the risk capital for industry and who one would think should be the last to be penalised. It is capricious in its incidence in that dividends

on preference shares cause an additional liability to fall on the ordinary shareholders while interest on debentures and other loans does not. But, worst of all, it is withdrawing from industry resources which are more than ever necessary in these days of inflation to enable plant to be maintained efficiently and a business to be expanded. Like so much of this reckless socialist taxation, it must in the end react unfavourably on the volume of employment. It is in fact a disguised capital levy.

G. R. HERRON AND SON

(Wool Merchants and Topmakers, Wool Combers, Wool Scourers, Fellmongers and Leather Dressers)

SUBSTANTIALLY IMPROVED RESULTS

PHENOMENAL RISE IN WOOL PRICES

TAXATION A DETERRENT TO DEVELOPMENT AND EXPANSION

MR F. J. HILL'S STATEMENT

The forty-eighth ordinary general meeting of G. R. Herron and Son, Limited, was held on March 14th in London.

Mr F. J. Hill, the Chairman, presided. The Secretary (Mr C. C. B. Rice) read the notice convening the meeting and the auditors' report.

The following is the Chairman's Statement which had been circulated with the report and accounts:

The financial year of the company which ended October 31, 1950, was an exceptional one and the results as shown by the accounts will, I am sure, be looked upon as satisfactory. World affairs generally, however, are in so deplorable a state that a great deal of anxiety and uncertainty must be felt as to what the future may hold.

It is common knowledge that the price of wool has risen to its present height more rapidly than at any time in the history of the trade and at today's unprecedented values the matter of obtaining supplies and financing purchases in the raw wool markets of the world presents a very difficult problem for all concerned.

INCREASE IN ISSUED CAPITAL

In accordance with a resolution which was passed at an Extraordinary General Meeting held on July 18, 1950, the issued capital of the company was increased by the issue of 432,000 ordinary shares of 2s. each which were allotted to members in the form of a scrip bonus and, as will be seen from the balance-sheet, the issued ordinary share capital is now £151,200. This, together with the preference share capital of £150,000, makes a total of £301,200.

ACCOUNTS

The net profit for the year after allowing for all items of expenditure as shown in the accounts, but before providing for taxation, is £377,327, compared with £194,867 for the preceding year. This, together with the amount brought in from the year ended October 31, 1949—namely £22,059—and taxation recoveries and provisions not required £1,183, amounts to £400,569, out of which provision for profits tax and income-tax requires £194,230, leaving available the sum of £206,339.

Your board recommend that a final dividend of 9 per cent. be paid on the increased ordinary issued capital and this, together with the interim dividend of 6 per cent. paid on October 31, 1950 (making 15 per cent. for the year), and the dividend paid on the preference shares, absorbs £16,599 after deduction of tax. General reserve is increased by transferring to it £169,930 and this now stands at £300,000, leaving £19,810 to be

Income tax and profits tax do not tell the full story. Local and indirect taxes are an increasing burden on industry today. In 1950 our total of such taxes was nearly £45,000, against about £28,000 in 1949. Thus all forms of taxation together took no less than 61 per cent. of our net profits.

Copies of the full speech can be obtained from the Secretary of the Company at Crown House, Rugby.

carried forward. Having regard to the very high price of wool, the reserve of £300,000 is no more than your board thinks may be adequate to provide for the contingency of any severe fall in the market. Provident fear is the mother of safety and I feel sure that shareholders will appreciate the necessity for strengthening the financial position of the company while there is the opportunity to do so.

Stocks at £1,370,017 show a very considerable increase, compared with the previous year, and this is attributable partly to the increased turnover we are doing and partly, of course, to the very much higher value of wool. I might mention that all the wool stock represented by the amount shown in the balance sheet has since been sold and replaced by fresh supplies. It is our policy to keep the unsold position at the very lowest possible.

PROFITS ESSENTIAL TO PRESERVATION OF BUSINESS

The profits earned during the year have in no way been achieved through speculative dealing, and are largely the outcome of increased turnover obtained by normal trading methods. We have the advantage of being able to process the bulk of the wool we purchase in our own mills which, as referred to in my statement last year, have been and are still being improved and modernised by re-equipment and replacement of old machinery. This has, to no small extent, assisted in the increased profit shown by the accounts, but we have also, of course, had the wind behind us in the shape of an almost continued rise in prices throughout the year.

Nowadays when a trading concern succeeds in making a large profit, the fact is often seized upon by unscrupulous persons for propaganda purposes with a view to sowing discontent and dissension among those who are not sufficiently informed as to how such profits are utilised.

At the present time, perhaps more so than ever before, profits are essential to the preservation of any business and there must be many people who do not appreciate that in the great majority of cases a very small percentage indeed of what is earned goes into the pockets of the proprietors or shareholders. In our own case, while it is true that a substantial profit is shown to have been made, the bulk of this, after suffering heavy taxation, has had to be applied in many ways entirely for the advantage of the business as a whole. Not least is assisting to provide the money required for purchasing replacements of stocks of wool in what has been an almost continuously advancing market since the beginning of last year. Indeed I might say that without the assistance of the profits we

have earned, we should, at today's fabulous prices, have found it extremely difficult to finance the requirements necessary to keep our mills supplied with raw material and our workpeople fully employed.

TOP MAKING

The total weight of Tops sold during the financial year under review increased by 24 per cent. compared with the previous year, and a comparison of direct export sales for the same period shows an increase of 74 per cent. During the year covered by the accounts, Merino Top prices show an advance of 122 per cent. and low Crossbreds have advanced by no less than 208 per cent. As these price increases took place mainly in the last four months of our financial year, the effect is only, to a minor degree, reflected in the year's profits and such benefit as may accrue therefrom should be evident in the current year's results. Since the close of our financial year at the end of October, there has been a further phenomenal rise in wool prices, and so far as can be seen at the moment the peak has not even yet been reached.

WALKER, HOLDSWORTH AND COMPANY, LIMITED

Reorganisation necessary to modernise the mill continued throughout the year, but completion of this work was considerably hindered through delay in obtaining the requisite certificate from the Ministry of Works in respect of alterations to the building. Eventually the permit was granted and plans for making a first-class sorting room have been carried out. Rearrangement of the plant has now practically been completed and output of Tops is steadily increasing.

CENTRAL MILLS, BRADFORD

Output from these mills continues to increase as improvements and replacement of machinery proceed. The year under review, I am glad to say, has been particularly free from any mechanical breakdown or interference in production of Tops.

CURRENT FINANCIAL YEAR

No one in these times can be expected to give any reasonable forecast of events. Our lives and our business are planned for us to a greater extent than ever in the past and the natural laws of normal supply and demand have in many ways become distorted by the state of affairs that prevails today. I can say, however, that the first period of trading since October 31, 1950, leads me to hope that unless there is some severe deterioration in the present position, we can look forward to results which will at least be no less satisfactory than those presented to you in last year's accounts. There is the promise of still heavier taxation which will accentuate the serious effect that the present high rate has had on the resiliency of all trading concerns. The necessity to find the cash for this purpose puts a grievous burden on the back of industry and is a direct deterrent to development and expansion.

As a result of the greatly increased cost of wool, much more money is needed from time to time to provide temporary finance in respect of wool purchases. It has therefore become necessary to increase our borrowing powers, and a resolution to this effect will be proposed at an extraordinary general meeting to be held immediately following the annual general meeting.

I am pleased once again to say that the company has continued to receive loyal and highly efficient service from its department managers, clerical and technical staff and from the whole body of operatives in the mill.

The report and accounts were adopted and the other formal business duly transacted. At a subsequent Extraordinary General Meeting a resolution was passed increasing the board's borrowing powers.

SCOTTISH EQUITABLE LIFE ASSURANCE SOCIETY

STEADY NEW BUSINESS PROGRESS

SIR EWAN MACPHERSON-GRANT'S REVIEW

The annual general meeting of the Scottish Equitable Life Assurance Society was held on March 15th in Edinburgh.

The Right Honourable The Earl of Stair, K.T., D.S.O., presided, and called upon Sir Ewan G. Macpherson-Grant of Ballindalloch, Bart., Chairman of the Board of Directors, to submit the report and balance sheet.

Sir Ewan Macpherson-Grant, after referring with deep regret to the great loss which the Society had sustained by the death of Sir Charles Fergusson, who had been a distinguished member of the board for 20 years, said:—

I think, in submitting the report and accounts, that I cannot make a better start than by drawing your attention to the first figure which appears in the report. That is the total of the premiums paid to the Society in the year. The figure exceeds for the first time £1,000,000. This, I think you will agree, constitutes a landmark in the Society's progress.

RECORD NEW BUSINESS

Steady progress continues so far as new business is concerned and for the fifth consecutive year a record has been achieved in net new sums assured, viz., £3,403,000, as shown in the report in your hands.

There has been paid away in claims during the year £880,000. As the revenue account shows, the endowment assurance claims are practically the same in amount as in 1949, while the claims by death are up by some £80,000. Your chairman last year drew attention to the very favourable mortality experience of the Society over a period of years and to the outstandingly good results of 1949. During 1950, we experienced a swing in the opposite direction, producing one of those exceptional periods which we must expect from time to time. On the other hand, you will see that our net interest income on the Life Assurance Fund has increased from £457,000 to £489,000; this is due in part to an increase in the funds over the year and in part to the fact that a higher average rate of interest was earned on our investments. I think that the increase in the rate earned is most satisfactory. Comparing with the year 1949, the figures are as follows:—

	1949	1950	Increase
Effective Gross Rate	£4 14 1%	£4 18 7%	4/6%
Effective Net Rate	£3 10 9%	£3 13 4%	2/7%

Expenses of management show an increase of only about 2 per cent. over the previous year which, in the light of mounting costs in all directions, must be regarded as exceptionally favourable.

I have referred to mortality experience, interest earnings and expenses which in a life office are three of the principal items of consideration in bonus earnings. Actuarial calculations made since the end of the year which take these matters and all other relevant factors into account show that the rate of profit earned in the first two years of the quinquennium, which was not unsatisfactory, was increased in 1950.

BALANCE SHEET

There is nothing calling for special comment in the comparison of the balance sheet

figures with those of the previous year—the substantial alterations in British Government Securities and British Government Guaranteed Securities indicating merely exchanges from one class of Government obligation to another. Your Chairman last year referred to the downward trend of stock exchange prices during 1949 in spite of which, however, there was a substantial excess of market values over the balance sheet figures at December 31, 1949. I am pleased to say that this desirable margin was materially increased during 1950.

TEMPERANCE PERMANENT BUILDING SOCIETY

MR CYRIL W. BLACK ON THE YEAR'S PROGRESS

The ninety-seventh annual general meeting of the Temperance Permanent Building Society was held on March 8th at Caxton Hall, London.

Mr Cyril W. Black, J.P., M.P., F.R.I.C.S., the chairman, in the course of his speech, said: The operations of the Society during 1950 may be considered very satisfactory when regard is paid to the many difficulties to which we have been subjected during the period. Modest expansion has characterised the activities of the Society, but in the main it has been a year of consolidation.

INCREASE IN ASSETS AND MORTGAGES

The total assets at December 31st last amounted to the record figure of £25,911,800, an increase of £1,540,228. The amount standing to the credit of shareholders and depositors increased by £1,419,731 to a total of £24,137,763.

The development of our business makes it possible for us to continue to receive investments in either shares or deposits. The present rates of interest are 2½ per cent. on shares and 1½ per cent. on deposits, in each instance tax being paid by the Society. Moreover, the Society is prepared to accept moneys from trustees in cases where the terms of the trusts permit. Our shares and deposits afford a medium of investment which compares very favourably with others generally considered suitable for trust funds. They have the very great advantage of involving no expense either on investment or on withdrawal; they can be realised at short notice and without fear or possibility of depreciation; the rates of interest are generous and the security afforded unsurpassed.

The Society now has behind it nearly a century of satisfactory business, and we are proud to be able to claim that during the whole of this period no one has ever lost a single penny as a result of investing in the Society.

The total amount advanced on mortgage during the year was £5,313,975, approximately 80 per cent. of the amount advanced being secured on properties where the advance did not exceed £2,000.

Of the total amount outstanding on mortgages, £22,836,417, it is a notable fact that less than £550,000 was outstanding in respect of mortgages where the debt exceeded £5,000. The average amount outstanding on the mortgages of the Society was, in fact, only about £890.

In this period of high property values, with the resulting risk of depreciation, your directors have subjected all mortgage applications to the most careful scrutiny, and have thought it wise and prudent to continue the policy of only accepting mortgage business with which they have been thoroughly satisfied. An indication of the rigorous character of the scrutiny applied to mortgage applications may be obtained from the fact that the

Since our last annual meeting the directors have made two executive appointments, in both cases by promotion of members of our own staff. Mr Robert Smith, Secretary of our Manchester Branch, has been appointed Pensions Supervisor, and Mr Angus McDonald, M.A., F.F.A., has been appointed an Executive Assistant at Head Office. We wish both these gentlemen all success in their new activities.

The adoption of the report and accounts was carried unanimously.

total amount for which mortgage applications were received during the year was approximately £8,000,000, whereas the total amount actually advanced on mortgage represents less than two-thirds of this total.

RESERVES, LIQUIDITY AND TAXATION

The board has always attached the greatest possible importance to the strengthening of the reserves of the Society and, during the year under review, appropriations of £85,000 to general reserve account and £10,284 to contingency account have been made, raising these reserves to the impressive totals of £1,200,000 and £260,000 respectively. The total amount in cash and investments at the end of the year was nearly three million pounds, a figure that may be regarded as representing a satisfactory degree of liquidity for an institution of our character and size.

I feel compelled to refer again to the crippling burden of the taxation to which we, in common with other building societies, are subjected. The total payable in respect of income-tax and profits tax during the year amounted to very nearly £300,000, the highest figure we have ever had to bear. The balance of profit available for making additions to our reserves has only been secured as a result of the most careful examination by your directors of the various items comprised in management expenses.

I am very glad to pay my tribute again to the splendid work done during the year by our managing director, Mr Ronald Bell, his executive colleagues, and the members of the staff. During yet another year they have been unsparing in their efforts to promote the interests of the Society and the satisfactory position now reported is due in large measure to their faithful and enthusiastic labours.

POST-WAR REVIEW

Information regarding the expansion of our operations during the post-war period will no doubt be of interest. For this purpose I propose to make some comparisons between the position at December 31, 1945, and the position at December 31, 1950. The following figures and statistics bear eloquent testimony to the progress made.

	Dec. 31, 1945	Dec. 31, 1950
Total assets	£11,881,068	£25,911,800
Mortgage asset — Greater London area (estimated percentage)	68%	44%
Mortgage asset — Other areas (estimated percentage)	32%	56%
No. of mortgages	15,335	25,580
No. of investors	17,191	27,338
No. of borrowers	13,909	25,052
Aggregate reserves	£1,141,430	£1,476,040
Investments and cash	£1,462,483	£2,946,583

I would particularly draw attention to the much greater spread of our mortgages throughout the United Kingdom, a factor which is further emphasised when we recall that in 1939, 99 per cent. of our mortgage asset was secured on properties in the Greater London area. This is a matter to which your directors attach very considerable importance and amply justifies the decisions taken by the board in 1943 and 1944 to open branch offices in the main provincial cities throughout the kingdom. The effective result is that our mortgages are spread over very wide and diverse areas, both rural and urban, and that any local adverse factors which might at some future date exercise a depressing effect on property values in any particular area would only have a strictly limited effect on our business.

GOVERNMENT HOUSING POLICY

In conclusion you may perhaps expect me to say a little regarding current business and future prospects. In common with most other business enterprises, the operations of our Society are subject today to the influence of political circumstances to an unprecedented degree. Governments since the war have pursued a policy which has resulted in the discouragement of home ownership.

The rigid controls exercised by the Government upon local authorities and the building industry have resulted in a great retarding of house building. Although there are approximately the same number of men employed in the building industry today as before the war, the policy of rigid controls has resulted in only about 500 houses per day being completed compared with about 1,000 houses per day before the war. It has never been the view of building societies that the local authorities should not play their part of the solution of the housing problem. Indeed, they have a part to play which is essential if all sections of the public are to be satisfactorily housed, but undue emphasis upon local authority housing to the detriment of houses built for sale has resulted in the community undertaking vast obligations for subsidies which will continue over a period of 60 years.

The inter-war years, whatever criticism may be made of them, constituted a period of progress in slum clearance and housing development unparalleled before or since, and the Government would do well to pay regard to the experience of this period. I place on record my conviction that until the building industry is given a far greater measure of freedom than it enjoys at the present time, house building will not achieve a satisfactory tempo. When, however, the building industry is liberated from the many unreasonable restrictions to which it is at present subjected, it will again, in partnership with the building societies, enable rapid progress to be made towards the bringing into being of a well-housed nation. The instinct for home ownership is deep-seated and strongly persists, notwithstanding the political discouragements to which it is subjected. Because the Building Society Movement ministers to this instinct, I have every confidence in its future, and particularly in the future of our great Society, over whose destinies I count it an honour to preside. I know you will all continue to render us the invaluable service of making widely known our facilities both for home purchase loans and for investments, so that we can go forward into the future, confident of our ability to make a worth-while contribution to the times in which we live.

The report and statement of accounts were adopted.

HARRODS LIMITED

SATISFACTORY RESULTS

SIR RICHARD BURBIDGE'S REVIEW

The annual general meeting of Harrods Limited, will be held on April 2nd, on the company's premises, Brompton Road, London, S.W.1.

The following are extracts from the statement of the chairman, Sir Richard Burbidge, Bart., C.B.E., circulated with the report and accounts for the year ended January 31, 1951.

TRADING RESULTS

After provision for taxation the amount of profit to be dealt with by Harrods Limited, including net dividends from the subsidiaries, is £551,281; an increase of £57,944 on last year. This enables the directors to increase the appropriations to buildings reserve and contingencies reserve by £55,968 to £130,968 and to recommend the payment of a final dividend of 10 per cent. and a bonus of 5 per cent. on the ordinary stock making for the fifth successive year a total dividend of 20 per cent. less income tax for the year. The balance of profit to be carried forward to next year is increased by £11,642 to £322,276.

During the first six months of the year trading conditions were disappointing and a slight increase in turnover was more than off-set by increased expenses, so that during that period the net profit of all your companies was less than for the first six months of the previous year.

In the second half of the year, however, turnover increased substantially, firstly because of more seasonable weather in the autumn, and secondly because of rising prices and fear of shortages. The final result was that the net profit (before taxation) of the group for the year increased by £70,335 to £1,526,963.

Partly due to the higher rate of profits tax, provision for taxation absorbs nearly the whole of the increased profit, as £66,424 more than last year is required. Consequently after allowing for the dividends to the preference shareholders of the subsidiaries, the net profit after taxation is £635,685, or £3,911 more than last year. The subsidiary companies have retained £84,404 of this profit as additions to their reserves, £54,033 less than last year. In the past we have left a very large proportion of their profits in the subsidiaries with a view to building up their internal position, but in my recent statements to you I have indicated that Harrods could expect to receive, as they have now done, a larger proportion of the profits of the older subsidiaries. The amount retained is still substantial and quite sufficient for their purposes.

The only other item in the consolidated profit and loss account to which I need refer is that of £4,270,505 under the heading expenditure and charges. This amount is £392,212 more than last year and this continuing rise in expenses is our chief problem today. Much of this increase in expenditure is unavoidable, but I can assure you, every item is watched carefully. Salaries, wages and pensions amount to £2,666,032, an increase of £271,502 over last year. As this follows an increase of £275,734 in the previous year, staff expenditure has increased by over 25 per cent. in two years. I should explain perhaps that in addition to wages this item includes expenditure on staff welfare, such as sick pay, sports clubs and pensions.

The amount charged for pensions and pension funds is £181,640, and includes a special amount of £47,509 which has been provided to increase certain lower pensions, mostly granted before the war. I am sure stockholders will approve our action in doing something to help these old employees of ours.

In addition to the amount charged against the profit and loss account, an amount of

£13,100 has been provided from the reserves of Wm. Henderson and Sons Limited to enable the staff of that company to join the Harrods Limited staff pension fund, while £35,773 has been charged against the non-contributory pension account chiefly to pay pensions to staff who were not members of the contributory funds.

BALANCE SHEETS

The only item to which I need refer in the balance sheet of Harrods Limited, is revenue reserves which have increased by £210,610 to £1,995,125. Replacement of assets reserves is £63,000 more than last year and includes a payment of £41,516 received in respect of war damage to fixtures and plant.

CONSOLIDATED BALANCE SHEET

The revenue reserves at £2,679,482 are £310,012 more than last year and together with the capital reserve and the future income tax account total £4,495,514, which is more than double the issued ordinary stock of Harrods Limited. The revenue reserves have increased by £555,867 in the last two years and have helped to provide the extra money necessary to finance the increases in stocks including purchase tax, debtors and the re-equipping of the businesses.

I do not think there is any other item on the liabilities side of the balance sheet that calls for attention. On the assets side there have been net additions to the fixtures, plant and rolling stock amounting to £250,153, which after the writings off leaves a total of £459,309 to cover the fixtures, etc., of all the businesses. Stocks in trade at £3,036,585 are only slightly more than last year and represent merchandise at good value, in many cases at prices far below replacement levels.

Bank balances and tax reserve certificates are £201,222 less than last year, but current assets as a whole are £152,352 more than last year and are nearly £3,000,000 in excess of current liabilities which are £79,397 less than last year.

PROSPECTS

After reviewing the satisfactory progress of the company's various businesses, the statement continues:—

That concludes my remarks on the past year's trading. You are all well aware of present conditions and you will readily realise that it is impossible for me to make any forecast as to the future. We are warned that we must expect that the supply of consumer goods to the shops will be restricted. There is also no doubt that at present price levels goods are harder to sell, and that many prices will continue to rise. On the other hand, it is to be remembered that when customers are buying less freely they tend to buy more carefully and to buy where they will get real value for money and good service. It is on that foundation that the goodwill of your businesses has been built up and I feel confident that this will now stand us in good stead. Moreover, this is the Festival of Britain year and it is expected that a large number of visitors from the provinces and abroad will be attracted to London for the Festival. Following the success of Harrods centenary and our effort to attract overseas visitors, I feel sure that a large proportion of the Festival visitors will shop in our stores.

Whether the favourable trading factors will counterbalance the unfavourable ones remains to be seen. I can only assure you that everybody will do their best to maintain and forward the interests of your businesses.

JUTE INDUSTRIES LIMITED

IMPROVED TRADING RESULTS

INCREASED VOLUME OF PRODUCTION AND TURNOVER

DIFFICULTIES FACING THE INDUSTRY

MR W. G. N. WALKER'S STATEMENT

The thirtieth annual general meeting of Jute Industries Limited was held on March 12th in the board room of the Association of Jute Spinners and Manufacturers, 5, Cowgate, Dundee, Mr W. G. N. Walker (chairman and managing director) presiding.

The secretary (Mr W. A. Jeffray, C.A.) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended September 30, 1950:—

Your directors received with profound regret and sorrow the intimation of the death of their much esteemed colleague, James Ernest Cox, which occurred on July 17, 1950, and desire to place on record their appreciation of his services to the company over the past thirty years. Mr Cox was chairman of Cox Brothers Limited, and, when that company in 1920 was merged in Jute Industries Limited, he joined your board and was elected chairman, a position which he held until April, 1948.

His wide experience and outstanding ability as chairman proved to be of great value in steering the company through difficult times. It was most gratifying to his colleagues that, after his resignation as chairman, he intimated his willingness to retain a seat on the board. His courage and fortitude in overcoming his loss of eyesight from the spring of 1948 until his death, inspired us all, and we miss a loyal and much valued friend.

Mr W. G. Greenfield, who had been secretary of the company since 1927, retired on March 31, 1950; I would like on behalf of the board to pay tribute to Mr Greenfield's valued and unsparing service during that period. We have appointed Mr W. A. Jeffray, C.A., as secretary in his place.

Last year a statement was circulated with the accounts dealing mainly with the financial part of my survey; a supplementary statement was made by me at the annual general meeting and thereafter circulated to stockholders. This course was adopted because the Jute Industry at that time was going through a critical period and it was difficult so far in advance of the meeting to give a reasoned forecast of future trading. I propose to adopt the same procedure on this occasion.

SATISFACTORY RESULTS

The group trading profit exceeds last year's figure by £163,700, and will, I feel sure, be considered a satisfactory result. This year's figure is considerably higher than your directors anticipated early in the year's trading. It has been achieved mainly by an increase in both volume of production and turnover, and has fully justified the large capital outlays on modernisation which your directors have incurred over the past few years. Your directors consider that these capital outlays combined with our present organisation have, subject to reasonable trading conditions, gone a long way towards

placing the company on a sound profit earning basis.

BALANCE SHEET ITEMS

The consolidated and parent company's balance sheets have, with the exception of the creation of a general reserve, been prepared on similar lines to last year. A provision of £50,000 has again been made for depreciation of buildings; the depreciation provision for plant and machinery has been raised by £10,000 to £90,000 by reason of the large sums expended on capital additions. The tax equalisation reserve, which was created last year to spread the tax relief on initial allowances over future years and thus more nearly relate the charge for taxation each year to the profits of that year, has been increased from £25,000 to £90,500. In arriving at this figure £2,500, a proportion of the reserve created last year, has been written back into the accounts under review.

The parent company's stock valuation as at September 30, 1950, is £432,581 up on the previous year due to higher prices of raw materials and increased activity. This stock is largely covered by Board of Trade cover schemes, but your directors have considered it necessary to transfer from the profit and loss account an amount of £150,000, making the total of the stock reserve in the balance sheet £250,000. The reserves which stood in last year's balance sheet under the headings of reconstruction of buildings and modernisation of plant (£490,000) and contingencies (£65,000) have been transferred to a new general reserve to which £125,000 has also been transferred from the profit and loss account, making a total of £680,000 under the new general heading. The cessation of the reconstruction reserve does not imply that the directors have decided to abandon their policy of progressive modernisation, but merely that the expenditure against which these provisions were originally made has now been incurred and your directors would prefer in these uncertain times to see a general unspecified reserve rather than one definitely prescribed for a specific purpose.

DIVIDEND PROPOSAL

In view of the improved trading results attained, and in spite of the continuing and increasing necessity to strengthen the financial position of the company, your directors feel justified in recommending the payment of a dividend of 10 per cent. on the ordinary stock, carrying with it, in accordance with the articles of association, a dividend of 12 per cent. on the 8 per cent. non-cumulative participating preference stock.

BACKGROUND TO CLOTH SHORTAGE

Addressing the meeting the chairman said with your permission I will take the accounts and the statement which was circulated with them as read.

The United Kingdom is face to face with a nation-wide packaging crisis; jute cloth and bags are therefore of vital importance. I wish, therefore, to give an outline of the causes of the present cloth shortage because I think it only right that our stockholders and

customers should understand the background to our present difficulties. Why is it that this country, which prewar had the largest jute manufacturing industry outside India, finds itself today in a position of acute shortage of jute goods? It is because the supply of Indian manufactured goods, upon which Government policy over the past thirty years has made us more and more dependent, has failed us.

This was the only country in the world in prewar years which did not protect its jute industry against the importation of goods manufactured by cheap Indian labour, consequently the home industry from the early part of this century had to give way to Indian manufactured goods for most of the standard cloth and bag uses. Large-scale unemployment in the manufacturing area of Dundee and district resulted.

LABOUR A REAL ISSUE

When war came in 1939 no labour priority was given to the United Kingdom jute industry. Its younger members of both sexes went off to the Services, or to armament industries and, after two concentrations, production fell to about 50 per cent. of prewar. Approximately two-thirds of the essential requirements of cloth and bags for the home market were then met by Indian imported goods and one-third by Dundee manufactured goods. In 1945 Dundee had been scheduled as a development area and new industries were brought in at a time when the jute industry was faced with rebuilding its labour force; Dundee now has a wide diversification of industry and labour shortage is a real issue.

WIDE RANGE OF INDUSTRIES DEPENDENT ON JUTE

Three years ago the Jute Working Party report drew attention to the danger of allowing a wide range of industries to become more and more dependent on Indian manufactured goods. Certain assurances were given in 1948 by the President of the Board of Trade, but so far, H.M. Government, like its predecessors in office, has left this wide range of industries dependent on the importation of manufactured cloth. In September, 1949, currency devaluation caused friction between India and Pakistan and supplies of imported cloth from India began to decline. Today this country is receiving very reduced quantities of cloth from India, and the Jute Control are obliged to purchase at very high prices what surplus continental production they are offered. The home industry operating at only two-thirds of its prewar production level has become the last line of defence, and supplies of cloth and bags in no way meet the essential demands of the country. The home manufacturers have been directed to make the types of cloth formerly imported and which are vitally necessary amongst other things for the packaging requirements of the agricultural and food industries of this country. The result is that industries, such as linoleums, have had their supplies, which they have traditionally drawn from Dundee, reduced to an embarrassing extent. In contrast, the protected jute manufacturing industries of other countries are not only able to look after their own domestic requirements, but also to enter new markets and to export their surplus jute goods at prices far above today's Dundee level.

HOME INDUSTRY BUSY

The home producing industry is extremely busy, but it is being steered away from its traditional markets and forced to make the very types of cloth which it had lost to India through lack of protection in the interwar years. It is being forced to do this without any guarantee that these markets will be

available to it in the future. You will readily see why your directors, while perhaps being satisfied as to the immediate demand for the products of the Dundee industry, are apprehensive regarding the long term outlook.

We have, of course, a large numbers of customers in various trades who are in no way affected by the remarks which I have already made. To these we shall continue to give service to the best of our ability, although in the national interest they may yet find our products directed away from them. If this does happen it will be through no want of endeavour on our part, but from sheer necessity.

EXPORTS RESTRICTED

The reduction in supplies to traditional consuming industries applies not only to the home market, but also to exports. Your company has large demands, from the United States of America and other countries, which it has been prevented from fulfilling because the volume of cloth available is insufficient to meet the home demands of industries which require jute goods of all types as one of their basic materials. At today's price levels based on prewar volume of exports your company could, if the supply and licensing position permitted, earn an additional \$2,000,000 per annum in the United States of America and Canada.

DEFENCE—HIGH PRIORITY INDUSTRY

I have so far made no reference to defence. The supply position is quite serious enough without superimposing additional defence requirements upon it. No other conclusion can be drawn than that the home producing jute industry has become one of the highest priority and that no action should be taken which would in any way reduce the labour available to it.

INDIA-PAKISTAN AGREEMENT

The preliminary details of the India-Pakistan Trade Agreement have been so widely publicised within the past fortnight that there is no need for me to elaborate on what has already been stated. It is difficult at this stage to prophesy what effect this welcome and commonsense conclusion to seventeen months of inter-Dominion wrangling will have on our raw jute supplies, or on consumers of jute goods in this country—the effects, whatever they may be, will not be immediate and should have little influence on either the trading profits of your company during the current year, or on supplies for the United Kingdom consuming industries for some months to come.

ASSURANCES REQUIRED

The merchanting part of our business, which deals in Indian imported goods, has already suffered a severe blow at the hands of India, who has let down the United Kingdom, her second largest customer; the longer India leaves this country without jute goods the more harm she is going to do to herself. The inter-Dominion dispute has done irreparable damage to the future of jute as a packaging material. India cannot expect to use the United Kingdom as a market for the surplus production which she cannot sell elsewhere. A large quantity of imported goods will always be required, but surely in the national interest the time has come when our Government, having, I hope, learnt a lesson, should give the home producing industry an assurance that manufactured goods will only be imported as a balancing factor to cover the demands which cannot be met by the home producing industry rather than home production being a balancing factor to cover the demands not met by imported goods.

PAKISTAN RAW JUTE EXPORTS—U.K.'S SHARE DISAPPOINTING

This time last year I told you that the port of Chittagong was Pakistan's only outlet for her raw jute exports. The position today is different; the advent of the new anchorage at Chalna has greatly increased Pakistan's potential export of raw jute. Apart from freight, Pakistan is now finding no difficulty in disposing of her raw jute crop. Her export performance for the past few months through Chittagong, Chalna, and Calcutta in bond has been most impressive; the United Kingdom share, however, has been disappointing. Pakistan should be encouraged to look upon the United Kingdom as an expanding market for raw jute.

MODERNISATION AND RE-EQUIPMENT

I referred two years ago to your directors' postwar programme for the re-equipping of three of our mills with sliver spinning machinery. Two of these have been working to capacity on double shift for some time, and the third in Manhattan Works is now operating on the basis of a full single shift; these three mills between them are producing 300 tons of yarn per week. Your directors have also decided to re-equip the factory in Manhattan Works with looms for the production of circular woven cloth. A number of these looms are now running and the bags made from this type of cloth are being well received. This factory will produce 10 million bags per annum when completed.

The modernisation and re-equipment which we have carried out on a wide scale—together with three day nurseries and improved working conditions—has enabled us to recruit our present labour force. Labour-saving machinery and re-deployment have increased production per man hour substantially with a consequent increase in wage earnings. It must be realised, however, that this process of evolution takes time, covering as it does over 4,000 employees in Dundee working in 2,500,000 square feet of manufacturing premises. We have found the advice of industrial consultants of great assistance and the trade unions sympathetic to the schemes which we have already put into operation.

The industry has shown that it has enterprise and initiative and now has a sound basis on which to expand. Expansion on mass production lines, coupled with modernisation, could increase materially the productivity of the industry without a very large increase in the labour force. This expansion can only be carried out if we have a background of standard goods with which to fit in the wide variations of counts of yarn and types and widths of cloth that are a *sine qua non* of a textile industry. We must know our future markets before we can specify machinery—particularly looms—for installation in Dundee or elsewhere.

Your directors have continued to diversify the activities of the company and have recently taken up a proportion of the issued capital of a company manufacturing multi-wall paper sacks. This venture will enable us to meet in a small way the demands of some of our customers who have turned to the use of paper sacks for certain purposes. It is, however, a minor undertaking and must not be looked upon as one which will have a material effect on our future trading profits.

CURRENT YEAR'S PROSPECTS

In spite of the various repercussions that rapidly increasing price levels may have upon our trading, I am hopeful that we shall again be able to place satisfactory accounts before you next year.

Finally, I would like to express my real appreciation to all executives, management, staff and employees, at home and overseas,

for the wholehearted way in which they have worked together over the past year. I want to pay tribute not only to their individual efforts, which have been beyond praise, but even more particularly to the keenness and enthusiasm with which they have tackled the many difficulties continuously arising; this team spirit, a characteristic of your company, is also one of its greatest assets.

The report and accounts were adopted; a dividend on the ordinary stock of 10 per cent., less income tax, was approved.

The retiring directors, Mr Robert S. Walker and Mr James Strachan, were re-elected and the remuneration of the auditors, Messrs Dewar and Robertson, C.A., Edinburgh, having been fixed, the proceedings terminated.

BIRMINGHAM AND DISTRICT INVESTMENT TRUST

DIVIDEND RAISED TO 15 PER CENT.

The sixty-seventh annual general meeting of the Birmingham and District Investment Trust Limited was held on March 13th in London.

Mr H. C. Drayton, chairman and managing director, in the course of his speech, said: Our revenue for the year under review totals £556,155, as against a gross revenue last year of £596,000. It is interesting to take our profit and loss account and see how that income has varied. We have received approximately the same amount in interest from our associated companies; our general investments at £198,000 show a £20,000 increase and our interest on deposits has gone up by £2,000.

Traffic receipts are £1,200 against £67,000 last year and that decrease, less the increase in our general investments, is the explanation of the difference in our gross revenue this year. Last year I told you that our traffic receipts would cease last December. It is therefore no surprise to you to see such a decrease.

When we deduct our expenses and our taxation, which amount to no less than £249,500, and the debenture stock interest, there is a balance available for distribution to the Preference and Ordinary stockholders of £266,000. Before dealing with that sum, there is one other item to which I should like to draw your attention and that is that owing to the cessation of our interest in traffic receipts the reserve for future taxation no longer required, amounts to £77,000. We have brought that into the profit and loss account as a credit, but we are transferring it together with another £100 to general reserve, making the latter £300,000 as against £220,000.

After paying 15 per cent. on the Ordinary stock, compared with 12 per cent. last year, there will be a balance of £145,000 to be added to the undivided profits account as against £200,000 last year.

TAXATION AND OMNIBUS FARES

Stockholders are aware that our holding in associated companies is made up largely of a holding in the Birmingham and Midland Motor Omnibus Co. That company for a great number of years had the proud boast that in spite of increased wages and costs they had been able to keep their charges at the same prewar rate. Last April we had taxation placed upon us of an additional 9d. a gallon on petrol, and it has been very difficult for us, working in the business, to see why that was imposed as the omnibus is the working man's motor-car.

We hoped in our companies that we could absorb the greater part of that 9d. a gallon

but, when we had an increase in wages put upon us in January, we found that we should have either to apply for increased fares or else that our profit would be considerably reduced. I do just sound a note of warning that the results of that particular company may tend to fluctuate and not be as steady as they have been in the past.

We are faced this year with unknown quantities by reason of the taxation which

is likely to arise in the Budget. One would feel happy in facing any increase in taxation which is laid upon the country by the Government if there was a feeling that the taxation would be levied only in the interests of the nation and in a manner which would hurt the nation least, whereas it is likely that political considerations will play a larger part in the imposition of taxation.

The report was adopted.

THE MONOTYPE CORPORATION LIMITED

SUCCESSFUL RESULTS

INCREASED TURNOVER AND PROFITS

SIR GEOFFREY ELLIS'S STATEMENT

The forty-third annual general meeting of the Monotype Corporation Limited was held on March 13th in London, Sir Geoffrey Ellis, Bt. (chairman), presiding.

The following is the chairman's statement circulated with the accounts.

This year's accounts once again show a notable advance both in turnover and consequently profits. Our order book remains full both for home and export. The progress we have made in face of strong competition has been achieved not only by a keen selling campaign, but by the realisation of our customers, both old and new, of what "Monotype" machines and type faces are capable of producing, with wide range and ready adaptability to modern printing needs.

PROGRESS IN ALL COUNTRIES

We have kept in close touch with our friends the Lanston Monotype Machine Company of Philadelphia, and we have to thank them for their help in arranging for Mrs Beatrice Ward, one of our typographical experts, to make an extended tour of printing centres in the United States of America and Canada. As a result of that visit we are experiencing a definite increase in the demand for our special type faces. The same keen interest is being shown by Near and Far East printers who have steadily growing demands for their special scripts.

We are taking every opportunity to develop this part of our business which is the inevitable concomitant of every machine sold. With this new and increasing demand in mind we are now considering building extensions for our Matrix Department.

During the last year, together with our general manager, I paid a long and detailed visit to Holland and the Scandinavian countries. We were greatly encouraged by our reception and found keen interest in developing the possibilities of our machines. We had expected, after rehabilitation was over, to find some diminution in orders, but on the whole we are glad to report continued demand.

In Switzerland there is some halt in machine demand. This was not unexpected because of that country's unusual speed of recovery but we find the demand for, and interest in, our special type faces keener than ever. We have changed our office from Basle to Berne, where larger and more commodious offices, justified by our steadily increasing trade, indicated the need of moving. In addition the new centre is commercially more convenient.

In France we find the same keen interest in the capabilities of our machines and in the type faces used for that fine printing in which many of our French customers now excel. One of our French customers has today the

largest "Monotype" installation in Continental Europe. Thanks to some relief from the vagaries of import control our French company now enjoys a sound and steady business and moreover maintains a large and busy workshop for ancillary purposes.

In Italy trade recovery is continuing and we have many interesting inquiries.

In Spain, now that a too long delayed acknowledgment of the regime is in force, we have arranged to extend our activities.

In Germany, with our new headquarters at Frankfurt and greater freedom and closer touch with German business as a whole, we have steadily improved our position. Our sales of machines have been unexpectedly good. We have been able to make manufacturing agreements in relation to certain accessories and repairs with good friends on the spot which we believe will prove of outstanding value to the printing industry in Germany and possibly in an even wider neighbouring area. This year, for the first time, thanks to a more predictable currency basis, we include the accounts of our German company. Not only have we a profit but our goodwill has been immeasurably increased. We have every hope of further progress.

For the rest of Europe, even if our representatives are barred entry by the Iron Curtain, our machines and their accessories speak for themselves and are still ordered. Our trade there, both for machines, type faces and accessories, is satisfactory.

In Egypt, as in Switzerland, the period of recovery is over, and we are now on a normal trade basis. We continue to receive inquiries, and some orders, from Palestine and Turkey. From our separate organisations in India and Pakistan the demand remains as keen as ever, and we are doing our best to help our friends in those countries in their efforts to establish a scholarly and yet popular basis for new scripts.

In Australia economic conditions leave business somewhat difficult to arrange. In New Zealand we are doing well in a limited demand market.

DEVELOPMENTS AT SALFORDS WORKS

Turning now to our works at Salfords—compared with the prewar days we have trebled our output. To achieve this we have spent £110,000 on new building and £280,000 on new machinery and written off everything that does not correspond with modern conditions of production. In this I may instance our determination three years ago to establish an independent supply of electric power and light, and as a result today there has been no break in production. Our new offices, badly needed, are just on completion, and we have in hand plans for the erection of a new building for matrix pro-

duction and space for research. For some time we have been closely employed on the development of a photo-composing machine which in due course will be ready for commercial experiment. We have to thank certain of our printing friends for the practical help they have given us in our experiments and for the keen interest they are showing in this development. All this we have been able to do out of our own resources and we feel sure you will agree that our policy of strong reserves has been fully justified. The capital expenditure required to complete the work immediately in hand is £75,000.

THE DIVIDEND

We now feel that our shareholders are entitled to some little extra share in our success. We are therefore recommending an increase of 2½ per cent. in the dividend. The majority of our shareholders hold few shares and can justly be described as those of the nation who are savers rather than spenders, and upon whom the provision of future industrial capital largely depends. In the scramble for readjustment following inflation they have been pushed aside and forgotten and by some derided. Yet they are still being enjoined to save. There can be little inflation as a result of such increased dividend since this, in the case of savers, will rather stem the sale of meagre capital than lead to any increase of personal expenditure. The total dividend of 17½ per cent. amounts only to approximately 4½ per cent. on the true capital employed in the business.

THE FUTURE

You will be asking—what of our misadventure? At present we can see good trade ahead for several years to come, but can hardly expect growth at the tempo of the few recovery years. Everything depends now on the international political barometer. When the coming munitions storm will mean specially fine engineering works like our own is uncertain. No doubt we shall in due course be directed. All we can say is, with the experience of two wars behind us, we are ready to do our share in the insurance of peace.

CHAIRMAN'S RESIGNATION

May I end on a personal note. After nearly thirty years on our board, and for nine years in daily touch with "Monotype" production and administration, I feel I am entitled to ask the board for some relief and therefore to accept my resignation. To this they have agreed and have been kind enough to arrange that what experience I have gained will still be at their disposal. I cannot thank my colleagues too warmly for all the ungrudging support they have given me through trying and difficult days. I do not forget, nor can I forget, the strong and loyal support I have always had from Mr Silcock, our general manager, and the staff throughout works and office. I am very pleased to know that my colleagues have invited Lord Ramsden to succeed me in the chair. Lord Ramsden's standing and ability are well known and for many years he has been in close touch with our organisation.

OXFORD UNIVERSITY NUFFIELD COLLEGE

Nuffield College proposes to elect an Official Fellow who will be required to devote himself to research in Economics and invites applications from men and women, to be received not later than April 30th. The stipend will be according to age and qualifications. Further particulars may be obtained on application.

THE UNIVERSITY OF MANCHESTER

AMENDED NOTICE

Applications are invited for the post of LECTURER IN ECONOMICS. Salary scale £500 to £1,100 per annum with membership of the F.S.S.U. and Children's Allowance Scheme. Initial salary according to qualifications and experience. Applications should be sent not later than March 31, 1951, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

PETERBOROUGH JOINT EDUCATION BOARD

PETERBOROUGH TECHNICAL COLLEGE

Applications are invited for a full-time appointment in the Commerce and General Education Department of the College. Candidates should be graduates in Commerce or Economics or hold an equivalent professional qualification with teaching experience and some industrial or commercial experience.

Under the 1948 Burnham Technical Report, this post would have been that of a Senior Assistant at a salary of £700-£800; the salary scale under the new report has not yet been decided.

The appointment will date from September 1, 1951. Full details and form of application may be obtained from the undersigned (on receipt of a stamped addressed foolscap envelope) to whom completed forms should be returned within 14 days of the appearance of this advertisement.

LESLIE TAIT,

Chief Education Officer.
Education Offices, Town Hall, Peterborough.

BIBIANI (1927) LIMITED

NOTICE IS HEREBY GIVEN that the Board of Directors have today recommended a Final Dividend (No. 27) on the Issued Capital of the Company at the rate of 7.2d. per Unit of Stock, less Income Tax at 9s. in the £. This Dividend, which is in respect of the year ended September 30, 1950, to be payable on and after May 24, 1951, to all Stockholders on the Registers on March 22, 1951.

THE TRANSFER BOOKS WILL BE CLOSED from March 23, 1951, till March 31, 1951, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,

E. W. MORGAN, Secretary.
Registered Address: 10, Old Jewry, London, E.C.2.
March 13, 1951.

ASHANTI GOLDFIELDS CORPORATION LIMITED

NOTICE IS HEREBY GIVEN that the Board of Directors have today recommended a Final Dividend (No. 109) on the Issued Capital of the Corporation at the rate of 1s. 6d. per Unit of Stock less Income Tax at 9s. in the £. This Dividend, which is in respect of the year ended September 30, 1950, to be payable on and after May 24, 1951, to all Stockholders on the Registers on March 22, 1951.

THE TRANSFER BOOKS WILL BE CLOSED from March 23, 1951, till March 31, 1951, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,

E. W. MORGAN, Secretary.
Registered Address: 10, Old Jewry, London, E.C.2.
March 13, 1951.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability)—NOTICE TO SHAREHOLDERS—The Seventieth Annual General Meeting of the Shareholders of this Company, for the election of Directors to take the places of the retiring Directors and for the transaction of business generally, will be held on Wednesday, the second day of May next, at the principal office of the Company, at Montreal, at twelve o'clock noon (daylight saving time, if operative). The Ordinary Stock Transfer Books will be closed at Montreal, Toronto, New York and London at 3 p.m. on Tuesday, the tenth day of April, 1951. The Preference Stock Books will be closed in London at the same time. All books will be re-opened on Thursday, the third day of May, 1951. By order of the Board, F. BRANLEY, Secretary. Montreal, March 12, 1951.

Poll and Parliament

THAT its moral and political authority is decaying does not prevent a modern government from having several trumps to play in a struggle turning on parliamentary procedure. The methods will have, indeed, to be rather more subtle than the one tried this week—the decision by the President of the Board of Trade to hold up increases in controlled prices because they provide Orders for the Conservatives to oppose in the early hours of the morning. This is simply a confession that the Government cannot govern. No one doubts that the new Orders are necessary to the execution of the Government's chosen policy of price control. By withholding them, Mr Wilson is abdicating his administrative responsibility for the sake of party calculations that should be quite unconnected with the work of the Board of Trade. If Mr Wilson were to stick to his position, the production of utility goods, on which the Government stakes so much, would be gravely disorganised.

On this point the Opposition can afford to hold out longer than the Government. In refusing on Tuesday to discuss procedure with Mr Chuter Ede until Mr Wilson's "threats" were withdrawn, Mr Churchill was taking his stand on perfectly good ground. Indeed, it can hardly be supposed that the Cabinet as a whole ever seriously considered the implications of Mr Wilson's action. Not only is the case bad, but it is also too paradoxical to be presented with any conviction. A more eloquent man than Mr Wilson would be needed to persuade people that it is the Conservatives who are attacking the country's traders by opposing Orders whose purpose is to control their prices.

A skilled Parliamentarian like Mr Chuter Ede, however, can probably find more effective means of defence against the Conservative decision to conduct total war in the House of Commons. Neither side can gain anything from a prolonged struggle of the kind that refusal to compromise would make inescapable, and it must be hoped that something will come of the discussions that Mr Ede suggested on Monday. What is to be proposed is, presumably, that time for the discussion of Orders should be provided earlier in the day; in principle, the Opposition can hardly refuse to accept some change. No one can wish Parliament to remain as undignified and ill-mannered as it has been in the past two weeks. But dignity is not everything, and it will be sensibly restored only if the deeper issues are first frankly faced by both sides. There are no grounds for the moral indignation that the new Conservative tactics of full opposition have provoked. Naturally Labour dislikes being harried. And it is not surprising that prominent Liberals should lavish scorn on the Tory policy. In this matter the Liberals are not independent: they have even stronger reasons for not wanting to fight a general election yet than has the Labour party. But these are matters of party advantage, not of the public interest. It may be questioned whether the Tory tactics are well-judged, whether they will in fact serve their

purpose; but that is very different from condemning them as an affront to democracy.

It is, after all, Mr Attlee who has decided to stay in office in spite of all the evidence that opinion has turned strongly against his party. A year ago everyone agreed that he was right to accept the responsibilities of government with what looked like an unworkably small majority. But this agreement rested on two presuppositions: one was that a fresh election could not be expected to produce an appreciably different result; the other was that, in deference to the closeness of the two main parties in popular support, a one-party government would be constrained to behave much as if it were a national government.

These assumptions are out of date. The Government has in fact tried to go on as if it commanded a clear majority both in the country and in Parliament. From the issue of steel nationalisation downwards, it has clung as far as it dared to its own particular policies. It has ignored the deep distrust in which those policies are undoubtedly held by a very large section of public opinion. It has persisted in them even after the sharp shift in the emphasis of national needs that the defence programme represents. It has, indeed, given up a few things it would like to do but the country does not like. It has not sought to do the things on which a wider area of national agreement could have been commanded. It has been, at best, no more than a somewhat shorn party government. In this way one of the assumptions of March, 1950, has been deliberately destroyed by the Government itself. The other has been taken from it. There is no reason to doubt that in the past few months opinion has turned strongly against Labour; in all probability an election now would produce a firmly-based Conservative Government.

On both these counts the moral basis of Labour's authority has gone. It is the Government that has broken the rules of the game—the rules as they can reasonably be applied to the unprecedented situation created by the 1950 election—and the Opposition has every claim to fight back by any means that accord with the spirit as well as the letter of British parliamentary practice. It is true, of course, that by looking back justification by precedent can easily be found for Mr Attlee's action. Governments have overstayed their welcome before—and after a year or two have generally paid the price in overwhelming defeat. But to call in aid precedents from the beginning of the century, or earlier, is to ignore the new factor in the present situation. That, whether the politicians like it or not, is the public opinion poll. Essentially what this probing does is to make democracy more self-conscious. That may well be bad for democracy, as it often is for the individual. But the ill-effects will not be overcome by continuing to behave as if the polls did not exist. They do exist; they have firmly established their reputation for general (though not necessarily altogether consistent) accuracy, and it is inevitable that political tactics should take account of their evidence. If any purist thinks that the Conservatives ought to ignore the evidence, it is necessary only to get one question answered honestly: Is it conceivable that the Government would be content to remain in office as it is, with all the inconvenience (but no more) that a narrow majority would then involve, if the polls showed their present margin in favour of Labour instead of the Conservative party?

The polls enable the general feeling for or against the Government to be known with some accuracy continuously. It has to be hoped that in most situations the parties will not need to watch this evidence closely. Parliamentary majorities are not often so narrow nor swings of opinion so large as in the past twelve months: few governments have taken so many chances, only to have the unpopular delayed consequences of past policies pile up in a way that has happened lately. But the fact that a situation is uncommon is no reason for ignoring the perfectly plain needs that it creates. With the evidence of the public opinion polls so firmly against it, a Government as insecure as Mr Attlee's is bound to be hesitant and fumbling. Given the rest of its history, it cannot escape being a bad government—and will remain so even if (as is very likely) the spring and summer bring for it the temporary recovery of some of its lost support.

If these points are accepted, it is a peculiarly academic view of politics to go on to argue that nevertheless the Government should be allowed to die in an orderly fashion. The sufferer has too much will to live to make that possible: and the country's immediate need for firm government is hardly so unimportant that nature can unconcernedly be left to take its course. The Conservatives would be failing in the central duty of politics if they did not try to force Labour out by every means that parliamentary government puts at their disposal. There is nothing illegitimate about the prolonged debating of Orders. Far more obstructive methods have often been used for much narrower purposes. What is new is not that Orders are being discussed far into the night, but that if a vote is taken the Government runs a considerable risk of defeat—at great administrative inconvenience to itself. But this was the risk implicit in the terms on which the Government decided a year ago to carry on, and on which it is now determined to stay in power if it can. The Opposition is quite entitled in these circumstances to try to make the terms unpleasant enough for Mr Attlee to be compelled to change his mind.

On its own side, the Opposition is also taking a considerable risk. By its nature, the strategy of concentrating effort on forcing the Government out quickly will leave the Conservatives weakened if after two or three months it has not succeeded. The particular tactics chosen intensify the danger. To harass the Government on petty matters, to hold Parliament in a state of continuous tension, is all right, and will probably not provoke any real public disapproval, if it does not last very long; after a while, unless just the right moment can be found for a change of tactic, it will simply make the Opposition look silly. This is no doubt perfectly well realised by the leaders of the Conservative party. They have decided to take their chance while it exists and if they fail they will have no more reason to complain of the consequences than has the Government to complain of the present consequences of its decision to stick to office if not to govern. In the meantime, the independently-minded section of the public must be tempted to call a plague on both their houses; it cannot, however, refuse to recognise that, given the attitude of the Government, the Opposition is doing what any politicians in its position ought to do. If it is a very doubtful method of securing an adequate Government for Britain in 1951, so is every other practical possibility.

Moral Disarmament

NAPOLEON'S maxim that in war the moral is to the material as three to one has been over-quoted and over-rated. But it has sane truth, and even in the midst of material preparations for self-defence, the moral campaign should not be forgotten. For a period of time, the length of which no one can foresee, both the free nations and the Soviet Empire face a test of the morale of their citizens. A continuous struggle will be waged for the minds of men, which will range across the frontiers between the two worlds. Political warfare will seek to weaken the resistance of the opponent as well as to strengthen the staying power of friendly populations.

Perhaps these phrases seem over-dramatic when applied to Great Britain. Morale to an Englishman is something that only foreigners have—some of them have good morale, some bad. It is true that Great Britain's psychological defences against political warfare are perhaps the strongest in the world. There are few Communists here, and even in the trade unions, as an article last week pointed out, their influence, though by no means negligible, is small. But even in England Soviet political warfare should not be written off; the last six months have shown how many people will dance to a tune composed in Moscow who would be horrified to know that they are helping the Soviets win the cold war. And in other countries, with livelier imaginations and less fortunate pasts, political warfare can be all-important.

In this campaign the Russians have already secured the initial advantages that come to the party that is both organised and unscrupulous. They have in the World Peace Council, the body which directs the Soviet peace propaganda, an instrument for the moral disarmament of the West which is worth serious attention on account of the part which it plays in Russian strategy. There is some danger of under-estimating the Council, which recently held a conference in the Soviet sector of Berlin to deal in particular with the question of German and Japanese rearmament. On the face of it, the Berlin conference seemed to be just another gathering, under the sign of Picasso's preposterous bird, at which insults were hurled at America by the stage army of Signor Nenni, the Red Dean from Canterbury, Mr Kuo Mo-jo from Peking, a Soviet woman agronomist, a black African student, German proletarian poets and Professor Joliot-Curie, *in absentia* because he had once again been refused a visa. Moreover, the Council had mournfully to record that none of its previous demands to the United Nations had been considered by that body. And its latest set of resolutions look on the surface turgid and pretentious.

The Council decided to send a last warning to Uno and to present itself as an alternative where the "people"—especially the people of the colonial territories—can air their grievances; it decided to organise regional conferences in France to oppose German rearmament, in India to oppose Japanese rearmament, in Mexico to oppose "Truman imperialism" in Latin America. It will seek joint action with pacifist societies, the Quakers and others, it will canvass the support of the Churches, it will set up a propaganda office, start its own newspaper with M. Pierre Cot as editor, and

award peace prizes worth 15 million francs through a jury on which the Dean of Canterbury will sit. On the whole, it seemed, the Council might be dismissed as a talking shop.

There are, however, a number of reasons why such a judgment would be wrong. The first concerns the nature of propaganda in general. Mere reiterated talk with the object of hammering in one simple lesson is the basic method of all effective methods of influencing the minds of men *en masse*. Once external circumstances appear to accord with the propaganda, the simple slogans that have so often been half-consciously heard become an explanation of events and a guide to behaviour. Specifically, the sudden threat of American action against China to counter Chinese intervention in Korea for the first time made large numbers of Europeans almost automatically conclude that the United States was a potential danger to world peace. At that moment, the Russian campaign scored a victory.

In the second place, the World Peace Council is relatively potent in comparison with western propagandists because it constitutes a branch of an organisation. Lenin laid down, and Stalin has adopted the principle, that organisation is vital, that once the "correct" policy has been decided upon by the party leaders, everything stands or falls by the extent to which a disciplined organisation is in existence to carry it out. The peace campaign is no exception. Policy is laid down by the Cominform, which represents, in the language of capitalism, a holding company with two principal operating subsidiaries—the World Peace Council with the intelligentsia as its "market" and the World Federation of Trade Unions (WFTU) to corner the labour world. In each case the directing brains are provided by the parent company working through the local Communist parties of the world.

All the Cominform branches have a special task allotted to them. The WFTU and subversive agents everywhere must create civil wars, strikes, mutinies, sabotage and rebellions; and the World Peace Council must see that western governments do nothing about them. The basic aim of all is to bring about "revolutionary situations" in the western camp, following the Leninist tactic whereby the Communist *élite* preserves itself as a general staff, directing the masses into the front line without exposing itself to disastrous reprisals. Behind the peace campaign are the same revolutionaries who seized power in Russia after mutinies of the masses against an imperialist war, following years of underground subversive work. It is, indeed, one of the most disquieting features of the present situation that so much evidence offers itself to prove that the minds of Russia's ageing rulers dwell so much on the experience of their early careers. They appear to be seized with a mortal terror lest any Communist at home or abroad should think that history is not precisely repeating itself down to the last dot of Marxist-Leninist theory and Stalinist practice.

The aim of the peace movement is, then, to aid subversion, not mere pacifism. Quakers and "neutralists"

will be used, but Stalin demands positive actions. The World Peace Council met in Berlin with a directive from the Kremlin, conveyed in Stalin's recent "interview" with *Pravda*. It was to take action, because although war is "not yet inevitable" it can only be avoided if "the people's will" makes itself felt. To aid this process, the World Peace Council has two main tasks. The first is to prevent the United Nations from supporting the western powers if they take action to resist aggression, to subdue rebellions or to arm the Germans and Japanese. The second, related to the first, is to foment the very actions which the western powers are to be hindered from resisting. A resolution at the Berlin conference revealed very clearly the importance which Moscow attaches to unrest in the colonial territories. It was also explained recently by a propagandist speaking to the Russian people. America, he said, would find it hard to start a war until the colonial revolts had been suppressed. In other words, the native rebels are to act as cannon fodder in order to give Russia time to complete its rearmament. This, according to Moscow, is the era of colonial liberation, of the attack on the "rear of the capitalist camp."

The democracies, therefore, are faced with the problem of combating a much more insidious attack than one launched openly by Communists for Communism. They must meet an appeal not to do something unpleasant but—far more seductive—to do nothing. How should they best tackle the task? It is clear from the outset that no success can come of trying to overwhelm an organised campaign designed to win the educated masses of the world by an occasional address from an individual to individuals. Western statesmen, Foreign Offices and broadcasting services must rid themselves of the idea that to make an admirable, weighty rejoinder to Moscow's charges, and to make it once, is enough. If they find it difficult to grasp what is required of them, let them imagine themselves involved in a permanent international general election. No local politician, however inexperienced, is so foolish as to think that he stands a chance at the polls without the aid of an active party machine. There is no reason why Foreign Ministers should be more optimistic in the international contest that is now on. A permanent machine for western

The British Universities—I

The Postwar Boom

THE war caused an earthquake in the nation's estimate of the importance of the universities. The result has been since 1945 to alter both the character and the contours of the university landscape almost out of recognition. Where the universities were, in predominant degree, financially self-supporting, they are now predominantly state-aided. Where three major universities used to overawe the rest (at least south of the Tweed), the lesser ones have so grown in size, importance and distinction that they can now in certain departments outbid and outdo the ancient universities. Where before the war a majority of the 50,000 university students had independent means, now only a minority of some 84,000 students are financed by their parents. It is no longer respectable for the universities to stay in their ivory towers; the danger is now that they may be forced to serve the needs of the nation at too utilitarian a level.

political warfare should be created, and, once in action, it must be used for firing incessantly into the enemy's ranks.

Next to the organisation comes the policy. Successful propaganda needs a consistent theme, to be plugged on every occasion. And the theme, if it is to be really effective, must not be defensive. It is true that the Communist accusations of war-mongering cannot be left completely unanswered. But much the best defence is attack, unceasing attack against the crimes of the Soviet imperialists. There should be a full-scale onslaught on the fraudulent, sinister "peace" campaign of the Soviet Union's rulers and their cynical misuse of the workers and colonial peoples. An unremitting attack should be made on Russian imperialism, with exposures of the "inner contradictions" (to borrow a Marxist phrase) of the neo-Czarist camp. The point should be made over and over again that Communism means economic exploitation, that its first victims are truth and decency, that it is a device for depressing the living standards of the workers.

In such propaganda there is no need to go beyond the truth—indeed, it would be both wrong and foolish to do so. There is plenty of perfectly truthful material to hand. The "peace" campaign itself has created difficulties for Moscow which offer many opportunities for exploitation. To take only one example from recent weeks, when Signor Togliatti, on his return from the Kremlin, announces that the Communist Party of Italy will drop its opposition if the Italian Government will only change its foreign policy, he provides an opening which should be seized at once until neither a patriot nor a Socialist can remain in the party with an easy conscience.

In material rearmament it is possible only to have larger numbers than the enemy of the same weapons as are in his hands. In political warfare the western nations have, in freedom and truth, two most potent weapons which the Communists cannot copy. But, like all other weapons, they need to be mounted, ranged and fired at the enemy to produce any effect. That is the task to which a North Atlantic Political Warfare Executive should be addressing itself.

This upheaval has inevitably caused very severe strains and stresses within the universities. They have undertaken the education of more teachers, dentists, technologists, scientists, veterinary surgeons, sociologists, orientalisks and the like. Whether the sum of these additions implies a sensible interpretation of the function of the universities has been far too little considered. Sir Walter Moberley's "The Crisis in the University," the *Universities Quarterly* and PEP (Political and Economic Planning) have asked some of the important questions. Inside the universities it is difficult to find people who are prepared to survey the landscape as a whole and to criticise on broad principles.

The purpose of this and a succeeding article is to review what has happened at the universities since 1945 and to attempt to ask some of the critical questions for the

next decade. The boom is over. The pressure of the ex-service students is almost at its end. The schoolmen are pouring in. The total population of British universities seems to be stabilising for the moment at about 84,000. The first postwar financial quinquennium ends next year; the universities are at present deeply engrossed in making their estimates and plans for the new quinquennium, and in preparing to persuade the University Grants Committee to give them more money than the Treasury will disgorge. Future university plans are therefore in the melting pot, and the claims of rearmament have made the ingredients of the mixture uncertain.

What are the outstanding changes since 1945? Following the Barlow Report on Scientific Manpower in 1946, the universities undertook to double their student population (other than medical students) within a decade. This would have meant an increase to 88,000 by 1955. In fact, numbers were increased to nearly 84,000 by 1948-9, and in the autumn of 1950 were 83,600. There is no reason to suppose that they will fall further unless the total of state and local scholarships proves insufficient at a time when progressively fewer parents are able to pay for a university education. It seems just as improbable that numbers will increase rapidly. The results of a recent inquiry among the schools suggested that very few, if any, suitable pupils are failing to gain admittance to a university, even if it is not always the university of their first choice. The conclusion is confirmed from other sources. Until the schools can provide more qualified pupils there appears, therefore, to be little case for increasing the number of university students.

*

There has been much argument about estimates of future numbers. Until the current academic year it has not been possible to gauge the situation with any assurance. For five years the universities have been stuffed full of ex-service students fed to the universities by government grants. During this period many people have argued that when the universities resumed their dependence on students straight from school the post-war expansion would be found to be only a temporary bulge; the standard of entry could not be maintained with double the number of arts, science and technological students. Though it is not possible yet to give a categorical assurance, the ex-service students are a tiny minority among this year's entrants and the universities consider that the standard of entry is still steady. It looks as if the pessimists were wrong.

The first table shows how the increase in numbers has been distributed among the universities and university colleges. The proportional increases at Oxford, Cambridge and London have been modest. It is the provincial universities that have swollen out of recognition. It is, therefore, in these that controversy is strongest and the teaching and administrative problems are most acute. By a modest amount of new building and a more economical use of old, Oxford and Cambridge have squeezed in the extra numbers. The staff problems, however, remain considerable and colleges have rightly refused to elect to fellowships more dons than they can reasonably accommodate at the high table or in the Senior Common Room. But this leaves several hundred dons at both universities unattached to any college, and therefore without any of the old traditional roots. The financial pressures that have forced economy on the colleges and made the universities affluent have also increased

this tendency. It is now the university that has the money to make new lectureships rather than the colleges to make new fellowships.

In London the pattern has been different. Most damaged by bombing, London has been the slowest to recover, even though it has had the lion's share of the building resources allocated to the universities. London has also had to wrestle with other difficulties unique to itself. The increasing demands up and down the country for London external degrees, and the equally pressing demands from the university colleges in England and the colonies for internal degrees have laid an increasing burden on the staff, both teaching and administrative. It is

TABLE I—NUMBERS OF UNIVERSITY STUDENTS

	Pre-war	Autumn Term, 1950	Per cent Increase

GRAND TOTAL.....	3.05	23.23*	32.83*

* Estimate.

difficult to resist the conclusion that London has now bitten off more than it can properly digest, and that it should either disgorge its responsibilities for external degrees or divide off parts of itself to form separate universities. A student population of 18,000 may be inadequate for a metropolis of 10 million, but a single university of this size is already too big.

The universities' expansion in size has been rapid enough. The growth in public expenditure on the universities has been even more startling. Treasury grants are now running at ten times the prewar figure. Just before the war, Exchequer grants were about £2,250,000 a year. For the current financial year they are some £23 million. Nor is this the whole story. Before the war, some £900,000 a year was being paid to students by the Ministry of Education and local authorities in the shape of university scholarships and grants. By 1948-9,

this sum had risen to £10½ million. Since that date the sharp fall in the number of ex-service students in the universities has reduced the number of grants to them. On the other hand, the number of state and local scholarships has been further increased. It is unlikely that the figure next year will be less than £7,000,000. This means that by direct grants or by scholarships the taxpayer and ratepayer are contributing at least £30 million towards the universities, compared with £3,000,000 before the war. The figures (some of which are necessarily rather rough estimates) are set out in the second table.

The universities have, indeed, been very liberally treated by the state as far as money is concerned. In this condition of affluence, they—and more particularly the provincial universities, which were chronically indigent before the war—can barely recognise themselves. But if money has been freely available, bricks and mortar have not. The limitations on building have affected the universities most cruelly; at the moment when they at last appeared to be making progress, the claims of rearmament have flung everything again into uncertainty. In 1947, the Chancellor of the Exchequer stated that building schemes totalling £40 million had been approved in principle but that national resources would not permit more than £20 millions' worth to be built within five years. A year ago it looked as if the universities might outstrip that £20 million. Now delaying action by the Government departments, rather than outright refusal, has put nearly every project six or nine months behind schedule. For next year all is uncertainty.

The universities have for five years been living under conditions of great austerity in accommodation. Here

and there an excellent new hall of residence has been built, or a new refectory and common room, or a huge new building for nuclear physics. Some universities have done better than others, either because of local building conditions or because of a certain buccaneering spirit on the part of their Vice-Chancellors. But, generally speaking, expansion, if any, has been by means of temporary huts (or even caravans, at Birmingham); lecture rooms, laboratories, staff rooms and refectories are crammed to overflowing. The supposed elegance and spaciousness of university life remain a mirage. Overcrowding can be tolerated for a while, and if the prospects of relief look reasonably close. An indefinite postponement would make them not only much harder to bear, but must bring into question the very assumptions upon which a university education is based.

Taken as a whole, the universities have a great deal to be thankful for and a great deal to be proud of during the past six years. They have shown every sign of vitality. One university college, Nottingham, has grown to full university stature; Southampton is on the verge of the same transformation. A brand-new university, that of North Staffordshire, has sprung straight into all-but-adult status this year with 155 students. A new university college, Leicester, has entered the university family. The universities, and more particularly the civic universities, have not only survived the earthquake; they have used it to good purpose. When the history of the universities comes to be written, 1945 may well appear as the turning point when the civic universities changed from satellites into sovereign states; but for that to be so the work of the past five years will have to be consolidated in the next five.

Britain, Persia and Oil

THE British Government has warned the Persians that there can be no unilateral cancellation of their agreement with that major British enterprise—the Anglo-Iranian Oil Company. Simultaneously, the Persian Lower House, the Majlis, has approved, "in principle" and with acclamation, the nationalisation of Persia's oil industry, and the Upper House, the Senate, confirmed this decision last Wednesday. It has not yet defined exactly what it envisages when it uses the word nationalisation, but some of its members certainly mean expropriation. The situation looks like deadlock.

A pause may now be expected for three reasons. First, Persia's New Year falls this week and every sensible citizen takes a holiday. Secondly, the new Prime Minister, Hussein Ala, has had the courage to moderate the over-excitement that followed upon the murder of his predecessor, General Razmara, by banning inflammatory meetings and, as this was not fully effective, the Shah introduced martial law after the attempted murder of the Minister of Education. Thirdly, the Majlis oil commission has asked for two months in order to formulate detailed proposals for nationalisation.

It is worth examining the reasons why, in a country that is formally wedded to democracy but lives on the edge of the iron curtain, such a dangerous state of feeling has boiled up between a British company and the Persian people. The word "people" is here used with purpose, because successive governments, as they have come to power and had to handle Persia's international and

financial affairs, have seen the virtues of agreement with the company; but they have either met a bullet for doing so, as Razmara did, or else have seceded from their view under pressure from their fellow countrymen.

The present basis upon which the company extracts oil from the Persian subsoil and refines it inside Persia is an agreement reached in 1933. Because the then ruler of Persia was a dictator—Reza Shah—Persians consider this to have been reached under duress. The Persians at the time wanted this agreement because it is designed to protect them against financial loss in years of low production; 1931 and 1932 had been such years, and had hit the Persian exchequer badly. But there were thereafter few or no lean years and before long there was a war boom, with production increasing by great leaps, as indeed did the amounts paid in royalty and tax to the Persian government. Unfortunately, it was plain that successive governments were frittering these receipts on inessentials instead of devoting them to social reform and capital development. This fact gives the company some excuse—though an excuse which it used too freely—for its delay in offering Persia a richer share of the profits than it had been able to pay in 1933. The offer, known as the Supplemental Agreement, was made in 1949 and the Persian government of the time initialled and published it. But its contents have never been understood by the Persian people. For reasons which mystify even the company's warmest admirers, this technically efficient

concern made no attempt to explain the advantages to Persia of the agreement. The details were kept in a drawer, and were hedged about with unnecessary and unwise secrecy. Company officials took the line that advance publicity for the agreement was "for the Persians to do." But the Persians are masters of carping and criticism, so of course they demolished the agreement while the company said nothing in its favour. Meanwhile, the American companies on the far side of the Persian Gulf reached a new royalty agreement with King Ibn Saud which contained the simple and joyous formula of "fifty-fifty." A careful assessment of the very different basis on which the two agreements were conceived would probably show that, in any bad year, the Anglo-Iranian's "supplemental" was the better offer.

★

Critics of Anglo-Iranian must recognise that it has a difficult landlord. It has to contend not only with an excitable populace but also, inside the Majlis, with a small but determined group called the National Front who are bent on "nationalisation" and who admit that they are ready to harness mullahs and fanatics in order to get their way. What is more, their basic conception of nationalisation has the sympathy of many intelligent younger men who, even though they know the desperate state of Persia's national finances, feel that the country has grown up since 1933 and that anything short of a "partnership" basis is now beneath its dignity. So strong are these Persian emotions that they completely dwarf what is, to any outsider, a vital element in the situation. Persia shares a long frontier with the Soviet Union and for years it has kept pressure from the north at bay by a balancing feat which has been achieved largely thanks to the major British interest situated in the southern province of Khuzistan. To chase out this interest would be to upset the balance. Yet such are the passions now aroused by the "nationalisation" cry that any Englishman who mentions the Soviet danger is written off as a producer of red herrings.

The Anglo-Iranian company is not without blame for its day-to-day handling of Persia. It takes the line that "we are busy oil men, with a job of extraction to do, and we have no time for scenes"; too few of its staff speak Persian well, or have been outside the oilfield and refinery areas. Nevertheless, the company does a great deal for the Persian people. For instance, its expenditure in Persia on wages and sales below cost to its employees amounts to nearly one-third of the expenditure of the central government on the civil service. The average wage paid to its Persian labour in Abadan was, in 1950, 64 rials per day, whereas in the Persian textile factories of Isfahan it is easy to find adult workers earning only 12 rials. It is the only industry in the country which pays superannuation or observes the Persian law. Yet it is everywhere reviled—perhaps because it gives too much in secret, for instance in advances that veil the inefficiency of the Persian Government's financial management.

Both Houses of the Persian Parliament are now out on a limb, committed to "nationalisation," though some of their members know they could not extract the oil or market it themselves. There is a shortage of petroleum engineers, and it might be imprudent to part with an excellent team, of a single nationality, for a mixed bag of untried variety and quality. It remains to be seen

whether a "nationalisation" formula can be produced that would retain at least some of the present virtues, including that of paying into the needy Persian exchequer both well and regularly. But who is to make the proposal? The Majlis oil commission, which is committed to proposing something, or the company? In such a situation he who keeps the initiative has the best chance of getting what he wants.

Should the deadlock continue between the partners, they should, in theory, resort to arbitration and each appoint an arbitrator, but in their present mood the Persians may well refuse to do this. The company could then take the matter to the International Court. The greatest danger in the situation will be if the pause does not occur and Teheran temperatures remain at their present height. Since the assassination of General Razmara on March 7th Persians have raced from crisis to crisis. Thus proposals and decisions reached by more sober minds away from the intoxicating air of Teheran have been overtaken by events and rendered useless and out of date. For this reason, and because Persians, like all Moslem peoples, respect power and strength, one or two naval vessels might perhaps usefully manoeuvre in the Persian Gulf near Abadan. The British Government would also do well to ensure that preparations are made to reinforce the RAF bases in nearby Iraq at short notice, should the situation suddenly deteriorate still further. The nationalist virus spreads amazingly quickly in the Middle East.

An additional and important misfortune in this connection has been the dull and often characterless service put over the air by the BBC in Arabic and Persian. In countries where newspapers are so often irresponsible political sheets, the politicians and a large section of the public will listen to the radio if they hear news and even views which are reliable and not available elsewhere. Unhappily the Middle Eastern services of the BBC, which built up so great a reputation during the war, have, largely through overwhelming desire to please everyone all the time, lost their interest and many of their listeners. Irresponsible and sometimes inaccurate messages from foreign correspondents on the spot have further inflamed Persian nationalist passions.

The effects of Persian action are already apparent in Iraq, where a movement to expropriate the petroleum field there is gaining ground. In Cairo a group of Egyptian politicians want to expropriate the Suez Canal. Happily this great international waterway is well guarded by the British army and nothing more tiresome than noisy agitation need be anticipated. There is a similar situation in the petroleum-bearing island of Bahrain, to which the Persians have made loud and renewed claims. The disagreement between the Persian Government and the Petroleum Company is thus no longer a local one. If the Persians expropriate the Anglo-Iranian Oil Company it is likely that other Middle Eastern governments will soon follow their example. It is not without significance that the Russians and the local Communist parties are giving the extreme nationalists their full support. Indeed it may well be part of Moscow's plan to encourage nationalist sentiments in the Middle East in order to deny the free nations the wealth of Middle Eastern petroleum. But it is still possible that a firm policy, pursued from London and supported by Washington, will render more drastic measures unnecessary.

NOTES OF THE WEEK

Birth of the Schuman Plan

The initialling of the Schuman Plan in Paris on March 12th marks a personal triumph for M. Jean Monnet as well as the beginning of an historic experiment in international co-operation. In these days of impersonal governmental powers, it is peculiarly satisfactory to find that the character of one individual still counts for so much. Whatever practical results emerge from the Plan, the weight of his influence on the men from six different countries who have been negotiating it during the last nine months will remain. This is above all true of the German delegation, led by Professor Hallstein who now becomes permanent head of the new Federal German Foreign Office. He has now had the best possible training for his office.

It is well to record M. Monnet's actual achievement, since the future of the steel-coal pool is still far from certain. It has still to be ratified by the parliaments of the associated countries in the teeth of opposition from varied and powerful interests. Dr Adenauer, in particular, is faced by the prospect that the Bundestag may undo all the efforts which he and Professor Hallstein have made to convince America that Germany is ready to sacrifice some of its narrow national advantages for the cause of Franco-German co-operation. It would be well if he were to be helped by a public declaration that the Ruhr Authority will hand over to the Higher Authority of the Schuman Plan, as soon as there is a reasonable prospect that the latter will be effective.

Owing to the unfortunate tactics of the Americans during the final negotiations in Bonn and Paris, the British Government finds itself among those with a grievance about the settlement that has been reached. The American pressure and mediation, which brought about a compromise agreement between the French and German delegations, were necessary and beneficial in themselves; but they were marred by a lack of consideration for the right of the British in the High Commission for Germany to share in decisions regarding the reorganisation of the Ruhr. Since the British Government is already suspected of opposing the Schuman Plan, it would be particularly regrettable if it should now—chiefly owing to an American breach of diplomatic manners—give the impression that the worst suspicions are founded.

However, even if there are no objections from London and the Plan is ratified by all the Parliaments concerned, it still remains to be proved that it will work. Neither goodwill nor admiration for the results so far achieved in Paris can remove scepticism about the practical application of the Plan, if it is to retain the original ideas of its creators.

Eisenhower's Appointments

The list of the commanders and senior staff officers who are to serve under General Eisenhower is a very satisfactory one. The preponderance of British officers is surprisingly large, but there is not the slightest doubt that on a consideration of merit and ability it is justified. Field-Marshal Montgomery, as the senior of the two Deputy Supreme Commanders concerned with instituting common methods of administration and tactics, will be in a position to do a great deal of good. Air Chief Marshal Sir Hugh Saunders as the Deputy Supreme Commander (Air) is a less-known quantity, but he has considerable experience in co-ordinating the European air forces. Admiral Sir Patrick Brind, who is to command the northern area with an American air commander and a Danish and a Norwegian land commander under him, has made a considerable reputa-

tion as Commander-in-Chief in the Far East. The man who has most to prove himself as a commander of a large force is General Juin, who becomes the commander of the land forces in the central area, for he has never commanded a formation larger than a corps. But given the insistence of the French that the land forces in the centre must be commanded by a Frenchman, he is the best man available.

The Mediterranean Command remains shrouded in obscurity for the reason that the original concept of a southern area of General Eisenhower's command, to embrace solely the Western Mediterranean, has foundered on the strategic impossibility of treating the defence of the Mediterranean—and the Middle East—as anything less than a unity. The Nato governments are now having to consider the appointment of a third Supreme Commander, equivalent in status to General Eisenhower in Europe and Admiral Felteler in the Atlantic, who should defend the Mediterranean and at the same time allot some special force to guard General Eisenhower's southern flank.

In the meantime, General Eisenhower has started to lay down his own lines of communication to the twelve governments whom he serves by appointing Colonel Drexel Biddle as assistant chief of staff in charge of national affairs—that is, political liaison. This in itself does not necessarily mean that the General has decided to dispense with any more complicated arrangements. But the sensible thing would be to leave it at that, with strong wires to the Deputies in London, rather than filling Versailles with eleven more liaison officers who might only cross the wires. In theory, governments should say the same thing, however many people they employ to say it; as this is not always true in practice, the fewer people the better. The only elaboration on the present arrangements that is possibly worth considering is that, if the Deputies are to continue to sit in London, they might themselves appoint a single representative to Versailles.
